RADAR

https://radar.uxp.godaddy.com/radset/team-post-publish

Editor code

https://github.com/gdcorp-inf/next-editor/blob/master/src/client/components/modals/PublishPublishSuccess/RADAPostPublishModal.js

Notes

Likely, all of the post publish modals should be in RADAR. Some exceptions are made, e.g. experiments, and you will find those modals and conditions in the code.

For development/testing purposes, you can force a specific modal to appear using this override flag: https://switchboard.int.dev-gdcorp.tools/instantpages/edit/FeatureFlags.postPublishOverride (DEV, but you can find in all envs)

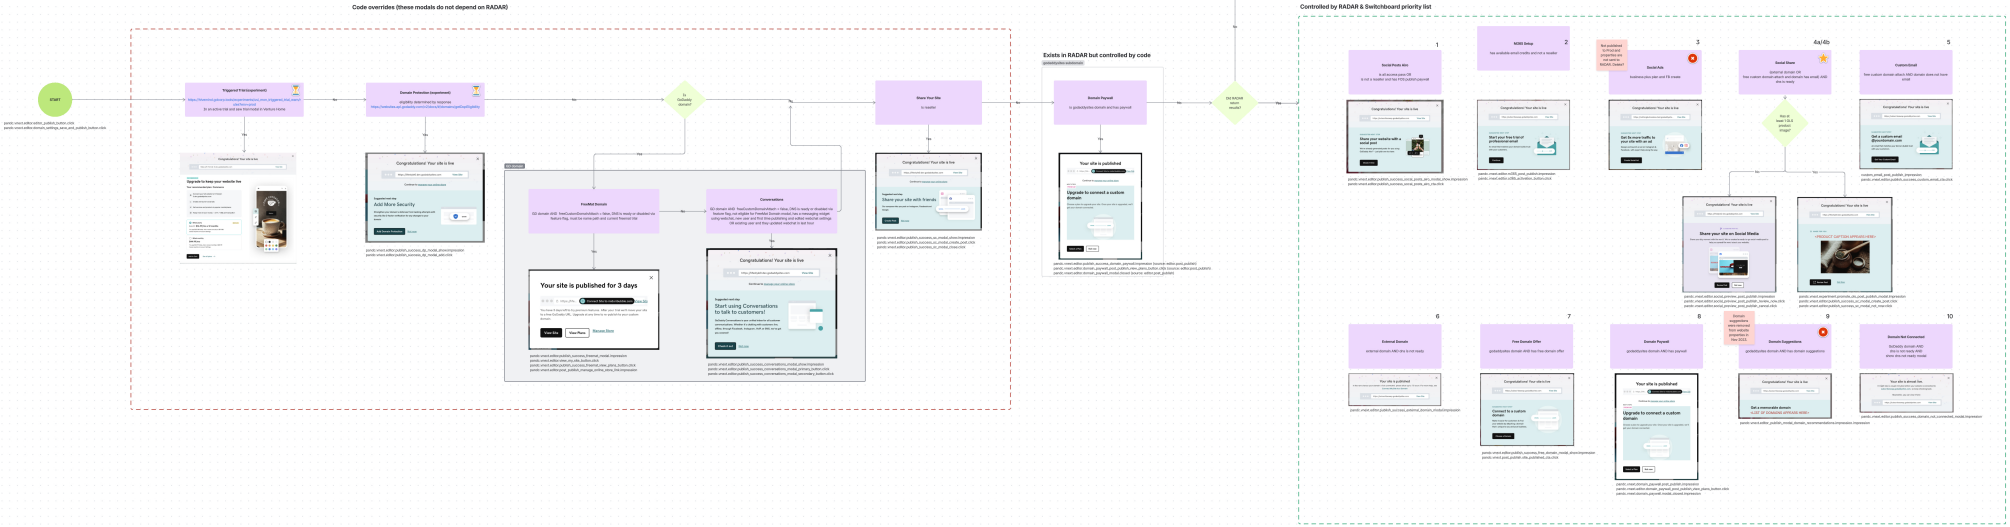
Priority list for RADAR

https://switchboard.int.gdcorp.tools/instantpage/edit/radCardPriorityList

If a customer is eligible to see multiple post publish modals, this list determines the priority/ordering in which they are shown.

Legend

- Default modal that is shown if user is not eligible for any others or some type of error occurs.
- Experiment currently running
- Candidate to be deleted
- Modal might be working improperly



Notes

If the modal is using RADAR and is not listed in the priority list, it will never appear to customers.

If a customer is eligible to see multiple post publish modals, this list determines the priority/ordering in which they are shown. The numbers shown above should be in sync with the priority list.

Ex: If a customer is eligible to see M365 Setup (2) and Custom Email (5), the customer will be shown M365 Setup because it is ranked higher in the priority list.

Some of the modals in RADAR also specify market eligibility.
