ONLY ALLOWS THE
DOOR OPEN 3
INCHES!

ENCRYPTED BARREL

164BNE BALL BARREL

Security is the first duty that a steel door must fulfill. The Steel door “lock-set” is the most important component that ensures security. Steel doors are preferred to ensure the security of places such as residences, offices and workplaces. A steel door that cannot provide safer, healthier and higher quality service to its users is meaningless.

STEEL ELEMENTS

Each door includes an interior and exterior pre-hung steel frame and pre welded hinges. The door unit is framed with 17 Gage steel and designed with a 1/2” overlapping edge to seal the door against the interior frame creating protection against the elements. Two structural beams run from top to bottom adding rigidity and strength. The remaining cavities are filled with rockwool for insulation. Finally, a solid (10 mm) MDF interior panel completes the interior look while our decorative Laminox exterior panel beautifies the finished product for years of trouble-free use and durability.

STEEL DOOR SMART LOCK SYSTEM-COMING SOON!

The smart lock system is also considered among the steel door accessories today. The smart lock system, which can be applied to all cylinders and locks, can be controlled remotely and allows opening and closing with an electronic key, mechanical key, remote memory, fingerprint control and by phone.

WARRANTY

Retro Steel Doors will provide a one (1) year limited warranty for installation and functionality for each of our doors, beginning on the date of your purchase or closing with one of our Builder partners. This warranty does NOT cover cosmetic abnormalities including scratches, fading or dents after installation. Our Warranty includes the proper function of our locking and safety systems.

SPECIFICATIONS

Each door in our warehouse today is 6' 10" tall and 3' wide, future doors will comply the standard dimension of doors in the US (6'8" tall and 3' wide). Steel doors are heavy! The typical weight of a steel door is 140 lbs. which is consistent with "Steel Security" doors. Engineering of structural requirements is recommended for every steel door and generally the entry wall should be framed with 2x6" dimensional lumber, triple studs on each side and a 2x10" header. Exact specifications and installation guidelines are available upon request.

NOTE: 8' tall doors are currently only available as a special order.

DO YOU NEED A RIGHT HAND SWING OR A LEFT HAND SWING?

All of our designs are available as a **Right Hand Swing (RH)** or a **Left Hand Swing (LH)**. Please be sure to purchase the correct swing for your home. The best way to determine which swing you currently have in your home, is to follow these instructions:

Open your door completely, stand in your doorway with your back to the hinges, next raise both arms to shoulder level, then determine which arm mocks the swing of your door opening. If your right arm duplicates the way your door swung open, then you have a Right Hand Swing (RH) door. If your left arm duplicates the way your door swung open, you have a Left Hand Swing (LH) door. Easy Peezy! (EP).

WHAT IS LAMINOX?

Laminox is wood-look composite material maintaining it's decorative properties against natural elements such as sun, rain, wind and storms. In short, Laminox is a composite wood-look veneer used as a decorative element on steel doors. Laminox is the most durable product used to create decorative wooden elements.
