

Dish washer not cleaning properly? – By Stan's Prop

Have you found that when looking at a newly washed glass there is some residue in the bottom? Felt a residue inside and out? Or found that its efficiency has significantly dropped?

It is no surprise that from time to time our dishwashers need a little bit of TLC to ensure its continued performance and efficiency. Thankfully, despite popular belief the maintenance of a dish washer can be a simple task, although not a pleasant job to complete.

Having been asked to investigate the cause of poor dishwasher performance on many occasions, most of the time the offending item has been the spray arms becoming clogged with either food residue or scale.

So what can you do? Well here is an outline of what you can do to improve your dish washers performance:

1. Remove the spray arms & unclog
2. Clean the inside of your dishwasher
3. Remove any residue & scale Build up – Removing scale can be a tougher task – We use natural methods (no chemicals)
4. Remove the coarse filter at the bottom of the dish washer and clean underneath.

When you have completed the above tasks you should find a remarkable improvement in your dish washer's performance!

Not fancy tackling this yourself? We are happy to provide this service for you, please call to discuss this further.
