Hades Down	6.0-6.2	6.0-6.2	6.0-6.2		6.2-6.8	6.2-6.8	6.2-6.8	6.4
Olympus Up	6.0-6.2	6.0-6.2	6.0-6.2		6.2-6.8	6.2-6.8	6.2-6.8	6.4

Please Note two major things. A). This is a feeding schedule written by customers/ for customers. It is a reference point. Make your own in time and share it with us. B). Nectar For The Gods is a Calcium Based Nutritional Nutrient. PH is CRITICAL. No where below pH of 6 and no higher then a pH of 7.0

- The most important component of every garden, beside the nutrients you choose, is the soil you will be planting in. We encourage all gardeners to test their soils pH and PPM's before planting. Do not let the package sell you on a medium, because talk is cheap. Make sure to do your own testing and prepare your medium according to your results. We recommend a simple test called the slurry test. To do this, take 2 ounces of medium and 2 ounces of water and let them sit in a container together until the medium is fully saturated. Then insert your PPM and pH meters directly into the slurry and read those numbers. Nectar for the god's performs best when the medium is in the pH range of 6.3-6.7 and the PPM are between 300-500. If your soil sample comes out with a lower pH and or higher PPM's, a pre-planting flush with Herculean Harvest and/or Olympus Up Liquid Lime will help correct these issues before planting.

- When in doubt, flush it out. If you are noticing signs of deficiencies like calcium, potassium, magnesium or nitrogen, do not rush out and buy a bottle of pretend cures. We say this because nine out of ten times it has something to do with your soil numbers. This would be a good time to slurry test your medium to see what is going on. Usually we can tie up and unlock the elements that we feels a deficient by flushing with Herculean Harvest pH'd to 6.5 with Olympus Up. The calcium in these products help tie up salt and neutralize acids. If you have any questions or comments, log onto [www.oregonsonly.com](http://www.oregonsonly.com). We can and will help.
