2019 Consumer Confidence Report

Water System Name: Trinity County Waterworks District #1 Report Date: 2019

We test the drinking water quality for many constituents as required by state and federal regulations. This report shows the results of our monitoring for the period of January 1 to December 31, 2019 and may include earlier monitoring data.

Este informe contiene información muy importante sobre su agua para beber. Favor de comunicarse Trinity County Waterworks District #1 at P O Box 217 Hayfork, Ca 96041 (530)628-5449 para asistirlo en español.

这份报告含有关于您的饮用水的重要讯息。请用以下地址和电话联系 Trinity County Waterworks District #1 以获得中 文的帮助; P O Box 217 Hayfork, Ca 96041 (530)628-5449.

Ang pag-uulat na ito ay naglalaman ng mahalagang impormasyon tungkol sa inyong inuming tubig. Mangyaring makipag-ugnayan sa Trinity County Waterworks District #1 P O Box 217 Hayfork, Ca 96041 tumawag sa (530)-628-5449 para matulungan sa wikang Tagalog.

Báo cáo này chứa thông tin quan trọng về nước uống của bạn. Xin vui lòng liên hệ Trinity County Waterworks District #1 tại P O Box 217 Hayfork, Ca 96041 (530)628-5449 để được hỗ trợ giúp bằng tiếng Việt.

Tsab ntawv no muaj cov ntsiab lus tseem ceeb txog koj cov dej haus. Thov hu rau Trinity County Waterworks District #1 ntawm P O Box 217 Hayfork, Ca 96041 (530)628-5449 rau kev pab hauv lus Askiv.

Name & general location of source(s): Big C	reek and Ewing Reservoir
Drinking Water Source Assessment information:	Assessment Date: November 2019. Most vulnerable to low density septic systems and historic mining operation. Contact Redding office of the Ca. State Water Resources Control Board Division of Drinking Water (530)224-4880.
Time and place of regularly scheduled board mee	tings for public participation: Third Tuesday of every month at 2:00pr

Time and place of regularly scheduled board meetings for public participation: Third Tuesday of every month at 2:00pm held in the Board Room located at 320 Reservoir Road, Hayfork, Ca.

For more information, contact: Craig J Hair, Jr. District Manager Phone: (530) 628-5449

TERMS USED IN THIS REPORT

Maximum Contaminant Level (MCL): The highest level of Secondary Drinking Water Standards (SDWS): MCLs for contaminants that affect taste, odor, or appearance of the drinking a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is water. Contaminants with SDWSs do not affect the health at the economically and technologically feasible. Secondary MCLs MCL levels. are set to protect the odor, taste, and appearance of drinking Treatment Technique (TT): A required process intended to reduce water. the level of a contaminant in drinking water. Maximum Contaminant Level Goal (MCLG): The level of Regulatory Action Level (AL): The concentration of a contaminant a contaminant in drinking water below which there is no which, if exceeded, triggers treatment or other requirements that a known or expected risk to health. MCLGs are set by the U.S. water system must follow. Environmental Protection Agency (U.S. EPA). Variances and Exemptions: Permissions from the State Water Public Health Goal (PHG): The level of a contaminant in Resources Control Board (State Board) to exceed an MCL or not drinking water below which there is no known or expected comply with a treatment technique under certain conditions. risk to health. PHGs are set by the California Environmental Level 1 Assessment: A Level 1 assessment is a study of the water Protection Agency. system to identify potential problems and determine (if possible) Maximum Residual Disinfectant Level (MRDL): The why total coliform bacteria have been found in our water system. highest level of a disinfectant allowed in drinking water. Level 2 Assessment: A Level 2 assessment is a very detailed study There is convincing evidence that addition of a disinfectant is of the water system to identify potential problems and determine (if necessary for control of microbial contaminants. possible) why an E. coli MCL violation has occurred and/or why Maximum Residual Disinfectant Level Goal (MRDLG): total coliform bacteria have been found in our water system on The level of a drinking water disinfectant below which there multiple occasions. is no known or expected risk to health. MRDLGs do not ND: not detectable at testing limit **ppm**: parts per million or milligrams per liter (mg/L)

reflect the benefits of the use of disinfectants to control microbial contaminants.

Primary Drinking Water Standards (PDWS): MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.

ppb: parts per billion or micrograms per liter (μ g/L) **ppt**: parts per trillion or nanograms per liter (ng/L) **ppq**: parts per quadrillion or picogram per liter (pg/L) **pCi/L**: picocuries per liter (a measure of radiation) **The sources of drinking water** (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants*, such as salts and metals, that can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- *Pesticides and herbicides*, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- *Radioactive contaminants*, that can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. EPA and the State Board prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The U.S. Food and Drug Administration regulations and California law also establish limits for contaminants in bottled water that provide the same protection for public health.

Tables 1, 2, 3, 4, 5, and 6 list all of the drinking water contaminants that were detected during the most recent sampling for the constituent. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The State Board allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative of the water quality, are more than one year old. Any violation of an AL, MCL, MRDL, or TT is asterisked. Additional information regarding the violation is provided later in this report.

TABLE 6 – DETECTION OF UNREGULATED CONTAMINANTS						
Chemical or Constituent (and reporting units)	Sample Date	Level Detected	Range of Detections	Notification Level	Health Effects Language	
Vanadium (ppb)	4/10/2002	1 ppb	Single Sample	50 ррb	The babies of some pregnant women who drink water containing is excess of the notification level may have an increased risk of developmental effects, based on studies in laboratory animals.	

Additional General Information on Drinking Water

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Lead-Specific Language: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. **Trinity County Waterworks District #1** is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you do so, you may wish to collect the flushed water and reuse it for another beneficial purpose, such as watering plants. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (1-800-426-4791) or at http://www.epa.gov/lead.

For Systems Providing Surface Water as a Source of Drinking Water

TABLE 8 - SAMPLING RESULTS SHOWING TREATMENT OF SURFACE WATER SOURCES

Treatment Technique ^(a) (Type of approved filtration technology used)	Conventional Treatment
	Turbidity of the filtered water must:
Turbidity Performance Standards ^(b) (that must be met through the water treatment process)	1 – Be less than or equal to NTU in 95% of measurements in a month.
	2 – Not exceed NTU for more than eight consecutive hours.
	3 – Not exceed NTU at any time.
Lowest monthly percentage of samples that met Turbidity Performance Standard No. 1.	100%

Highest single turbidity measurement during the year	<0.3 NTU
Number of violations of any surface water treatment requirements	0

(a) A required process intended to reduce the level of a contaminant in drinking water.

(b) Turbidity (measured in NTU) is a measurement of the cloudiness of water and is a good indicator of water quality and filtration performance. Turbidity results which meet performance standards are considered to be in compliance with filtration requirements.

Trinity County Waterworks has a Chemical Monitoring Waiver for TCP 1223 due to previous monitoring results, user

population characteristics and surrounding land uses.

Summary Information for Federal Revised Total Coliform Rule Level 1 and Level 2 Assessment Requirements

Level 1 or Level 2 Assessment Requirement not Due to an *E. coli* MCL Violation

Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful, waterborne pathogens may be present or that a potential pathway exists through which contamination may enter the drinking water distribution system. We found coliforms indicating the need to look for potential problems in water treatment or distribution. When this occurs, we are required to conduct assessment(s) to identify problems and to correct any problems that were found during these assessments.

During the past year we were required to conduct 0 Level 1 assessment(s). 0 Level 1 assessment(s) were completed. In addition, we were required to take 0 corrective actions and we completed 0 of these actions.

During the past year 0 Level 2 assessments were required to be completed for our water system. 0 Level 2 assessments were completed. In addition, we were required to take 0 corrective actions and we completed 0 of these actions.

Level 2 Assessment Requirement Due to an E. coli MCL Violation

E. coli are bacteria whose presence indicates that the water may be contaminated with human or animal wastes. Human pathogens in these wastes can cause short-term effects, such as diarrhea, cramps, nausea, headaches, or other symptoms. They may pose a greater health risk for infants, young children, the elderly, and people with severely-compromised immune systems. We found *E. coli* bacteria, indicating the need to look for potential problems in water treatment or distribution. When this occurs, we are required to conduct assessment(s) identify problems and to correct any problems that were found during these assessments.

We were required to complete a Level 2 assessment because we found *E. coli* in our water system. In addition, we were required to take 0 corrective actions and we completed 0 of these actions.
