# Brick-2 Video Wall Processor Multiple Source Switching

Copyright Media Technologies, 2007

# Overview

- Often more sources need to be switched onto the video wall than the processor can support directly.
- This document shows an example where 20 video sources need to be switched onto a 4x5 video wall either as a big picture, or as 20 individual images, one on each monitor.
- Different display configurations can be achieved using this setup.
- In this example, the matrix switches can be controlled by the Brick-2 processor for easy integration of the complete system.
