# Tens of Thousands of Lives Could Have Been Saved if Research on COVID Treatments Hadn't Been Suppressed, Doctors and Economists Say

*The government's "near complete" lack of guidance and research on treatment options — "apart from vaccines" — is "unconscionable," said University of Wisconsin critical care specialist Dr. Pierre Kory.*

**By Children's Health Defense Team**

***Miss a day, miss a lot.*** *Subscribe to The Defender's Top News of the Day. It's free.*

Since the first days of the declared coronavirus pandemic, doctors faithful to their Hippocratic Oath have been searching for — and identifying — effective COVID-19 treatments.

In mid-November, Dr. Peter McCullough, vice chief of internal medicine at Baylor University Medical Center, and three other experts outlined safe and available treatments for the Senate's influential Homeland Security & Governmental Affairs Committee.

University of Wisconsin critical care specialist Dr. Pierre Kory followed up with more discussion of viable COVID treatments at a Dec. 8 appearance before the same committee.

However, as Children's Health Defense Chairman Robert F. Kennedy Jr. observed during a March 2021 conversation with McCullough, "we've seen this very strange conflict ... that many of those treatments that could save lives, instead of being promoted and investigated and studied by the health authorities, are instead being sabotaged and made ... inaccessible."

The government's "near complete" lack of guidance and research on treatment options — "apart from vaccines" — is, according to Kory, "unconscionable."

The tragic fallout of this government strategy is now becoming apparent. In a recent working paper analyzing the determinants of COVID-19 fatalities, the authors — Michigan State University economics professor Mark Skidmore and co-author Hideki Toya — estimated "if the U.S. had made [hydroxychloroquine] widely available early on, 80,000 to 100,000 lives could have been saved."

McCullough had already reached similar conclusions when he told senators in November the U.S. "could have saved half of the lives lost" if COVID treatment protocols had not been squelched.

By March, McCullough had revised his estimate upward, asserting that "as many as 85% of COVID deaths could have been prevented through early treatment."

# The Vaccine Safety Project

Pa **LEARN MORE**

**e Authorization**

As early as March and April 2020, doctors began communicating — with cautious optimism — their experiences using interventions with years or decades of safe use behind them, including the promising repurposing of well-known drugs (for example, hydroxychloroquine, the inhaled steroid budesonide and ivermectin) as well as positive results from judicious use of supplements and therapies such as vitamin C, vitamin D, vitamin B1 (thiamine), zinc, iodine and nebulized hydrogen peroxide. They also noted that some of these interventions functioned equally well as prophylaxis.

For example, a new review of randomized controlled trial evidence for ivermectin and COVID-19, published by Kory and co-authors in the *American Journal of Therapeutics*, points to “large, statistically significant reductions” in deaths as well as improvements in clinical recovery. The results, say these authors, clearly indicate that “an oral agent effective in all phases of COVID-19 has been identified.”

According to Kory, government agencies that refuse to recommend ivermectin as a treatment option “are not keeping up with the data,” which “have done nothing but deepen and become more consistent.”

Pushing back, some judges have ordered hospitals to give ivermectin to COVID patients who have exhausted the few treatment options that government agencies are willing to endorse. In one such case, an 80-year-old woman made a “complete turnaround” in less than 48 hours.

As for hydroxychloroquine, the database of COVID-19 hydroxychloroquine studies now numbers nearly 300. These studies consistently show positive effects with early treatment and appropriate dosing.

There are many indications that micronutrient deficiencies — including deficiencies of vitamin D and vitamin B1 — may make some individuals vulnerable to COVID and its complications.

In February, Brazilian doctors reported “immediate neurologic improvement” and “accelerated ventilatory weaning” in patients who had COVID-19-related neurological complications after they received safe and low-cost intravenous B1 treatment.

Writer Bill Sardi has suggested that cases diagnosed as COVID-19 could, in fact, be beriberi (vitamin B1 deficiency). Vitamin B1 controls the autonomic nervous system, affecting functions such as breathing, heartbeat and digestion.

Sardi explains that many aspects of modern living — “over-consumption of sugars, alcohol, coffee and tea and medicines like the anti-diabetic drug metformin” — can help induce B1 deficiencies or block the critical vitamin’s absorption. He has also hypothesized that increased consumption of these items during COVID lockdowns could explain what has come to be known as “long COVID.”

**More blood on their hands?**

Under the law, the Food and Drug Administration (FDA) is not allowed to award Emergency Use Authorization (EUA) status to vaccines or other unapproved medical products unless the agency determines “there are no adequate, approved and available alternatives.”

The availability of treatment options clearly rebutted the contention of vaccines being the only way forward. Nevertheless, FDA made — in quick succession — the EUA decisions that enabled the rollout of the Pfizer, Moderna and Janssen (Johnson & Johnson) COVID injections just a few weeks after McCullough’s Senate testimony and a few days after Kory gave his testimony.

The consequences of this myopic and quite possibly criminal suppression of COVID treatments are not limited to the deaths that could have been averted through appropriate treatment. Many of the individuals who have accepted COVID vaccines might have made a different decision had they known about and had access to the promising and affordable COVID treatments identified by McCullough, Kory and other ethical physicians.

Instead, 4,178 individuals have died following COVID vaccination (as of May 3), and reports of injuries are flooding in from all over the nation and the world — highlighting serious problems such as blood clots, Guillain-Barré syndrome, heart inflammation and neurological disorders.

Some people are not unreasonably comparing COVID vaccination to Russian roulette.

Former Health and Human Services (HHS) COVID advisor Dr. Paul Alexander recently expressed major concern about giving children the experimental shots, describing the lopsided risk-benefit calculus. In addition to children’s “almost zero risk of [COVID] infection,” Alexander pointedly called attention to the fact that vaccine manufacturers have complete immunity from legal liability for COVID-vaccine-related deaths and injuries.

Alarming, the FDA ignored Alexander’s concerns and has just amended its authorization of the Pfizer vaccine to permit its emergency use with children as young as 12, notwithstanding the growing number of injuries being reported in older teens.

For example, a 17-year-old high school athlete in Utah was hospitalized with blood clots in the brain following his first Pfizer injection. Another high school student, afflicted with seizures and blood clots after receiving the Johnson & Johnson vaccine, has already incurred healthcare costs of over half a million dollars.

## **Doubling down**

Under the guise of “consumer protection” and “false marketing,” the government appears to be doubling down on its suppression of non-vaccine approaches to COVID.

For example, under the disingenuously named “COVID-19 Consumer Protection Act” — part of the 2021 Consolidated Appropriations Act signed into law by then-President Trump in late December — the U.S. Department of Justice began actively pursuing enforcement actions against healthcare providers who encourage use of supplements such as zinc and vitamin D to treat or prevent COVID.

Given that these and other micronutrients have been uncontroversially recommended for years for influenza, the common cold and other respiratory infections, the motives for the clampdown cannot be taken at face value.

Great article! 3 linchpins of the biggest scam in human history:

1. The myth of asymptomatic transmission
2. The criminal misuse of PCR tests
3. Scorn for cheap vaccine alternatives that are *actually* "safe and effective."

Any *one* of these points destroys the narrative and exposes the scam. Maybe a "3-b" would include Fauci's GOF work over the decades, and the origin debate.

Not scorn, but evil manipulation so they could, as Moderna said they did, download "operating systems" to start the transhuman movement. If there is a treatment, they have no excuse to use emergency vaccines.

There are now people who have taken this death jab, who can now place a magnet at the injection site and it sticks!!!!!! Begs to question what else is in this kill shot? Now is the time to get informed and stay on top of things and more importantly just say NO! Stick with Mother Nature shes knows best!

This is just a hunch, so please take it for what it's worth:  
I'm worried that the magnet thing is a "clowning" psyop. Clowning is one of the three main psyops along with false flag and agents provocateur. The media needs something to latch onto, where they can show "crazy conspiracy theorists" doing wild things and getting fooled by magnet videos. MSM will then show this on a loop to normies who desperately want to think of "anti-vaxxers" as ignorant gullible fools, instead of learned people like RFK, Jr.

Have you in fact tried or seen this done? I don't believe it. The amount of metal, not to mention ferrous material, is either microscopic or non-existent (I don't believe there's ferrous material to begin with). I believe that aluminum is the most common catalyst used by vaccine manufacturers and there is a valid reason for it. I suspect this is a lame meme you've latched onto.

The first video I saw on this phenomenon, I thought it was fake but then I watched this video...

<https://odysee.com/@TimTrut...>

I couldn't deny this phenomenon but then someone (person A) I know in my telegram group said she had 5 friends who tested it and it did not stick.

More people then responded to the above

above...

"It's not fake I've (person B) done it myself to 2 people but also I tried it on 3 other people that got their shots 2-3 months ago and it didn't stick .... the ones that stuck got their 2nd shot 2-3 weeks ago .... maybe to longer it's in their it is less concentrated in one area ? Like it spreads out ? Idk"

"I (person C) know someone that was vaxed that set off the metal detector in the airport right where she was vaccinated."

"I (person D) asked friend who got the Pfizer to try it and he said it doesn't work. No magnet got attached. Probably a fake video. Well I tried to warn him not to get it but his wife insisted."

I then asked person A when did her 5 friends took the jab and her response, "April 24 they took their second"

Now the above information (fragmented) are just insufficient to conclusively say anything meaningful. Perhaps, time elapsed since jab was administered and the type of jab (manufacturer specific) will determine if it will stick or not? What are your thoughts?

**Snowcat007** → Uncle 5 — 🚩

3 years ago

My thoughts are that it probably dispersed in those the magnets did not stick to. Doesn't mean it's gone, just spread out. Or they got a different batch? At this point I believe there's enough crap in these kill shots that we'll never get to the truth.

My thoughts are these are tracking nanobots, which do move. My

question is what's happens if you get an MRI?

What I do know is I will never comply!

So far, I have not seen any articles, studies or evidence for the existence of 'nanobots' at an advanced technological level to be able to self-replicate or somehow got basic AI capability. I would be interested to read such information if anyone else have got reference to them.

But...the following references might be relevant to the 'magnetic' phenomenon:

**Superparamagnetic nanoparticle delivery of DNA vaccine**

<https://pubmed.ncbi.nlm.nih...>

**Genetically engineered 'Magneto' protein remotely controls brain and behaviour**

<https://webcache.googleuser...>

...The most powerful of these is a method called optogenetics, which enables researchers to switch populations of related neurons on or off on a millisecond-by-millisecond timescale with pulses of laser light. Another recently developed method, called chemogenetics, uses engineered proteins that are activated by designer drugs and can be targeted to specific cell types....

...Neuroscientist Steve Ramirez of Harvard University, who uses optogenetics to manipulate memories in the brains of mice, says the study is "badass"...

An even greater myth is in the process of being exposed now as well:

The myth that viruses are pathogens and cause disease.

Check out Dr Tom Cowan on Bitchute. Some amazing analyses of the medical literature!

He's working with virologist Dr Stefan Lanka & microbiologist Dr Andy Kaufman, among others.

Viruses have NEVER been proven to cause disease. Wow.

So there has never been an actual need for vaccines, ever.

Vaccines generate \$50 Billion per year in sales, and \$500 Billion per year for meds to treat vaccine injuries (per RFK Jr talk in 2019)

All. For. Nothing.

I'll check out Tom Cowan, but is there a beginner guide to this subject, or something that initially caught your attention? Showing my ignorance, but...the flu is contagious, and is a virus. Is this just a semantics issue, as in the flu is not considered a disease? What are RFK, Jr.'s views on this I wonder?

I am still of the opinion that the virus was assembled in the Wuhan lab.

I think I can say that it is the general view of CHD that the virus exists. We have many scientific advisers - all opposed to the agenda - and while they may have doubts about prevalence none of them doubt it's existence.

Perhaps treat those who have similar symptoms that might *indicate* infection with Sars CoV2? As [Meryl Nass](#) writes:

I have challenged those who deny Covid is caused by a real virus to explain what, exactly, is causing these symptoms if it is not a virus.

\*it has a very predictable incubation period, averaging 6 days.

\*Properly used PPE protects the wearer from exposure.

\*It causes mostly similar syndromes in those who get very ill.

\*The syndrome, while relatively unique, is similar to that caused by SARS-1 in 2003.

\*The illness responds well to antiviral drugs.

Patients get better quickly when viral-killing protocols, including hydroxychloroquine or ivermectin, are used early in the illness.

Ivermectin, are used early in the illness.

Obviously viruses can be created!  
Who would do such a thing? Perhaps unreliable Nations wishing to undermine or destroy their enemies!  
Obvious but true!  
Let natural immunity protect you - not dangerous fast tracked profit making vax!  
Use Vitamin D and, in the unlikely event you get 'Wuhan Flu' use Ivermectin or another of the various safe and proven non-vax treatments!

Nass writes: "... what, exactly, is causing these symptoms if it is not a virus." This profoundly foolish statement by Nass indicates to me - and, I think, to you too - that nothing Nass has to say about the coronavirus is worth consideration. Wrong premises lead to wrong conclusions. Virologists think the same as Nass and look what that thinking led to - vaccines that maim and kill.

Pneumonia or influenza, same as every other year. Check death rates for the last 5 years. There are no spikes, in fact, in 2020 the death rate

was a little lower. Never was a pandemic.

I believe the hydroxy and zinc therapy would give relief to anyone with an influenza and possibly pneumonia in a matter of hours. Too many people have come forward and gave testimony on how quickly they were relieved and could breathe. I think most of those people had a bad case of seasonal flu and in some cases pneumonia.

If I am not mistaken, part of the Emergency Use Authorization requires that there are no alternative treatments. If this is the case, of course they will doom treatments, they will create fake science with studies of treatments that are doomed to fail. Bottom line, they wanted a vaccine that they could sell to every man woman and child. The investments were made up front, before we had data from alternative treatments. They would not sink that investment cost. It was decided, there would not be any forthcoming treatments.

**Evidence**

3 years ago

No other solution unless taking all the players to court, deliberately lowering pcr cycles to hide covid positive infections only for vaccinated is deceiving public in broad daylight and no

one dares to question CDC about this change. I he stated reason for the 28 CT maximum is to avoid false positives on people who have been vaccinated, which would discourage acceptance of the vaccines.

CDC is not recommending the lower threshold for anyone else being tested. False positives must be avoided to encourage vaccinations, but false positives to prevent children from attending school or maintain other government restrictions seem OK with CDC. Vaccinated people are now in danger because their infections will be greatly missed. CDC is even allowing the vaccinated not to wear masks if they are together, opening the door for a catastrophe.

Matthew 15:14, NASB:

"Leave them alone; they are blind guides of blind people. And if a person who is blind guides another who is blind, both will fall into a pit.
