

HH-185 Handheld Microphone Boom

Assistive Listening • Wireless Tour Guide • Pass-Around Q&A Wireless Microphone • Point-to-Source

- *Unidirectional microphone reduces background room noise*
- *Allows user to “point” to the desired sound source*
- *May be used as a pass-around handheld microphone*

The HH-185 microphone boom allows the standard M-216 microphone transmitter to be used as a handheld wireless microphone. It may be passed around in a group setting or held and pointed in the direction of the desired sound source.

The gain control on the M-216 transmitter allows the user to adjust the sensitivity of the microphone. The HH-185 boom incorporates a unique integral antenna design so that no external antenna is required while still maintaining the maximum transmission range.

The HH-185 can also be used with the PR-216 Option P receiver as a handheld, “point-to-sound source” type device to add functionality to the AT-216 assistive listening system.
