

# Chrystal IBC Cell

N-type mono Bifacial Interdigitated Back Contact solar cell

## MECHANICAL DATA

Area	25199 mm <sup>2</sup>
Format	G1; 158.75 x 158.75mm, 223mm diameter ± 0.3mm
Thickness	160µm ± 20µm
Layout	4 bus bar

## Electrical cell classification (sorting under AM 1.5G illumination at 25°C)

Cell class / Efficiency (%)	22.8	23.0	23.2	23.4	23.6
Power (Wp)	5.75	5.80	5.85	5.90	5.95
Isc (A)	10.33	10.36	10.40	10.44	10.47
Voc (mV)	692	694	696	698	701
FF (%)	80	80	81	81	81
Impp (A)	9.92	9.94	9.97	10.03	10.08
Umpp (mV)	579	583	586	588	590

## Temperature coefficients

Isc	0.037% /K
Uoc	-0.24% /K
Efficiency	-0.29% /K

## Typical Quantum efficiency

## Bi-Faciality

Bifaciality 75%

# Chrystal IBC Cell

N-type mono Bifacial Interdigitated Back Contact solar cell

## KEY FEATURES

### Made in European Union

All cells are manufactured in Lithuania

### Bi-facial

Valoe Chrystal IBC cells are bifacial. Bifacial systems can yield up to 25% more electricity compared with standard system

### PID Free

N-Type cell does not suffer from Potential Induced Degradation in the same way as standard p-type cell do

### LID / LaTiD free

N-Type cells are also immune to light and elevated temperature induced degradation that can cause severe yield loss with p-type high efficiency cells.

### Hot Spot Free cell design

Valoe Chrystal IBC cells have low breakdown voltage that is spread in large area. Thus Hot spots can not form on these cells

### 3rd party verification of cell efficiency

Cell efficiency is confirmed using verified by outside institute such as Fraunhofer Callab and measuring equipment is regularly calibrated using reference cells.

### Traceable quality

Cell manufacturing is tracked and recorded into MES system and data is stored to ensure consistent quality

### 100% Inspection

All cells are inspected and sorted using automated visual, IV measurement and Electro Luminance inspection system. The cells are sorted into different categories by power, current and color qualification

### Positive Sorting

The cells are sorted into power bins in a way that all cells exceed the nominal efficiency of the bin.
