## 2056 – The Global Orbital Watch

*Written by Travis Kodanvi*

Despite our global internet finally coming back online- it was quick to get a shocking news spread.

The long-abandoned International Space Station is making headlines, but this time for a far more ominous reason: it's expected to re-enter Earth's atmosphere later this year. Once a hub of international research and cooperation, the station has been uncrewed and largely neglected since the early 2030s. Now, after years of orbital decay, experts warn that its uncontrolled descent could pose a real, if unpredictable, risk.

Engineers tracking the station say that while most of it will likely burn up upon re-entry, some denser components could survive and reach the ground. Authorities emphasize that the chance of debris hitting populated areas is low, but the exact trajectory remains uncertain. Aviation agencies are already preparing to adjust flight paths as a precaution, and satellite operators are keeping a close eye on potential collision risks in low-Earth orbit.

The ISS, launched decades ago as a collaborative effort between multiple nations, has been a symbol of scientific achievement—and now, a reminder of the dangers of leaving massive orbital structures unmanaged. Officials from the Global Orbital Authority stress that they are monitoring the situation closely and will issue alerts if necessary, but urge the public not to panic.

For now, the world watches as a relic of humanity's space ambitions slowly drifts toward Earth, a quiet but potent reminder that even our greatest technological achievements are not immune to the laws of physics.
