**General Vet Notes:** 1/17/23: Geriatric dog, unspayed female suspected, has vulvar mass/growth possibly pedunculated growth (dfd: benign vs neoplastic). Stiff when walking around - arthritis. Hangs head - vetnroflexion. Reported to have possible seizures or syncope - needing to observe to figure out what is being reported - get a video if possible. Severe dental disease. Hypermature bilateral cataracts very limited vision. Difficult to auscult possible murmur, need to re-evaluate. Drew blood - chemistry overall NSF, decreased T4 insignificant. Having foster drop off again for observation for two days to see if can see more concerns, also plan to get possible chest xrays if P will allow. - BOK

1/19-20/2023: P unable to move around much, stays in her bed, head presses against bed. When she is up on all four feet is unsteady and wobbly, and circles consistently. Has not eaten for me even when offered variety or hand fed. QOL is suffering and P unaware and unresponsive to surroundings. Inhumane to continue treatments or monitoring, P has chronic pain and declining clinically/neurologically. Humane euthanasia recommended and performed. - BOK

Temp hold in freezer, foster possibly wants to take body for cremation.

**Diagnostic Interpretation for TT4**

- < 1.0 µg/dL Low
- 1.0 - 2.0 µg/dL Low Normal
- 1.0 - 4.0 µg/dL Normal
- > 4.0 µg/dL High
- 2.1 - 5.4 µg/dL Therapeutic

Dogs with no clinical signs of hypothyroidism and results within the normal reference range are likely euthyroid. Dogs with low T4 concentrations may be hypothyroid or "euthyroid sick". Occasionally, hypothyroid dogs can have T4 concentrations that are low normal. Dogs with clinical signs of hypothyroidism and low or low normal T4 concentrations may be evaluated further by submission of freeT4 (fT4) and canine TSH. A high T4 concentration in a clinically normal dog is likely a variation of normal; however elevations may occur secondary to thyroid auto antibodies or rarely thyroid neoplasia. For dogs on thyroid supplement, acceptable 4-6 hour post pill total T4 concentrations generally fall within the higher end or slightly above the reference range.

**SDMA:**

SDMA and CREA within reference interval: impairment of GFR is unlikely. Recommended next step: evaluate complete urinalysis.
