LOCAL GOVERNMENT CLIMATE AND ENERGY STRATEGY GUIDES

# Energy Efficiency in Water and Wastewater Facilities

A Guide to Developing and Implementing  
Greenhouse Gas Reduction Programs

# LOCAL GOVERNMENT CLIMATE AND ENERGY GUIDE:

- comprehensive, straightforward overview of greenhouse gas (GHG) emissions reduction strategies that local governments can employ.
- Topics include: energy efficiency, transportation, community planning and design, solid waste and materials management, and renewable energy.
- government staff and elected officials can use these guides to plan, implement, and evaluate climate and energy projects.

The background of the entire slide is a dense, overlapping field of US dollar bills of various denominations, including \$1, \$5, \$10, \$20, and \$100 bills, scattered across a dark background.

# OVERALL ENERGY CONSUMPTION

Energy can account 10% of a local government's annual operating budget

A significant amount of this municipal energy use occurs at WTP/WWTP

W & WW utilities accounts for 35% of typical U.S. municipal energy budgets

Electricity use accounts for 25–40 % of the operating budgets for WW utilities

# AERATION IS EXPENSIVE TO OPERATE

A hand is holding a lit match over a US dollar bill. The match is lit, and the flame is bright yellow and orange. The dollar bill is partially visible, showing the portrait of George Washington and the text 'ONE DOLLAR'. The background is dark and out of focus.

Up to 65% of total energy consumption can be aeration

Trying to aerate and mix with same equipment can save

Treatment Plant's are one of the top energy consumers in town

# WHERE IS IT USED?

EQ Basins

Aeration Basin

Aerobic Digesters

Lagoons

Others?

# WHAT ARE WE TRYING TO ACCOMPLISH?

The background image shows an aeration tank in a wastewater treatment plant. The water surface is covered with numerous circular diffusers, each creating a vortex of water and a thick layer of white foam. The foam is interspersed with patches of brownish-yellow sludge. The tank is bordered by a concrete wall, and trees and a building are visible in the background under an overcast sky.

Oxygen for BOD Removal

Oxygen for Ammonia  
Removal

Odor Control

Degassing

Mixing

# ENERGY AUDITS AND ENERGY REDUCTION GRANTS

The background of the slide is a dark blue night sky with several bright, jagged lightning bolts striking down. At the bottom, there are faint, colorful lights (green, orange, red) that appear to be city lights or a distant horizon.

## FACILITY AUDIT INCENTIVE PROGRAM

Learn more about cash incentive programs that provide reimbursement for facility audits.

# DUKE SMART \$AVER

## How it Works

1

### Apply

You submit your application and savings calculations.

2

### Receive an offer

We'll evaluate your application within four to six weeks and send you a preliminary incentive offer.

3

### Install

You have up to one year to install the project.

4

### Get paid

It takes up to four weeks for Duke Energy to evaluate your installation and process the incentive payment.

*Smart \$aver Custom Incentives range from 25 to 150 percent of the project's annual electric savings. The simple payback time must be greater than one year after applying for the incentive and cannot exceed 50 percent of the incremental project costs for customers in Indiana, or 75 percent for customers in Kentucky, Ohio and the Carolinas.*

# START WITH THE EASIEST FIRST...EQ BASINS

## Flow Equalization Basins (EQ Basins)

Not looking for full treatment

Often overlooked

Should Focus on  
mixing

Degassing for Algae  
Control

Same technology and equipment  
as aeration basin

# HOW MUCH OXYGEN

Pounds of Oxygen to Remove BOD and Ammonia

Many factors contribute, such as sludge age, temperature, etc.

1.0-1.2 Pounds of Oxygen per Pound of BOD

4.6 Pounds of Oxygen per Pound of Ammonia

# OXYGEN REQUIREMENT EXAMPLE .200 MGD PLANT

Aerator Loading = Flow(MGD)x mg/l x 8.34

BOD = .200 MGD x 350 mg/l x 8.34 = 584 lbs/BOD

BOD = 1.2 lbs O<sub>2</sub> x 584 lbs = 700 lbs of O<sub>2</sub>/Day

Ammonia = .200 MGD x 35 mg/l x 8.34 = 58 lbs/Ammonia

Ammonia = 4.6 lbs O<sub>2</sub> x 58 lbs = 267 lbs of O<sub>2</sub>/Day

# OXYGEN REQUIREMENT EXAMPLE .200 MGD PLANT

Aerator Loading = Flow(MGD)x mg/l x 8.34

700 lbs O<sub>2</sub> BOD + 267 lbs O<sub>2</sub> Ammonia = 967 lbs O<sub>2</sub>/day

967 lbs O<sub>2</sub>/day / 24 hours = 41 pounds O<sub>2</sub> per Hour

# STANDARD OXYGEN TRANSFER EFFICIENCY (SOTE)

Conducted in a ASCE Certified Lab

Chemicals used to deplete O<sub>2</sub> from clean water

Aeration turned on and O<sub>2</sub> recharge monitored by multiple probes

Gives industry standard to compare different types of aeration

# TESTING FACILITY FOR OXYGEN TRANSFER

# STANDARD OXYGEN TRANSFER EFFICIENCY (SOTE) RANGES

1.5 to 10 lbs O<sub>2</sub>/BHP-Hour

Mechanical Surface Aerators

Coarse Bubble Diffusers

Jet Aerators/Aspirators

Fine Bubble Diffusers

# MECHANICAL SURFACE MOUNTED AERATORS

Splash  
Aerator

Surface Mixer Aerator

Mix water well horizontally,  
lower SOTE

# MECHANICAL SURFACE MOUNTED AERATORS

Bradley ProFusion with Floats  
and Sphere

Bradley ProFusion Removable Core  
Deep water mixing, bubble contact chamber

# VIDEO

- BIG ProFusion's Video:
- <https://www.youtube.com/watch?v=GoGkCBHm0k8>
- See how it works here!

# COARSE BUBBLE DIFFUSERS

Good at Mixing, Fair SOTE

# FINE BUBBLE DIFFUSERS

FAir Mixing, good SOTE

# DISTANCE CAN HURT, PLACE THE ENERGY WHERE IT IS NEEDED

Blower/Diffuser	Duty	Operational Horsepower
<u>Blower</u> 25 HP positive displacement rotary lobe blower with 90% efficiency motor for 640 CFM @ 6 PSIG 25 HP @ 50% efficiency = 12.5 HP	Boost ambient air for a discharge pressure of 6 PSIG	12.5 HP
<u>Piping</u> High pressure piping system requiring 2.4 PSIG pressure loss for delivery of 640 CFM 40% x 12.5 HP to transport air from blower to diffuser = 5 HP	Deliver high pressure air from blower to diffuser	5 HP
<u>Diffuser</u> Fine bubble diffuser to an oxygen aeration and mix the waste sludge 60% x 12.5 HP for aeration/mixing	Injection of small air bubbles in waste sludge for aeration and agitation	7.5 HP

# OXYGEN IS IMPORTANT, BUT SO IS MIXING

Keep solids in suspension

Odor control

Decrease short-circuiting

Bring oxygen, pollutants and bugs together

Must Consider vertical and Horizontal Mixing

# DIFFERENT BUBBLES DIFFERENT JOBS

Moves Water,  
Coarse Bubbles

Transfers Gas,  
Fine Bubbles

# COMBINING TECHNOLOGIES FOR IMPROVED EFFICIENCIES

Blade +  
Diffusers

Fine +  
Coarse  
Bubble

Fine bubble  
blade + jet prop

# SAGR SYSTEM

# CUTAWAY VIEW OF SAGR:

- A. HDPE liner** prevents infiltration while sacrificial walls help the SAGR maintain its shape during construction.
- B. Influent distribution chamber** ensures influent is spread across the width of the bed.
- C. Clean stone** provides surface area for bacteria while preventing temperature shock. Mulch-covered for insulation.
- D. Linear aeration** covers the base for fully-aerobic conditions.
- E. Effluent collection chamber** is gravity fed to minimize O&M.

# LAGOONS HAVE UNIQUE NEEDS & 5 COMMON ISSUES

Short-Circuiting

Insufficient Horizontal and vertical mixing

Excessive Sludge

Highly Fluctuating O<sub>2</sub> Levels

Excessive Algae

# SHORT-CIRCUITING

A close-up of a robot's head, featuring two large, circular, metallic sensors or eyes. The robot's body is partially visible, showing yellow hydraulic cylinders and various mechanical components. The background is a blurred outdoor setting with a blue sky and some foliage.

Need to utilize entire lagoon

Large area to cover, placement critical

Horizontally Push Water

Hydraulic Curtain

# SHORT-CIRCUITING

- Dr. Middlebrooks says it best:
- *“Short-circuiting is the greatest deterrent to successful pond performance, barring any toxic effects.”*
- *“The importance of the hydraulic design of a pond system cannot be overemphasized”*
- A jet force created by a horizontal influent structure powered by a lift station.
- Structure vertically/ manifold?

# SHORT-CIRCUITING

- • Pond inlet position, size and location. A small inlet placed horizontally in the cell can force influent wastewater a third to a half of the way through a cell bypassing valuable treatment capacity
- • I&I and varied flow rates. Sewage under high pressure introduced to a pond will “jet” across the pond bypassing treatment capacity. Smaller influent piping accelerates sewage flow.
- • Pond outlet set too close to the influent
- • Temperature affects water density. Incoming sewage finds same water density and “ride” along that level.
- • Sludge accumulation. Sludge “steals” valuable treatment capacity...
- • Position of aeration equipment and baffles. Improperly placed baffles and aeration can contribute to short-circuiting
- • Wind. Good or bad

# 10% RETURN FLOW

- Taking 10% of daily flow and returning back to head of plant.
- Takes good, aerated, “clean” water, back to the raw coming in.
- Lots of pumps can do this depending on flow.
- Can see multiple benefits to your treatment process and numbers.
- H&S recommends on all lagoons.

# INSUFFICIENT HORIZONTAL & VERTICAL MIXING

Three stand mixers are shown from the waist up, with their stainless steel mixing bowls. The mixers are colored red, yellow, and blue. The red mixer is on the left, the yellow one in the middle, and the blue one on the right. They are positioned against a bright blue background.

Large area to cover, placement critical

Must mix vertically and Horizontally in one motion while adding O<sub>2</sub>

Diffusers would need to cover large area

Mechanical Surface Aerator/Mixer must have ability to vertically mix

Three stand mixers are shown from the waist down, with their stainless steel mixing bowls. The mixers are colored white, pink, and blue. The white mixer is on the left, the pink one in the middle, and the blue one on the right. They are positioned against a bright blue background.

# EXCESSIVE SLUDGE, MMMM

No solids handling like mechanical plant

Contributes to short-circuiting, BOD and capacity

Water and O<sub>2</sub> needs to flow over sudge layer for toxin flushing to digest

Can foul diffusers for loss of efficiencies

# HIGHLY FLUCTUATING O<sub>2</sub> LEVELS

Needs to be evenly distributed over a large area

Algae can be the cause

Needs to be balanced for a healthy ecosystem

# EXCESSIVE ALGAE

Algae can produce free O<sub>2</sub>

70% of Earth's O<sub>2</sub> is produced by Algae...NICE!

Algae needs to be controlled to prevent pH, TSS and BOD issues

Mixing and Aeration can degas the CO<sub>2</sub> and break the thermocline for Algae Control

Water must be aggressively agitated for degassing

# ALGAE IN WASTEWATER

- TSS, BOD and pH Violations
- Dying Algae helps Increased Sludge
- Clogs Filters
- Difficult to Disinfect

# ALGAE NEEDS 3 MAIN INGREDIENTS TO THRIVE

WANT TO STOP ALGAE? REMOVE 1  
INGREDIENT

# OTHER ALTERNATIVES THAT COULD HELP

Improved Headworks to remove extra organics

SCADA System for better control

MBBR requires less mixing power

Additional monitoring points throughout

VFD's

Other suggestions?

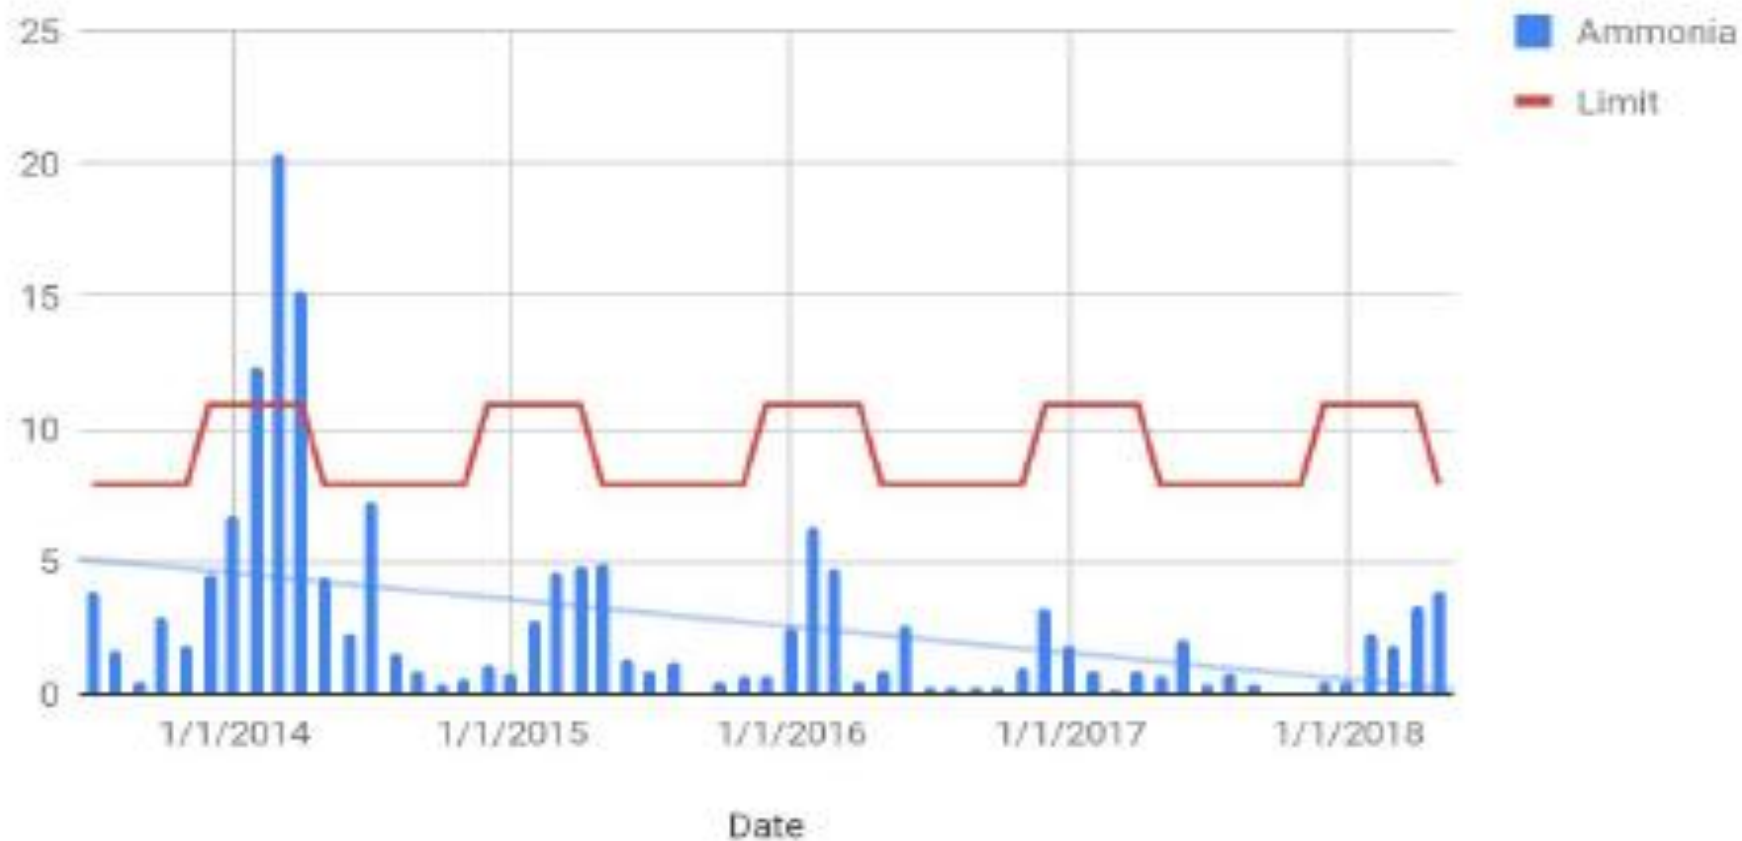

Consistent Maintenance plan

# BAINBRIDGE CASE STUDY

- Project Name: Bainbridge Indiana Lagoon Enhancement
- Installation Date: April 2014
- Equipment: 8 ProFusions in Lagoon 1 and 2 ProFusions in Lagoon 2
- Facility Design Flow MGD: .0820
- Summary:
- Bainbridge is a small town in West Central Indiana with a population of 750. Bainbridge was
- facing new permit limits for ammonia and wanted to keep their lagoon system rather than
- building a mechanical plant. They also treated algae with chemicals prior to the
- installation, but
- once the ProFusions were installed, they were able to stop applying chemicals and could rely
- on
- the ProFusions to keep the water clean. This is one of the first lagoon installations using
- the
- Bradley Innovation Group equipment. Bainbridge has been in compliance since the Bradley
- equipment was installed and data points are trending in the right direction for continued
- improvement.
