Monitoring & Management System

Why do we need a bed sterilizer ?

## Why do we need a bed sterilizer ?

Infection control is a top priority for everyone working in healthcare environments.

NICE has estimated that 300,000 patients a year in England develop a healthcare-associated infection (HCAI).

However, these figures only included NHS facilities – where HCAI was found to cost over £1 billion per year – so the true scale of the issue across the entire healthcare sector is likely to far exceed the NICE estimate.

## Why do we need a bed sterilizer?

### WHAT IS HCAI?

Healthcare-associated infection covers any infection that develops as a direct result of medical intervention, e.g. surgical treatment, or indirectly as a result of being in contact with a healthcare setting e.g. a hospital or care home.

Due to the prevalence and cost of HCAI, both to patient wellbeing and financially, healthcare professionals work hard to comply with infection prevention and control policy.

Individual policies may vary slightly to suit the needs of a specific facility, but all policies will include guidelines for personal hygiene e.g. handwashing, proper disposal of single-use equipment, and maintenance of reusable equipment – including mattresses.

This means that proper mattress decontamination isn't just important, it's actually a requirement in many healthcare settings.

What is bed sterilizer ?

## About us

### **22 Years' Professional Experience in Medical Field**

With 22 years' professional accumulation in medical field, BEST Tech is established to provide leading medical air purification, hospital bed disinfection, space and surface disinfection and other solutions to hospital and non-hospital field including designing, installation, commissioning, maintenance, service and IT monitoring service.

## Product Overview

BEST/SCX Hospital Bed Sterilizer adopts ozone as the disinfection agent and to reach disinfection, deodorization, and bleaching. It has the characteristics of quick disinfection, no dead angles, no damage to the processed items, and convenient operation.

## Working Principle

The air in the bed cover is drawn out till nearly vacuum to provide better penetration and contact of disinfect agent, then O<sub>3</sub> is delivered into the cover/bag for disinfection. Afterward, O<sub>3</sub> is pumped out and decomposed into oxygen by catalyst filter.

Real-time view of work process

## About Ozone technology

Ozone technology is an alternative to conventional thermal washing machines. It uses a natural, cold water ozone laundry process rather than hot water and harsh bleaching agents.

The Department of Health and the FDA have validated ozone technology has a highly effective decontamination method. The ozone dissolves in water and then disinfects by oxidising microbial cells – destroying **99.999% of harmful micro-organisms** such as MRSA, E. coli, Norovirus and C. difficile spores.

## Benefits of Ozone technology

Ozone technology has several key advantages over traditional decontamination methods:

**Eco-friendly:** using cold water and avoiding harsh chemicals reduces the environmental impact.

**Fast:** Ozone technology destroys bacteria 3,200x faster than chlorine solutions. So, you can get your mattresses back in use quicker.

**Extends mattress life:** Harsh chemicals and high temperatures can damage the mattress as well as the environment. Ozone technology avoids both and so can significantly increase the lifespan of mattresses.

## Product advantages

### Fast

Extremely fast disinfection, the shortest disinfection time is only 20 minutes

Automatically memorize the last working mode, only need "one-key disinfection" when used again

Built-in ozone concentration, temperature and humidity sensors, real-time monitoring of equipment working status

It can record the position of disinfection bed and the completion of disinfection, and provide data for hospital bed management and hospital infection management

7"

7 inch large touch screen, human-computer interaction disinfection process and results of real-time viewing

O<sub>3</sub>

New generation ozone removing technology, dual purification ensures no residue and no secondary pollution

Large storage with hidden lock for multi-safety storage of accessories

APP

App remote monitoring, more convenient equipment management (optional)

Enhanced disinfection, faster and more efficient

Unique design, beautiful and fashionable, made of durable alloy material

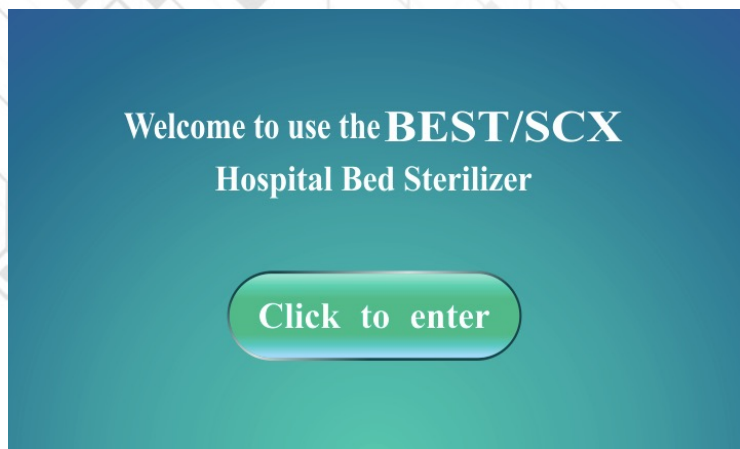

Built in printer for printing disinfection data at any time

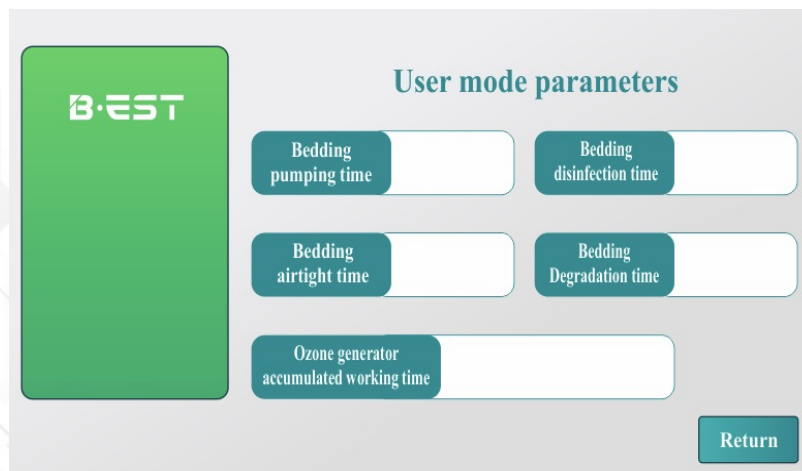

Separately disinfect the bedding and the interior of the brown mat (optional) to remove various peculiar smells (bloody smell, musty smell, medicine smell, big and urine smell, etc.)

7-inch large screen human-computer interaction

Intuitive operation

Disinfection parameter setting

Disinfection record query

One-key disinfection

One-key  
disinfection

Automatically memorize the last working mode ensuring "one-key disinfection" when used again

## User Mode

Time parameters can be set by themselves.

After the mode and parameters are determined, press the corresponding start button to enter the corresponding automatic disinfection program according to the disinfection target.

The disinfection indicator light is on, and the bedding or mattress can be disinfected. It runs automatically without any other operations.

Ozone analysis + adsorption, double purification

Ozone analysis

Activated carbon adsorption

After the disinfection process, the working gas is purified by the dual functions of analysis and activated carbon adsorption, with no residue and no secondary pollution

\*Effect diagram

## Enhancing Monitor (optional)

1. The device has temperature, humidity, micro pressure, ozone concentration sensor, WiFi and Bluetooth module, battery (supporting both wireless and wired charging);
2. It can exchange data with the bed sterilizer through Bluetooth, transmit data of the above sensors to the sterilizer, record and print all relevant data of the disinfection process. And the user can check the current working status through the machine screen at any time;
3. The humidity of the disinfection environment can be changed by intelligent atomization, so as to enhance the efficacy of ozone disinfection. The comprehensive monitoring data of multiple sensors can help the sterilizer to start the full automatic mode, so as to achieve more accurate and scientific disinfection purpose in the most convenient way;
4. The equipment has a separate air circulation system, which can quickly make the disinfection environment meet the most appropriate requirements and create a better working condition for high-level disinfection.
5. All monitoring data can be transmitted to local server through WiFi. Users can remotely view all disinfection records and traceability management information through PC or mobile phone monitoring management software, and realize remote control of equipment.

## Optional

Alloy material, durable

## Smart Bed Sterilizer

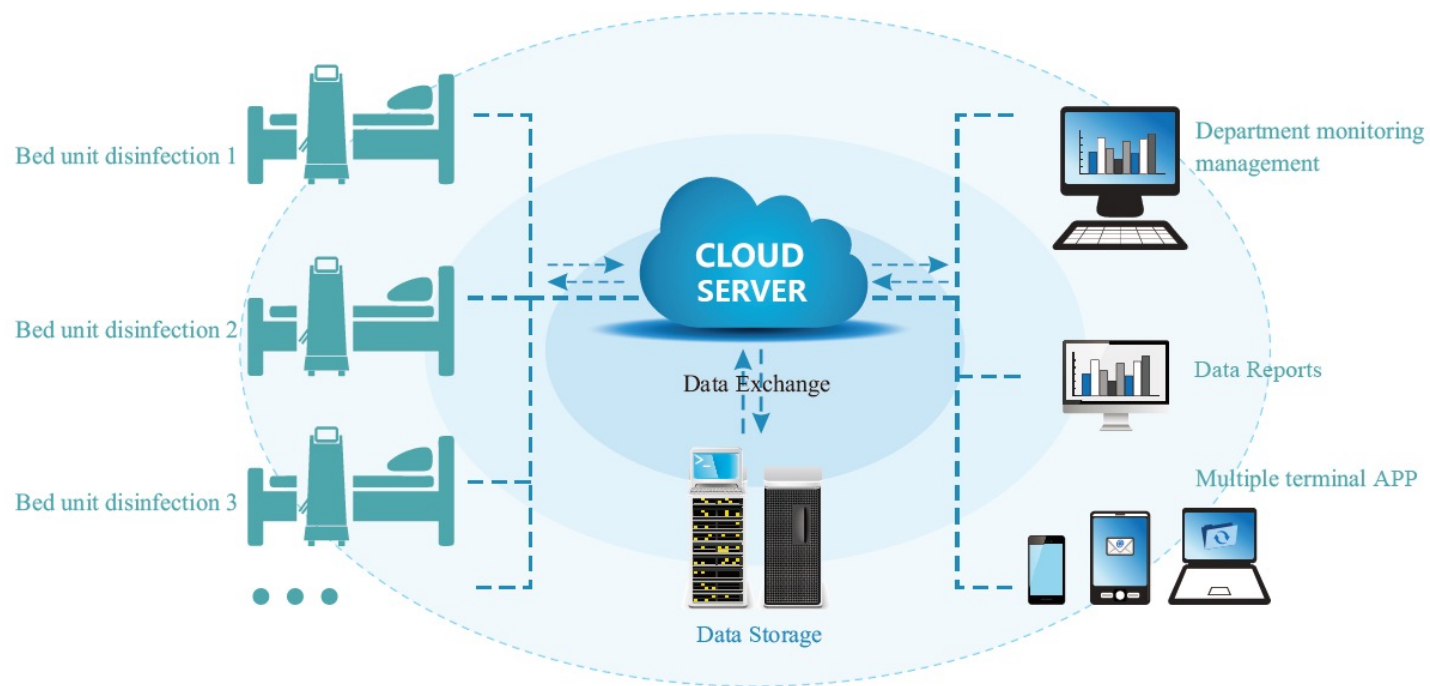

## Traditional Bed Sterilizer

Belst bed sterilizer	Items	Other brands of bed sterilizer
7-inch touch screen, atmospheric and clear at a glance	<input checked="" type="checkbox"/> display	Digital tube display
Large capacity, high speed and high efficiency	<input checked="" type="checkbox"/> cpu	Small capacity, simple function
Mobile phone operation, simple, intuitive, easy to operate	<input checked="" type="checkbox"/> operating	Setting the time and other content is particularly troublesome
Yes, record the work content, parameters and disinfection success of each time	<input checked="" type="checkbox"/> printer	no
Equipped with temperature and humidity sensor and ozone concentration detection	<input checked="" type="checkbox"/> Ozone concentration, temperature and humidity	no
system (optional), it can provide real-time working status of equipment	<input checked="" type="checkbox"/> Internal disinfection of mattress	no
Yes, patented technology, faster, better and more comprehensive disinfection for bed unit (optional)	<input checked="" type="checkbox"/> Sterilization enhancer	no
Access to smart cloud services, mobile APP operation, more convenient device management (optional)	<input checked="" type="checkbox"/> Cloud service	no
Alloy covers, beautiful and safer	<input checked="" type="checkbox"/> Covers	Rough structure
Large-capacity storage space, can be placed in disposable sterilization cover and non-disposable disinfection cover.	<input checked="" type="checkbox"/> Storage room	Small capacity

# Monitoring & Management System

## Organization (optional)

## 6 Innovations

Smart Sensors  
Collecting ambient data

Efficiency Enhancer  
Unique humidity controlling to  
reach faster and higher efficiency

Smart Control System  
Provide smart control of enhancer  
according to ambient data

Cloud service  
Record disinfection data and provide  
record printing, reports, graphics

Smart Management  
Clear and intuitive management  
of beds in different departments

Efficiency Comparison  
Compare disinfection data with local disinfection standard  
to verify disinfection efficiency

## Features

1

### Group Management

The device and the bed unit in the department can be bounded together on mobile APP, including the category number of the articles to be disinfected and also the operator number for traceability of disinfection.

2

### Real Time Positioning

Map View in the software provides realtime positions of the devices, the remaining disinfection time to drastically improve the utilizing efficiency and the turn over time of multiple devices.

3

### Real Time Monitoring

Real time monitoring and displaying of key parameters of the devices. Timely provide users errors and malfunctions and realize instant service support.

4

### Disinfection Records

All work parameters of devices connected to the software can be recorded. Disinfection quality could be traced and viewed at any time. Monthly and yearly report could be generated automatically for analysis and review.
