

This client's concern was for high quality performance over a relatively long cumulative wire run. The PS301 was the ideal source, since each of its three comms circuits has its own regulator and the capacitance of the cable on the three runs remains separate. In addition, the robust 2.4A output means that the PS301 is actually lightly loaded.

Using the 'Link' switch, the Video, Lighting and Audio circuits can be joined when required. The PS301 also provides for the input of an auxiliary audio feed from the main mix to be fed to each of the three circuits at its own preferred level.

With almost 300m of cable and eleven stations, this system requires a robust and powerful supply.
