2023 U.P. DEER CAMP SURVEY

Information provided by cooperating deer camps in the U.P.
Report prepared by Michigan Department of Natural Resources (DNR) Staff
February 2024

Thanks to all who made this year's survey possible by recording their deer sightings, harvest, and comments for the 2023 firearm season. The information you provided helps us better understand the size, trend, and composition of the deer herd and the issues that are important to you concerning deer management. This report begins with information applicable to the entire U.P. region, and then briefly looks at western and eastern sides of the U.P. before results by Deer Management Unit (DMU) are compared. A summary of written comments is in the middle of the report, and the 22 DMU summaries are at the end. A summary of results with page references is available on [page 5](#).

The U.P. Deer Camp Survey is used to monitor deer sightings, deer harvest, and hunter opinions during the 16-day firearm season. It provides hunters and DNR staff with feedback on the status of the deer herd and hunting satisfaction soon after the season ends. Beginning in the early 1990's, deer camps have been casually recruited into the survey. Camp survey forms and postage-paid envelopes were mailed to 477 contact persons prior to the 2023 season.

To encourage responses and support the survey, several U.P. sportsperson groups provided prizes for a random drawing of camp contact persons who responded. Thank you to the following sportsperson groups for providing the prizes:

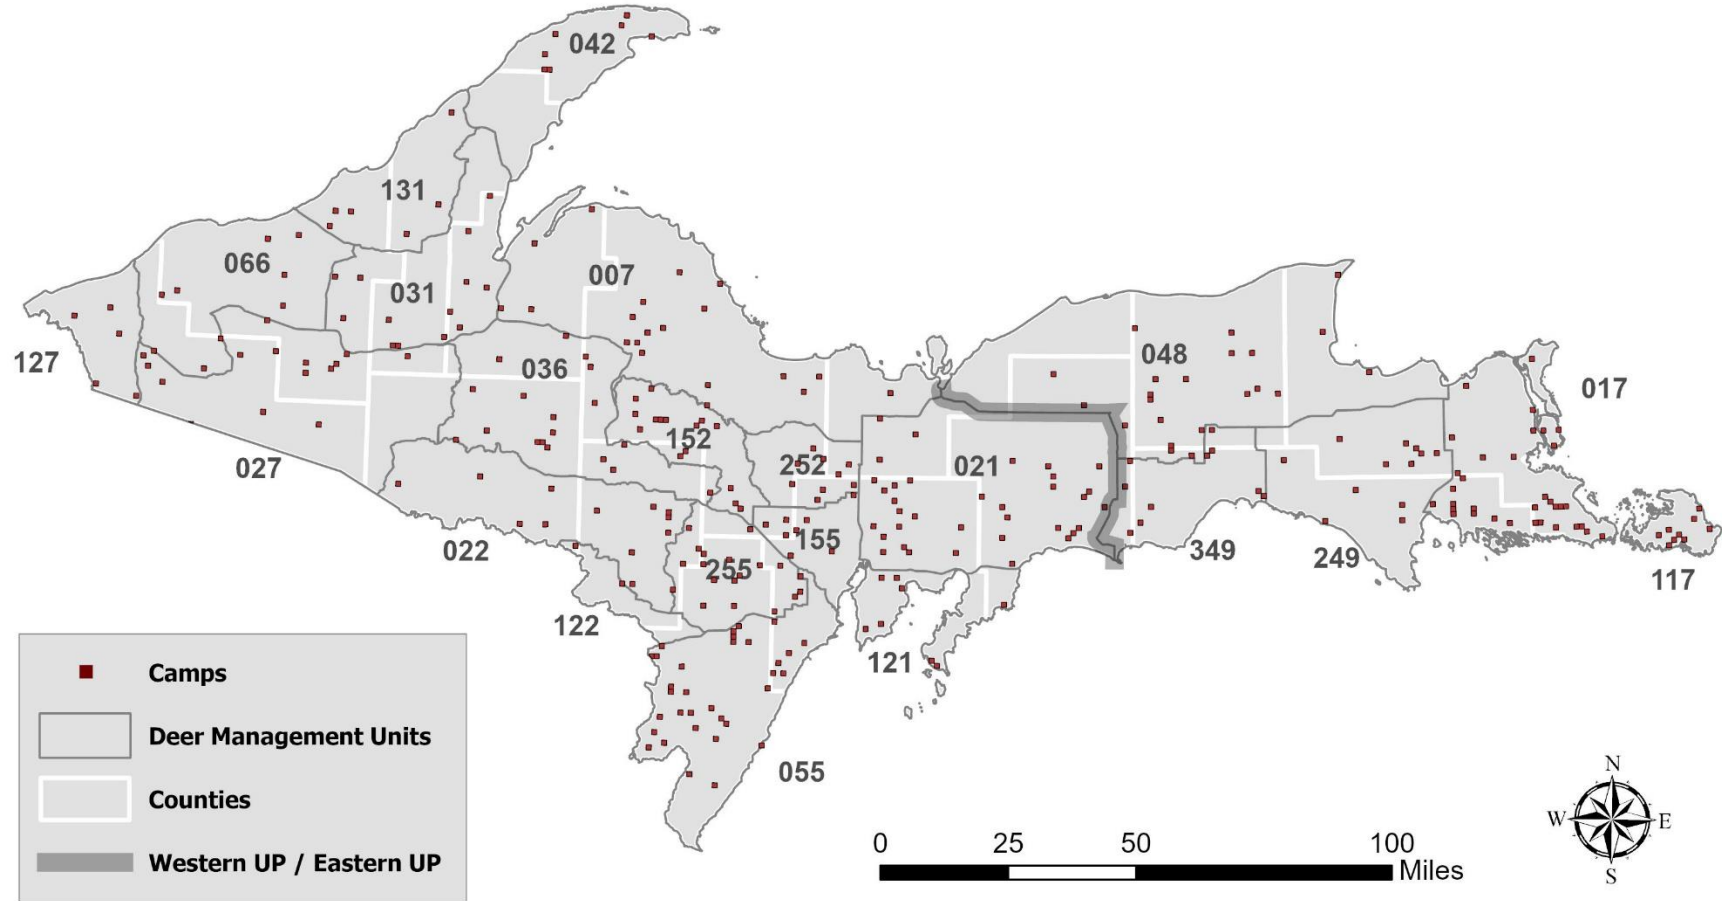

Eastern U.P.

Drummond Island Sportsmen's Club
Raber Area Sportsmen's Club
Les Cheneaux Sportsmen's Club
Straits Area Sportsmen's Club
St. Mary's River Sportsmen's Club
Chippewa County Shooting Association
Mackinac Chapter of the
National Deer Association
Michigan Sharp-tailed Grouse Association

Western U.P.

Eastern Dickinson County
Sportsmen's Club
U.P. Whitetails Association, Inc.
Wildlife Unlimited of Dickinson County

Upper Peninsula Deer Camp Survey Locations 2023 Firearm Season

Summary of the 2023 U.P. Deer Camp Survey

| <u>U.P. Region Results</u> | <u>2022</u> | <u>2023</u> | <u>Page</u> |
|--|-------------|-------------|-------------|
| 1. Deer seen per hunter day <i>decreased</i> : | 3.4 | 2.2 | 6 |
| 2. Percent of hunters harvesting a buck <i>decreased</i> : | 24% | 19% | 8 |
| 3. Fawn observations per 100 does <i>decreased</i> : | 53 | 44 | 10 |

| <u>Percent of camps in 2023 rating</u> | | | | <u>Page</u> | |
|--|----------------|-------------------|-------------|-------------|----|
| 4. Deer herd trend: | More – 4% | Same number – 19% | Fewer – 77% | 10 | |
| 5. Season rating: | Excellent – 2% | Good – 11% | Fair – 25% | Poor – 66% | 11 |

| <u>Western U.P. (Page 12)</u> | <u>2022</u> | <u>2023</u> | <u>Page</u> |
|--|-------------|-------------|-------------|

| 14. Deer herd trend: | More – 13% | Same number – 33% | Fewer – 54% | |
| 15. Season rating: | Excellent – 2% | Good – 18% | Fair – 34% | Poor – 46% |

Other Information

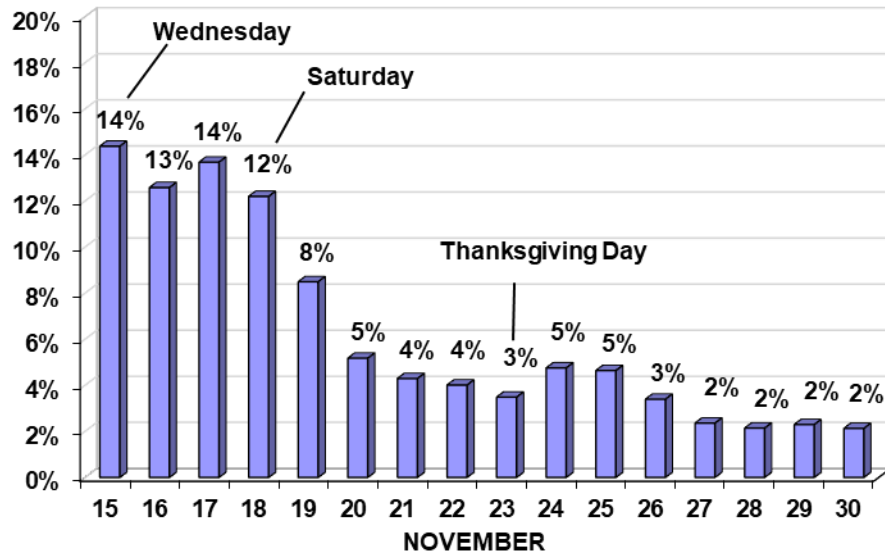

16. Deer management units (DMU's) are compared with each other in terms of participation, daily deer sightings, buck kill success, and fawn-doe ratios ([pages 14-17](#)).
17. Winter snow conditions are summarized on [pages 17-18](#).
18. Archery season participation is summarized on [page 19](#).
19. Camps kept track of sightings of 11 wildlife species besides deer ([page 19](#)).
20. Camps wrote numerous comments on their survey forms. These comments were placed in categories, and updates on most common issues as well as other items are provided ([pages 20-24](#)).
21. Deer season statistics are provided in Tables 1 – 3 based on area (U.P. Region, West U.P., or East U.P.) ([pages 25-27](#)), and for each DMU in Table 4 ([page 28](#)).
22. Hunter-generated statistics and a summary of written comments are provided for each of the 22 DMU's ([pages 30-40](#)).

U.P. Region

(Also see Tables 1 – 3 on pages 25 – 27)

A total of 364 camps occupied by 1,394 hunters participated in the 2023 U.P. Deer Camp Survey. A map showing the distribution of participants is on page 4 and a table of summary statistics from across the region is on page 25. Eighty percent of the participating camps also participated in 2022. Hunters spent a total of 7,894 days hunting, 9% more days afield than in 2022. On average, 4 hunters occupied each deer camp, and each person hunted 6 days during the 16-day firearm season. Approximately 61% of the hunting effort was completed during the first five days of the season (by the end of the first weekend).

HUNTER PARTICIPATION IN THE 2023 FIREARM SEASON
Percent of total hunting effort occurring on each day

Deer Observations: The average number of deer observed per hunter during the entire 2023 firearm season was 12 deer (2 bucks and 10 antlerless), which decreased from the 19 deer (3 bucks and 16 antlerless) observed during the 2022 season. Note: unidentified deer are considered antlerless in the analysis of deer sighting data. Hunters observed 2.2 deer per hunter day, a decrease from 2022 (3.4) and below the long-term average of 2.9 (see graph on next page).

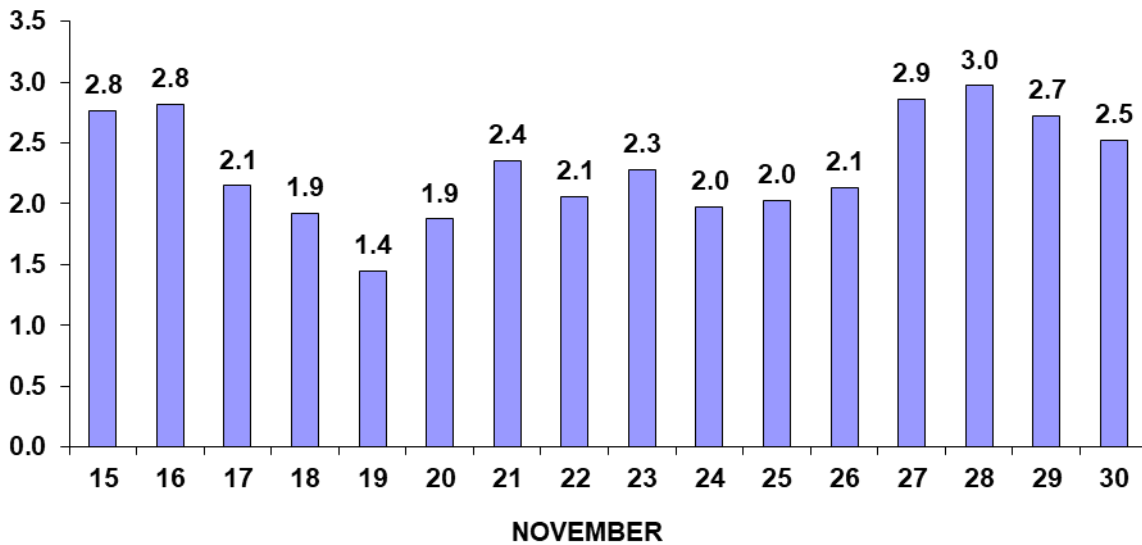

U.P. Region

**NUMBER OF DEER OBSERVED PER HUNTER DAY
Firearm Season**

Hunters observed, on average, 1 to 3 deer per day during each day of the 2023 firearm season (see graph below), which decreased from the 3 to 4 during the 2022 season.

**NUMBER OF DEER OBSERVED PER DAY
2023 Firearm Season**

Doe Sightings per Buck: Two adult does were observed per adult buck on opening day in 2023, down from 3 in 2022. The sex ratio skewed to a ratio of 4 – 7 does per buck as the season progressed as more bucks than does were removed from the population by hunters.

U.P. Region

NUMBER OF ADULT DOES OBSERVED PER ADULT BUCK
2023 Firearm Season

Harvest: Nineteen percent of hunters harvested a buck, down from 24% in 2022 (which is also the long-term average). One percent of hunters harvested a 2nd buck. Since 2003, 4% or less of participating hunters reported taking a 2nd buck each year.

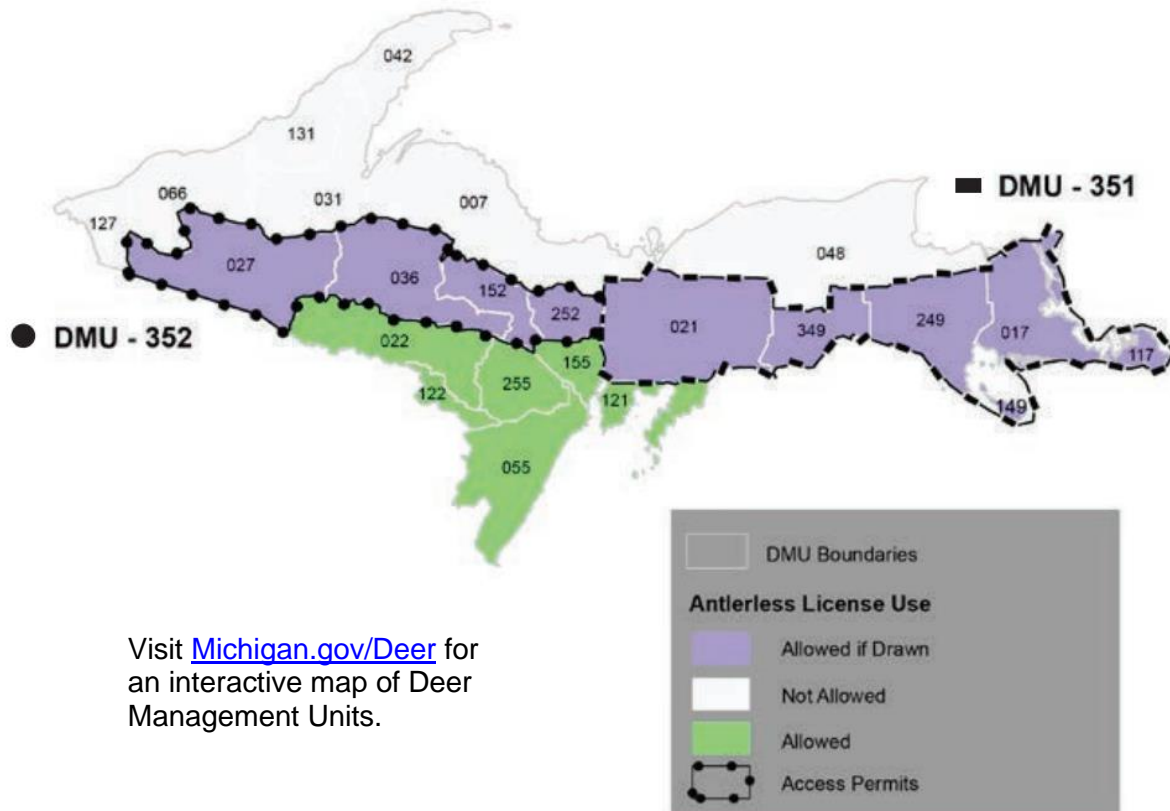

HUNTER SUCCESS RATES AT U.P. COOPERATING DEER CAMPS
Firearm Season

Five percent of Deer Camp Survey participants reported harvesting an antlerless deer (doe or fawn) in 2023, which was the same as in 2022. Antlerless deer accounted for 24% of the total harvest at camps in the U.P. in 2023 whereas 76% of the take was bucks. Of the 73 hunters who harvested an antlerless deer, 86% took only 1 and the remaining 14% took 2. In the past, some hunters have taken antlerless deer during archery and muzzleloader seasons, but only those taken during firearm season are included in this survey.

U.P. Region

Starting in 2021, universal antlerless licenses – available over the counter with no drawing involved – could be used in DMU’s 022, 055, 121, 122, 155, and 255 in the south-central U.P. In DMU’s 351 (in eastern U.P.) and 352 (in western U.P. – see map below), 1,000 antlerless deer hunting access permits were available via drawing in each of these DMU’s. A hunter needed to have an antlerless deer hunting access permit to use a universal antlerless license in these DMU’s. Hunters could not harvest an antlerless deer in the northern U.P., which included DMU’s 007, 031, 042, 048, 066, 127, & 131. The map and information below provide a summary.

- “Allowed” (green): a universal antlerless license could be used to take an antlerless deer. Universal antlerless licenses could be purchased without an application, with a limit of 10 per hunter for the season.
- “Allowed if drawn” (purple): an antlerless deer hunting access permit needed to accompany the universal antlerless license (1 antlerless hunting access permit + 1 universal antlerless license for each antlerless deer harvested). In each DMU – 351 in the eastern U.P. and 352 in the western U.P. – there were 1,000 antlerless hunting access permits available in 2022 through a drawing.
- “Not Allowed” (white): no antlerless harvest was allowed with a universal antlerless license.
- In addition to the above, archers could pursue antlerless deer in DMU’s open to antlerless harvest with their deer or deer combination licenses. However, DMU’s 127, 066, 031, 131, 042, 007, and 048 were closed to antlerless harvest during the archery seasons.

U.P. Region

Fawn to Doe Ratio: Hunters observed 44 fawns per 100 does, a decrease from the 53 reported in 2022 and below the long-term average of 51.

FAWNS OBSERVED PER 100 DOES
Firearm Season

Deer Herd Trend: The majority of camps (77%) felt there were fewer deer compared to 2022, 19% felt that deer numbers were similar to 2022, and 4% felt there were more. During the 2022 season, 45% of camps felt there were fewer deer than in 2021 while 21% felt there were more deer.

2023 Deer Herd Trend Compared to Last Year

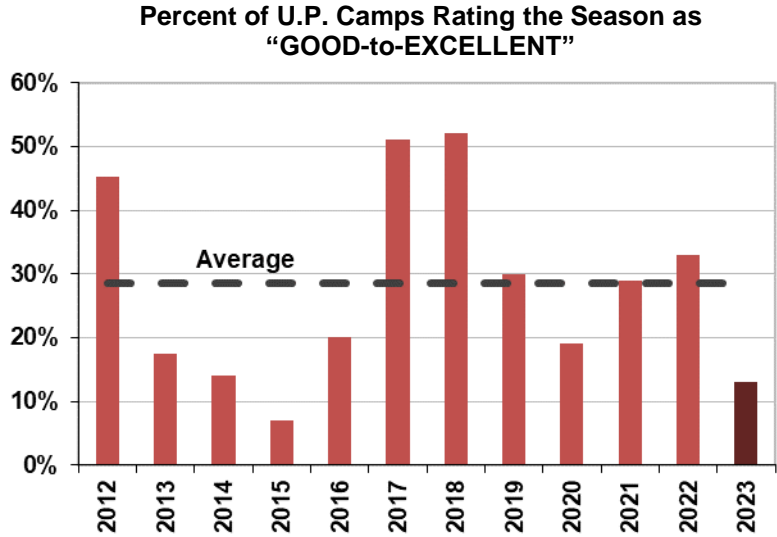

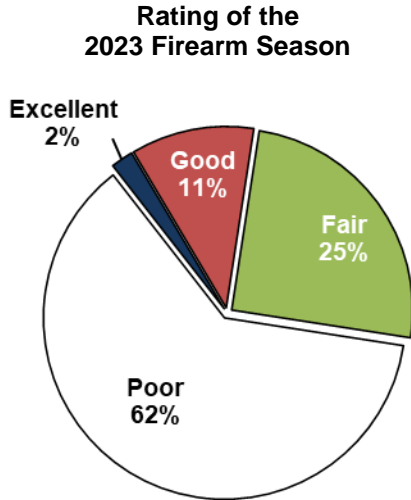

Percent of U.P. Camps Rating "More Deer" than the Previous Year

U.P. Region

Rating of the Season: Camps were asked to rate the firearm season as excellent, good, fair, or poor. Thirteen percent rated the season as good to excellent, which is below the 2022 rate of 33% as well as the long-term average (28%). Most (87%) camps rated the 2023 season as fair to poor.

Western U.P.

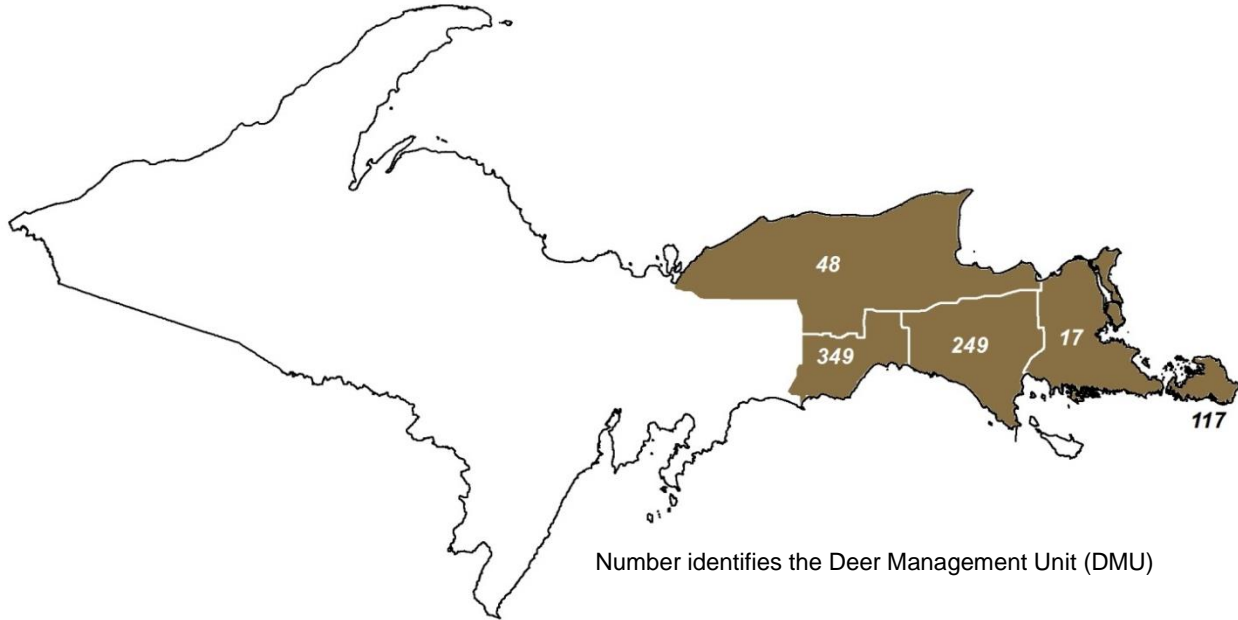

Results for the Western U.P. portion of the survey area (shown above) have been reported since the late 1990's. This portion includes the majority of DMU's in the U.P. Results for the Western U.P. are detailed in [Table 2 on page 26](#). Some of these results are summarized here.

Western U.P. participants observed 2.2 deer per hunter day and 44 fawns per 100 does in 2023. The deer observation rate decreased from 3.5 in 2022 while the fawn-to-doe ratio decreased from 54. Eighteen percent of hunters harvested a buck (see graph below), down from 28% in 2022. Eleven percent of camps rated the 2023 season as excellent or good compared to 30% in 2022.

Buck Hunter Success Rates at West U.P. Cooperating Deer Camps
Firearm Season

Eastern U.P.

Results for the Eastern U.P. portion of the survey area (shown above) have been reported since 2003. This area contains 5 of the 22 DMU's in the U.P. Results for the Eastern U.P. are detailed in [Table 3 on page 27](#). Some of these results are summarized here.

Eastern U.P. participants observed 2.4 deer per hunter day and 43 fawns per 100 does in 2023. The sighting rate and number of fawns observed per 100 does both decreased from 2022 (3.0 and 50, respectively). Nineteen percent of hunters harvested a buck (see graph below) compared to 17% in 2022. Twenty percent of camps rated the 2023 season as excellent or good compared to 38% in 2022.

Buck Hunter Success Rates at East U.P. Cooperating Deer Camps
Firearm Season

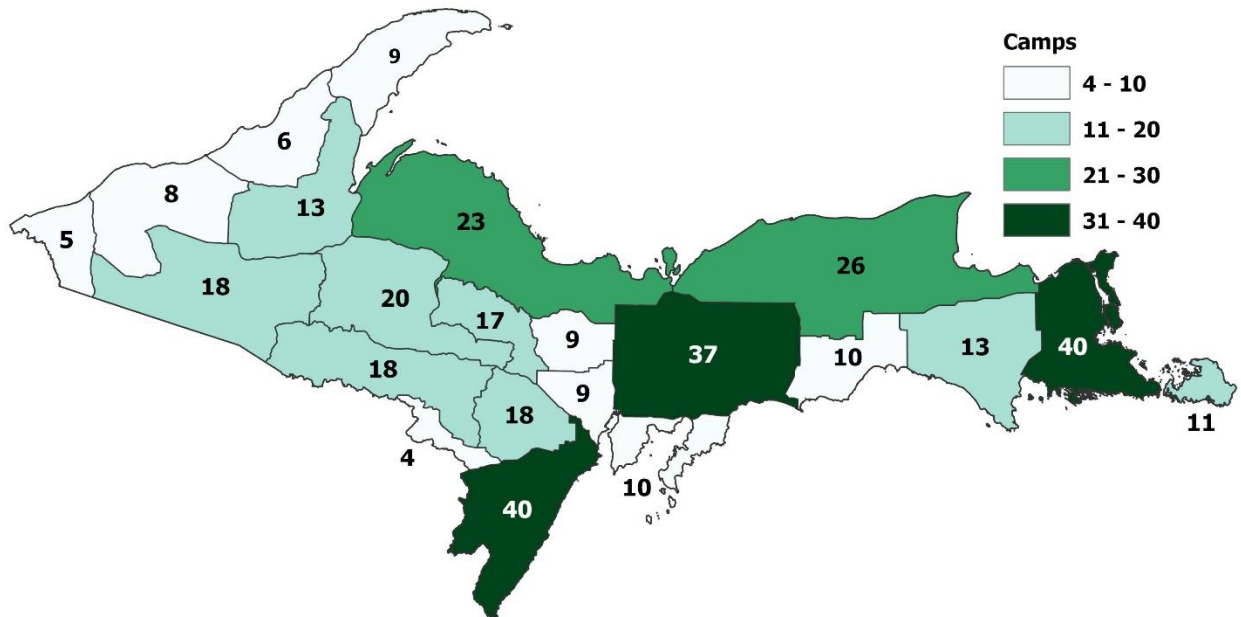

RESULTS BY DEER MANAGEMENT UNIT

(Also see [Table 4 on page 28](#))

Individual Deer Management Unit (DMU) Statistics: Separate statistics and the most common camp comments are provided for each individual DMU at the end of this report ([pages 30-40](#)). Please note that “does seen per buck” refers to opening day only on those pages. Refer to the map on [page 4](#) for the location of the respective DMU.

Participation: The map below shows camp participation in 2023 by DMU. Some DMU's had very light participation this year. *We caution that the results presented here for individual DMU's with few participating camps may not be representative of the majority of hunters within the DMU.* In 2023, about half of the DMU's (12) fell below desired participation levels of > 15 camps and > 50 hunters.

Hunting participation is declining nationally and in the state of Michigan. Participation in this U.P. Deer Camp Survey has followed a similar trend since 2013; hunter participation has declined at least 40% from more than 2,400 hunters participating in this survey in 2013 to less than 1,400 in 2023 (see graph below). If this continues, results from this camp survey could become less representative of the majority of U.P. hunters, which would impact its value for monitoring hunter observations, harvest, and opinion. Low participation ultimately means a low sample size, which causes a number of concerns including accuracy of the results. Some results may not be reported in the future if sample sizes are deemed inadequate to represent the area, and ultimately this survey may be impacted if participation decreases far enough. This survey has been important to participants and other readers, and to DNR staff as we consider management recommendations. Considering this, we encourage additional participation in DMU's with relatively few participants (particularly those with < 15 camps or < 50 hunters). Interested hunters can contact David Jentoft at the Sault Ste. Marie Customer Service Center (906-635-6161 ext. 4 or jentoftd@michigan.gov) or Colter Lubben at the Escanaba Customer

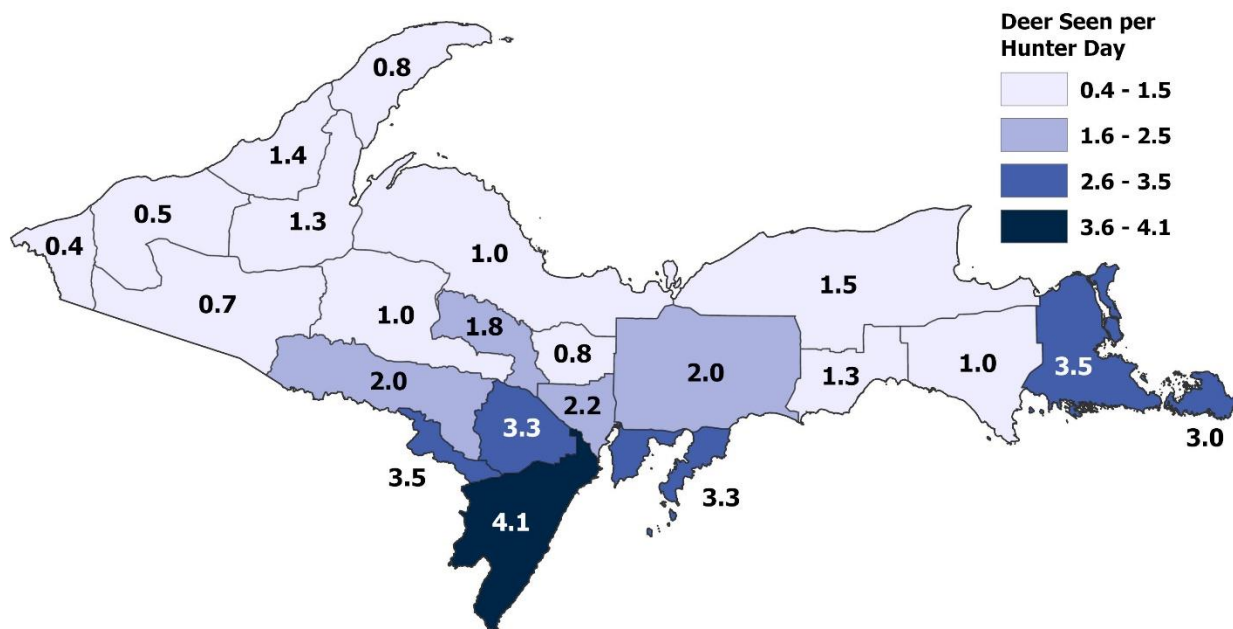

Service Center (906-789-8204 or lubbenc1@michigan.gov) to receive survey materials next firearm season.

Participation in a U.P. Deer Camp Survey
Number of Camps and Hunters Participating each Year

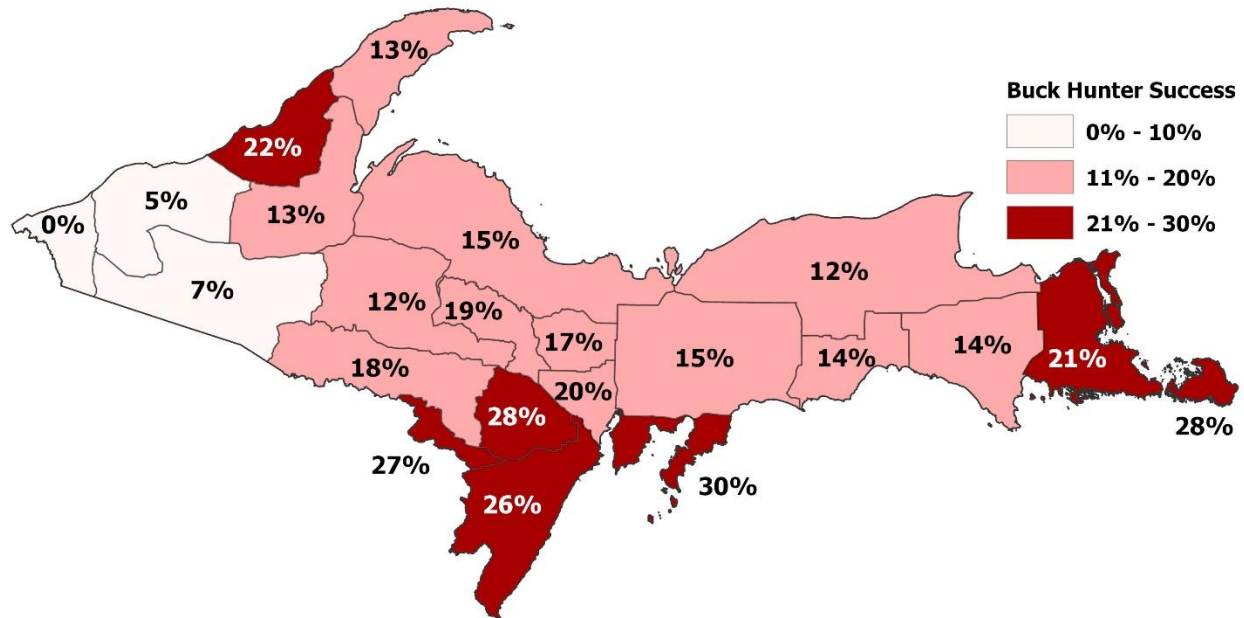

Note: separate East U.P. & West U.P. Deer Camp Surveys were combined in 2012 to the U.P. Deer Camp Survey

Deer Observations per Hunter Day: The number of deer seen per hunter day during the 2023 firearm season ranged from 0.4 in DMU 127 (based on only 5 camps) to 4.1 in DMU 055. Sighting rates decreased in 21 DMU's compared to 2022 and remained similar (within 0.1) in one DMU (117) (see map below).

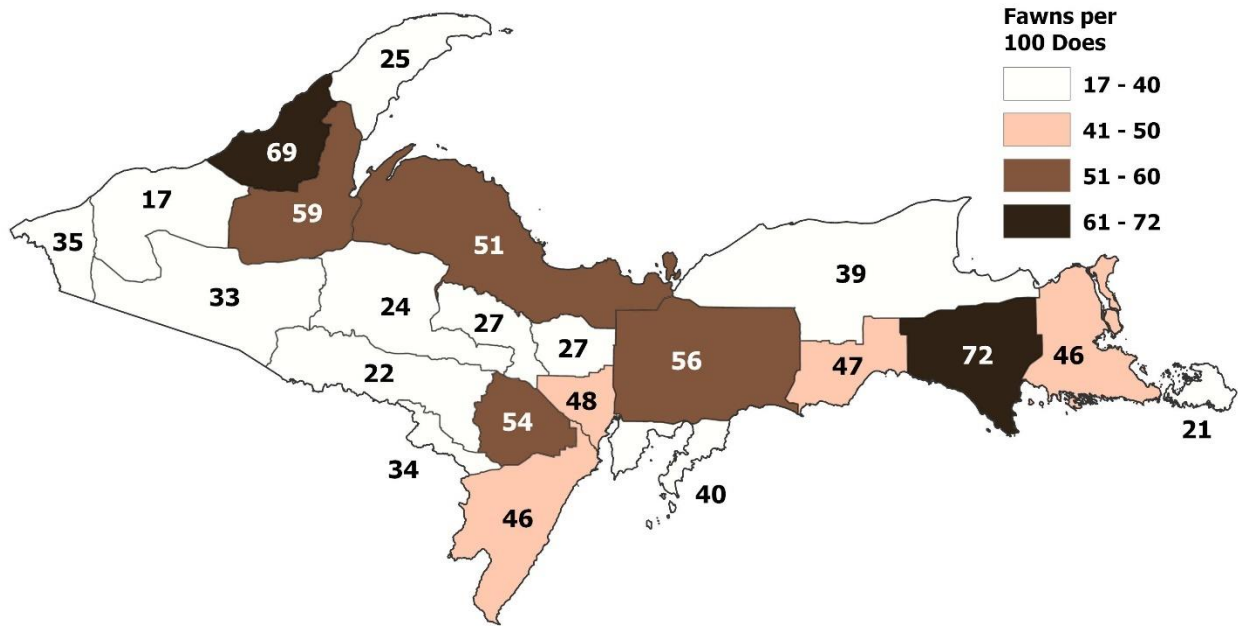

Buck Harvest: Buck kill success ranged from a low of no participants reporting harvesting a buck in DMU 127 (only 11 hunters represented) to a high of 30% in DMU 121. The rate increased in 4 DMU's compared to 2022, decreased in 17, and remained similar (within 1%) in one DMU (252). There has not been a clear relationship between deer abundance (as measured by daily deer sightings) and the percent of hunters killing a buck. Sometimes a unit with low deer sightings will record a high buck kill success, and conversely, a unit with high deer sightings will record low success. This seems illogical on the surface but may be due to hunters passing on buck kill opportunities in DMU's where deer are plentiful, hunters being less choosy in low deer density areas, or hunters achieving high success rates in low deer density areas due to reduced competition from other hunters.

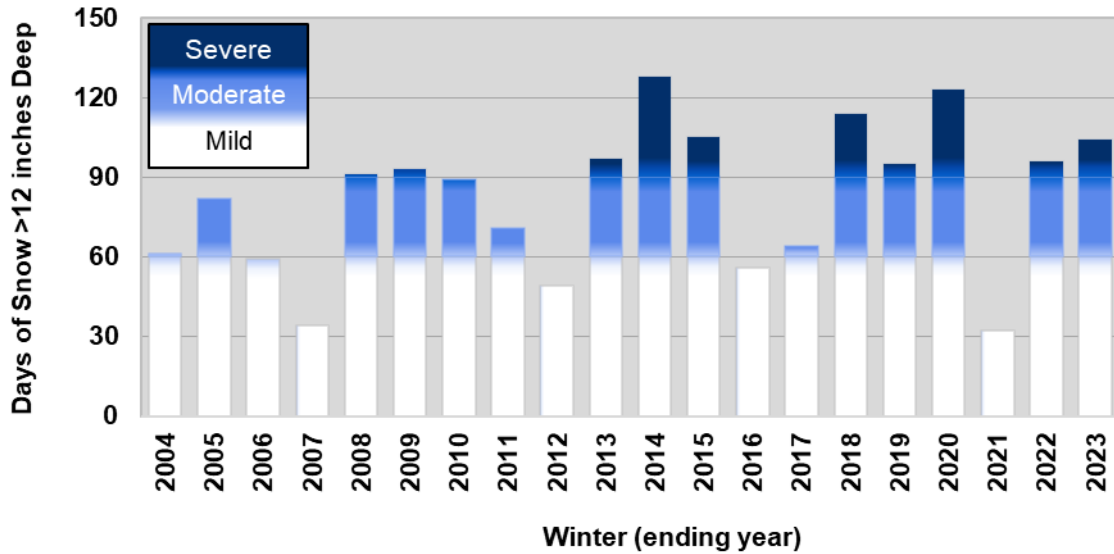

While buck harvest may not be clearly related to deer abundance, results in previous reports have regularly suggested that hunters seem more willing to pass on bucks in areas where they have multiple buck sightings per season. In contrast, hunters appear less willing to “let ‘em go” in areas where few, if any, bucks are seen. The decision to take a buck is often voluntary and based on the choice of the hunter at the time of the buck sighting. However, there are some restrictions based on license type (which the hunter chooses when purchasing) and hunting location (buck regulations in DMU 117 – Drummond Island – differ some from the rest of the U.P.) that are regulatory.

Fawn to Doe Ratio: The number of fawns observed per 100 does varied from a low of 17 fawns per 100 does in DMU 066 (8 camps participating) to a high of 72 fawns per 100 does in DMU 249. The ratio increased in 4 of the 22 DMU's compared to 2022, decreased in 17, and remained similar (within 1) in one DMU (017). The fawn-to-doe ratio must be interpreted with caution because it can be sensitive to changes in doe observations rather than simply reflecting changes in fawn observations. For example, if fawn sightings compared to the previous year decreased, but not as much as doe sightings, higher rates can result. If fawn sightings increased, but not as much as doe sightings, lower rates can result.

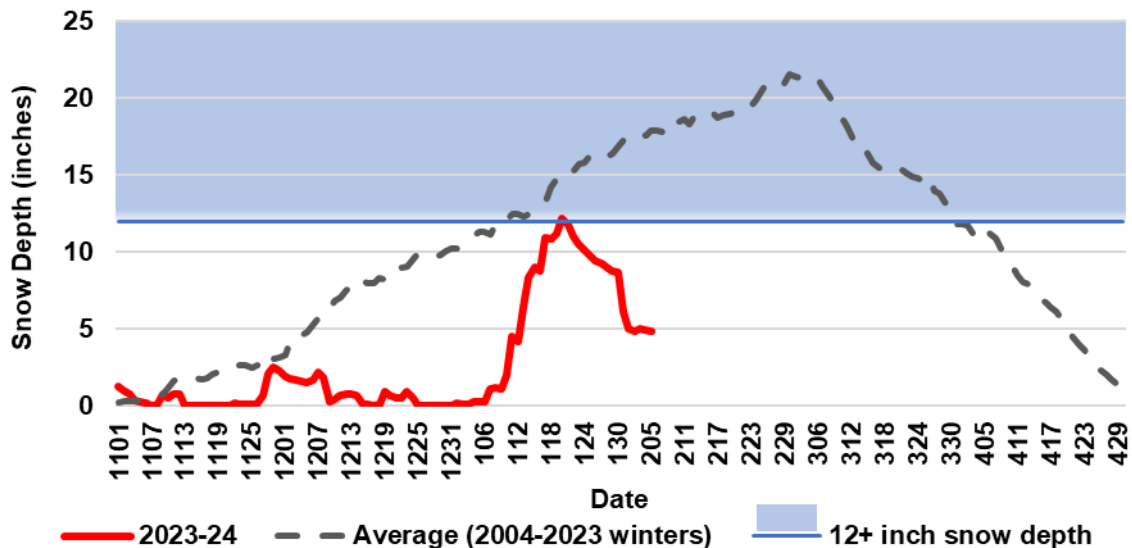

Winter Conditions: Wildlife Division staff in the U.P. currently monitor snow conditions each winter using Snow Data Assimilation System (SNODAS) results from the NOAA National Weather Service’s National Operational Hydrologic Remote Sensing Center. While any snow can impact wildlife, decades of research have suggested that severe winter conditions including deeper snow can be more impactful to deer. Impacts include reduced mobility and access to food, increased energy expenditures, and other effects that ultimately lead to reduced overall health and reproductive success, and even mortality. Consecutive severe winters can be more impactful than a single severe winter. Deer trend indicators like harvest success often decrease following severe winters, and particularly consecutive severe winters. Currently, the duration of snow greater than 12 inches deep is one of the indicators used to monitor the intensity of winter. The graph on the next page shows the duration of snow > 12 inches deep by winter in the U.P. and Wildlife Division’s approximate classification of a winter based on this duration.

Duration of 'Deep' Snow in the U.P. by Year
Number of Days the Average U.P. Snow Depth was > 12 inches

As of February 5, 2024, the average snow depth for the U.P. for the 2023-24 winter was 5 inches and there had been only 1 day when the U.P. average was > 12 inches deep. This is below the long-term average of 28 days for this date. While this has been a mild winter to date, the severity of this winter will likely depend on conditions during the latter half of it, similar to past years.

U.P. Average Snow Depths
based on SNODAS system

Antlerless Deer Harvest Opinions: Camps were asked whether they supported the availability of antlerless deer harvest opportunities in their location at this time. Forty-one percent of respondents answered yes, while 59% answered no. The percent of camps answering yes since 2018 is as follows: 2023 – 41%, 2022 – 51%, 2021 – 43%, 2020 – 45%,

2019 – 48%, 2018 – 50%. Responses varied by area. Support for antlerless harvest opportunities was generally highest in the southcentral U.P. where deer densities are highest and antlerless harvest opportunities have been greater than in other areas of the U.P.

Archery Participation: Camps were asked to indicate how many hunters participated in the early archery season (Oct. 1 – Nov. 14) and how many planned to hunt in the late archery season (Dec. 1 – Jan. 1). Twenty-three percent of participants hunted in the early archery season, and 9% planned to hunt in the late archery season. These results are similar to past years as shown in the table below. Some hunters have expressed concerns about the effects of archery hunting on the deer population, particularly late season hunting. Results here suggest that few hunters (<10%) participate in the late portion of the archery season (December); the majority of archery hunting effort appears to be in the early part of the season (October and early November). According to harvest reporting results, approximately 10% of the U.P. archery harvest in 2023 occurred in the late portion of the archery season (Dec. 1 – Jan. 1). Approximately 2% of all deer harvested in the U.P. during all seasons were harvested during the late portion of the archery season.

Archery Participation by Year
% of Camp Survey hunters participating in archery season

| | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | 2020 | 2021 | 2022 | 2023 |
|--|------|------|------|------|------|------|------|------|------|------|
| Early Archery (Oct. 1 – Nov. 14) | 24% | 21% | 23% | 22% | 21% | 22% | 22% | 23% | 18% | 23% |
| Late Archery (Dec. 1 – Jan. 1) | 8% | 7% | 7% | 7% | 5% | 6% | 9% | 7% | 7% | 9% |

Other Wildlife Sightings: Deer camps kept track of furbearing mammals and other select species observed while hunting during firearm season (see [tables 5 and 6 on page 29](#)). Wild turkeys topped the list of all species observed, as they typically do, with 2,749 sightings. This is a substantial increase from the 1,567 reported in 2022. Cougar observations have ranged from 0 to 7 per year during the past 10 years. In 2023, 1 sighting was reported.

When sightings are standardized to account for different numbers of hunter days each year, a sighting index can be developed (animals seen per 100 hunter days – see graph on next page). See [Table 6 on page 29](#) for index values by year. We do not know whether these sighting indices depict the actual population trends of these furbearer populations.

COYOTE, WOLF, & BOBCAT SIGHTINGS PER 100 HUNTER DAYS
U.P. Deer Camp Survey

Comments by Hunters: Deer camps wrote many comments on their survey forms. To summarize these comments in a meaningful manner, we tallied each according to its subject matter. Comments mentioned by at least 5 camps were extracted from the forms and assigned to one of 3 major subject categories shown below. The subject matter receiving the greatest number of unsolicited comments was predators. The most common individual comment related to wolves or wolf sign in the area this season. Updates and information on some of the subjects follow.

COMMENTS PROVIDED BY CAMPS IN THE 2023 U.P. DEER CAMP SURVEY

Predators

| | |
|---|-----------|
| Numerous wolves, tracks, or howls in my area | 57 |
| Wolves having a negative impact on deer | 45 |
| Control wolves or allow us to control them | 35 |
| Predators having a negative impact on deer | 20 |
| Numerous coyotes, tracks, or howls in my area | 12 |
| Observed fewer wolves or wolf sign | 8 |
| | <hr/> 177 |

Deer Abundance

Less

| | |
|--|-----------|
| Fewer deer observed this season | 101 |
| Fawns were not abundant or fewer in number | 29 |
| Fewer mature bucks on camera/seen | 13 |
| Less does seen | 11 |
| | <hr/> 154 |

COMMENTS (continued)

More

| | |
|--------------------------------|-------|
| More young bucks | 9 |
| More deer observed this season | 5 |
| | <hr/> |
| | 14 |

Deer abundance total: 168

Other

| | |
|--|-------|
| Severe winters affecting deer numbers | 11 |
| Less hunters in camp because of low deer numbers | 8 |
| Not going to hunt in the U.P. next year due to low numbers | 7 |
| Did not hunt in the U.P. due to low deer numbers | 5 |
| Thinking about selling camp | 5 |
| Deer habitat needs attention | 5 |
| | <hr/> |
| | 41 |

Updates on Comment Subjects & Other Items

Wolves and Coyotes: The most popular comment thread in 2023 was predators, particularly wolves. The most numerous predator comments were about numerous wolf observations and/or sign around hunting locations, the view that their presence was having a negative impact on deer, and requests for their control. Similar comments about coyotes, and predators in general, were made by several camps.

Wolves

Despite having secure populations in the three Great Lakes States (Minnesota, Wisconsin, and Michigan) wolves remain on the list of federally protected species. Wolves in much of the Lower 48 states were removed from the Federal Endangered Species List in January 2021, only to be returned to the list in February 2022 due to a federal court decision that vacated the USFWS order. This action marked the 6th time, due to lawsuits or threat of lawsuits against the USFWS delisting efforts, that the Federal legal status of wolves changed in Michigan since 2003.

The DNR supports the federal rule to delist wolves because the state's wolf population has long surpassed federal and state goals for recovery. Currently, wolves in Michigan are classified as a protected game species. It remains illegal to kill a wolf, except in defense of human life. Livestock owners will continue to be compensated for wolf depredation losses. Hunting of wolves while they are on the endangered species list is not permitted.

The minimum winter wolf population in the U.P. is stable and has remained somewhere between 600 and 700 animals for more than a decade. The continued trend of statistical stability indicates that gray wolves may have reached their biological carrying capacity within the U.P. Wolf presence has only been confirmed twice genetically in the Lower Peninsula in recent times; in 2004 and 2014.

At one time we conducted our wolf track survey across the whole U.P., this task was becoming too time consuming so in 2007 we developed and evaluated a sampling survey to reduce the search area to allow more time to accurately count wolves in adjacent territories. This approach uses a geographic stratification and produces an unbiased, precise estimate of total wolf abundance during the winter months when wolves are at their lowest population level, which is why we report the estimate as the minimum winter wolf population estimate. In 2023, we started exploring an occupancy model method which utilizes a grid system of trail cameras to estimate wolf abundance. If this new method of estimating wolf abundance works it would allow us to provide estimates during the summer or fall when the yearly wolf population cycle is at a higher point, which would allow us to move away from only reporting the minimum wolf population estimate, something the sportsmen and women of Michigan have been requesting. This winter we are utilizing both methods which will allow us to evaluate the traditional track survey and the trail camera method.

For those hunting with dogs the DNR has produced a new online dashboard, making incidence of wolf-dog conflicts more accessible for viewers. The dashboard includes mapped data points of conflicts and a database of incidents over many years. The improvement in presenting the data was suggested from members of the Wolf Management Advisory Council.

For more information on gray wolves in Michigan, visit www.michigan.gov/wolves and to check out the new wolf-dog conflict online dashboard, visit Wolf and dog conflicts at that site.

Coyotes

Coyotes can be trapped from October 15 to March 1 and can be hunted year-round. Coyotes may be taken on private property at any time without a license if doing or about to do damage. Hunters have been able to harvest coyotes during firearm season since 2010.

Deer Abundance, Management, & Regulations: Deer abundance was the second-most popular comment thread in 2023. Most of these comments related to lower deer numbers than the previous season(s), similar to the past 2 seasons, and were consistent with camp ratings of the deer herd (see graph on [page 10](#)). The comments corresponded with lower deer sightings and lower hunter success rates. The reported harvest in the new statewide deer harvest reporting system was also lower in 2023 than 2022.

A December 21, 2023, DNR press release “[Taking stock of Michigan’s latest deer harvest](#)” addressed the lower harvest reporting as of that date as well as other related issues. When reviewing the preliminary data available from the Midwest, the northern states appear to have very similar reductions in harvest.

The article indicated that, in Michigan, there are numerous factors that may act singularly or in combination to influence deer abundance, and they can vary over space and time. Some of these factors have a greater impact on deer populations and thus are more important than others. In addition, some of these limiting factors can be managed by state wildlife agencies, while others cannot. Predators (including wolves), winter weather, habitat quality, changes to deer harvest regulations, declining hunter numbers and changes in timber harvest all play a combined role in changes to the deer population in the U.P. The “[Factors Limiting Deer Abundance in the Upper Peninsula](#)” complete report available on the DNR’s web site provides more information. Numerous factors can also affect deer harvest. For example, given that 50% of the deer harvests in rifle season occur within the first three to four days, unusual weather at

the beginning of the season can decrease harvest, like the warm, windy days we had this season. Even what day of the week the opener falls on can change harvest.

The article explained that the DNR has taken numerous actions, often in concert with partnering groups, agencies or individuals, to improve deer habitat and low deer numbers. Deer habitat management is ongoing, including managing food resources and shelter species on state-managed lands. The U.P. Habitat Workgroup has worked for several years to improve habitat for deer in areas where they spend the critical winter months. The workgroup membership is composed of DNR Wildlife and Forestry employees, federal forest managers, members of the Michigan Natural Resources Commission, and wildlife and forestry interests. The [Deer Habitat Improvement Partnership Initiative](#), a DNR grant program for the U.P., is supported by the state's Deer Range Improvement Program, which is funded by a portion of deer hunting license revenue, and has improved thousands of acres of deer habitat. The DNR's Wildlife Habitat grant program provides funding to enhance and improve the quality and quantity of game species habitat in support of specific goals from the DNR Wildlife Division's strategic plan.

On January 17, 2024, the new Deer Management Initiative was announced in a press release. The DNR, in collaboration with the Michigan Natural Resources Commission, is initiating a comprehensive Deer Management Initiative aimed at evaluating and responding to present-day deer management challenges. The initiative seeks to develop recommendations to address these challenges and ensure the sustainable and healthy management of deer populations and their habitats across the state. The DNR will actively engage with stakeholders from various natural resources organizations as well as tribal partners to develop recommendations that acknowledge these challenges and work toward improved deer management in the state. The DNR is also seeking to involve unaffiliated individuals who have concerns about deer management to encourage a far-reaching, representative discussion. Those interested in participating in this vital initiative were invited to submit their applications by Jan. 31, 2023, and successful applicants were to be notified shortly thereafter. To submit thoughts on topics that the groups should consider, or ideas for improvement, interested persons were asked to email DNR-Wildlife@Michigan.gov, including the term "DMI" in the subject line.

Deer harvest reporting became available in 2021 and was mandatory in 2022 and 2023. Data collected through harvest reporting is used to help manage the deer population in Michigan. Hunters were encouraged to go to www.michigan.gov/DNRHarvestReport or use the DNR Hunt Fish app to register a deer. As of February 4, 2024, approximately 16,900 deer harvested in the U.P. in 2023 had been reported, 75% of which were antlered bucks. This was approximately 26% fewer deer (~24% fewer bucks) than reported in 2022. The harvest reporting results can be viewed at www.mdnr-elicense.com/HarvestReportSummary.

Wildlife Division staff hold sportsperson coalition meetings to provide regular interaction with local stakeholders on an array of topics in the U.P., including regular discussions of deer management issues. Contact your local DNR wildlife biologist or technician for a meeting schedule if you are interested in attending.

Chronic Wasting Disease (CWD): Chronic wasting disease is a fatal nervous system disease found in animals of the family Cervidae, including deer, moose, and elk. A 4-year-old doe killed in Dickinson County's Waucedah Township on a deer-damage shooting permit in September 2018 tested positive for CWD. This event marked the first confirmation of CWD in the U.P.

The DNR established a core surveillance area in 2018 (totals 660 sq. mi.) centered on Waucedah Township, where the DNR tested over 2,600 deer to better determine the extent of

infected deer. Given no additional CWD positives have been detected within the U.P. core surveillance area, the DNR is adapting its surveillance efforts within this area as well as within other areas of the state. The Department has established a team to revise CWD strategies including updating the 2012 CWD Response Plan, developing a Michigan CWD Management Plan, and address details of operations or implementation of those strategies. Thanks to hunters and others involved for submitting samples to try to reach the surveillance goals and becoming actively involved in preventing the spread of CWD. Visit www.michigan.gov/cwd for more information and the latest updates on CWD.

Acknowledgements: This survey was conducted through the DNR's Escanaba and Sault Ste. Marie Customer Service Centers. Jo Ann Alexander, Kari Diffenderfer, Rachel Leggett, and Rebecca Randazzo handled administrative and processing aspects of the survey. David Jentoft and Colter Lubben coordinated the survey and prepared this report. This project was supported by the Federal Aid in Wildlife Restoration Act, Michigan Project W-147-R-5.
