

Relighting Recommendations

Beeswax is a very dense, natural product and produces a higher burn temperature. By dipping the wick in the melted wax, it will "refuel" the cotton wick for easier relighting and will reduce the smoke.

So for the best results, push the wick ver into the liquid wax with a toothpick, as you extinguish the flame. Be sure to return the wick to its upright position for relighting ease.

Keep the wick trimmed to 1/4". This will use less fuel (wax) and insure a longer burn time.

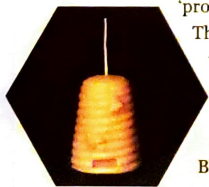

Taking Care of Your Beeswax Candles

100% natural beeswax requires a little more care than other wax candles. It will eventually get a powdery appearance on the surface. This is mother natures

'protective coating' called BLOOM.

The best way to remove bloom is to rub it off with your hands, this will make your candle shiny again. The warmth of your hands will wipe it right off.

Bloom is also very good for your skin.

If your beeswax candle should get bumped while it is lit and hot wax flows over; put the wick out using the method above, let it completely cool and the flow over spot will heal itself. If it is a large hole you can take some wax as its cooling and patch the area. After it is completely cooled you can relight as usual.

Spilled Beeswax will peel right off hard surfaces and will iron off fabric or carpet by using brown paper bag. Beeswax will NOT leave residue or stain behind.

Local Honey!!

Here's the BUZZ about Beeswax

Did you know???

Beeswax is natural air purifier and will actually clean the air you breathe as they burn. A negative ion is released that attaches to the positive ions in your air like dust, pet dander, pollen, food smells, smoke and other irritants, cancelling them out. So, for those who suffer from asthma or allergies, beeswax candles will actually make your home or office a healthier, more comfortable place to live and work. PLUS...beeswax is an all natural product and will burn cleaner with less soot. Beeswax is a very dense wax which helps it burn up to 2x longer than standard paraffin candles, which means you get a bigger burn for your buck!
