Soil Investigation

In Building Construction, the foundation is considered the most crucial element of a structure's integrity. It can also be one of the most costly transition in a construction project if no Soil Investigation were done prior to purchasing and designing.

A Soil Investigation report along with predetermined soil tests, are some of the main parameters used by engineers to determine the type, size and design of a particular foundation system for a building.

Having the knowledge beforehand of knowing the ground conditions of a specific property and knowing how it will react to a building foundation are key factors in the Building and Real Estate Investment process.

Need a soil investigation done on a property you are interested in purchasing? Contact us at info@goldmarcinternational.com
