COREY WENGER
JAARS

As an engineering student, Corey sensed the Lord calling him to more than just a career in engineering. While attending the Urbana student missions conference, Corey discovered how many opportunities there are for supporting missions with technical skills. He made a commitment to give the Lord his skills for the glory of Christ's Kingdom.

After completing a Masters degree in electrical engineering, Corey joined Wycliffe Bible Translators to work as a software developer on the Speech Analyzer project. The Waxhaw, NC-based project was a remarkable fit with his digital signal processing background.

Based at the JAARS center in Waxhaw since 1997, Corey has worked on various technical projects. His initial involvement in language software development centered around developing linguistic and translation software. Since 2009 he has worked with a team that provides electrical power solutions to translators and language workers around the world. Many of these language teams are in some of the the most difficult places to work, without power or reliable communications options. It is exciting for Corey and his team to be able to meet these critical needs and help make translation possible in these far flung languages where God's Word is just being heard for the first time!

Corey and his wife Delisa met while working as software developers at the JAARS center. Married in 2002, they have since been blessed with 3 boys.
