Every Business Needs a Server
What can it do for you?

J. LO TECH
Making I.T. Happen

Whether you have two PCs or five, you need a centralized location to manage, store, send, process, protect and monitor all of your business data, files and back up everything to serve your customers better, 24 hours a day, 7 days a week, 365 days a year.

- **Your customer's data can be updated by any user on a PC connected to your server so the latest information accessed is always current**

- **Your employees can update, and share documents, presentations and spreadsheets, regardless of where they are**

- **All software and data is administered by the server to all your business PCs so everything is coordinated and protected and running at its smoothest**

YES, **you need something besides a couple of desktop PCs to process data faster and more efficiently.**

Every Business Needs a Server
What can it do for you?

J. LO TECH
Making I.T. Happen

Do You need a Server?

- Are you prepared for a hard drive crash? Are you prepared to recover all of the files or re-enter or re-create the data you lost?

- Are you backing up all of that important information, whether accounting spreadsheets, pricing proposals, contact documents?

- Do your employees have access to the latest version of your important information or are there multiple versions?

- Do your employees have the same access to all of your business' critical and confidential data? What if they left?

- Does each PC have the latest virus protection with the most current updates? What if your business was stifled by a malicious attack?

Don't let the stress of an IT infrastructure get in the way of your company's growth.
