• Alternating Current:

The current whose magnitude changes with time and direction reverses periodically is called alternating current. a) Alternating emf E and current I at any time am given by:

 $E = E_0 \sin \omega t$

Where $E_0 = NBA\omega$

$$I = I_0 \sin(\omega t - \phi)$$

Where $I_0 = \frac{NBA\omega}{R}$

$$\omega = 2\pi n = \frac{2\pi}{T}$$

Where T is the time period.

• Values of Alternating Current and Voltage

a) Instantaneous value:

It is the value of alternating current and voltage at an instant t.

b) Peak value:

Maximum values of voltage E_0 and current I_0 in a cycle are called peak values.

c) Mean value:

For complete cycle,

$$\langle E \rangle = \frac{1}{T} \int_{0}^{T} E dt = 0$$
$$\langle I \rangle = \frac{1}{T} \int_{0}^{T} I dt = 0$$

Mean value for half cycle: $E_{mean} = \frac{2E_0}{\pi}$

d) Root - mean- square (rms) value:

$$E_{rms} = (\langle E^2 \rangle)^{1/2} = \frac{E_0}{\sqrt{2}} = 0.707E_0 = 70.7\%E_0$$
$$I_{rms} = (\langle I^2 \rangle)^{1/2} = \frac{I_0}{\sqrt{2}} = 0.707I_0 = 70.7\%I_0$$

RMS values are also called apparent or effective values.

• Phase difference Between the EMF (Voltage) and the Current in an AC Circuit

a) For pure resistance:

The voltage and the current are in same phase i.e. phase difference $\phi = 0$

b) For pure inductance:

The voltage is ahead of current by $\frac{\pi}{2}$ i.e. phase difference $\phi = +\frac{\pi}{2}$.

c) For pure capacitance:

The voltage lags behind the current by $\frac{\pi}{2}$ i.e. phase difference $\phi = -\frac{\pi}{2}$

• Reactance:

ม

Reactance

a)
$$X = \frac{E}{I} = \frac{E_0}{I_0} = \frac{E_{rms}}{I_{rms}} \pm \pi / 2$$

Inductive reactance

$$X_{L} = \omega L = 2\pi n L$$

Capacitive reactance

c)
$$X_c = \frac{1}{\omega C} = \frac{1}{2\pi nC}$$

• Impedance:

Impedance is defined as,

$$Z = \frac{E}{I} = \frac{E_0}{I_0} = \frac{E_{rms}}{I_{rms}}\phi$$

Where ϕ is the phase difference of the voltage E relative to the current I.

a) For L – R series circuit:

$$Z_{RL} = \sqrt{R^2 + X_L^2} = \sqrt{R^2 + \omega L^2}$$
$$\tan \phi = \left(\frac{\omega L}{R}\right) or \phi = \tan^{-1}\left(\frac{\omega L}{R}\right)$$

b) For R – C series circuit:

$$Z_{RC} = \sqrt{R^2 + X_C^2} = \sqrt{R^2 + \left(\frac{1}{\omega C}\right)^2}$$
$$\tan \phi = \frac{1}{\omega CR} \text{ Or } \phi = \tan^{-1}\left(\frac{1}{\omega CR}\right)$$

c) For L – C series circuit:

$$Z_{LCR} = \sqrt{R^2 + (X_L - X_C)^2}$$
$$= \sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}$$
$$\tan \phi = \frac{\left(\omega L - \frac{1}{\omega C}\right)}{R} \text{ Or } \phi = \tan^{-1} \left(\frac{\omega L - \frac{1}{\omega C}}{R}\right)$$

• Conductance:

Reciprocal of resistance is called conductance.

$$G = \frac{1}{R}mho$$

- Power in and AC Circuit:
 - a) Electric power = (current in circuit) x (voltage in circuit) P = IE
 - b) Instantaneous power:

 $P_{inst} = E_{inst} \times I_{inst}$

c) Average power:

$$P_{av} = \frac{1}{2} E_0 I_0 \cos \phi = E_{rms} I_{rms} \cos \phi$$

d) Virtual power (apparent power):

$$=\frac{1}{2}E_0I_0=E_{rms}I_{rms}$$

- Power Factor:
 - a) Power factor

$$\cos\phi = \frac{P_{av}}{P_v} = \frac{R}{Z}$$

- b) For pure inductance Power factor, $\cos \phi = 1$
- c) For pure capacitance

Power factor, $\cos\phi=0$

d) For LCR circuit

Power factor,
$$\cos\phi = \frac{R}{\sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}}$$

$$X = \left(\omega L - \frac{1}{\omega C}\right)$$

• Wattless Current:

The component of current differing in phase by $\frac{\pi}{2}$ relative to the voltage, is called wattles current.

• The rms value of wattless current:

$$= \frac{I_0}{\sqrt{2}} \sin \phi$$
$$= I_{rms} \sin \phi = \frac{I_0}{\sqrt{2}} \left(\frac{X}{Z}\right)$$

• Choke Coil:

- a) An inductive coil used for controlling alternating current whose self- inductance is high and resistance in negligible, is called choke coil.
- b) The power factor of this coil is approximately zero.

• Series Resonant Circuit

- a) When the inductive reactance (XL) becomes equal to the capacitive reactance (XC) in the circuit, the total impedance becomes purely resistive (Z=R).
- b) In this state, the voltage and current are in same phase ($\phi = 0$), the current and power are maximum and impedance is minimum. This state is called resonance.
- c) At resonance,

$$\omega_r L = \frac{1}{\omega_r C}$$

Hence, resonance frequency is,

$$f_r = \frac{1}{2\pi\sqrt{LC}}$$

d) In resonance, the power factor of the circuit is one.

• Half – Power Frequencies:

Those frequencies f_1 and f_2 at which the power is half of the maximum power (power at resonance), i.e., f_1 and f_2 are called half – power frequencies.

$$P = \frac{1}{2} P_{\text{max}}$$
$$I = \frac{I_{\text{max}}}{\sqrt{2}}$$
$$\therefore P = \frac{P_{\text{max}}}{2}$$

- Band Width:
 - a) The frequency interval between half power frequencies is called band width.

: Bandwidth $\Delta f = f_2 - f_1$

b) For a series LCR resonant circuit,

$$\Delta \mathbf{f} = \frac{1}{2\pi} \frac{R}{L}$$

• Quality Factor (Q):

 $Q = 2\pi \times \frac{\text{Maximum energy stored}}{\text{Energy dissipated per cycle}}$ $= \frac{2\pi}{T} \times \frac{\text{Maximum energy stored}}{\text{Mean power dissipated}}$ Or $Q = \frac{\omega_r L}{R} = \frac{1}{\omega_r CR} = \frac{f_r}{(f_2 - f_1)} = \frac{f_r}{\Delta f}$
