

# ACT

## PREVENTING FENTANYL EXPOSURE AND CROSS CONTAMINATION

# A

### Assess

Assess location for loose powders, residues or areas which may contain potentially lethal powders that can lead to cross contamination and additional exposures

# C

### Contain

Contain suspicious powders with the **BLOC™** Encapsulation Device following assessment. Don appropriate personal protective equipment if necessary.

# T

### Transport

Transport affected personnel to emergency facilities following containment and administration of naloxone. Monitor personnel for sudden onset of overdose symptoms.

Daily, first responders are at risk of secondary fentanyl exposure while enforcing laws, responding to overdose incidents or rendering aid to personnel suffering from exposures. These incidents easily become *Cascading Mass Casualty Events* involving police officers, medical personnel and emergency room staff. Using **ACT** will prevent unintentional exposures and cross contamination. Containment is crucial, and **BLOC™** is the only rapidly deployed containment device in the world.
