What are Crowns and Bridges?

With new advancements in dentistry, crowns and bridges are able to restore the esthetics and function of missing, decayed or damaged teeth. A crown or cap is a tooth replacement that fits over your existing teeth or implants, while a bridge replaces teeth that are connected by 2 or more crowns.

Types:

There are several different materials available, depending on your particular needs and preferences.

FULL METAL

Usually made of gold alloy, are long lasting and durable.

PORCELAIN & METAL

Natural looking and stronger than full ceramic restorations.

FULL PORCELAIN

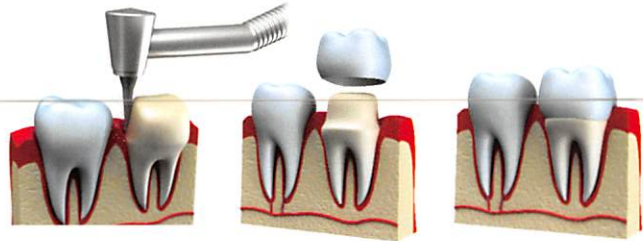

All-Ceramic restorations are the most natural and esthetic.

About Crowns and Bridges

Your dentist may choose to prescribe a fixed restoration to repair or replace missing teeth.

1. Your existing tooth will be prepared by removing the outer layer of enamel to allow seating and fitting of your new cap.
2. An impression is made to create an exact model of your existing teeth and sent to the laboratory for fabrication of your crown.
3. A temporary crown is placed on your prepared tooth until the permanent restoration is finished and ready to be inserted.
4. Finally, the temporary cap will be removed and the final new crown will be seated and permanently cemented.

Benefits and Advantages:

Crowns and Bridges restore the health, function, and beauty of your smile!

- *Looks and feels like permanent teeth and blends in with your natural smile*
- *Restores the health and strength of broken dentition*
- *Functions and acts as natural permanent teeth*
- *A cosmetic solution for missing or damaged teeth*
