

Spill Response

Service

SynergyAspen provides environmental consulting services to assess, mitigate, remediate, monitor and reclaim land-based spills in BC. SynergyAspen is not an emergency response provider; we respond to spills once it is safe to do so.

Challenge & Issues

Challenges occur in managing spills which occur in remote areas. SynergyAspen's expertise in remote sites and logistics planning enables us to respond to spills efficiently and effectively.

Solution

Through our multi-disciplinary professionals, resourcefulness, and good standing relationships with contractors, SynergyAspen can deploy a team to mobilize to the spill to immediately assess the environmental impact and liability.

SynergyAspen provides initial assessment and remedial action plan to ensure that spills are remediated as timely as possible to mitigate the effects to the environment.

Our multi-disciplinary team also provides environmental monitoring, wildlife impact mitigation strategies and reclamation services for "one-stop" project management.

SynergyAspen has responded to a variety of spills: tanker rollovers on remote resource roads; tank rollover on highway with impacts to adjacent private residential lands; well site and pipeline spills from methanol, produced water or condensate releases; frac-out response and monitoring in creeks. SynergyAspen responds to land-based spills during all seasons and conditions.
