

AUTO ARMING QUICK LOCK LOCK-UP SYSTEM

* In this example Full Throttle Switch starts Channels 1-8. When Transbrake Switch is depressed, timer will not start when Full Throttle Switch closes until Transbrake Switch is released. (When Blue and Black wires are connected, Channels 1-8 start)

- In this example the *Quick Lock* lock-up system would not be powered up until the programmed "Start" time for Channel 8 is reached. System would power down when the programmed "Off" time for Channel 8 is reached. Example: Turn lock-up system on at 1.5 seconds, off at 7.99 seconds.
