[F] 427.2.2 One-hour interior room. Where an exterior wall cannot be provided for the room, a 1-hour interior room ~~or enclosure~~ shall be provided and shall be a room or enclosure separated from the remainder of the building by fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both, with a fire-resistance rating of not less than 1 hour. Openings between the room or enclosure and interior spaces shall be provided with self-closing smoke- and draft-control assemblies having a fire protection rating of not less than 1 hour. An automatic sprinkler system shall be installed within the room. The room shall be exhausted through a duct to the exterior. Supply and exhaust ducts shall be enclosed in a 1-hour rated shaft enclosure from the room to the exterior. Approved mechanical ventilation shall comply with the International Mechanical Code and be provided with a minimum rate of 1 cubic foot per minute per square foot (0.00508 m³/s/m²) of the area of the room.

Reason:

These revisions are editorial in nature and do not alter the application of the code requirements.

For example, the addition of these words clarifies that the "opening" is not self-closing, but rather the opening is "provided with" self-closing assemblies.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no change in application of the code requirements.

F297-18 Part I

IFC: 5306.5

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

5306.5 Medical gas systems and equipment. ~~Medical gas systems including, but not limited to, distribution piping, supply manifolds, connections, pressure regulators and relief devices and valves and equipment,~~ shall be installed, tested and labeled in accordance with NFPA 99 and the general provisions of this chapter. Existing medical gas systems and equipment shall be used and maintained in accordance with the use, maintenance, inspection and testing provisions of NFPA 99 for medical gas systems and equipment.

Internal ID: 693

F297-18 Part II

IPC: 1202.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Plumbing Code

Revise as follows:

[F] 1202.1 Nonflammable medical gases. Nonflammable medical gas systems, inhalation anesthetic systems and vacuum piping systems shall be ~~designed-installed, tested and installed-labeled~~ in accordance with NFPA 99.

Exceptions:

1. This section shall not apply to portable systems or cylinder storage.
2. Vacuum system exhaust terminations shall comply with the International Mechanical Code.

Reason:

This change clarifies that the application of NFPA 99 includes the use, testing and labeling of medical gas systems and equipment (K909, K924 and K928).

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is an operational change regarding use, maintenance and testing. This will not increase the cost of construction on the healthcare industry.

Internal ID: 3404

F298-18

IFC: 5307.3.2

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov)

2018 International Fire Code

Revise as follows:

5307.3.2 Gas detection system. Where ventilation is not provided in accordance with Section 5307.3.1, a gas detection system shall be provided in rooms or indoor areas and in below-grade outdoor locations with insulated carbon dioxide systems. Carbon dioxide sensors shall be provided within 12 inches (305 mm) of the floor in the area where the gas is expected to accumulate or other *approved* locations. The system shall be designed as follows:

1. Activates an audible and visible supervisory alarm at a normally attended location upon detection of a carbon dioxide concentration of 5,000 ppm (9000 mg/m³).
2. Activates an audible and visible alarm within the room or immediate area where the system is installed and stops the flow of carbon dioxide upon detection of a carbon dioxide concentration of 30,000 ppm (54 000 mg/m³).

Reason:

This proposal seeks to add an automatic shut-off valve to the CO₂ system piping and require activation of that stop valve when the concentration reaches 30,000 PPM. NIOSH recommended limits for CO₂ exposure are as follows: 5,000 ppm is the time-weighted average limit; 30,000 ppm is the Short Term Exposure Limit for 15 minutes; and 40,000 PPM is Immediately Dangerous to Life and Health. With the increased use of liquefied carbon dioxide, and it's increased use in restaurants and other assembly occupancies, it is becoming more likely that a system pipe failure can lead to exposures to people that exceed 30,000 PPM if the flow is not stopped. The way the code is written, there is a supervisory alarm at 5,000 PPM, at which point in time it is expected that responsible personnel will mitigate the exposure. However, if the conditions have continued to worsen such that the 30,000 PPM alarm is triggered, there is concern that this expected manual intervention has not occurred or has not been effective. Adding an automatic shut-off valve at the discharge of the CO₂ source is a minor increase in costs that greatly increases the chances that the concentration of CO₂ does not rise significantly above 30,000 PPM.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal adds an automatic shut-off valve, as well as wiring and relays between the valve and the detection panel. The costs associated with this installation is an increase from what is currently required in the code.

Internal ID: 1125

F299-18

IFC: 5601.1; IBC [F] 307.1.1

Proponent: Dave Frable, U.S. General Services Administration, representing U.S. General Services Administration

2018 International Fire Code

Revise as follows:

5601.1 Scope. The provisions of this chapter shall govern the possession, manufacture, storage, handling, sale and use of *explosives, explosive materials*, fireworks and small arms ammunition.

Exceptions:

1. The Armed Forces of the United States, Coast Guard or National Guard.
2. *Explosives* in forms prescribed by the official United States Pharmacopoeia.
3. The possession, storage and use of small arms ammunition where packaged in accordance with DOTn packaging requirements.
4. The possession, storage and use of not more than 1 pound (0.454 kg) of commercially manufactured sporting black powder, 20 pounds (9 kg) of smokeless powder and 10,000 small arms primers for hand loading of small arms ammunition for personal consumption.
5. The use of *explosive materials* by federal, state and local regulatory, law enforcement and fire agencies acting in their official capacities.
6. Special industrial *explosive* devices that in the aggregate contain less than 50 pounds (23 kg) of *explosive materials*.
7. The possession, storage and use of blank industrial-power load cartridges where packaged in accordance with DOTn packaging regulations.
8. Transportation in accordance with DOTn 49 CFR Parts 100-185.
9. Items preempted by federal regulations.
10. Federal law enforcement agencies acting in their official capacities storing explosive materials in accordance with the Bureau of Alcohol, Tobacco, Fire Arms and Explosives Regulations, 27 CFR, Part 555.

2018 International Building Code

Revise as follows:

[F] 307.1.1 Uses other than Group H. An occupancy that stores, uses or handles hazardous materials as described in one or more of the following items shall not be classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of Section 416 and the International Fire Code.
2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the International Fire Code.
3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment.
4. Cleaning establishments that utilize combustible liquid solvents having a flash point of 140°F (60°C) or higher in closed systems employing equipment *listed* by an *approved* testing agency, provided that this occupancy is separated from all other areas of the building by 1-hour *fire barriers* constructed in accordance with Section 707 or 1-hour *horizontal assemblies* constructed in accordance with Section 711, or both.
5. Cleaning establishments that utilize a liquid solvent having a flash point at or above 200°F (93°C).
6. Liquor stores and distributors without bulk storage.
7. Refrigeration systems.
8. The storage or utilization of materials for agricultural purposes on the premises.

9. Stationary storage battery systems installed in accordance with the International Fire Code.
10. Corrosive personal or household products in their original packaging used in retail display.
11. Commonly used corrosive building materials.
12. Buildings and structures occupied for aerosol product storage shall be classified as Group S-1, provided that such buildings conform to the requirements of the International Fire Code.
13. Display and storage of nonflammable solid and nonflammable or noncombustible liquid hazardous materials in quantities not exceeding the maximum allowable quantity per *control area* in Group M or S occupancies complying with Section 414.2.5.
14. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the International Fire Code.
15. Stationary fuel cell power systems installed in accordance with the International Fire Code.
16. Capacitor energy storage systems in accordance with the International Fire Code.
17. Group B higher education laboratory occupancies complying with Section 428 and Chapter 38 of the International Fire Code.
18. The storage and use of explosive materials by Federal law enforcement agencies acting in their official capacities in accordance with the Bureau of Alcohol, Tobacco, Fire Arms and Explosives Regulations, 27 CFR, Part 555.

Reason:

Several Federal Law Enforcement Agencies by the nature of their mission have a need to store explosive materials at or near their base of operation. For example, Federal Law Enforcement Agencies utilizing canine teams to provide explosive detection have a need to store explosive canine training aids and Federal Law Enforcement Agencies that confiscate explosive materials during their daily activities also need storage areas near their base operations to store these types of explosive materials. However, following the prescriptive storage requirements in Chapter 56 for explosive materials would prohibit the storage of these types of explosive materials within Federally-owned buildings and in some cases prohibit such storage on Federally-owned property. This proposed code change attempts to address this issue by including an additional exception that would permit Federal Law Enforcement Agencies acting in their official capacities to follow the requirements in the Bureau of Alcohol, Tobacco, Fire Arms and Explosives Regulations, 27 CFR, Part 555, Commerce in Explosives – Subpart K, in lieu of the requirements in Chapter 56.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed code change would only affect Federally-owned buildings and Federally-owned property based on primarily Federal Law Enforcement Agency operational issues and not construction costs.

Internal ID: 1879

F300-18

IFC: 5601.1.3

Proponent: William Koffel, representing American Pyrotechnics Association (wkoffel@koffel.com)

2018 International Fire Code

Revise as follows:

5601.1.3 Fireworks. The possession, manufacture, storage, sale, handling and use of fireworks are prohibited.

Exceptions:

1. Storage and handling of fireworks as allowed in Section 5604.
2. Manufacture, assembly and testing of fireworks as allowed in Section 5605.
3. The use of fireworks for fireworks displays as allowed in Section 5608.
4. The possession, storage, sale, handling and use of specific types of Division 1.4G fireworks where allowed by applicable laws, ordinances and regulations, provided that such fireworks and facilities comply with ~~NFPA 1124 Section 5609~~, CPSC 16 CFR Parts 1500 and 1507, and DOTn 49 CFR Parts 100–185, as applicable for consumer fireworks.

Reason:

The current edition of NFPA 1124 does not contain requirements that address the retail sales and storage of consumer fireworks.

This is a companion change to a proposal that expands Section 5609 to address consumer fireworks in a comprehensive manner without a reference to NFPA 1124.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The requirements for Section 5609 are fairly consistent with industry practice and the provisions in previous editions of NFPA 1124.

Internal ID: 2233

F301-18

IFC: 5604.6.5

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov)

2018 International Fire Code

Revise as follows:

5604.6.5 Signs and placards. Property on which Type 1 magazines and outdoor magazines of Types 2, 4 and 5 are located shall be posted with signs stating: NO SMOKING and EXPLOSIVES—KEEP OFF. These signs shall be of contrasting colors with a minimum letter height of 3 inches (76 mm) with a minimum brush stroke of $\frac{1}{2}$ inch (12.7 mm). The signs shall be located to minimize the possibility of a bullet shot at the sign hitting the magazine.

Reason:

This is a simple proposal to add a requirement to provide NO SMOKING signs to limit sources of ignition where explosive materials are stored.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction by requiring an additional sign, or a larger sign, to be provided where storing explosive materials in magazines.

Internal ID: 1077

F302-18

IFC: 5606.1, 5606.6 (New), 5606.6.1 (New), 5606.6.2 (New), 5606.6.3 (New), 5606.6.4 (New), 5606.6.5 (New), 5606.6.6 (New), 5606.6.7 (New), 5606.6.8 (New)

Proponent: Adria Reinertson, Riverside County Fire Department, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)

2018 International Fire Code

Revise as follows:

5606.1 General. Indoor storage and display of black powder, smokeless propellants, small arms primers ~~and~~ small arms ammunition, and commercial reloading shall comply with this section and NFPA 495.

Add new text as follows:

5606.6 Commercial Reloading. Commercial reloading of small arms ammunition shall comply with Sections 5606.6.1 through 5606.6.8.

5606.6.1 Electrical. Areas within 3 feet of reloading equipment shall be Class I, Division 2, Group A type.

5606.6.2 Exhaust Fans. Squirrel cage blowers shall not be used for exhausting hazardous fumes, vapors or gases. Only nonferrous fan blades shall be used for fans located within the ductwork and through which hazardous materials are exhausted. Motors shall be located outside the duct.

5606.6.3 Work Stations. Work stations shall be separated by distance, barrier or other approved alternatives so that fire in one station will not ignite material in another work station.

5606.6.4 Personnel Limits. The number of occupants in each process building and in each magazine shall not exceed the number necessary for proper conduct of production operations.

5606.6.5 Approved Containers. Smokeless powder shall be kept in its original container.

5606.6.6 Static Controls. The work area shall be provided with approved static controls.

5606.6.7 Waste Disposal. Approved receptacles with covers shall be provided for each location for disposing of waste material and debris. These waste receptacles shall be emptied and cleaned as often as necessary but not less than once each day or at the end of each shift.

5606.6.8 Safety Rules. General safety rules and operating instructions governing the particular operation or process conducted at that location shall be available at each location.

Reason:

This proposal does not limit commercial loading and reloading, it provides safety measures to ensure hazards are properly mitigated. These provisions will give the code official the tools to consistently apply life safety standards to assist business owners to efficiently conduct business, Due to the similar hazards in the classification of fireworks, verbiage from the fireworks section is utilized.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal may minimally increase the cost of construction and/or operations due to the added safety features.

Internal ID: 606

F303-18

IFC: 5609

Proponent: William Koffel, representing American Pyrotechnics Association (wkoffel@koffel.com)

2018 International Fire Code

Revise as follows:

SECTION 5609 TEMPORARY STORAGE OF CONSUMER RETAIL SALES AND STORAGE OF CONSUMER FIREWORKS

5609.1 General. Where the display or temporary retail sales and associated storage of fireworks 1.4G (consumer fireworks) is allowed by Section 5601.1.3, Exception 4, such display or storage shall comply with the applicable requirements of NFPA 1124.~~this section.~~

Add new text as follows:

5609.2 Retail sales of consumer fireworks. Retail sales of consumer fireworks in both new and existing buildings, structures, and facilities shall comply with the requirements of this section unless otherwise indicated.

5609.2.1 Special Requirements for Retail Sales of Consumer Fireworks. Retail sales of consumer fireworks, including their related storage and display for sale of such fireworks, shall be in accordance with this section.

5609.2.1.1 Occupancy classification. Retail sales of consumer fireworks in buildings complying with this Section shall be classified as Use Group M.

5609.2.1.2 Prohibition. The retail sales of fireworks and novelties that do not comply with the regulations of the U.S. Consumer Product Safety Commission as set forth in 16 CFR 1500 and 1507 and the regulations of the U.S. Department of Transportation as set forth in 49 CFR 100 to 178, including their related storage and display for sale, shall be prohibited.

5609.2.2 Third party testing. Consumer fireworks shall be tested and certified by an approved, independent third party testing agency for compliance with the regulations of the Consumer Product Safety Commission (CPSC) as set forth in 16 CFR 1500 and 1507, using a test sampling plan that meets CPSC requirements.

5609.2.3 Permits. Where required by state or local laws, ordinances, or regulations, a permit for the following shall be obtained for the storage of consumer fireworks in connection with the retail display or sale of consumer fireworks to the public.

5609.2.4 Fire department access. Any portion of an exterior wall shall be accessible within 150 ft. (45.7 m) of a public way or an approved fire department access road.

5609.2.5 Smoking. Smoking shall be regulated in accordance with Sections 5609.2.5.1 and 5609.2.5.2

5609.2.5.1 Location. Smoking shall not be permitted inside or within 50 ft. (15.5 m) of sales facility

5609.2.5.2 Signage. At least one sign that reads as follows, in letters at least 2 in. (51 mm) high on a contrasting background, shall be conspicuously posted at each entrance or within 10 ft. (3.05 m) of every aisle directly serving the fireworks sales area:

FIREWORKS

NO SMOKING

5609.2.6 Retail sales displays. Retail displays of fireworks shall be in accordance with Sections 5609.2.6.1 through 5609.6.3.3.

5609.6.1 Height of sales display. Partitions, counters, shelving, cases and similar space dividers shall not exceed 6 ft. (1.8 m) in height above the floor surface inside the perimeter of the retail sales area. Where located along the

perimeter of the consumer fireworks retail sales area, the maximum height of sales display shall be limited to 12 ft. (3.6 m).

5609.2.6.2 Flame breaks. Where continuous displays of consumer fireworks are located on shelving, cases, counters, and similar display fixtures, a flame break shall be provided so that the maximum distance between flame breaks does not exceed 16 ft (4.9 m) where measured along the length of the display.

5609.2.6.2.1 Extension of Flame break. The flame break shall extend be in accordance with the following:

1. From the display surface to not less than 6 in. (150 mm) above the full height of the displayed merchandise or to the underside of the display surface directly above.

2. For the full depth of the displayed merchandise.

5609.2.6.2.2 Mixed packaging. Where packaged fireworks merchandise is displayed on the same level as individual unpackaged fireworks devices, the flame break required in 5609.2.7.2.1 shall not be required where in accordance with both of the following:

1. The length of the display level containing individual unpackaged fireworks devices is interrupted by packaged fireworks merchandise, or open space, or any combination thereof, having a continuous length of not less than 8 ft. (2.4 m).

2. The distance between flame breaks does not exceed 32 ft. (9.8 m).

5609.2.6.2.3 Continous storage. Where a merchandise display level contains packaged fireworks merchandise, such merchandise shall be permitted to be displayed in a continuous length on the same level, where the display does not exceed 32 ft. (9.8 m) without the flame break required in 5609.2.6.2.1.

5609.6.2.4 Aisle. . An aisle having a minimum width of 48 in. (1.2 m) shall be permitted to substitute for the flame break.

5609.2.6.2.5 Displays facing aisles. Where displays of merchandise face aisles that run along both long sides of the display fixtures or display surface, a flame break shall be installed lengthwise between the abutting display fixtures or along the approximate longitudinal centerline of the display surface so as to separate the merchandise facing one of the aisles from the merchandise that abuts it facing the other aisle.

5609.2.6.2.6 Freestanding displays. Freestanding display racks, pallets, tables, or bins containing packaged fireworks merchandise shall be permitted without flame breaks, provided the dimensions of the area occupied by the fireworks merchandise do not exceed 4 ft. (1.2 m) in width, 8 ft. (2.4 m) in length, and 6 ft. (1.8 m) in height, and the displayed fireworks merchandise is separated from other displays of merchandise by aisles having a minimum clear width of 4 ft. (1.2 m).

5609.2.6.2.7 Displays of hardboard panels. Where both of the facing vertical surfaces of the abutting display fixtures are constructed of perforated hardboard panels not less than ¼ in. (6 mm) thick that are separated from each other by an open space not less than 1 ½ in. (38 mm) wide, a flame break shall not be required.

5609.2.6.2.8 Permanent sales facilities. In Permanent Sales Facilities the longitudinal flame break shall not be required where the display fixture or surface is adjacent to an aisle that is not used for public egress.

5609.2.6.3 Shelving. Shelving shall be in accordance with 5609.2.6.3.1 through 5609.2.6.3.3

5609.2.6.3.1 General. Shelving or other surfaces used to support fireworks display merchandise shall be permitted to have not more than 10 percent of the area of the shelf contain holes or other openings.

5609.2.6.3.2 Openings. The 10 percent limitation on the area of holes or other openings in the shelf used to support fireworks display merchandise shall not be applicable under the following conditions:

1. Where both of the facing vertical surfaces of the abutting display fixtures are constructed of perforated hardboard panels not less than ¼ in. (6 mm) thick and separated from each other by an open space not less than 1 ½ in. (38 mm) wide.

2. Where such merchandise is suspended from or fastened to the shelf or surface or is displayed as packaged merchandise on the surface or in bins.

5609.2.6.3.3 Flame breaks and solid display. Flame breaks and solid display surfaces shall not be required for packaged fireworks merchandise displayed in bins or display racks or on pallets or tables located at the end of a row of display fixtures where the following conditions are met:

1. Such end displays are separated from the ends of the display fixtures by an open space not less than 3 in. (76 mm) wide.
2. The fireworks merchandise occupies an area having dimensions not greater than the width of the end of the row of display fixtures and a depth not greater than 30 in. (910 mm).
3. The minimum required widths of the adjacent aisles are maintained, but in no case is the aisle width less than 48 in. (1.2m).

5609.2.7 Covered fuses. Only consumer fireworks meeting the criteria for covered fuses shall be permitted.

5609.2.7.1 Packaged fireworks. A consumer fireworks device shall be considered as having a covered fuse if the fireworks device is contained within a packaged arrangement, container, or wrapper that is configured such that the fuse of the fireworks device cannot be touched directly by a person handling the fireworks without the person having to puncture or tear the packaging or wrapper, unseal or break open a package or container, or otherwise damage or destroy the packaging material, wrapping, or container within which the fireworks are contained.

5609.2.8 Aerial Devices. Aerial devices shall be packaged and displayed for sale in a manner that will limit travel distance of ejected pyrotechnic components if ignition of the fireworks occurs.

5609.2.9 Other Materials. Combustible materials and merchandise shall not be stored directly above the consumer fireworks in retail sales.

5609.2.10 Training. All personnel handling consumer fireworks shall receive safety training related to the performance of their duties.

5609.3 Retail Sales of Consumer Fireworks in Permanent Sales Facilities. Permanent sales facilities for retail sale of consumer fire works shall comply with Sections 5609.3.1 through 5609.3.7.3.

5609.3.1 Quantity Limitations. The floor area occupied by the retail displays of consumer fireworks in Permanent Sales Facilities shall not exceed 40 percent of the available floor area within the retail sales area.

5609.3.2 Construction of Permanent Sales Facilities. New permanent sales facilities shall not exceed one story in height.

5609.3.3 Multiple-Tenant buidlings

. Multiple-tenant buildings shall comply with Sections 5609.3.3.1 and 5609.3.3.2.

5609.3.3.1 Buildings with other tenants. Where new permanent sales facilities are located in a building containing other tenants, the permanent sales facility shall be separated from the other tenants by fire barriers with a minimum fire resistance rating of two hours and having no openings.

5609.3.3.2 Sprinkler protection. Where the new permanent sales facilities are protected with an automatic sprinkler system complying with 903.3.1.1, the fire resistance rating of the fire barrier required by 5609.3.3.1 shall be permitted to be not less than 1 hour.

5609.3.4 Fire protection. An automatic sprinkler system complying with 903.3.1.1 shall be provided throughout permanent sales facilities in which fireworks sales are conducted as follows:

1. In new permanent sales facilities greater than 3000 ft² (276 m²) in area
2. In existing permanent sales facilities greater than 7500 ft² (694 m²) in area

5609.3.5 Storage rooms. Storage rooms, containing consumer fireworks in a new Permanent Sales Facilities shall be protected with an automatic sprinkler system complying with 903.3.1.1 or separated from the retail sales area by a fire barrier having a fire resistance rating of not less than 1 hour.

5609.3.6 Fire alarms. A fire alarm system shall be provided in accordance with Section 907.

5609.3.7 Separation distances. Separation distances shall be provided in accordance with Section 5609.3.7.1 through 5609.3.7.3 as applicable.

5609.3.7.1 New facilities

. New Permanent Sales Facilities shall be separated from adjacent permanent buildings and structures in accordance with Table 5609.3.7.1.

5609.3.7.2 Existing facilities. Existing Permanent Sales Facilities shall be separated from adjacent permanent buildings and structures by not less than 10 ft (3.05m) or shall be separated by a wall with a 1-hour fire resistance rating.

**Table 5609.3.7.1
SEPARATION DISTANCE BETWEEN NEW PERMANENT BUILDINGS AND STRUCTURES**

Seperation distance		Exterior Wall Fireresistance Rating (hr)	Exterior Wall Opening Protection Rating (hr)
Ft	M		
<u>< 10</u>	<u><3.05</u>	<u>2</u>	<u>1-1/2</u>
<u>>10 - <60</u>	<u>>3.05- <18.3</u>	<u>1</u>	<u>3/4</u>
<u>> 60</u>	<u>>18.3</u>	<u>0</u>	<u>0</u>

5609.3.7.3 Parking.. No motor vehicle or trailer used for the storage of consumer fireworks shall be parked with 10 ft. (3 m) of a permanent sales facility, except when the vehicle or trailer is delivering, loading, or unloading fireworks or other merchandise and materials used, stored, or displayed for sale in the facility.

5609.3.8 Means of Egress. Means of egress in permanent retail sales facilities shall be in accordance with Sections 5609.3.8.1 through 5609.3.8.3.

5609.3.8.1 Number of exits. The minimum number of exits provided from the retail sales area shall be not less than three.

5609.3.8.2 Exit access travel distance. Exits provided for permanent sales facilities shall be located so that the exit access travel distance does not exceed 75 ft. (22.9 m).

5609.3.8.3 Emergency lighting. Emergency lighting shall be provided for permanent sales facilities.

5609.3.9 Operations. Operations of retail sales of consumer fireworks in permanent facilities shall be in accordance with Sections 3609.3.9.1 through 5609.3.9.3.

5609.3.9.1 Distances from Entrances and Exits. Distance to entrances and exits shall comply with Sections 5609.3.9.1.1 and 5609.3.9.1.2.

5609.3.9.1.1 Public entrances. No consumer fireworks shall be displayed for sale or stored within 5 ft (1.5 m) of any public entrance in an enclosed building or structure.

5609.3.9.1.2 Private entrances. No consumer fireworks shall be displayed for sale or stored within 2 ft (0.6 m) of any exit or private entrance in an enclosed building or structure.

5609.3.9.2 Security. Fire works shall be kept Secure in permanent sales facilities in accordance with Sections 5609.3.9.2.1 through 5609.3.9.2.3.

5609.3.9.2.1 Non business hours. Permanent sales facilities shall be secured when unoccupied and not open for business, unless fireworks are not kept in the facility during such times.

5609.3.9.2.2 Removal and transferring. The fireworks displayed or stored in a permanent sales facilities shall be allowed to be removed and transferred to a temporary storage structure or location.

5609.3.9.2.3 Ignition sources. Fireworks shall not be ignited, discharged, or otherwise used within 300 ft. (91.5 m) of a permanent sales facilities.

5609.3.9.3 Display and Handling. Not less than 50 percent of the available floor area within the retail sales area shall be open space that is unoccupied by retail displays and used only for aisles and cross-aisles.

5609.4 Requirements for Retails Sales of Consumer Fireworks in Temporary Sales Facilities. . The retail sales of consumer fire works in temporary sales facilities shall be in accordance with Sections 5609.4.1 through 5609.4.6.4.

5609.4.1 Construction of Temporary Sales Facilities. New Temporary Sales Facilities shall not exceed one story in height.

Exception: Temporary Sales Facility stands greater than 1600 ft² (148 m²) in area that also meet the construction

requirements for a permanent structure.

5609.4.2 Sale from vehicles. The sale of consumer fireworks from vehicles including automobiles, trucks, motor homes and travel trailers is not permitted except when the vehicle meets the requirements for a Temporary Sales Facility stand.

5609.4.3 Signage. In addition to the signage required in 5609.2.6 at least one sign that reads as follows, in letters at least 4 in. (102 mm) high on a contrasting background, shall be conspicuously posted on the exterior the temporary sales facility:

NO FIREWORKS DISCHARGE

WITHIN 100 FEET

5609.4.4 Separation Distances. Temporary sales facilities shall be located as specified in Table 5609.4.4 and in accordance with Sections 5609.4.4.1 and 5609.4.4.2.

5609.4.4.1 Clearance to Combustibles. The area located within 10 ft. (9 m) of a temporary sales facilities shall be kept free of accumulated dry grass, dry brush, and combustible debris.

5609.4.4.2 Parking. No motor vehicle or trailer used for the storage of consumer fireworks shall be parked within 10 ft. (3 m) of a Temporary Sales Facilities, except when the vehicle or trailer is delivering, loading, or unloading fireworks or other merchandise and materials used, stored, or displayed for sale in the facility.

**Table 5609.4.4
MINIMUM SEPARATION DISTANCES FOR TEMPORARY SALES FACILITIES**

Type	Separation Distance											
	Buildings		Combustibles		Tents		Vehicle Parking		Stands		Storage of Fireworks	
	Ft	M	Ft	M	Ft	M	Ft	M	Ft	M	Ft	M
Tents	20	6.1	20	6.1	20	6.1	10	3.05	20	6.1	20	6.1
Stands	20	6.1	10	3.05	20	6.1	10	3.05	20	6.1	20	6.1

5609.4.5 Means of Egress. Means of egress and temporary retail sales of consumer fire works shall be in compliance with Sections 5609.4.5.1 through 5609.4.5.6.

5609.4.5.1 Number of Exits. The minimum number of exits provided from the retail sales area shall be not less than three for Temporary Sales Facilities that are larger than 1,200 ft². All other Temporary Sales Facilities shall have a minimum of two exits, regardless of area.

5609.4.5.2 Egress through storage rooms. Required means of egress from the retail sales area shall not be allowed to pass through storage rooms or areas.

5609.4.5.3 Egress Travel Distance. Egress travel distance shall be in accordance with Sections 5609.4.5.3.1 and 5609.4.5.3.2.

5609.4.5.3.1 Exits provided for Temporary Sales . Facilities tents shall be located so that the exit access travel distance does not exceed 75 ft. (22.9 m).

5609.4.5.3.2 Exits provided for Temporary Sales. Facilities stands shall be located so that the exit access travel distance does not exceed 35 ft. (10.6 m).

5609.4.5.4 Aisles. Aisles shall have a minimum clear width of 48 in. (1.2 m) except in temporary sales facilities stands where the interior is not accessible to the public, the minimum clear width of aisles shall be 28 in. (710 mm).

5609.4.5.5 Dead-end aisles. Dead-end aisles shall be prohibited.

5609.4.5.6 Emergency Lighting. Emergency lighting shall be provided for temporary sales facilities. Emergency lighting shall not be required in Temporary Sales Facilities that are not open for business after dusk or for Temporary Sales Facilities stands where the interior is not accessible to the public.

5609.4.6 Sales Display. Consumer fireworks shall be displayed in a manner that prevents the fireworks from being handled by persons other than those operating, supervising, or working in the Temporary Sales Facilities stand where the stand does not allow access to the interior by the public.

5609.4.7 Portable Generators. Portable generators shall be in accordance with Sections 5609.4.7.1 through 5609.4.7.4.

5609.4.7.1 Fuel. Fuel for generators shall be permitted to be Class I, Class II, or Class III liquids and shall be limited to not more than 5 gallons (18.9 L) unless the generator fuel storage is located at least 50 ft. (15.2 m) from the temporary sales facility.

5609.4.7.2 Limitations. Portable generators supplying power to Temporary Sales Facilities shall use only Class I or Class III combustible liquid fuels.

5609.4.7.3 Separation of generators. Portable generators shall be located not less than 20 ft. (6.1 m) from the Temporary Sales Facilities.

5609.4.7.4 Separation of fuels. Generator fuels shall be stored not less than 20 ft. (6.1 m) from the Temporary Sales Facilities.

5609.5 Requirements for Retail Sales of Consumer Fireworks in Stores. Retail sale of consumer fireworks shall comply with Section 5609.5.1 through 5609.5.6

5609.5.1 Applicability. The requirements of Section 5609.4 do not apply where both of the following conditions exist:

1. The area of the retail sales floor occupied by the retail displays of consumer fireworks does not exceed 25 percent of the area of the retail sales floor in the building or 600 ft² (55.5m²), whichever is less.
2. The consumer fireworks are displayed and sold in a manner approved by the fire code official and comply with the applicable provisions of this code, federal and state law, and local ordinances.

5609.5.2 Requirements. Consumer fireworks displayed for sale in stores shall comply with all of the following:

1. Such fireworks shall be under the visual supervision of a store employee or other responsible party while the store is open to the public.
2. Such fireworks shall be packaged fireworks merchandise.
3. Such fireworks shall be packaged and displayed for sale in a manner that will limit travel distance of ejected pyro-technical components if ignition of the fireworks occurs.
4. Where consumer fireworks meeting the description of aerial devices and audible ground devices are sold, such devices shall be displayed for sale in an area of the store that is physically separated from the rest of the store in a manner that restricts entry by the public, and the area of the store shall be provided with not less than two means of egress, so located that there is no common path of travel and the distance to reach an egress point from the area does not exceed 35 ft (10.7m).

5609.5.3 Automatic Sprinkler System. The store shall be protected with an automatic sprinkler system in accordance with 903.3.1.1 in accordance with the following:

1. New stores greater than 3000 ft² (552.2 m²) in area
2. Existing stores greater than 7500 ft² (694 m²) in area

5609.5.4 Fire Alarm System. A fire alarm system shall be provided as required by Section 907. In addition, in stores greater than 3000 ft² (280 m²), a public address system or a means for manually activating audible and visible alarm indicating devices located throughout the facility shall be provided at a constantly attended location when the store is occupied.

5609.5.5 Storage Rooms. Storage rooms containing consumer fireworks in a store shall be protected with an automatic sprinkler system complying with 903.3.1.1 or shall be separated from the retail sales area by a fire barrier having a fire resistance rating of not less than 1 hour.

5609.5.6 Means of Egress. Exits provided for stores shall be located so that the exit access travel distance from the area where consumer fireworks are displayed does not exceed 75 ft. (22.9 m).

5609.6 Storage of Consumer Fireworks. The storage of consumer fireworks shall comply with Sections 5609.6.1 through 5609.6.9.3

5609.6.1 Non applicability. This section shall not apply to buildings or facilities where the net weight of the pyrotechnic content of consumer fireworks stored does not exceed 125 lb., or 250 lb. where the building is protected throughout with an automatic sprinkler system complying with 903.3.1.1

5609.6.2 Storage locations. Consumer fireworks storage buildings shall not also be used as a magazine for the storage of other explosive materials. Consumer fireworks shall be permitted to be stored in a magazine.

5609.6.3 Reworking and processing. Any reworking or processing of consumer fireworks shall only be permitted to be performed in a building meeting the requirements of NFPA 1124 for Process Buildings.

5609.6.4 Occupancy restrictions. Consumer fireworks storage buildings shall not be used for residential occupancies and shall not be located in residential areas.

5609.6.5 Finished products. Finished consumer fireworks at a manufacturing or distribution facility shall be stored in consumer fireworks storage buildings, trailers, semitrailers, metal shipping containers, or magazines.

5609.6.6 Receiving and packaging. Receiving, picking, packing, packaging, and shipping shall be permitted in

consumer fireworks storage buildings or areas.

5609.6.7 Separation Distances. Consumer fireworks storage or work buildings at distribution facilities shall be separated from adjacent permanent buildings and structures in accordance with Table 5609.6.7

Table 5609.6.7
SEPARATION DISTANCE FOR CONSUMER FIREWORKS STORAGE OR WORK BUILDINGS

<u>Separation distances</u>		<u>Exterior Wall Fireresistance Rating (hr)</u>	<u>Exterior Wall Opening Protection Rating (hr)</u>
<u>Ft</u>	<u>M</u>		
<u>< 10</u>	<u>< 3.05</u>	<u>2</u>	<u>1-1/2</u>
<u>>10 - <60</u>	<u>>3.05- <18.3</u>	<u>1</u>	<u>3/4</u>
<u>> 60</u>	<u>>18.3</u>	<u>0</u>	<u>0</u>

5609.6.8 Operations. Operations shall be in accordance with Sections 5609.8.1 through 5609.6.8.

5609.6.8.1 Receiving and storing. Receiving, storing, picking from cartons, packing into cartons, packaging into retail packages including assortments, shipping, and other similar operations involving finished consumer fireworks shall be permitted in consumer fireworks storage or work buildings, rooms, or areas that meet the requirements of this chapter.

5609.6.8.2 Picking, sorting and packaging. Picking, sorting, packaging, packing, and other similar operations involving finished consumer fireworks shall be conducted in consumer fireworks work buildings or consumer fireworks work rooms or areas in consumer fireworks storage buildings that meet the requirements of this chapter.

5609.6.8.3 Locking doors and windows. Exterior doors and windows shall be kept locked when the building is not occupied or otherwise attended.

5609.6.8.4 Consumer fireworks. 5609.6.8.4 Consumer fireworks shall be in accordance with the following:

1. Consumer fireworks shall be stored in DOT-approved packaging.
2. Cartons shall be stacked neatly and in a stable manner.
3. Consumer fireworks returned to these buildings shall be permitted to be stored temporarily in cartons until repackaging or repacking can be performed.
4. Firearms, unless carried by authorized personnel or law enforcement personnel, shall not be permitted inside a consumer fireworks storage or work building, room, or area or within 50 ft. (15.2 m) of stored consumer fireworks.

5609.6.9 Housekeeping. Housekeeping shall comply with Section 5609.6.9.1 through 5609.6.9.3.

5609.6.9.1 Loose black powder. Loose black powder or other exposed pyrotechnic composition shall be prohibited.

If loose composition is discovered, it shall be removed immediately and disposed of in an approved manner.

5609.6.9.2 Fireworks storage or work areas. Consumer fireworks storage or work buildings, rooms, or areas shall comply with all of the following:

1. Interiors shall be kept clean, dry and free of grit and rubbish.
2. Tools used for cleaning up loose pyrotechnic composition shall not have spark-producing metal parts.
3. Sweepings shall be disposed of in an approved manner.

5609.6.9.3 Clearance. The area around consumer fireworks storage or work buildings shall be kept clear of brush, dried vegetation, rubbish, and similar combustibles for a distance of at least 25 ft. (7.6 m).

Reason:

The current edition of NFPA 1124 no longer contains requirements addressing the retail sales and storage of consumer fireworks. Whereas almost every state allows the sale of some consumer fireworks, the fire official has no requirements to enforce that specifically address such facilities. The proposal is not about whether the sale of consumer fireworks should be permitted; but rather, where they are permitted the proposal provides a minimum set of requirements that a fire official can apply to provide an acceptable level of safety.

The requirements contained in this proposal are not as comprehensive as the standalone requirements contained in previous editions of NFPA 1124. Instead, the approach taken was to rely on other sections of the IFC to address provisions such as illumination of the means of egress, portable fire extinguishers, electrical equipment, etc. Instead, the proposed revisions focus on requirements that are mostly unique to consumer fireworks facilities such as flame breaks and covered fuses.

The proposal contains a set of general requirements that apply to all facilities in which consumer fireworks are sold (5609.2). The general provisions are then followed by requirements unique to three separate types of facilities: permanent sales facilities (5609.3); temporary sales facilities (5609.4); and retail stores in which consumer fireworks are displayed and sold along with other goods and merchandise (5609.5). The storage related to the sale of consumer fireworks is covered in Section 5609.6.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

The transition from the requirements of NFPA 1124 to the proposed requirements for Section 5609 should not impact the cost of construction. Since previous editions of the IFC require compliance with NFPA 1124 and since the proposed new sections and other existing sections of the I-codes are technically consistent with NFPA 1124-2013, there should not be an impact on the cost of construction.

IFC: TABLE 5703.6.2, Chapter 80

Proponent: Bob Torbin, OmegaFlex, representing OmegaFlex (bob.torbin@omegaflex.net)

2018 International Fire Code

Revise as follows:

**TABLE 5703.6.2
PIPING STANDARDS**

PIPING USE	STANDARD
Power Piping	ASME B31.1
Process Piping	ASME B31.3
Pipeline Transportation Systems for Liquid Hydrocarbons and Other Liquids	ASME B31.4
Building Services Piping	ASME B31.9
Double Containment Piping	UL971A: UL1369

Add new standard(s) follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

971A -2006:

Outline of Investigation for Metallic Underground Fuel Pipe

1369-18:

Aboveground Piping Requirements

Reason:

This proposal covers metallic and composite primary carrier, secondary containment, and integral primary/secondary piping systems (piping and fittings) intended for above and below ground use in applications for the distribution of petroleum-based flammable and combustible liquids. The intent and design of double containment systems are focused on preventing fuel/liquid leaks that could result in severe fire hazards.

The primary metallic (316 stainless steel) tubing is a zero-permeation pipe which is highly resistant to corrosion with exceptional crush resistance. The UV stabilized Nylon 12 protective containment layer offers exceptional resistance to hydrocarbons, chemical and water exposure, and carries a 50 psig rating. An EFEP secondary barrier jacket layer is bonded to the Nylon 12 protective layer to offer secondary containment with exceptional permeation resistance for product compatibility. The interstitial space between the tubing and jacket allows continuous monitoring for leak detection, with a 50 psig rating for pressurized systems. The self-flaring fitting provides a metal to metal sealing surface with excellent reliability and is field-attachable using standard hand tools. This class of piping product has been used (above and below grade) for a variety of fuels for several years without failure for many applications such as marinas, gasoline stations and small power generators.

Cost Impact

The code change proposal will decrease the cost of construction .

The use of a listed encasement system results in cost savings because the piping and encasement are installed simultaneously. This avoids the labor cost of separately installing the conduit and piping. In addition, the sealing and venting methods (when required) are also integrated within the encasement system, thus eliminating the need to separately assemble and/or install sealing and venting components within standard conduit.

Analysis: A review of the standards proposed for inclusion in the code, UL 971A -2006 and UL 1369-18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Fire Code

Add new text as follows:

5703.7 Fuel line piping protection. Fuel lines supplying a generator providing required emergency power inside a building identified as Risk Categories III and IV by Table 1604.5 of the International Building Code shall be separated from areas of the building other than the room the generator is located in by one of the following methods:

1. A fire-resistant pipe-protection system that has been tested in accordance with UL 1489. The system shall be installed as tested and in accordance with the manufacturer's installation instructions, and shall have a rating of not less than 2 hours. Where the building is protected throughout with an automatic sprinkler system installed in accordance with Sections 903.3.1.1 or 903.3.1.2, the required rating shall be reduced to 1 hour.
2. An assembly that has a fire-resistance rating of not less than 2 hours. Where the building is protected throughout with an automatic sprinkler system installed in accordance with Sections 903.3.1.1 or 903.3.1.2, the required fire-resistance rating shall be reduced to 1 hour.
3. Other approved methods.

Add new standard(s) follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

1489-2016:

Fire Resistant Pipe Protection Systems Carrying Combustible Liquids

Reason:

This proposal is intended to require fuel lines supplying a generator providing required emergency power in buildings identified as Risk Categories III and IV be separated from areas of the building other than the room the generator is located in using one of three methods. The second two methods shown, a fire-resistance-rated assembly or other approved methods, are currently specified as options for separating fuel lines supplying generators in Section 1203.1.2 of the IFC, and Sections 403.4.8.2 and 2702.1.2 of the IBC. The new method proposed herein is through the use of a fire-resistant pipe-protection system. This new method is also being proposed in separate proposals for the above referenced Sections of the IFC and IBC.

The separation of fuel lines is being proposed for Risk Category III and IV buildings. Buildings identified as Risk Category III are those building and other structures that represent a substantial hazard to human life in the event of failure. Buildings identified as Risk Category IV are those buildings and other structures designated as essential facilities. As such, these two Risk Categories include facilities where the operation of emergency and standby power is especially critical.

UL 1489 addresses the fire-resistive performance of fuel lines protected for an hourly rating. UL 1489 compliments the two standards currently referenced in the International Fire Code for establishing fire-resistance ratings: ASTM E119 and UL 263. The standard describes the same test equipment and same time-temperature fire exposure as ASTM E119 and UL 263. However, the sample testing configuration specifically addresses pipe-protection systems. The Conditions of Acceptance follow the intent of ASTM E119 and UL 263, but specifically address the performance requirements for fire-resistant pipe-protection systems. Specifically the Conditions of Acceptance require 1) resistance to the fire and hose stream exposure without developing openings in the pipe, and 2) preventing a temperature increase exceeding 325°F at any single point or 250°F at any cross section along the pipe.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction because it requires fire protection of fuel lines not previously required to be protected.

Analysis: A review of the standard proposed for inclusion in the code, UL1489-2016, with regard to the ICC criteria for

referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

IFC: 5704.2.11.4.2, 5704.2.11.4.2.1 (New)

Proponent: Adria Reinertson, Riverside County Fire Department, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)

2018 International Fire Code

5704.2.11.4.2 Leak detection. Underground storage tank systems shall be provided with an *approved* method of leak detection from any component of the system that is designed and installed in accordance with NFPA 30.

Add new text as follows:

5704.2.11.4.2.1 Location. The leak detection panel status shall be annunciated at an approved on-site location.

Reason:

Enables the fire code official to locate the leak detection panel in a conspicuous location where it will be readily visible and accessible by on-site personnel.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction, it is simply a requirement of where to locate the panel.

Internal ID: 609

F307-18

IFC: 5704.2.13.1.5, Chapter 80

Proponent: Jeffrey Shapiro, representing STI/SPFA (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

5704.2.13.1.5 Reinstallation of underground tanks. Tanks that are to be reinstalled for flammable or *combustible liquid* service shall be in accordance with this chapter, ASME *Boiler and Pressure Vessel Code* (Section VIII), ~~API 12-P~~, API1615, UL 58 and UL 1316.

Update standard(s) as follows:

API

American Petroleum Institute
1220 L Street, NW
Washington DC 20005

~~Spec 12P—3rd Edition (Reaffirmed 2008):~~

~~Specification for Fiberglass Reinforced Plastic Tanks~~

Reason:

The only reference to this standard is in Section 5704.2.13.1.5, which is applicable only to underground tanks that are being reinstalled after removal. API-12P is a tank manufacturing standard scoped only to aboveground tanks (from the summary description of the standard provided on API's Web site: "Tanks covered by this specification are intended for aboveground and atmospheric pressure service." Since the current reference is out of scope with the standard (underground reinstallation vs. aboveground new), it is recommended that the reference and the standard be deleted. IFC Section 5704.2.7 defers tank construction requirements to NFPA 30, and if a reference to API-12P is desired, that should be taken to NFPA 30.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Removal of a reference to a standard that is outside of its applicable scope, so technically not allowed anyway.

Internal ID: 2125

F308-18

IFC: 5704.3.1.1

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Fire Code

Revise as follows:

5704.3.1.1 ~~Approved~~ Listed containers. ~~Only approved containers~~ Containers and portable tanks shall be ~~used~~ listed in accordance with UL 30 or UL 1313.

Reason:

This proposal provides clarification and guidance to the fire code official for the safety of portable containers by replacing the requirement for "approved" to the appropriate listing standards that correlate with NFPA 30.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply changes requirement from "approved" containers to the listing requirements to the appropriate testing standards.

Proponent: Leslie Townzen, Townzen & Associates, Inc, representing Medline Industries, Inc (les@townzen-consulting.com)

2018 International Fire Code

Add new text as follows:

5704.3.7 Storage of Alcohol-Based Hand Sanitizers. Storage of alcohol-based hand sanitizers classified as Class I or II Flammable Liquids in Group S Occupancy warehouse uses shall be in accordance with Sections 5704.3.7.1 through 5704.3.7.5.

5704.3.7.1 Maximum Allowable Quantity . For occupancies other than Group S wholesale uses that are less than 80,000 sq. ft. in size, indoor storage of alcohol based hand sanitizers shall not exceed the maximum allowable quantities per control area indicated in Table 5003.1(1).
For Group S Occupancy Warehouses greater than 80,000 sq. ft., indoor storage of alcohol based hand sanitizers shall not exceed the maximum allowable quantities per control area indicated in Table 5704.3.7.1(1).

5704.3.7.2 Container type. Containers for alcohol based hand sanitizers shall be of any material.

5704.3.7.3 Container capacity. Containers for sanitizers shall not exceed a capacity of 1 gallons (3.79 L).

Exception: Metal containers not exceeding 55 gallons (208 L) are allowed to store up to the maximum allowable quantity per control area of Class IB and IC liquids in a control area in accordance with tables 5003.1(1) or Table 5704.3.7.1(1). The building shall be equipped throughout with an approved automatic sprinkler system in accordance with Tables 5704.3.6.3(4) through 5704.3.6.3(8) The containers shall be provided with plastic caps without cap seals and shall be stored upright. Containers shall not be stacked or stored in racks and shall not be stored in areas open to the public.

5704.3.7.4 Fire protection and storage arrangements. Fire protection and container storage arrangements shall be in accordance with Table 5704.3.7.3(1) or the following:

1. Storage on shelves shall not exceed 6 feet (1829 mm) in height, and shelving shall be metal.
2. Storage on pallets or in piles greater than 4 feet 6 inches (1372 mm) in height, or where the ceiling exceeds 18 feet (5486 mm) in height, shall be protected in accordance with Table 5704.3.6.3(4), and the storage heights and arrangements shall be limited to those specified in Table 5704.3.6.3(2).
3. Storage on racks greater than 4 feet 6 inches (1372 mm) in height, or where the ceiling exceeds 18 feet (5486 mm) in height shall be protected in accordance with Table 5704.3.6.3(5), and the storage heights and arrangements shall be limited to those specified in Table 5704.3.7.3(1). Combustible commodities shall not be stored above flammable and combustible liquids.

5704.3.7.5 Storage plan. Where required by fire the code official, aisle and storage plans shall be submitted in accordance with Chapter 50.

TABLE 5704.3.7.1(1)

MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF ALCOHOL BASED HAND SANITIZERS IN GROUP S WAREHOUSE OCCUPANCIES MORE THAN 80,000 SQ. FT., a, b

<u>Type of Liquid</u>	MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA (gallons)	
	<u>Sprinklered in accordance with Tables 5704.3.6.3(4) through 5704.3.6.3(8) and Table 5704.3.7.5.1</u>	<u>Sprinklered with ESFR Systems ^e</u>
<u>Class I, II, III</u>	<u>5,000^d</u>	<u>10,000^e</u>

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m², 1 gallon = 3.785 L, 1 gallon per minute per square foot = 40.75 L/min/m².

a. This table shall only apply to Group S warehouse occupancies greater than 80,000 sq. ft. that are classified as Type I or II construction in accordance with the International Building Code.

b. Control areas shall be separated from each other by not less than a 1-hour fire barrier.

c. Where warehouse storage areas exceed 80,000 square feet in area and such storage area is not accessible to the public, the maximum allowable quantities are allowed to be increase by 2 percent for each 1,000 square feet of area in excess of 80,000 square feet, up to a maximum of 100 percent of the table amounts. A control area separation is not required. The cumulative amounts, including amounts attained by having an additional control area, shall not exceed 20,000 gallons.

e. ESFR automatic sprinkler systems installed in accordance with Section 903.3.1.1.

a. When the building is protected by an ESFR automatic sprinkler system designed in accordance with Section 903.3.1.1 for Group A Plastics and high hazard occupancies.

Reason:

This code change is being submitted for the second time. During the first attempt, we received several comments on some of the short falls for the change. The most common comment was that there was no fire test data to support the changes that we were proposing.

As a result, the code changes you see now is vastly different that what we proposed last cycle. We conducted both ½ and full fire pallet testing of the product. This test conducted by Southwest Research Institute on July 11, 2017. The test results are attached for your review.

We first tested the product in a ½ pallet configuration because we did not know how the product was going to react. After seeing the results of the first test, we felt confident on doing a full pallet test.

As you can see by the test results even for the full pallet test, the heat release rate (HRR) was relatively low, even at the peak it was only 1857kW and that was at 13minutes and 20 seconds into the test.

As shown in the pictures during the fire test and the summary of the test, this product did not act like what we thought it would for being a Class I Flammable Liquid classification. The fire was not violent by any means because of the alcohol content. This fire did not have the violent burn rate and reaction that we typically see with a flammable liquids fire.

I sent the fire test results to the two-main people who had opposition of the code change, and in our discussions, it was agreed that the test provided enough information based on the results that a full-scale test was not needed.

We discussed how could we fit the change into the code, and it was decided that sanitizers would have its own section instead of trying to modify the code in the Group M section.

So, what you have now is a new section with requirement that would allow for increased MAQ amounts in Group S, warehouse occupancies with fire protection and size limitations.

Background:

The hand sanitizers are not intended for consumption; therefore, the exemption permitted for alcoholic beverages with alcohol contents greater than 50% does not apply (though hand sanitizers are no more flammable than alcoholic beverages). These materials do comply with the individual container limitation, though they do not technically fall into the category for exemption.

Until recently, sanitizer products have not been in similar demand to alcoholic beverages. As such, the issue of storing the materials practically has only recently been realized. The most recent editions of the Codes have started addressing hand sanitizers including an exception from the hazardous materials provisions for wall mounted hand rubs containing alcohol. However, the storage of these materials is not specifically addressed in the latest editions of the codes.

The quantity limitations per the "S" occupancy have simply not caught up with those allowed for wholesale retail spaces compared to other occupancies. These spaces are permitted to store up to 30,000 gallons of flammable liquids in accordance with Table 5704.3.4.1 of the Fire Code in lieu of 240 gallons in accordance with the Table 5003.1.1(1) of the Fire Code.

The logic behind the increased capacity for retail operations is based upon the inherent need for retail occupancies to have larger quantities of stock available for purchase to operate effectively; this is exactly the same reason that large Group S warehouses need this increase to be able to operate in an effective manner.

The only significant difference between a traditional wholesale retail store and the typical Group S facility is the restriction of public access. However, by restricting public access the occupant load of the space is lower than the occupant load of a traditional retail space. The occupant load factor used to determine the occupant load for a retail space on grade is 30 square feet per person, which is ten times denser than the occupant load factor associated with storage (300 square feet per person). As such, the calculated occupant load of a retail space is ten times greater than a storage space.

By restricting public access to the space, only staff is permitted in the storage area. Warehouse employees are trained to respond appropriately to a fire event and are familiar with the layout of the space, including aisles and exit paths. This combined with a lower occupant load significantly decreases the egress time for the occupants of the facility. As such, the storage space presents a lower life safety hazard than a traditional wholesale retail establishment. Property loss prevention is a larger factor than in a retail facility.

As stated above, although the storage space presents a lesser hazard to life than a retail establishment, a wholesale retailer is permitted to have a maximum of 30,000 gallons of Class IB and IC liquids. The maximum permitted quantity is ten times greater than the limit proposed for Group S warehouse facility.

The Building and Fire Codes recognize that to operate certain types of establishments, it is necessary to maintain a stock of specific products in excess of the maximum permitted control area quantities.

Retail establishments that sell alcoholic beverages require larger quantities of beverages than permitted for control areas.

To permit the sale of these materials, the codes exempt alcoholic beverages in retail and storage uses when packaged in individual containers not exceeding 1.3 gallons, regardless of the actual alcohol content. This includes alcoholic beverages that contain alcohol content of up to 90%.

Medicines, cosmetics, and foodstuff with an alcohol content of less than 50% are exempt as well.

However, medicines, cosmetics, and foodstuffs containing more than 50% alcohol are not exempt from the quantity limitation. The hand sanitizers have an alcohol content of more than 50%. The hand sanitizers are not intended for consumption; therefore, the exemption permitted for alcoholic beverages with alcohol contents greater than 50% does not apply (though hand sanitizers are no more flammable than alcoholic beverages). Some supplies materials do comply with the individual container limitation, though they do not technically fall into the category for exemption.

Until recently, sanitizer products have not been in similar demand to alcoholic beverages. As such, the issue of storing the materials practically has only recently been realized. The most recent editions of the Codes have started addressing hand sanitizers including an exception from the hazardous materials provisions for wall mounted hand rubs containing alcohol. However, the storage of these materials is not specifically addressed in the latest editions of the codes.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Impact will be based on individual needs and their own decision if they want to store more than the 240 gallons in their warehouse.

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Fire Code

Revise as follows:

2301.1 Scope. Automotive motor fuel-dispensing facilities, marine motor fuel-dispensing facilities, fleet vehicle motor fuel-dispensing facilities, aircraft motor-vehicle fuel-dispensing facilities ~~and~~ and repair garages, and on-demand mobile fueling shall be in accordance with this chapter and the International Building Code, International Fuel Gas Code and International Mechanical Code. Such operations shall include both those that are open to the public and private operations.

~~SECTION 5707.2~~2312 ON-DEMAND MOBILE FUELING OPERATIONS

~~5707.1~~2312.1 **General.** On-demand mobile fueling operations that dispense Class I, II and III liquids into the fuel tanks of motor vehicles shall comply with Sections ~~5707.1~~2312.1 through ~~5707.6.3~~2312.6.3.

Exception: Fueling from an *approved* portable container in cases of an emergency or for personal use.

~~5707.1~~2312.1.1 **Approval required.** Mobile fueling operations shall not be conducted without first obtaining a *permit* and approval from the *fire code official*. Mobile fueling operations shall occur only at *approved* locations.

~~5707.2~~2312.2 **Mobile fueling vehicle.** . An on-demand mobile fueling vehicle shall be one of the following:

1. A vehicle that has chassis-mounted tanks or containers where the aggregate cargo capacity does not exceed 1200 gallons (4592 L). A mobile fueling vehicle with a mounted *tank* in excess of 110 gallons (415 L) shall comply with the requirements of Section 5706.6, Section ~~5707.2~~2312 and NFPA 385.
2. A vehicle that carries a maximum of 60 gallons (227 L) of motor fuel in metal safety cans *listed* in accordance with UL 30 or other *approved* metal containers, each not to exceed 5 gallons (19 L) in capacity. Containers shall be secured to the mobile fueling vehicle except when in use.

The mobile fueling vehicle shall comply with all local, state and federal requirements. The mobile fueling vehicle and its equipment shall be maintained in good repair.

~~5707.3~~2312.3 **Required documents.** Documents developed to comply with Sections ~~5707.3.1~~2312.3.1 through ~~5707.3.3~~2312.3.3 shall be updated as necessary by the *owner* of the mobile fueling operation and shall be maintained in compliance with Section 108.3.

~~5707.3~~2312.3.1 **Safety and emergency response plan.** Mobile fueling operators shall have an *approved* written safety and emergency response plan that establishes policies and procedures for fire safety, spill prevention and control, personnel training and compliance with other applicable requirements of this code.

~~5707.3~~2312.3.2 **Training records.** Mobile fueling vehicles shall be operated only by designated personnel who are trained on proper fueling procedures and the safety and emergency response plan. Training records of operators shall be maintained.

~~5707.3~~2312.3.3 **Site plan.** Where required by the *fire code official*, a site plan shall be developed for each location at which mobile fueling occurs. The site plan shall be in sufficient detail to indicate: all buildings, structures, *lot lines*, property lines and appurtenances on site and their use or function; all uses adjacent to the *lot lines* of the site; fueling locations, the locations of all storm drain openings and adjacent waterways or wetlands; information regarding slope, natural drainage, curbing, impounding and how a spill will be kept on the site property; and the scale of the site plan.

~~5707.4~~2312.4 **Mobile fueling areas.** Mobile fueling shall not occur on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited.

~~5707.4~~2312.4.1 **Separation.** Mobile fueling shall not take place within 25 feet (7620 mm) of buildings, property lines or combustible storage.

Exception: The *fire code official* shall be authorized to decrease the separation distance for dispensing from metal

safety cans or other *approved* metal containers in accordance with Section ~~5707.2.2312.2.~~

Where dispensing operations occur within 15 feet (4572 mm) of a storm drain, an *approved* storm drain cover or an *approved* equivalent method that will prevent any fuel from reaching the drain shall be used.

~~5707.4.2312.4.2~~ Sources of ignition. Smoking, open flames and other sources of ignition shall be prohibited within 25 feet (7620 mm) of fuel dispensing activities. Signs prohibiting smoking or open flames within 25 feet (7620 mm) of the vehicle or the point of fueling shall be prominently posted on the mobile fueling vehicle. The engines of vehicles being fueled shall be shut off during fueling.

~~5707.5.2312.5~~ Equipment. Mobile fueling equipment shall comply with Sections ~~5707.5.12312.5.1~~ through ~~5707.5.4.2312.5.4.~~

~~5707.5.12312.5.1~~ Dispensing hoses and nozzles. Where equipped, the dispensing hose shall not exceed 50 feet (15 240 mm) in length. The dispensing nozzles and hoses shall be of an *approved* and *listed* type.

~~5707.5.2312.5.2~~ Fuel limit. Mobile fueling vehicles shall be equipped with a fuel limit switch set to a maximum of 30 gallons (116 L) and a nozzle or other *approved* device that, when activated, immediately causes flow of fuel from the mobile fueling vehicle to cease.

~~5707.5.32312.5.3~~ Fire extinguisher. An *approved* portable fire extinguisher complying with Section 906 with a minimum rating of 40-B:C shall be provided on the mobile fueling vehicle with signage clearly indicating its location.

~~5707.5.42312.5.4~~ Spill kit. Mobile fueling vehicles shall contain a minimum 5-gallon (19 L) spill kit of an *approved* type.

~~5707.6.2312.6~~ Operations. Mobile fueling vehicles shall be constantly attended during fueling operations with brakes set and warning lights in operation. Mobile fueling vehicles shall not obstruct emergency vehicle access roads.

~~5707.6.12312.6.1~~ Dispensing hose. Where equipped, mobile fueling vehicles shall be positioned in a manner to preclude traffic from driving over the dispensing hose. The dispensing hose shall be properly placed on an *approved* reel or in an *approved* compartment prior to moving the mobile fueling vehicle.

~~5707.6.2312.6.2~~ Drip control. Operators shall place a drip pan or an absorbent pillow under the nozzle and each fuel fill opening prior to and during dispensing operations to catch drips.

~~5707.6.3.2312.6.3~~ Spill reporting. Spills shall be reported in accordance with Section 5003.3.1.

Reason:

This proposal places the mobile fueling regulations into Chapter 23, the chapter governing motor fuel dispensing facilities and repair garages. When the language was adopted into the 2018 IFC, the scope of Chapter 23 was not able to be changed during public comment, so mobile fueling regulations were included into Chapter 57, Flammable and Combustible Liquids. The scope of chapter 23 has been revised to include on-demand mobile fueling.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal has no regulatory change, editorial only.

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Fire Code

Revise as follows:

5707.1 General. On-demand mobile fueling operations that dispense Class I, II and III liquids into the fuel tanks of motor vehicles shall comply with Sections 5707.1 through ~~5707.6.3, 5707.6.6.~~

Exception: Fueling from an *approved* portable container in cases of an emergency or for personal use.

5707.2 Mobile fueling vehicle. An on-demand mobile fueling vehicle shall be one of the following:

1. A ~~tank vehicle in accordance with NFPA 385~~ that has chassis-mounted tanks ~~or containers~~ where the aggregate cargo capacity does not exceed ~~1200-1600~~ gallons (~~4592-6057~~ L).
2. A ~~mobile fueling vehicle with a mounted tank in excess of one or more chassis-mounted tanks or chassis-mounted containers that do not exceed 110 gallons (415 L) individual capacity and having an aggregate capacity that does not exceed 1200 gallons (4592 L) shall comply with the requirements of Section 5706.6, Section 5707 and NFPA 385.2 or the weight capacity of the vehicle in accordance with DOT.~~
3. A vehicle that carries a maximum of 60 gallons (227 L) of motor fuel in metal safety cans listed in accordance with UL 30 or other approved metal containers, each not to exceed 5 gallons (19 L) in capacity. ~~Containers shall be secured to the mobile fueling vehicle except when in use.~~
4. The mobile fueling vehicle shall comply with all local, state and federal requirements.
5. Mobile fueling vehicles with a chassis-mounted tank in excess of 110 gallons (415 L) shall comply with the requirements of Section 5706.6, Section 5707, and NFPA 385.
6. The mobile fueling vehicle and its equipment shall be maintained in good repair.
7. Safety cans and approved metal containers shall be secured to the mobile fueling vehicle except when in use.
8. Fueling a motor vehicle from tanks or containers mounted in a trailer connected to a mobile fueling vehicle shall be prohibited.

5707.3.3 Site plan. Where required by the *fire code official*, a site plan shall be developed for each location at which mobile fueling occurs. The site plan shall be in sufficient detail to indicate the following: ~~all~~

1. All buildings ~~, and structures;~~
2. Lot ~~lot~~ lines ~~or~~, property lines ~~and appurtenances~~
3. Electric car chargers
4. Solar photovoltaic parking lot canopies
5. Appurtenances on site and their use or function; ~~all~~
6. All uses adjacent to the lot lines of the site; ~~fueling locations, the locations~~
7. Fueling locations
8. Locations of all storm drain openings, bioswales and adjacent waterways or wetlands; ~~information~~
9. Information regarding slope, natural drainage, curbing, impounding ~~and how~~
10. How a spill will be kept on the site property; ~~and the scale~~
11. Scale of the site plan.

5707.4 Mobile fueling areas. ~~Mobile fueling~~ The mobile fueling vehicle and point of connection of the vehicle being fueled shall not occur on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited.

5707.4.1 Separation. ~~Mobile fueling~~ The point of connection of the vehicle being fueled shall not take place within 25 feet (7620 mm) of buildings, lot lines, property lines or combustible storage. Mobile fueling vehicles shall not park within 10 feet (3048 mm) of buildings, lot lines, property lines, or combustible storage.

Exception-Exceptions:

1. The fire code official shall be authorized to decrease the separation distance for dispensing from metal safety cans or other approved metal containers in accordance with Section 5707.2.
2. The point of fueling shall not take place within 10 feet (3048 mm) of buildings, lot lines, property lines, or combustible storage when the mobile fueling vehicle has an approved vapor recovery system or is servicing vehicles with on board refueling vapor recovery.

Where dispensing operations occur within 15 feet (4572 mm) of a storm drain or bioswale, an *approved* storm drain cover or an *approved* equivalent method that will prevent any fuel from reaching the drain or bioswale shall be used.

Add new text as follows:

5707.4.3 Electrical equipment. Mobile fueling shall not occur within 20 feet of electrical equipment located within 18 inches of the ground unless such electrical equipment is rated for Class I, Division 2 hazardous locations in accordance with the National Electrical Code.

Revise as follows:

5707.5 Equipment. Mobile fueling equipment shall comply with Sections 5707.5.1 through ~~5707.5.4~~ 5707.5.5.

5707.5.1 Dispensing hoses and nozzles. Where equipped, the dispensing hose shall not exceed 50 feet (15 240 mm) in length. The dispensing nozzles and hoses shall be of an *approved* and *listed* type. Where metal-to-metal contact cannot be made between the nozzle and the fuel fill opening, then a means for bonding the mobile fueling vehicle to the motor vehicle shall be provided and employed during fueling operations.

Add new text as follows:

5707.5.2 Break-away device. A listed break-away device shall be provided at the nozzle.

Exception: Mobile fueling vehicles equipped with an approved brake interlock tied to the nozzle holder that prohibits movement of the mobile fueling vehicle when the nozzle is removed from its holder or tied to the delivery of fuel that prevents activation of the pumping system.

Revise as follows:

~~**5707.5.2**~~ ~~**5707.5.3 Fuel Shut off valve and fuel limit.**~~ Mobile fueling vehicles shall be equipped with a listed shutoff valve assembly and a fuel limit switch set to a maximum of 30 gallons (116 L) and a nozzle or other approved device that, when activated, immediately causes flow of fuel from the mobile fueling vehicle to cease.

~~**5707.5.3**~~ **5707.5.4 Fire extinguisher.** An *approved* portable fire extinguisher complying with Section 906 with a minimum rating of ~~40-4-A:80-B:C~~ shall be provided on the mobile fueling vehicle with signage clearly indicating its location.

~~**5707.5.4**~~ **5707.5.5 Spill kit.** Mobile fueling vehicles shall contain a minimum 5-gallon (19 L) spill kit of an *approved* type.

Add new text as follows:

5707.6.3 Safety cones. Safety cones or other visual barriers shall be employed as warning devices to highlight the vehicle fueling area.

5707.6.4 Vehicle lights. The mobile fueling vehicle flasher lights shall be in operation while dispensing operations are in progress.

5707.6.5 Nighttime deliveries. Nighttime deliveries shall only be made in areas deemed adequately lighted by the fire code official.

~~**5707.6.3**~~ **5707.6.6 Spill reporting.** Spills shall be reported in accordance with Section 5003.3.1.

Reason:

5707.1 This section is revised to reflect the added subsections to 5707.6.

5707.2 This section has been reorganized for clarification and to better emphasize the three distinct mobile fueling vehicles: 1) a tank vehicle as defined in NFPA 385, 2) a vehicle with portable containers (not cargo tanks or portable tanks due to size) mounted in the back, and 3) motor vehicles transporting portable safety cans and metal containers.

The 1,200 gallon size threshold for mobile fueling tank vehicles was an arbitrary value chosen based on the specs of already existing, custom-designed vehicles that were in operation at the time the mobile fueling language was put in the Code. Operations have shown that a ~1,550 gallon total tank capacity allows the right ratio and total volume of different grades of gasoline, significantly reducing the number of required tank vehicle reloadings. This proposal increases the allowed capacity only of tank vehicles, which are required to conform to stringent DOT and NFPA 385 requirements.

5707.3.3. Showing the location of electric car chargers and solar photovoltaic parking lot canopies on the site map assists the fire code official identify potential sources of ignition since generally these systems use ordinary electrical not rated for hazardous locations. The mobile fueling operator also needs to be aware of where these systems exist so that appropriate setbacks can be maintained during fueling. Also, identifying bioswales on the site map is important since bioswales should be protected from liquid intrusions in a manner similar to storm drain openings.

5707.4 This clarifies the language of the section to make it consistent with section 5707.4.2 and the original concern. The primary safety concern was the fumes from the fuel dispensing, and the separation requirement was used to address the hazard.

5707.4.1. Providing clarification that both the mobile fueling vehicle and the point of fuel transfer at the receiving vehicle are intended to be kept 25 feet from buildings, property lines and combustible storage. Also, adding specific text to require bioswales to be protected from liquid intrusion since bioswales present a direct path for liquids to reach the environment.

5707.4.3. Industry position is that unrated electrical equipment is not an ignition source and thus not subject to the setback requirement of 5707.4.2. This proposal establishes setbacks for unrated electrical equipment that may be in the vicinity of fueling operations such as electric car chargers and solar photovoltaic car canopies. The intent is to ensure that where unrated electrical systems exist and is located within 18 inches of the ground that fueling operations are kept at least 20 feet from the electrical equipment. This setback is consistent with requirements in Chapter 57 and NFPA 30 for flammable liquids.

5707.5.1. Adds a requirement for bonding of the fueling vehicle to the vehicle being fueled during fueling to minimize static. This is generally accomplished by having fuel hose with an integral bond wire and newer vehicles have a bond wire at the fill opening. Consistent with NFPA 30A requirement.

5707.5.2. Adding a new requirement for a breakaway device or approved brake interlock to ensure if the mobile fueling vehicle drives away with the hose and nozzle engaged in the receiving vehicle that the hose/nozzle will disconnect and prevent minimize spills. A similar provision appears in NFPA 30A.

5707.5.3. Clarifying that in addition to the fuel limit switch that the system shall include a shutoff valve assembly that activates upon activation of the switch. A similar provision appears in NFPA 30A.

5707.5.4. Increasing the size of the portable fire extinguisher carried on the mobile fueling vehicle to 4A:80BC to enable extinguishment of a larger pool fire. Increased size is consistent with NFPA 30A.

5707.5.5 This section has been renumbered from 5707.4.

5707.6.3. Adds a requirement for safety cones or other barrier to be in place during fueling as a warning to pedestrians and other vehicles. Consistent with NFPA 30A requirement.

5707.6.4. Adds a requirement that the mobile fueling vehicle flasher lights be on during fueling operations as a warning to pedestrians and other vehicles. Consistent with NFPA 30A requirement.

5707.6.5 Adds a requirement that nighttime deliveries have adequate lighting is prudent and good practice so that all equipment including emergency equipment can be seen and easily accessed. Nighttime deliveries are common in this industry. This new provision is consistent with NFPA 30A requirement.

5707.6.6 This section has been renumbered from 5707.6.3.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members

of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

IFC: 5707.1.1, 5707.3.3

Proponent: Scott Hempy, Filld, Inc., representing Filld, Inc. (scott@filld.co)

2018 International Fire Code

Revise as follows:

5707.1.1 Approval required. Mobile fueling operations shall not be conducted without first obtaining a *permit* and approval from the *fire code official*. Mobile fueling operations shall occur only at *approved locations or areas*.

5707.3.3 Site plan. Where required by the *fire code official*, a site plan shall be developed for each location or area at which mobile fueling occurs. The site plan shall be in sufficient detail to indicate: all buildings, structures, *lot lines*, property lines and appurtenances on site and their use or function; all uses adjacent to the *lot lines* of the site; fueling locations, the locations of all storm drain openings and adjacent waterways or wetlands; information regarding slope, natural drainage, curbing, impounding and how a spill will be kept on the site property; and the scale of the site plan.

Reason:

Reason Statement for Sections 5707.1.1 and 5707.3.3

Mobile Fueling Locations or Areas

Requiring approval of each individual fuel delivery location imposes an undue burden on fire code officials that is not proportionate to the level of risk posed by operations at such locations. Moreover, on a practical basis, because the fee amount outweighs the value of the service at many individual locations with lower or less consistent demand (e.g., small businesses or residential locations with a single vehicle) it becomes prohibitive.

This industry supported proposal solves this problem by allowing a fire code official to approve mobile fueling by permitted mobile fueling operators in areas determined safe, all in accordance with a site plan submitted by a mobile fueling operator detailing how it will safely provide mobile fueling services in full compliance with the code. This will reduce costs and staffing needs for the fire services, while still maintaining a high level of safety.

For over a century, companies have been safely delivering diesel fuel and propane to millions of residences throughout the United States. According to the Energy Information Administration, in 2007, 8.1 million homes used heating oil as their main source of fuel necessitating between 32 million and 40 million deliveries a year. In contrast, mobile fueling of vehicles at residences involves the transfer of substantially less fuel entailing significantly reduced overall risk. Trained professionals operating in full compliance with the procedures and equipment requirements set forth in Section 5707 can safely transfer fuel to vehicles in residential areas. Limiting the fire code officials' authority to permitting locations only on an individual basis unnecessarily drives up the costs and time required of fire code officials and limits the ability of the public to realize the full benefits of mobile fueling.

The use of an area-wide permitting scheme is common practice in many other regulatory spaces. For example, the U.S. Environmental Protection Agency (EPA) may issue a general National Pollution Discharge Elimination System permit to cover a group of dischargers with similar qualities within a given geographical location. As indicated by the EPA, general permits "offer a cost-effective option for permitting agencies because of the large number of facilities that can be covered under a single permit" (see <https://www.epa.gov/npdes/about-npdes#types>). This is precisely the type of balanced permitting scheme that should be used in the context of mobile fueling.

Cost Impact

The code change proposal will decrease the cost of construction .

These changes should not adversely affect the cost of enforcing the Code. In some cases, the changes may reduce local fire code official costs, by allowing for a fire code official to approve larger areas, as opposed to each specific location.

Internal ID: 1531

F313-18

IFC: 5707.3.3

Proponent: Andrew Klein, representing Booster Fuels (andrew@asklein.com)

2018 International Fire Code

Revise as follows:

5707.3.3 Site plan. ~~Where required by the~~ The fire code official, has the authority to require a site plan shall be developed for each location at or area in which mobile fueling occurs. The ~~Where the fire code official requires a site plan, the plan shall be developed by the mobile fueling operator and shall be in sufficient detail to ensure safety and the protection of the environment during fueling operations. The fire code official is authorized to require the site plan~~ to indicate: all buildings, structures, *lot lines*, property lines and appurtenances on site and their use or function; all uses adjacent to the *lot lines* of the site; fueling locations, the locations of all storm drain openings and adjacent waterways or wetlands; information regarding slope, natural drainage, curbing, impounding and how a spill will be kept on the site property; and the scale of the site plan.

Reason:

This proposal clarifies the intent of a site plan and provides the fire code official the ability to use a graded approach in determining what must be indicated. The previous language, which this proposal fixes, provided the fire code official with a binary decision as to whether or not to require a site plan. If a site plan was required, the language left no room to apply a graded approach to what must be indicated on the site plan based on the features of the site or group of sites. Such rigid language poses a liability risk to jurisdictions that approve a site plan that does not indicate the entirety of objects in the list. This proposal keeps the list as a guide but gives the authority back to the fire code official to determine what must be indicated in the site plan.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal clarifies the intent of the site plan, should one be required. Since site plans are not always required, this code change proposal has no effect on the cost of operations if a fire code official does not require a site plan. When a fire code official chooses to require a site plan, this code change proposal MAY have the potential to slightly decrease the cost of operations if a site plan with fewer details is sufficient and acceptable. Because many jurisdictions do not currently require the entirety of objects in the list, there overwhelmingly will be no change in the cost of operations even when a site plan is required.

Internal ID: 1834

F314-18

IFC: 5707.4

Proponent: Andrew Klein, representing Booster Fuels (andrew@asklein.com)

2018 International Fire Code

Revise as follows:

5707.4 Mobile fueling areas. Mobile fueling shall not occur on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited unless adequate and direct access from grade-level is provided as determined by the fire code official.

Reason:

There are some sites where a building or underground parking structure is below a grade-level parking lot. Fueling at such a location does not hinder emergency vehicle access, and fueling may be performed safely. This proposal provides the fire code official the ability to permit fueling at such locations when adequate emergency vehicle access is provided.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal simply clarifies where mobile fueling is permitted.

Internal ID: 1832

F315-18

IFC: 5707.4

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

5707.4 Mobile fueling areas. Mobile fueling shall not occur on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited.

Mobile fueling sites shall be restricted to commercial, industrial, governmental, or manufacturing, where the parking lot is primarily intended for employee vehicles. Mobile fueling shall be conducted for fleet fueling or employee vehicles only, not the general public. Commercial sites shall be restricted to office-type or similar occupancies that are not primarily intended for use by the public.

Reason:

The general public does not expect a hazardous operation to be occurring in a typical parking lot or for a fuel truck to be traversing such parking lot, temporarily fueling a vehicle, and moving on to the next area in the parking lot to fuel the next vehicle. Vehicular accidents occur in parking lots on a regular basis, but the presence of a fuel truck, especially one in the process of fueling a vehicle greatly adds to the potential risk involved in such accidents. By restricting such operations to the occupancies in question, the employees of the business may be adequately notified to expect such operations to occur in the parking lot.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no construction involved in this regard, but this proposed code change would limit the ability of on-demand mobile fuelers to conduct operations in areas frequented by the public.

Internal ID: 923

F316-18

IFC: 5707.4, 5707.4.1 (New)

Proponent: Scott Hempy, representing Filld, Inc. (scott@filld.co)

2018 International Fire Code

Revise as follows:

5707.4 Mobile fueling areas. Where mobile fueling shall not occur on public streets, or public ways fueling operations shall comply with all of the following: ~~or inside buildings. Fueling~~

The mobile fueling vehicle shall have an approved vapor recovery system or shall only service vehicles with on-board refueling vapor recovery;

The mobile fueling vehicle shall comply with all applicable parking and traffic vehicle laws;

Mobile fueling activities may not obstruct vehicular or pedestrian traffic.

The fire code official may also limit the occurrence of mobile fueling on public streets and public ways to certain time periods of the day when pedestrian and vehicular traffic is substantially reduced. ~~on the roof level of parking structures or other buildings is prohibited.~~

5707.4.1 Prohibited locations. Mobile fueling shall not occur inside or on the roof level of buildings or parking structures.

Reason:

These changes in Sec. 5707.4 allows for mobile fueling to occur on public streets or public ways only when allowed by the fire code official and only when specified conditions are met.

The recently adopted restrictions on mobile fueling on public streets and public ways are motivated by concerns over potential scenarios such as collision with a mobile fueling vehicle or the ignition of gasoline vapors from a nearby ignition source. The proposed modification to the requirements for mobile fueling on public streets and public ways will address these concerns by giving the fire code official discretion to authorize mobile fueling operations in public streets and public ways while ensuring that public safety remains paramount. At the same time, this change will eliminate an unnecessarily restrictive prohibition and allow mobile fueling operations to continue to grow in a safe but reasonable manner.

The mobile fueling vehicle operator must comply with three conditions of fueling to ensure safety while fueling in public ways or public streets. First, identical to the modification of Sec. 5707.4 (Exception 2) proposed by the Fire Code Action Committee, mobile fueling can only occur if an approved vapory recovery mechanism is utilized. Second, all applicable parking laws must be obeyed. Third, similar to the modification of Sec. 5707.6.3 proposed by the FCAC, any temporary obstruction that could be created by a fueling hose or any other mobile fueling equipment must be marked in accordance with applicable industry best practices. The optional imposition of time-of-day restrictions provides yet another rational and simple method for substantially mitigating risk without unreasonably constraining mobile fueling operations.

These changes allow a jurisdiction to exercise its discretion to allow mobile fueling on a public street or public way subject to compliance with stated conditions. For example, a municipality with 'car-sharing' programs, for which mobile fueling is a key service provider, could allow for mobile fueling of street-parked 'car-share' vehicles. This modification enables the fire code official to allow the benefits of mobile fueling to be realized by an important subset of customers — those who can only participate via the use of public streets or public ways, while simultaneously affirming the discretion of the fire code official to ensure that any and all operations will be conducted safely.

Tank vehicle parking in public streets and public ways is already allowed in conjunction with "dispensing activities" in Sec. 5706.6.2.2. The enclosed files demonstrate instances in which fueling from public streets is common practice for many propane and heating oil delivery companies while, in fact, using much larger tank vehicles (not limited at the 1200 gallon mobile fueling threshold). Several jurisdictions (e.g., Oregon) have adopted Sec. 5706 for Class 1 flammable liquids as well - so this application would already apply in those jurisdictions and would create more consistency in the Code. The USDOT 49 CFR allows for mobile fueling trucks to park on public ways and public streets, such that this modification will better harmonize applicable code and provide greater clarity and certainty for all those involved.

The industry is confident that adding this allowance will not compromise safety, will increase the authority of the local fire code official, and will enable mobile fueling to occur in public streets or public ways when and where appropriate.

Bibliography:

None

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These changes should not adversely affect the cost of enforcing the Code.

Internal ID: 607

F317-18

IFC: 6003.1.3

Proponent: Ellie Klausbruckner, Klausbruckner & Associates, Inc, representing Klausbruckner & Associates, Inc.
(ek@klausbruckner.com)

2018 International Fire Code

Revise as follows:

6003.1.3 Treatment ~~system-highly system—highly~~ toxic liquids. Exhaust scrubbers or other systems for processing vapors of highly toxic liquids shall be provided where a spill or accidental release of such liquids can be expected to release highly toxic vapors indoors at *normal temperature and pressure*. Treatment systems and other processing systems shall be installed in accordance with the International Mechanical Code.

Reason:

Exhaust scrubbers are typically designed to capture vapors indoors. Expecting exhaust scrubbers to be installed outdoors and to capture release of highly toxic vapors is impractical. We believe the original intent of this section is for life safety of occupants inside a building in the event of a release.

Cost Impact

The code change proposal will decrease the cost of construction .

There may be a decrease in cost of construction if this section is misapplied to outdoor storage of highly toxic liquids.

Internal ID: 2353

F318-18

IFC: 6103.2.1.1

Proponent: Bruce Swiecicki, National Propane Gas Association, representing National Propane Gas Association (bswecicki@npga.org)

2018 International Fire Code

Revise as follows:

6103.2.1.1 Use in basement, pit or similar location. LP-gas containers shall not be used in a *basement, pit, an above-grade underfloor space* or similar location where heavier-than-air gas might collect. ~~LP-gas containers shall not be used in an above-grade underfloor space or basement collect~~ unless such location is provided with an *approved* means of ventilation.

Exception: Use with self-contained torch assemblies in accordance with Section 6103.2.1.6.

Reason:

In the current text, the first sentence conflicts with the second sentence because “basement” appears in both. By definition in the IBC, a basement cannot be an above-grade floor space.

It is appropriate to permit cylinders to be used in basements or any floor space where sufficient ventilation is provided. For example, floor maintenance machines, plumber’s pots and forklift trucks powered by propane are frequently used in basements, as well as other floor areas throughout the building.

The building code defines a basement as follows:

[BG] BASEMENT. A story that is not a story above grade plane (see “Story above grade plane”). This definition of “Basement” does not apply to the provisions of Section 1612 for flood loads.

[BG] STORY ABOVE GRADE PLANE. Any story having its finished floor surface entirely above grade plane, or in which the finished surface of the floor next above is:

1. More than 6 feet (1829 mm) above grade plane; or
2. More than 12 feet (3658 mm) above the finished ground level at any point.

[BG] GRADE PLANE. A reference plane representing the average of finished ground level adjoining the building at exterior walls. Where the finished ground level slopes away from the exterior walls, the reference plane shall be established by the lowest points within the area between the building and the lot line or, where the lot line is more than 6 feet (1829 mm) from the building, between the building and a point 6 feet (1829 mm) from the building.

Cost Impact

The code change proposal will increase the cost of construction .

The code change proposal may increase the cost of construction in buildings where the installation or modification of a ventilation system is required to achieve compliance with this paragraph. Otherwise, this code change will neither increase nor decrease the cost of construction.

Internal ID: 2198

F319-18

IFC: 6110.1, 6110.2

Proponent: Bruce Swiecicki, representing National Propane Gas Association (bswecicki@npga.org)

2018 International Fire Code

Revise as follows:

6110.1 ~~Temporarily out of service.~~ Removed from service. LP-gas containers whose use has been temporarily discontinued shall comply with all of the following:

1. Be disconnected from appliance piping.
2. Have LP-gas container outlets, except relief valves, closed or plugged.
3. Be positioned with the relief valve in direct communication with the LP-gas container vapor space.

6110.2 ~~Permanently out of service.~~ Removal from site. LP-gas containers ~~to be placed permanently out of service~~ shall be removed from the site.

Reason:

There is some confusion over the current text between the phrase “temporarily discontinued” and the phrase “interruption of service” in paragraph 406.6.3 of the International Fuel Gas Code. The IFC Handbook commentary clarifies the intent of 6110.1 by stating the following:

When a new LP-gas supplier installs a tank at a customer’s facility, he or she is responsible for ensuring that the previous supplier’s tank is removed from service and safely stored until it can be retrieved.

The commentary for 6110.2 also states:

This provision is an extension of Section 6110.1 and requires that any container placed out of service must be retrieved by its owner.

The intent of the provisions in 6110 is to address containers that have been discontinued from service due to the customer changing propane supply companies. It is common practice for containers that have been disconnected from the fuel gas piping to be stored on site until they are retrieved by the owner of the container, which is typically the previous LP-gas supplier.

The proposed changes to this section will clarify that these provisions apply to a container whose use has been discontinued and will be removed from the site, rather than one in which the fuel gas service is temporarily interrupted, such as may occur at a summer home that is closed after the season ends.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal does not affect the cost of construction because it addresses the safety issues associated with changing LP-Gas suppliers.

Minimum distance to next pile	Note b	Note b	Note b
Minimum distance to walls	2 feet	2 feet ^c	2 feet ^c
Maximum quantity per pile	MAQ	100 tons	100 tons
Maximum quantity per building	MAQ	2000 tons	No Limit

For SI: 1 foot = 304.8 mm, 1 pound = 0.454 kg, 1 ton = 0.907185 metric ton.

- a. Maximum storage height in nonsprinklered buildings is limited to 6 feet. In sprinklered buildings see NFPA 400 for storage heights based on ceiling sprinkler protection.
- b. The minimum aisle width shall be equal to the pile height, but not less than 4 feet and not greater than 8 feet.
- c. For protection level and detached storage under 4,500 pounds, there shall not be a minimum separation distance between the pile and any wall.

**TABLE 6304.1.5(2)
STORAGE OF CLASS 3 OXIDIZER LIQUIDS AND SOLIDS**

STORAGE CONFIGURATION	LIMITS		
	Control area storage	Group H occupancy storage	Detached storage
Piles			
Maximum width	12 feet	16 feet	20 feet
Maximum height	Note a	Note a	Note a
Maximum distance to aisle	8 feet	10 feet	10 feet
Minimum distance to next pile	Note b	Note b	Note b
Minimum distance to walls	4 feet	4 feet ^c	4 feet ^c
Maximum quantity per pile	NA	30 tons	100 tons
Maximum quantity per building	MAQ	1200 tons	No Limit

For SI: 1 foot = 304.8 mm, 1 pound = 0.454 kg, 1 ton = 0.907185 metric ton.

- a. Maximum storage height in nonsprinklered buildings is limited to 6 feet. In sprinklered buildings see NFPA 400 for storage heights based on ceiling sprinkler protection.
- b. The minimum aisle width shall be equal to the pile height, but not less than 4 feet and not greater than 8 feet.
- c. For protection level and detached storage under 2,300 pounds, there shall not be a minimum separation distance between the pile and any wall.

Reason:

This code change as a whole should be a formatting/editorial changes as follows:

6303.1 addresses requirements for oxidizer when below the MAQ. Therefore everything addressing Oxidizers below the MAQs has been renumbered as a subsection to 6303.1.

Section 6303.1.1 addresses special limitations for indoor storage and use by occupancy. Section 6303.1.1.2 was not related to a specific occupancy. Therefore it has been moved to 6303.1.5 with no change in content.

Section 6303 are the general requirements where MAQs are not exceeded. However there are control area columns in Table 6304.1.5(1) and (2) which address exceeding the MAQs instead of Section 6303. Therefore we have moved those columns and added them to existing table 6303.2 (which has been renumbered to 6303.1.4).

Additionally in Table 6303.1.4, for Class 2 and 3 oxidizers the maximum amount per building currently indicates "MAQ" which we believe is sending the user to Chapter 50 for MAQs and control areas. But as it is written it can be misinterpreted that the total amount of Class 2 and 3 Oxidizers PER BUILDING is limited to the basic MAQs (i.e. one control area) not combined MAQs in the control areas. Therefore "MAQ" has been revised to a Note d sending the user to Chapter 50.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

We believe this to be editorial for clarification.

Internal ID: 1626

F321-18

IFC: D103.2

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

D103.2 Grade. Fire apparatus access roads shall not exceed 10 percent in grade. Where the fire code official determines that the fire apparatus access road will be utilized for ladder operations, the subject grade shall not exceed 6% in any direction.

Exception: Grades steeper than 10 percent as *approved* by the *fire code official*.

Reason:

Most apparatus manufacturers limit the ability to operate a ladder at a maximum 6% grade or require diminished ability to utilize the ladder at grades exceeding 6% whether in the direction of fire lane or cross slope.

Cost Impact

The code change proposal will increase the cost of construction .

The requirement for a lesser grade may increase the cost of construction of some projects having greater topographical constraints.

Internal ID: 922

F322-18

IFC: D103.5

Proponent: Joseph Hetzel, Thomas Associates, Inc., representing Door & Access Systems Manufacturers Association (jhetzel@thomasamc.com)

2018 International Fire Code

Revise as follows:

D103.5 Fire apparatus access road gates. Gates securing the fire apparatus access roads shall comply with all of the following criteria:

1. Where a single gate is provided, the gate width shall be not less than 20 feet (6096 mm). Where a fire apparatus road consists of a divided roadway, the gate width shall be not less than 12 feet (3658 mm).
2. Gates shall be of the ~~swinging or sliding~~ horizontal swing, horizontal slide, vertical lift or vertical pivot type.
3. Construction of gates shall be of materials that allow manual operation by one person.
4. Gate components shall be maintained in an operative condition at all times and replaced or repaired when defective.
5. Electric gates shall be equipped with a means of opening the gate by fire department personnel for emergency access. Emergency opening devices shall be *approved* by the *fire code official*.
6. Methods of locking shall be submitted for approval by the *fire code official*.
7. Electric gate operators, where provided, shall be *listed* in accordance with UL 325.
8. Gates intended for automatic operation shall be designed, constructed and installed to comply with the requirements of ASTM F2200.

Reason:

The proposal was previously designated as F401-16. Reasoning submitted at that time was as follows:

- Vertical lift gates and vertical pivot gates should be included in the criteria provision involving acceptable gate types because such gates can comply with the criteria in D103.5 including being covered in and being able to comply with UL 325 and ASTM F2200.
- Vertical lift gates can be designed to meet required minimum height clearances above roadways.
- The swinging and sliding gate type terminology has been revised to reflect terminology used in ASTM F2200.

During the Committee Action Hearing in 2016, the proposal was disapproved based on the view that vertical lift gates and vertical pivot gates cannot meet the criteria of "manual operation by one person" (D103.5, #3) and "a means of opening the gate...for emergency access" (D103.5, #5.)

DASMA then submitted a public comment requesting Approved as Submitted, with the following reasoning:

- All vehicular gates, including swinging and sliding gates, require site training and instruction for both manual operation and electric based emergency operation, and thus compliance with the stated criteria.
- A typical gate specification (under CSI Division 32 31 00) requires that the gate installer provide training in operation and safety of the gate.
- Training is needed because not only are there different methods for each gate type, but gate operator manufacturers, gate construction companies and automated gate system manufacturers may have different methods for the same gate type.
- Therefore, the two additional gate types should be equally acceptable with respect to the currently referenced gate types, allowing for site space conditions to dictate which gate type works best.

During the Final Action Hearings in 2016 the proposal was Approved as Submitted, but then failed by one vote to get the required 2/3 approval during the subsequent On-Line Governmental Voting period.

The proposal should be approved since it improves and clarifies the code, supported by the reasoning.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is intended to clarify gate types and has no bearing on construction cost.

F323-18

IFC: D105.1

Proponent: Thomas Parsons, representing myself

2018 International Fire Code

Revise as follows:

D105.1 Where required. Where the vertical distance between the grade plane and the highest roof surface exceeds 30 feet (9144 mm), *approved* aerial fire apparatus access roads shall be provided.

For purposes of this section, the highest roof surface shall be determined by the greatest height measurement from average grade to:

1. the The eave of a pitched roof, the intersection of the roof to the exterior wall, or the top of parapet walls, whichever is greater, sloped roof which has a slope less than 60 degrees with the horizontal plane, and a roof surface less than 20 feet from the eave to the highest point on the roof;
2. The point that is 1/2 the vertical height of a sloped roof which has a slope less than 60 degrees with the horizontal plane and a roof surface greater than 20 feet from the eave to the highest point of the roof;
3. The top of a parapet wall;
4. The highest point of a flat roof;
5. The highest point of a sloped roof that is a slope 60 degrees or greater with the horizontal plane.

Reason:

1) The reason for the change is that fire department access to a sloped roof using a ground ladder is contingent upon using a roof ladder that can be secured to the slope of the roof. ISO fire suppression rating schedule requires fire department's to carry a roof ladder. Typically a pumper truck can carry a 16-foot roof ladder and a ladder truck can carry up to a 20-foot roof ladder. A sloped roof with a surface length greater than 20 feet from the eave to the highest part of the roof cannot be accessed from a ground ladder using a 20-foot roof ladder.

2) Roofs with a slope of 60 degrees or greater from the horizontal plane are defined under the building code as an exterior wall. A mansard roof is a sloped roof with a slope of 60 degrees or greater from the horizontal plane.

3) Dormers and openings in gable roofs that connect to habitable spaces are critical access and egress points for firefighters. Whether affecting a rescue, fire control, or ventilation, exterior access using a ladder up to a dormer window or gable window is necessary to for life safety and property conservation purposes.

Cost Impact

The code change proposal will increase the cost of construction .

Buildings with windows in dormers or gable roofs above 30 feet, will require aerial apparatus access. Buildings with a mansard roof with the highest roof surface above 30 feet will require aerial apparatus access. Buildings with sloped roofs that are longer than 20 feet from the eave to the peak, will require aerial access.

There may be additional costs to widen streets and roads, as well as remove obstructions for aerial apparatus access for the buildings that don't meet these exceptions.

Internal ID: 420

F324-18

IFC: D105.1

Proponent: Thomas Parsons, representing myself

2018 International Fire Code

Revise as follows:

D105.1 Where required. Where the vertical distance between the grade plane and the highest roof surface exceeds 30 feet (9144 mm), *approved* aerial fire apparatus access roads shall be provided. For purposes of this section, the highest roof surface shall be determined by measurement to the eave of a pitched roof, the intersection of the roof to the exterior wall, or the top of parapet walls, whichever is greater.

Exception: Buildings of Type IA, Type IB, or Type IIA Construction, equipped throughout with an automatic sprinkler system in accordance to Section 903.3.1.1; and having firefighter access through an enclosed stairway with a Class I Standpipe from the lowest level of fire department vehicle access to all roof surfaces.

Reason:

Fire Department Aerial Apparatus Access is rarely needed for Buildings of Type IA, Type IB, or Type IIA Construction, equipped throughout with an automatic sprinkler system in accordance to NFPA 13; and having firefighter access through an enclosed stair or stair(s) with a Type I Standpipe System from the lowest level of fire department vehicle access to all roof surfaces. Firefighting operations including ventilation can be achieved through the interior of these buildings using enclosed stairs as means of egress from the hazard area. The requirement for a Class I standpipe is for fire suppression and firefighter protection when operating hoselines at the roof or at a lower floor level. High rise buildings as required by 403.4.7 shall have means for smoke removal. These means do not require aerial apparatus access.

Cost Impact

The code change proposal will decrease the cost of construction .

The cost of widening existing streets and roads, and the cost of removing overhead obstructions along existing streets would be unnecessary if aerial apparatus access is not required for these types of buildings where aerial apparatus access would be rarely necessary.

Internal ID: 918

F325-18

IFC: D107.1

Proponent: Richard Boisvert, Brighton Area Fire Authority, representing Michigan Fire Inspector's Society (rboisvert@brightonareafire.com)

2018 International Fire Code

Revise as follows:

D107.1 One- or two-family dwelling residential developments. Developments of one- or two-family *dwelling units* where the number of *dwelling units* exceeds 30 shall be provided with two separate and *approved* fire apparatus access roads.

Exceptions:

1. Where there are more than 30 *dwelling units* ~~on~~accessed from a single public or private fire apparatus access road and all *dwelling units* are equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, access from two directions shall not be required.
2. The number of *dwelling units* ~~on~~accessed from a single fire apparatus access road shall not be increased unless fire apparatus access roads will connect with future development, as determined by the *fire code official*.

Reason:

As written, the language implies that the 30 dwelling units must be on a single access road to qualify for the exceptions, however, the main code section for D107.1 refers to the "Development". This change in language will allow a development with a single access road (public or private), to qualify for the exceptions while having more than a single road in the development.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is a typographical correction to clean up potential misinterpretation of the section.

2018 International Fire Code

Add new text as follows:

SECTION H104 SECURITY

H104.1 General. Hazardous materials storage, dispensing, use and handling areas shall be secured against unauthorized entry and safeguarded in a manner approved by the fire code official.

H104.2 Chemical Facility Anti-Terrorism Standards (CFATS). Chemical facilities deemed to be high risk by the U.S. Department of Homeland Security shall be required to develop and implement security plans in accordance with the Chemical Facility Anti-Terrorism Standards (CFATS) set forth in 6 CFR Part 27.

Revise as follows:

SECTION H104H105 REFERENCED STANDARD ~~IBC-18~~

~~ICC~~
~~IBC-18~~International Building Code
~~DHS CFATS~~
~~U.S. DEPARTMENT OF HOMELAND SECURITY, INFRASTRUCTURE SECURITY COMPLIANCE DIVISION~~
~~6 CFR Part 27 - 2007 Chemical Facility Anti-Terrorism Standards - H104.2~~

Reason:

The U.S. Department of Homeland Security (DHS) has developed regulations to strengthen security at the nation's highest-risk chemical facilities by developing Chemical Facility Anti-Terrorism Standards (CFATS) published in the Code of Federal regulations. This proposal is not intended to require the fire code official to enforce the CFATS regulations but rather is intended to ensure that fire code officials and chemical facility operators are aware of the existence of these regulations. Chemical facility operators are able to determine whether the facility possesses Chemicals of Interest (COI) covered by the Standard at or above the applicable Screening Threshold Quantity (STQ) under CFATS and thus required to submit a Top-Screen document to DHS, by referring to Appendix A of 6 CFR Part 27 or online at https://www.dhs.gov/xlibrary/assets/chemsec_appendixafinalule.pdf.

The Chemical Facility Anti-Terrorism Standards (CFATS) program identifies and regulates high-risk chemical facilities to ensure they have security measures in place to reduce the risks associated with these chemicals. Initially authorized by Congress in 2007, the program uses a dynamic multi-tiered risk assessment process and requires facilities identified as high-risk to meet and maintain performance-based security standards appropriate to the facilities and the risks they pose.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

High-risk chemical facilities needing to comply with the federal Chemical Facility Anti-Terrorism Standards may be required to enhance on-site security infrastructure. The reference standard is used to determine whether a chemical facility is required to comply with the US Department of Homeland Security Chemical Facility Anti-Terrorism Standards.

Analysis: A review of the standard proposed for inclusion in the code,U.S. DEPARTMENT OF HOMELAND SECURITY, INFRASTRUCTURE SECURITY COMPLIANCE DIVISION 6 CFR Part 27 - 2007 Chemical Facility Anti-Terrorism Standards , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1765

F327-18

IFC: N107.5, N107.5.1, N107.5.2

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org); Bruce Swiecicki, representing National Propane Gas Association (bswiewicki@npga.org)

2018 International Fire Code

Revise as follows:

N107.5 Liquid propane-LP-gas containers. ~~Liquid propane-Liquefied petroleum (LP) gas containers shall comply with Sections N107.5.1 through N107.5.5 and Chapter 61.~~

N107.5.1 LP-gas containers exceeding 12 pounds (5 kg) of water capacity. The use of LP-gas containers exceeding 12 pounds (5 kg) of water capacity shall be prohibited.

N107.5.2 Where more than one LP-gas container is present in the same area. ~~Where more than one LP-gas container is present in the same area, the aggregate weight of all containers in the area shall not exceed 12 pounds (5 kg) of water capacity.~~ cylinders shall be separated from each other by a minimum of 20 feet.

Reason:

O'Brian:

Several fatal events were analyzed related to outdoor public gatherings and structural failures in the development of these new code requirements to improve the authority of code officials to ensure public safety and create a level playing field for the owners of tents, outdoor structures and the promoters of outdoor gatherings by providing a reasonable set of code requirements for these structures and events.

This proposal is a minor change to correct the requirements for LP-gas use. The current requirements for utilizing LP-gas in trade shows are too restrictive because they only allow one 5-pound propane cylinder for an entire trade show floor. That is obviously unrealistic. One would expect to see hearth products such as fireplaces, as well as radiant heaters and other appliances on the show floor.

This proposal will correlate Appendix N with 6103.2.1.5 and will also bring the IFC into harmony with paragraph 6.22.9.1 of NFPA 59-2017.

The containers that will be used are DOT approved cylinders that conform to the federal requirements in Title 49 of the Code of Federal Regulations. Cylinders over 4 pounds through 40 pounds propane capacity will also have cylinder valves installed that provide safety attributes such as not flowing gas unless the connection to the appliance has been made properly; a thermal link that will shut off the flow of gas when the connection is subjected to elevated temperatures (225F), and an excess flow protection device that is contained in the appliance-side connection so that if the connecting hose is severed, the check valve will operate and stop the flow of gas.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Swiecicki:

The proposed change to N107.5 will reference the correct spelling for the term "LP-Gas." Also, the reference to Chapter 61 is appropriate since that chapter addresses LP-gas.

The current requirements for utilizing LP-gas in trade shows are too restrictive because they only allow one 5-pound propane cylinder for an entire trade show floor. That is obviously unrealistic. One would expect to see hearth products such as fireplaces, as well as radiant heaters and other appliances on the show floor.

This proposal will correlate Appendix N with 6103.2.1.5 and will also bring the IFC into harmony with paragraph 6.22.9.1 of NFPA 58-2017.

The containers that will be used are DOT approved cylinders that conform to the federal requirements in Title 49 of the Code of Federal Regulations. Cylinders over 4 pounds through 40 pounds propane capacity will also have cylinder valves installed that provide safety attributes such as not flowing gas unless the connection to the appliance has been

made properly; a thermal link that will shut off the flow of gas when the connection is subjected to elevated temperatures (225F), and an excess flow protection device that is contained in the appliance-side connection so that if the connecting hose is severed, the check valve will operate and stop the flow of gas.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

O'Brian:

This proposal amends an Appendix that may be adopted by a jurisdiction. The proposal adjusts propane use requirements for indoor trade shows which has no correlation to building construction or cost of construction.

Swiecicki:

Note that Bruce Swiecicki noted that this would reduce the cost of construction. This proposal will decrease the cost of construction by permitting small portable cylinders to be used for trade show exhibitions instead of having to pipe or run hose from inside an exhibition hall to the outdoors where a large container may be serving the exhibition.

IFC: Appendix O (New), O101 (New), O101.1 (New), O101.2 (New), O101.3 (New), O101.4 (New), O101.5 (New), O102 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

APPENDIX O **FIRE INSPECTIONS AND FIRE PLAN EXAMINER QUALIFICATIONS**

O101 QUALIFICATIONS

O101.1 Fire Marshal/Fire code official. The fire marshal/fire code official shall have experience as a firefighter or fire officer, architect, fire protection engineer, inspector, fire protection contractor or some combination of these fields. In addition, the fire marshal/fire code official shall have experience and/or formal training in supervisory skills. The fire code official shall be certified as a fire code official, fire marshal, or fire protection engineer through a recognized licensure or certification program. With the exception of architects and fire protection engineers, certification or licensure for fire marshal shall demonstrate the qualifications outlined in NFPA 1037. The fire marshal/fire code official shall be appointed or hired by the fire chief or executive management of the governing authority.

O101.2 Chief fire inspector. The fire marshal/fire code official is authorized to designate chief fire inspectors to serve as supervisors or fire service officers to administer the provisions of the International Fire Code and to supervise plans examiners and inspectors. Each supervisor or fire service officer in the role of chief fire inspector shall have experience as a firefighter or fire officer, architect, fire protection engineer, inspector, fire protection contractor, or some combination of these fields. In addition, when chief fire inspectors are appointed, they shall have experience or formal training in supervisory skills. The chief fire inspector shall be certified or licensed through a recognized licensure or certification program as a fire inspector, fire safety inspector, fire code plans examiner, fire protection engineer, or in an equivalent field of expertise. With the exception of architects and fire protection engineers, certification or licensure programs for chief fire inspector shall demonstrate qualifications in accordance with NFPA 1037 or NFPA 1031.

O101.3 Fire code plans examiner. The fire marshal/fire code official shall appoint or hire such number of officers, plans examiners, assistants and other employees as shall be authorized by the jurisdiction. To be appointed or hired as a fire code plans examiner experience as a firefighter, fire officer, fire inspector, building inspector/plans examiner, fire protection contractor, fire protection engineer or engineer in training , or architect is required. An Associate Degree in Fire Protection or Building Construction Technology shall be deemed an acceptable alternative for the necessary experience. The fire code plans examiner shall be certified or licensed through a recognized licensure or certification program as a fire code plans examiner, combination fire inspector/plans examiner, fire protection engineer, or in an equivalent field of expertise. With the exception of architects and fire protection engineers, certification or licensure programs for fire inspector or plans examiner shall demonstrate qualifications in accordance with NFPA 1031. Entry level employees or trainees shall be permitted to be hired and assigned to work under the direction and authority of the fire marshal/fire code official while obtaining the required experience and certification(s).

O101.4 Fire inspector. The fire marshal/fire code official is authorized to appoint or hire such number of officers, inspectors, assistants and other employees as shall be authorized by the jurisdiction. A person shall not be appointed or hired as fire code inspector who has not had experience as a firefighter, fire officer, fire protection contractor, fire protection engineer or engineer in training, or architect. Completion of 15 semester units or 22 quarter units from a recognized college in Fire Protection or Building Construction Technology shall be an acceptable alternative to the one year of experience. The fire code inspector shall be certified or licensed through a recognized licensure or certification program as a fire inspector, combination fire inspector/plans examiner, fire safety inspector, fire protection engineer, or in an equivalent field of expertise. With the exception of architects and fire protection engineers, certification or licensure programs for fire inspector or plans examiner shall demonstrate qualifications in accordance with NFPA 1031.. Entry level employees or trainees shall be permitted to be hired and assigned to work under the direction and authority of the fire marshal/fire code official while obtaining the required experience and certification(s).

O101.5 Termination of employment. Employees in the position of fire marshal, fire code official, chief fire inspector, fire inspector, or fire code plans examiner shall not be removed from office except for cause after full opportunity has been given to be heard on specific charges before such applicable governing authority.

0102 REFERENCED STANDARDS

NFPA 1031-2014 Standard for Professional Qualifications for Fire Inspector and Plan Examiner

NFPA 1037-2016 Standard on Fire Marshal Professional Qualifications

Reason:

This proposed change is result of an evaluation of previous work by the CTC that was based on the “NIST Charleston Sofa Store Fire Recommendations”. This work and the follow-up work of the FCAC addresses the NIST and other investigative reports on the fire that occurred on the evening of June 18, 2007 in the Sofa Super Store in Charleston, South Carolina to identify issues that can be addressed by the International Codes.

In connection with their investigation, NIST analyzed the fire ground, consulted with other experts, and performed computer simulations of fire growth alternatives. Based on these analyses, NIST concluded that the following sequence of events is likely to have occurred. A fire began in packing material and discarded furniture outside an enclosed loading dock area. The fire spread to the loading dock, then into both the retail showroom and warehouse spaces. During the early stages of the fire in the two latter locations, the fire spread was slowed by the limited supply of fresh air. This under-ventilation led to generation of a large mass of pyrolyzed and only partially oxidized effluent. The smoke and combustible gases flowed into the interstitial space below the roof and above the suspended ceiling of the main retail showroom. As this space filled with unburned fuel, the hot smoke also seeped through the suspended ceiling into the main showroom and formed a hot smoke layer below the suspended ceiling. Up to this time, the extent of fire spread into the interstitial space was not visible to fire fighters in the store. If the fire spread had been visible to the fire fighters in the store, it would have provided a direct indication of a fire hazard in the showroom. Meanwhile, the fire at the back of the main showroom and the gas mixture below the suspended ceiling were both still fuel rich. When the front windows were broken out or vented, the inflow of additional air allowed the heat release rate of the fire to intensify rapidly and added air to the layer of unburned fuel below the suspended ceiling enabling the ignition of the unburned fuel/air mixture. The fire swept from the rear to the front of the main showroom extremely quickly, and then into the west and east showrooms. Nine fire fighters were killed in the Sofa Super Store fire. NIST developed eleven recommendations to help mitigate such future losses.

Recommendation 3 of the NIST report reads as follows:

“Qualified Fire Inspectors and Building Plan Examiners: NIST recommends that all state and local jurisdictions ensure that fire inspectors and building plan examiners are professionally qualified to a national standard such as NFPA 1031 Standard for Professional Qualifications for Fire Inspector and Plan Examiner. Professional qualification may be demonstrated through a nationally accepted certification examination, such as the Fire Plan Examiner; Fire Inspector I and II, and Certified Fire Marshal.”

Following a review of recommendation 3 of the NIST report a new Appendix K is proposed. This proposal is similar in scope and intent to Section A101.3 of Appendix A of the International Building Code where suggested qualifications for building official, chief inspector, inspector and plan examiner are established.

The purpose of this proposal is to provide optional criteria for qualifications of employees who enforce the Fire Code through inspections and plan examinations. A jurisdiction that wants to make this appendix a mandatory part of the code would need to specifically list this appendix in its adoption ordinance. In recognition of the fact that some jurisdictions are mandated by applicable state law to employ only persons licensed by the state to perform certain duties, the proposal was drafted as an Appendix.

This proposal would not require fire inspectors or fire plan examiners to have had previous experience in Fire Code enforcement, but would merely require that they possess experience in a related job category. As with the efforts by the CTC, it is not the intent of the FCAC to prohibit a plan review and inspection staff from hiring and training entry level employees. The training of such entry level should simply be supervised by trained and certified personnel.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal should not have any direct impact on the cost of construction. This proposal deals with the jurisdiction that serves as the authority having jurisdiction and the qualifications of personnel involved with applying and enforcing the fire code. If there are any cost impacts to construction it would possibly be the permitting costs necessary to

adequately staff the fire code enforcement authority with qualified personnel.

Internal ID: 1922

2018 GROUP A – PROPOSED CHANGES TO THE INTERNATIONAL FUEL GAS CODE

FUEL GAS CODE COMMITTEE

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL FUEL GAS CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some FG code change proposals may not be included on this list, as they are being heard by another committee.

FG1-18

IFGC: 202

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

THIS CODE CHANGE PROPOSAL HAS BEEN PLACED ON THE IMC COMMITTEE AGENDA. PLEASE SEE THE IMC HEARING ORDER.

2018 International Fuel Gas Code

Revise as follows:

[M] PIPING. Where used in this code, "piping" refers to either pipe or tubing, or both.

Pipe. A rigid conduit ~~of iron, steel, copper, copper alloy or plastic~~ used to convey fuel gas or other fluid.

Tubing. Semirigid conduit ~~of copper, copper alloy aluminum, plastic or steel~~ used to convey fuel gas or other fluid.

Reason:

Definitions should not contain technical requirements. The code in other sections provide the list of acceptable materials. The deletion would coordinate with the definition as revised in the 2018 National Fuel Gas Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The definition changes do not impact the code's installation requirements.

Internal ID: 1370

FG2-18

IFGC: 202 (New)

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Add new definition as follows:

SERVICE METER ASSEMBLY. The meter, valve, regulator, piping, fittings and equipment installed by the service gas supplier before the point of delivery.

Reason:

The “Point of Delivery” definition uses the term “service meter assembly” but that term is not defined. The proposed would help clarify the code. AGA will also be proposing the same definition for the 2021 National Fuel Gas Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The definition does not add code installation requirements.

Internal ID: 1668

FG3-18

IFGC: 202 (New)

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Add new definition as follows:

SYSTEM SHUTOFF. A valve installed after the point of delivery to shut off the entire piping system.

Reason:

AGA is proposing a definition to cover a valve that may be installed for customer use to shut off the entire customer piping system. That valve would be installed downstream of the point of delivery (see proposed revision to POD definition) and would be owned by the customer. A similar definition and coverage for system shutoff valve is being proposed for the 2021 National Fuel Gas Code. Under current federal law, only qualified personnel are permitted to operate a gas utility's system components covered under the law. The gas service shutoff valve is one such covered component. Some gas utilities have chosen to provide a shutoff valve after the point of delivery as part of the service meter assembly for customer use to shut down their gas piping without the need to operate the gas utility's covered service shutoff valve.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The new definition does not change the code's installation requirements.

Internal ID: 1382

FG4-18

IFGC: 202

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Revise as follows:

VALVE. A device used in piping to control the gas supply to any section of a system of piping or to an appliance.

Service Shutoff. A valve, installed by the serving gas supplier between the source of supply and the point of delivery, to shut off the entire piping system.

Reason:

The revision clarify that the service shutoff valve is always installed between the gas supply and point of delivery. The point of delivery is a defined term.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The definition change does not change the code's installation requirements.

Internal ID: 1379

FG5-18

IFGC: 202 (New)

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Add new definition as follows:

SERVICE METER ASSEMBLY. The meter(s), valve(s), piping, fittings, and equipment installed by the serving gas supplier to connect the gas supply to the customer piping system.

Reason:

The “Point of Delivery” definition uses the term “service meter assembly” but that term is not defined. The proposed would help clarify the code. AGA will also be proposing the same definition for the 2021 National Fuel Gas Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The new definition does not changed the code's installation requirements.

Internal ID: 1377

FG6-18

IFGC: 202

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Revise as follows:

REGULATOR, MONITORING. A pressure regulator set in series with another pressure regulator for the purpose of automatically taking control of the pressure downstream of the monitored regulator when that pressure exceeds a set minimum, preventing an overpressure in the downstream piping system.

Reason:

Definitions should not contain technical requirements. Section 416 provide the pressure limits. The deletion would coordinate with the definition as revised the 2018 National Fuel Gas Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The definition change does not impact the code's installation requirements.

Internal ID: 1375

FG7-18

IFGC: 202

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Revise as follows:

POINT OF DELIVERY. For natural gas systems, the point of delivery is the outlet of the service meter assembly or the outlet of the service regulator or service shutoff valve where a meter is not provided. Where a system shutoff valve is provided ~~at~~after the outlet of the service meter assembly, such valve shall be considered to be downstream of the point of delivery. For undiluted liquefied petroleum gas systems, the point of delivery shall be considered to be the outlet of the service pressure regulator, exclusive of line gas regulators, in the system.

Reason:

AGA is also proposing coverage for a “system shutoff” valve and its inclusion in the POD definition clarifies that definition’s intent. The word “at” indicates that the valve will be very close to the POD. That may not be the case where a length of pipe may be installed prior to the installation of the valve. The word “after” would include all locations.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The changes do not revise the code's installation requirements.

Internal ID: 1373

FG8-18

IFGC: 202 (New)

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Fuel Gas Code

Add new definition as follows:

PRESS-CONNECT JOINT A permanent mechanical joint incorporating an elastomeric seal or an elastomeric seal and corrosion-resistant grip or bite ring. The joint is made with a pressing tool and jaw or ring approved by the fitting manufacturer.

Reason:

The definition for Press-Connect Fittings is not included into the IFGC. The term Press-Connect Fittings are used in the International Fuel Gas Code sections 403.10.1 and 403.10.2. Adding the definition of Press-Connect Joint will align the definition already used in the IMC and IPC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This definition currently exists in other ICC model codes and is simply added for reference. This proposal is an additional option for a pipe joint method and will not require an added cost to construction.

Internal ID: 792

FG9-18

IFGC: 301.12

Proponent: Kelly Cobeen, Wiss Janney Elstner Associates, Inc., representing Federal Emergency Management Agency/Applied Technology Council Seismic Code Support Committee (KCobeen@wje.com); Michael Mahoney, Federal Emergency Management Agency, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov)

2018 International Fuel Gas Code

Revise as follows:

301.12 Seismic resistance. Where earthquake loads are applicable in accordance with the International Building Code, ~~the supports~~ fuel gas appliance and system supports, anchorage, and bracing shall be designed and installed for the seismic forces in accordance with Chapter 16 of that code.

Reason:

The added text clarifies the IBC location where specific seismic requirements are defined. This is simply intended to make the seismic design provisions more easily used, consistent with the intent as stated in 2015 NEHRP Recommended Provisions Section 1.1.2, to preserve life safety by maintaining the position of components through anchorage, bracing and strength.

Bibliography:

NEHRP Recommended Seismic Provisions for New Buildings and Other Structures, 2015 Edition (FEMA P-1050-1).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed wording clarifies the intent of the code and does not impose any new requirements that were not already in effect.

Internal ID: 1034

FG10-18

IFGC: 304.13(IFGS) (New)

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Add new text as follows:

304.13(IFGS) Existing Appliances. Existing appliance installations shall be inspected to verify compliance with the provisions of Section 304 and Chapter 5 where a component of the building envelope is modified as described by one or more of 304.13 (1) through (6). Where the appliance installation does not comply with Section 304 and Chapter 5, the installation shall be altered as necessary to be in compliance with Section 304 and Chapter 5.

1. The building is modified under a weatherization program.
2. A building permit is issued for a building addition or exterior building modification.
3. Three or more window assemblies are replaced.
4. Three or more storm windows are installed over existing windows.
5. One or more exterior door and frame assemblies are replaced.
6. A building air barrier is installed or replaced.

Reason:

AGA is proposing an extract of section 9.1.24 from ANSI Z223.1, National Fuel Gas Code. The code requirement would address renovations to existing buildings that could impact the supply of combustion air and the performance of venting systems. AGA is aware of weatherization programs that fail to consider the importance of ensuring that existing gas appliance installations continue to meet the IFGC combustion air and venting requirements when efforts to reduce air infiltration are undertaken. This proposal is offered solely for coordinating the IFGC with ANSI Z223.1 (NFGC). This text is offered "as is" for the IFGC and it is not intended that such text be modified from a technical standpoint. The subject text was revised in the 2018 NFGC (ANSI Z223.1) and this proposal will cause the IFGC text to be consistent with such revised text in ANSI Z223.1 (NFGC).

Bibliography:

ANSI Z223.1 National Fuel Gas Code, American Gas Association, 2018

Cost Impact

The code change proposal will increase the cost of construction .

The new section will require inspections and possible modifications.

Internal ID: 1384

FG11-18

IFGC: 307.2

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmcmann@jeffco.us)

2018 International Fuel Gas Code

Revise as follows:

307.2 Fuel-burning appliances. Liquid combustion byproducts of condensing appliances shall be collected and discharged to an approved plumbing fixture or disposal area in accordance with the manufacturer's instructions. Condensate piping shall be of approved corrosion-resistant material and shall be not smaller than the drain connection on the appliance. Such piping shall maintain a minimum slope in the direction of discharge of not less than one-eighth unit vertical in 12 units horizontal (1-percent slope).

Where condensate piping is concealed, and the primary and secondary drain system pipes serving the same appliance terminate together at a remote location, the terminations shall be identified as to which is the primary or secondary drain.

Reason:

Reason: Condensate drain systems from the same appliance need to be identified when terminating together at a remote location when the piping is concealed or partially concealed and could have possibly changed orientation. Occupants and service personnel won't be able to tell by looking at the piping which system is discharging and can't identify if they have a problem.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Simple identification should not increase cost.

Internal ID: 122

FG12-18

IFGC: 401.5

Proponent: Bob Torbin, OmegaFlex, representing OmegaFlex (bob.torbin@omegaflex.net)

2018 International Fuel Gas Code

Revise as follows:

401.5 Identification. For other than steel pipe and CSST, exposed *pipng* shall be identified by a yellow label marked "Gas" in black letters. The marking shall be spaced at intervals not exceeding 5 feet (1524 mm). The marking shall not be required on ~~pipe~~ pipng located in the same room as the *appliance* served. CSST shall be identified as required by ANSI LC 1/CSA 6.26.

Reason:

Recent changes in the ANSI LC-1 Standard for CSST now permits the CSST jacket to be either yellow or black. The marking requirements of LC-1 permit the marking color to be selected by the manufacturer provided it is a high contrasting color compared to the jacket color (such as white on black). The marking requirement also requires the word "Fuel Gas" be printed every two feet along the tubing. The proposed modification recognizes that the marking requirements of ANSI LC-1 can meet the intent of the marking requirements of the Identification Section as an equivalent marking.

The replacement of the word "pipe" in the third sentence with the word "pipng" reflects the marking application is intended only for copper pipe/tubing and CSST, and thus reflects the proper use of the term as defined in Chapter 2.

Cost Impact

The code change proposal will decrease the cost of construction .

The use of factory-marked tubing results in cost savings because this avoids the labor and material costs of separately installing stick-on labels to field-installed piping.

Internal ID: 1092

FG13-18

IFGC: 404.2

Proponent: Shannon Corcoran, CSA Group, representing CSA Group (shannon.corcoran@csagroup.org)

2018 International Fuel Gas Code

Revise as follows:

404.2 CSST. CSST piping systems shall be installed in accordance with the terms of their approval, the conditions of listing in accordance with ANSI LC 1/CSA 6.26, the manufacturer's instructions and this code.

Reason:

The purpose of this proposal is to clarify the intent that CSST is installed in accordance with the manufacturer's listing to the applicable ANSI standard, ANSI LC 1 / CSA 6.26.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The references will increase the need for products to comply, however compliance to the referenced standards is not expected to impact the cost of construction.

Internal ID: 1114

FG14-18

IFGC: 404.5

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmcmann@jeffco.us)

2018 International Fuel Gas Code

Revise as follows:

404.5 Fittings in concealed locations. Fittings installed in concealed locations shall be limited to the following types:

1. ~~Threaded Right-hand- threaded elbows, tees, couplings, plugs and couplings-caps.~~
2. Brazed fittings.
3. Welded fittings.
4. Fittings listed to ANSI LC-1/CSA 6.26 or ANSI LC-~~4-4~~.

Reason:

Not all fittings are in the list. Unions are not permitted to be concealed and left-right couplings are still being used. These couplings are a form of union.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is editorial in nature.

Internal ID: 186

FG15-18

IFGC: 404.6

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Delete and substitute as follows:

~~**404.6 Underground penetrations prohibited.** Gas piping shall not penetrate building foundation walls at any point below grade. Gas piping shall enter and exit a building at a point above grade and the annular space between the pipe and the wall shall be sealed.~~

404.6 Underground penetrations prohibited.Piping through foundation wall. ~~Gas piping shall not penetrate building foundation walls at any point below grade. Gas piping shall enter and exit a building at a point above grade and the~~ Underground piping where installed below grade through the foundation or basement wall of a building shall be encased in a protective pipe sleeve. The annular space between the pipe-gas piping and the wall sleeve shall be sealed.

Reason:

A change adopted into the 2015 edition prohibits gas piping from penetrating a foundation or basement wall below grade. This change was adopted without evidence that such penetrations have resulted in a safety concern. Below grade penetrations have a long been permitted and have proven to be a safe installation method. The revised language would reinstate this allowance. At least one State, Georgia, has amended the IFGC to delete the prohibition and allow below grade penetration like the proposed text. GA text is as follows: "404.6 Piping through foundation wall. Underground piping where installed below grade through the foundation or basement wall of a building, shall be encased in a protective pipe sleeve. The annular space between the gas piping and the sleeve shall be sealed."

Cost Impact

The code change proposal will decrease the cost of construction .

The change will reduce the need to bring piping above ground in some installations. That will reduce the length of piping required as well as reduce the number of fittings used.

Internal ID: 1385

FG16-18

IFGC: 404.11.2

Proponent: Bob Torbin, OmegaFlex, representing OmegaFlex (bob.torbin@omegaflex.net)

2018 International Fuel Gas Code

Revise as follows:

404.11.2 Protection methods. Underground piping shall comply with one or more of the following:

1. The piping shall be made of corrosion-resistant material that is suitable for the environment in which it will be installed.
2. Pipe shall have a factory-applied, electrically-insulating coating. Fittings and joints between sections of coated pipe shall be coated in accordance with the coating manufacturer's instructions.
3. The piping shall have a cathodic protection system installed and the system shall be monitored and maintained in accordance with an *approved* program.
4. The piping shall be installed within an encasement system listed for underground use or within a non-metallic, watertight conduit.

Reason:

The ICC Evaluation Service issued a listing criteria for polyethylene sleeved CSST (LC 1023) dated May 2009. The use of listed encasement systems (such as polyethylene sleeved CSST) has been included in the National Fuel Gas Code (NFPA 54) Section 7.1.6 since the 2012 edition, and was included in the 2018 edition of the International Fuel Gas Code. This type of product has been used underground without failure or damage for approximately 15 years. Use of pre-assembled encasement systems streamlines the installation of gas piping underground or beneath buildings and concrete slabs, and can be installed underground without joints where required. This will improve safety (no potential leakage sites) when installing such systems. The use of buried conduit is already permitted by Section 404.14 piping underground beneath buildings, but needs to be added here for consistency.

Cost Impact

The code change proposal will decrease the cost of construction .

The use of buried conduit is already permitted by Section 404.14 piping underground beneath buildings. The use of a listed encasement system results in cost savings because the piping and encasement are installed simultaneously.

This avoids the labor cost of separately installing the conduit and piping. In addition, the sealing and venting methods (when required) are also integrated within the encasement system, thus eliminating the need to separately assemble and/or install sealing and venting components within standard conduit.

Internal ID: 1097

FG17-18

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Delete without substitution:

~~**404.11.5 Prohibited use.** Uncoated threaded or socketwelded joints shall not be used in piping in contact with soil or where internal or external crevice corrosion is known to occur.~~

Reason:

Section 404.11.2 #2 requires that all piping have a factory-applied protective coating and that fittings and joints between sections of coated pipe shall be coated in accordance with the coating manufacturer's instructions. Therefore section 404.11.5 is not needed. We note that most of 404.11 is new for the 2018 edition and section 404.11.5 which was in previous editions should have been deleted when this new material was added.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Section 404.11.2 #2 requires coated piping.

Internal ID: 855

FG18-18

IFGC: 404.18

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Revise as follows:

404.18 Pipe ~~cleaning~~ debris removal. The interior of piping shall be clear of debris. The use of a flammable or combustible gas to clean or remove debris from a *piping* system shall be prohibited.

Reason:

The code prohibits the use of flammable or combustible gas to clean piping but does not require piping to be clear of debris. The proposed text would add in the requirement which would also harmonize it with the National Fuel Gas Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Pipe is usually cleared of debris as it is being assembled . No change in the code's installation requirements.

Internal ID: 1663

FG19-18

IFGC: 404.18

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Revise as follows:

404.18 Pipe cleaning. Prior to testing, the interior of the piping system shall be cleared of all debris. The use of a flammable or combustible gas to clean or remove debris from a piping system shall be prohibited.

Reason:

The code prohibits the use of flammable or combustible gas to clean piping but does not require piping to be cleaned. The proposed text would add in the requirement which would also harmonize it with the National Fuel Gas Code.

Cost Impact

The code change proposal will increase the cost of construction .

The revision clarifies that all piping is to be cleaned and therefore may increase the cost of construction.

Internal ID: 1356

FG20-18

IFGC: 409.8 (New)

Proponent: John Cecil II, representing self (jcecil@msn.com)

2018 International Fuel Gas Code

Add new text as follows:

409.8 Building shutoff. A shutoff valve that will shutoff the gas supply to the entire building shall be installed, indoors or outdoors, within 6 feet of the entrance of the gas supply piping into the building. The shutoff valve shall not require the use of a tool to operate it.

Reason:

Reason: The shutoff valve will allow the gas supply to the building to be shutoff in an emergency without having to utilize the utility owned shutoff valve located upstream of the meter and service regulator equipment..

Bibliography:

Submitted by John Allan Cecil, presently a combination inspector for Garrett County, MD. jcecil@msn.com 240-381-6231

Cost Impact

The code change proposal will increase the cost of construction .

The cost of this Code change would be minimum, basically the cost of a gas valve. The value would be, is that there would be one location, one valve, to turn off the whole house gas supply if there is an emergency.

Internal ID: 494

FG21-18

IFGC: 411.1, Chapter 8, 08

Proponent: Shannon Corcoran, representing CSA Group (shannon.corcoran@csagroup.org)

2018 International Fuel Gas Code

Revise as follows:

411.1 Connecting appliances. Except as required by Section 411.1.1, *appliances* shall be connected to the *pipng* system by one of the following:

1. Rigid metallic pipe and fittings.
2. Corrugated stainless steel tubing (CSST) where installed in accordance with the manufacturer's instructions.
3. Semirigid metallic tubing and metallic fittings. Lengths shall not exceed 6 feet (1829 mm) and shall be located entirely in the same room as the *appliance*. Semirigid metallic tubing shall not enter a motor-operated *appliance* through an unprotected knockout opening.
4. *Listed and labeled appliance* connectors in compliance with ANSI Z21.24/CGA 6.10 and installed in accordance with the manufacturer's instructions and located entirely in the same room as the appliance.
5. *Listed and labeled quick-disconnect devices in compliance with ANSI Z21.41/CGA 6.9* used in conjunction with *listed and labeled appliance* connectors.
6. *Listed and labeled convenience outlets in compliance with ANSI Z21.90/CGA 6.24* used in conjunction with *listed and labeled appliance* connectors.
7. *Listed and labeled outdoor appliance* connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer's instructions.
8. *Listed outdoor gas hose connectors* in compliance with ANSI Z21.54 used to connect portable outdoor appliances. The gas hose connection shall be made only in the outdoor area where the appliance is used, and shall be to the *gas pipng* supply at an appliance shutoff valve, a listed quick-disconnect device or listed gas convenience outlet.
9. Gas hose connectors for use in laboratories and educational facilities in accordance with Section 411.4.

CHAPTER 8 REFERENCED STANDARDS

Add new standard(s) follows:

ANSI

American National Standards
Institute
25 West 43rd Street 4th Floor
New York NY 10036

ANSI Z21.41/CSA 6.9-2014:

Quick disconnect devices for use with gas fuel appliances

ANSI Z21.90/CSA 6.24-2015:

Gas convenience outlets and optional enclosures

Reason:

This proposal is intended to provide clarity in the Code by including reference to the applicable ANSI standard for quick-disconnect devices (ANSI Z21.41/CSA 6.9) and convenience outlets (ANSI Z21.90/CSA 6.24).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The references will increase the need for products to comply, however compliance to the referenced standards is not expected to impact the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1136

Proponent: Ted Williams, American Gas Association, representing American Gas Association (twilliams@aga.org)

THIS CODE CHANGE PROPOSAL HAS BEEN PLACED ON THE IFC COMMITTEE AGENDA. PLEASE SEE THE IFC HEARING ORDER.

2018 International Fuel Gas Code

SECTION 413 (IFGC) COMPRESSED NATURAL GAS MOTOR VEHICLE FUEL-DISPENSING FACILITIES

[F] 413.1 General. Motor fuel-dispensing facilities for CNG fuel shall be in accordance with this section and the International Fire Code. The operation of CNG motor fuel-dispensing facilities shall be regulated by the International Fire Code.

[F] 413.2 General. Storage vessels and *equipment* used for the storage, compression or dispensing of CNG shall be *approved* or *listed* in accordance with Sections 413.2.1 through 413.2.3.

[F] 413.2.1 Approved equipment. Containers; compressors; pressure-relief devices, including pressure-relief valves; and pressure regulators and *pipng* used for CNG shall be *approved*.

[F] 413.2.2 Listed equipment. Hoses, hose connections, dispensers, gas detection systems and electrical *equipment* used for CNG shall be *listed*. Vehicle fueling connections shall be *listed* and *labeled*.

Revise as follows:

[F] 413.2.3 General Residential Fueling Appliances. Residential fueling *appliances* shall be ~~in accordance with Section 413.4~~ listed to CSA/ANSI NGV 5.1. The capacity of a residential fueling appliance (RFA) shall not exceed 5 standard cubic feet per minute (0.14 standard cubic meter/min) of natural gas.

Add new text as follows:

413.2.4 Non-residential fueling appliances. Non-residential fueling appliances shall be listed to CSA/ANSI NGV 5.2. The capacity of a non-residential fueling appliance, listed to that standard as a vehicle fueling appliance (VFA), shall not exceed 10 standard cubic feet per minute (0.28 standard cubic meter/min) of natural gas.

[F] 413.3 Location of dispensing operations and equipment. Compression, storage and dispensing *equipment* shall be located outdoors, above ground.

Exceptions:

1. Compression, storage or dispensing *equipment* is not prohibited in buildings where such buildings are of noncombustible construction as set forth in the International Building Code and are unenclosed for not less than three-quarters of their perimeter.
2. Compression, storage and dispensing *equipment* is allowed to be located indoors or in vaults in accordance with the International Fire Code.

[F] 413.3.1 Location on property. In addition to the fuel-dispensing requirements of the International Fire Code, compression, storage and dispensing *equipment* not located in vaults complying with the International Fire Code and other than residential fueling appliances shall not be installed:

1. Beneath power lines.
2. Less than 10 feet (3048 mm) from the nearest building or property that could be built on, public street, sidewalk or source of ignition.

Exception: Dispensing *equipment* need not be separated from canopies that provide weather protection for the dispensing *equipment* and are constructed in accordance with the International Building Code.

3. Less than 25 feet (7620 mm) from the nearest rail of any railroad track.

4. Less than 50 feet (15 240 mm) from the nearest rail of any railroad main track or any railroad or transit line where power for train propulsion is provided by an outside electrical source, such as third rail or overhead catenary.
5. Less than 50 feet (15 240 mm) from the vertical plane below the nearest overhead wire of a trolley bus line.

Revise as follows:

[F] 413.4 Residential fueling appliance installation. Residential fueling *appliances* shall be installed in accordance with Sections 413.4.1 through 413.4.3, requirements of CSA/ANSI NGV 5.1, manufacturer installation instructions, and Section 2308 of the International Fire Code for RFAs.

Delete without substitution:

~~**[F] 413.4.1 Listing and installation.** Residential fueling appliances shall be listed in accordance with ANSI NGV 5.1. Residential fueling appliances shall be installed in accordance with the appliance manufacturer's installation instructions.~~

~~**[F] 413.4.2 Gas connection.** Residential fueling appliances shall not be rigidly connected to the gas supply piping.~~

~~**[F] 413.4.3 Indoor installation.** A residential fueling appliance installed indoors or used for indoor fueling shall comply with all of the following:~~

1. ~~The capacity shall not exceed 5 cubic feet per minute (0.14 m³/min) of natural gas.~~
2. ~~Fuel gas from the pressure relief and blowdown systems shall be vented to the outdoors.~~
3. ~~A methane gas detector shall be installed in the room or space containing the appliance or where fueling occurs and shall be located not lower than 6 inches (152 mm) from the highest point in the room or space. The detector shall be set to activate at one-fifth of the lower limit of flammability of natural gas and shall be interlocked with the residential fuel appliance to stop or prevent its operation upon activation. The detector shall have an audible or visible alarm.~~
4. ~~The capacity of a residential fueling appliance installed outdoors for outdoor fueling shall not exceed 10 feet cubic per minute (0.28 m³/min) of natural gas. Residential fueling appliances located outdoors shall be installed on a firm, noncombustible base.~~

Add new text as follows:

413.5 Non-residential fueling appliance installation. Non-residential fueling appliances shall be installed in accordance with requirements for vehicle fueling appliances (VFA) in CSA/ANSI NGV 5.2, manufacturer installation instructions, and Section 2308 of the International Fire Code for VFAs.

Revise as follows:

~~**[F] 413.5-413.6 Private fueling of motor vehicles.** Self-service CNG-dispensing systems, including key, code and card lock dispensing systems, shall be limited to the filling of permanently mounted fuel containers on CNG-powered vehicles.~~

In addition to the requirements in the International Fire Code, the owner of a self-service CNG-dispensing facility shall ensure the safe operation of the system and the training of users.

~~**[F] 413.6-413.7 Pressure regulators.** Pressure regulators shall be designed, installed or protected so their operation will not be affected by the elements (freezing rain, sleet, snow, ice, mud or debris). This protection is allowed to be integral with the regulator.~~

~~**[F] 413.7-413.8 Valves.** *Piping to equipment* shall be provided with a remote manual shutoff valve. Such valve shall be provided with ready access.~~

~~**[F] 413.9-413.10 Discharge of CNG from motor vehicle fuel storage containers.** The discharge of CNG from motor vehicle fuel cylinders for the purposes of maintenance, cylinder certification, calibration of dispensers or other activities shall be in accordance with this section. The discharge of CNG from motor vehicle fuel cylinders shall be accomplished through a closed transfer system or an *approved* method of atmospheric venting in accordance with Section 413.9.1 or 413.9.2.~~

[F] ~~413.8-413.9~~ Emergency shutdown control. An emergency shutdown device shall be located within 75 feet (22 860 mm) of, but not less than 25 feet (7620 mm) from, dispensers and shall also be provided in the compressor area. Upon activation, the emergency shutdown system shall automatically shut off the power supply to the compressor and close valves between the main gas supply and the compressor and between the storage containers and dispensers.

[F] ~~413.9.1-413.10.1~~ Closed transfer system. A documented procedure that explains the logical sequence for discharging the cylinder shall be provided to the code official for review and approval. The procedure shall include what actions the operator will take in the event of a low-pressure or high-pressure natural gas release during the discharging activity. A drawing illustrating the arrangement of *pipng*, regulators and *equipment* settings shall be provided to the code official for review and approval. The drawing shall illustrate the *pipng* and regulator arrangement and shall be shown in spatial relation to the location of the compressor, storage vessels and emergency shutdown devices.

[F] ~~413.9.2-413.10.2~~ Atmospheric venting. Atmospheric venting of motor vehicle fuel cylinders shall be in accordance with Sections 413.9.2.1 through 413.9.2.6.

[F] ~~413.9.2.1-413.10.2.1~~ Plans and specifications. A drawing illustrating the location of the vessel support, *pipng*, the method of grounding and bonding, and other requirements specified herein shall be provided to the code official for review and approval.

[F] ~~413.9.2.2-413.10.2.2~~ Cylinder stability. A method of rigidly supporting the vessel during the venting of CNG shall be provided. The selected method shall provide not less than two points of support and shall prevent horizontal and lateral movement of the vessel. The system shall be designed to prevent movement of the vessel based on the highest gas-release velocity through valve orifices at the vessel's rated pressure and volume. The structure or appurtenance shall be constructed of *noncombustible materials*.

[F] ~~413.9.2.3-413.10.2.3~~ Separation. The structure or appurtenance used for stabilizing the cylinder shall be separated from the site *equipment*, features and exposures and shall be located in accordance with Table 413.9.2.3.

**[F] TABLE ~~413.9.2.3-413.10.2.3~~
SEPARATION DISTANCE FOR ATMOSPHERIC VENTING OF CNG**

EQUIPMENT OR FEATURE	MINIMUM SEPARATION (feet)
Buildings	25
Building openings	25
Lot lines	15
Public ways	15
Vehicles	25
CNG compressor and storage vessels	25
CNG dispensers	25

For SI: 1 foot = 304.8 mm.

[F] ~~413.9.2.6-413.10.2.6~~ Signage. Approved NO SMOKING signs shall be posted within 10 feet (3048 mm) of the cylinder support structure or appurtenance. *Approved* CYLINDER SHALL BE BONDED signs shall be posted on the cylinder support structure or appurtenance.

[F] ~~413.9.2.4-413.10.2.4~~ Grounding and bonding. The structure or appurtenance used for supporting the cylinder shall be grounded in accordance with NFPA 70. The cylinder valve shall be bonded prior to the commencement of venting operations.

[F] ~~413.9.2.5-413.10.2.5~~ Vent tube. A vent tube that will divert the gas flow to the atmosphere shall be installed on the cylinder prior to the commencement of the venting and purging operation. The vent tube shall be constructed of pipe or tubing materials *approved* for use with CNG in accordance with the International Fire Code. The vent tube shall be capable of dispersing the gas not less than 10 feet (3048 mm) above grade level. The vent tube shall not be provided with a rain cap or other feature that would limit or obstruct the gas flow.

At the connection fitting of the vent tube and the CNG cylinder, a *listed* bidirectional detonation flame arrester shall be provided.

Update standard(s) as follows:

ANSI

American National Standards
Institute
25 West 43rd Street
New York NY 10036
US

CSA/ANSI NGV 5.1-20152016:

Residential Fueling Appliances

CSA/ANSI NGV 5.2-2017:

Vehicle Fueling Appliances (VFA)

Reason:

This proposal adopts “residential fueling appliance” (RFA) and light-commercial “vehicle fueling appliance” (VFA) coverage for listed appliances from ANSI-recognized standards CSA/ANSI NGV 5.1 and CSA/ANSI NGV 5.2, respectively, and applies installation requirements from those standards, manufacturer installation instructions, and proposed parallel requirements to go into the International Fire Code, Section 2308. Requirements in the two CSA standards cover design, installation, labeling, and other requirements for these two classes of listed appliances and differentiate fueling appliances based on input flow rates and other requirements applicable to residential occupancies in the case of NGV 5.1 and light-commercial occupancies in the case of NGV 5.2. RFA coverage is already found in IFGC Section 413; VFA coverage is proposed as new coverage in the IFGC and IFC.

NFPA 52-2016 already defines and differentiates RFAs and VFAs based on limitations on input flow capacities: 5 SCFM for RFAs and 10 SCFM for VFAs for which coverage is now proposed for both the IFGC and IFC. Parallel coverage RFAs and VFAs is proposed to a new edition of NFPA 52 (2019 edition); however, final action on those proposals has not been taken at the time of the submission of this proposal.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal addresses appliance requirements, including installation requirements, unrelated to facility construction.

Analysis: A review of the standards proposed for inclusion in the code, CSA/ANSI NGV 5.2—2017 and CSA/ANSI NGV 5.1-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

2018 International Fuel Gas Code

Revise as follows:

602.1 General. Decorative appliances for installation in *approved* solid fuel-burning fireplaces shall be ~~tested-listed~~ in accordance with ANSI Z21.60/CSA 6.26 and shall be installed in accordance with the manufacturer's instructions. Manually lighted natural gas decorative appliances shall be ~~tested-listed~~ in accordance with ANSI Z21.84.

602.2 Flame safeguard device. Decorative appliances for installation in approved solid fuel-burning fireplaces, with the exception of those ~~tested-listed~~ in accordance with ANSI Z21.84, shall utilize a direct ignition device, an ignitor or a pilot flame to ignite the fuel at the main burner, and shall be equipped with a flame safeguard device. The flame safeguard device shall automatically shut off the fuel supply to a main burner or group of burners when the means of ignition of such burners becomes inoperative.

603.1 General. Log lighters shall be ~~tested-listed~~ in accordance with CSA 8 and installed in accordance with the manufacturer's instructions.

604.1 General. Vented gas fireplaces shall be ~~tested-listed~~ in accordance with ANSI Z21.50/CSA 2.22, shall be installed in accordance with the manufacturer's instructions and shall be designed and equipped as specified in Section 602.2.

605.1 General. Vented gas fireplace heaters shall be installed in accordance with the manufacturer's instructions, shall be ~~tested-listed~~ in accordance with ANSI Z21.88/CSA 2.33 and shall be designed and equipped as specified in Section 602.2.

608.1 General. Vented wall furnaces shall be ~~tested-listed~~ in accordance with ANSI Z21.86/CSA 2.32 and shall be installed in accordance with the manufacturer's instructions.

609.1 General. Floor furnaces shall be ~~tested-listed~~ in accordance with ANSI Z21.86/CSA 2.32 and shall be installed in accordance with the manufacturer's instructions.

610.1 General. Duct furnaces shall be ~~tested-listed~~ in accordance with ANSI Z83.8/CSA 2.6 or UL 795 and shall be installed in accordance with the manufacturer's instructions.

613.1 General. Clothes dryers shall be ~~tested-listed~~ in accordance with ANSI Z21.5.1/CSA 7.1 or ANSI Z21.5.2/CSA 7.2 and shall be installed in accordance with the manufacturer's instructions.

617.1 General. Pool and spa heaters shall be ~~tested-listed~~ in accordance with ANSI Z21.56/CSA 4.7 and shall be installed in accordance with the manufacturer's instructions.

618.1 General. Forced-air warm-air furnaces shall be ~~tested-listed~~ in accordance with ANSI Z21.47/CSA 2.3 or UL 795 and shall be installed in accordance with the manufacturer's instructions.

620.1 General. Unit heaters shall be ~~tested-listed~~ in accordance with ANSI Z83.8/CSA 2.6 and shall be installed in accordance with the manufacturer's instructions.

621.1 General. Unvented room heaters shall be ~~tested-listed~~ in accordance with ANSI Z21.11.2 and shall be installed in accordance with the conditions of the listing and the manufacturer's instructions. Unvented room heaters utilizing fuels other than fuel gas shall be regulated by the International Mechanical Code.

622.1 General. Vented room heaters shall be ~~tested-listed~~ in accordance with ANSI Z21.86/CSA 2.32, shall be designed and equipped as specified in Section 602.2 and shall be installed in accordance with the manufacturer's instructions.

623.1 Cooking appliances. Cooking appliances that are designed for permanent installation, including ranges, ovens, stoves, broilers, grills, fryers, griddles, hot plates and barbecues, shall be ~~tested-listed~~ in accordance with ANSI

Z21.1, ANSI Z21.58/CSA 1.6 or ANSI Z83.11/CSA 1.8 and shall be installed in accordance with the manufacturer's instructions.

624.1 General. Water heaters shall be ~~tested-listed~~ in accordance with ANSI Z21.10.1/CSA 4.1 ~~and or~~ ANSI Z21.10.3/CSA 4.3 and shall be installed in accordance with the manufacturer's instructions. Water heaters utilizing fuels other than fuel gas shall be regulated by the International Mechanical Code.

625.1 General. Refrigerators shall be ~~tested-listed~~ in accordance with ANSI Z21.19/CSA 1.4 and shall be installed in accordance with the manufacturer's instructions. Refrigerators shall be provided with adequate clearances for ventilation at the top and back, and shall be installed in accordance with the manufacturer's instructions. If such instructions are not available, not less than 2 inches (51 mm) shall be provided between the back of the refrigerator and the wall and not less than 12 inches (305 mm) above the top.

626.1 General. Gas-fired toilets shall be ~~tested-listed~~ in accordance with ANSI Z21.61 and installed in accordance with the manufacturer's instructions.

627.1 General. Gas-fired air-conditioning appliances shall be ~~tested-listed~~ in accordance with ANSI Z21.40.1/~~CGA-CSA~~ 2.91 or ANSI Z21.40.2/~~CGA-CSA~~ 2.92 and shall be installed in accordance with the manufacturer's instructions.

628.1 General. Illuminating appliances shall be ~~tested-listed~~ in accordance with ANSI Z21.42 and shall be installed in accordance with the manufacturer's instructions.

630.1 General. Infrared radiant heaters shall be ~~tested-listed~~ in accordance with ANSI Z83.19 or Z83.20 and shall be installed in accordance with the manufacturer's instructions.

636.1 General. Permanently fixed-in-place outdoor decorative appliances shall be ~~tested-listed~~ in accordance with ANSI Z21.97 and shall be installed in accordance with the manufacturer's instructions.

Reason:

This proposal is intended to require the appliance to be listed by an organization acceptable to the code official. Listed, as defined in Section 202 includes a requirement that an approved agency posts the certification record in a public forum which is available to the Authority Having Jurisdiction for verification purposes. Testing, according to Section 301.4.1, does not require the testing agency to provide a listing or approved products and appliances.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Manufacturers of gas-fired appliances and gas regulators currently have their products listed by nationally recognized testing laboratories and/or nationally recognized certification bodies. Changing the term "tested" to "listed" will not affect the cost to install these products.

Internal ID: 1155

FG24-18

IFGC: 611.2

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Revise as follows:

611.2 Installation. *Nonrecirculating direct-fired industrial air heaters* shall not be used to supply any area containing sleeping quarters. *Nonrecirculating direct-fired industrial air heaters* shall be installed only in industrial or commercial occupancies. ~~*Nonrecirculating direct-fired industrial air heaters* shall be permitted to provide ventilation air.~~

Reason:

Section 611.1 requires that this appliance be installed in accordance with the manufacturers installation instructions which will place limits on their use. The deletion would coordinate the 2018 National Fuel Gas Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code's installation requirements are not impacted by the change.

Internal ID: 1391

FG25-18

IFGC: 612.2

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Revise as follows:

612.2 Location. ~~Recirculating direct-fired industrial air heaters shall be installed only in industrial and commercial occupancies. Recirculating direct-fired air heaters shall not serve any area containing sleeping quarters. Recirculating direct-fired industrial air heaters shall not be installed in hazardous locations or in buildings that contain flammable solids, liquids or gases, explosive materials or substances that can become toxic when exposed to flame or heat.~~

Reason:

Section 612.3 requires that this appliance be installed in accordance with the manufacturers installation instructions which will place limits on their use. The deletion would coordinate the 2018 National Fuel Gas Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code's installation requirements are not impacted by this change since section 612.3 would still determine where these heaters can be installed.

Internal ID: 1395

FG26-18

IFGC: 614.6, [M]614.6.1 (New)

Proponent: Brent Ursenbach, representing Salt Lake County Planning and Development Services
(bursenbach@slco.org)

THIS CODE CHANGE PROPOSAL HAS BEEN PLACED ON THE IMC COMMITTEE AGENDA. PLEASE SEE THE IMC HEARING ORDER.

2018 International Fuel Gas Code

Revise as follows:

[M] 614.6 Makeup air. Installations exhausting more than 200 cfm (0.09 m³/s) shall be provided with makeup air. ~~Where a closet is designed for the installation of a clothes dryer, an opening having an area of not less than 100 square inches (645 mm²) for makeup air shall be provided in the closet enclosure, or makeup air shall be provided by other approved means.~~

Add new text as follows:

[M]614.6.1 Closet Installation. Where a closet is designed for the installation of a clothes dryer, an opening having an area of not less than 100 square inches (645 mm²) for makeup air shall be provided in the closet enclosure, or makeup air shall be provided by other approved means.

Reason:

Section 614.6, Makeup air addresses two different conditions. First, all dryers over 200 CFM, typically a commercial dryer, require makeup air. Second, if any dryer is located in a closet, there must be an opening allowing makeup air into the closet, to replace air exhausted by the dryer. This requirement applies to any dryer installed in a closet, not only 200 CFM dryers. This proposal simply breaks the section into 2 parts, eliminating any confusion.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply divides a single paragraph into two. No additional requirements are added to the code.

Internal ID: 1470

FG27-18

IFGC: 621.2

Proponent: Craig Conner, representing self (craig.conner@mac.com)

2018 International Fuel Gas Code

Revise as follows:

621.2 Prohibited use. One or more unvented room heaters shall not be used as the sole source of comfort heating in a *dwelling unit*. Unvented room heaters shall not be installed within new dwelling units.

Reason:

New codes are making new dwelling units significantly tighter. Unvented room heaters are vented directly into the conditioned space. Heating combustion products should not be vented directly into the conditioned space of tight dwellings.

Unvented room heaters should not be used as a primary source of heating. Vented versions of the unvented heaters are commonly available.

In the last code cycle provisions to allow unvented alcohol burning devices were twice rejected in the ICC process. Likewise, unvented gas room heaters should not be allowed.

Cost Impact

The code change proposal will increase the cost of construction .

Vented gas heaters are commonly available. These cost more due the need to provide a vent.

Many builders will not install unvented room heaters due to concerns with NO_x (nitrus oxides), liability, etc. Since they are already choosing not to install unvented heaters, this would have no impact on those builders.

Internal ID: 1788

FG28-18

IFGC: 623.2

Proponent: Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gcmcmann@jeffco.us)

2018 International Fuel Gas Code

Revise as follows:

623.2 Prohibited location. Cooking appliances designed, tested, *listed* and *labeled* for use in commercial occupancies shall not be installed within dwelling units or within any area where domestic cooking operations occur.

Exceptions:

1. Appliances that are also listed as domestic cooking appliances.
2. ~~Where the installation is designed by a licensed Professional Engineer, in compliance with the manufacturer's installation instructions.~~

Reason:

The new exception #2 was added because at least one state government modified the IFGC to permit commercial cooking appliances to be installed in dwellings if an engineer designed the job. This was done solely because some consumers were demanding commercial cooking appliances in their homes. The marketplace has already taken care of this demand because appliance manufacturers offer many commercial style appliances that are dual listed as both commercial and household appliances. This is already addressed in exception #1. There is no reason to risk occupant safety by installing commercial appliances in dwellings when there are many appliances that are listed for dwelling installation and have the commercial features and capacities that consumers want. Exception # 2 permits cooking appliances listed only for commercial applications to be installed in a dwelling if a licensed professional Engineer designs the kitchen installation and follows the manufacturers installation instructions. This is a contradictory statement because the manufacturers instructions will likely prohibit commercial appliances in dwellings. This is also contrary to Section 301.3 which requires appliances to be listed and labeled for the application in which they are used. Commercial ranges are not listed and labeled for use in a dwelling , therefore it is a code violation whether or not it has the blessing of the design engineer. Some appliance nameplates state that a commercial appliance is not intended for domestic use, so installation in a dwelling would be a violation of the manufacturers instructions as well as Section 301.3. Commercial cooking appliances are not suitable or even safe within dwellings because they require large clearances to combustibles, might require non-combustible floors and require exhaust systems similar to what is required in restaurants. This exception is not only unnecessary, it allows appliance installation instructions, Section 301.3 and the appliance listing to be violated.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is strictly editorial.

Internal ID: 939

FG29-18

IFGC: 620.4

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Revise as follows:

620.4 Clearance. Suspended-type unit heaters shall be installed with clearances to *combustible materials* of not less than 18 inches (457 mm) at the sides, 12 inches (305 mm) at the bottom and 6 inches (152 mm) above the top where the unit heater has an internal draft hood or 1 inch (25 mm) above the top of the sloping side of the vertical draft hood. ~~Floor-mounted type unit heaters shall be installed with clearances to *combustible materials* at the back and one side only of not less than 6 inches (152 mm). Where the flue gases are vented horizontally, the 6-inch (152 mm) clearance shall be measured from the draft hood or vent instead of the rear wall of the unit heater. Floor-mounted type unit heaters shall not be installed on combustible floors unless *listed* for such installation.~~

Clearances for servicing all unit heaters shall be in accordance with the manufacturer's installation instructions.

Exception: Unit heaters *listed* for reduced *clearance* shall be permitted to be installed with such clearances in accordance with their listing and the manufacturer's instructions.

Reason:

We are unaware of any newly manufactured floor-mounted unit heaters. The deletion would coordinate the 2018 National Fuel Gas Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

New types of these unit heaters no longer exist.

Internal ID: 1389

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL MECHANICAL CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some M code change proposals may not be included on this list, as they are being heard by another committee.

M1-18

IMC: 202 (New), 202

Proponent: Andrew Klein, representing Self Storage Association (andrew@asklein.com)

2018 International Mechanical Code

Add new definition as follows:

DEDICATED STORAGE AREA. The floor area within an occupiable space that is designated solely for storage.

Revise as follows:

BREATHING ZONE. The region within an occupied space between planes 3 and 72 inches (76 and 1829 mm) above the floor and more than 2 feet (610 mm) from the walls of the space ~~or,~~ from dedicated storage areas and from fixed air-conditioning equipment.

Reason:

This proposal clarifies the application of Section 403.3.1.1, regarding required minimum outdoor airflow rates. The current code language is inconsistently applied when there are fixed storage areas that do not change without a permit. Examples of such floor areas may include those dedicated to high-piled rack storage, self-storage facility units that are not fully partitioned off from interior corridors, and other floor areas that are designated solely for storage.

Ignoring the volume taken up by storage and the thermal mass it provides in helping with temperature regulation results in the oversizing of HVAC equipment, increasing energy use and limiting the effectiveness of humidity control that properly-sized systems provide. By adding a new defined term, dedicated storage area, the minimum outdoor airflow rates for occupiable space with dedicated storage areas can be properly calculated.

Cost Impact

The code change proposal will decrease the cost of construction .

In buildings where there are fixed or designated storage areas, this proposal will reduce the minimum required outdoor airflow rate and thus decrease the initial cost of HVAC equipment and also reduce the operational cost of maintaining conditioned air within the building.

Internal ID: 1671

M2-18

IMC: SECTION 202, 202 (New)

Proponent: Brent Ursenbach, representing Salt Lake County Planning and Development Services
(bursenbach@slco.org)

2018 International Mechanical Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

INDIRECT EVAPORATIVE COOLING. The evaporative cooling process where water evaporates into a secondary air stream, removing heat from a primary air stream utilizing a heat exchanger.

DIRECT EVAPORATIVE COOLING. The evaporative cooling process where water evaporates directly into the air stream, reducing the air's dry-bulb temperature and raising its humidity level.

Reason:

These two definitions are proposed to clarify the difference between direct and indirect evaporative cooling. Additionally, these definitions are proposed as part of this proponent's proposal to IMC 602.2 and 603.5.1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

These definitions simply identify the difference between two types of evaporative cooling.

Internal ID: 2002

M3-18

IMC: 202

Proponent: Charles Stock, representing Spunstrand Inc

2018 International Mechanical Code

Revise as follows:

THERMAL RESISTANCE (R-value). A measure of the ability to retard the flow of heat and represented in units of $\text{Ft}^2 \times \text{h} / \text{BTU}$ or $\text{K} \times \text{m}^2 / \text{W}$. The R-value is the reciprocal of thermal conductance.

Reason:

In recent years specifying engineers, third party product listing groups, builders, and end users have all been bombarded with questionable thermal performance claims by product manufacturers. All of this recent noise has left many wondering if they are getting the performance their projects actually require. This proposed addition of recognized/acceptable units for R-value's is an additional step towards clarifying and unifying what is and what is not actual a trusted measure of thermal performance properties. These units are published for clarification in the International Energy Conservation code for this very reason. Failing to add this clarification to the International Mechanical Code could result in the continued use of misleading or insufficiently insulated products being used in the market.

Bibliography:

2015 ICC International Energy Conservation Code, ICC, 2015

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

By adding further clarification, this proposal should simply assist in making sure that expected performance and value already being purchased is actually being delivered.

Internal ID: 1430

M4-18

IMC: 202

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (JBENGINEER@aol.com)

2018 International Mechanical Code

Revise as follows:

FLAMMABILITY CLASSIFICATION (REFRIGERANT). ~~Refrigerants shall be assigned to one of the three classes 1, 2 or 3 in accordance with ASHRAE 34. For Classes 2 and 3, the heat of combustion shall be calculated assuming that combustion products are in the gas phase and in their most stable state. The alphabetical/numerical designation used to identify the flammability of refrigerants.~~

~~**Class 1.** Refrigerants that do not show flame propagation when tested in air at 14.7 psia (101 kPa) and 140°F (60°C). Indicates a refrigerant with no flame propagation.~~

~~**Class 2L.** Indicates a refrigerant with lower flammability and lower burning velocity.~~

~~**Class 2.** Refrigerants having a lower flammability limit (LFL) of more than 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) and a heat of combustion of less than 8169 Btu/lb (19 000 kJ/kg). Indicates a refrigerant with lower flammability.~~

~~**Class 3.** Refrigerants that are highly flammable, having a LFL of less than or equal to 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) or a heat of combustion greater than or equal to 8169 Btu/lb (19 000 kJ/kg). Indicates a refrigerant with higher flammability.~~

~~**REFRIGERANT SAFETY CLASSIFICATIONS.** Groupings—The alphabetical/numerical designation that indicate both the toxicity and flammability classes in accordance with Section 1103.1. The classification group is made up of a letter (A or B) that indicates the toxicity class, followed by a number (1, 2 or 3) that indicates the flammability class. Refrigerant blends are similarly classified, based on the compositions at their worst cases of fractionation, as separately determined for toxicity and flammability. In some cases, the worst case of fractionation is the original formulation of refrigerants.~~

~~**TOXICITY CLASSIFICATION CLASSIFICATION (REFRIGERANT).** Refrigerants shall be classified for toxicity in one of two classes in accordance with ASHRAE 34. An alphabetic designation used to identify the toxicity of refrigerants. Class A indicates a refrigerant with lower toxicity. Class B indicates a refrigerant with higher toxicity.~~

Reason:

The current definitions of “flammability classification” and “toxicity classification” are improper since these contain mandatory code requirements. The definitions should only define the term, not contain requires with the use of the word “shall.” The definition of refrigerant safety classifications is incorrect because ASHRAE 34 was revised regarding the means of identifying the classification of refrigerants.

The classification or group of refrigerant is an alphabetical/numerical designation that is used to identify the flammability and toxicity of a given refrigerant. There were two new classifications added to ASHRAE 34, A2L and B2L. These designations were previously subclasses. Now they are a full class of refrigerant.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These are definition changes.

Internal ID: 913

M5-18

IMC: 202

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Mechanical Code

Revise as follows:

PRESS-CONNECT JOINT. A permanent mechanical joint incorporating an elastomeric seal or an elastomeric seal and corrosion – resistant grip or bite ring. The joint is made with a pressing tool and jaw or ring approved by the fitting manufacturer.

Reason:

This change is simply editorial to provide clarity as this component of the "press-connect joint", if present, is often referred to as grip ring and, or bite ring by manufacturer's as well as installers. This change will eliminate any confusion that occurs when determining if a component referenced as a bite ring in technical specifications still meets the definition provided in the International codes. Grip and Bite rings serve the same purpose for permanent mechanical attachment to piping or tubing.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal to revise the definition of press-connect joint clarifies that the design of a press-connect joint may incorporate a grip or bite ring. This clarification removes any confusion in terminology of the internal components by the manufacturer as they are sometimes labeled as bite ring or grip ring. This changes does not increase cost of construction, testing or listings, it is for clarification purposes only..

Internal ID: 740

M6-18

IMC: 301.18

Proponent: Kelly Cobeen, Wiss Janney Elstner Associates, Inc, representing Federal Emergency Management Agency/Applied Technology Council - Seismic Code Support Committee (KCobeen@wje.com); Michael Mahoney, Federal Emergency Management Agency, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov)

2018 International Mechanical Code

Revise as follows:

301.18 Seismic resistance. Where earthquake loads are applicable in accordance with the International Building Code, mechanical system supports, anchorage, and bracing, shall be designed and installed for ~~the~~ seismic forces in accordance with Chapter 16 of the International Building Code.

Reason:

The added text clarifies the IBC location where specific seismic requirements are defined. This is intended to simply make the seismic design provisions more easily used, consistent with the intent as stated in 2015 NEHRP Recommended Provisions Section 1.1.2, to preserve life safety by maintaining the position of components through anchorage, bracing and strength.

Bibliography:

NEHRP Recommended Seismic Provisions for New Buildings and Other Structures. 2015 Edition (FEMA P-1050-1), Federal Emergency Management Agency, Washington, D.C.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposals clarifies the intent of the code and does not impose any new requirements that were not already in effect.

Internal ID: 1025

M7-18

IMC: TABLE 305.4

Proponent: Forest Hampton, Lubrizol Advanced Materials, Inc., representing Lubrizol Advanced Materials, Inc.
(forest.hampton@lubrizol.com)

2018 International Mechanical Code

Revise as follows:

**TABLE 305.4
PIPING SUPPORT SPACING^a**

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
ABS pipe	4	10 ^c
Aluminum pipe and tubing	10	15
Cast-iron pipe ^b	5	15
Copper or copper-alloy pipe	12	10
Copper or copper-alloy tubing	8	10
CPVC pipe or tubing, 1 inch and smaller	3 ^d	10 ^c
CPVC pipe or tubing, 1 ¹ / ₄ -inches and larger	4 ^d	10 ^c
Lead pipe	Continuous	4
PB pipe or tubing	2 ² / ₃ (32 inches)	4
PE-RT 1 inch and smaller	2 ² / ₃ (32 inches)	10 ^c
PE-RT 1 ¹ / ₄ inches and larger	4	10 ^c
PEX tubing 1 inch and smaller	2 ² / ₃ (32 inches)	10 ^c
PEX tubing 1 ¹ / ₄ inches and larger	4	10 ^c
Polypropylene (PP) pipe or tubing, 1 inch and smaller	2 ² / ₃ (32 inches)	10 ^c
Polypropylene (PP) pipe or tubing, 1 ¹ / ₄ inches and larger	4	10 ^c
PVC pipe	4	10 ^c
Steel tubing	8	10
Steel pipe	12	15

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. See Section 301.18.
- b. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.
- c. Mid-story guide.
- d. Hanger spacing is calculated at 180°F (82.2°C). For applications with lower temperatures, piping support need not comply with the table where the piping is supported in accordance with the manufacturer's installation instructions and is approved.

Reason:

CPVC piping can use longer support spacing at lower temperatures, but additional tables would add complexity. Allowing a CPVC system to utilize specific manufacturer's instructions under specific conditions and with prior AHJ approval would be of use in some installations. A footnote seems sufficient in those cases.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This will not increase the cost of construction as it only adds an additional option for the installer.

Internal ID: 1644

M8-18

IMC: 306.4.2 (New)

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcman@jeffco.us)

2018 International Mechanical Code

Add new text as follows:

306.4.2 Ladder required. Where mechanical equipment or appliances that require servicing are located in under floor spaces that are over 30 inches in depth, access openings to such space shall be equipped with a permanently affixed approved ladder capable of withstanding a 300-pound (136.1 kg) load. Such ladders shall be securely fastened to the structure at the top and bottom, shall have a rung spacing of not less than 14 inches (356 mm) and not less than 18 inches (457 mm) between rails. Ladders constructed of dimensional lumber shall be not less than nominal two by four material. Fasteners shall be in accordance with Table 2304.10.1, Item 16 of the International Building Code for end nailing or other approved fastening methods.

Reason:

The code tells us how to go up but it doesn't tell us how to go down. Ladders constructed of wood in many instances lack the quality in construction to support the weight imposed on them. Often the rungs break exposing the fasteners that can seriously wound the person accessing the ladder. There needs to be a ladder capable of withstanding the repeated use that accessing appliances and equipment in crawlers and under floor spaces require. Many of these spaces are used for storage. The spacing requirements are the same as found in 306.5 along with the loading requirements. This proposal provides much flexibility in construction and would apply to dwellings as well. Guidance for using wood has been provided. Other methods of construction of ladders shall be up for approval by the AHJ.

Cost Impact

The code change proposal will increase the cost of construction .

This requirement may increase the cost as it has not been required to install a ladder in a under floor access opening or under floor space to date although many just do it anyway in a haphazard way.

Internal ID: 209

M9-18

IMC: 307.2.3

Proponent: Darwin Bryant, representing MODERN AC PRODUCTS LLC. (darwinbryant@ymail.com)

2018 International Mechanical Code

Revise as follows:

307.2.3 Auxiliary and secondary drain systems. In addition to the requirements of Section 307.2.1, where damage to any building components could occur as a result of overflow from the *equipment* primary condensate removal system, one of the following auxiliary protection methods shall be provided for each cooling coil or fuel-fired *appliance* that produces condensate:

1. An auxiliary drain pan with a separate drain shall be provided under the coils on which condensation will occur. The auxiliary pan drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain and the terminus of such drain shall be provided with an insect screen. The pan shall have a minimum depth of 1¹/₂ inches (38 mm), shall be not less than 3 inches (76 mm) larger than the unit, or the coil dimensions in width and length and shall be constructed of corrosion-resistant material. Galvanized sheet steel pans shall have a minimum thickness of not less than 0.0236 inch (0.6010 mm) (No. 24 gage). Nonmetallic pans shall have a minimum thickness of not less than 0.0625 inch (1.6 mm).
2. A separate overflow drain line shall be connected to the drain pan provided with the *equipment*. Such overflow drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain and the terminus of such drain shall be provided with an insect screen. The overflow drain line shall connect to the drain pan at a higher level than the primary drain connection.
3. An auxiliary drain pan without a separate drain line shall be provided under the coils on which condensate will occur. Such pan shall be equipped with a water-level detection device conforming to UL 508 that will shut off the *equipment* served prior to overflow of the pan. The auxiliary drain pan shall be constructed in accordance with Item 1 of this section.
4. A water-level detection device conforming to UL 508 shall be provided that will shut off the *equipment* served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line, or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.

Exception: Fuel-fired appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

Reason:

I've been in the hvac industry for over 20 years, and have been called upon time after time from both residential and businesses to find out why water would be coming through the attic onto the rooms below, the main reason for this is not poor installation, it's from "insects" such as "dirt dauber's" making their nest inside the emergency drain line and stopping it up. It does not matter if the unit's have a float switch installed, that only turns off the condenser, which stops making ice, but the evaporator coil is frozen solid when there is ice on the evaporator, and when ice starts to melt, it fills up the emergency drain pan. If the emergency drain line is restricted with some of these pest, water will be overflowing the emergency drain pan, and onto the rooms below. Its very expensive to have all the sheet rock replaced, furniture replaced, and in some instances, even mold starts to grow,

The construction industry is vast, especially in the state of texas. If every contractor, would be required to have a devise in place such as an insect screen it would ensure two (2) things, its extra insurance for the business owner as well as the homeowner, also, if you have such a devise in place, the homeowner would possibly get a discount on their homeowner insurance. For the resale value of a home, its a plus if you have the hvac technicians install these on each unit, therefore having the insect screen on board while installing the new furnace insures the homeowner that all precaution's have been considered in the sale of their home.

The building code forum concerning secondary condensate drains have two (2) purposes. One is to convey

condensate and the other is to warn the occupant that the primary has ceased to function. In order of importance, the secondary trumps the primary in that the secondary is the last chance to prevent an inadvertent release of condensate where it will cause damage. Gravity if available is trustworthy. A switch or pump is not trustworthy. Gravity does not wear out or get stuck but switches and pumps do. A switch or pump that has never operated, located in a dusty hot attic for fourteen (14) years might not work. This shows there is a need for emergency condensate drain line when there is a float switch as long as there is a condensate drain line then it must be protected from insects!

M10-18

IMC: 307.1, 307.1.2 (New), 307.2.3.3 (New)

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmcmann@jeffco.us)

2018 International Mechanical Code

307.1 Fuel-burning appliances. Liquid *combustion* by-products of condensing appliances shall be collected and discharged to an *approved* plumbing fixture or disposal area in accordance with the manufacturer's installation instructions. Condensate piping shall be of *approved* corrosion-resistant material and shall not be smaller than the drain connection on the appliance. Such piping shall maintain a minimum horizontal slope in the direction of discharge of not less than one eighth unit vertical in 12 units horizontal (1-percent slope).

Add new text as follows:

307.1.2 Identification. Where condensate piping is concealed, primary and secondary drain pipes that serve the same appliance and terminate together at a remote location shall be identified.

307.2.3.3 Identification. Where condensate piping is concealed, primary and secondary drain pipes that serve the same appliance and terminate together at a remote location shall be identified.

Reason:

Condensate drain systems from the same appliance need to be identified when terminating together at a remote location when the piping is concealed or partially concealed and could have possibly changed orientation. Occupants and service personnel won't be able to tell by looking at the piping which system is discharging and can't identify if they have a problem

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Simply marking the lines in a way that the code official approves should not increase the cost.

Internal ID: 121

M11-18

IMC: 307.2.1.1 (IPC [M] 314.2.1.1) (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Add new text as follows:

307.2.1.1 (IPC [M] 314.2.1.1) Condensate discharge. Condensate drains shall not directly connect to any plumbing drain, waste or vent pipe. Condensate drains shall not discharge into a plumbing fixture other than a floor sink, floor drain, trench drain, mop sink, hub drain, standpipe, utility sink or laundry sink. Condensate drain connections to a lavatory wye branch tailpiece or to a bathtub overflow pipe, shall not be considered as discharging to a plumbing fixture. Except where discharging to grade outdoors, the point of discharge of condensate drains shall be located within the same occupancy, tenant space or dwelling unit as the source of the condensate.

Reason:

The codes are silent on draining condensate to fixture connections (lav tailpiece and tub overflow) even though such practice is common in some locations. It is also common to find holes drilled into plumbing vents and stacks for the purpose of directly connecting a condensate drain. This practice is prohibited by code by strong implication, extended logic, but is not stated in plain text. This proposal lists the appropriate fixtures for receiving condensate waste and prohibits discharge to inappropriate fixtures. Condensate from one tenant space or dwelling must not discharge at a point in another tenant space or dwelling for reasons of limited access and potential damage to property.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

M12-18

IMC: SECTION 313 (New), 313.1 (New), ordinal

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Mechanical Code

Add new text as follows:

SECTION 313 SYSTEM DESIGN CONSIDERATIONS

313.1 Design of Building Water Systems. The design of building water systems shall be in accordance with ASHRAE 188.

ASHRAE

ASHRAE
1791 Tullie Circle NE
Atlanta GA 30329

188-2018:

Legionellosis: Risk Management for Building Water Systems

Reason:

ASHRAE Standard 188 was developed with the intent of providing code officials and building operators' information on how to manage the risk of legionellosis. ASHRAE Standard 188 was published on June 26, 2015, and is now publicly available as a final, published ANSI Standard. ASHRAE Standard 188 (2018) has been in continuous maintenance, and several addenda have been approved and published, as well as improvements in code compatible language which will be incorporated into the published 2018 standard. There are many design considerations in the ASHRAE standard that will help minimize Legionella bacteria growth in building water systems which can lead to Legionnaires Disease when water droplets are aerosolized and breathed in. Following the ASHRAE Standard will minimize the risk of a person contracting Legionnaires' disease or Legionellosis by having the design team consider system maintenance procedures to control the risk of legionellosis associated with plumbing & mechanical systems.

For more information on the standard, go here: <http://www.techstreet.com/ashrae/products/1897561>.

Bibliography:

Bibliography: See the following websites for more information:

www.LegionellaPrevention.org.

<http://www.cdc.gov/legionella/about/>

www.Legionella.com

www.hcinfo.com

http://www.who.int/water_sanitation_health/emerging/legionella.pdf

Cost Impact

The code change proposal will increase the cost of construction .

Buildings without a history of Legionella and not fitting the requirements will not need to add to the cost of construction. A water management plan will need to be done if a building meets certain minimum requirements. The cost of construction to address temperature, stagnation and water treatment will slightly increase the cost of construction and maintenance. Any building that is operating without growing Legionella should already has these processes in place, this will simply require documentation as part of a water management plan. This will provide for system design, operation and treatment that will minimize legionella bacteria growth and help prevent Legionnaires Disease.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

M13-18

IMC: 202 (New), 403.3.1, 403.3.2, 403.3.2.1

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Mechanical Code

Add new definition as follows:

BALANCED VENTILATION SYSTEM. A ventilation system where the total outdoor air supply air flow and total exhaust air flow are simultaneously within 10% of their average.

Revise as follows:

403.3.1 Other buildings intended to be occupied. The design of local exhaust systems and ventilation systems for outdoor air for occupancies other than Group R-2, R-3 and R-4 ~~three stories and less above grade plane~~ shall comply with Sections 403.3.1.1 through 403.3.1.5.

403.3.2 Group R-2, R-3 and R-4 occupancies, ~~three stories and less~~ occupancies. The design of local exhaust systems and ventilation systems for outdoor air in Group R-2, R-3 and R-4 occupancies ~~three stories and less in height above grade plane~~ shall comply with Sections 403.3.2.1 through 403.3.2.5.

403.3.2.1 Outdoor air for dwelling units. ~~An outdoor air~~ A balanced ventilation system ~~consisting of a mechanical exhaust system, supply system or combination thereof~~ shall be installed to provide outdoor air for each dwelling unit. ~~Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system.~~ The balanced ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.01A_{\text{floor}} + 7.5(N_{br} + 1)$$

(Equation 4-9)

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = floor area, ft²

N_{br} = number of bedrooms; not to be less than one

Exception: The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor air flow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.

Reason:

Chapter 4 requires outdoor air to be provided by an outdoor air ventilation system. For dwelling units other than those in low-rise buildings of R-2, R-3, and R-4 occupancies, this ventilation system is required to be balanced (Section 403.3.1.5). Outdoor air is defined as "Ambient air that enters a building through a ventilation system, through intentional openings for natural ventilation, or by infiltration." Unless a ventilation system is balanced, it will introduce transfer air from neighboring units, which can negate much of the benefit of ventilation. This proposal will align the requirements for low-rise mechanical ventilation units with existing requirements for mid- and high-rise ventilation units (i.e., dwelling units in buildings of all R2, R3, and R4 occupancies would need balanced ventilation systems to provide outdoor air). Further, it will permit lower ventilation rates for mid- and high-rise dwelling units than currently allowed, thereby saving significant energy.

Precedents and rationale for this proposal include:

Exhaust dwelling unit ventilation systems are not permitted for mid-rise or high-rise dwelling units in the IMC (Section 403.3.5.1 requires that systems be balanced), were not permitted for mid- or high-rise dwelling units that were in compliance with ASHRAE 62.1, and should not be permitted low-rise buildings of R-2, R-3, and R-4 occupancies either. Such systems establish pressure imbalances across dwelling units, and the majority of the makeup air introduced by such systems is not outdoor air, but is transfer air from adjacent units or corridors.

Exhaust dwelling unit ventilation with dedicated passive vent air inlets should also not be permitted in any attached dwelling unit, because research has shown that these systems consistently fail to provide the targeted outdoor air flow rates. Industry experience with dedicated makeup air inlets and a recent study conducted by the Northwest Energy Efficiency Alliance,[1] have demonstrated that occupants generally keep inlets closed. The same study concluded that, "the analysis of inlet vents failed to show clear benefits from their usage." A separate study

sponsored by the U.S. Department of Energy also found dedicated passive air inlets to be ineffective: “airflow from the passive vents was 13%–36% of the exhaust ventilation rate.... most of the makeup air comes from unintentional sources—from leaks in the exterior envelope, neighboring apartments, or the corridor.”[2] Further, this study demonstrated that verifying the targeted outdoor air flow rate at dedicated outdoor air inlets was not possible in the dwelling units tested.

Supply-only outdoor air systems with or without dedicated makeup air outlets solve some of the problems with exhaust systems (e.g., providing a known source of filtered outdoor air), but they too induce pressure differentials that can lead to transfer of odors and pollutants across dwelling units and between dwelling units and corridors/common areas, diminishing the benefit of providing filtered outdoor air.

Unlike exhaust-only systems, exhaust with dedicated passive vent outdoor air inlets, and supply-only systems, **balanced mechanical ventilation systems** do not induce pressure differentials across attached dwelling units and do not introduce transfer air with outdoor air. The IMC already requires that high-rise dwelling unit “ventilation systems shall be balanced by an approved method” (2015 IMC Section 403.3.1.5). Reducing pressure differentials not only reduces the transfer of odor and pollutants between dwelling units and corridors/common areas, but it also limits the migration of moisture through building assemblies via air leakage, which can lead to condensation, mold, and durability problems. Additionally, balanced systems are able to provide filtered air directly from the outdoors and to temper the outdoor air (if provided with a heat or energy recovery core), increasing the likelihood of system operation by occupants.

[2] Maxwell, S., Berger, D., and Zuluaga, M. 2016. Evaluation of Passive Vents in New Construction Multifamily Buildings. (Subcontractor Report, NREL/SR-5500-64758). Golden, CO: National Renewable Energy Laboratory.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the costs of engineering and construction where similar requirements do not already exist. For example, the IMC already requires that ventilation air be balanced for mid- and high-rise dwelling units. The requirement for balanced ventilation can be achieved by coupling an in-line supply fan with an exhaust fan that has a similar exhaust rate. Where balanced ventilation is not already required by the IMC, exhaust fans are required. Assuming that the exhaust fan is already installed, the incremental cost is associated with the supply fan, supply fan ducting, and the control/wiring to run both the supply and exhaust fan off a single switch. An in-line supply fan costs around \$120 retail. Ducting for the in-line supply fan can be estimated at ~\$19 per linear foot, or ~\$100 for a short, 5' run from the exterior. In-line supply fans are frequently specified to provide outdoor air in multifamily projects - especially in warm and mild climates. Where this is the case, the only incremental costs associated with this proposal would be for the wiring and switch to control the supply and exhaust fan simultaneously. Any incremental costs incurred are expected to decrease as balanced systems become more common; furthermore, the incremental costs are offset by the expected improvement in air quality and its associated health benefits.

Internal ID: 2371

M14-18

IMC: 307.2.2 (IPC [M] 314.2.2)

Proponent: Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

2018 International Mechanical Code

Revise as follows:

307.2.2 Drain pipe materials and sizes. Components of the condensate disposal system shall be ABS, cast iron, ~~galvanized steel~~, copper, ~~and~~ copper alloy, CPVC, cross-linked polyethylene, ~~galvanized steel~~, PE-RT, polyethylene, ~~ABS polypropylene~~, CPVC, PVC, ~~or polypropylene~~ PVDF pipe or tubing. Components shall be selected for the pressure and temperature rating of the installation. Joints and connections shall be made in accordance with the applicable provisions of Chapter 7 of the International Plumbing Code relative to the material type. Condensate waste and drain line size shall be not less than $\frac{3}{4}$ -inch pipe size internal diameter and shall not decrease in size from the drain pan connection to the place of condensate disposal. Where the drain pipes from more than one unit are manifolded together for condensate drainage, the pipe or tubing shall be sized in accordance with Table 307.2.2.

Reason:

List should be alphabetized. PERT and PVDF pipes and tubes already in the code could certainly be used in the application.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Adding other options for materials will not alter cost.

Internal ID: 950

M15-18 Part I

IMC: 401.2

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

THIS IS A 2 PART CODE CHANGE. BOTH PARTS WILL BE HEARD BY THE IMC COMMITTEE. PLEASE SEE THE HEARING ORDER FOR THE IMC COMMITTEE.

2018 International Mechanical Code

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2 inch water column (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code, the dwelling unit~~ Group-R dwelling units served by space-heating or cooling equipment shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

Internal ID: 596

M15-18 Part II

IBC: 1202.1

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

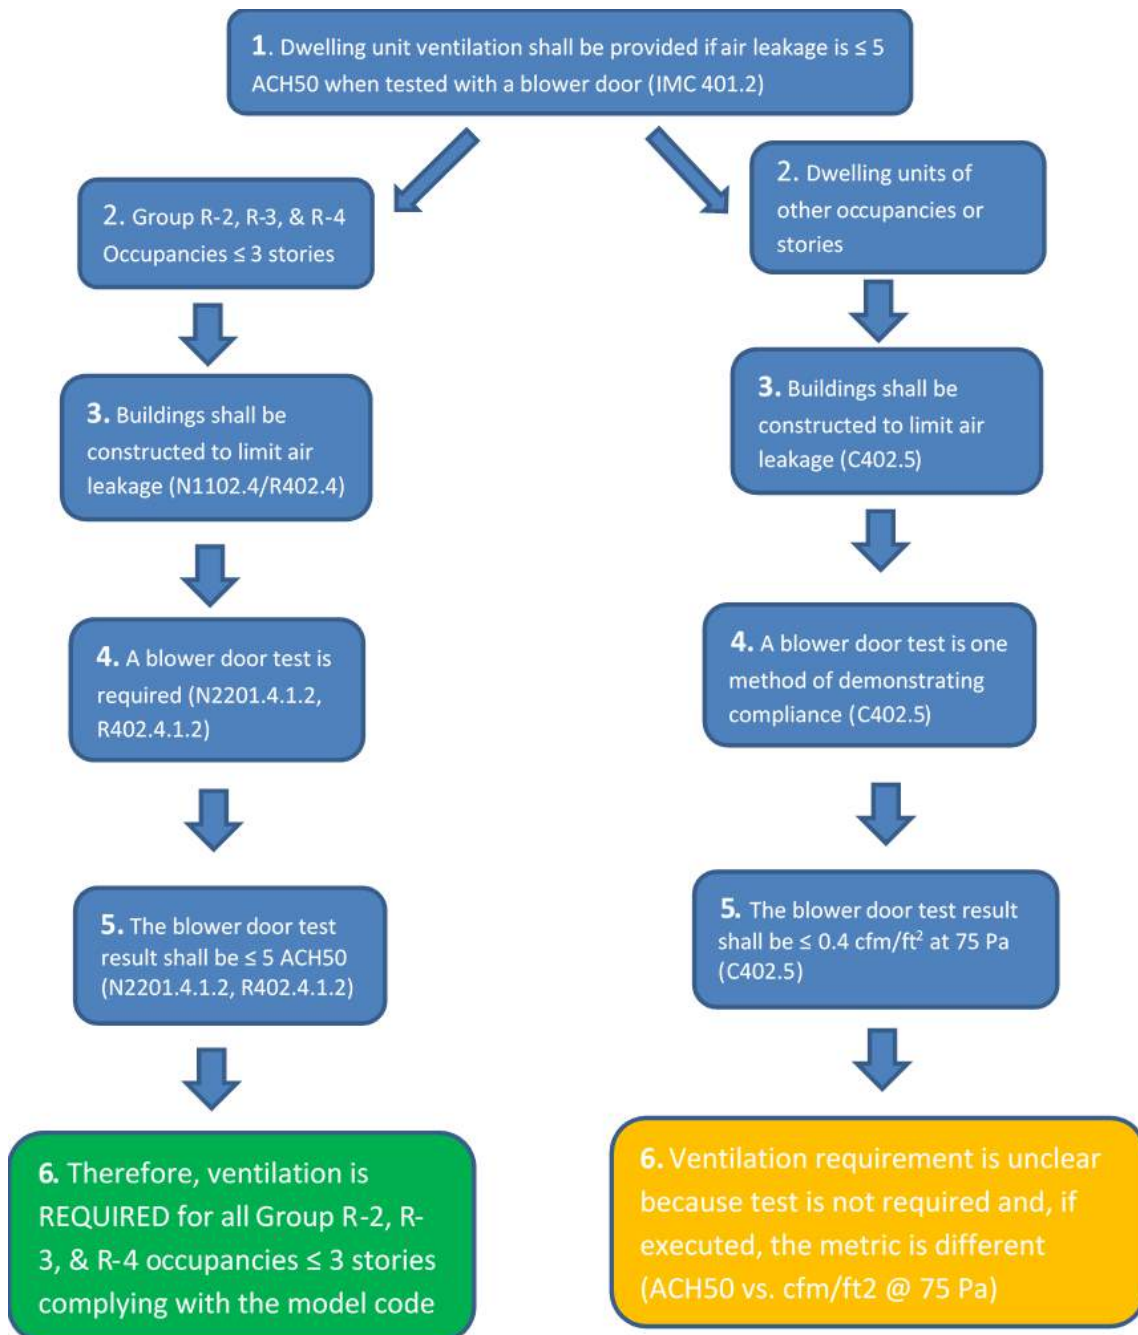

2018 International Building Code

1202.1 General. Buildings shall be provided with natural ventilation in accordance with Section 1202.5, or mechanical ventilation in accordance with the International Mechanical Code. ~~Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour where tested with a blower door at a pressure 0.2 inch w.c. (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code—Residential Provisions, the dwelling unit~~ . Group R dwelling units served by the space-heating or cooling equipment shall be ventilated by mechanical means in accordance with Section 403 of the International Mechanical Code. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407 of the International Mechanical Code.

Reason:

Building tight dwelling units has benefits of energy efficiency; improved comfort; and improved odor, rodent, and sound control. Tight buildings are typically the byproduct of better fire and smoke control as well. Beginning with the 2012 IECC, building tight has been code minimum practice, which is good. However, we learned in the 1970s that building tight without mechanically ventilating results in sick building syndrome.

So, since 2012, the code has required that when dwelling units are tested and verified to be tight, they also be provided with mechanical ventilation. The problem is that we've heard from ICC staff, code officials, builders, and design professionals that it's hard to follow the code language requirements. Currently, we have a 6-step process to identify that mechanical ventilation is required for all low-rise, Group-R IMC dwelling units. For mid- and high-rise dwelling units that are built to the IECC commercial chapter, it's not clear whether mechanical ventilation is required since they have a different testing metric than is referenced in Section 401.2 of the IMC. This introduces needless confusion. Here's what the process looks like:

Instead of a 6-step process, we can simplify the code and enforcement by jumping straight to the conclusion for low-rise, Group R-2, R-3, and R-4 occupancies: mechanical ventilation is required for all dwelling units. This proposal does exactly that. Additionally, this proposal recognizes that the target maximum leakage rate for high-rise dwelling units (0.4 cfm/ft² @ 75 Pa) is comparable to that of low-rise dwelling units (5 ACH50), and the effective leakage to outdoors for all attached dwelling units is far below that of single family detached homes that are already required by the IRC to provide mechanical ventilation. Additionally, U.S. Census data show that occupancy per square foot of floor area in multifamily dwelling units is almost twice that of single family dwelling units, demonstrating a greater need for mechanical ventilation in multifamily dwelling units. For these reasons, the I-code requirement for mechanical ventilation of dwelling units should be extended beyond the current requirement for only low-rise dwelling units to include mid- and high-rise dwelling units.

Finally, this proposal introduces an exception for the mechanical ventilation requirement in climates and situations where natural ventilation is expected to provide all of the climate control and ventilation needed (i.e., when no space-heating or cooling equipment is provided). A similar exception exists in ASHRAE 62.2.

Cost Impact

The code change proposal will increase the cost of construction .

Ventilation is already required for IMC Group R-2, R-3, and R-4 dwelling units, so this proposal will not increase the cost of construction for these dwelling units. This proposal will increase the cost of construction for mid- and high-rise

dwelling units that are not currently provided with mechanical ventilation. However, this initial investment may be recouped by building owners based on greater tenant satisfaction and retention with respect to indoor air quality.

Internal ID: 3484

M16-18

IMC: 401.4, 501.3.1

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Mechanical Code

Revise as follows:

401.4 Intake opening location. Air intake openings shall comply with all of the following:

1. Intake openings shall be located not less than 10 feet (3048 mm) from lot lines or buildings on the same lot.
2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, streets, alleys, parking lots and loading docks, except as specified in Item 3 or Section 501.3.1. Outdoor air intake openings shall be permitted to be located less than 10 feet (3048 mm) horizontally from streets, alleys, parking lots and loading docks provided that the openings are located not less than 25 feet (7620 mm) vertically above such locations. Where openings front on a street or public way, the distance shall be measured from the closest edge of the street or public way.
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening. Separation is not required between intake air openings and living space exhaust air openings of an individual dwelling unit or sleeping unit where a factory-built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the manufacturer's instructions.
4. Intake openings on structures in flood hazard areas shall be at or above the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment.

501.3.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings that are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.
3. For all *environmental air* exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings into buildings for all occupancies other than Group U, and 10 feet (3048 mm) from mechanical air intakes. Such exhaust shall not be considered hazardous or noxious. Separation is not required between intake air openings and living space exhaust air openings of an individual dwelling unit or sleeping unit where a factory-built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the manufacturer's instructions.
4. Exhaust outlets serving structures in flood hazard areas shall be installed at or above the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment.
5. For specific systems, see the following sections:
 - 5.1. Clothes dryer exhaust, Section 504.4.
 - 5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.13, 506.4 and 506.5.
 - 5.3. Dust, stock and refuse conveying systems, Section 511.2.
 - 5.4. Subslab soil exhaust systems, Section 512.4.
 - 5.5. Smoke control systems, Section 513.10.3.
 - 5.6. Refrigerant discharge, Section 1105.7.
 - 5.7. Machinery room discharge, Section 1105.6.1.

Reason:

This proposal is very similar to a PMGCAC proposal on the same subject. The only difference is that this proposal does not include the word "approved" in front of "factory-built intake/exhaust termination combination fitting". In some jurisdictions, equipment or products requiring approval will trigger an "alternative means and methods" process to secure a permit. As explained in the reason statement below, these products have been determined to perform well across manufacturers and models. With good performance and insignificant deviation across products, there is no need to further scrutinize these products or delay permits for dwelling units that specify them. This is the position of the Home Ventilating Institute.

The rest of the reason statement echoes that in the PMGCAC proposal:

Intake/exhaust combination terminations are regularly installed with heating and energy recovery ventilators (H/ERVs) used for dwelling units. Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water.

Manufacturer tests conducted by Natural Resources Canada (NRC) have demonstrated that use of intake/exhaust combination terminations results in minimum cross-contamination of airflows (i.e., not exceeding 4%; see NRC report A1-007793¹). These results are aligned with ASHRAE 62.2 approval of such devices which limits cross-contamination to 10%, as verified by the manufacturer. If approved, this proposed modification to the IRC would limit application of intake/exhaust combination terminations to "factory-built" units. Approval of this proposed modification is expected to result in more affordable and architecturally-flexible terminations.

Note: The IRC defines living space as, "space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes". The use of the term "environmental air" was also considered, but was abandoned because "environmental air" can also include exhaust air from parking garages and clothes dryers, which we want to exclude from this exception.

Bibliography:

1. Ouazia, B. 2016. Evaluation of a dual hood performance in term of contaminant re-entrainment from exhaust to supply. A1-007793. National Research Council Canada. For a copy of the report, please contact the proponent at the email address provided. Additional reports are available from the proponent upon request.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal can reduce the number of intake and exhaust penetrations required for a dwelling unit, thereby reducing the cost of construction.

Internal ID: 1915

M17-18

IMC: 401.4, 501.3.1

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

401.4 Intake opening location. Air intake openings shall comply with all of the following:

1. Intake openings shall be located not less than 10 feet (3048 mm) from lot lines or buildings on the same lot.
2. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, streets, alleys, parking lots and loading docks, except as specified in Item 3 or Section 501.3.1. Outdoor air intake openings shall be permitted to be located less than 10 feet (3048 mm) horizontally from streets, alleys, parking lots and loading docks provided that the openings are located not less than 25 feet (7620 mm) vertically above such locations. Where openings front on a street or public way, the distance shall be measured from the closest edge of the street or public way.
3. Intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening. Separation is not required between intake air openings and living space exhaust air openings of an individual dwelling unit or sleeping unit where an approved factory-built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the manufacturer's instructions.
4. Intake openings on structures in flood hazard areas shall be at or above the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment.

501.3.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings that are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.
3. For all *environmental air* exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings into buildings for all occupancies other than Group U, and 10 feet (3048 mm) from mechanical air intakes. Such exhaust shall not be considered hazardous or noxious. Separation is not required between intake air openings and living space exhaust air openings of an individual dwelling unit or sleeping unit where an approved factory-built intake/exhaust combination termination fitting is used to separate the air streams in accordance with the manufacturer's instructions.
4. Exhaust outlets serving structures in flood hazard areas shall be installed at or above the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment.
5. For specific systems, see the following sections:
 - 5.1. Clothes dryer exhaust, Section 504.4.
 - 5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.13, 506.4 and 506.5.
 - 5.3. Dust, stock and refuse conveying systems, Section 511.2.
 - 5.4. Subslab soil exhaust systems, Section 512.4.
 - 5.5. Smoke control systems, Section 513.10.3.
 - 5.6. Refrigerant discharge, Section 1105.7.
 - 5.7. Machinery room discharge, Section 1105.6.1.

Reason:

Intake/exhaust combination terminations are regularly installed with heating and energy recovery ventilators (H/ERVs) used for dwelling units. Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water.

Manufacturer tests conducted Natural Resources Canada (NRC) have demonstrated that use of intake/exhaust combination terminations results in minimum cross-contamination of airflows (i.e., not exceeding 4%; see NRC report A1-007793¹). These results are aligned with ASHRAE 62.2 approval of such devices which limits cross-contamination to 10%, as verified by the manufacturer. If approved, this proposed modification is expected to result in more affordable and architecturally flexible terminations.

Note: The IRC defines living space as, “space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes”.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Bibliography:

Ouazia, B. 2016. Evaluation of a dual hood performance in term of contaminant re-entrainment from exhaust to supply. A1-007793. National Research Council Canada. For a copy of the report, please contact the proponent at the email address provided. Additional reports are available from the proponent upon request.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

IMC: 403, 403.2.1, ordinal

Proponent: David Bixby, Air Conditioning Contractors of America (ACCA), representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

2018 International Mechanical Code

Revise as follows:

SECTION 403 MECHANICAL VENTILATION

403.2.1 Recirculation of air. The outdoor air required by Section 403.3 shall not be recirculated. Air in excess of that required by Section 403.3 shall not be prohibited from being recirculated as a component of supply air to building spaces, except that:

1. Ventilation air shall not be recirculated from one *dwelling* to another or to dissimilar occupancies.
2. Supply air to a swimming pool and associated deck areas shall not be recirculated unless such air is dehumidified to maintain the relative humidity of the area at 60 percent or less. Air from this area shall not be recirculated to other spaces where more than 10 percent of the resulting supply airstream consists of air recirculated from these spaces. The design and installation of dehumidification systems shall comply with ACCA Manual SPS, HVAC Design for Swimming Pools and Spas.
3. Where mechanical exhaust is required by Note b in Table 403.3.1.1, recirculation of air from such spaces shall be prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited. Where recirculation of air is prohibited, all air supplied to such spaces shall be exhausted, including any air in excess of that required by Table 403.3.1.1.
4. Where mechanical exhaust is required by Note g in Table 403.3.1.1, mechanical exhaust is required and recirculation from such spaces is prohibited where more than 10 percent of the resulting supply air-stream consists of air recirculated from these spaces. Recirculation of air that is contained completely within such spaces shall not be prohibited.

Add new standard(s) follows:

ACCA

Air Conditioning Contractors of
America
2800 Shirlington Road, Suite 300
Arlington VA 22206

ANSI/ACCA 10 Manual SPS - 2010 RA 2017:

HVAC Design for Swimming Pools and Spas

Reason:

ACCA Manual SPS, HVAC Design for Swimming Pools and Spas, is a manual specifically focused on the design of HVAC systems for indoor pools and spas. Manual SPS is an ANSI-recognized standard that was developed with input from original equipment manufacturers (OEM), mechanical contractors, and consulting engineers. Manual SPS addresses the unique dynamics for pools and spas including controlling dew point temperatures of space air as well as space temperature, sealing and insulating duct work, and dehumidification systems and indoor air quality.

ACCA Manual SPS is proposed to be added to Chapter 15 Referenced Standards to support a proposed change to 403.2.1 adding SPS as a requirement for dehumidification design for swimming pools.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cost impacts for using Manual SPS will depend on the extra time involved in designing and coordinating an HVAC system for a swimming pool or spa project. System designers and installers must first scrutinize a project's plans and coordinate directly with the architect or builder to identify potential condensation, moisture control and air quality problems. These potential issues must be resolved between all parties before proceeding with the mechanical design. Once this has been addressed, the designer/installer will follow Manual SPS to install systems and OEM equipment used for controlling dew point temperature and dry-bulb temperature in an enclosed pool-spa space. .

M19-18

IMC: 404.1

Proponent: Randall Dahmen, Self, representing Self

2018 International Mechanical Code

Revise as follows:

404.1 Enclosed parking garages. Mechanical ventilation systems for enclosed parking garages shall operate continuously or shall be automatically operated by means of carbon monoxide detectors applied in conjunction with nitrogen dioxide detectors. Such detectors shall be listed in accordance with UL 2075 and installed in accordance with their listing and the manufacturers' instructions. Carbon monoxide detectors shall operate the system automatically at a level of 35 parts per million (ppm) and higher. Nitrogen dioxide detectors shall operate the system automatically at a level of 1 part per million (ppm) and higher. Automatic operation shall cycle the ventilation system between the following two modes of operation:

- 1.Full-on at an airflow rate of not less than 0.75 cfm per square foot [$0.0038 \text{ m}^3/(\text{s} \cdot \text{m}^2)$] of the floor area served.
- 2.Standby at an airflow rate of not less than 0.05 cfm per square foot [$0.00025 \text{ m}^3/(\text{s} \cdot \text{m}^2)$] of the floor area served.

Reason:

Carbon monoxide and nitrogen dioxide detectors are manufactured with a wide variety of detection capability. The current language is vague and provides no direction as to the threshold at which the detectors are to require operation of enclosed parking garage ventilation systems..

The Occupational Safety and Health Administration (OSHA) permissible exposure limit for carbon monoxide is 50 ppm of air, or 55 milligrams per cubic meter (mg/m^3) as an eight-hour time-weighted average concentration. The National Institute for Occupational Safety and Health (NIOSH) recommends exposure levels (REL) below the OSHA air-quality numbers. They recommend keeping exposure to less than 35ppm, or $40 \text{ mg}/\text{m}^3$ in eight hours.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code already requires the installation of carbon monoxide, as well as nitrogen dioxide, detectors. The proposed change only involves addressing the threshold at which they operate.

Internal ID: 1667

M20-18

IMC: 401.2, 403.1

Proponent: Shaunna Mozingo, representing City of Cherry Hills Village, Colorado Code Consulting (smozingo@coloradocode.net)

2018 International Mechanical Code

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code, the dwelling unit shall be ventilated by Dwelling units complying with the air leakage requirements of the International Energy Conservation Code or ASHRAE 90.1 shall be ventilated by~~ mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air* except that mechanical ventilation air requirements for Group R-2, R-3 and R-4 occupancies ~~three stories and less in height above grade plane~~ shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

Reason:

After receiving many questions on the ventilation requirements for R-2 dwellings it has become clear that this section of the IMC is not easily understood, agreed with or being enforced as written. A stakeholder group was put together to tackle the issue and to see how we could change the ventilation requirements to be better understood. The group consisted of members from CAPMO, PNNL, Commissioning Agents, Mechanical Engineers, Code Officials, energy raters and energy advocates.

The mantra of the meeting was: "We either agree that it isn't required or agree that it is - then we change it."

Here were the discussed issues that we saw:

1: The lack of understanding of R-2's over 3 stories or 3 stories and less. (IECC definitions of residential and commercial buildings). Most people aren't looking at these definitions in the IECC so they all assume that since an "R-2" is built out of the IBC it is considered a commercial building in the IECC. When they get to the IMC and it starts talking about 3 stories or less and over 3 stories they don't understand why the buildings are treated differently for ventilation or any other requirement. While, from a building science perspective it can make sense why these buildings are separated this way, a lot of education time is spent on this very issue.

RESIDENTIAL BUILDING. For this code, includes detached one- and two-family dwellings and multiple single-family dwellings (townhouses) as well as Group R-2, R-3 and R-4 buildings three stories or less in height above grade plane.

COMMERCIAL BUILDING. For this code, all buildings that are not included in the definition of "Residential building."

2: IMC wording that is confusing, especially for people who also read the IRC Mechanical and the IECC because they aren't worded the same and it makes it hard to know what the requirements are. Some confusion came in by code officials who were requiring mechanical ventilation for all R-2s, commercial or residential, because they felt that the section below was stating that all envelopes had to be as tight as 3ach/50 even if they weren't tested. We had to go to ICC for an interpretation of the issues because 50% of the people believed mechanical ventilation was required for any R-2 and 50% believed it was only required for R-2s 3 stories or less.

401.2 Ventilation required.

Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and I-2 occupancies shall be ventilated by mechanical means in accordance with

Section 407.

403.1 Ventilation system.

Mechanical ventilation shall be provided by a method of supply air and return or exhaust air except that mechanical ventilation air requirements for Group R-2, R-3 and R-4 occupancies three stories and less in height above grade plane shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and exhaust air. The system shall not be prohibited from producing negative or positive pressure. The system to convey ventilation air shall be designed and installed in accordance with Chapter 6.

3: ICC's code opinion:

From: Jason Toves <jtoves@ICCSafe.ORG> **Sent:** Wednesday, April 12, 2017 1:07 PM **To:** Shaunna Mozingo **Cc:** Renee Testroet **Subject:** RE: Section 401.2 - 2015 IMC

Ms. Mozingo,

Following are the responses to your questions.

April 12, 2017

RE: 15 IMC 401.2

Q1: Are R-2 occupancies in commercial buildings, as defined in the 2015 IECC, required to have a blower door test performed per Section 401.2 of the 2015 IMC?

A1: No, Section 401.2 of the IMC does not require blower door testing of R-2 occupancies in commercial buildings. It requires mechanical ventilation when R-2 occupancies are tested in accordance with Section R402.4.1.2 of the International Energy Conservation Code and the air infiltration rate is less than 5 air changes per hour, without requiring such testing.

Q2: Are R-2 occupancies in commercial buildings, as defined in the 2015 IECC, required to be mechanically ventilated per Section 401.2 of the 2015 IMC?

A2: No, Section 401.2 requires either natural ventilation per Section 402 or mechanical ventilation per Section 403. Section 401.2 only requires mechanical ventilation when R-2 occupancies are tested in accordance with Section R402.4.1.2 of the International Energy Conservation Code and the air infiltration rate is less than 5 air changes per hour, without requiring mechanical ventilation for R-2 occupancies in commercial buildings.

It should be noted that Section R402.4.1.2 of the 2015 International Energy Conservation Code applies to "Residential Buildings" (as defined in the IECC) only.

So now you decide, should ventilation actually be required in R-2 occupancies over 3 stories the same as it should be in buildings of less than 3 stories? Why should it be different when both codes require a tight building envelope with continuous air barriers?

The overarching feeling from the group was: "Everyone is building tight. Hinging mechanical ventilation on a test is causing a problem. It should just be required for all R occupancies."

We played around with the wording and finally just decided that it was easiest to just say that if your envelope complies with an energy code you must provide mechanical ventilation. It was that simple so that is what we did.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction but depending on the method chosen to mechanically ventilate (balanced, exhaust only, supply only), the cost typically only includes the cost of a timer/timers for an exhaust fan that is already required in a bathroom so that it runs continuously or down to 25% of the time. There are definitely climates where an exhaust only or supply only system are not recommended but there are more and more options for an economical balanced system that doesn't rely on an ERV or HRV, even though those costs are coming down as well.

For SI: 1 cubic foot per minute = 0.0004719 m³/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 m³/(s • m²), °C = [(°F) -32]/1.8, 1 square foot = 0.0929 m².

- a. Based on *net occupiable floor area*.
- b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).
- c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.
- d. Ventilation systems in enclosed parking garages shall comply with Section ~~404.404~~.
- e. Rates are per water closet or urinal. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
- f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
- g. Mechanical exhaust is required and recirculation from such spaces is prohibited except that recirculation shall be permitted where the resulting supply airstream consists of not more than 10 percent air recirculated from these spaces. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).
- h. For nail salons, each manicure and pedicure station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per ~~station~~ station as measured not more than 12 inches (305 mm) horizontally and vertically from the point of chemical application. Exhaust inlets shall be located in accordance with Section 502.20 ~~and 502.20.1~~. ~~Where one or more required source capture systems operate continuously during occupancy, the exhaust rate and outdoor airflow rate from such systems shall be permitted to be applied to the exhaust flow rate and outdoor airflow rate required by Table 403.3.1.1 for the nail salon.~~
- i. Where nail salon services or a nail salon occupancy is ancillary to the main occupancy classification and a source capture system is provided in accordance with Section 502.20 and 502.20.1, the minimum ventilation rates for the main occupancy classification shall be permitted according to Table 403.3.1.1.

502.20 Manicure and pedicure stations. Manicure and pedicure stations shall be provided with ~~an a source capture exhaust system~~ in accordance with Table 403.3.1.1, Note h. Manicure tables and pedicure stations ~~not provided with factory installed exhaust inlets~~ shall be provided with fixed in-place, immovable exhaust inlets located not more than 12 inches (305 mm) horizontally and vertically from the point of chemical application and shall not draw fumes or contaminants past the human face. The source capture exhaust system shall be prohibited from recirculating air and shall discharge exhaust in accordance with Section 501.3 and shall also comply with the provisions of Section 502.20.1.

Add new text as follows:

502.20.1 Makeup Air. Makeup air shall be supplied during the operation of source capture exhaust systems that are provided for manicure tables and pedicure stations . The amount of makeup air supplied to the building from all sources shall be approximately equal to the amount of exhaust air for all exhaust systems for the building. The makeup air shall not reduce the effectiveness of the exhaust system. Makeup air shall be provided by gravity or mechanical means or both. Mechanical makeup air systems shall be automatically controlled to start and operate simultaneously with the exhaust system. Makeup air intake opening locations shall comply with Section 401.4. and Makeup air temperature shall comply with Section 508.1.

**Reason:
INTRODUCTION**

"Many of us go to nail salons to relax and to be pampered. We don't think of these places as potentially hazardous work environments, yet for many manicurists, regular on-the-job exposure to toxic chemicals is a reality. Workers often experience headaches, dizziness, rashes and other acute symptoms. Some chemicals are known to cause cancer and reproductive, developmental, and respiratory harm" (a)

The intent of these suggested modifications is to (1) better clarify the requirements for a source capture exhaust

system at manicure and pedicure stations where ambiguity exists, and to (2) better ensure the effectiveness of the exhaust system in removing harmful fumes and contaminants at the source and providing a healthy, safe environment for nail salon workers and their clients.

1. PROPOSED MODIFICATION TO TABLE 403.3.1.1 note h.

REASON: The suggested modification to note h in Table 403.3.1.1 attempts to clarify the minimum distance from which the exhaust rate is to be measured and give the AHJ or design professional better criteria by which to test and confirm code compliance. Also the balancing of exhausted air with makeup air is required by the IMC, therefore, the outdoor airflow rate should be permitted to be applied to the outdoor airflow rate required by Table 403.3.1.1 for the same reasons the exhaust rate is currently permitted to be applied when the source capture system is running continuously during occupancy.

2. PROPOSED ADDITION of note j TO TABLE 403.3.1.1

REASON: The addition of note j attempts to address increasing instances where nail services are offered in places like a retail or business occupancy where those nail services are not the primary business or occupancy. In these circumstances, if a source capture system is installed in accordance with Section 502.20 and 502.20.1, additional equipment and higher operating costs to comply with the greater nail salon ventilation rates would be reduced.

3. PROPOSED MODIFICATION TO SECTION 502.20 Manicure and Pedicure Stations

REASON: Work practices are an important part of achieving successful control of fume exposures; in particular, positioning the exhaust inlet close to the source of chemical application.

It is easy to confuse a fan's ability to blow a jet of air with it's ability to draw air into an exhaust inlet. That's why an exhaust inlet must be close to the source of the contamination to be an effective source capture system. Frequent changes in the location and position of the exhaust inlet from the source of chemical application can diminish the exhaust system's ability to draw air into the exhaust inlet at the code-required minimum air flow rate.

Therefore, it is suggested that the code require the exhaust inlets to be fixed in-place and immovable (for both factory and field installations) to ensure the desired maximum source capture effectiveness without depending on user control or placement.

Although a 50CFM exhaust rate at 12 inches (horizontally and vertically) from the source of chemical application is effective in capturing fumes and other contaminants, it's important to recognize that even when this requirement is met, the possibility of fumes to be drawn past the face of the technician and consumer still exist. This suggested modification helps to eliminate this possibility.

It is important to clarify that source capture exhaust is to be discharged to the outdoors and not recirculated. This requirement is consistent with other exhaust systems regulated by the IMC. We suggest including a reference to existing Section 501.3 to better clarify this requirement.

4. PROPOSED NEW SUB-SECTION: 502.20.1 Makeup Air.

REASON: The suggested addition of a new sub-section intends to recognize and reinforce the requirement for balancing the exhausted air with makeup air and help provide guidance on intake opening locations and makeup air temperature by referencing existing Sections 401.4 and 508.1 respectively.

M22-18

IMC: 401.3

Proponent: Randall Dahmen, Self, representing Self

2018 International Mechanical Code

Revise as follows:

401.3 When required. Ventilation shall be provided during the periods that the room or space is occupied.

For swimming pool and deck areas, ventilation shall be provided continuously.

Reason:

Swimming pool and deck areas are commonly known to be susceptible to the growth of mold. Current language only requires ventilation to be provided when a room or space is occupied. It is a known fact that swimming pool areas continue to create humidity, distribute chloramines, etc. even when there is no individual in the space. The State of Wisconsin requires that natatorium areas be ventilated continuously. When complaints are made concerning swimming pool areas, one of the first efforts in the investigation is to validate that the ventilation is fully functional and operating continuously. It has been found on multiple occasions that the lack of a functioning ventilation system is the typical cause of a swimming pool mold problem, as well as indoor air quality issue.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The equipment required to operate the swimming pool ventilation equipment is already required by code.

Internal ID: 1566

M23-18

IMC: 403.3.1.2

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Mechanical Code

Revise as follows:

403.3.1.2 Exhaust ventilation. Exhaust airflow rate shall be provided in accordance with the requirements of Table 403.3.1.1. Outdoor air introduced into a space by an exhaust system shall be considered as contributing to the outdoor airflow required by Table 403.3.1.1. Intermittently operated exhaust fans in toilet rooms, bathrooms and shower rooms shall be provided with a delay-shutoff timer, occupant sensor or humidity sensor control.

Reason:

This code change provides compliance options for intermittently operated exhaust fans when the facility is occupied (occupant or humidity sensor activation) and for a limited period of time after the user leaves the room (delay timer, occupant or humidity sensor deactivation). Delay timer, occupant and humidity sensor exhaust fan controls are a consistent and effective means of removing moisture and pollutants from toilet, bath and shower facilities in private dwellings and public spaces in accordance with IMC Table 403.3.1.1.

The humidity level in a restroom or shower facility can be a perfect breeding ground for mold, mildew and micro-organisms that can negatively impact occupant health. Excess moisture has tremendous potential for damaging a building. It cracks and peels paint, ruins gypsum wallboard, causes exterior paint failure, warps doors and rusts cabinets and fixtures. Without control, it can even cause deterioration of joists and framing. As it condenses on windows, walls, ceilings and cabinets, it attracts dirt. It encourages mildew on tile grout and generally provides an environment for increased bacterial growth.

According to the Home Ventilation Institute, an intermittently operated exhaust fan needs to run at least 20 minutes after each shower to sufficiently remove moisture from an average size bathroom. Exhaust systems reduce the risk of mildew and mold growth which is a sanitation and durability concern in dwellings and public spaces, regardless of climate. Delay timer, occupant and humidity sensor controlled exhaust fans are more effective than a manually operated fan or an operable window that is usually left closed during the winter and summer months of the year.

Automatic shut-off controls help to ensure exhaust fan operates when toilet, bath and shower facilities are in use and for a limited period of time after the user leaves the room. Automatic controls also save energy by ensuring fans don't unnecessarily run after removal of moisture and pollutants.

Bibliography:

ASHRAE 62.1-2016 Ventilation and Acceptable Indoor Air Quality

Home Ventilating Institute - <http://www.hvi.org/publications/HowMuchVent.cfm>

Cost Impact

The code change proposal will increase the cost of construction .

A basic dial delay timer switch costs \$15, a basic occupant sensor costs \$10 and a basic humidity sensor switch costs \$46. Timer, occupant and moisture controlled exhaust fans reduce the potential of making costly moisture damage repairs to correct problems that is easy to avoid with sufficient local exhaust.

For SI: 1 cubic foot per minute = 0.0004719 m³/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 m³/(s • m²), °C = [(°F) - 32]/1.8, 1 square foot = 0.0929 m².

- a. Based on *net occupiable floor area*.
- b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).
- c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.
- d. Ventilation systems in enclosed parking garages shall comply with Section 404.
- e. Rates are per water closet or urinal. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
- f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
- g. Mechanical exhaust is required and recirculation from such spaces is ~~prohibited except that recirculation shall be permitted where the resulting supply airstream consists of not more than 10 percent air recirculated from these spaces.~~ prohibited. For occupancies other than science laboratories, where there is a wheel type energy recovery ventilation (ERV) unit in the exhaust system design, the volume of air leaked from the exhaust airstream into the outdoor airstream within the ERV shall be less than 10 percent of the outdoor air volume. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).
- h. For nail salons, each manicure and pedicure station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

Reason:

The proposed change makes the code intended language consistent with ASHRAE 62.1-2016.

As written the exception allows a larger percentage of recirculated exhaust air that may negatively affect IAQ.

A simple way to look at the current language is that the purpose of exhaust is to remove the air and its associated compounds from the building. Allowing 10% supply air to consist of exhausted air compromises the purpose of exhaust.

Bibliography:

ASHRAE 62.1 - 2016

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal revises recirculation air requirements. However, this does not dictate system design to meet those requirements and therefore does not increase the cost of construction.

Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

Reason:

This proposal seeks to update the existing ventilation rate table in the IMC. Standard 62.1 is the source material for this table, and this updates table 403.3.1.1 to match the appropriate ventilation rates in 62.1-2016.

Bibliography:

ASHRAE Standard 62.1-2016

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal revises ventilation rates for specific spaces within varying occupancy classifications. For systems where the exhaust airflow rate was increased, these systems also had a minimum and maximum ventilation rate based on the frequency of occupation within that space. The exhaust airflow values that were increased were the minimum values for kitchens and restrooms. These spaces are infrequently occupied, leading to the maximum value of exhaust ventilation being required. Therefore, this proposal does increase the cost of construction.

Internal ID: 354

M26-18

IMC: SECTION 403, 403.4 (New)

Proponent: Craig Conner, representing self (craig.conner@mac.com)

2018 International Mechanical Code

SECTION 403 MECHANICAL VENTILATION

Add new text as follows:

403.4 Devices venting combustion products into conditioned space. Permanently installed combustion appliances that are designed to vent combustion products into occupied conditioned space shall be approved by a licensed design professional.

Exception: Stoves, ovens and pilot lights.

Reason:

Combustion devices which are designed to vent combustion products into the conditioned space are high risk from the perspective of indoor air quality. These devices also increase interior moisture and can add contaminants such as NO_x (nitrous oxides).

Cost Impact

The code change proposal will increase the cost of construction .

There will likely be a cost associated with the review by a licensed design professional. However, it is also possible that the design professional will be less expensive than correcting any problem resulting from routinely venting combustion products into conditioned space.

Internal ID: 2011

M27-18

IMC: 403.3.1.1 (New), 403.3.1.1.1, 403.3.1.1.2 (New), 403.3.1.1.2.1 (New), 403.3.1.1.2.2 (New), 403.3.1.1.2.3 (New), 403.3.1.1.2.4 (New), 403.3.1.1.2.4.1 (New), 403.3.1.1.2.4.2 (New), 403.3.1.1.2.4.3 (New), 403.3.1.1.2.5 (New), 403.3.1.1.2.6 (New), 403.3.1.1.2.7 (New)

Proponent: Michael McFarland, enVerid Systems, representing enVerid Systems (mmcfarland@enverid.com)

2018 International Mechanical Code

Add new text as follows:

403.3.1.1 Outdoor Airflow Rate. The outdoor air flow rate shall comply with the ventilation rate procedure specified in Section 403.3.1.1.1 or the indoor air quality procedure specified in Section 403.3.1.1.2.

Revise as follows:

~~403.3.1.1~~ **403.3.1.1.1 Outdoor airflow rate-Ventilation Rate Procedure.** Ventilation systems shall be designed to have the capacity to supply the minimum outdoor airflow rate, determined in accordance with this section. In each occupiable space, the ventilation system shall be designed to deliver the required rate of outdoor airflow to the *breathing zone*. The occupant load utilized for design of the ventilation system shall be not less than the number determined from the estimated maximum occupant load rate indicated in Table ~~403.3.1.1~~ 403.3.1.1.1. Ventilation rates for occupancies not represented in Table ~~403.3.1.1~~ 403.3.1.1.1 shall be those for a listed *occupancy* classification that is most similar in terms of occupant density, activities and building construction; or shall be determined by an *approved* engineering analysis. The ventilation system shall be designed to supply the required rate of *ventilation air* continuously during the period the building is occupied, except as otherwise stated in other provisions of the code. With the exception of smoking lounges, the ventilation rates in Table ~~403.3.1.1~~ 403.3.1.1.1 are based on the absence of smoking in occupiable spaces. Where smoking is anticipated in a space other than a smoking lounge, the ventilation system serving the space shall be designed to provide ventilation over and above that required by Table ~~403.3.1.1~~ 403.3.1.1.1 in accordance with accepted engineering practice.

Exception: The occupant load is not required to be determined based on the estimated maximum occupant load rate indicated in Table ~~403.3.1.1~~ 403.3.1.1.1 where *approved* statistical data document the accuracy of an alternate anticipated occupant density.

Add new text as follows:

403.3.1.1.2 Indoor Air Quality Procedure. Ventilation systems shall be designed to have the capacity to supply the breathing zone outdoor airflow rate determined in accordance with Sections 403.3.1.1.2.1 through 403.3.1.1.2.7.

403.3.1.1.2.1 Contaminant Sources. Each contaminant of concern, for purposes of the design, shall be identified. For each contaminant of concern, indoor sources and outdoor sources shall be identified, and the emission rate for each contaminant of concern from each source shall be determined. Where two or more contaminants of concern target the same organ system, these contaminants shall be considered to be a contaminant mixture.

403.3.1.1.2.2 Contaminant Concentration. For each contaminant of concern, a concentration limit and its corresponding exposure period and an appropriate reference to a cognizant authority shall be specified. For each contaminant mixture of concern, the ratio of the concentration of each contaminant to its concentration limit shall be determined, and the sum of these ratios shall be not greater than one.

Exception: Consideration of odors in determining concentration limits shall not be required.

403.3.1.1.2.3 Perceived Indoor Air Quality. The design level of indoor air acceptability shall be specified in terms of the percentage of building occupants, visitors, or both expressing satisfaction with perceived IAQ.

403.3.1.1.2.4 Design Approach. Zone and system outdoor airflow rates shall be the larger of those determined in accordance with Section 403.3.1.1.2.4.1 and either Section 403.3.1.1.2.4.2 or 403.3.1.1.2.4.3, based on emission rates, concentration limits, and other relevant design parameters.

403.3.1.1.2.4.1 Mass Balance Analysis. Using a steady-state or dynamic mass-balance analysis, the minimum outdoor airflow rates required to achieve the concentration limits specified in Section 403.3.1.1.2.2 shall be determined for each contaminant or contaminant mixture of concern within each zone served by the system.

403.3.1.1.2.4.2 Subjective Evaluation. Using a subjective occupant evaluation conducted in the completed building, the minimum outdoor airflow rates required to achieve the level of

acceptability specified in Section 403.3.1.1.2.3 shall be determined within each zone served by the system.

403.3.1.1.2.4.3 Similar Zone. The minimum outdoor airflow rates shall be not less than those found in accordance with Section 403.3.1.1.2.4.2 for a substantially similar zone.

403.3.1.1.2.5 Air cleaning. Based on contaminant of concern sources and concentrations, particulate or gaseous air cleaning might be specified. Particulate matter filters and air cleaners shall report a third-party efficiency reporting value (MERV) in accordance with ASHRAE Standard 52.2. Gaseous scrubbers and air cleaners shall report a third-party efficiency test for the contaminants of concern in accordance with an approved standard and a third-party certification of no by-products production such as ozone, formaldehyde, and other VOCs. Devices that add pollutants to the indoor air, even in small quantities, are prohibited under this procedure.

403.3.1.1.2.6 Combined IAQ Procedure and Ventilation Rate Procedure. Where the IAQ Procedure is used in conjunction with the Ventilation Rate Procedure and applied to a zone or system, the Ventilation Rate Procedure shall be used to determine the required zone minimum outdoor airflow, and the IAQ Procedure shall be used to determine the additional outdoor air or air cleaning necessary to achieve the concentration limits of the contaminants and contaminant mixtures of concern.

403.3.1.1.2.7 Documentation. Where the IAQ Procedure is used, the following information shall be included in the design documentation: the contaminants and contaminant mixtures of concern considered in the design process, the sources and emission rates of the contaminants of concern, the concentration limits and exposure periods and the references for these limits, and the analytical approach used to determine ventilation rates and air-cleaning requirements. The contaminant monitoring and occupant or visitor evaluation plans shall also be included in the documentation.

Reason:

This proposal is to add ASHRAE 62.1 Indoor Air Quality Procedure (IAQP) as an alternative to determining outside airflow rates for mechanical ventilation (in buildings other than R-2, R-3, and R-4 three stories or less). Currently, the IMC Section 403 for mechanical ventilation only allows for ASHRAE 62.1 Ventilation Rate Procedure, as outlined in IMC 2018, Section 403.3.1.1. In this proposal, "403.3.1.1 Outdoor Airflow Rate" would become "403.3.1.1.1 Ventilation Rate Procedure" and all of its subsections would remain unchanged (except subsection numbering would change, for example, the first subsection would be 403.3.1.1.1.1, and so on, but these changes were not submitted to avoid confusion in the proposal). A new section "403.3.1.1.2 Indoor Air Quality Procedure" is added and uses the ASHRAE 62.1 IAQP text. In addition, Section "403.3.1.1 Outdoor Airflow Rate" will now simply introduce the two ventilation compliance options - 403.3.1.1.1 Ventilation Rate Procedure and 403.3.1.1.2 Indoor Air Quality Procedure.

The reasoning for adding ASHRAE 62.1 IAQP for determining outdoor airflow rates is as follows:

ASHRAE 62.1 is generally considered a leading authority on the topic of building ventilation. The standard has had the Indoor Air Quality Procedure (IAQP) since 1981, and has refined and improved it over the years. Adoption of this procedure is rapidly increasing among building owners, large corporations, property management firms, universities, and government institutions in the US and internationally (examples include: Apple, Google, Cisco, Morgan Stanley, Boston Properties, Hines, CBRE, ArcBest, United States GSA, United States American Embassy School, Univ of Miami, Univ of Tennessee, Harvard University, LSU, Diplomat Resorts, Air Liquide, Azrieli, Bank Leumi, China Europe International Business School, Elbit, and others. In addition, major mechanical engineering firms (MEP firms) have adopted the technology in their HVAC designs for clients, including Syska Hennessey, AHA, TLC Engineering, Haltom Engineering, and HRVAC Consulting Engineering, among others.

The rise in adoption is primarily due to new sorbent-based air cleaning technologies that address all molecular contaminants of concern inside buildings, and therefore can be used to clean and recycle indoor air so that less outside air is required for ventilation. There are several significant health and energy efficiency benefits to using less outside air:

1) "Fresh air" is no longer so fresh in big cities and near highways and airports. Studies show that living and working near a highway dramatically increases your risk of cardiovascular disease due to the higher concentrations of ultrafine particles and gases from automobiles that pass through normal particle filters. In addition, many major metropolitan areas frequently have high ozone action days as well as generally high particle pollution. Using typical mechanical ventilation rates specified in the IMC, many buildings replace their entire volume of indoor air with outside air every 1-2 hours, and therefore expose occupants to high volumes of these pollutants. With IAQP, air cleaning

technologies can be taken into consideration for managing indoor contaminant concentrations and lower outside airflow may be possible, which could reduce the influx of outdoor pollutants. Furthermore, some sorbent-based air cleaning technologies can remove outdoor pollutants such as ozone which are not captured by typical outside air filtration.

2) Energy codes are rightfully becoming more stringent, but are more and more difficult to achieve. Finding economical means to meet these energy codes is important. In addition, indoor environment quality needs to be maintained. According to the US EIA, HVAC accounts for nearly half of the energy consumption in US commercial buildings. In many climates, heating and/or cooling outside air ventilation can account for 30-50% of total HVAC energy consumption. When using IAQP with indoor air cleaning, outside airflow rates generally can be decreased quite significantly - often 60-70%, resulting in a 20-30% savings in annual HVAC energy consumption. This is a significant savings and is incremental to most other energy saving techniques.

3) Although building codes are followed at design and build stages, they are not typically followed in building operations. A high percentage of buildings are being operated with zero ventilation during summer and winter. In a survey to members of the International Facility Management Association (IFMA), 62% of them admitted to closing the outside air damper. The real percentage in the field is likely higher since those who close the outside air damper may have chosen not to complete the survey. There are numerous reasons for shutting off ventilation in a building: a) facility managers trying to reduce energy consumption due to financial incentives awarded for reducing utility bills, b) avoiding complaints when HVAC systems cannot manage the extra load introduced by outside air on extreme temperature days, c) HVAC designers will typically design systems to meet the load for 99% of the hours in the year, but this means roughly 90 hours - or 3 hours everyday for 30 days of a hot summer - require more cooling (or heating) capacity than the system can handle and therefore causing facility managers to simply close the outside air damper for the entire summer (or winter), and a very common situation is d) improperly positioned "freeze stats" that trigger the outside airflow to be closed off when temperatures reach 35 degrees F or lower. The best solution would be better enforcement of codes after occupancy. However, if these buildings had used IAQP with indoor air cleaning, at least the air cleaning would still be occurring even if outside airflow has been closed off and occupants would have better indoor air quality.

4) Lastly, the most significant reduction in HVAC load is on peak days. Thus, peak capacity of HVAC equipment can often be reduced by 20%, or even as high as 40%. This presents a significant capital expense savings in the construction or renovation of buildings, and in most designs, the addition of the sorbent-based air cleaning products will cause a net savings overall.

For all these reasons, the IMC should catch up to the ASHRAE 62.1 standard and include the Indoor Air Quality Procedure. The proposal uses this procedure almost verbatim, plus one additional section requiring filters and air cleaners to report third-party efficiency tests based on ASHRAE standardized tests 52.2 and 145.2. This section is added to ensure that the filters and air cleaners have proved their effectiveness for all contaminants of concern.

Bibliography:

ASHRAE 62.1 - 2016, Section 6.3 and Appendices C and E.

Cost Impact

The code change proposal will decrease the cost of construction .

The ASHRAE 62.1 Indoor Air Quality Procedure will likely be used when it can reduce the cost of construction, and this should occur in most sites due to reduction in chillers, AHU capacity, coolant piping size, outside air duct sizes, relief air ducts, and boiler/heating capacity.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

M28-18

IMC: 403.3.2.5

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

403.3.2.5 Ventilating equipment. ~~Exhaust equipment serving single dwelling units~~ Fans providing exhaust or outdoor air shall be listed and labeled to provide the minimum required air flow in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.

Reason:

Industry experience and research have shown that "for advertised airflows that are not certified, the actual installed airflow can be a small fraction of the advertised value".¹ The 2018 IMC and IRC now require listing and labeling flows in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51 for exhaust equipment serving single dwelling units. This requirement should be expanded to all fans under the scope of the ANSI standard to ensure that flows are reported on an equivalent basis. AMCA and HVI maintain listings of products tested in accordance with the standard.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

~~**403.3.1.5 Balancing.** The *ventilation* air distribution system shall be provided with means to adjust the system to achieve not less than the minimum ventilation airflow rate as required by Sections 403.3 and 403.3.1.2. Ventilation systems shall be balanced by an *approved* method. Such balancing shall verify that the ventilation system is capable of supplying and exhausting the airflow rates required by Sections 403.3 and 403.3.1.2.~~

Add new text as follows:

608.1 Balancing. Air distribution, ventilation and exhaust systems shall be provided with means to adjust the system to achieve the design airflow rates and shall be balanced by an approved method. Ventilation air distribution shall be balanced by an approved method and such balancing shall verify that the air distribution system is capable of supplying and exhausting the airflow rates required by Chapter 4.

Reason:

The second sentence of this section is relocated from Chapter 4 where it is out-of-place and often overlooked. The first sentence simply applies the same requirement to air distribution systems as is currently required for ventilation systems, because the code was silent on balancing for such systems.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 478

M30-18

IMC: 403.3.1.3

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

403.3.1.3 System operation. The minimum flow rate of outdoor air that the ventilation system must be capable of supplying during its operation shall be permitted to be based on the rate per person indicated in Table 403.3.1.1 and the actual number of occupants present. Where demand controlled ventilation is employed to adjust the outdoor air flow rate based on the actual number of occupants present, the minimum quantity of outdoor air shall not fall below that determined from the area outdoor airflow rate column of Table 403.3.1.1 during periods when the building is expected to be occupied.

Reason:

Demand control ventilation systems modulate outdoor airflow based on the number of occupants present in a space, and if zero occupants are detected, the ventilation airflow might be reduced to zero cfm. This scenario ignores the fact that the ventilation table in the IMC has two components; cfm rate per person and cfm rate per square foot of space. When the space is expected to be occupied, such as during business hours, the contaminants coming from the space contents still need to be diluted by ventilation air, therefore the cfm/SQ FT component of ventilation must not be shut off.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 486

M31-18

IMC: 407.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

407.1 General. Mechanical ventilation for ambulatory care facilities and Group I-2 occupancies shall be designed and installed in accordance with this code and ASHRAE 170- and NFPA 99.

Reason:

In addition to meeting the previous codes and standards referenced in this section in order to meet federal conditions of participation health care facilities must comply with the ventilation requirements listed in NFPA 99, Health Care Facilities Code (K521). This change will align the ventilation requirements for ambulatory care and Group I-2 facilities.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

Costs will increase with this change because it will have additional ventilation requirements. However, it does not add cost to the healthcare industry because certified facilities already follow these requirements in the context of the federal standards.

Internal ID: 633

M32-18

IMC: 202 (New), 403.3.2.1

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingsscience.com)

2018 International Mechanical Code

Add new definition as follows:

BALANCED VENTILATION. Any combination of concurrently operating mechanical exhaust and mechanical supply whereby the total mechanical exhaust airflow rate and the total mechanical supply airflow rate are substantially the same.

Revise as follows:

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each dwelling unit. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.01A_{\text{floor}} + 7.5(N_{br} + 1)$$

(Equation 4-9)

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft²

N_{br} = number of bedrooms; not to be less than one

Exception-Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor air flow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4.9 shall be reduced by 25%, provided that all of the following conditions apply:
 - 2.1. A ducted system supplies recirculated air directly to each bedroom and the largest common area.
 - 2.2. For continuously operating systems, not less than 70% of the air volume in the conditioned space is recirculated each hour through the ducted system, or for intermittently operated systems, an equivalent air recirculation is provided during each four-hour period.
 - 2.3. The whole-house ventilation system is a balanced ventilation system.

Reason:

This code change credits the better performance of whole-building dilution ventilation systems that are distributed, mixed and balanced.

Distributed, mixed and balanced ventilation is more effective at controlling indoor contaminants than typical exhaust ventilation that provides no distribution and mixing. Exhaust ventilation can draw in contaminants from garages, attics, crawlspaces, soil and wall assemblies in single-family detached and multi-family construction as well as from neighboring units in multi-family construction. Ventilation that does not provide distribution and mixing can allow high levels of contaminant concentration in various spaces within houses, especially rooms where people spend a lot of time with doors closed such as bedrooms. Distribution and mixing homogenizes interior conditions reducing potentially harmful high intermittent contaminant concentrations in interior spaces. There are multiple ways to get to 70% mixing; for example, a recirculation mode that ensures that a central space conditioning system fan operates at least 20 minutes per hour would often meet the criteria for 70% air recirculation.

This code change does not penalize exhaust ventilation, it justifiably credits balanced ventilation. Exhaust only ventilation should not be given the same indoor air quality credit since typical exhaust ventilation systems result in less air change than balanced ventilation systems and do not provide as effective control of contaminants.

Cost Impact

The code change proposal will decrease the cost of construction .

The lower required ventilation rate recognizes that more effective ventilation requires less ventilation. This option could lower the cost of both construction and operation.

Internal ID: 1636

M33-18

IMC: 403.3, ordinal

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Mechanical Code

Revise as follows:

403.3 Outdoor air and local exhaust airflow rates. Group R-2, R-3 and R-4 occupancies three stories and less in height above grade plane shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2-~~or~~ ASHRAE 62.2. Other buildings intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

Update standard(s) as follows:

ASHRAE

ASHRAE
1791 Tullie Circle NE
Atlanta GA 30329
US

~~ANSI/AMCA 210—ANSI/ASHRAE 51—07:~~

~~Laboratory Methods of Testing Fans for Aerodynamic Performance Rating~~

~~ASHRAE—2017:~~

~~ASHRAE Fundamentals Handbook~~

~~15—2016:~~

~~Safety Standard for Refrigeration Systems~~

~~34—2016:~~

~~Designation and Safety Classification of Refrigerants~~

~~62.1—2016:~~

~~Ventilation for Acceptable Indoor Air Quality~~

~~170—2017:~~

~~Ventilation of Health Care Facilities~~

~~180—2012:~~

~~Standard Practice for Inspection and Maintenance of Commercial Building HVAC Systems~~

~~62.2-2016:~~

~~Ventilation and Acceptable Indoor Air Quality in Residential Buildings with Addenda b, d, k, l, q, and s~~

Reason:

This proposed modification would provide ventilation system designers/specifiers of low-rise dwelling units with the OPTION of using ASHRAE Standard 62.2 to comply with the ventilation requirements of the IMC without requiring designers/specifiers to use the standard. ASHRAE 62.2 is the ANSI standard for establishing minimum acceptable indoor air quality for dwelling units. There are several reasons that designers/specifiers may want to use ASHRAE 62.2 instead of the IMC for compliance, including: greater flexibility for specifying climate-appropriate ventilation controls, ability to achieve energy and cost savings for homeowners by shifting operation of the ventilation system to times when ambient temperature and humidity are favorable, flexibility to specify innovative systems that can be demonstrated to provide equivalent exposure to pollutants, ability to down-size and save money on balanced ventilation equipment versus what may be required by the code, and 62.2's use by code-plus programs such as ENERGY STAR and LEED.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Costs of compliance with 62.2 versus alternative compliance paths will vary based on the application. This proposal gives builders the OPTION of using 62.2, meaning there will be no required increase or decrease in the cost of construction.

IMC: 501.2, 504.1, 505.3,

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmcmann@jeffco.us)

2018 International Mechanical Code

Revise as follows:

501.2 Independent system required. Single or combined mechanical exhaust systems for environmental air shall be independent of all other exhaust systems. Dryer, domestic kitchen and hazardous exhaust shall be independent of all other systems. Type I exhaust systems shall be independent of all other exhaust systems except as provided in Section 506.3.5. Single or combined Type II exhaust systems for food-processing operations shall be independent of all other exhaust systems. ~~Kitchen-Commercial kitchen~~ exhaust systems shall be constructed in accordance with ~~Section 505 for domestic cooking operations and Sections 506 through 509, for commercial cooking operations.~~

504.1 Installation. Clothes dryers shall be exhausted in accordance with the manufacturer's instructions. Dryer exhaust systems shall ~~be independent of all other systems and shall convey the moisture and any products of combustion to the outside of the building.~~

Exception: This section shall not apply to listed and labeled condensing (ductless) clothes dryers.

505.3 Exhaust ducts. Domestic cooking exhaust equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, ~~and shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.~~ Installations in Group I-1 and I-2 occupancies shall be in accordance with the International Building Code and Section 904.13 of the International Fire Code.

Exceptions:

1. In other than Groups I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - 2.1. The duct shall be installed under a concrete slab poured on grade.
 - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
 - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
 - 2.5. The PVC ducts shall be solvent cemented.

Delete without substitution:

~~**510.4 Independent system.** Hazardous exhaust systems shall be independent of other types of exhaust systems.~~

Reason:

This is strictly an editorial clean up as the code doesn't have to keep repeating itself.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

This is strictly editorial.

Internal ID: 128

M35-18

IMC: 502.20, 502.20.1 (New)

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmann@jeffco.us)

2018 International Mechanical Code

Add new text as follows:

502.20 Manicure and pedicure stations. Manicure and pedicure stations shall be provided with an exhaust system in accordance with Table 403.3.1.1, Note h. Manicure tables and pedicure stations not provided with factory-installed exhaust inlets shall be provided with exhaust inlets located not more than 12 inches (305 mm) horizontally and vertically from the point of chemical application.

502.20.1 Operation. The exhaust system for manicure and pedicure stations shall have controls that operate the system continuously when the space is occupied.

Reason:

Measures need to be taken that will prevent the exhaust system from being turned off after the inspection process is over. There are some 200,000 Nail Salons in the US employing some 375,000 people. Some of the chemicals employed in this process are acetone, isopropyl alcohol, Butyl acetate, dibutyl phthalate, ethyl acetate, ethyl methacrylate, formaldehyde, methacrylate, toluene, including nail dust and nail fungus. Many operators simply turn off the exhaust system simply because it's too noisy there by putting the clients and employees at risk to these toxic fumes. Sometimes they are turned off to save on energy costs. When the fumes become overpowering the technicians end up opening doors to deal with the built up fumes even in the winter. This is an unacceptable situation that can easily be avoided. The same theory applies to kitchen exhaust systems. Requiring the system to operate at all times while occupied and operating will result in less fugitive vapors that can harm individuals.

Cost Impact

The code change proposal will increase the cost of construction .

This could **possibly** increase cost in that it would take some coordination to interlock the power source with maybe the lights or some other automatic way of turning on the system.

Internal ID: 133

M36-18

IMC: 501.6 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Add new text as follows:

501.6 Common ducts. Exhaust fan ducts that are under positive pressure shall not be connected to a common duct or shaft, except where the common duct or shaft is maintained at a negative pressure. The discharge outlet of exhaust fans that serve separate dwelling or sleeping units shall not be connected to a common duct or shaft, except where the common duct or shaft is maintained at a negative pressure.

Reason:

Exhaust ducts that are under positive pressure cannot be joined because the airflow from one fan will leak out through the fan that is not running. Only if the fans that share an exhaust duct are all running simultaneously, could backflow be prevented. Backdraft dampers in common exhaust fans have a significant leakage rate, thus the fan that is not running will see backflow from the common duct and the exhaust air from one space will dump into another space. If the fans discharge to a common exhaust shaft that is under negative pressure, there is no problem and this proposal would not prevent that arrangement. It is extremely undesirable (and unthinkable) to use a common duct for fans that serve different dwelling and sleeping units because odors, smoke, pathogens, chemical irritants, etc. would be carried from one unit to another.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction only where the cost of an additional roof, wall or soffit penetration is more than the cost of larger common ducts, tee and wye fittings, fasteners, sealants and hangers and the extra labor to assemble common duct arrangements.

This proposal will increase the cost of construction if additional roof or wall penetrations cost more than combined exhaust discharge ducts. Combining ducts into a common duct adds material costs, as does making roof and wall penetrations.

Internal ID: 561

M37-18

IMC: 504.8.3

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

504.8.3 Transition ducts. Transition ducts used to connect the dryer to the exhaust duct system shall be a single length that is *listed* and *labeled* in accordance with UL 2158A. Transition ducts shall be not greater than 8 feet (2438 mm) in length and shall not be concealed within construction. The installation of transition ducts shall be in accordance with the dryer manufacturer's installation instructions.

Reason:

Dryer manufacturers will specify in their installation instructions whether or not transition ducts are allowed. The use of transition ducts must be consistent with the appliance installation instructions.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 378

M38-18

IMC: 504.4.2 (New)

Proponent: Rick Harpenau, representing self (rick@dryerbox.com)

2018 International Mechanical Code

Add new text as follows:

504.4.2 Animal Grill. Where grilles are provided on dryer exhaust duct terminals to prevent entry of animals, the grille shall consist entirely of vertical slots without horizontal or diagonal members, the slots shall have a width of not less than 5/8 inch (15.9 mm), and the total open area of the grille shall be not less than 4 times the opening area of the exhaust duct.

Reason:

Rural areas across our country experience sufficient intrusion of squirrels, rodents and birds. So much so that homeowners seek or create their own protection. Many resort to mechanical cloth wraps with wire spacing of less than ½". Plastic grilles are common as well but due to the lack of material strength, the grill partitions are large and flat promoting accelerated lint build up. Some plastic wall vent hoods incorporate an integral defensive grill. Generally, this design does not provide an adequate area spread and aperture size of each opening is insufficient to allow the lint accumulation to release and exit.

Currently Section 504.4 clearly indicates screens shall not be installed at the duct termination. Grilles and screens could be considered equivalent in description causing confusion. A separate section defining acceptable grilles seems logical and removes the equal comparison argument for grilles and screens and their use at or near the dryer termination.

Vertical bars resist accelerated lint build up.

The text simply lays out criteria for cages to feature vertical bars.

Bibliography:

Inventor of the Dryerbox. Owner of In-O-Vate Technologies Inc.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

A rodent/bird defensive grill or cage is an owner/occupant discretionary item. Wording is necessary to distinguish grills from disallowed screens.

Internal ID: 338

M39-18

IMC: 504.4, 504.8.2

Proponent: Rick Harpenau, representing self (rick@dryerbox.com)

2018 International Mechanical Code

Revise as follows:

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. ~~Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow.~~ Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or *chimney*. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums. ~~Clothes dryer exhaust ducts shall be sealed in accordance with Section 603.9.~~

504.8.2 Duct installation. Exhaust ducts shall be supported at ~~4-foot intervals~~ not to exceed 4 feet (1219 mm) intervals and shall be secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Exhaust duct joints shall be sealed in accordance with Section 603.9 and shall be mechanically fastened. Ducts shall not be joined with screws or similar fasteners that protrude more than 1/8 inch (3.2 mm) into the inside of the duct.

Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such cavities shall allow the installation of the duct without deformation.

Reason:

Like the Residential Code M1502, installation details are covered in one spot under Duct Installation. For consistency it seems appropriate to list the details in one section and under the same section title. In reading 504.4 and 504.8.2 it is unclear if mechanical fastening is required or not. This revision places mechanical fastening in one place and provides a much clearer version.

The italicized formatting of the word Chimney seems unnecessary.

These changes bring clarity and consistency to the sections and format between the Res and Mech codes.

These images show the importance of both mechanical fastening, seam taping and 4 foot interval support spacing.

Bibliography:

Inventor of the Dryerbox receptacle and owner of In-O-Vate Technologies Inc since 1996

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is for consistency and clarification. No cost increase or decrease is involved.

Internal ID: 322

M40-18

IMC: 506.3.2.5

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Mechanical Code

Revise as follows:

506.3.2.5 Grease duct test. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. ~~A light test~~ One of the following tests shall be performed to determine that all welded and brazed joints are liquid tight.

1. A water spray test as prescribed in this section
2. Where approved, a light test as prescribed in this section
3. An approved equivalent test

A light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. A test shall be performed for the entire duct system, including the hood-to-duct connection. The duct work shall be permitted to be tested in sections, provided that every joint is tested. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.

A water test shall be performed by simulating a grease duct cleaning operation by use of a pressure washer that is designed for grease duct cleaning and that operates at a pressure of not less than 1500 psi. The water shall be applied directly to all areas to be tested. Water applied to the duct interior surfaces shall not be visible on any exterior surfaces of the duct during the test.

Reason:

The flexibility within this proposal will allow the code official some discretion to decide which duct test has worked best in the past and which to apply to the current installation.

Based upon information from industry, code officials and end users, there are alternative methods of duct leakage testing currently being used successfully by industry. The intent of the language is to not limit the user to the light test or prohibit other methods where approved by local authority having jurisdiction. As an example, the State of Minnesota 2015 Mechanical and Fuel Gas Code has options of a light, air or water test. Additionally, there has been questions regarding the effectiveness of the light test to find pinhole leaks and leaks around over-lapping joints.

ASHRAE Standard 154-2016 "Ventilation for Commercial Cooking Operations" included the alternate water or approved equivalent tests during the last revision cycle. The proposed language harmonizes the two documents.

A recent committee member reported to the Standard 154 committee regarding comments from IKECA regarding leak testing. IKECA's recommendation was a water pressure test. Their comments included that the light test is ineffective, especially on pinhole leaks covered by slag. The water pressure washing without detergent prior to wrapping the duct is the most effective method to find leaks. Contractors bristle at this initially, but when told that this is the same conditions the duct will be subjected to at the first duct cleaning they are more receptive. As a result, some contractors are beginning to require that this test be performed before wrapping to ensure there are no leaks, and this helps them in that they are not called back at a later date to fix leaking exhaust ducts.

Bibliography:

ASHRAE Standard 154-2016 "Ventilation for Commercial Cooking Operations"

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal seeks to add flexibility on behalf of the AHJ in reference to grease duct testing and does not impact how the grease duct itself is constructed. Therefore, it does not increase the cost of construction.

Internal ID: 1542

M41-18

IMC: 506.3.2.5

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Mechanical Code

Revise as follows:

506.3.2.5 Grease duct test. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. IMC: 507.2.6.1 (New)

Proponent: Drew Dorrance, South Salt Lake City, representing South Salt Lake City (drd_007@hotmail.com); Don Davies (don.davies@slcgov.com)

2018 International Mechanical Code

Add new text as follows:

507.2.6.1 Clearance for glazing from Type 1 hood. Glazing installed within 18 inches (457 mm) of a Type 1 hood shall be tempered and rated for 900 degrees fahrenheit. Window frames shall meet the requirements of Section 507.2.6, and the cooking appliance installation instructions.

Reason:

Currently windows are being installed near ranges, and type 1 hoods with no guidelines in the mechanical code. As long as the glazing is non-combustible it can currently be installed in a potentially hazardous situation. Glazing that is both heat treated and tempered adds protection to bystanders. For example there are situations where restaurants want patrons to watch their food be prepared on the grill.

Cost Impact

The code change proposal will increase the cost of construction .

The code change proposal will increase the cost of construction. The cost would be related to the price of heat-treated and tempered glazing.

Internal ID: 1467

M43-18

IMC: 510.6.5

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gcmann@jeffco.us)

2018 International Mechanical Code

Revise as follows:

510.6.5 Makeup air. *Makeup air from all sources shall be provided during operations at a rate approximately equal to the rate that air is exhausted by the hazardous exhaust system. Makeup air shall be provided by gravity or mechanical means or both. Mechanical makeup air systems shall be automatically controlled to start and operate simultaneously with the exhaust system. The makeup air shall not reduce the effectiveness of the exhaust system. Makeup air intakes shall be located in accordance with Section 401.4.*

Reason:

This is strictly an editorial cleanup with no new requirements. This section lacks the pertinent information that designers need to be aware of when using this Section.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is strictly an editorial proposal.

Internal ID: 914

M44-18

IMC: 510.7.2, 510.7.3

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gcmcmann@jeffco.us)

2018 International Mechanical Code

Revise as follows:

510.7.2 Floors. Hazardous exhaust systems that penetrate a floor/ceiling assembly shall comply with one of the following:

1. Exhaust ducts shall be enclosed in a fire-resistance-rated shaft constructed in accordance with the International Building Code- or
2. The duct shall be provided with a field applied duct enclosure material, system, product or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration fire stop system tested and listed in accordance with ASTM E 814 or UL 1479 and having a "F" and "T" rating equal to the fire resistance rating of the assembly being penetrated. The duct enclosure and fire stop system shall be installed in accordance with the listing and the manufacturers instructions. Exposed duct wrap systems shall be protected where subject to physical damage.

510.7.3 Wall assemblies. Hazardous exhaust duct systems that penetrate fire-resistance-rated wall assemblies shall be enclosed in fire-resistance-rated construction from the point of penetration to the outlet terminal, except where the interior of the duct is equipped with an approved automatic fire suppression system. Ducts shall be enclosed in accordance with the International Building Code requirements for shaft construction and such enclosure shall have a minimum fire-resistance rating of not less than the highest fire-resistance-rated wall assembly penetrated.

Exception: Exhaust ducts shall not be required to be installed in a shaft where a field applied duct enclosure material, system, product or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration fire stop system tested and listed in accordance with ASTM E 814 or UL 1479 and having a "F" and "T" rating equal to the fire resistance rating of the assembly being penetrated. The duct enclosure and fire stop system shall be installed in accordance with the listing and the manufacturers instructions. Exposed duct wrap systems shall be protected where subject to physical damage.

Reason:

Various manufacturers of duct wrap materials have listings that apply to HVAC ducts that provide one and two hour fire resistant ratings. There are times where building a shaft is not practical or possible. This proposal recognizes the benefits of flexibility these systems provide and should be an option for the designers. These systems have been proved to be very effective in commercial kitchen systems and should be an option in this situation. To always require a shaft isn't practical when there is a perfectly good alternative.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This Proposal has the potential to decrease costs by not having to construct a shaft using conventional materials and methods. Savings in labor costs may also be realised .

Internal ID: 625

M45-18

IMC: 507.1

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmcmann@jeffco.us)

2018 International Mechanical Code

Revise as follows:

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or II and shall be designed to capture and confine cooking vapors and residues. A Type I or Type II hood shall be installed at or above appliances in accordance with Sections 507.2 and 507.3. Where any cooking appliance under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed. Where a Type I hood is installed, the installation of the entire system, including the hood, ducts, exhaust equipment and makeup air system shall comply with the requirements of Sections 506, 507, 508 and 509.

Exceptions:

1. Factory-built commercial exhaust hoods that are listed and labeled in accordance with UL 710, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5.
2. Factory-built commercial cooking recirculating systems that are listed and labeled in accordance with UL 710B, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5. Spaces in which such systems are located shall be considered to be kitchens and shall be ventilated in accordance with Table 403.3.1.1. For the purpose of determining the floor area required to be ventilated, each individual appliance shall be considered as occupying not less than 100 square feet (9.3 m²).
3. Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application in accordance with NFPA 96, a hood shall not be required at or above them.
4. Smoker ovens with integral exhaust systems provided that the appliance is installed in accordance with the manufacturer's installation instructions, is listed and tested for the application and complies with Chapter 5

Reason:

Not all smokers are created equal. Just because they are categorized as a Heavy-Duty Appliance shouldn't necessarily require them to be located under a type I hood when they have an integral exhaust system. Some of these units are equipped with evacuators and flue collectors which won't let any smoke out when the doors open. When the option to use standard exhaust systems that eliminate the possibility for smoke to escape into the kitchen, requiring them to be located under a hood isn't necessary. The blanket statement that all smoker ovens must be located under a hood regardless of the situation doesn't represent the technology that's available with these units and an exception is appropriate in these cases.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a cost neutral proposal.

Internal ID: 127

M46-18

IMC: 507.6.1

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmann@jeffco.us)

2018 International Mechanical Code

Revise as follows:

507.6.1 Capture and containment test. The permit holder shall verify capture and containment performance of the exhaust system. This field test shall be conducted with all appliances under the hood at operating temperatures, with all sources of outdoor air providing makeup air for the hood operating and with all sources of recirculated air providing conditioning for the space in which the hood is located operating. Capture and containment shall be verified visually by observing smoke or steam produced by actual or simulated cooking, such as that provided by smoke candles and smoke puffers. ~~Smoke bombs shall not be used.~~generators.

Reason:

The term "smoke generators" includes all forms of smoke producing products and smoke bombs are the very best way to test a hood system. We want to take the system to the extreme just as we do testing grease ducts to 2000 degrees. Smoke bombs do not produce unrealistic examples of real cooking procedures and actually the decision should be left to the code official to determine what the best way to test is depending on the duty of the system. This passed last cycle at the committee level and was overturned at the public comment period.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is editorial in nature.

Internal ID: 134

M47-18

IMC: 506.3.9

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gcmann@jeffco.us)

2018 International Mechanical Code

Revise as follows:

506.3.9 Grease duct horizontal cleanouts. Cleanouts serving horizontal sections of grease ducts shall:

1. Be spaced not more than 20 feet (6096 mm) apart.
2. Be located not more than 10 feet (3048 mm) from changes in direction that are greater than 45 degrees (0.79 rad).
3. Be located on the bottom only where other locations are not available and shall be provided with internal damming of the opening such that grease will flow past the opening without pooling. Bottom cleanouts and openings shall be approved for the application and installed liquid-tight.
4. Not be closer than 1 inch (25 mm) from the edges of the duct.
5. Have opening dimensions of not less than 12 inches by 12 inches (305 mm by 305 mm). Where such dimensions preclude installation, the opening shall be not less than 12 inches (305 mm) on one side and shall be large enough to provide access for cleaning and maintenance.
6. ~~Shall be~~ Be located at grease reservoirs.
7. Be located within 3 feet of horizontal discharge fans.

Reason:

There are times when it's not practical to expect maintenance personnel to open a hinged fan on the side of a building especially if it's higher than 10. Some fans are very large and could be unsafe to attempt to open it. A much safer and simpler solution is to install a clean-out within a close distance so as to clean and service the fan from the inside.

Cost Impact

The code change proposal will increase the cost of construction .

The increase in cost would amount to an additional cleanout installed near the fan discharge.

Internal ID: 123

M48-18

IMC: 504.8.2

Proponent: James Tinner, representing City of Bellingham Washington (jetinner@cob.org)

2018 International Mechanical Code

Revise as follows:

504.8.2 Duct installation. Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Joists in ducts shall be mechanically fastened on at least two opposing sides by rivets, screws or similar fasteners. Ducts shall not be joined with screws or similar fasteners that protrude more than $\frac{1}{8}$ inch (3.2 mm) into the inside of the duct. Tapes or mastics shall not be deemed adequate to fasten duct joints.

Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such cavities shall allow the installation of the duct without deformation.

Reason:

Failure of dryer exhaust duct joints is common and can cause significant damage if the failure is not observed and corrected. IRC Section M1502.4.2 already contains language requiring mechanical connections of dryer duct joints. I intend to submit a code change proposal in the IRC to clarify that tapes and mastics are not adequate to secure dryer duct joints.

Cost Impact

The code change proposal will increase the cost of construction .

The change will add a few minutes to the time needed to mechanically fasten dryer duct joints. The cost increase will be minimal but will exist.

Internal ID: 104

M49-18

IMC: 507.2

Proponent: John Addario, NYS Department of State Division of Building Standards and Codes, representing New York State Department of State - Division of Building Standards and Codes (john.addario@dos.ny.gov)

2018 International Mechanical Code

Revise as follows:

507.2 Type I hoods. Type I hoods shall be installed where cooking *appliances* produce grease or smoke as a result of the cooking process. Type I hoods shall be installed over *medium-duty, heavy-duty and extra-heavy-duty cooking appliances*.

Exception: A Type I hood shall not be required ~~for an electric cooking appliance where not more than two electric cooking appliances are installed per room and~~ where an approved testing agency provides documentation that ~~the~~ each appliance effluent contains 5 mg/m³ or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m³/s) in accordance with UL 710B.

Reason:

The current code has an exception for the requirement for a Type I hood for electric cooking appliances when the effluent contains 5 mg/m³ or less grease output. The proposed modification would allow an exception for, two or less electric cooking appliances installed under a single hood, when the effluent contains 5 mg/m³ or less grease per unit. The proposed modification recognizes that the output of grease may not be great enough to require a Type I hood when you have just one unit installed under a single hood. In some situations, several of these units are installed and grouped together, some of these units are specifically designed to be stacked on top of one another. Obviously, the need for multiple units increases the output of the total amount of grease created and justifies the fact that a Type I hood should be required. The proposed modification would continue to provide relief for two or less electric appliances which individually don't exceed a maximum output level of grease.

Cost Impact

The code change proposal will increase the cost of construction .

The costs would remain the same when two or less units are installed under one hood. The price would increase when several units are installed under one hood.

Internal ID: 1108

M50-18

IMC: 505.3

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

505.3 Exhaust ducts. Domestic cooking exhaust equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems. Installations in Group I-1 and I-2 occupancies shall be in accordance with the International Building Code and Section 904.13 of the International Fire Code.

Exceptions:

1. ~~In other than Groups I-1 and I-2, where~~ Where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - 2.1. The duct shall be installed under a concrete slab poured on grade.
 - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
 - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
 - 2.5. The PVC ducts shall be solvent cemented.

Reason:

In Section 505.3, Exception #1 language was incorrectly added that would prohibit Group I-1 and I-2 occupancies from having recirculating hoods. As long as proper mechanical or natural ventilation is provided, the hood is installed per manufacturer's instructions, and it meets the ventilation requirements, there is no justification on why these hoods cannot be re-circulating.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will decrease the cost of construction .

This exception where permitted in Groups I-1 and I-2 could result in a reduction of shaft and duct requirements to vent the hood to the outside, possibly through several floors.

Internal ID: 1306

M51-18

IMC: 505.3, 505.7 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

505.3 Exhaust ducts. Domestic cooking exhaust equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems. ~~Installations in Group I-1 and I-2 occupancies shall be in accordance with the International Building Code and Section 904.13 of the International Fire Code.~~

Exceptions:

1. In other than Groups I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - 2.1. The duct shall be installed under a concrete slab poured on grade.
 - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
 - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
 - 2.5. The PVC ducts shall be solvent cemented.

Add new text as follows:

505.7 Domestic cooking systems. Cooktops and ranges installed in the following occupancies shall be protected in accordance with Section 904.13.1 of the International Fire Code.

1. In Group I-1 occupancies where domestic cooking facilities are installed in accordance with Section 420.8 of the International Building Code.
2. In Group I-2, Condition 1 occupancies where domestic cooking facilities are installed in accordance with Section 407.2.6 of the International Building Code.
3. In Group R-2 college dormitories where domestic cooking facilities are installed in accordance with Section 420.10 of the International Building Code.

Reason:

M45-15 as modified created the last sentence to IMC Section 505.3. The last sentence in 505.3 is an incorrect and circular reference. There are no exhaust hood requirements in IBC 407 or 410 (Group I-2 and I-1 respectively) - those sections send you to IMC for exhaust hood. The intent seems to be more as a reference to the protection in the hood in IFC Section 904.13. See new Section 505.7 for a better reference that is a copy of text already in IFC 904.13. Our intent is that if the other proposals related to domestic cooking in Group I-1 and I-2 are accepted that the references would be coordinated in the IMC and IFC.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC

website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an editorial correction of references.

Internal ID: 1304

M52-18

IMC: 506.5.2, 15

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Mechanical Code

Revise as follows:

506.5.2 Pollution-control units. The installation of pollution-control units shall be in accordance with the manufacturer's installation instructions and all of the following:

1. Pollution-control units shall be listed and labeled in accordance with UL ~~1978-8782~~.
2. Fans serving pollution-control units shall be listed and labeled in accordance with UL 762.
3. ~~Pollution~~Bracing and supports for pollution-control units shall be ~~mounted and secured in accordance with the manufacturer's installation instructions and~~ of noncombustible material securely attached to the structure and designed to carry gravity and seismic loads within the stress limitations of the International Building Code.
4. Pollution-control units located indoors shall be listed and labeled for such use. Where enclosed duct systems, as required by Section 506.3.11, are connected to a pollution control unit, such unit shall be ~~located in a room or space listed and labeled, in accordance with UL 2221 or ASTM E2336, for location in an enclosure~~ having the same fire-resistance rating as the duct enclosure. Access shall be provided for servicing and cleaning of the unit. The space or enclosure shall be ventilated in accordance with the manufacturer's installation instructions.
5. ~~A clearance of not less than 18 inches (457 mm)~~ Clearances shall be maintained between the pollution-control unit and combustible ~~material~~ material in accordance with the listing.
6. Roof-mounted pollution-control units shall be listed for outdoor installation and shall be mounted not less than 18 inches (457 mm) above the roof.
7. Exhaust outlets for pollution-control units shall be in accordance with Section 506.3.13.
8. An airflow differential pressure control shall be provided to monitor the pressure drop across the filter sections of a pollution-control unit. When the airflow is reduced below the design velocity, the airflow differential pressure control shall activate a visual alarm located in the area where cooking operations occur.
9. Pollution-control units shall be provided with a factory-installed fire suppression system.
10. Service space shall be provided in accordance with the manufacturer's instructions for the pollution control unit and the requirements of Section 306.
11. Wash-down drains shall discharge through a grease interceptor and shall be sized for the flow. Drains, shall be sealed with a trap or other approved means to prevent air bypass. Where a trap is utilized it shall have a seal depth that accounts for the system pressurization and evaporation between cleanings.
12. Protection from freezing shall be provided for the water supply and fire suppression systems where such systems are subject to freezing.
13. Duct connections to pollution-control units shall be in accordance with Section 506.3.2.3. Where water splash or carryover can occur in the transition duct as a result of a washing operation, the transition duct shall slope downward toward the cabinet drain pan for a length not less than 18 inches (457 mm). Ducts shall transition to the full size of the unit's inlet and outlet openings.
14. Extra-heavy-duty appliance exhaust systems shall not be connected to pollution-control units except where such units are specifically designed and listed for use with solid fuels.
15. Pollution-control units shall be maintained in accordance with the manufacturer's instructions.

Add new standard(s) follows:

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096

8782-17:

Outline of Investigation for Pollution Control Units for Commercial Cooking

Reason:

This proposal further refines the requirements for pollution control units, as follows:

Item 1: UL 1978, the Standard for Grease Ducts, does not contain all the requirements necessary for listing PCUs. UL developed the UL 8782, "Outline of Investigation for Pollution Control Units for Commercial Cooking", in collaboration with code officials, manufacturers, and installers. UL 8782 contains both construction and performance requirements to address various issues not covered by UL 1978, including:

Air filtration components – PCUs use various methods of filtration, such as electrostatic precipitators or grease filters.
Electrical requirements – PCUs are also electrical equipment, for purposes of providing both power and control.

Item 3: Clarifies the requirements for mounting and supporting PCUs. These are the same requirements that are used for supporting grease ducts (IMC Section 506.3.3).

Item 4: Requirements used to evaluate the effectiveness of the combination of a PCU and an enclosure as a fire rated enclosure system and through penetration firestop system, as well as the enclosure's effect on the PCU are contained in UL 2221 and ASTM E2336.

Item 5: UL 8782 contains the same performance criteria as UL 1978 to establish the minimum clearances to combustible material. UL 8782 requires the PCUs to be marked with the minimum clearances.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No cost impact. Manufacturers are already testing and certifying their PCUs in accordance with UL 8782. This proposal provides clarity on the requirements for PCUs, as well as additional flexibility.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 423

M53-18 Part I

IMC: 504.6 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Systemair (JBEngineer@aol.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IMC COMMITTEE AND PART II WILL BE HEARD BY THE IRC M/P COMMITTEE. PLEASE SEE THE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Mechanical Code

Add new text as follows:

504.6 Booster fans prohibited. Domestic booster fans shall not be installed in dryer exhaust systems.

Internal ID: 1167

M53-18 Part II

IRC: M1502.4.5 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Systemair (JBEngineer@aol.com)

2018 International Residential Code

Add new text as follows:

M1502.4.5 Booster fans prohibited. Domestic booster fans shall not be installed in dryer exhaust systems.

Reason:

This change is being proposed for clarity to distinguish between old style booster fans and dryer exhaust duct power ventilators (DEDPV). UL 2158 (electric dryer standard) and ANSI Z21.5.1/CSA 7.1 (gas dryer standard) prohibit domestic dryers from connecting to dryer exhaust systems having booster fans. The warning required to be included in the installation instructions by both standards reads, "WARNING: Risk of Fire. Do not install a booster fan in the exhaust duct."

Booster fans were a class of ventilators that were installed before the introduction of dryer exhaust duct power ventilators or DEDPVs. DEDPV are regulated by UL 705, whereas old style booster fans were not specifically addressed in any UL standard. DEDPVs are not impacted by this change since Section 504.5 in the Mechanical Code and Section M1502.4.4 of the Residential Code permit the installation and use of DEDPVs.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change only clarifies current code requirements.

Internal ID: 3416

M54-18

IMC: 506.3.7

Proponent: Keith Page, Hart & Cooley / Selkirk, representing Hart & Cooley / Selkirk - Engineering Manager

2018 International Mechanical Code

Revise as follows:

506.3.7 Prevention of grease accumulation in grease ducts. Duct systems serving a Type I hood shall be constructed and installed so that grease cannot collect in any portion thereof, and the system shall slope not less than one-fourth unit vertical in 12 units horizontal (2-percent slope) toward the hood or toward a grease reservoir designed and installed in accordance with Section 506.3.7.1. Where horizontal ducts exceed 75 feet (22 860 mm) in length, the slope shall be not less than one unit vertical in 12 units horizontal (8.3-percent slope).

Exception: Factory-built grease ducts shall be installed at a slope that is in accordance with the listing and manufacturer's installation instructions.

Reason:

To be in harmony with other code bodies across the country as NFPA and UMC both have this language incorporated. Factory-built manufacturers have been installing to a lesser slope for many years according to their respective testing agency listings.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The installation of factory-built grease duct has been installed w/ lesser slope by means of following our UL listed instructions and therefore this code editorial update won't change the current field installation process. In fact, in some instances where there is a very long horizontal run (i.e. exceeding 75'), the lower slope requirement of a UL listed duct mitigates the often used see-saw design of rectangular field fabricated ducts that typically require drains at the bottom of the see-saw, thus requiring maintenance

Internal ID: 1220

M55-18

IMC: 510.4

Proponent: Mark Jelinske, representing Self (mjelinske@rmhgroup.com)

2018 International Mechanical Code

Revise as follows:

510.4 Independent system. Hazardous exhaust systems shall be independent of other types of exhaust systems.

Exception: Environmental air exhaust inlets combined with hazardous exhaust inlets in the same room.

Reason:

In a laboratory with fume hoods, the hoods alone may not provide an adequate ventilation air exchange rate, particularly in a modern lab with Variable Air Volume fume hoods. In this very common case, auxiliary exhaust air inlets are used to maintain the proper air changes.

In some cases, this has been hard to justify where a hard core interpretation is made that "if it isn't a fume hood, it isn't hazardous", and therefore they can't be combined.

In most cases, it is recognized that this is the right way to do it, and a little "dancing" is required to say the absence of the auxiliary exhaust would trigger the conditions of 510.2 and therefore making it a Hazardous Exhaust, while trying to not notice the requirements of 510.6.4 "that contaminants are captured by an airstream at the area where the emissions are generated".

It is recognized that this concept could be overextended by using the Hazardous Exhaust to provide ventilation of support spaces, offices, corridors, etc. not associated with the fume hood. Thus the restriction to room with a fume hood.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The intent of this proposal is to clarify a common design practice.

Internal ID: 1477

M56-18

IMC: 510.4 (New), 510.5

Proponent: Mark Jelinske, representing Self (mjelinske@rmhgroup.com)

2018 International Mechanical Code

Add new text as follows:

510.4 Incompatible Materials. Incompatible materials, as defined in the International Fire Code, shall not be exhausted through the same hazardous exhaust system.

Revise as follows:

~~**510.5 Incompatible materials and common shafts.** Incompatible materials, as defined in the International Fire Code, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.~~

Exception: The provisions of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:

1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
2. The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.
3. Hazardous exhaust ductwork originating in different fire areas and manifolded together in a common shaft shall meet the provisions of Section 717.5.3, Exception 1, Item 1.1 of the International Building Code.
4. Each control branch has a flow regulating device.
5. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.
6. Radioisotope hoods are equipped with filtration, carbon beds or both where required by the *registered design professional*.
7. Biological safety cabinets are filtered.
8. Each hazardous exhaust duct system shall be served by redundant exhaust fans that comply with either of the following:
 - 8.1. The fans shall operate simultaneously in parallel and each fan shall be individually capable of providing the required exhaust rate.
 - 8.2. Each of the redundant fans is controlled so as to operate when the other fan has failed or is shut down for servicing.

Reason:

The provisions for incompatible materials and common shafts should be separated.

Materials that are incompatible do not lose their incompatibility just because the duct system they are being conveyed in meets the exceptions of 510.5.

The provisions for separate shafts, and the exceptions to allow manifolding has to do with maintaining the integrity of the separate fire areas and vertical separations in a system where Smoke or Fire dampers are not allowed

These two concepts are incompatible.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This should be a clarification to the original intent. It is unlikely responsible designers are currently combining materials they know to be incompatible in the same duct system.

Internal ID: 1472

M57-18

IMC: 508.1.1

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

508.1.1 Makeup air temperature. ~~The temperature differential between *makeup air* and the air in the conditioned space shall not exceed 10°F (6°C) except where the added heating and cooling loads of the *makeup air* do not exceed the capacity of the HVAC system.~~ HVAC system that serves the kitchen space shall have the additional capacity necessary for the latent and sensible loads that are introduced by the makeup air supplied to the kitchen space, or the makeup air shall be conditioned by dedicated systems such that the difference in temperature between the makeup air supplied to the kitchen space and the design setpoint temperature in the kitchen space is not greater than 10 degrees F (6 degrees C).

Exception: Makeup air supplied to a compensating hood need not be conditioned.

Reason:

This rewrite of the section intends to clarify the intent which was to either design the HVAC system for the kitchen to handle makeup air loads, or to have a dedicated makeup air conditioning system. It is also clarified that the 10 degree differential applies to the thermostat setpoint temperature in the kitchen, not the temperature of the kitchen as it happens to be at any given point in the day. If the HVAC system can handle the loads from makeup air, then the kitchen space temperature will reflect the thermostat setpoint. If a dedicated makeup air system is installed, then it must adhere to the delta 10 degree criterion. The exception recognizes that makeup air fed directly to the integral makeup air plenum of a hood or directly into the mouth of a hood need not be conditioned, since it might not affect the comfort of the employees.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 439

M58-18

IMC: 514.2

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Revise as follows:

514.2 Prohibited applications. Energy recovery ventilation systems shall not be used in the following systems:

1. Hazardous exhaust systems covered in Section 510.
2. Dust, stock and refuse systems that convey explosive or flammable vapors, fumes or dust.
3. Smoke control systems covered in Section 513.
4. Commercial kitchen exhaust systems serving Type I ~~or Type II~~ hoods.
5. Clothes dryer exhaust systems covered in Section 504.

Exception: The application of ERV equipment that recovers sensible heat only utilizing coil-type heat exchangers shall not be limited by this section.

Reason:

This revision simply relaxes the prohibition on ERV's for Type II hoods. Type II hoods discharge warm moist air and ERV's can take advantage of the rich source of latent and sensible heat energy. Type II hood exhaust does not contain grease vapors and cooking particulates that could create a hazard with ERV heat exchangers.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 442

M59-18

IMC: 504.4.1 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Add new text as follows:

504.4.1 Termination location. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. Where the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into buildings including openings in ventilated soffits.

Reason:

Current code does not address clearances between building openings and clothes dryer exhaust terminals. This proposal coordinates with the requirement in the IRC.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 557

M60-18

IMC: 514.2

Proponent: Randall Dahmen, Self, representing Self

2018 International Mechanical Code

514.2 Prohibited applications. Energy recovery ventilation systems shall not be used in the following systems:

1. Hazardous exhaust systems covered in Section 510.
2. Dust, stock and refuse systems that convey explosive or flammable vapors, fumes or dust.
3. Smoke control systems covered in Section 513.
4. Commercial kitchen exhaust systems serving Type I or Type II hoods.
5. Clothes dryer exhaust systems covered in Section 504.

~~Exception~~ Exceptions:

1. The application of ERV equipment that recovers sensible heat only utilizing coil-type heat exchangers shall not be limited by this section.
2. An engineered energy recovery ventilation system shall not be limited by this section provided that corrosion, cross-contamination and fouling are addressed by such engineered system.

Reason:

The incorporation of the proposed language will provide greater opportunities for energy conservation via energy recovery systems. The language reinforces the reasoning in the code as to why certain energy recovery systems should not be used, by providing guidance to systems that meet the intent of the code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The intent of the proposed wording was to provide design flexibility for energy conservation efforts. There is no change to the cost of construction

Internal ID: 1701

M61-18

IMC: 507.5

Proponent: Randall Dahmen, Self, representing Self

2018 International Mechanical Code

Revise as follows:

507.5 Capacity of hoods. Commercial food service hoods shall exhaust a minimum net quantity of air determined in accordance with this section and Sections 507.5.1 through 507.5.5 or as determined by engineering analysis. The net quantity of *exhaust air* shall be calculated by subtracting any airflow supplied directly to a hood cavity from the total exhaust flow rate of a hood. Where any combination of *heavy-duty*, *medium-duty* and *light-duty cooking appliances* are utilized under a single hood, the exhaust rate required by this section for the heaviest duty *appliance* covered by the hood shall be used for the entire hood.

Reason:

The current code language provides no flexibility for reducing the minimum exhaust rate for the various listed hoods. The intent of this proposed language change is to allow for the use of reduced exhaust rates if it can be demonstrated to the code official that a reduced exhaust rate would be acceptable for the proposed use. In general, exhaust rates for kitchen hoods are dependent on the type of food cooked, the amount of grease vapor or smoke produced, the temperature(s) of the cooking appliance or cooking oils, etc.

The intent is provide an opportunity to reduce the minimum exhaust rate, and thereby increase energy savings since the exhaust fan will not be required to operate at the current mandated exhaust rates. Additionally, in those cooler regions, adoption of this proposed language will require less tempered make-up air to be brought into the building for air balancing purposes as is required by IMC 508.

Cost Impact

The code change proposal will decrease the cost of construction .

Although an exhaust fan is required for all commercial kitchen hoods, the size of the exhaust fan may be able to be decreased due to a reduced minimum exhaust flow rate, assuming adequate justification has been provided to the code official.

Internal ID: 1696

M62-18

IMC: SECTION 511, 511.1, 511.1.1, 511.1.5

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

2018 International Mechanical Code

SECTION 511 DUST, STOCK AND REFUSE CONVEYING SYSTEMS

Revise as follows:

511.1 Dust, stock and refuse conveying systems. Dust, stock and refuse conveying systems shall comply with the provisions of Section 510 and Sections 511.1.1 through 511.2 and the International Fire Code.

511.1.1 Collectors and separators. Collectors and separators involving such systems as centrifugal separators, bag filter systems and similar devices, and associated supports shall be constructed of noncombustible materials and shall be located on the exterior of the building or structure. A collector or separator shall not be located nearer than 10 feet (3048 mm) to combustible construction or to an unprotected wall or floor opening, unless the collector is provided with a metal vent pipe that extends above the highest part of any roof with a distance of 30 feet (9144 mm).

Exceptions:

1. Collectors such as "Point of Use" collectors, close extraction weld fume collectors, spray finishing booths, stationary grinding tables, sanding booths, and integrated or machine-mounted collectors shall be permitted to be installed indoors provided that the installation is in accordance with the International Fire Code and NFPA 70.
2. Collectors in independent exhaust systems handling combustible dusts shall be permitted to be installed indoors provided that such collectors are installed in compliance with the International Fire Code and NFPA 70.

511.1.5 Explosion relief vents-control. ~~A safety or explosion relief vent~~ Explosion control shall be provided in accordance with the requirements of the International Fire Code on all systems that convey combustible refuse or stock ~~of an explosive nature, that produce combustible dusts in such a manner that the concentration and conditions create a fire or explosion hazard based on a Dust Hazard Analysis prepared in accordance with the requirements~~ Section 2203.2 of the International Building Fire Code.

Reason:

This proposal is follow up work correlating the IBC, IMC and IFC provisions with the work done on Chapter 22 Combustible Dust and Chapter 37 Combustible Fibers in the IFC along with Section 426 of the IBC. Last cycle IBC Section 426 and Chapter 22 Combustible Dust-Producing Operations were updated to apply the new NFPA 652 Standard on the Fundamentals of Combustible Dust as the lead document when identifying and managing combustible dust hazards.

In this proposal Section 511.1 has been modified to add "and the International Fire Code" in the top scoping section. In looking at 511.1 and the following sections the IFC would only apply for the exceptions to Section 511.1.1 when it should apply generally regardless of whether or not a system is located inside or on th exterior of a facility.

Section 511.1.5 is modified to rename it 'Explosion Control" which is the correct terminology, the necessary protection features are much more than just "relief vents". "Explosion control" has been inserted as the lead requirement to be applied with linkage to the IFC as the correct document for installing explosion control. In addition language has been added "that produce combustible dusts in such a manner that the concentration and conditions create a fire or explosion hazard based on a Dust Hazard Analysis prepared" which is a phrase being applied and updated in other areas of the codes foor the required assessment of the potential hazard. Finally, the pointer to Section 2203.2 of the IFC leads the designer and the code official to the linkage with NFPA 652.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Updating the language to correlate with other changes in the codes is not expected to increase or decrease the cost of construction, however, increasing clarification in code application provides an opportunity to reduce costs.

Internal ID: 1624

M63-18

IMC: 602.2, 603.5.1

Proponent: Brent Ursenbach, Salt Lake County Planning and Development Services, representing Salt Lake County Planning and Development Services (bursenbach@slco.org)

2018 International Mechanical Code

Revise as follows:

602.2 Construction. *Plenum* enclosure construction materials that are exposed to the airflow shall comply with the requirements of Section 703.5 of the International Building Code or such materials shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125°F (52°C) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. ~~Air-Supply air~~ plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing direct evaporative ~~coolers-cooling systems~~.

603.5.1 Gypsum ducts. The use of gypsum boards to form air shafts (ducts) shall be limited to return air systems where the air temperatures do not exceed 125°F (52°C) and the gypsum board surface temperature is maintained above the airstream dew-point temperature. ~~Air-Supply air~~ ducts formed by gypsum boards shall not be incorporated in air-handling systems utilizing direct evaporative ~~coolers-cooling systems~~.

Reason:

This code sentence as written, may be interpreted to prohibit the use of a gypsum board plenum in any building using any form of evaporative cooling. It also prohibits the use of individual or combination direct and indirect evaporative cooling systems where the supply air system is ducted. The proponent assumes the intent is to prevent a condition where the gypsum board in a plenum is exposed to air with a potentially high relative humidity.

This proposed code change continues to prohibits direct evaporatively cooled air from being discharged into a gypsum board supply air plenum, while allowing this extremely effective and efficient cooling option, with a gypsum board return air plenum.

Direct and indirect evaporative cooling systems use only a fraction of the energy used by direct expansion cooling systems. These systems are very effect and commonly used in buildings of virtually all uses and occupancies in dry climates. Cooling towers, a form of indirect evaporative cooling are used in all climates.

Please see ASHRAE Handbook - HVAC Systems and Equipment, Chapter 41, for a detailed discussion on Evaporative Air-Cooling Equipment

For clarity, the following definitions have been proposed this code cycle:

Direct Evaporative Cooling- The evaporative cooling process where water evaporates directly into the air stream, reducing the air's dry-bulb temperature and raising its humidity level.

Indirect Evaporative Cooling-The evaporative cooling process where water evaporates into a secondary air stream, removing heat from a primary air stream using a heat exchanger.

Cost Impact

The code change proposal will decrease the cost of construction .

In dry climates, direct and indirect evaporative cooling systems often provide up to 75% of the required cooling capacity, allowing the DX cooling system sizing to be similarly reduced. This decreases the initial cost of construction, while reducing the operating cost over the life of the systems.

(bursenbach@slco.org)

2018 International Mechanical Code

601.5 Return air openings. Return air openings for heating, ventilation and air-conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturer's installation instructions, ACCA Manual D or the design of the registered design professional.
5. Return air taken from one dwelling unit shall not be discharged into another dwelling unit.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.
8. Return air shall not be taken from indoor swimming pool enclosures and associated deck areas.

Exceptions:

1. Where the air from such spaces is dehumidified in accordance with Section 403.2.1, Item 2.
2. Dedicated HVAC systems serving only such spaces.

Exceptions:

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen and are located not less than 10 feet (3048 mm) from the cooking appliances.
2. Taking return air from a kitchen is not prohibited in a dwelling unit where the kitchen and living spaces are in a single room and the cooking appliance is electric and located not less than 5 feet in any direction from the return air intake opening.
- ~~2-3.~~ Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage.

Reason:

There is an increasing trend towards smaller living spaces, including studio apartment, extended stay hotels, small homes and even tiny homes. Where the cooking appliance and living space are combined in a single space, requiring 10' between to return air inlet and the small cooking appliance serves no purpose. Cooking odors, even from burned food, will spread throughout the room, no matter how far the return is located from the appliance.

As some may be concerned with air-flow towards a return inlet impacting the flame of a gas burner, this exception is limited to electric appliances.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal will in some cases, reduce the length of return air duct required, reduce duct ceiling drops, resulting in a material and labor savings.

Internal ID: 1475

M65-18

IMC: 602.2.1.7

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

2018 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing piping and tubing. Plastic piping and tubing used in plumbing systems shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with ASTM E84 or UL 723.

~~**Exception:** Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.~~

Reason:

Most officials and members do not realize that the allowable smoke developed criteria included in the 602.2.1.7 exception for the UL 2846 test protocol is approximately 2.5 times higher than the traditional limit of 50 that the code requires for ASTM E 84 or UL 723 tests. Charlotte Pipe conducted UL 2846 tests at Underwriters Laboratories. Our testing found the requirements of the UL 2846 exception to be less restrictive than the E 84 protocol. For example, we tested two 3/4" CPVC pipes to the ASTM E 84 protocol and they failed the requirements of the code with a smoke developed index of 115, while two identical 3/4" pipes passed the requirements of the UL 2846 test exception in the same lab, with an average optical density of .05. Currently, the 602.2.1.7 exception allows an average optical density up to .15.

This exception was passed during the last cycle with no data to support such a huge increase in the allowable limit for smoke development. While the UL 2846 may be a reasonably good test for plastic piping, the requirements of the exception should have been developed relative to the E 84 and UL 723 flame spread and smoke developed criteria for each product type before being added to the codes. By allowing the requirements of the 602.2.1.7 exception to remain in the code we are allowing products that could produce almost three times the amount of smoke in plenum areas. This exception circumvents the requirements of the code which exist to preserve the health and safety of the public and should be stricken.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal will not increase or decrease the cost of construction and is intended to clarify existing language by identifying and prohibiting testing practices that circumvent the code requirements

M66-18

IMC: 602.2.1.7

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

2018 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing piping and tubing. Plastic piping and tubing used in plumbing systems shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with all requirements of ASTM E84 or UL 723. Mounting methods, supports and test specimen dimensions that are not specified in ASTM E 84 or UL 723 shall be prohibited.

~~**Exception:** Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.~~

Reason:

A growing issue in the plumbing industry is that the ATSM E 84 test protocol is being modified to test combustible piping materials. At the direction of plastics manufacturers, test labs will modify mounting methods, supports and test specimen dimensions to achieve results that are in compliance with the 25/50 benchmarks the code requires. These results are then used to secure a listing by third party certifiers to serve as proof to code officials of compliance to the flame spread and smoke developed index requirements found in the code.

The question of whether a piping material is in compliance to the flame spread and smoke developed requirements of the code is often further blurred as third party certifiers provide listings indicating that materials meet the 25/50 requirements using modified test methods. Third party certifiers disclose this information in their full listing or report, but this is not always easily identified or even accessible to officials. An inspector seeing ASTM E 84 on a pipe would likely assume that it meets the requirement of the code without fully knowing or understanding the restrictions that exist in the listing. In fact, listing agencies assume that the inspector will analyze the listing and make their own determination on compliance. This code change proposal provides notice to the official that simply adding the ASTM E 84 or UL 723 marking to the wall of the pipe does not necessarily mean that the product was tested in full compliance with the standard in the manner that the code intends.

Charlotte Pipe has conducted ASTM E 84 tests at two different test facilities and found that results below the 25/50 flame spread and smoke developed index are not achievable when performed to the full requirements of ASTM E 84. Our testing has shown that CPVC and PVC piping will not pass the ASTM E 84 without modification of the mounting method, supports or test specimen dimensions.

If the practice of accepting modified test results is allowed to continue, then the requirements of the code will not be achieved. ASTM E 84 is a comparison test, and the 25/50 flame spread and smoke developed index is not a requirement of the standard, but of the code itself. If the 25/50 requirement is too restrictive, then an effort should be made to change the code. If the ASTM E 84 test method is flawed, change the standard. However, we can no longer allow the use of modified tests and third party listings to circumvent the requirements of the code which exist to preserve the health and safety of the public.

Most officials and members do not realize that the allowable smoke developed criteria included in the 602.2.1.7 exception for the UL 2846 test protocol is approximately 2.5 times higher than the traditional limit of 50 that the code requires for ASTM E 84 or UL 723 tests. In addition to ASTM E 84 testing, Charlotte Pipe conducted UL 2846 tests at Underwriters Laboratories. Our testing found the requirements of the UL 2846 exception to be less restrictive than the E 84 protocol. For example, we tested two 3/4" CPVC pipes to the ASTM E 84 protocol and they failed the requirements of the code with a smoke developed index of 115, while two identical 3/4" pipes passed the requirements of the UL 2846 test exception in the same lab, with an average optical density of .05. This exception currently allows an average optical density of up to .15.

This exception was passed during the last cycle with no data to support such a huge increase in the allowable limit for smoke development. While the UL 2846 may be a reasonably good test for plastic piping, the requirements of the exception should have been developed relative to the E 84 and UL 723 flame spread and smoke developed criteria for each product type before being added to the codes. By allowing the requirements of the 602.2.1.7 exception to remain in the code we are allowing products that could produce almost three times the amount of smoke in plenum areas.

This exception should be stricken from the code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal will not increase or decrease the cost of construction and is intended to clarify existing language by identifying and prohibiting testing practices that circumvent the code requirements.

Internal ID: 1848

M68-18

IMC: 603.8, 603.8.3

Proponent: Charles Stock, Spunstrand Inc, representing Spunstrand Inc

2018 International Mechanical Code

Revise as follows:

603.8 Underground ducts. Ducts shall be *approved* for underground installation and shall be in compliance with Section 603.4 or 603.5. Metallic ducts not having an *approved* protective coating shall be completely encased in not less than 2 inches (51 mm) of concrete.

603.8.3 Plastic ducts and fittings. Plastic ducts shall be constructed of PVC ~~having a~~ that carries a recognized cell classification designation per ASTM D1248 or ASTM D1784 and shall have a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D2412. Plastic duct fittings shall be constructed of either PVC or high-density polyethylene and shall be in compliance with SMACNA Thermoplastic (PVC) Construction Standards. Plastic duct and fittings shall be utilized in underground installations only. The maximum design temperature for systems utilizing plastic duct and fittings shall be ~~150°F-125°F (66°C-52°C).~~

Reason:

The additions made to 603.8 are intended to clarify that underground duct work, regardless of the material used, shall still comply with the other requirements for metallic or non-metallic duct work as outlined in 603.4 and 603.5. Furthermore, the additions made to 603.8.3 are intended to supply a much needed and missing definition or standard around what is considered allowable plastic duct construction. These additions are needed to insure a consistent and trusted outcome from utilizing "plastic duct work". Lastly, the temperature change from 150F down to 125F is needed to avoid concerns with potential heat distortion issues of plastic duct when used in conjunction with modern heating units capable of higher output air temperatures.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no expected cost impact due to the proposed changes as it is simply adding much needed clarifications and further details to products, standards, and terms existing in the code.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1437

M69-18

IMC: 603.5

Proponent: Charles Stock, Spunstrand Inc, representing Spunstrand Inc

2018 International Mechanical Code

Revise as follows:

603.5 Nonmetallic ducts. Nonmetallic ducts shall be constructed with Class 0 or Class 1 duct material and shall comply with UL 181. Fibrous duct construction shall conform to the SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards. Plastic duct construction shall conform to the SMACNA Thermoplastic Duct (PVC) Construction Standards. Phenolic duct construction shall conform to the SMACNA Phenolic Duct Construction Standards. Fiberglass duct shall conform to the SMACNA Thermoset FRP Duct Construction Standards. The air temperature within nonmetallic ducts shall not exceed 250°F (121°C).

Reason:

Section 301 requires the listing and labeling of almost all installed products in a mechanical system. These listings/labels are to show compliance then with specific standards outlined in the products respective sections. Section 603 has recognized and trusted construction standards for metal duct and fibrous duct, but does not for a handful of other materials often used for air duct. The additions in this proposal are intended to supply the needed and missing material specific product/construction standards for these other duct construction materials.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No cost impact is expected as this simply adds needed clarification to the code.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1435

M70-18

IMC: 603.2, ordinal

Proponent: David Bixby, Air Conditioning Contractors of America (ACCA), representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

2018 International Mechanical Code

Revise as follows:

603.2 Duct sizing. Ducts installed within a single dwelling unit shall be sized in accordance with ACCA Manual D, the appliance manufacturer's installation instructions or other approved methods; Zoned duct systems shall also comply with ACCA Manual Zr. Ducts installed within all other buildings shall be sized in accordance with the *ASHRAE Handbook of Fundamentals* or other equivalent computation procedure.

Add new standard(s) follows:

ACCA

Air Conditioning Contractors of
America
2800 Shirlington Road, Suite 300
Arlington VA 22206

ANSI/ACCA 11 Manual Zr - 2018:

Residential HVAC System Zoning

Reason:

Currently there is no coverage in the mechanical code to address the design of zoned duct systems. ACCA Manual Zr provides procedures for designing zoned comfort systems for single family detached homes, duplex and triplex homes, row houses, town houses, and large multi-family structures that are compatible with ACCA Manual J procedures for residential load calculations. In addition, use of Manual Zr will avoid the potential for an improperly designed zoned duct system to adversely impact the safe operation and durability of the heating/cooling equipment. For code officials, Manual Zr has three normative sections to determine clear compliance. Manual Zr is also a consensus-based ANSI standard. A proposal to add ACCA Manual Zr to Chapter 15, Referenced Standards, has also been submitted.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cost impacts for using Manual Zr would be minimal, other than some extra time involved. Installers will have to ensure the installation of equipment and zoning devices complies with OEM installation instructions, as well as documenting such. Code officials will have to verify and document airflow rates, set-points for operation and safety controls, which will involve minimal time.

Internal ID: 1870

M71-18

IMC: 602.2.1.8

Proponent: Jay Peters, Codes and Standards International, representing The Copper Development Association (peters.jay@me.com)

2018 International Mechanical Code

Revise as follows:

602.2.1.8 Pipe and duct insulation within plenums. Pipe and duct insulation contained within plenums, including insulation adhesives, shall have a flame spread index of not more than 25 and a smoke developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Pipe and duct insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F(121°C). Pipe and duct insulation shall be listed and labeled. Pipe and duct insulation shall not be used to reduce the maximum flame spread and smoke-developed indexes specified in Section 602.2.1.7 except where tested as a composite assembly of the pipe, tubing, insulation, coatings and adhesives in accordance with ASTM E84 or UL 723.

Reason:

Fire walls, partitions, and similar protective assemblies are tested as composite assemblies, not as individual components. It is critical to have the best understanding possible of how an installed system will perform in the field which equates to replicating those conditions, especially in a plenum. This proposal clarifies that when materials do not meet minimum plenum safety requirements, simply covering them with plenum rated insulation may not be adequate protection, depending on the properties of the material being protected. Some insulation manufacturers market insulation materials for plenums, utilizing a "modified" E84 test, yet the code does not have provisions to use modified tests. Although there are insulation products that meet the flame and smoke requirements for plenums, the materials wrapped within them may begin to degrade, deteriorate and off-gas toxic fumes and substances into plenum spaces due to the high heat, even when protected. This off-gas could result in potential health and life-safety issues for occupants and first responders. All materials within plenums must meet the minimum plenum criteria and the code specifically identifies the proper tests. The IMC does not currently allow for "modified" test procedures in plenums.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies that installations must meet the existing code provisions.

Internal ID: 1343

M72-18

IMC 607.4 (IBC 717.4)

Proponent: Joseph Sandman, representing self (josephs@fioptics.com)

THIS CODE CHANGE PROPOSAL HAS BEEN PLACED ON THE IBC-FS AGENDA. PLEASE SEE THE IBC-FS HEARING ORDER.

2018 International Mechanical Code

Revise as follows:

[BF] 607.4 Access and identification. Fire and smoke dampers shall be provided with an *approved* means of access, ~~large enough~~ to permit inspection and maintenance of the damper and its operating parts. Dampers equipped with fusible links, internal operators, or both shall be provided with an access door that is not less than 12 inches (305mm) square or provided with a removable duct section. The access shall not affect the integrity of fire-resistance-rated assemblies. The access openings shall not reduce the fire-resistance rating of the assembly. Access points shall be permanently identified on the exterior by a label having letters not less than 0.5 inch (12.7 mm) in height reading: FIRE/SMOKE DAMPER, SMOKE DAMPER or FIRE DAMPER. Access doors in ducts shall be tight fitting and suitable for the required duct construction.

Reason:

Fire and smoke dampers are an important part of a HVAC ductwork system, in the event of a fire they are designed to close and prevent the spread of fire and smoke throughout the building duct work system, giving the building occupants enough time to evacuate and also providing the fire department sufficient time to enter the building and extinguish the fire safely.

The NFPA requires all fire and smoke dampers be periodically inspected, maintained and tested per their guidelines to assure these dampers function properly in the event of a fire.

The NFPA requires that fire and smoke dampers are inspected and maintained through an access door that provides full unobstructed access to these dampers. These access doors are mounted on the ductwork as close as possible to the damper. Access doors work well for large fire and smoke dampers because the ductwork size is large enough to except an adequate sized access door, the problem is with the smaller fire and smoke dampers, the ductwork is too small to mount an adequate size access door. NFPA 80 addresses this problem by mandating the minimum size access door shall be no smaller than 12 inch square or you must supply a removable ductwork section, this removable section provides the technician performing the inspection with the unobstructed access needed to properly inspect and maintain the smaller fire and smoke dampers.

Our concerns are with the smaller fire and smoke dampers, because in many cases the removable ductwork sections for these dampers are not being provided as mandated by the NFPA 80, rather inadequate small access doors are being installed in the ductwork system next to the fire and smoke damper. Small access doors don't provide the access needed to properly inspect and maintain the fire and smoke dampers. The inadequacies of these access doors is nothing new in the HVAC industry, in many cases when it becomes time for the periodic damper inspections the maintenance technician will ignore and pass over the small fire and smoke dampers knowing that it's virtually impossible to perform the inspection through the access doors. We are asking for your help in addressing this problem, these fire and smoke dampers are much to important to be ignored, they save lives and countless dollars in property damage, the solutions are known they are just not being implemented.

My recommendation would be to adopt the National Fire Protection Association (NFPA) standards as set forth in NFPA 80 - **19.2.3 Access.** Dampers equipped with fusible links, internal operators, or both shall be provided with an access door that is not less than 12 in. (305mm) square or provided with a removable duct section.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change will reduce the time for inspecting and servicing fire dampers by 50%.

Internal ID: 141

M73-18

IMC: 602.2.1.7

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing piping and tubing. Plastic piping and tubing used in plumbing systems shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with ASTM E84 or UL 723. The testing shall be conducted without water within the pipe.

Exception: Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

Reason:

This proposal should be simple clarification but it highlights the fact that many approvals (even at ICC ES) are based on testing in accordance with a "modified" version of ASTM E84. One of the key modifications is the use of water within the pipes during testing. ASTM E84 does not authorize the use of water during testing of pipes (or of any other product). The reports indicate that a "modified" version of ASTM E84 has been used for the testing but that does not follow the intent (or the letter) of either ASTM E84 or the IMC. The intent of the use of products in plenums is for comparative testing of the products as received for inclusion in the plenum, and that does not include water.

This proposal has language very similar to that in M77 from the last cycle, and has the same effect. M77 was approved as submitted at the Public Comment hearing but failed in the Online Governmental Consensus Voting Process. I attach the full proposal and comment section for M77, with its associated information.

The language in M77 at the last cycle discussed the inclusion of "any liquid" within the pipe. The present proposal is more specific in that it states that it is not allowed to include water because that is the liquid that is being used. Note that fires in plenums typically occur during construction or renovation, when pipes are not full of water (or any other liquid). Note also that this section is generic for any plastic pipe in plenums and not exclusive to those carrying water.

The proposal was disapproved by the mechanical code committee because they felt it was not necessary for the code to clarify what is in the test standards. A variety of ICC ES approvals show that, in fact, products are being approved when tested with water, meaning that the clarification is important to ensure that there is an understanding that such "modifications" are not acceptable.

Cost Impact

The code change proposal will increase the cost of construction .

The effect of this change is that some pipe materials that are in use today with incorrect fire testing and/or incorrect listings will have to be replaced in new construction by safer materials tested in proper accordance with ASTM E84.

Internal ID: 172

M74-18

IMC: 604.3

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Mechanical Code

Revise as follows:

604.3 Coverings and linings. ~~Coverings~~ Duct coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Coverings and linings shall be listed and labeled.

Exception: Polyurethane foam insulation that is spray applied to the exterior of ducts in attics and crawlspaces shall be subject to all of the following requirements:

1. The foam plastic insulation shall have a flame spread index not greater than 25 and a smoke developed index not greater than 450, when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231.
2. The foam plastic insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C).
3. The foam plastic insulation complies with the requirements of Section 2603 of the International Building Code.
4. The foam plastic insulation is protected against ignition in accordance with the requirements of Section 2603.4.1.6 of the International Building Code.

Reason:

The proposal is the same as M98-15 PC1. M98 was approved as modified by the committee. PC1 was approved during the Public Comment hearing but failed to get the necessary majority in the online vote.

The proposal adds an exception allowing a greater smoke-developed index for some applications of foam plastic insulation on the exterior surfaces of ducts in attics or crawlspaces under certain specified conditions. The exception applies only to foam insulation meeting the requirements of IBC Section 2603 and the ignition barrier requirements in IBC Section 2603.4.1.6. This additional option is consistent with the options in Section M1601.3 of the IRC.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal will permit greater flexibility in material selection.

Internal ID: 1898

M75-18

IMC: 602.2.1.7

Proponent: Mike Fischer, Kellen Company, representing Self (mfischer@kellencompany.com)

2018 International Mechanical Code

Revise as follows:

602.2.1.7 Plastic plumbing piping and tubing. Plastic piping and tubing used in plumbing systems shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with ASTM E84 or UL 723. Plastic piping and tubing shall be tested without water or other fluids within the test specimens.

Exception: Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

Reason:

This proposal is a revisiting of the debate on M77-15, which was approved during the PCH but failed to gather the required 2/3 majority during the online vote.

It should seem obvious that testing plastic pipes in the ASTM E84 Steiner Tunnel Test Chamber by filling them with water during testing would artificially improve the product's test performance. Evaluation reports issued by certification entities including ICC-ES have included testing in precisely that manner. ASTM E 84 cannot possibly cover every possible condition. It is important that the code provide clear guidance on this matter to ensure that the intended level of fire safety is met.

It is my opinion that testing plastic pipes- especially for drainage or condensate lines that are normally empty- is not currently permitted by the code. While Section 602.2.1.7 does not currently address test specimen preparation, ASTM E84 does not permit testing in this manner. The only way that testing plastic piping for use in plenums outside of the code-prescribed ASTM E84 test could be qualified, then, would be under Section 105.2 Alternative materials, design and methods of construction and equipment.

There is a catch, however; Section 105.2 provides guidance to the code official on alternative means and methods:

"An alternative material, design or method of construction shall be approved where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, not less than the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety."

Approval of pipes for flame spread rating with water in the specimen under a mutated version of ASTM E84 is not consistent with Section 105.2.

I ask the Mechanical Committee to approve this proposal and remove any doubt about the application of ASTM E84 for plastic piping and tubing.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

It is my opinion that the code does not currently permit testing plastic piping and tubing with water in the test specimens. For that reason, this code change is editorial and will assist with enforcement of the current provisions, not change the provisions.

M76-18

IMC: 602.1, 602.2, 602.2.1, 602.3, 602.3.3, 602.3.4, 602.3.5, 602.2.1.4, 602.2.1.4.1, 602.2.1.4.2, 602.3.1 (New), 602.3.2 (New), 602.3.6, 602.3.7, 602.3.8, 602.3.9, 602.3.10 (New), [BS] 602.4

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

602.1 General. Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces, mechanical equipment rooms and the framing cavities addressed in Section 602.3. Plenums shall be limited to one fire area. Air systems shall be ducted from the boundary of the fire area served directly to the air-handling equipment. Fuel-fired appliances shall not be installed within a plenum.

Revise as follows:

602.2 Construction of plenums. *Plenum* enclosure construction materials that are exposed to the airflow shall comply with the requirements of Section 703.5 of the International Building Code or such materials shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125°F (52°C) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

~~602.3~~**602.2.1 Stud cavity and joist space plenums.** Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:

1. Such cavities or spaces shall not be utilized as a *plenum* for supply air.
2. Such cavities or spaces shall not be part of a required fire-resistance-rated assembly.
3. Stud wall cavities shall not convey air from more than one floor level.
4. Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the International Building Code.
5. Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by *approved* fireblocking as required in the International Building Code.
6. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

~~602.2.1~~**602.3 Materials within plenums.** ~~Except as required by Sections 602.2.1.1 through 602.2.1.8, materials~~ Materials within plenums shall be noncombustible or shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723 in compliance with the applicable requirements in Sections 602.3.1 through 602.3.10.

Exceptions:

- ~~1. Rigid and flexible ducts and connectors shall conform to Section 603.~~
- ~~2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.~~
- ~~3. This section shall not apply to materials exposed within plenums in one- and two-family dwellings.~~
- ~~4. This section shall not apply to smoke detectors.~~
- ~~5.2.~~ Combustible materials fully enclosed within one of the following:
 - ~~5.1.2.1.~~ Continuous noncombustible raceways or enclosures.
 - ~~5.2.2.2.~~ Approved gypsum board assemblies.
 - ~~5.3.2.3.~~ Materials listed and labeled for installation within a plenum and listed for the application.
- ~~6.3.~~ Materials ~~This section shall not apply to materials~~ in Group H, Division 5 fabrication areas and the

areas above and below the fabrication area that share a common air recirculation path with the fabrication area.

~~602.2.1.1~~**602.3.3 Wiring.** Combustible electrical wires and cables and optical fiber cables exposed within a plenum shall be listed and labeled as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262, or shall be installed in metal raceways or metal sheathed cable. Combustible optical fiber and communication raceways exposed within a plenum shall be listed and labeled as having a peak optical density not greater than 0.5, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm) when tested in accordance with UL 2024. Only plenum-rated wires and cables shall be installed in plenum-rated raceways.

~~602.2.1.2~~**602.3.4 Fire sprinkler piping.** Plastic fire sprinkler piping exposed within a *plenum* shall be used only in wet pipe systems and shall be listed and labeled as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm) when tested in accordance with UL 1887.

~~602.2.1.3~~**602.3.5 Pneumatic tubing.** Combustible pneumatic tubing exposed within a *plenum* shall be listed and labeled as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm) when tested in accordance with UL 1820.

Delete without substitution:

~~602.2.1.4~~ **Electrical equipment in plenums.** ~~Electrical equipment exposed within a plenum shall comply with Sections 602.2.1.4.1 and 602.2.1.4.2.~~

~~602.2.1.4.1~~ **Equipment in metallic enclosures.** ~~Electrical equipment with metallic enclosures exposed within a plenum shall be permitted.~~

~~602.2.1.4.2~~ **Equipment in combustible enclosures.** ~~Electrical equipment with combustible enclosures exposed within a plenum shall be listed and labeled for such use in accordance with UL 2043.~~

Add new text as follows:

602.3.1 Ducts, connectors, duct coverings, linings, and tape. Rigid and flexible ducts and connectors shall conform to Section 603. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.

602.3.2 Smoke detectors. Smoke detectors shall be listed and labeled, and shall be installed with the sampling tubes included in the listing in accordance with the manufacturer's installation instructions, the International Building Code, and the International Fire Code.

Revise as follows:

~~602.2.1.5~~**602.3.6 Discrete electrical, plumbing and mechanical products in plenums.** Where discrete electrical, plumbing and mechanical products and appurtenances are located in a plenum and have exposed combustible material, they shall be listed and labeled for such use in accordance with UL 2043.

~~602.2.1.6~~**602.3.7 Foam plastic in plenums as interior finish or interior trim.** Foam plastic in plenums used as interior wall or ceiling finish or interior trim shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E84 or UL 723 at the maximum thickness and density intended for use, and shall be tested in accordance with NFPA 286 and meet the acceptance criteria of Section 803.1.2 of the International Building Code. As an alternative to testing to NFPA 286, the foam plastic shall be approved based on tests conducted in accordance with Section 2603.9 of the International Building Code.

Exceptions:

1. Foam plastic in plenums used as interior wall or ceiling finish or interior trim shall exhibit a flame spread index of 75 or less and a smoke developed index of 450 or less when tested in accordance with ASTM E84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by a thermal barrier complying with Section 2603.4 of the International Building Code.
2. Foam plastic in plenums used as interior wall or ceiling finish or interior trim, shall exhibit a flame

spread index of 75 or less and a smokedeveloped index of 450 or less when tested in accordance with ASTM E84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm).

3. Foam plastic in plenums used as interior wall or ceiling finish or interior trim, shall exhibit a flame spread index of 75 or less and a smokedeveloped index of 450 or less when tested in accordance with ASTM E84 or UL 723 at the maximum thickness and density intended for use, where it is separated from the airflow in the plenum by not less than a 1-inch (25 mm) thickness of masonry or concrete.

~~602.2.1-7~~602.3.8 Plastic plumbing piping and tubing. Plastic piping and tubing used in plumbing systems shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with ASTM E84 or UL 723.

Exception: Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

~~602.2.1-8~~602.3.9 Pipe and duct insulation within plenums. Pipe and duct insulation contained within plenums, including insulation adhesives, shall have a flame spread index of not more than 25 and a smoke developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Pipe and duct insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F(121°C). Pipe and duct insulation shall be listed and labeled.

Add new text as follows:

602.3.10 Other combustible materials. Other combustible materials not covered by Section 602.3 shall be listed and labeled as having a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723.

[BS] 602.4 Flood hazard. For structures located in flood hazard areas, plenum spaces shall be located above the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment or shall be designed and constructed to prevent water from entering or accumulating within the plenum spaces during floods up to such elevation. If the plenum spaces are located below the elevation required by Section 1612 of the International Building Code for utilities and attendant equipment, they shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to such elevation.

Reason:

This proposal does not intend to make any technical changes to the existing requirements. The intent of this proposal is to provide clarity as to what various materials are permitted within a plenum under specific conditions. The current Sections 602.2 and 602.3 are requirements for the constructing the plenum, and thus the current Section 602.3 should be a subsection of Section 602.2. Section 602.2.1 and its subsections are not for the construction of the plenum, but what materials are permitted within the plenum, and thus should not be a subsection of Section 602.2.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 487

M77-18

IMC: 606.2

Proponent: Raymond Grill, representing Self (ray.grill@arup.com)

2018 International Mechanical Code

Revise as follows:

606.2 Where required. Smoke detectors shall be installed where indicated in Sections 606.2.1 through 606.2.3.

Exception: Smoke detectors shall not be required where air distribution systems are incapable of spreading smoke beyond the ~~enclosing walls, floors and ceilings of the room or space~~ floor or smoke compartment in which the smoke is generated.

Reason:

The current exception is too limiting. It has been interpreted to not be allowed when there are more than one room on a floor. While smoke spread can occur much easier through a door opening than through a duct. The system have smoke detector activated shut off to prevent smoke spreading to other floors, smoke compartments on a floor or areas of the building.

Cost Impact

The code change proposal will decrease the cost of construction .

The provision of smoke detectors for automatic shut in the case of having more than one "room" on a floor is excessively costly. Each additional duct detector can cost \$500 and up depending on the location and installation constraints. The devices also require regular testing which increases operating costs.

Internal ID: 2316

M78-18 Part I

IMC: 602.1,

Proponent: Robert Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IMC COMMITTEE AND PART II WILL BE HEARD BY THE IRC M/P COMMITTEE. PLEASE SEE THE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Mechanical Code

Revise as follows:

602.1 General. Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces, and mechanical equipment rooms, ~~and the framing cavities addressed in Section 602.3~~ Plenums shall be limited to one fire area. Air systems shall be ducted from the boundary of the fire area served directly to the air-handling equipment. Fuel-fired appliances shall not be installed within a

Delete without substitution:

~~**602.3 Stud cavity and joist space plenums.** Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:~~

- ~~1. Such cavities or spaces shall not be utilized as a *plenum* for supply air.~~
- ~~2. Such cavities or spaces shall not be part of a required fire resistance rated assembly.~~
- ~~3. Stud wall cavities shall not convey air from more than one floor level.~~
- ~~4. Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the International Building Code.~~
- ~~5. Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by *approved* fireblocking as required in the International Building Code.~~
- ~~6. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.~~

Internal ID: 3474

M78-18 Part II

IRC: M1601.1.1

Proponent: Robert Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com)

2018 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA *HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. ~~Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:~~
 - ~~7.1.7. These cavities or spaces shall~~ Building framing cavities shall not be used as a plenum for supply air.
 - ~~7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.~~
 - ~~7.3. Stud wall cavities shall not convey air from more than one floor level.~~
 - ~~7.4. Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by tight fitting fireblocking in accordance with Section R602.8.~~
 - ~~7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air ducts or plenums.~~
8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Reason:

This code change proposal will create alignment between the IECC and the IMC as the IECC does not allow building cavities to be used as duct work that is seeing pressure from the air handling unit. It is impossible to control the air that is being pushed and pulled through building cavities that are used as ducts. When you pan a floor system for example, the air that is returning to the furnace comes from many more places than the room the intended. Air, having a tremendous ability to transport moisture, energy, and pollutants needs to be better controlled than is possible by using building cavities as duct work and therefore HVAC systems need to be fully ducted. The Energy Code recognizes the Building durability, efficiency, and safety concerns with gaining better control of air flow that is being pushed and pulled by the hair handling. Moisture control, energy control, pollutant control, house and room pressure control are all gained by fully ducting HVAC systems and not allowing building cavities to be used as duct work.

Cost Impact

The code change proposal will increase the cost of construction .

This Code proposal will increase the code of construction because it will require fully ducted HVAC systems which improving durability, safety, and effincy of the building we build

Internal ID: 1604

M79-18

IMC: 703 (New)

Proponent: Ted Williams, American Gas Association, representing American Gas Association (twilliams@aga.org)

2018 International Mechanical Code

Add new text as follows:

701.3 Outdoor Combustion Air. In Climate Zones 3 through 8, where outdoor combustion air is provided to a room containing a space-heating fuel burning appliance, and such room is within the thermal envelope of the building, the outdoor combustion air shall be tempered.

Exceptions:

1. The room is sealed and insulated in accordance with the requirements of Section R402.4.4 or C402.5.3 of the International Energy Conservation Code.
2. The appliance is a direct-vent appliance.
3. An automatic means to stop the flow of outdoor air during the off cycle of the appliance shall be provided in combustion air openings or in combustion air ducts.

Reason:

Limitation of inflow of cold unconditioned combustion air to appliance rooms is needed to address unsafe behaviors such as blocking outdoor combustion air inlets in winter to maintain appliance room temperatures that are consistent with the rest of the conditioned space. The proposal limits inflow of cold unconditioned air to the conditioned space during off-cycles of the appliance by requiring combustion air tempering or other means. Other means, allowed by exception, include applying the sealing and insulating requirements of the International Energy Conservation Code, restricting appliance types to those that would not pull cold unconditioned air into the appliance room itself, or installation of “J traps” or other combustion air ducting designs that have been shown to limit inflow of unconditioned air during appliance off cycles. On-cycle room temperatures would continue to be augmented by appliance jacket losses and venting system heat losses to the room during appliance operation.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Outdoor combustion air tempering can be addressed by installing tempering intake fan systems to existing combustion air ductwork at a small incremental cost. Alternatively and through one of the proposed exceptions, “J trap” combustion air duct work can be installed at minimal incremental cost. Either of these approaches represent insignificant costs relative to thermally isolating the room containing the combustion appliances (also to be permitted as an exception in the proposal as an option that would be consistent with the International Energy Conservation Code).

Internal ID: 2007

M80-18

IMC: 801.21 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Add new text as follows:

801.21 Blocked vent switch. The venting system for oil-fired appliances shall be equipped with a device that will stop burner operation in the event that the venting system is obstructed. Such device shall have a manual reset, and shall be installed in accordance with the manufacturer's instructions.

Reason:

Such devices can save lives in the event that a chimney or Type L vent is blocked by debris, decaying masonry or dead animals. Gas furnaces are equipped with thermal and/or pressure devices that will sense failure of the venting system, but such is not known to be required for oil-fired appliances. Such devices have been installed for many decades, but not necessarily required. These devices are typically provided for or are an option for draft regulators that are commonly installed in the vent of oil-fired appliances.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction because an additional device is mandated beyond what is currently required by the code.

Internal ID: 383

M81-18

IMC: SECTION 920.4 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Mechanical Code

SECTION 920 UNIT HEATERS

920.1 General. Unit heaters shall be installed in accordance with the listing and the manufacturer's instructions. Oil-fired unit heaters shall be tested in accordance with UL 731.

920.2 Support. Suspended-type unit heaters shall be supported by elements that are designed and constructed to accommodate the weight and dynamic loads. Hangers and brackets shall be of noncombustible material. Suspended-type oil-fired unit heaters shall be installed in accordance with NFPA 31.

920.3 Ductwork. A unit heater shall not be attached to a warm-air duct system unless *listed* for such installation.

Add new text as follows:

920.4 Prohibited Uses. In Group I-2 and ambulatory care facilities, suspended-type unit heaters are prohibited in corridors, exit access stairways and ramps, exit stairways and ramps and patient sleeping areas.

Reason:

Suspended type heaters should not be in the means of egress because of the element of risk for these types of heaters, such as open flame, carbon monoxide and other products of combustion. Fuel being piped to these heaters could be an additional risk. The defend in place concept relies on the means of egress to temporarily house residents and patients (K523).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The elimination of this type of heater unit will not add cost to these types of facilities

Internal ID: 634

M82-18

IMC: 929, 929.1, 202

Proponent: Tessa Quinones, The Hickman Group, representing MacroAir Technologies, Inc.
(admin@thehickmangroup.com)

2018 International Mechanical Code

Revise as follows:

SECTION 929 ~~HIGH-VOLUME-LARGE-DIAMETER~~ CEILING FANS

929.1 General. Where provided, ~~high-volume-large-diameter~~ ceiling fans shall be tested and labeled in accordance with AMCA 230, listed and labeled in accordance with UL 507, and installed in accordance with the manufacturer's instructions.

~~HIGH-VOLUME, LARGE-DIAMETER~~ CEILING FAN. A ~~low-speed~~ low-speed ceiling fan that circulates large volumes of air and that is greater than 7 feet (2134 mm) in diameter. These fans are sometimes referred to as High-Volume, Low-Speed (HVLS) fans.

Reason:

This proposal aligns the IMC large diameter ceiling fan terminology with the DOE definitions per test standard 10-CFR-Part 430-Appendix U, Section 1.14, as published in 2016.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is only an editorial revision; changing terminology.

Internal ID: 1146

M83-18

IMC: 905.1

Proponent: Tom Stroud, representing Hearth, Patio, and Barbecue Association (stroud@hpba.org)

2018 International Mechanical Code

Revise as follows:

905.1 General. Fireplace stoves and solid-fuel-type room heaters shall be *listed* and *labeled* and shall be installed in accordance with the conditions of the listing. Fireplace stoves shall be tested in accordance with UL 737. Solid-fuel-type room heaters shall be tested in accordance with UL 1482. Fireplace inserts intended for installation in fireplaces shall be *listed* and *labeled* in accordance with the requirements of UL 1482 and shall be installed in accordance with the manufacturer's instructions. New Wood Burning Residential Hydronic Heaters shall be EPA certified

Reason:

Over the last few years there have been numerous states that have been banning outdoor hydronic heaters, the reason being that they were very dirty. In work with ASTM and EPA, the units that are now being certified are a completely different product and should be considered as such and allowed by code. If the product is going to be installed, they need to be EPA certification standards.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Currently the only Outdoor Hydronic Heaters being sold in the US are required to meet EPA Certification, so there is not a cost impact related to the installation. This code addition would allow the money spent for the unit could meet the approval by the AHJ.

Internal ID: 1796

IMC: 202, 202 (New), SECTION 929 (New), 929.1 (New), Chapter 15, 15

Proponent: Bo Manalo, EcoSmart Inc., representing EcoSmart Inc. (bo@ecosmartfire.com)

2018 International Mechanical Code

Add new definition as follows:

SECTION 202 GENERAL DEFINITIONS

UNVENTED ALCOHOL FUEL BURNING DECORATIVE APPLIANCE. A stationary, self-contained appliance intended to be directly or indirectly secured to a wall or floor and not intended for duct connection. Such appliance burns alcohol and is made in a manufacturing facility for subsequent delivery to the installation site.

Add new text as follows:

SECTION 929 UNVENTED ALCOHOL FUEL BURNING DECORATIVE APPLIANCES

929.1 GENERAL. Unvented alcohol fuel-burning decorative appliances shall be listed and labeled in accordance with UL1370 and shall be installed in accordance with the conditions of the listing, manufacturer's installation instructions, and Chapter 3.

Add new standard(s) follows:

CHAPTER 15 REFERENCED STANDARDS

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096

UL1370-11:

Unvented Alcohol Fuel Burning Decorative Appliances, with revisions through March 25, 2016

Reason:

This proposal adds a provision for a newer type of decorative appliance. It provides clear and specific requirements for the installation of unvented, self-contained alcohol fuel burning appliances. The requisite ANSI consensus UL Standard 1370 includes performance-based criteria that provide a consistent application of requirements and best practices to ensure safe installation and operation. The Standard includes combustion testing for carbon dioxide and carbon monoxide emission limits, oxygen depletion, materials and construction requirements. The Standard also tests for user abuse testing, stability, temperature, and wind tests.

These appliances are intended for decorative purposes and not intended to be utilized as a primary heat source. Denatured alcohol is formulated for the application and limited to a maximum input rate of 0.25 gallons of fuel per hour (0.95 liters per hour). They are not provided with means for duct connection nor is there electric/mechanical assist of heated air movement, such as a fan-blower assembly. The appliances are labeled with minimum room volume requirements for installation.

The proposal improves the Code by providing installers and building officials with a clear path on specifications that pertain to these products. Installation is intended to be in accordance with local codes, the manufacturer's installation instructions and markings on the appliance.

Cost Impact

The code change proposal will increase the cost of construction .

This may reduce the cost of construction by simplifying the design/review process.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1616

M86-18 Part I

IMC: 908.1, 916.1, 918.1, 918.2, 1101.2, 15

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IMC COMMITTEE AND PART II WILL BE HEARD BY THE IRC M/P COMMITTEE. PLEASE SEE THE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Mechanical Code

Revise as follows:

908.1 General. A cooling tower used in conjunction with an air-conditioning *appliance* shall be installed in accordance with the manufacturer's instructions. Factory-built cooling towers shall be listed in accordance with UL 1995, or UL/CSA 60335-2-40.

916.1 General. Pool and spa heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired pool and spa heaters shall be tested in accordance with UL 1261. Pool and spa heat pump water heaters shall comply with UL 1995, or UL/CSA 60335-2-40, or CSA C22.2 No. 236.

Exception:

Portable residential spas and portable residential exercise spas shall comply with UL 1563 or CSA C22.2 No. 218.1.

918.1 Forced-air furnaces. Oil-fired furnaces shall be tested in accordance with UL 727. Electric furnaces shall be tested in accordance with UL 1995, or UL/CSA 60335-2-40. Solid fuel furnaces shall be tested in accordance with UL 391. Forced-air furnaces shall be installed in accordance with the listings and the manufacturer's instructions.

918.2 Heat pumps. Electric heat pumps shall be tested in accordance with UL 1995, or UL/CSA 60335-2-40.

1101.2 Factory-built equipment and appliances. *Listed* and *labeled* self-contained, factory-built *equipment* and appliances shall be tested in accordance with UL 207, UL 412, UL 471 ~~or 1995, UL1995, UL/CSA 60335-2-40, or UL 60335-2-89.~~ Such *equipment* and appliances are deemed to meet the design, manufacture and factory test requirements of this code if installed in accordance with their listing and the manufacturer's instructions.

Add new standard(s) follows:

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096

UL/CSA 60335-2-40 -17:

Household and Similar Electrical Appliances - Safety - Part 2-40: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers.

UL 60335-2-89-17:

Household and Similar Electrical Appliances - Safety - Part 2-89: Particular Requirements for Commercial Refrigerating Appliances with an Incorporated or Remote Refrigerant Unit or Compressor

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 424

M86-18 Part II

IRC: M1402.1, M2006.1, 44

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Residential Code

Revise as follows:

M1402.1 General. Oil-fired central furnaces shall conform to ANSI/UL 727. Electric furnaces shall conform to UL 1995 or UL/CSA 60335-2-40.

M2006.1 General. Pool and spa heaters shall be installed in accordance with the manufacturer's installation instructions. Oil-fired pool heaters shall comply with UL 726. Electric pool and spa heaters shall comply with UL 1261. Pool and spa heat pump water heaters shall comply with UL 1995, UL/CSA 60335-2-40 or CSA C22.2 No. 236.

Exception: Portable residential spas and portable residential exercise spas shall comply with UL 1563 or CSA C22.2 No. 218.1.

Update standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062

UL/CSA ~~ANCE 60335-2-40—201240—2017~~:

Standard for Household and Similar Electrical Appliances, Part 2: Particular Requirements for ~~Motor-compressors~~ Electrical Heat Pumps, Air-Conditioners and Dehumidifiers

Reason:

The UL Standard for Safety for Heating and Cooling Equipment, UL 1995 will be phased out by the year 2020, and will be replaced by UL 60335-2-40, the Standard for Safety for Household and Similar Electrical Appliances, Part 2-40: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers. UL 60335-2-40 is harmonized with requirements in Canada and Europe. These requirements include provisions for the most current technology and use of flammable refrigerants, and is currently being used to list new products. UL 412 and UL 471 will be phased out by the year 2020 and will be replaced by UL 60335-2-89.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

It is not anticipated that the change in the product standards will increase the cost of construction.

Internal ID: 3440

M87-18

IMC: 1004.1

Proponent: Donald Jones, Representing myself only - not my employer, representing Self (donald_m_jones@att.net)

2018 International Mechanical Code

Revise as follows:

1004.1 Standards. Boilers shall be designed, constructed and certified in accordance with the ASME Boiler and Pressure Vessel Code, Section I or IV. Controls and safety devices for boilers with fuel input ratings of less than 12,500,000 Btu/hr (3,662,500 W) ~~or less~~ shall meet the requirements of ASME CSD-1. Controls and safety devices for boilers with inputs greater than or equal to 12,500,000 Btu/hr (3,662,500 W) shall meet the requirements of NFPA 85. Packaged oil-fired boilers shall be listed and labeled in accordance with UL 726. Packaged electric boilers shall be listed and labeled in accordance with UL 834. Solid-fuel-fired boilers shall be listed and labeled in accordance with UL 2523.

Reason:

The IMC jurisdictional references to ASME CSD-1 and NFPA 85 are incorrect -- slightly. Per the IMC, boilers rated 12,500,000 Btu/h are within the jurisdiction of CSD-1; this is **not** correct. The IMC needs to be modified to reflect the proper application of referenced codes. NFPA 85 has jurisdiction of boilers **12,500,000 Btu/h and greater**; CSD-1 includes **boilers less than 12.5 million Btu/h**.

Bibliography:

NFPA 85 Chapter 1 Administration 1.1 Scope

Chapter 1 Administration

1.1* Scope. This code applies to the following:

- (1) Single burner boilers, multiple burner boilers, stokers, and atmospheric fluidized bed boilers with a fuel input rating of 3.7 MWt (12.5 million Btu/hr) or greater

Description of CSD-1 from ASME website:

The rules of this Standard cover requirements for the assembly, installation, maintenance, and operation of controls and safety devices on automatically operated boilers directly fired with gas, oil, gas-oil, or electricity, having fuel input ratings under 12,500,000 Btu/hr.

[https://www.asme.org/products/codes-standards/csd1-2015-controls-safety-devices-automaticall-\(1\)](https://www.asme.org/products/codes-standards/csd1-2015-controls-safety-devices-automaticall-(1))

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Boiler installations are already required to adhere to the referenced codes (according to the revised IMC text), so this "code change" has no effect on construction costs.

IMC: Chapter 2, SECTION 202, 202, 202 (New), 202, Chapter 11, SECTION 1101, 1101.2, SECTION 1103, 1103.1, TABLE 1103.1, SECTION 1104, 1104.3, 1104.3.1, 1104.3.1.1 (New), 1104.3.1.1.1 (New), 1104.3.1.1.2 (New), 1104.3.1.1.3 (New), 1104.3.1.1.4 (New)

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Mechanical Code

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

Revise as follows:

FLAMMABILITY CLASSIFICATION (REFRIGERANT). ~~Refrigerants shall be assigned to one of the three classes 1, 2 or 3 in accordance with ASHRAE 34. For Classes 2 and 3, the heat of combustion shall be calculated assuming that combustion products are in the gas phase and in their most stable state. The alphabetical/numerical designation used to identify the flammability of refrigerants.~~

Class 1. ~~Refrigerants that do not show flame propagation when tested in air at 14.7 psia (101 kPa) and 140°F (60°C). Indicates a refrigerant with no flame propagation.~~

Class 2L. Indicates a refrigerant with lower flammability and lower burning velocity.

Class 2. ~~Refrigerants having a lower flammability limit (LFL) of more than 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) and a heat of combustion of less than 8169 Btu/lb (19 000 kJ/kg). Indicates a refrigerant with lower flammability.~~

Class 3. ~~Refrigerants that are highly flammable, having a LFL of less than or equal to 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) or a heat of combustion greater than or equal to 8169 Btu/lb (19 000 kJ/kg). Indicates a refrigerant with higher flammability.~~

Add new definition as follows:

REFRIGERANT CONCENTRATION LIMIT (REFRIGERANT) (RCL) The refrigerant concentration limit, in air, intended to reduce the risks of acute toxicity, asphyxiation, and flammability hazards in normally occupied, enclosed spaces.

Revise as follows:

REFRIGERANT SAFETY CLASSIFICATIONS GROUP CLASSIFICATION. ~~Groupings that indicate the toxicity and flammability classes in accordance with Section 1103.1. The classification group is made up of a letter (A or B) that indicates the toxicity class, followed by a number (1, 2 or 3) that indicates the flammability class. Refrigerant blends are similarly classified, based on the compositions at their worst cases of fractionation, as separately determined for toxicity and flammability. In some cases, the worst case of fractionation is the original formulation. The alphabetical/numerical designation that indicates both toxicity and flammability classifications of refrigerants.~~

Toxicity. See "Toxicity classification (Refrigerant)."

Flammability. See "Flammability classification (Refrigerant)."

TOXICITY CLASSIFICATION CLASSIFICATION (REFRIGERANT). ~~Refrigerants shall be classified for toxicity in one of two classes in accordance with ASHRAE 34:~~An alphabetical designation used to identify the toxicity of refrigerants. Class A indicates a refrigerant with lower toxicity. Class B indicates a refrigerant with higher toxicity.

CHAPTER 11 REFRIGERATION

SECTION 1101 GENERAL

1101.2 Factory-built equipment and appliances. *Listed and labeled* self-contained, factory-built *equipment* and appliances shall be tested in accordance with UL 207, 412, 471 ~~or 1995-, 484, 541, 1995, 60335-2-24, 60335-2-40 or 60335-2-89.~~ Such *equipment* and appliances are deemed to meet the design, manufacture and factory test requirements of this code if installed in accordance with their listing and the manufacturer's instructions.

SECTION 1103 REFRIGERATION SYSTEM CLASSIFICATION

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Each refrigerant shall be assigned to one of the following refrigerant safety group classifications: A1, A2L, A2, A3, B1, B2L, B2, or B3. For refrigerants that do not have values in Table 1103.1, the safety group, RCL value, and OEL value shall be determined in accordance with ASHRAE 34 and approved.

TABLE 1103.1

REFRIGERANT CLASSIFICATION, AMOUNT AND OEL

CHEMICAL REFRIGERANT	FORMULA	CHEMICAL NAME OF BLEND	REFRIGERANT SAFETY GROUP CLASSIFICATION	AMOUNT OF REFRIGERANT PER OCCUPIED SPACE				[F] DEGREES OF HAZARD ^a

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. For installations that are entirely outdoors, use 3-1-0.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk. ~~The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~

SECTION 1104 SYSTEM APPLICATION REQUIREMENTS

1104.3 Refrigerant restrictions. Refrigerant applications, maximum quantities and use shall be restricted in accordance with Sections 1104.3.1 through 1104.3.4.

1104.3.1 Air-conditioning for human comfort. In other than industrial occupancies where the quantity in a single independent circuit does not exceed the amount in Table 1103.1, Group B1, B2, ~~B2L~~ and B3 refrigerants shall not be used in high-probability systems for air-conditioning for human comfort. Refrigerating systems containing Group A2L refrigerants shall comply with Section 1104.3.1.1.

Add new text as follows:

1104.3.1.1 Group A2L Refrigerants. High-probability systems using Group A2L refrigerants for human comfort applications shall comply with Sections 1104.3.1.1.1 through 1104.3.1.1.4. Nonoccupiable spaces with refrigerant containing equipment, including piping, shall comply with the amounts indicated in Table 1103.1, except as permitted by Section 1104.3.1.1.3.

1104.3.1.1.1 Listing and Installation Requirements. Where required per Section 1104.3.1.1, refrigerating systems shall be listed, labeled, and installed in accordance with the manufacturer's instructions, and any markings on the equipment restricting the installation. The nameplate shall include a symbol indicating that a flammable refrigerant is used, as specified by the product listing. A label indicating that a flammable refrigerant is used shall be placed adjacent to service ports and other locations where service involving components containing refrigerant is performed, as specified by the product listing.

A refrigerant detector shall be provided in accordance with Section 1104.3.1.1.4 where one or more of the following conditions are met:

1. For Commercial, Public Assembly and Large Mercantile occupancies where the refrigerant charge of any independent circuit exceeds 22 lb (10 kg).
2. For Institutional and Residential occupancies where the refrigerant charge of any independent circuit exceeds 6.6 lb (3 kg).
3. Where using the provisions of Section 1104.3.1.1.3.
4. Where a refrigerant detector is required by the product listing.

When the refrigerant detector senses a rise in refrigerant concentration above the value specified in Section 1104.3.1.1.4, all of the following shall apply:

1. A minimum flow rate of supply air shall be provided in accordance with the following equation: $Q \geq 1001 \times M / \text{LFL}$, (for SI: $Q \geq 60000 \times M / \text{LFL}$), where Q is the supply air flow rate ft³/min (m³/h), M is the refrigerant charge lb (kg), and LFL is the lower flammability limit lb per 1000 ft³ (g/m³).
2. The compressor and all other electrical devices shall be turned off, excluding the control power transformers, control systems, and the supply air fan. The supply air fan shall continue to operate for not less than 5 minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 1104.3.1.1.4.
3. Any device that controls air flow located within the product or in duct work that supplies air to the

occupied space shall be fully opened. Any device that controls air flow shall be listed.

4. Heaters and electrical devices located in the ductwork shall be turned off

1104.3.1.1.2 Ignition Sources. Open flame-producing devices shall not be permanently installed in the ductwork that serves the space. Continuously operating hot surfaces exceeding 1292°F (700°C) shall not be located within the ductwork that serves the space. Unclassified electrical devices shall not be located within the ductwork that serves the space.

1104.3.1.1.3 Refrigerant Containing Equipment Located Indoors. For refrigeration compressors and pressure vessels located in an indoor space that is accessible only during service and maintenance it shall be permissible to exceed the amounts indicated in Table 1103.1 where all of the following conditions apply:

Exceptions:

1. The largest single circuit charge does not exceed 6.6 lb (3 kg) for Residential and Institutional occupancies, and does not exceed 22 lb (10 kg) for C
2. The space where compressors and pressure vessels are located is provided with an air distribution system in accordance with the following equation: $Q \geq 1001 \times M / LFL$, (for SI: $Q \geq 60000 \times M / LFL$), where Q is the supply air flow rate ft³/min (m³/h), M is the refrigerant charge lb (kg), and LFL is the lower flammable limit lb per 1000 ft³ (g/m³).
3. Exhaust air is removed from the air distribution system at a minimum rate of 4 air changes per hour and the system has provisions for makeup air. Exhaust air that is removed from the air distribution system is either discharged outside of the building envelope, or discharged to an indoor space, provided that the refrigerant concentration will not exceed the amount indicated in Table 1103.1.
4. The air distribution system is started when the refrigerant detector senses refrigerant in accordance with Section 1104.3.1.1.4. The location of the refrigerant detector is in accordance with Section 1104.3.1.1.4. The air distribution system continues to operate for not less than 30 minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 1104.3.1.1.4 (1.).
5. The inlet for return air to the air distribution system is located where refrigerant from a leak is expected to accumulate. The inlet elevation is within 12 inches (30 cm) of the lowest elevation in the space where the compressor or pressure vessel is located.
6. In addition to the requirements of Section 1104.3.1.1.2 there are no open flame producing devices or continuously operating hot surfaces exceeding 1292°F (700°C) that are located within space where the equipment is installed.

1104.3.1.1.4 Refrigerant Detectors.

Refrigerant detectors shall comply with all of the following:

1. The refrigerant detector set point to activate the functions required by Section 1104.3.1.1.1 shall be at a value not exceeding 25% of the lower flammable limit (LFL).
2. One or more refrigerant detectors shall be located such that refrigerant will be detected if the refrigerating system is operating, or not operating. For refrigerating systems that are connected to the occupied space through ductwork, refrigerant detectors shall be located within the listed equipment. For refrigerating systems that are directly connected to the occupied space without ductwork, the refrigerant detector shall be located in the equipment, or shall be located in the occupied space at a height of not more than 12 inches (30 cm) above the floor and within a horizontal distance of not more 3.3 ft (1.0 m) with a direct line of sight of the unit.
3. The refrigerant detector as installed, including any sampling tubes, shall cause the functions required by Section 1104.3.1.1.1 within a time not to exceed 10 seconds, after exposure to a refrigerant concentration exceeding 25% of the LFL.
4. The refrigerant detector shall provide a means for automatic operational self-test as provided in the product listing. Use of a refrigerant test gas is not required. If a failure is detected, a trouble alarm shall be activated and the actions required by Section 1104.3.1.1.1 shall be initiated.
5. The refrigerant detector shall be tested during installation to verify the alarm set point and response time as required by Section 1104.3.1.1.4 items 1 and 3. After installation, the refrigerant detector shall be tested to verify the alarm set point and response time annually or at an interval not exceeding the manufacturer's installation instructions, whichever is less.

Reason:

The proposed code changes include technical content based on ASHRAE Standard 34-2016 with Addendum G and ASHRAE Standard 15-2016 with Addendum D. The revisions in these two ASHRAE addenda are dependent and must be correlated as shown in this code change proposal. Upon publication, these addenda will be incorporated into the 2019 editions of ASHRAE 34 and ASHRAE 15.

There was a considerable amount of industry research into the use of flammable refrigerants that occurred in 2016 and 2017, following the announcement in June 2016 of a collaborative research effort between ASHRAE, AHRI, and US DOE. ASHRAE SSPC15 relied upon this body of knowledge in drafting the addenda to the 2016 edition of Standard 15.

The refrigerant safety group classification is an alphabetical/numerical designation that is used to identify both the toxicity and flammability classifications of a given refrigerant. There are two new safety group classifications added to ASHRAE 34: A2L and B2L. Previously 2L was a sub-class of class 2 as an interim measure to implement changes to refrigerant flammability classification into ASHRAE 34 prior to making associated changes to a future edition of ASHRAE 15; but now 2L is a separate class and safety requirements must be revised to distinguish between class 2 and class 2L.

The current definitions of “flammability classification” and “toxicity classification” are improper since both contain mandatory code requirements. The definitions should only define the term, not contain code requirements with the use of the word “shall.” The current definition of refrigerant safety classifications is incorrect due to revisions to ASHRAE 34. The attempt to define the technical requirements of flammability are not correct. ASHRAE 34 goes into extensive requirements as to how to test and classify a refrigerant regarding flammability. The code should leave the technical requirements to ASHRAE 34 which is accomplished in Section 1103.1. The definition only has to identify the meanings of the classification categories. These terms used are found in the body of ASHRAE 34. The addition of “refrigerant” to the term “flammability classification” and “toxicity classification” clarify that the definitions only apply to refrigerants. Flammability and toxicity are terms also used in the ventilation sections of the code. These definitions do not apply to the use of those terms in Chapter 5.

Additional UL standards are added in Section 1101.2, because without product safety standards that include provisions for equipment using Group A2L refrigerants, the proposal would have no means of implementation, since it relies upon the use of listed and labeled equipment. Rapid refrigerant detection of Group A2L flammable refrigerants, and air movement to enable rapid mixing of released refrigerant, are at the core of the requirements presented in this code proposal.

Bibliography:

Addendum G to ASHRAE Standard 34-2016

Addendum D ASHRAE Standard 15-2016

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

While this proposal may introduce new requirements for A2L refrigerants, the type of refrigerant utilized within a building is up to the owner and designer. Therefore this proposal does not necessarily increase the cost of construction.

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. For installations that are entirely outdoors, use 3-1-0.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.
- f. The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.

Reason:

The Refrigerant Classifications (except Degrees of Hazard) are determined by ASHRAE SSPC 34 and published in ASHRAE Standard 34. This proposal seeks to update the refrigerant table with the new refrigerants added to Standard 34 since the last code cycle. The reasons for the additions of new refrigerants can be found at <https://www.ashrae.org/standards-research--technology/standards-addenda>. All proposed changes are either incorporated into ASHRAE Standard 34-2016 or the published addenda to ASHRAE Standard 34-2016 located at the link above.

Bibliography:

AHRAE Standard 34-2016

Addenda a, b, c, d, f, w, ak, al, am, an to ASHRAE Standard 34-2016 - <https://www.ashrae.org/standards-research--technology/standards-addenda>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Updating the table of refrigerants that could be used in systems does not add labor or material costs because the choice of refrigerant is up to the owner and designer.

Internal ID: 369

M90-18

IMC: 1102.3

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcman@jeffco.us)

2018 International Mechanical Code

Delete without substitution:

~~**1102.3 Access port protection.** Refrigerant access ports shall be protected in accordance with Section 1101.10 whenever refrigerant is added to or recovered from refrigeration or air-conditioning systems.~~

Reason:

This is already covered in Section 1102.3 and is complied with at the building stage. The deleted Section is a maintenance operation that cannot be verified after the inspection process because it won't generate a permit unless specifically adopted by the AHJ. This is better suited to be in the Existing Building Code or the Property Maintenance Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is editorial in nature.

Internal ID: 163

M91-18

IMC: 1106.2

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Mechanical Code

Revise as follows:

1106.2 Elevated temperature. There shall not be an open flame-producing device or continuously operating hot surface over 800°F (427°C) permanently installed in the room.

Exceptions:

1. Open flame-producing devices shall not be prohibited in machinery rooms for ammonia refrigeration equipment where combustion air is ducted from outside of the machinery room and sealed in such a manner as to prevent any refrigerant leakage from entering the combustion chamber.
2. Open flame-producing devices and continuously operating hot surfaces shall not be prohibited in machinery rooms for ammonia refrigeration equipment where refrigerant leak detection in the machinery room will automatically stop the equipment or process producing an open flame or hot surface when a refrigerant leak is detected.

Reason:

IIAR has separately proposed that Chapter 11 entirely defer to IIAR standards to eliminate overlap and correlation issues. If that proposal is successful, this proposal is unnecessary. However, if the IMC retains requirements that impact ammonia refrigeration, this section needs to be correlated with IIAR 2 for consistency. The technical justification is 1) Sealed combustion chambers do not present a risk of ignition of refrigerant leakage, and 2) Ignition sources that will automatically shut off when a refrigerant leak is detected do not present a hazard for ammonia because ammonia's flammability range begins at about 160,000 ppm (16% in air) and codes requires leak detection to activate ventilation at 1,000 ppm or less.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed exceptions provide design options that are not mandatory and therefore do not have a mandatory cost impact.

Internal ID: 2020

M92-18

IMC: 1107.5.4

Proponent: Jay Peters, Codes and Standards International, representing Cerro Flow Copper, RLS LLC
(peters.jay@me.com)

2018 International Mechanical Code

Revise as follows:

1107.5.4 Copper tubing joints. Copper tubing joints used in refrigerating systems containing Group A2, A3, B2 or B3 refrigerants shall be brazed. Soldered joints shall not be used in such refrigerating systems. Press-connect fittings shall be tested in accordance with UL 207.

Reason:

Press-connect fittings used for refrigeration systems are typically tested and listed to meet the requirements in UL 207. This proposal assists inspectors and manufacturers by clarifying the need for certification and the standard by which they are to be listed and tested.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Refrigeration fittings are already required to be tested and listed per ASHRAE Standard 15 and the IMC. This proposal just clarifies the proper standard to which they are to be tested and listed.

Internal ID: 2271

IMC: 1101.1, 1101.1.1 (New), 1101.1.2 (New), 1101.6, TABLE 1103.1, 1104.2.2, 1104.3.3, 1104.3.4, 1105.6.3, 1105.8, 1105.9, 1106.3, 1106.4, 1108.2

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Mechanical Code

Revise as follows:

1101.1 Scope. This chapter shall govern the design, installation, construction and repair of refrigeration systems that vaporize and liquefy a fluid during the refrigerating cycle. ~~Refrigerant piping design and installation, including pressure vessels and pressure relief devices, shall conform to this code.~~ Permanently installed refrigerant storage systems and other components shall be considered as part of the refrigeration system to which they are attached.

Add new text as follows:

1101.1.1 Refrigerants other than ammonia. Refrigerant piping design and installation, including pressure vessels and pressure relief devices, for systems containing a refrigerant other than ammonia shall comply with this chapter and ASHRAE 15.

1101.1.2 Ammonia refrigerant. Refrigeration systems using ammonia as the refrigerant shall comply with IAR 2, IAR 3, IAR 4 and IAR 5, and shall not be required to comply with this chapter.

Delete without substitution:

~~**1101.6 General.** Refrigeration systems shall comply with the requirements of this code and, except as modified by this code, ASHRAE 15. Ammonia refrigerating systems shall comply with this code and, except as modified by this code, ASHRAE 15, IAR 2, IAR 3, IAR 4 and IAR 5.~~

Revise as follows:

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. ~~For installations that are entirely outdoors, use 3-1-0.~~ The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.
- f. ~~The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to rooms and spaces that: are within industrial occupancies; contain a refrigerant evaporator; are maintained at temperatures below 68°F (20°C); and are used for manufacturing, food and beverage preparation, meat cutting, other processes and storage. Where a machinery room would otherwise be required by Section 1104.2, a machinery room shall not be required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.

Exceptions Exception:

- ~~1. Refrigerant detectors are not required in unoccupied areas that contain only continuous piping that does not include valves, valve assemblies, equipment, or equipment connections.~~
- ~~2. Where approved alternatives are provided, refrigerant detectors for ammonia refrigeration are not required for rooms or areas that are always occupied, and for rooms or areas that have high humidity or other harsh environmental conditions that are incompatible with detection devices.~~
4. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.4).
5. All electrical *equipment* and appliances conform to Class 1, Division 2, *hazardous location* classification requirements of NFPA 70 where the quantity of any Group A2, B2, A3 or B3 refrigerant, ~~other than ammonia,~~ in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space.
6. All refrigerant-containing parts in systems with a total connected compressor power exceeding 100 horsepower (hp) (74.6 kW) except evaporators used for refrigeration or dehumidification, condensers used for heating, control and pressure relief valves for either, low-probability pumps and connecting piping are located either outdoors or in a *machinery room*.

1104.3.3 All occupancies. The total of all Group A2, B2, A3 and B3 refrigerants ~~other than R-717, ammonia,~~ shall not exceed 1,100 pounds (499 kg) except where *approved*.

1104.3.4 Protection from refrigerant decomposition. Where any device having an open flame or surface temperature greater than 800°F (427°C) is used in a room containing more than 6.6 pounds (3 kg) of refrigerant in a single independent circuit, a hood and exhaust system shall be provided in accordance with Section 510. Such exhaust system shall exhaust *combustion* products to the outdoors.

Exception: A hood and exhaust system shall not be required where any of the following apply:

1. The refrigerant is R-~~717, R-~~ 718 or R-744.
2. The *combustion* air is ducted from the outdoors in a manner that prevents leaked refrigerant

from being combusted.

1105.6.3 Ventilation rate. ~~For other than ammonia systems, the mechanical~~ Mechanical ventilation systems shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions, as required by Sections 1105.6.3.1 and 1105.6.3.2. ~~The minimum required emergency ventilation rate for ammonia shall be 30 air changes per hour in accordance with IIAR 2.~~ Multiple fans or multispeed fans shall be allowed to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.

Delete without substitution:

~~**1105.8 Ammonia discharge.** Pressure relief valves for ammonia systems shall discharge in accordance with ASHRAE 15.~~

Revise as follows:

[F] 1105.9 Emergency pressure control system. ~~Permanently installed refrigeration systems containing more than 6.6 pounds (3 kg) of flammable, toxic or highly toxic refrigerant or ammonia~~ Emergency pressure control systems shall be provided with an emergency pressure control system in accordance with Section 605.10 of the International Fire Code.

Delete without substitution:

~~**1106.3 Ammonia room ventilation.** Ventilation systems in ammonia machinery rooms shall be operated continuously at the ventilation rate specified in Section 1105.6.3.~~

Exceptions:

- ~~1. Machinery rooms equipped with a vapor detector that will automatically start the ventilation system at the ventilation rate specified in Section 1105.6.3, and that will actuate an alarm at a detection level not to exceed 1,000 ppm.~~
- ~~2. Machinery rooms conforming to the Class 1, Division 2, hazardous location classification requirements of NFPA 70.~~

Revise as follows:

1106.4 Flammable refrigerants. Where refrigerants of Groups A2, A3, B2 and B3 are used, the *machinery room* shall conform to the Class 1, Division 2, *hazardous location* classification requirements of NFPA 70.

Exceptions-Exception:

- ~~1. Ammonia machinery rooms that are provided with ventilation in accordance with Section 1106.3.~~
- ~~2. Machinery rooms for systems containing Group A2L refrigerants that are in accordance with Section 1106.5.~~

1108.2 Test gases. Tests shall be performed with an inert dried gas including, but not limited to, nitrogen and carbon dioxide. Oxygen, air, combustible gases and mixtures containing such gases shall not be used.

~~**Exception:** The use of air is allowed to test R-717, ammonia, systems provided that they are subsequently evacuated before charging with refrigerant.~~

Reason:

IIAR is an ANSI accredited standards developer with a complete suite of standards to regulate ammonia refrigeration from initial design through decommissioning of systems. IIAR standards adopted by the IMC and IFC comprehensively regulate ammonia refrigeration, and there is no need to continue the complexity of overlapping requirements in the IMC.

When IIAR 2 was completely rewritten in 2014 to become both a code and a standard, a gap analysis was performed with the IMC and other model codes to confirm or facilitate alignment. The resulting IIAR 2 became a comprehensive document, intended to function as a standalone design regulation without reliance on a mechanical code. This is particularly valuable to jurisdictions in the U.S. and abroad that do not adopt a mechanical code.

A similar change was approved for the 2018 Uniform Mechanical Code. The 2018 UMC no longer covers ammonia refrigeration, instead deferring to IIAR standards. Likewise, ASHRAE is processing Addendum A to ASHRAE 15,

which deletes ammonia refrigeration requirements from that standard.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

IIAR standards are already adopted by the IMC, and thereby, compliance with these standards is already required. Deferral of ammonia systems to IIAR 2 will reduce the complexity of overlapping regulations and should not impact cost of construction.

Internal ID: 1190

M94-18

IMC: 1101.6, 1101.6.1 (New), 1101.6.2 (New), 1105.8

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Mechanical Code

Revise as follows:

1101.6 General. Refrigeration systems shall comply with the requirements of this code ~~and, except as modified by this code, ASHRAE 15. Ammonia refrigerating systems shall comply with this code and, except as modified by this code, ASHRAE 15, IIAR 2, IIAR 3, IIAR 4 and IIAR 5 .~~

Add new text as follows:

1101.6.1 Refrigerants other than ammonia. Where a refrigerant other than ammonia is used, refrigeration systems and the buildings in which such systems are installed shall be in accordance with ASHRAE 15.

1101.6.2 Ammonia refrigeration. Refrigeration systems using ammonia refrigerant and the buildings in which such systems are installed shall comply with IIAR 2, IIAR 3, IIAR 4 and IIAR 5.

Revise as follows:

1105.8 Ammonia discharge. Pressure relief valves for ammonia systems shall discharge in accordance with ~~ASHRAE 15~~ IIAR 2.

Reason:

IIAR 2 has become a standalone standard that no longer relies on ASHRAE 15 for supplemental requirements. Accordingly, it is no longer necessary for the IMC to require ammonia refrigeration systems to comply with both ASHRAE 15 and IIAR 2. This proposal provides direction to users with respect to proper application of the reference standards. In a separate proposal, IIAR is recommending that IMC Chapter 11 completely defer to IIAR 2 and other IIAR standards for regulation of ammonia, and that is the preferred action. However, should that action not be successful, this proposal will at least provide correct references to applicable standards.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

ASHRAE 15 and IIAR standards are existing reference standards that are already applicable to refrigeration systems. The proposal simply clarifies which standards apply based on the refrigerant being used.

Household and Similar Electrical Appliances - Safety - Part 2-89: Particular Requirements for Commercial Refrigerating Appliances with an Incorporated or Remote Refrigerant Unit or Compressor

UL/CSA 60335-2-40 -17:

Household and Similar Electrical Appliances - Safety - Part 2-40: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers.

Reason:

Establishing a table to identify the standards that apply to the various types of equipment and appliances will assist in uniform application of this code requirement. Adding UL 109, UL 427, UL 474, UL 484, UL 60335-2-89, and UL 60335-2-40, which are standards used in testing and listing refrigeration equipment, will make the code complete.

Cost Impact

The code change proposal will decrease the cost of construction .

Reduce costs by providing clarity

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 427

M96-18

IMC: 1104.2, 1104.2.1, 1104.3.1, 1104.3.2

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (JBEngineer@aol.com)

2018 International Mechanical Code

Revise as follows:

1104.2 Machinery room. Except as provided in Sections 1104.2.1 and 1104.2.2, all components containing the refrigerant shall be located either outdoors or in a *machinery room* where the quantity of refrigerant in an independent circuit of a system exceeds the amounts shown in Table 1103.1. For refrigerant blends not listed in Table 1103.1, the same requirement shall apply where the amount for any blend component exceeds that indicated in Table 1103.1 for that component. This requirement shall also apply where the combined amount of the blend components exceeds a limit of 69,100 parts per million (ppm) by volume. Machinery rooms required by this section shall be constructed and maintained in accordance with Section 1105 for Group A1 and B1 refrigerants and in accordance with Sections 1105 and 1106 for Group ~~A2L, A2, B2L~~, B2, A3 and B3 refrigerants.

Exceptions:

1. Machinery rooms are not required for *listed equipment* and appliances containing not more than 6.6 pounds (3 kg) of refrigerant, regardless of the refrigerant's safety classification, where installed in accordance with the equipment's or appliance's listing and the *equipment* or *appliance* manufacturer's installation instructions.
2. Piping in conformance with Section 1107 is allowed in other locations to connect components installed in a *machinery room* with those installed outdoors.

1104.2.1 Institutional occupancies. The amounts shown in Table 1103.1 shall be reduced by 50 percent for all areas of institutional occupancies except kitchens, laboratories and mortuaries. The total of all Group A2, ~~B2L~~, B2, A3 and B3 refrigerants shall not exceed 550 pounds (250 kg) in occupied areas or machinery rooms.

1104.3.1 Air-conditioning for human comfort. In other than industrial occupancies where the quantity in a single independent circuit does not exceed the amount in Table 1103.1, Group B1, ~~B2L~~, B2 and B3 refrigerants shall not be used in high-probability systems for air-conditioning for human comfort.

1104.3.2 Nonindustrial occupancies. Group A2 and ~~B2L~~, B2 refrigerants shall not be used in high-probability systems where the quantity of refrigerant in any independent refrigerant circuit exceeds the amount shown in Table 1104.3.2. Group A3 and B3 refrigerants shall not be used except where *approved*.

Exception: This section does not apply to laboratories where the floor area per occupant is not less than 100 square feet (9.3 m²).

Reason:

ASHRAE 34 changed the classification of refrigerants. Two new groups were added, A2L and B2L. Previously, these types of refrigerants were subclasses of A2 and B2 respectively. With the change in designation, these sections need to be updated to reflect the additional classifications of refrigerants.

Both A2L and B2L refrigerants are flammable, however, they have a lower burning velocity. A2L refrigerants are used in high probability systems, whereas, B2L refrigerants are not.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change reflect the change in classification of refrigerants.

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. For installations that are entirely outdoors, use 3-1-0.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.
- f. ~~The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~

Reason:

ASHRAE 34 changed the classification of refrigerants. Two new groups were added, A2L and B2L. Previously, these types of refrigerants were subclasses of A2 and B2 respectively. With the change in designation, the table needs to be updated to reflect the appropriate classification. Additionally, note f no longer applies.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This only changes the classification of existing refrigerants.

2018 International Mechanical Code

Revise as follows:

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Each refrigerant shall be assigned to a single group of refrigerants. The group of refrigerants shall be A1, A2L, A2, A3, B1, B2L, B2, and B3.

Reason:

This proposed change adds general requirements found in ASHRAE 34. This added text will assist the code official in understanding how refrigerants are classified into a specific group of refrigerants. It will also make it clear to the code official that a refrigerant can only fall within one group of refrigerants.

ASHRAE 34 approved a change making A2L and B2L full groups of refrigerants. Previously, A2L was a subgroup of A2 and B2L was a subgroup of B2 refrigerants.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change only impacts the classification of refrigerants.

Delete and substitute as follows:

~~SECTION 1107 REFRIGERANT PIPING~~ ~~SECTION 1107 PIPING MATERIAL~~

~~**1107.1 Piping.** Refrigerant piping material for other than R-717 (ammonia) systems shall conform to the requirements in this section.~~

~~Piping material and installations for R-717 (ammonia) refrigeration systems shall comply with IAR 2.~~

~~**1107.2 Used Materials.** Used pipe, fittings, valves and other materials that are to be reused shall be clean and free of foreign materials and shall be approved for reuse.~~

~~**1107.3 Material rating.** Materials, joints and connections shall be rated for the operating temperature and pressure of the refrigerant system. Materials shall be suitable for the type of refrigerant and type of lubricant in the refrigerant system. Magnesium alloys shall not be used in contact with any halogenated refrigerants. Aluminum, zinc, magnesium, and their alloys shall not be used in contact with R-40 (methyl chloride).~~

~~**1107.4 Piping materials standards.** Refrigerant pipe shall conform to one or more of the standards listed in Table 1107.4. The exterior of the pipe shall be protected from corrosion and degradation.~~

TABLE 1107.4
REFRIGERANT PIPE

<u>4</u>	<u>0.64</u>	<u>0.96</u>

1107.6 Valves. Valves shall be of materials that are compatible with the type of piping material, refrigerants, and oils in the system. Valves shall be listed and labeled and rated for the temperatures and pressures of the refrigerant systems in which the valves are installed.

1107.7 Flexible connectors, expansion and vibration compensators. Flexible connectors and expansion and vibration control devices shall be listed and labeled for use in refrigerant systems.

SECTION 1108 JOINTS AND CONNECTIONS

1108.1 Approval. Joints and connections shall be of an approved type. Joints and connections shall be tight for the pressure of the refrigerant system when tested in accordance with Section 1110.

1108.1.1 Joints between different piping materials.. Joints between different piping materials shall be made with approved adapter fittings. Joints between dissimilar metallic piping materials shall be made with a dielectric fitting or a dielectric union conforming to dielectric tests of ASSE 1079. Adapter fittings with threaded ends between different materials shall be joined with thread lubricant in accordance with Section 1108.3.4.

1108.2 Preparation of pipe ends. Pipe shall be cut square, reamed and chamfered, and shall be free of burrs and obstructions. Pipe ends shall have full-bore openings and shall not be undercut.

1108.3 Joint preparation and installation. Where required by Sections 1108.4 through 1108.9, the preparation and installation of brazed, flared, mechanical, press-connect, soldered, threaded and welded joints shall comply with Sections 1108.3.1 through 1108.3.5.

1108.3.1 Brazed joints. Joint surfaces shall be cleaned. An approved flux shall be applied where required by the braze filler metal manufacturer. The piping being brazed shall be purged of air to remove the oxygen and filled with one of the following inert gases: oxygen-free nitrogen, helium, or argon. The piping system shall be pre-purged with an inert gas for a minimum time corresponding to five volume changes through the piping system prior to brazing. The pre-purge rate shall be at a minimum velocity of 100 feet per minute. The inert gas shall be directly connected to the tube system being brazed to prevent the entrainment of ambient air. After the pre-purge, the inert gas supply shall be maintained through the piping during the brazing operation at a minimum pressure of 1.0 psi and a maximum pressure of 3.0 psi. The joint shall be brazed with a filler metal conforming to AWS A5.8.

1108.3.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

1108.3.2.1 Flared joints. Flared fittings shall be installed in accordance with the manufacturer's instructions. The flared fitting shall be used with the tube material specified by the fitting manufacturer. The flared tube end shall be made by a tool designed for that operation.

1108.3.2.2 Press-connect joints. Press-connect joints shall be installed in accordance with the manufacturer's instructions.

1108.3.3 Soldered joints.. Joint surfaces to be soldered shall be cleaned and a flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32. Solder joints shall be limited to refrigerant systems using Group A1 refrigerant and having a pressure of less than or equal to 200 psi.

1108.3.4 Threaded joints.. Threads shall conform to ASME B1.20.1, ASME B1.20.3, ASME B1.13M, or ASME B1.1. Thread lubricant, pipe-joint compound, or thread tape shall be applied on the external threads only and shall be approved for application on the piping material.

1108.3.5 Welded joints. Joint surfaces to be welded shall be cleaned by an approved procedure. Joints shall be welded with an approved filler metal.

1108.4 Aluminum tube. Joints between aluminum tubing or fittings shall be brazed, mechanical, press-connect, or welded joints conforming to Section 1108.3.

1108.5 Brass (copper alloy) pipe. Joints between brass pipe or fittings shall be brazed, mechanical, press-connect, threaded, or welded joints conforming to Section 1108.3.

1108.6 Copper pipe. Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, press-connect, soldered, threaded, or welded joints conforming to Section 1108.3.

1108.7 Copper tube. Joints between copper or copper-alloy tubing or fittings shall be brazed, flared, mechanical, press-connect, or soldered joints.

1108.8 Steel pipe. Joints between steel pipe or fittings shall be mechanical joints, threaded, press-connect, or welded joints conforming to Section 1108.3.

1108.9 Steel tube. Joints between steel tubing or fittings shall be flared, mechanical, press-connect, or welded joints conforming to Section 1108.3.

SECTION 1109 REFRIGERANT PIPE INSTALLATION

1109.1 General. Refrigerant piping installations, other than R-717 (ammonia) refrigeration systems, shall comply with the requirements of this section. The design of refrigerant piping shall be in accordance with ASME B31.5.

1109.2 Piping location. Refrigerant piping shall comply with the installation location requirements of Sections 1109.2.1 through 1109.2.6. Refrigerant piping for group A2L and B2L shall also comply with the requirements of Section 1109.3. Refrigerant piping for group A2, A3, B2 and B3 shall also comply with the requirements of Section 1109.4.

1109.2.1 Minimum height.. Exposed refrigerant piping installed in open spaces that afford passage shall be not less than 7 feet 3 inches (2210 mm) above the finished floor.

1109.2.2 Refrigerant pipe enclosure. Refrigerant piping shall be protected by locating it within the building elements or within protective enclosures.

Exception: Piping protection within the building elements or protective enclosure shall not be required in any of the following locations:

1. Where installed without ready access or located more than 7 feet 3 inches (2210 mm) above the finished floor.
2. Where located within 6 feet (1830 mm) of the refrigerant unit or appliance.
3. Where located in a machinery room complying with Section 1105.

1109.2.3 Prohibited locations. Refrigerant piping shall not be installed in any of the following locations:

1. Exposed within a fire-resistance-rated exit access corridor,
2. Interior exit stairway,
3. Interior exit ramp,
4. Exit passageway, or

5. Elevator, dumbwaiter or other shaft containing a moving object.

1109.2.4 Piping in concrete floors. Refrigerant piping installed in concrete floors shall be encased in pipe, conduit, or ducts. The piping shall be protected to prevent damage from vibration, stress and corrosion.

1109.2.5 Refrigerant pipe shafts. Refrigerant piping that penetrates two or more floor/ceiling assemblies shall be enclosed in a fire-resistance-rated shaft enclosure. The fire-resistance-rated shaft enclosure shall comply with Section 713 of the International Building Code.

Exceptions:

1. For systems using R718 refrigerant.
2. Piping in a direct system using Group A1 refrigerant where the refrigerant quantity does not exceed the limits of Table 1103.1 for the smallest occupied space through which the piping passes.
2. Piping located on the exterior of the building where vented to the outdoors.

1109.2.6 Exposed piping surface temperature. Exposed piping with ready access having surface temperatures greater than 120°F (49°C) or less than 5°F (-15°C) shall be protected from contact or shall have thermal insulation that limits the exposed insulation surface temperature to a range of 5°F (-15°C) to 120°F (49°C).

1109.3 Installation requirements for A2L and B2L refrigerants. Piping systems using Group A2L or B2L refrigerant shall comply with the requirements of Sections 1109.3.1 through 1109.3.3.

1109.3.1 Pipe protection. In addition to the requirements of Section 305.5, aluminum, copper, and steel tube used for Group A2L and B2L refrigerants and located in concealed locations where tubing is installed in studs, joists, rafters or similar member spaces and located less than 1-1/2 inches (38 mm) from the nearest edge of the member, shall be continuously protected by shield plates. Protective steel shield plates having a minimum thickness of 0.0575 inch (1.463 mm) (No. 16 gage) shall cover the area of the tube plus the area extending not less than 2 inches beyond both sides of the tube..

1109.3.2 Shaft ventilation. Refrigerant pipe shafts with systems using Group A2L or B2L refrigerants shall be naturally or mechanically ventilated. The shaft ventilation exhaust outlet shall comply with Section 501.3.1. Naturally ventilated shafts shall have a pipe, duct, or conduit not less than 4 inches in diameter that connects to the lowest point of the shaft and extends to the outdoors. The pipe, duct, or conduit shall be level or pitched downward to the outdoors. Mechanically ventilated shafts shall have a minimum airflow velocity in accordance with Table 1109.3.2. The mechanical ventilation shall be continuously operated or activated by a refrigerant detector. Systems utilizing a refrigerant detector shall activate the mechanical ventilation at a maximum refrigerant concentration of 25 percent of the lower flammable limit of the refrigerant. The detector, or a sampling tube that draws air to the detector, shall be located in an area where refrigerant from a leak will concentrate. The shaft shall not be required to be ventilated for double wall refrigerant pipe where the interstitial space of the double wall pipe is vented to the outdoors.

**TABLE 1109.3.2
SHAFT VENTILATION VELOCITY**

Cross Sectional Area of Shaft (sq. in.)	Minimum Ventilation Velocity (feet per minute)
≤ 20	100
> 20 - ≤ 250	200
> 250 - ≤ 1250	300
> 1250	400

1109.3.3 Pipe identification. Refrigerant pipe located in areas other than the room or space where the refrigerating equipment is located shall be identified. The pipe identification shall be located at intervals not exceeding 20 feet on the refrigerant piping or pipe insulation. The identification shall indicate the refrigerant designation and safety group classification of refrigerant used in the piping system. For Group B2L refrigerants the identification shall also include the following statement: "DANGER - Toxic Refrigerant." The minimum height of lettering of the identification label shall be ½ inch.

1109.4 Installation requirements for A2, A3, B2, and B3 refrigerants. Piping systems using Group A2, A3, B2, or B3 refrigerant shall comply with the requirements of Section 1109.4.1 through 1109.4.3.

1109.4.1 Piping material. Piping material for Group A2, A3, B2, or B3 refrigerant located inside the building, except for machinery rooms, shall be copper pipe, brass pipe, or steel pipe. Pipe joints located in areas other than the machinery room shall be welded. Self-contained listed and labeled equipment or appliances shall have piping material based on the listing requirements.

1109.4.3 Shaft ventilation. Refrigerant pipe shafts with systems using Group A2, A3, B2, or B3 refrigerants shall be continuously mechanically ventilated. The shaft ventilation exhaust outlet shall comply with Section 501.3.1. Mechanically ventilated shafts shall have a minimum airflow velocity as specified in Table 1109.3.2. The shaft shall not be required to be ventilated for double wall refrigerant pipe where the interstitial space of the double wall pipe is vented to the outdoors.

1109.4.3 Pipe identification.. Refrigerant pipe shall be identified with the refrigerant designation and safety group classification of refrigerant used in the piping system and the following statement: "DANGER - Risk of Fire or Explosion, Flammable Refrigerant." For Group B2 and B3 refrigerants the identification shall also include the following statement: "DANGER - Toxic Refrigerant." The identification shall be at intervals not exceeding 5 feet on the refrigerant piping or pipe insulation. The minimum height of lettering of the identification label shall be 1 inch.

1109.5 Refrigerant pipe penetrations. The annular space between the outside of a refrigerant pipe and the inside of a pipe sleeve or opening in a building envelope wall, floor, or ceiling assembly penetrated by a refrigerant pipe shall be sealed in an approved manner with caulking material, foam sealant or closed with a gasketing system. The caulking material, foam sealant or gasketing system shall be designed for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Refrigerant pipes penetrating fire-resistance-rated assemblies or membranes of fire-resistance-rated assemblies shall be sealed or closed in accordance with Section 714 of the International Building Code.

1109.6 Stress and strain. Refrigerant piping shall be installed so as to prevent strains and stresses that exceed the structural strength of the pipe. Where necessary, provisions shall be made to protect piping from damage resulting from vibration, expansion, contraction, and structural settlement.

1109.7 Condensate control. Refrigerating piping and fittings that, during normal operation, will reach a surface temperature below the dew point of the surrounding air, and are located in spaces or areas where condensation has the potential to cause a safety hazard to the building occupants, structure, electrical equipment or any other equipment or appliances, shall be insulated or protected in an approved manner to prevent damage from condensation.

1109.8 Stop valves. Stop valves shall be installed in specified locations in accordance with Sections 1109.8.1 and 1109.8.2. Stop valves shall be supported in accordance with Section 1109.8.3 and identified in accordance with Section 1109.8.4.

Exceptions:

1. Systems that have a refrigerant pump out function capable of storing the entire refrigerant

- charge in a receiver or heat exchanger.
2. Systems that are equipped with provisions for pump out of the refrigerant using either portable or permanently installed refrigerant recovery equipment.
 3. Self-contained listed and labeled systems.

1109.8.1 Refrigerating systems containing more than 6.6 pounds (3.0 kg) of refrigerant. Stop valves shall be installed in the following locations on refrigerating systems containing more than 6.6 pounds (3.0 kg) of refrigerant:

1. The suction inlet of each compressor, compressor unit or condensing unit.
2. The discharge outlet of each compressor, compressor unit or condensing unit.
3. The outlet of each liquid receiver.

1109.8.2 Refrigerating systems containing more than 100 pounds (45 kg) of refrigerant. In addition to stop valves required by Section 1109.8.1, systems containing more than 100 pound (45 kg) of refrigerant shall have stop valves installed in the following locations:

1. Each inlet of each liquid receiver.
2. Each inlet and each outlet of each condenser, where more than one condenser is used in parallel

Exceptions:

1. Stop valves shall not be required on the inlet of a receiver in a condensing unit, nor on the inlet of a receiver that is an integral part of the condenser.
2. Systems utilizing nonpositive displacement compressors.

1109.8.3 Stop valve support. Stop valves shall be supported to prevent detrimental stress and strain on the refrigerant piping system. The piping system shall not be utilized to support stop valves on copper tubing or aluminum tubing 1 inch (25.4 mm) OD or larger in diameter.

1109.8.4 Identification. Stop valves shall be identified where their intended purpose is not obvious. Where valves are identified by a numbering or lettering system, legend(s) or key(s) for the valve identification shall be located in the room containing the indoor refrigeration equipment. The minimum height of lettering of the identification label shall be ½ inch (12.7 mm).

SECTION 1108 FIELD TEST

SECTION 1110 REFRIGERANT PIPING SYSTEM TEST

1110.1 General. Refrigerant piping systems, other than R-717 (ammonia) refrigeration systems, that are erected in the field, shall be pressure tested for strength and leak tested for tightness, in accordance with the requirements of this section, after installation and before being placed in operation, Tests shall include both the high and low-pressure sides of each system.

Exception: Listed and labeled equipment, including compressors, condensers, vessels, evaporators, gas bulk storage tanks, safety devices, pressure gauges and control mechanisms, shall not be required to be tested.

1110.2 Exposure of refrigerant piping system. Refrigerant pipe and joints installed in the field shall be exposed for visual inspection and testing prior to being covered or enclosed.

1110.3 Test gases. The medium used for pressure testing the refrigerant system shall be one of the following inert gases: oxygen-free nitrogen, helium, or argon. For R-744 refrigerant systems carbon dioxide shall be allowed as the test medium. For R-718 refrigerant systems water shall be allowed as the test medium. Oxygen, air, combustible gases and mixtures containing such gases shall not be used as test medium. Systems erected on the premises with tubing not exceeding 5/8 inch (15.8 mm) OD shall be allowed to use the refrigerant identified on the nameplate label or marking as the test medium.

1110.4 Test apparatus. The means used to pressurize the refrigerant piping system shall have on its outlet side, a test pressure measuring device and either a pressure-limiting device or a pressure-reducing device. The test pressure measuring device shall have an accuracy of ±3 percent or less of the test pressure, and shall have a resolution of 5% or less of the test pressure.

1110.5 Piping system pressure test and leak test. The refrigerant piping system shall be tested as a whole or separate tests shall be conducted for the low pressure-side and high pressure-side of the piping system. The refrigerant piping system shall be tested in accordance with both of the following methods:

1. The system shall be pressurized for a period of not less than 60 minutes to not less than the lower of the design pressures or the setting of the pressure relief device(s). The design pressures for testing shall be the pressure listed on the label nameplate of the condensing unit, compressor, compressor unit, pressure vessel, or other system component with a nameplate. Additional test gas shall not be added to the system after the start of the pressure test. The system shall not show loss of pressure on the test pressure measuring device during the pressure test. Where using refrigerant as a test medium in accordance with Section 1110.3, the test pressure shall be not less than the saturation dew point pressure at 77°F (25°C).
2. A vacuum of 500 microns shall be achieved. After achieving a vacuum, the system shall be isolated from the vacuum pump. The system pressure shall not rise above 1500 microns for a period of not less than 10 minutes.

1110.5.1 Joints and refrigerant-containing parts in air ducts. Joints and all refrigerant-containing parts of a refrigerating system located in an air duct of an air-conditioning system that conveys conditioned air to and from human-occupied spaces shall be tested at a pressure of 150 percent of the higher of the design pressure or pressure relief device setting.

1110.5.2 Limited charge systems. Limited-charge systems with a pressure relief device, erected on the premises, shall be tested at a pressure not less than one and one-half times the pressure setting of the relief device. Listed and labeled limited charge systems shall be tested at the equipment or appliance design pressure.

1110.6 Booster compressor. Where a compressor protected by a pressure relief device is used as a booster to obtain an intermediate pressure and such compressor discharges into the suction side of another compressor, the booster compressor shall be considered to be a part of the low pressure side of the system.

1110.7 Centrifugal/nonpositive displacement compressors. Where testing systems using centrifugal or other nonpositive displacement compressors, the entire system shall be considered to be the low pressure-side for test purposes.

1110.8 Contractor or engineer declaration. The installing contractor or registered design professional of record shall issue a certificate of test to the code official for all systems containing 55 pounds (25 kg) or more of refrigerant. The certificate shall give the test date, name of the refrigerant, test medium, and the field test pressure applied to the high pressure-side and the low pressure-side of the system. The certification of test shall be signed by the installing contractor or registered design professional and shall be made part of the public record.

Reason:

I organized a group of 8 experts in the field of refrigerant piping to help develop this code change. I refer to them as the Refrigerant Piping Committee. However, I am submitting this change as the proponent. In addition to the Committee I created, I circulated a draft to other experts in the field of refrigeration. I received a number of comments through that review. Those comments have been incorporated in the final text that I am submitting.

It is the intent of the Refrigerant Piping Committee to submit a similar change to ASHRAE 15 and the UMC. The goal is to update all refrigerant piping requirements addressing every type of refrigerant system other than ammonia.

This proposed change reorganizes and updates the requirements for refrigerant piping. Many of the requirements remain the same as in the current code. The change follows the format used in other chapters in the Mechanical Code and Plumbing Code for listing piping material, joints and connections, and installation requirement.

Section 1107 remains the piping material section, however, the title is changed to be consistent with other chapters. There is no need to repeat refrigerant. Section 1107.1 is the general section indicating that compliance to the section for material requirements. The exception to Section 1107.1 is necessary to clarify that the ammonia piping requirements are regulated by IIAR 2. Without this statement, there could be confusion since Section 1101.6 states to apply IIAR 2 except as modified by this code. The piping requirements do not apply to ammonia systems. Similar exception language appears in Section 1109.1 and 1110.1.

There is currently no section regarding used materials, yet other chapters include requirements for used materials. This section is similar to the used material requirements in other chapters.

Section 1107.3 is a general requirement for the piping material to be rated for the temperatures, pressures, and type of refrigerant. The aluminum exception for R-40 (methyl chloride) currently appears in Section 1107.5.5. The

requirements have been expanded to include zinc and magnesium alloys since these materials are also susceptible to failure from R-40 (methyl chloride). Magnesium alloys cannot be used with any halogenated refrigerants since the material will react and fail. This prohibition has been added.

Section 1107.4 includes a table for listing all of the acceptable piping material. The appropriate standards for the piping material are listed in the table. While the word brass was previously converted to copper alloy throughout the code, ASTM B43 is still identified as a brass pipe standard. Therefore, brass was used with copper alloy included in parenthesis.

The current code has a restriction on the use of mechanical joints with annealed copper tubing. This is a hold over requirement that is out of date. ASME B31.5 has a different limitation. Note 1 to the table includes the requirements listed in ASME B31.5.

Note 2 of the table currently appears in Section 1107.5.1. The requirement remains the same.

Section 1107.5 includes a table of the fitting standards used in refrigerant piping systems. Some of the standards are new to this chapter since the previous requirements were weak with regard to referencing the appropriate fitting standards. There is also a general reference to UL 207. There are refrigerant fittings that do not meet the fitting standard, however, they are listed to UL 207. This is an appropriate standard for specialty type of refrigerant fittings.

Copper tubing is a common material used in refrigerant piping systems. A common joint is a swaged fitting which is made in the field. Since the swaging of copper expands the wall of the pipe, thus weakening the outer tube of the joint where not supported by the joint filler material and inner tube, the depth of the swage must be included. This depth is similar to the brazed fitting cup depths in the ASME B16.50 standard. The maximum depth allows a 50% increase in cup depth. A greater depth will result in too weak a pipe wall.

Section 1107.6 adds requirements for valves. The current code has valve installation requirements but is missing valve material requirements.

Section 1107.7 adds material requirements for flexible connectors and expansion and vibration compensators. These components are required to be listed and labeled for refrigerant systems.

Section 1108 is organized similar to the joints and connections section in Chapter 12. Many of the requirements are new since the current code requirements are not up to date. The section is organized with general requirements in the beginning, followed by joining methods, and completed with piping material allowances of various joining methods.

Section 1108.1 is the general section on joints requiring them to be approved and meet the tightness requirements to pass the system test.

Section 1108.1.1 lists requirements for joints between different materials. A reference to the testing requirements in ASSE 1079 is made in the section for joints between dissimilar metals. The standard has appropriate testing requirements for dielectric tests that can be used on refrigeration piping systems even though the standard appears to address water piping systems. Section 1108.2 is similar to the preparation of pipe ends found in other chapters. The same requirements would apply to refrigerant piping.

Section 1108.3 lists all of the acceptable joining methods. For brazing, there are requirements for using an inert gas inside the piping. This prevents oxidation on the interior of the piping. If there is excessive oxidation, it could result in obstruction of small piping or components in the system, as well as other system chemistry degradation, increasing the probability of future repair work. Reducing the frequency of opening refrigerating systems for repair reduces the exposure to numerous hazards and risks. For many of the joints, a reference to UL 207 is included. This standard covers the various refrigerant joining methods. The press-connect refrigerant fittings are listed to this standard, as are many mechanical joints.

Section 1108.3.4 includes all of the various threads that are used in refrigerant piping systems. This expands the listing of ASME standards for threaded joints.

Sections 1108.4 through 1108.9 list each material and the acceptable joining methods for the particular material.

The piping installation requirements are listed in a separate section from the material and joints and connections. The piping requirements have been expanded to address the necessary safety measures to assure a proper piping installation.

With a greater use of VRV and VRF systems, there is significantly more refrigerant piping installed inside a building. Additionally, with split systems and multi-split systems in multistory residential buildings, there is also a significant amount of piping installed.

There will be an expanded use of Group A2L refrigerants that are low global warming potential refrigerants. These refrigerants were previously listed as a subgroup of A2 refrigerants. As a separate group, the requirements need to be provided to address the installation of piping with Group A2L refrigerants.

The new section on piping is divided into four main subject matters. The first part of the section addresses piping

requirements for all types of refrigerants being used. The second part is for Group A2L and B2L refrigerants. The third part is for piping requirements for Group A2, A3, B2, and B3 refrigerants. The last part has additional general requirements for piping installations.

Section 1109.1 includes a reference to ASME B31.5. This standard is currently referenced in Section 1107.1. There is no change regarding the application of ASME B31.5.

Section 1109.2 identifies which sections are applicable to which refrigerant groups.

Section 1109.2.1 is a rewording of the requirements currently found in Section 1107.2.

Section 1109.2.2 is a new section requiring refrigerant piping to be concealed within the building elements. While this is implied in the current code, it is not stated. Section 1109.2.2.1, allowing refrigerant piping to be exposed, is similar to the current allowance specified in Sections 1107.2 and 1107.3. The other allowance would be refrigerant piping located in a machinery room. Exposed piping is anticipated in a machinery room where access is restricted to authorized personnel.

Section 1109.2.3 is similar to current Section 1107.2. One of the changes is the allowance for refrigerant piping to be located in the ceiling of a corridor, hence, not exposed. This appears to be implied, however, when the ceiling space is considered a part of the corridor, it appears to be prohibited. Refrigerant piping, especially for multi-split systems is often installed in the ceiling of a corridor. If the RCL requirements are met, there is no hazard posed to the corridor.

Section 1109.2.4 is a duplication of the requirements currently found in Section 1107.2.1.

Section 1109.2.5 is a new section regulating the requirements for shaft containing refrigerant piping. A fire-resistance-rated shaft will be required when the refrigerant piping connects three or more stories. Other utilities can also be located within the same shaft. There are three exceptions proposed to the shaft requirements in Section 1109.2.5.1, one is when water is use, that is R718 refrigerant. The second is for the use of Group A1 refrigerants provided the smallest space in which the pipe pass meets the RCL requirements for the refrigerant. The last exception is for when the piping is installed on the outside of the building where any leak would vent to atmosphere.

Section 1109.2.6 is also a new requirement. This section is intended to protect an individual from directly contacting a hot or cold refrigerant pipe. The temperatures are based on avoiding burning the skin or causing frostbite or frost damage to the skin. One of the methods of protection would adding insulation around the pipe. This is the most common method of protection for exposed piping.

Section 1109.3 is a new section regulating the installation of piping using Group A2L or B2L refrigerants. These refrigerants are lower flammable, lower burning velocity refrigerants. While the refrigerant will burn, it doesn't ignite or burn very easily. Since it is flammable additional protection requirements are proposed.

Section 1109.3.1 will require continuous protection when the piping is located within 1-1/2 inches of the nearest edge of a member. Currently the code requires this level of protection in certain locations, such as the top plate and bottom plate. This section will require the protection where ever the piping is installed. The protection is intended to prevent the tubing from be punctured by a nail or screw.

Section 1109.3.2 requires ventilation of the shaft in which the refrigerant piping is located. A minimal movement of air will exhaust the leaking refrigerant out of the shaft. The velocity rates identified in Table 1109.3.2 are taken from a peer reviewed paper published by ASME, and ensure that density differences between air and refrigerant will not defeat the purpose to exhaust the released refrigerant out of the shaft, whether in horizontal or vertical shaft orientation.

The ventilation would only be required when there is a leak of refrigerant. A leak detector is required in the shaft to identify when a leak occurs. Another option would be to naturally ventilate the shaft or continuously ventilate the shaft. Since most refrigerants are heavier than air, they tend to move downward. If naturally ventilated, the refrigerant moves to outside the building. An exception to the ventilation requirements would be the use of double wall pipe. While this is not commonly installed, the possibility exists that there will be greater use of double wall pipe.

The final requirement in Section 1109.3.3 specifies the labeling requirements for the piping. Since B2L refrigerant is toxic, there are special requirements to label the pipe as containing toxic refrigerant.

Section 1109.4 has the special requirement for the more flammable and more toxic refrigerants. Section 1109.4.1 requires the systems to be installed using only pipe, not tubing. The added strength of the pipe will reduce any potential leak from a puncture. The exception to this requirement would be self-contained listed equipment. Some refrigerators and similar appliances are using Group A3 refrigerants. However, these appliances are tested and listed.

Section 1109.4.2 requires any shaft with these refrigerants to be continuously ventilated. The same velocity requirements apply to this group of refrigerants as Group A2L and B2L. There is also an exception for double wall pipe.

Section 1109.4.3 specifies the labeling requirements. The labels are similar to what is required in UL/CSA 60335-2-40.

Section 1109.5 is a new section regulating pipe penetrations. Any time a pipe penetrated a wall, floor, or ceiling, it must be sealed to prevent the passage of any refrigerant that may be leaking. There is a direct reference to the building

code for penetrations of fire-resistance-rated assemblies.

Section 1109.6 is a new requirement for pipe protection. Similar language has been used for other piping systems in the Mechanical Code and the Plumbing Code. The requirements are also applicable to refrigerant piping.

Sections 1109.7 through 1109.8.4 are rewording and relocation of current Sections 1107.4, 1107.8, 1107.8.1, 1107.8.2, and 1107.8.3.

The Refrigerant Piping Committee spent a considerable amount of time rewriting and discussing the testing requirements. The basis for Section 1110 is the current Section 1108. The key elements of Section 1108 are captured in the new section. The significant differences relate to the test medium, the test equipment, and the pressure and vacuum test.

The test gas is specified as being either oxygen-free nitrogen, helium, or argon. These are the three inert gases used for testing refrigerant piping systems. Carbon dioxide refrigerant systems are permitted to be tested with carbon dioxide. Water refrigerant piping systems are permitted to be tested with water.

For smaller systems, refrigerant contractors have used the refrigerant for testing. This would be permitted for systems having 5/8 inch or smaller tubing.

The accuracy of the test gage is not currently specified. Most test gages used by refrigerant contractors have an accuracy within 2-1/2 percent. The allowance for up to 3 percent takes into consideration other gages that may be used.

For the testing of the system, the Committee believes it is important to run two tests; one is a pressure test, the other is a vacuum test. When testing with internal pressures, a one-way leak in the reverse direction may not be discovered. However, when a vacuum is placed on the system, the leak will be identified. The standard test for refrigerant systems is one hour for pressure and 10 minutes for a vacuum. These tests have been added to the section.

Cost Impact

The code change proposal will increase the cost of construction .

The additional testing required for refrigerant piping will take additional time which equates to a high cost for labor.

IMC: 1107.5.3.1 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Add new text as follows:

1107.5.3.1 Copper joints. Joints in copper tubing shall not be made with epoxy or adhesives

Reason:

Refrigerant tubing should be joined by proven methods that have longevity, strength and resistance to heat and corrosion. Refrigerants can be toxic, flammable or both and can be harmful to the environment. There are no test or product standards for epoxy joints for refrigerant tubing.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

2018 International Mechanical Code

1103.2 Occupancy classification. Locations of refrigerating systems are described by *occupancy* classifications that consider the ability of people to respond to potential exposure to refrigerants. Where *equipment* or appliances, other than piping, are located outside a building and within 20 feet (6096 mm) of any building opening, such *equipment* or appliances shall be governed by the *occupancy* classification of the building. *Occupancy* classifications shall be defined as follows:

1. Institutional *occupancy* is that portion of premises from which occupants cannot readily leave without the assistance of others because they are disabled, debilitated or confined. Institutional occupancies include, among others, hospitals, nursing homes, asylums and spaces containing locked cells.
2. Public assembly *occupancy* is that portion of premises where large numbers of people congregate and from which occupants cannot quickly vacate the space. Public assembly occupancies include, among others, auditoriums, ballrooms, classrooms, passenger depots, restaurants and theaters.
3. Residential *occupancy* is that portion of premises that provides the occupants with complete independent living facilities, including permanent provisions for living, sleeping, eating, cooking and sanitation. Residential occupancies include, among others, dormitories, hotels, multiunit apartments and private residences.
4. Commercial *occupancy* is that portion of premises where people transact business, receive personal service or purchase food and other goods. Commercial occupancies include, among others, office and professional buildings, markets (but not large mercantile occupancies) and work or storage areas that do not qualify as industrial occupancies.
5. Large mercantile *occupancy* is that portion of premises where more than 100 persons congregate on levels above or below street level to purchase personal merchandise.
6. Industrial *occupancy* is that portion of premises that is not open to the public, where access by authorized persons is controlled, and that is used to manufacture, process or store goods such as chemicals, food, ice, meat or petroleum.
7. Mixed *occupancy* occurs where two or more occupancies are located within the same building. Where each *occupancy* is isolated from the rest of the building by tight walls, floors and ceilings and by self-closing doors, the requirements for each *occupancy* shall apply to its portion of the building. Where the various occupancies are not so isolated, the *occupancy* having the most stringent requirements shall be the governing *occupancy*.

Revise as follows:

**TABLE 1104.3.2
MAXIMUM PERMISSIBLE QUANTITIES OF REFRIGERANTS**

TYPE OF REFRIGERATION SYSTEM	MAXIMUM POUNDS FOR VARIOUS OCCUPANCIES			
	Institutional	Public Assembly	Residential	All other occupancies
Sealed absorption system				
In exit access	0	0	3.3	3.3
In adjacent outdoor locations	0	0	22	22
In other than exit access	0	6.6	6.6	6.6
Unit systems				
In other than exit access	0	0	6.6	6.6

For SI: 1 pound = 0.454 kg.

Reason:

The occupancy type "Assembly" in Table 1104.3.2 is incomplete and should be "Public Assembly" to be consistent with occupancy types as defined in Section 1103.2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Editorial change only, no technical change so no cost impact.

1203.3.4 Solvent-cemented joints. Joint surfaces shall be clean and free of moisture. An *approved* primer shall be applied to CPVC and PVC pipe-joint surfaces. Joints shall be made while the cement is wet. Solvent cement conforming to the following standards shall be applied to all joint surfaces:

1. ASTM D2235 for ABS joints.
2. ASTM F493 for CPVC joints.
3. ASTM D2564 for PVC joints.

CPVC joints shall be made in accordance with ASTM D2846.

Exception: For CPVC pipe joint connections, a primer is not required where all of the following conditions apply:

1. The solvent cement used is third-party certified as conforming to ASTM F493.
2. The solvent cement is yellow in color.
3. The solvent cement is used only for joining 1/2-inch (12.7 mm) through 2-inch (51 mm) diameter CPVC pipe and fittings.
4. The CPVC pipe ~~and or~~ fittings are manufactured in accordance with ASTM D2846.

Add new text as follows:

1203.8 CPVC/AL/CPVC plastic pipe. Joints between CPVC/AL/CPVC plastic pipes or fittings shall be mechanical, solvent-cemented or threaded joints conforming to Section 1203.3

Revise as follows:

~~1203.8.1~~**1203.9 Polybutylene plastic pipe and tubing.** Joints between polybutylene plastic pipe and tubing or fittings shall be mechanical joints conforming to Section 1203.3 or heat-fusion joints conforming to Section ~~1203.8.1~~**1203.9.1.**

~~1203.8.1~~**1203.9.1 Heat-fusion joints.** Joints shall be of the socket-fusion or butt-fusion type. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM D3309.

Add new standard(s) follows:

West Conshohocken PA 19428

F2855-12:

Standard Specification for Chlorinated Poly(Vinyl Chloride)/Aluminum/Chlorinated Poly(Vinyl Chloride) (CPVC-AL-CPVC) Composite Pressure Tubing

Reason:

Chlorinated Polyvinyl Chloride/Aluminum/Chlorinated Polyvinyl Chloride (CPVC/AL/CPVC) pipe was added to chapter 6 of the 2015 IPC for water service and water distribution pipe. It can also be used for hydronic piping and should be recognized in Chapter 12 of the IMC to give installers another option.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The addition of this piping material will not increase the cost of construction as it only adds another option for the installer.

C700
West Conshohocken PA 19428
US

F3253-2017:

Standard Specification for Crosslinked Polyethylene (PEX) Tubing with Oxygen Barrier for Hot - and Cold - Water Hydronic Distribution Systems

Reason:

ASTM's committee on plastics piping recently completed a new Standard, F3253 - Standard Specification for Crosslinked Polyethylene (PEX) Tubing with Oxygen Barrier for Hot - and Cold - Water Hydronic Distribution Systems. This new system standard covers both the oxygen barrier PEX tubing as well as the performance and material requirements for the fittings. While this standard essentially mirrors the existing ASTM F876 and F877 PEX standards from a dimensional standpoint and existing fittings interchangeability, it also mandates the inclusion of an oxygen barrier layer with defined pass/fail criteria essentially equal with the industry's long accepted norm of DIN 4726 concerning allowed oxygen permeation. This new standard also requires a minimum pull-out strength test for the fittings not included in ASTM F877 today. The inclusion of this new standard in no way changes the acceptance of the existing ASTM F876 and F877 which will remain in the mechanical hydronics code for the foreseeable future.

This standard's project has been in works for nearly 4 years and represents the work and input from nearly all of the PEX tubing manufacturers in North America. Your support of this proposal is most appreciated.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This additional standard will not result in any increased costs for construction.

Internal ID: 865

M105-18

IMC: 1203.9.3

Proponent: Richard Houle, Reliance Worldwide Corporation, representing Reliance Worldwide Corporation (rich.houle@rwc.com)

2018 International Mechanical Code

Delete without substitution:

~~**1203.9.3 Push-fit joints.** Push-fit joints that create a seal on the outside diameter of the tubing shall not be used with tubing that has an ethylene vinyl alcohol copolymer (EVOH) oxygen barrier layer.~~

Reason:

This code language is unnecessary as the standard for PEX tubing (ASTM F876) requires that the PEX tubing be marked with the standard designation(s) for the fitting system(s) approved for use with their tubing. The language is overly restrictive as some PEX manufactures have used the Push-to-Connect fittings on EVOH barrier tubing for years with great success. Reliance Worldwide Corporation support the use of Push-to-Connect Fittings on EVOH tubing and has not had any field issues with it use in this application. We respectfully request that this language be removed to allow those PEX manufacturers that wish to support the use of Push-to-Connect fittings on barrier tubing to continue to allow their use.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost impact because the fittings are already approved in the code. The added restriction is unnecessary because the approval of different fitting systems is already covered in the ASTM F876 Standard which addresses approved fittings with the PEX tubing by the tubing manufacturer.

Internal ID: 1349

M106-18

IMC: TABLE 1202.5

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC
(bill@profcc.us)

2018 International Mechanical Code

Revise as follows:

**TABLE 1202.5
HYDRONIC PIPE FITTINGS**

MATERIAL	STANDARD (see Chapter 15)
Copper and copper alloys	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.26; ASME B16.24; ASME B16.51; ASSE 1061; ASTM F1974
<u>CPVC</u>	<u>ASSE 1061; ASTM D2846</u>
Ductile iron and gray iron	ANSI/AWWA C110/A21.10; AWWA C153/A21.53; ASTM A395; ASTM A536; ASTM F1476; ASTM F1548
Ductile iron	ANSI/AWWA C153/A21.53
Gray iron	ASTM A126
Malleable iron	ASME B16.3
PE-RT fittings	ASSE 1061;ASTM D3261;ASTM F1807; ASTM F2098; ASTM F2159; ASTM F2735; ASTM F2769;CSA B137.1; CSA B137.18
PEX fittings	ASSE 1061;ASTM F877; ASTM F1807; ASTM F1960; ASTM F2080; ASTM F2159
Plastic	ASTM D2466; ASTM D2467; ASTM F438; ASTM F439; ASTM F877; ASTM F2389; ASTM F2735
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28; ASTM A53; ASTM A106; ASTM A234; ASTM A395; ASTM A420; ASTM A536; ASTM F1476; ASTM F1548

Reason:

CPVC is an accepted hydronic pipe in table 1202.4, but the CPVC fittings were not listed in table 1202.5. ASSE 1061 fittings are tested and listed to be used with CPVC that complies with ASTM D2846 and fittings that comply with ASTM D2846 are allowed as stated in section 1203.3.4.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Adding existing fittings to table

Internal ID: 1755

M107-18

IMC: 1203.14.3

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2018 International Mechanical Code

Revise as follows:

1203.14.3 Push-fit joints. ~~Push-fit joints that create a seal on the outside diameter of the tubing shall not be used with tubing that has an ethylene vinyl alcohol copolymer (EVOH) oxygen barrier layer. fittings shall comply with ASSE 1061 and be used with PE-RT tubing that is rated for use with such fittings by the tubing manufacturer.~~

Reason:

The language in the 2018 edition was not accepted by the 2018 Code Committee because 1) there was no technical evidence presented that there is an issue using certain fittings with EVOH tubing, and 2) stating how a product should not be used is improper code language. Even though the public comment submitted had no technical evidence to support the change, this myth was perpetuated at the Public Comment hearing and won a narrow and poorly attended floor vote. While it should not influence this specific Committee, it should be noted that this language is not in the 2018 IPC, IRC, or any other code in this country where PE-RT tubing applications are listed.

Due to the vast number of joining technologies, the issue of fitting use is addressed in the ASTM standards for PE-RT tubing. These standards require the tubing manufacturer to clearly mark the standard designation of the fitting system(s) for which the tubing is recommended for use. The proposed language will make the installer and code official cognizant of the installation requirements without having to add language of what not to do.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal bring the code back to the proper installation language.

Internal ID: 1944

M108-18

IMC: 1203.9.3

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2018 International Mechanical Code

Revise as follows:

1203.9.3 Push-fit joints. ~~fittings. Push-fit joints that create a seal on the outside diameter of the tubing shall not fittings shall comply with ASSE 1061 and be used with tubing that has an ethylene vinyl alcohol copolymer (EVOH) oxygen barrier layer. PEX tubing that is rated for use with such fittings by the tubing manufacturer.~~

Reason:

The language in the 2018 edition was not accepted by the 2018 Code Committee because 1) there was no technical evidence presented that there is an issue using certain fittings with EVOH PEX tubing, 2) there is a long history of these fittings in use with all PEX tubing, and 3) stating how a product should not be used is improper code language. Even though the public comment submitted had no technical evidence to support the change, this myth was perpetuated at the Public Comment hearing and won a narrow and poorly attended floor vote. While it should not influence this specific Committee, it should be noted that this language is not in the 2018 IPC, IRC, or any other code in this country where PEX tubing applications are listed.

Due to the vast number of joining technologies and PEX manufacturing methods, the issue of fitting use is addressed in the ASTM F876 standard for PEX tubing. ASTM F876 requires the tubing manufacturer to clearly mark the standard designation of the fitting system(s) for which the tubing is recommended for use. The proposed language will make the installer and code official cognizant of the installation requirements without having to add language of what not to do.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal returns this code to previous language.

1210.8 Installation. Piping, valves, fittings, and connections shall be installed in accordance with ANSI/CSA/IGSHPA C448 and the conditions of approval.

Update standard(s) as follows:

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

ANSI/CSA/IGSHPA C448 Series—16:

Design and Installation of Earth Energy Systems

Reason:

This proposal is on behalf of the International Ground Source Heat Pump Association (IGSHPA); Mark Metzner - President of IGSHPA Canada and the Chairman of ANSI/CSA/IGSHPA C448; and The Plastics Pipe Institute.

ANSI/CSA/IGSHPA C448-16 contains specific requirements for HDPE, PEX and PE-RT piping systems (pipe and fittings) for use as ground loop piping systems. By adding reference to C448 in this row, this will indicate that this material is explicitly approved in ANSI/CSA/IGSHPA C448-16. ANSI/CSA/IGSHPA C448-16 “Design and installation of ground source heat pump systems for commercial and residential buildings” is an ANSI designated bi-national consensus standard for the design and installation of ground source heat pump systems. It was first published in February 2016.

ANSI/CSA/IGSHPA C448-16 is the first ANSI approved consensus standard for the design and installation of ground source systems.

ANSI/CSA/IGSHPA C448-16 replaces the original version known as CSA C448-02, already referenced within the IMC Chapter 12. ANSI/CSA/IGSHPA C448-16 is a greatly enhanced system standard which includes the industry knowledge of ground source geothermal systems gained since 2002.

The Standard includes performance-based criteria that provides a consistent application of requirements and best practices throughout the United States and Canada. This Standard will ensure that stakeholders in the ground source heat pump systems market sector will supply and receive ground source heating / cooling systems that perform to design efficiency expectations and deliver true, long-term value.

This Standard was developed by a Bi-national Technical Committee which comprised of the industry's leaders from Canada and USA, including representatives of the following industry associations:

- American Society for Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)
- Geothermal Exchange Organization (GEO)
- International Ground Source Heat Pump Association (IGSHPA)
- International Ground Source Heat Pump Association Canada (IGSHPA - Canada)
- National Ground Water Association (NGWA)
- The Plastics Pipe Institute (PPI)
- Geothermal National & International Initiative (GEONII)

Heating, Refrigeration and Air Conditioning Institute of Canada (HRAI)

ANSI/CSA/IGSHPA C448-16 includes performance-based minimum requirements for industrial, commercial, institutional and residential applications. It addresses the following items related to ground source heat pump systems:

- equipment and material selection (including ground loop piping)
- site survey - geological and hydrogeological
- open and closed loop ground source heat pump system design / engineering
- direct expansion (DX) systems
- installation
- testing and verification
- documentation
- commissioning and decommissioning

ANSI/CSA/IGSHPA C448-16 applies to all ground source heat pump systems using outdoor ground loop heat exchangers as a thermal source or sink for heating and cooling, with or without supplementary heating or cooling source/s. The types of outdoor heat exchangers covered by this Standard include:

- ground heat exchangers - vertical and horizontal
- open-loop systems - drilled well and surface water
- submerged closed loop systems - fresh water and sea water
- standing column wells

The latest version of ANSI/CSA/IGSHPA C448 is available from CSA Program Manager Jovan Cheema; jovan.cheema@csagroup.org

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction because it is simply identifying another industry consensus standard (C448) to which existing materials PEX and PE-RT can comply.

Internal ID: 2164

M110-18

IMC: 1209.5, 1209.5.1, 1209.5.2

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Mechanical Code

Revise as follows:

1209.5 ~~Thermal barrier~~ Insulation and thermal break required. Radiant floor heating systems shall be provided with insulation and a thermal barrier break in accordance with Sections 1209.5.1 and 1209.5.2. Insulation *R*-values for slab-on-grade and suspended floor installation shall be in accordance with the International Energy Conservation Code.

Exception: Insulation shall not be required in engineered systems where it can be demonstrated that the insulation will decrease the efficiency or have a negative effect on the installation.

1209.5.1 Thermal break required. A thermal break shall be provided consisting of asphalt expansion joint materials or similar insulating materials at a point where a heated slab meets a foundation wall or other conductive slab.

1209.5.2 ~~Thermal barrier~~ Insulation material marking. Insulating materials utilized in ~~thermal barriers~~ radiant floor heating systems shall be installed such that the manufacturer's *R*-value mark is readily observable upon inspection.

Reason:

This proposal is an editorial change that removes the term "thermal barrier" and replaces it with "thermal break" in Section 1209.5 of the IMC for radiant floor heating systems. The term "thermal barrier" refers to fire performance requirements; this section is focusing only on the requirement to insulate the floor system. "Thermal barrier" should be used only to describe the protection of a combustible materials from direct exposure to fire.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is editorial in nature.

Internal ID: 1940

M111-18

IMC: SECTION 1209, 1209.1

Proponent: Michael Cudahy, representing self (mikec@cmservices.com)

2018 International Mechanical Code

SECTION 1209 EMBEDDED PIPING

Revise as follows:

1209.1 Materials. Piping for heating panels shall be standard-weight steel pipe, Type L copper tubing, polybutylene ~~or other approved~~ plastic pipe or tubing rated at 100 psi (689 kPa) at 180°F (82°C) ~~or plastic pipe or tubing that~~ complies with one of the standards in Table 605.4 of the International Plumbing Code.

Reason:

The language is unusual, and could be clearer in this section. Polybutylene is a plastic pipe and doesn't need to be specifically called out, and should be permitted if approved. Pipe used for hot water distribution like PE-RT should comply with the section, but so should materials like PVDF, which is not used in the hot water table. You should allow for all three of these example types. Maybe this needs it's own standards table.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No cost increase is expected by either adding additional materials or the modification to the text.

Add new standard(s) follows:

NSF

NSF International
789 N. Dixboro Road P.O. Box
130140
Ann Arbor MI 48105
US

NSF 358-4-2017:

Polyethylene of raised temperature (PE-RT) pipe and fittings for water-based ground-source (geothermal) heat pump systems

Reason:

At the proposal deadline, NSF 358-4 was still a draft standard, but it is expected to be published prior to the public hearing. The balloted draft standard will be submitted with the proposal. Anyone may receive a complimentary copy of this draft standard for the purpose of reviewing this proposal by emailing brown@nsf.org.

These tables contain the acceptable materials for geothermal ground loop pipe and fittings. PE-RT piping and associated fittings are already accepted materials with referenced standards. NSF 358-4 is a proposed ANSI standard written specifically to contain requirements for PE-RT geothermal piping and fittings. Companion standards NSF 358-1 (PE) and NSF 358-3(PP) are already approved in this table. NSF 358-4 addresses performance pressure testing, long term strength, chemical resistance, constant tensile load joint testing, suitability for burial and marking specific to geothermal PE-RT piping systems.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Adding an additional option will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Anyone wishing to receive a complimentary copy of this standard for the purpose of reviewing this code change can send an email to brown@nsf.org

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is adding an additional choice to the code which will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1081

M114-18

IMC: TABLE 1202.4

Proponent: LANCE MacNevin, Plastic Pipe Institute, representing Plastics Pipe Institute (Imacnevin@plasticpipe.org)

2018 International Mechanical Code

Revise as follows:

**TABLE 1202.4
HYDRONIC PIPE**

MATERIAL	STANDARD (see Chapter 15)
Acrylonitrile butadiene styrene (ABS) plastic pipe	ASTM D1527; ASTM F2806
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM D2846; ASTM F441; ASTM F442
Copper or copper-alloy pipe	ASTM B42; ASTM B43; ASTM B302
Copper or copper-alloy tube (Type K, L or M)	ASTM B75; ASTM B88; ASTM B135; ASTM B251
Cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pressure pipe	ASTM F1281; CSA CAN/CSA-B-137.10
Cross-linked polyethylene (PEX) tubing	ASTM F876; <u>CSA B137.5</u>
Ductile iron pipe	AWWA C115/A21.15; AWWA C151/A21.51
Lead pipe	FS WW-P-325B
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM F1282; CSA B137.9
Polypropylene (PP) plastic pipe	ASTM F2389
Polyvinyl chloride (PVC) plastic pipe	ASTM D1785; ASTM D2241
Raised temperature polyethylene (PE-RT)	ASTM F2623; ASTM F2769; CSA B137.18
Steel pipe	ASTM A53; ASTM A106
Steel tubing	ASTM A254

Reason:

CSA B137.5 is the CSA standard for "Crosslinked Polyethylene Tubing Systems for Pressure Applications". The requirements of B137.5 are harmonized with ASTM F876 to be equivalent. CSA B137.5 is already listed in Table 1210.4 as equivalent to ASTM F876.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

adding B137.5 for PEX in Table 1202.4: The code change proposal will not increase or decrease the cost of construction because the same PEX tubing that already meets the requirements of the listed ASTM F876 will already meet the requirements of CSA B137.5; requirements are harmonized.

Internal ID: 2150

M115-18

IMC: Chapter 12, SECTION 1204, 1204.1, 1204.2

Proponent: Craig Dipetrillo, representing self (cjd@dipetrilloproperties.com)

2018 International Mechanical Code

CHAPTER 12 HYDRONIC PIPING

SECTION 1204 PIPE INSULATION

Revise as follows:

1204.1 Insulation characteristics. Pipe insulation installed in buildings shall conform to the requirements of the International Energy Conservation Code; shall be tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231; and shall have a maximum flame spread index of 25 and a smoke-developed index not exceeding 450. Insulation installed in an air *plenum* shall comply with Section 602.2.1. Pipe insulation shall be continuous except where the piping passes through a framing member.

Exception: The maximum flame spread index and smoke-developed index shall not apply to one- and two-family dwellings.

1204.2 Required thickness. Hydronic piping shall be insulated to the thickness required by the International Energy Conservation Code.

Reason:

The intent of the proposal is to have consistency where the code requires insulation of water piping "to be continuous".

Testimony:

SUBMITTAL FOR CONTINUOUS INSULATION

For the past 25 years I have been a Commissioner on the Rhode Island Building Code Standards Committee as both a member and chairman. During those years I have been the chairman or member of the Energy, Mechanical and Plumbing Subcommittees. I have been very pleased with the progress of the energy conservation in mechanical and plumbing systems especially relating to insulation of piping. The ICC has clearly recognized the importance of pipe insulation used for hot water conveyance. Over the years ICC has established requirements of insulation of piping and how to install the insulation to achieve maximum energy savings. Specifically, the requirement of continuous insulation through the hangers/supports as addressed in section C404.4 of the IECC. Upon discussions established by Craig DiPetrillo in regards to his findings of inconsistency, and during my research I have noticed that the IMC and IPC have not clearly delineated the continuous insulation (C404.4) requirement. I have asked Craig DiPetrillo to introduce an amendment to Section 607.5 to address this installation methodology.

Sincerely yours,

Gordon W. Preiss P. E., LEED AP

Rhode Island Building Code Standard Committee Commissioner

Westerly R. I. 02891

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The intent of the proposal is to have consistency where the code requires insulation of water piping "to be continuous".

Internal ID: 1484

M116-18

IMC: 1203.7

Proponent: Forest Hampton, Lubrizol Advanced Materials, Inc., representing Lubrizol Advanced Materials, Inc.
(forest.hampton@lubrizol.com)

2018 International Mechanical Code

Revise as follows:

1203.7 CPVC plastic pipe. Joints between CPVC plastic pipe or fittings shall be mechanical, solvent-cemented or threaded joints conforming to Section 1203.3.

Reason:

Section 1203.7 is being revised to add mechanical joints as an option with CPVC pipe.. Mechanical joints with CPVC pipe have a proven track record in the field and are allowed by the IPC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The addition of this widely used joining method will not increase the cost of construction as it only adds another option for the installer.

Internal ID: 1649

M117-18

IMC: 1210.6.2

Proponent: Gary Morgan, representing Viega LLC (gary.morgan@viega.us)

2018 International Mechanical Code

Revise as follows:

1210.6.2 Preparation of pipe ends. Pipe shall be cut square, ~~be reamed,~~ and be free of burrs and obstructions. ~~CPVC, PE, and PVC pipe shall be chamfered.~~ Pipe ends shall have full-bore openings and shall ~~not be undercut.~~ be prepared in accordance with manufacturer's instructions.

Reason:

This section is specific to plastic pipes and some of the existing language refers to terms such as "reamed" and "undercut" which only apply to metallic pipes. The revised language is more appropriate by including reference to preparing pipe ends in accordance with manufacturer's instructions which will be specific to that particular type of plastic pipe.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is only a clarification of existing language and will not result in any increased cost of construction.

Internal ID: 1826

M118-18

IMC: 1210.8

Proponent: Gary Morgan, representing Viega LLC (gary.morgan@viega.us)

2018 International Mechanical Code

Revise as follows:

1210.8 Installation. Piping, valves, fittings, and connections shall be installed in accordance with the ~~conditions of approval.~~ manufacturer's instructions.

Reason:

The existing language "...shall be installed in accordance with the conditions of approval." is not consistent with IMC language and unclear what that statement even means. This simple revision will make this section read perfectly consistent with the IRC's equivalent ground-source heat-pump system loop piping section , M2105.17 Installation.

For information Section M2105.17 of the IRC reads as follows:

M2105.17 Installation. Piping, valves, fittings, and connections shall be installed in accordance with the manufacturer's instructions.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This editorial revision simply adds clarity and consistency to the statement and has no impacts on the costs of construction.

Internal ID: 1837

M119-18 Part I

IMC: 1209.1

Proponent: Chris Haldiman, representing Watts Water Technologies (chris.haldiman@wattswater.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IMC COMMITTEE AND PART II WILL BE HEARD BY THE IRC M/P COMMITTEE. PLEASE SEE THE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Mechanical Code

Revise as follows:

1209.1 Materials. Piping for heating panels shall be standard-weight steel pipe, Type L copper tubing, polybutylene or other *approved* plastic pipe or tubing rated at ~~100-80 psi (689 kPa)~~ 552kPa at 180°F (82°C).

Internal ID: 2160

M119-18 Part II

IRC: M2103.1

Proponent: Chris Haldiman, representing Watts Water Technologies (chris.haldiman@wattswater.com)

2018 International Residential Code

M2103.1 Piping materials. Piping for embedment in concrete or gypsum materials shall be standard-weight steel pipe, copper and copper-alloy pipe and tubing, cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pressure pipe, chlorinated polyvinyl chloride (CPVC), ~~polybutylene~~, cross-linked polyethylene (PEX) tubing, polyethylene of raised temperature (PE-RT) or polypropylene (PP) with a rating of not less than ~~100-80~~ psi at 180°F (~~690-552~~ kPa at 82°C).

Reason:

A 100 psi rating is not necessary in hydronic applications, particularly when the tubing is encased in a hard concrete or a gypsum material. Hydronic heating systems are typically designed with operating pressures of 12 psi - 20 psi, and these systems contain expansion tanks incorporated in them that are factory set to 12 psi. Safety relief valves on the boilers are typically set at 30 psi or 50 psi.

ASTM Standard F2623, "Standard Specification for Polyethylene of Raised Temperature (PE-RT) SDR 9 Tubing", states in Section 1.4, "The tubing produced under this specification shall be permitted for use in general fluid transport, including hydronics and irrigations systems."

I believe the retention of 100 psi minimum was an oversight when ASTM F2623 PE-RT was added to Table 1202.4.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

.It will not increase or decrease costs as the products used in hydronic applications are currently rated for 100 psi or 80 psi @180F. This will allow the use of products rated at 80 psi rated products to be used in embedded and not embedded systems.

2018 International Mechanical Code

Revise as follows:

**TABLE 1302.3
FUEL OIL PIPING**

MATERIAL	STANDARD (see Chapter 15)
Copper or copper-alloy pipe	ASTM B42; ASTM B43; ASTM B302
Copper or copper-alloy tubing (Type K, L or M)	ASTM B75; ASTM B88; ASTM B280; ASME B16.51
Labeled pipe	(See Section 1302.4)
Nonmetallic pipe	ASTM D2996
Steel pipe	ASTM A53; ASTM A106
Steel tubing	ASTM A254; ASTM A539
Stainless steel tubing	ASTM A240; UL1369; UL971A

Add new text as follows:

1302.9 Corrugated stainless steel tubing containment system. Corrugated stainless steel tubing that is factory-installed within a non-metallic containment system shall be listed and labeled in accordance with UL 1369 or UL 971A.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428
US

A240/A240M- 15a:

Standard Specification for Chromium and Chromium-nickel Stainless Steel Plate, Sheet and Strip for Pressure Vessels and for General Applications

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096
US

971A-2006:

Outline of Investigation for Metallic Underground Fuel Pipe

Reason:

The corrugated stainless steel tubing double-containment system, including termination fittings, is intended for use with fuel oil, as well as motor vehicle, aviation and marine fuels either above or below grade. The intent and design of double containment systems are focused on preventing fuel oil leaks that could result in severe fire hazards.

The corrugated stainless steel primary tubing is a zero-permeation pipe which is highly resistant to corrosion with exceptional crush resistance. The UV stabilized Nylon 12 protective containment layer offers exceptional resistance to hydrocarbons, chemical and water exposure, and carries a 50 psig rating. An EFEP secondary barrier jacket layer is bonded to the Nylon 12 protective layer to offer secondary containment with exceptional permeation resistance for product compatibility. The interstitial space between the tubing and jacket allows continuous monitoring for leak detection, with a 50 psig rating for pressurized systems. The self-flaring fitting provides a metal to metal sealing surface with excellent reliability and is field-attachable using standard hand tools. This class of piping product has been used for a variety of fuels for several years without failure, and is also permitted in the IFGC for similar applications for fuel gas systems (see Section 404.14).

Cost Impact

The code change proposal will decrease the cost of construction .

The use of a listed encasement system results in cost savings because the piping and encasement are installed simultaneously. This avoids the labor cost of separately installing the conduit and piping. In addition, the sealing and venting methods (when required) are also integrated within the encasement system, thus eliminating the need to separately assemble and/or install sealing and venting components within standard conduit.

M121-18

IMC: Chapter 13, SECTION 1301, 1301.1, 1301.2, 1301.3, 1301.4, 1301.5, SECTION 1302, 1302.1, 1302.2, TABLE 1302.3, 1302.3, 1302.4, 1302.5, 1302.6, 1302.7, 1302.8, SECTION 1303, 1303.1, 1303.1.1, 1303.2, 1303.3, 1303.3.1, 1303.3.2, 1303.3.3, 1303.3.4, 1303.3.5 (New), 1303.4, 1303.5, 1303.6, 1303.7, 1303.7.1, 1303.8, 1303.9, 15

2018 International Mechanical Code

CHAPTER 13 FUEL OIL PIPING AND STORAGE

SECTION 1301 GENERAL

1301.1 Scope. This chapter shall govern the design, installation, construction and repair of fuel-oil storage and piping systems. The storage of fuel oil and flammable and combustible liquids shall be in accordance with Chapters 6 and 57 of the International Fire Code.

1301.2 Storage and piping systems. Fuel-oil storage systems shall comply with Section 603.3 of the International Fire Code. Fuel-oil piping systems shall comply with the requirements of this code.

1301.3 Fuel type. An *appliance* shall be designed for use with the type of fuel to which it will be connected. Such *appliance* shall not be converted from the fuel specified on the rating plate for use with a different fuel without securing reapproval from the code official.

Revise as follows:

1301.4 Fuel tanks, piping, fittings and valves. The tank, piping, fittings and valves for appliances burning oil shall be installed in accordance with the requirements of this chapter. Where an oil burner is served by a tank, any part of which is above the level of the burner inlet connection and where the fuel supply line is taken from the top of the tank, an *approved* antisiphon valve or other siphon-breaking device shall be installed in lieu of the shutoff valve.

1301.5 Tanks abandoned or removed. All exterior above-grade fill piping shall be removed when tanks are abandoned or removed. Tank abandonment and removal shall be in accordance with Section 5704.2.13 of the International Fire Code.

SECTION 1302 MATERIAL

1302.1 General. Piping materials shall conform to the standards cited in this section.

1302.2 Rated for system. All materials shall be rated for the operating temperatures and pressures of the system, and shall be compatible with the type of liquid.

**TABLE 1302.3
FUEL OIL PIPING AND FITTINGS**

MATERIAL	STANDARD (see Chapter 15)
Copper or copper-alloy pipe <u>and fittings</u>	ASTM B42; ASTM B43; ASTM B302; <u>ASTM F3226</u>
Copper or copper-alloy tubing <u>and fittings</u> (Type K, L or M)	ASTM B75; ASTM B88; ASTM B280; ASME B16.51; <u>ASTM F3226</u>
Labeled pipe	(See Section 1302.4)
Nonmetallic pipe	ASTM D2996
Steel <u>and Stainless Steel</u> pipe <u>and fittings</u>	ASTM A53; ASTM A106; <u>ASTM A312</u> ; <u>ASTM F3226</u>
Steel <u>and Stainless Steel</u> tubing <u>and fittings</u>	ASTM A254; ASTM A539; <u>ASTM A269</u> ; <u>ASTM F3226</u>

1302.3 Pipe standards. Fuel oil pipe shall comply with one of the standards listed in Table 1302.3.

1302.4 Nonmetallic pipe. Nonmetallic pipe shall be *listed* and *labeled* as being acceptable for the intended application for flammable and combustible liquids. Nonmetallic pipe shall be installed only outdoors, underground.

1302.5 Fittings and valves. Fittings and valves shall be *approved* for the piping systems, and shall be compatible with, or shall be of the same material as, the pipe or tubing.

1302.6 Bending of pipe. Pipe shall be *approved* for bending. Pipe bends shall be made with *approved equipment*. The bend shall not exceed the structural limitations of the pipe.

1302.7 Pumps. Pumps that are not part of an *appliance* shall be of a positive-displacement type. The pump shall automatically shut off the supply when not in operation. Pumps shall be *listed* and *labeled* in accordance with UL 343.

1302.8 Flexible connectors and hoses. Flexible connectors and hoses shall be *listed* and *labeled* in accordance with UL 536.

SECTION 1303 JOINTS AND CONNECTIONS

1303.1 Approval. Joints and connections shall be *approved* and of a type *approved* for fuel-oil piping systems. Threaded joints and connections shall be made tight with suitable lubricant or pipe compound. Unions requiring gaskets or packings, right or left couplings, and sweat fittings employing solder having a melting point of less than 1,000°F (538°C) shall not be used in oil lines. Cast-iron fittings shall not be used. Joints and connections shall be tight for the pressure required by test.

1303.1.1 Joints between different piping materials. Joints between different piping materials shall be made with *approved* adapter fittings. Joints between different metallic piping materials shall be made with *approved* dielectric fittings or copper-alloy converter fittings.

1303.2 Preparation of pipe ends. Pipe shall be cut square, reamed and chamfered and be free from all burrs and obstructions. Pipe ends shall have full-bore openings and shall not be undercut.

1303.3 Joint preparation and installation. Where required by Sections 1303.4 through 1303.9, the preparation and installation of brazed, mechanical, threaded, press-connect and welded joints shall comply with Sections 1303.3.1 through ~~1303.3.4-1303.3.5~~.

1303.3.1 Brazed joints. All joint surfaces shall be cleaned. An *approved* flux shall be applied where required. The joints shall be brazed with a filler metal conforming to AWS A5.8.

1303.3.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions. ~~Press-connect joints shall conform to one of the standards listed in Table 1302.3.~~

1303.3.3 Threaded joints. Threads shall conform to ASME B1.20.1. Pipe-joint compound or tape shall be applied on the male threads only.

1303.3.4 Welded joints. All joint surfaces shall be cleaned by an *approved* procedure. The joint shall be welded with an *approved* filler metal.

1303.3.5 Press-Connect joints. Press-Connect joints shall be installed in accordance with the manufacturer's

instructions and shall conform to one of the standards listed in Table 1302.3.

1303.4 Copper or copper-alloy pipe. Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, threaded, press-connect or welded joints complying with Section 1303.3.

1303.5 Copper or copper-alloy tubing. Joints between copper or copper-alloy tubing or fittings shall be brazed, mechanical joints ~~complying with Section 1303.3, or press-connect joints that conform to one of the standards in Table 1302.3~~ or flared joints. Flared joints shall be made by a tool designed for that operation complying with Section 1303.3.

1303.6 Nonmetallic pipe. Joints between nonmetallic pipe or fittings shall be installed in accordance with the manufacturer's instructions for the *labeled* pipe and fittings.

1303.7 Steel and Stainless Steel pipe. Joints between steel or stainless steel pipe or fittings shall be threaded, press-connect or welded joints complying with Section 1303.3 or mechanical joints complying with Section 1303.7.1.

1303.7.1 Mechanical joints. Joints shall be made with an *approved* elastomeric seal. Mechanical joints shall be installed in accordance with the manufacturer's instructions. Mechanical joints shall be installed outdoors, underground, unless otherwise *approved*.

1303.8 Steel and Stainless Steel tubing. Joints between steel or stainless steel tubing or fittings shall be mechanical, press-connect or welded joints complying with Section 1303.3.

1303.9 Piping protection. Proper allowance shall be made for expansion, contraction, jarring and vibration. Piping other than tubing, connected to underground tanks, except straight fill lines and test wells, shall be provided with flexible connectors, or otherwise arranged to permit the tanks to settle without impairing the tightness of the piping connections.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428

A269-15:

Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service

A312-17:

Standard Specification for Seamless, Welded, and Heavily Cold Worked Austenitic Stainless Steel Pipes

F3226-16:

Standard Specification for Metallic Press-Connect Fittings for Piping and Tubing Systems

Reason:

Revisions for Chapter 13 have been included in one proposal for better discussion. Reason Statements will be provided under each Section number with proposed revisions.

Section 1301.4-proposed to include fittings in this section for consistency throughout the chapter.

Table 1302.3-Proposed revisions to this table include updating the Title to include both Pipe and Fittings. Currently fitting standards exist in this table. The proposed table revision includes the addition of ASTM F3226 (Press-connect fitting standard for copper, steel and stainless steel) which was recently published. ASTM A269 (stainless steel tubing standard) which is referenced in NFPA 31 and is recognized as acceptable for use in heating oil piping. Stainless steel tubing has been requested to be used due to its corrosion resistance properties. ASTM A312 (stainless steel pipe) is referenced for use in CSA B139 Installation code for Oil Burning Equipment.

Section 1303.3- this section adds press-connect joints in a new subsection 1303.3.5 and revises the section to state joints shall comply with sections 1303.3.1 through 1303.3.5.

Section 1303.3.2-Press-Connect joints have their own definition in the Chapter 2 of International Mechanical Code and needs to be uniquely identified from that of a Mechanical joint. The Mechanical Joint Definition does not exclude press-connect joints, but they are not listed under examples as types of joints see Chapter 2 definition below:

MECHANICAL JOINT.

1. A connection between pipes, fittings, or pipes and fittings that is not welded, brazed, caulked, soldered, solvent cemented or heat fused.

2. A general form of gas or liquid-tight connections obtained by the joining of parts through a positive holding mechanical construction such as, but not limited to, flanged, screwed, clamped or flared connections.

Section 1303.3.5-Press-Connect joints have their own definition in the Chapter 2 of International Mechanical Code and needs to be uniquely identified from that of a Mechanical joint.

PRESS-CONNECT JOINT. A permanent mechanical joint incorporating an elastomeric seal or an elastomeric seal and corrosion-resistant grip ring. The joint is made with a pressing tool and jaw or ring approved by the fitting manufacture.

Section 1303.4- this revision adds press-connect joints to acceptable copper or copper alloy pipe. The standard for press-connect fittings for use with copper or copper alloy pipe is ASTM F3226 which is included in Table 1302.2.

Section 1303.5- this proposed revision cleans up unnecessary language. All of the recognized joints are listed in subsections 1303.3.1 through 1303.3.5. The removal of the language referring press-connect joints to Table 1302.3 and is not needed as this is the requirement under Section 1303.3 Joint preparation and installation. Flared fittings are included in the definition of Mechanical joints and do not need to be specifically identified in this section. See definition of Mechanical joint below:

MECHANICAL JOINT.

1. A connection between pipes, fittings, or pipes and fittings that is not welded, brazed, caulked, soldered, solvent cemented or heat fused.

2. A general form of gas or liquid-tight connections obtained by the joining of parts through a positive holding mechanical construction such as, but not limited to, flanged, screwed, clamped or flared connections.

Section 1303.7-Stainless steel pipe is suitable for use in these systems and referenced as an acceptable piping material in CSA B139 Installation of Oil Fired Equipment Code section 5.2.1.2. This material has been specified due to its corrosion resistance properties.

Section 1303.8-NFPA 31 section 8.2.2.1 currently allows the use of stainless steel tubing. Stainless steel tubing is being specified on projects due to its corrosion-resistance properties and its compatibility as a piping material for fuel oil. Press-connect fittings are made for stainless steel piping and tubing and are already referenced in Chapter 13 of this code. Table 1302.3 has been proposed to be updated to add the stainless steel tubing and press-connect fitting standards ASTM A269 and ASTM F3226.

Chapter 15 Reference Standards- The standards proposed in Table 1302.3 that are not currently listed in Chapter 15 have been proposed to be added:

ASTM A269-15

Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service

ASTM A312-17

Standard Specification for Seamless, Welded, and Heavily Cold Worked Austenitic Stainless Steel Pipes

ASTM F3226-16

Standard Specification for Metallic Press-Connect Fittings for Piping and Tubing Systems

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These proposals provide an alternative to the existing pipe joining methods. The standards listed for Press-Connect type joints and stainless steel pipe are based on the alloys used and again are optional. No existing metallic alloys or joining methods are being removed as a result there are not costs associated with the proposed changes.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 909

M122-18

IMC: 1303.7

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Mechanical Code

Revise as follows:

1303.7 Steel and Stainless Steel pipe. Joints between steel or stainless steel pipe or fittings shall be threaded, press-connected or welded joints complying with Section 1303.3 or mechanical joints complying with Section 1303.7.1.

Reason:

Stainless steel pipe is suitable for use in these systems and referenced in CSA B139 Installation of Oil Fired Equipment Code. This material has been specified due to its corrosion resistance properties.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal includes stainless steel and press-connect fittings as alternates to existing steel and existing threaded or welded type connections. Since these are considered alternate to the existing there are no cost increases associated with this proposal..

F3226-16:

Standard Specification for Metallic Press-Connect Fittings for Piping and Tubing Systems

Reason:

Proposed revisions to this table include updating the Title to include both Pipe and Fittings. Currently there are fitting standards existing in this table. The proposed table revision includes the addition of ASTM F3226 (Press-connect fitting standard for copper, steel and stainless steel) which was recently published. ASTM A269 (stainless steel tubing standard) which is referenced in NFPA 31 and is recognized as acceptable for use in heating oil piping. Stainless steel tubing has been requested to be used due to its corrosion resistance properties. ASTM A312 (stainless steel pipe) is referenced for use in CSA B139 Installation code for Oil Burning Equipment.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal to update to the table with the mentioned standards simply allows for additional piping and connection options and does not remove any existing standards and therefore will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 875

M124-18

IMC: 1303.8

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Mechanical Code

Revise as follows:

1303.8 Steel and Stainless Steel tubing. Joints between steel or stainless steel tubing or fittings shall be mechanical, press-connected or welded joints complying with Section 1303.3.

Reason:

NFPA 31 section 8.2.2.1 currently allows the use of stainless steel tubing. Stainless steel tubing is being specified on projects due to its corrosion-resistance properties and its compatibility as a piping material for fuel oil. Press-connect fittings are made for stainless steel piping and tubing and are already referenced in Chapter 13 of this code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal includes stainless steel tubing and press-connect fittings as alternates to existing steel tubing and existing mechanical or welded type connections. Since these are considered alternate to the existing there are no cost increases associated with this proposal.

Internal ID: 860

M125-18

IMC: 1303.7

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Mechanical Code

Revise as follows:

1303.7 Steel pipe. Joints between steel pipe or fittings shall be threaded, press-connected or welded joints complying with Section 1303.3 or mechanical joints complying with Section 1303.7.1.

Reason:

Press-connect fittings are referenced in Chapter 13 of this code and this proposal includes them as a joining method for steel pipe.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The inclusion of press-connected fittings in addition to the existing joining methods currently allowed do not increase cost as they are just another option for pipe joining methods and are not required to be used.

Internal ID: 859

M126-18

IMC: TABLE 1302.3

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Mechanical Code

Revise as follows:

**TABLE 1302.3
FUEL OIL PIPING**

MATERIAL	STANDARD (see Chapter 15)
Copper or copper-alloy pipe	ASTM B42; ASTM B43; ASTM B302
Copper or copper-alloy tubing (Type K, L or M)	ASTM B75; ASTM B88; ASTM B280; ASME B16.51
Labeled pipe	(See Section 1302.4)
Nonmetallic pipe	ASTM D2996
Steel pipe	ASTM A53; ASTM A106
Steel tubing	ASTM A254; ASTM A539
<u>Stainless Steel tubing</u>	<u>ASTM A254; ASTM A269;</u>

Reason:

NFPA 31 section 8.2.2.1 currently allows the use of stainless steel tubing. Stainless steel tubing is being specified on projects due to its corrosion-resistance properties and its compatibility as a piping material for fuel oil.

Bibliography:

NFPA 31 Standard for Installation of Oil-Burning Equipment
 Chapter 8 Heating Fuel Piping Systems and Components Section 8.2.2.1
 National Fire Protection Agency
 2016

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The inclusion of stainless steel tubing and the related standards are optional and are not required to be used. Being this addition is optional, it will not increase the cost of construction as the existing materials may continue to be used and are not being eliminated.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 801

M127-18

IMC: 1402.8.1.2

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov); Angela Haupt (AHaupt@kirklandwa.gov)

2018 International Mechanical Code

Revise as follows:

1402.8.1.2 Rooftop-mounted solar thermal collectors and systems. The roof shall be constructed to support the loads imposed by roof-mounted solar collectors. Where mounted on or above the roof covering, the collector array ~~and supporting construction, stanchions and their attachments to the roof~~ shall be constructed of noncombustible materials or fire-retardant-treated wood conforming to the International Building Code to the extent required for the type of roof construction of the building to which the collectors are accessory.

Reason:

This code change clarifies that roof mounted solar collectors, the supports between the collectors and the roof (for example, sleepers, curbs and stanchions), and the attachments to the roof are required to be of non-combustible materials or FRT wood. The current text could be misinterpreted to mean that the entire roof assembly supporting the collectors and associated equipment, even if allowed to be of combustible materials by other provisions of the code, needs to be noncombustible materials or FRT which is not the case.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarrification only.

Internal ID: 249

M128-18

IMC: 1404.1

Proponent: Joseph Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (JoeCainPE@gmail.com)

2018 International Mechanical Code

Revise as follows:

1404.1 Collectors. Factory-built ~~solar thermal~~ collectors shall bear a label showing the manufacturer's name and address, ~~model number and serial number or certification number.~~

Reason:

The current language is inconsistent with labeling requirements of SRCC OG-100 labels. The proposed revision is to change the language to be consistent with SRCC OG-100 labels.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal includes editorial changes only.

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL PLUMBING CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some P code change proposals may not be included on this list, as they are being heard by another committee.

IPC: 202 (New)

Proponent: Pennie L Feehan, Pennie L. Feehan Consulting, representing Copper Development Association (penniefeehan@me.com)

THIS IS A 6 PART CODE CHANGE PROPOSAL. PARTS I and VI WILL BE HEARD BY THE IPC-IPSDC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. PART III WILL BE HEARD BY THE IMC COMMITTEE. PART IV WILL BE HEARD BY THE IFGC COMMITTEE. PART V WILL BE HEARD BY THE ISPSC COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Add new definition as follows:

COPPER ALLOY. A homogeneous mixture of not less than two metals where not less than 50% of the finished metal is copper.

Internal ID: 1595

P1-18 Part II

IRC: R202

Proponent: Pennie L Feehan, Pennie L. Feehan Consulting, representing Copper Development Association (penniefeehan@me.com)

2018 International Residential Code

Add new definition as follows:

COPPER ALLOY. A homogeneous mixture of not less than two metals where not less than 50% of the finished metal is copper.

Internal ID: 1599

P1-18 Part III

IMC: 202 (New)

Proponent: Pennie L Feehan, Pennie L. Feehan Consulting, representing Copper Development Association (penniefeehan@me.com)

2018 International Mechanical Code

Add new definition as follows:

COPPER ALLOY. A homogeneous mixture of not less than two metals where not less than 50% of the finished metal is copper.

Internal ID: 1590

P1-18 Part IV

IFGC: 202 (New)

Proponent: Pennie L Feehan, Pennie L. Feehan Consulting, representing Copper Development Association (penniefeehan@me.com)

2018 International Fuel Gas Code

Add new definition as follows:

COPPER ALLOY. A homogeneous mixture of not less than two metals where not less than 50% of the finished metal is copper.

Internal ID: 1587

P1-18 Part V

ISPSC: 202 (New)

Proponent: Pennie L Feehan, Pennie L. Feehan Consulting, representing Copper Development Association (penniefeehan@me.com)

2018 International Swimming Pool and Spa Code

Add new definition as follows:

COPPER ALLOY. A homogeneous mixture of not less than two metals where not less than 50% of the finished metal is copper.

Internal ID: 1602

P1-18 Part VI

IPSDC: 202 (New)

Proponent: Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

2018 International Private Sewage Disposal Code

Add new definition as follows:

COPPER ALLOY. A homogeneous mixture of not less than two metals where not less than 50% of the finished metal is copper.

Reason:

It is important to understand that copper tube is an almost pure copper alloy, composed of 99.9% Cu + Ag combined with no greater than 0.04% P. Whereas, a copper alloy is a mixture of at least two metals in which copper is the primary component comprising no less than 50% and is combined with other elements to create different copper alloys. Therefore, brass, bronze, red brass, etc. are all forms of Copper Alloy.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change only clarifies the code and doesn't impact the costs of labor or materials of construction.

Internal ID: 3126

P2-18

IPC: 202

Proponent: Gary Klein, Gary Klein and Associates, Inc., representing Self (gsmklein@comcast.net)

2018 International Plumbing Code

Revise as follows:

PUBLIC OR PUBLIC UTILIZATION. ~~In the classification of plumbing fixtures, “public” applies to fixtures in general toilet rooms of schools, gymnasiums, hotels, airports, bus and railroad stations, public buildings, bars, public comfort stations, office buildings, stadiums, stores, restaurants and other installations where a number of fixtures are installed so that their utilization is similarly unrestricted with unrestricted exposure to walk-in traffic.~~

PRIVATE. ~~In the classification of plumbing fixtures, “private” applies to fixtures in residences and apartments, and to fixtures in nonpublic toilet rooms of hotels and motels and similar installations in buildings where the plumbing fixtures are intended for utilization by a family or an individual that are not public.~~

Reason:

The purpose of this code change proposal is to clarify the distinction between private and public or public utilization.

The current definitions of private and public or public utilization are confusing to many who are responsible for implementing the IPC. This proposal attempts to simplify the two definitions by clearly defining one category and then stating that the other one is everything else. We have chosen to define public or public utilization.

The word “unrestricted” comes from ASME 112.18.1-2005¹ The wording “exposure to walk-in traffic” comes from ASME 112.18.1-2012/CSA B125.1-12. That document, referenced in the IPC and other I-codes, has a definition for “**Public Lavatory Fitting**— a fitting intended to be installed in non-residential bathrooms that are exposed to walk-in traffic.”² ANSI/ASHRAE/IES Standard 90.1-2016 supports this concept with the following definition: “**Public facility restroom** - a restroom used by the transient public.”³ Transient is used instead of walk-in traffic. We preferred “walk-in “ to “transient”, but either can work. It was our intent that using the same wording for a similar purpose helps to correlate the codes.

We believe that there are two key distinctions to make between public and private toilet facilities: level of access and frequency of use. “Public” toilet facilities are those with unrestricted access to anyone who enters the building. These toilet facilities are also likely to be used frequently throughout the hours of operation of each occupancy type. Some examples of these are: toilet facilities in airports, assembly occupancies such as stadiums and theaters, restaurants and other food service facilities, and in the lobbies of any non-residential building including public buildings, office buildings, manufacturing facilities, mercantile facilities and military facilities that have unrestricted access to walk-in traffic. Using both terms, “unrestricted” and “walk-in traffic” in the definition captures our intent for this code change proposal.

All other toilet facilities would then be considered private: those inside residences, hotel and motel rooms, patient rooms, and toilet facilities that are not in the lobbies of non-residential buildings. Their use is restricted to those who reside in or work in the occupancy. These toilet facilities are “private”.

The distinction is important because there are different requirements for public and private lavatories. Two such requirements come to mind: water temperature and flow rate. Currently, in the I-codes, private lavatories are required to be supplied with hot water; public lavatories are not. (See the table below) In addition, the flow rate for public lavatory faucets is limited to a maximum of 0.5 gpm or 0.25 gallons per cycle for metered faucets. (See Table 604.4 in the 2018 IPC. These values are taken from the Energy Policy Act (EPAAct) and have been a federal requirement since the 1990s.) Distinguishing more clearly between public and private toilet facilities will make it easier to explain why public lavatory faucets get the flow rates they do.

Adopting the proposed change to these definitions protects health and safety at least as well as the current definitions.

What follows is the reason statement that supports several change proposals. There is one reason statement for these proposals because the topics are interrelated and a comprehensive discussion is most likely to result in the best outcome for protecting the public’s health and safety

Health and safety for public hand washing needs to include 1) scald prevention, 2) hand washing efficacy and 3) minimizing the risk of pathogen growth in the building’s water distribution system.

We do not want the temperature of the water at public sinks to be too hot. We want the temperature of the water to

be comfortable for the users of public sinks so that people will scrub their hands long enough to get them clean. We want to reduce the likelihood that pathogens will grow in the water distribution system. And, we would like to accomplish all of these health and safety functions in the most cost effective and sustainable manner possible.

At present, we believe that there are a few provisions in the IPC that inadvertently create a public health risk. Changing the temperature limits in this definition is one part of resolving this problem.

When the provisions in the current definitions and the related sections were first codified, Legionella was not a significant concern to public health; many items known today were unknown then. Now Legionella in building water systems has become a major concern for public health with the incidence of Legionnaires' disease growing by 500% from 0.4 cases per 100,000 people in 2000 to 2.0 cases per 100,000 people in 2015.¹

At the time these same provisions were codified, it used be thought that warm water was necessary for effective hand cleaning to control the spread of germs (bacteria). Science has since proven that the temperature of the water used for handwashing does not impact the efficacy of removing bacteria at all.^{2, 3, 4} While each of these three papers are very clear the CDC sums it up best with "The temperature of the water does not appear to affect microbe removal; however, warmer water may cause more skin irritation and is more environmentally costly"⁴ The most important variables for removing bacteria from ones hands are scrubbing and the use of soap. Neither of these criteria is within the purview of a building code.

When scald prevention was discussed as part of codifying these same provisions, the unintended consequences of lower water temperature on waterborne pathogen growth was not known. Accordingly temperature of 140°F originally proposed for scald control in home hot water heaters was lowered to 130°F and finally a recommendation of 120°F was made because if 140°F was OK it was thought that adding a huge safety margin would only be better, we now know that huge safety margin had serious and significant unintended consequences. A temperature of 120°F is considered an abundantly safe scald limit. However, setting water heaters this low results in much of the hot water distribution system being at temperatures that ideal for growing pathogens.

Since 1998 OSHA guidelines have stated that hot water should be stored at 140F and delivered at a temperature greater than 120F. In 2009, the CDC published a study documenting scalding cases resulting in hospital visits by the elderly from 2001-2006. The elderly are the highest risk population for Legionnaires' disease and one of the highest risk for scalding. They found that more than 80% of the scalding cases were due to cooking activities in the kitchen. Less than 3% (220 out of 8,620 cases) were plumbing related.¹³

We believe that it is time to use our current knowledge of these interrelated elements to improve health and safety by revising the a few of the temperature related provisions in the 2018 IPC and the 2018 IRC-P

In both the IPC and the IRC, hot water is required to be supplied to plumbing fixtures and plumbing appliances intended for bathing, washing, or culinary purposes. The 2018 IPC and IRC-P have two different maximum temperature thresholds, which some say are for scald prevention. The temperature at public hand washing sinks (lavatories), is limited to 110°F. With the exception of bidets and emergency fixtures, which are also limited to 110°F, all other fixtures are limited to 120°F. Please see the table below.

Water Temperature Provisions in the 2018 IPC and IRC-P

Fixture	Maximum Temperature	Section
Bidet	110F (43C)	IPC 408.3 IRC P2721.2
Emergency showers and eyewash stations	110F (43C)	IPC 411.1*
Individual shower valve	120F (49C)	IPC 412.3 IRC P2708.4
Multiple (gang) showers	120F (49C)	IPC 412.4
Temperature-actuated, flow-reduction devices for individual fixture fittings	120F (49C)	IPC 412.7
Public lavatories	110F (43C)	IPC 419.5
Bath tub and whirlpool tub	120F (49C)	IPC 412.5 IRC 2713.3
Head shampoo sink faucet	120F (49C)	IPC 412.10
Footbaths and pedicure baths	120F (49C)	IPC 423.3

* The maximum temperature is not shown in this IPC section, but rather in the referenced standard. This standard also has a minimum acceptable temperature of 60F for emergency fixtures. This lower number might be useful guidance for jurisdictions with cold incoming water temperatures that want to raise the temperature of cold water for hand washing during the winter months where only cold water is supplied to public lavatory faucets.

Bidets, emergency showers and eyewash stations and public lavatories are required to have tempered water supplied through a water temperature limiting device that conforms to the appropriate ASSE, ANSI or CSA standard. The upper

limit of 110°F makes sense for bidets and emergency showers. It does not make sense for hand washing at public lavatories.

If 120°F is a safe temperature for showering, bathing, head shampooing, tubs, it is equally safe for hand washing at either public or private lavatory faucets. It does not make sense that the temperature is lower for hand washing than for tub bathing. If the water temperature rises quickly to an uncomfortably hot and unsafe number it is much easier to remove ones hands from the water coming out of the faucet than it is to get out of a bathtub or to get out of the way in a shower. There is no need to have a lower temperature supplied for hand washing than for showering or bathing. In fact this public lavatory temperature code is derived from ASHRAE 90.1 energy saving code, not safety.

In our research into this issue, we found that the 110°F temperature limitation for hand washing at public lavatories comes from an energy code, ASHRAE 90.1 (1989)⁵ “Energy Standard for Buildings Except Low-Rise Residential Buildings.” Section 11.4.5.2 presents the provisions for lavatories in public facility restrooms (such as those in service stations, airports, train terminals, and convention halls). These include the requirement for low flow rates (the document preceded the 1990’s era EPACT rules concerning public lavatory faucet flow rates) and for limiting the temperature to a maximum of 110°F.

In the very high use public toilets detailed in 90.1 (1989) the sinks are used many times per hour, and the combination of low temperature and low flow does not dramatically increase the health risks from waterborne pathogens; the very high turnover rates of the water in the piping brings in new disinfectant.

However, many toilet facilities currently classified as “public” are only used sporadically. The combination of low hot water temperature, low flow rate and infrequent usage, results in a very low turnover rate which in turn means that new disinfectant enters the piping very infrequently. This condition not only provides a localized incubation chamber for Legionella but once grown can result in contaminating the rest of the hot water system.

While the idea of establishing 85-110°F as a safe range for public hand washing seemed like a good idea at the time, it turns out this range is ideal for the growth of pathogens in the building’s water distribution system. Pathogens that affect humans grow in temperatures that are found in our bodies: 85-110°F. For example, Legionella reproduces at the highest rates in the range of 85-110°F. Legionnaires’ disease, caused by Legionella growth in building water systems has become a major public health concern.

Adding to the risk due to temperature is the complexity of the internal components of the mixing valves and the lack of maintenance these valves typically receive. Such maintenance is relatively time consuming and costly and is often ignored. By way of comparison, Australian codes for health and safety purposes require these local mixing valves to be disassembled and disinfected annually^{6, 7, 8}

Conclusions and Recommendations:

If 120°F is safe enough to protect against scalding for bathing, it is safe enough for public hand washing. If this temperature is safe enough for Health Care Occupancies (IPC Section 609.3), it is safe enough for the other occupancies covered by the IPC.

Maintaining temperatures in the range of 85-110°F that is currently required in Section 419.5 is unsafe because it provides ideal conditions for the growth of pathogens, bacteria dangerous to humans. All Legionella guidelines including OSHA 1998⁹, ASHRAE 2000¹⁰, CDC 2003¹¹, and CDC 2016¹² recommend maintaining hot water temperatures at fixtures and in hot water return lines at or above 120°F.

It is not necessary to specify the temperature range for supplying water for hand washing in public lavatories, only the maximum temperature to prevent scalding.

We recommend that the maximum safe temperature for the discharge of hot water into public hand washing sinks be raised to 120°F.

We recommend moving the break point between tempered and hot water from 110°F to 120°F.

We recommend enabling the use of cold water only, or tempered water, or both at public hand washing sinks.

Cost Impact

The code change proposal will decrease the cost of construction .

Justification:

Limiting public restrooms to only those that have unrestricted access to the transient public will decrease the cost of construction. Only public restrooms are currently required to be supplied with tempered water. This requires the installation of a mixing valve that complies with ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3. These valves are relatively expensive. In addition these valves need regular service, which is also costly. Reducing the number of restrooms that are classified as public will reduce the number of such valves that are required to be installed.

Internal ID: 2284

P3-18

IPC: 202

Proponent: James Kendzel, representing American Supply Association (jkendzel@asa.net)

2018 International Plumbing Code

Revise as follows:

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. ~~This definition includes a freestanding apparatus for the same purpose that is not connected to the potable water distribution system and that is supplied with potable water from a container, bottle or reservoir.~~

Reason:

The definition for water dispenser is being revised as it creates potential confusion and makes the provisions in Section 410.4 unenforceable. The definition of plumbing fixture is, a receptacle or device that is **connected to a water supply system** [emphasis added] or discharges to a drainage system or both. Such receptacles or devices require a supply of water; or discharge liquid waste or liquid-borne solid waste; or require a supply of water and discharge waste to a drainage system.

By definition, a water dispenser can not be both a plumbing fixture and a free standing device not connected to a potable water distribution system.

In addition, the general scope of the IPC is specifically related to the "the erection, installation, alteration, repairs, relocation, replacement, addition to, use or maintenance of **plumbing systems...**" [emphasis added]. A free standing device does not appear to be covered under the definition of **plumbing system** and therefore does not appear to fall within the scope of the IPC. Although a free standing device may fall under other regulations or agencies within a given jurisdiction, they do not appear to fall under the IPC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There should be no increase to construction since the proposed revision is only intended to provide consistency in the definition of terms and the use of those terms in the code.

Internal ID: 847

P4-18

202

Proponent: Jenifer Gilliland, City of Seattle, Washington, representing City of Seattle, Washington (jenifer.gilliland@seattle.gov)

2018 International Plumbing Code

SECTION 202 GENERAL DEFINITIONS

WATER COOLER. A drinking fountain that incorporates a means of reducing the temperature of the water supplied to it from the potable water distribution system.

Revise as follows:

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. ~~This definition includes a freestanding apparatus for the same purpose that is not connected to the potable water distribution system and that is supplied with potable water from a container, bottle or reservoir.~~

SECTION 410 DRINKING FOUNTAINS

410.4 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies where drinking fountains are required, *water dispensers* shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.

Reason:

A freestanding apparatus should not be substituted for a drinking fountain. There is nothing to stop a building owner from discontinuing the service or removing the equipment.

Having access to drinking fountains where someone can get water or access to a water dispenser where someone can use their own cup or bottle is important for occupant's health as well as helping our environment by reducing the number of plastic bottles going into the landfill. By eliminating the option to substitute a non-plumbed free standing apparatus containing a reservoir for a drinking fountain, we will also be saving the energy it would have taken to deliver the jugs or containers of water to supply the apparatus.

The water dispenser, which in many installations would be a water bottle filling station, could be plumbed as a separate fixture, combined with the traditional high-low drinking fountain in new equipment, or attached after-the-fact to existing drinking fountains.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Where this option is chosen, a permanent fixture would need to be installed instead of allowing for a portable system. However, there are a variety of options to choose from so the cost to the building owner should be about the same.

Internal ID: 3408

P5-18

IPC: 308.2

Proponent: Kelly Cobeen, Wiss Janney Elstner Associates, Inc., representing Federal Emergency Management Agency/ Applied Technology Council Seismic Code Support Committee (KCobeen@wje.com); Michael Mahoney, Federal Emergency Management Agency, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov)

2018 International Plumbing Code

Revise as follows:

308.2 Piping seismic supports. Where earthquake loads are applicable in accordance with the building code, plumbing piping supports, anchorage, and bracing shall be designed and installed for ~~the~~ seismic forces in accordance with Chapter 16 of the International Building Code.

Reason:

The added text clarifies the IBC location where specific seismic requirements are defined. This is simply intended to make the seismic design provisions more easily used, consistent with the intent as stated in 2015 NEHRP Recommended Provisions Section 1.1.2, to preserve life safety by maintaining the position of components through anchorage, bracing and strength.

Bibliography:

NEHRP Recommended Seismic Provisions for New Buildings and Other Structures, 2015 Edition (FEMA P-1050-1).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed wording clarifies the intent of the code and does not impose any new requirements that were not already in effect.

Internal ID: 1033

P6-18

IPC: TABLE 308.5

Proponent: Forest Hampton, Lubrizol Advanced Materials, Inc., representing Lubrizol Advanced Materials, Inc.
(forest.hampton@lubrizol.com)

2018 International Plumbing Code

Revise as follows:

**TABLE 308.5
HANGER SPACING**

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Acrylonitrile butadiene styrene (ABS) pipe	4	10 ^b
Aluminum tubing	10	15
Brass pipe	10	10
Cast-iron pipe	5 ^a	15
Chlorinated polyvinyl chloride (CPVC) pipe and tubing, 1 inch and smaller	3 ^c	10 ^b
Chlorinated polyvinyl chloride (CPVC) pipe and tubing, 1 ¹ / ₄ inches and larger	4 ^c	10 ^b
Copper or copper-alloy pipe	12	10
Copper or copper-alloy tubing, 1 ¹ / ₄ -inch diameter and smaller	6	10
Copper or copper-alloy tubing, 1 ¹ / ₂ -inch diameter and larger	10	10
Cross-linked polyethylene (PEX) pipe 1 inch and smaller	2.67 (32 inches)	10 ^b
Cross-linked polyethylene (PEX) pipe 1 ¹ / ₄ inch and larger	4	10 ^b
Cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pipe	2.67 (32 inches)	4
Lead pipe	Continuous	4
Polyethylene/aluminum/polyethylene (PE-AL-PE) pipe	2.67 (32 inches)	4
Polyethylene of raised temperature (PE-RT) pipe 1 inch and smaller	2.67 (32 inches)	10 ^b
Polyethylene of raised temperature (PE-RT) pipe 1 ¹ / ₄ inch and larger	4	10 ^b
Polypropylene (PP) pipe or tubing 1 inch and smaller	2.67 (32 inches)	10 ^b
Polypropylene (PP) pipe or tubing, 1 ¹ / ₄ inches and larger	4	10 ^b
Polyvinyl chloride (PVC) pipe	4	10 ^b
Stainless steel drainage systems	10	10 ^b
Steel pipe	12	15

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.
- b. For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe.
- c. For applications with lower use temperatures, piping support spacing shall be permitted to be in accordance with the manufacturer's installation instructions provided that such support spacing is approved.

Reason:

CPVC piping can use longer support spacing at lower temperatures, but additional tables would add complexity. Allowing a CPVC system to utilize specific manufacturer's instructions under specific conditions and with prior AHJ approval would be of use in some installations. A footnote seems sufficient in those cases.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This will not increase the cost of construction as it only adds an additional option for the installer.

Internal ID: 1216

P7-18 Part I

Part I IPC: 308.3

Part II IRC: P2605.1

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

308.3 Materials. Hangers, anchors and supports shall support the piping and the contents of the piping. Hangers and strapping material shall be of *approved* material that will not promote galvanic action. Hangers, anchors and supports shall be chemically compatible with the piping system.

Internal ID: 1741

P7-18 Part II

IRC: P2605.1

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

2018 International Residential Code

Revise as follows:

P2605.1 General. Piping shall be supported in accordance with the following:

1. Piping shall be supported to ensure alignment and prevent sagging, and allow movement associated with the expansion and contraction of the piping system.
2. Piping in the ground shall be laid on a firm bed for its entire length, except where support is otherwise provided.
3. Hangers and anchors shall be of sufficient strength to maintain their proportional share of the weight of pipe and contents and of sufficient width to prevent distortion to the pipe. Hangers and strapping shall be of *approved* material that will not promote galvanic action. Hangers, anchors and supports shall be chemically compatible with the piping system.
4. Where horizontal pipes 4 inches (102 mm) and larger convey drainage or waste, and where a pipe fitting changes the flow direction greater than 45 degrees (0.79 rad), rigid bracing or other rigid support arrangements shall be installed to resist movement of the upstream pipe in the direction of flow. A change of flow direction into a vertical pipe shall not require the upstream pipe to be braced.
5. Piping shall be supported at distances not to exceed those indicated in Table P2605.1.

Reason:

Some hangers and supports may be coated with vinyl, rubber or plastic materials. These materials may be chemically incompatible with some piping materials and their use could cause a failure of the piping system. Only hanger or support products determined to be chemically compatible with the piping systems being installed should be allowed to be used.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal will not increase or decrease the cost of construction because is is intended to clarify the existing requirements in regards to the compatibility of the products used.

Internal ID: 3495

P8-18 Part I

IPC: 305.8 (New)

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Add new text as follows:

305.8 Protection against UV exposure. Where installed in direct sunlight, ABS, PVC and CPVC piping systems shall be protected from exposure to ultraviolet radiation by an opaque tape wrap having a thickness of not less than 0.04 inch (1.02 mm) or by water-based latex paint.

Internal ID: 1747

P8-18 Part II

IRC: P2603.4 (New)

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

2018 International Residential Code

Add new text as follows:

P2603.4 Protection against UV exposure. Where installed in direct sunlight, ABS, PVC and CPVC piping systems shall be protected from exposure to ultraviolet radiation by an opaque tape wrap having a thickness of not less than 0.04 inch (1.02 mm) or by water-based latex paint.

Reason:

ABS, PVC and CPVC can suffer adverse effects from exposure to sunlight. Exposure to sunlight can cause surface discoloration and loss of impact strength to these piping systems. UV radiation affects PVC, CPVC and ABS when energy from the sun causes excitation of the molecular bonds in the plastic. The resulting reaction occurs only on the exposed surface of the pipe and to the extremely shallow depths of .001 to .003 inches. The effect does not continue when exposure to sunlight is terminated. A two-year study was undertaken to quantify the effects of UV radiation on the properties of PVC pipe (See Uni-Bell's UNI-TR-5). The study found that exposure to UV radiation results in a change in the pipe's surface color and a reduction in impact strength.

The presence of a solid surface between the sun and the pipe prevents UV degradation. One of the most common forms of UV protection is painting the pipe and fittings with a water based latex paint which has proven to be chemically compatible with these materials.

Bibliography:

[The Effects of Ultraviolet Radiation Radiation on PVC Pipe] [UNI-TR-5]

https://www.uni-bell.org/application/files/6014/5956/5837/The_Effects_of_Ultraviolet_Radiation_on_PVC_Pipe_.pdf

Cost Impact

The code change proposal will increase the cost of construction .

The cost of construction will increase slightly in certain applications because paint or tape material and the labor to apply will add minimal cost.

Internal ID: 3493

P9-18

IPC: 308.9

Proponent: Michael Cudahy, Plastic Pipe and Fittings Association (PPFA), representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

2018 International Plumbing Code

Revise as follows:

308.9 Parallel water distribution systems. Piping bundles for manifold systems shall be supported in accordance with Table 308.5. Support at changes in direction shall be in accordance with the manufacturer's instructions. Where hot water piping is bundled with cold or hot water piping, ~~each-hot water pipe-piping~~ shall be insulated in accordance with Section 607.5.

Reason:

Energy code has specific insulation requirements for all piping, this proposal points to the correct section of the code. Maybe, these requirements should be moved or duplicated in the IPC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Requirements are already existing. The proposal points to the requirements.

Internal ID: 946

P10-18

IPC: 202, 310, 310.1, 310.3, TABLE 403.1 (IBC [P]2902.1), 403.3.2 (IBC [P]2902.3.2), 403.3.6 (IBC [P]2902.3.6), 405.3.2, 405.3.4, 405.3.5

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Revise as follows:

PRIVATE. In the classification of plumbing fixtures, “private” applies to fixtures in residences and apartments, and to fixtures in nonpublic toilet ~~rooms~~ facilities of hotels and motels and similar installations in buildings where the plumbing fixtures are intended for utilization by a family or an individual.

PUBLIC OR PUBLIC UTILIZATION. In the classification of plumbing fixtures, “public” applies to fixtures in general toilet ~~rooms~~ facilities of schools, gymnasiums, hotels, airports, bus and railroad stations, public buildings, bars, public comfort stations, office buildings, stadiums, stores, restaurants and other installations where a number of fixtures are installed so that their utilization is similarly unrestricted.

SECTION 310 WASHROOM AND TOILET ~~ROOM~~ FACILITY REQUIREMENTS

310.1 Light and ventilation. Washrooms and toilet ~~rooms~~ facilities shall be illuminated and ventilated in accordance with the International Building Code and International Mechanical Code.

310.3 Interior finish. Interior finish surfaces of toilet ~~rooms~~ facilities shall comply with the International Building Code.

**TABLE 403.1

	and freight depots. Low and Moderate Hazard.						
--	---	--	--	--	--	--	--

a.The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the International Building Code.

b.Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c.A single-occupant toilet ~~room-facility~~ with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet ~~room-facility~~ and provision for privacy for the toilet ~~room-facility~~ user is provided.

d.The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e.For business and mercantile classifications with an occupant load of 15 or fewer, service sinks shall not be required.

f.The required number and type of plumbing fixtures for outdoor public swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.

403.3.2 Prohibited toilet ~~room-facility~~ location. Toilet ~~rooms-facilities~~ shall not open directly into a room used for the preparation of food for service to the public.

403.3.6 Door locking. Where a toilet ~~room-facility~~ is provided for the use of multiple occupants, the egress door for the room shall not be lockable from the inside of the room. This section does not apply to family or assisted-use toilet ~~rooms-facilities~~.

405.3.2 Public lavatories. In employee and *public* toilet ~~rooms-facilities~~, the required lavatory shall be located in the same room as the required water closet.

405.3.4 Water closet compartment. Each water closet utilized by the *public* or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet ~~rooms-facilities~~ located in a child day care ~~facilities~~ and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.

405.3.5 Urinal partitions. Each urinal utilized by the *public* or employees shall occupy a separate area with walls or partitions to provide privacy. The horizontal dimension between walls or partitions at each urinal shall be not less than 30 inches (762 mm). The walls or partitions shall begin at a height not greater than 12 inches (305 mm) from and extend not less than 60 inches (1524 mm) above the finished floor surface. The walls or partitions shall extend from the wall surface at each side of the urinal not less than 18 inches (457 mm) or to a point not less than 6 inches (152 mm) beyond the outermost front lip of the urinal measured from the finished backwall surface, whichever is greater.

Exceptions:

1. Urinal partitions shall not be required in a singleoccupant or family/assisted-use toilet room with a lockable door.
2. Toilet ~~rooms-facilities~~ located in a child day care ~~facilities~~ and containing two or more urinals shall be permitted to have one urinal without partitions.

Reason:

When toilet room was changed to toilet facility there were several instances in the code where the language wasn't changed. This proposal is just to clean up the language.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is just a cleanup for coordination of terminology that has no impact on costs.

Analysis: Duplicated text in the International Building Code is not shown for brevity.

P11-18 Part I

IPC: 312.3

Proponent: Robert Fuller, County of Roanoke, Virginia, representing R. G. Fuller (rfuller@roanokecountyva.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

312.3 Drainage and vent air test. Plastic piping shall not be tested using air except where air is removed by an evacuation of the system with a vacuum type pump to achieve a uniform gauge pressure of -5 psi (-34.5 kPa) or to balance a 10-inch column of mercury. An air test shall be made by forcing air into the system until there is a uniform gauge pressure of 5 psi (34.5 kPa) or sufficient to balance a 10-inch (254 mm) column of mercury. This pressure shall be held for a test period of not less than 15 minutes. Any adjustments to the test pressure required because of changes in ambient temperatures or the seating of gaskets shall be made prior to the beginning of the test period.

Internal ID: 1932

P11-18 Part II

IRC: P2503.5.1

Proponent: Robert Fuller, County of Roanoke, Virginia, representing R. G. Fuller (rfuller@roanokecountyva.gov)

2018 International Residential Code

Revise as follows:

P2503.5.1 Rough plumbing. DWV systems shall be tested on completion of the rough piping installation by water or, air for piping systems other than plastic or, by a vacuum of air for plastic piping systems, without evidence of leakage. ~~Either~~The test shall be applied to the drainage system in its entirety or in sections after rough-in piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than 5 feet (1524 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.
3. Vacuum Test. The portion under test shall be evacuated of air by a vacuum type pump to achieve a uniform gauge pressure of -5 pounds per square inch or a negative 10-inches of mercury column (-34 kPa). This pressure shall be held without the removal of additional air for a period of 15 minutes.

Reason:

The code change allowance for this alternate test is a means for testing plastic piping systems when the ambient temperatures are below freezing where water cannot be used for the test. There is no safety hazard in testing with a vacuum such as that has occurred in the past with a positive pressure test which is no longer allowed for just concern.

There is no requirement to use this alternate method.

The equipment to perform the test is readily available on the market and many contractors have this equipment to perform the test among their tools at present.

This allowance will actually help to mitigate the cost of construction delays and prevent potential damage to plastic piping systems when water cannot be used while avoiding the dangerous, now disallowed use of air pressurizing the plastic piping system.

Cost Impact

The code change proposal will decrease the cost of construction .

The code already requires testing. This alternate test method doesn't require any more time or materials than other testing methods. This is just an option that can be used.

The equipment to perform the test is readily available on the market and many contractors already have this equipment to perform the test among their tools at present. The cost of contractor tooling doesn't add to the cost of construction of the building as the contractor has to remain competitive.

However, use of this method will help to mitigate the cost of construction delays (waiting for warmer weather to test with water) and the cost of repairing freeze damage where testing with water is attempted in freezing weather.

P12-18

IPC: 312.10.2, Chapter 15

Proponent: Brianne Hall, representing Self (bnhall@ftch.com)

2018 International Plumbing Code

Revise as follows:

312.10.2 Testing. Reduced pressure principle, double check, pressure vacuum breaker, reduced pressure detector fire protection, double check detector fire protection, and spill-resistant vacuum breaker backflow preventer assemblies and hose connection backflow preventers shall be tested at the time of installation, immediately after repairs or relocation and at least annually. The testing procedure shall be performed in accordance with one of the following standards: ASSE 5013, ASSE 5015, ASSE 5020, ASSE 5047, ASSE 5048, ASSE 5052, ASSE 5056, CSA B64.10 or CSA B64.10.1. Test gauges shall comply with ASSE 1064.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1064—2006 (R2011):

Performance Requirements for Backflow Prevention Assembly Field Test Kits

Reason:

Gauges that comply with ASSE 1064 are specifically designed for testing backflow devices describing the proper accuracy (linearity & repeatability) and precision, while compensating for varying operating conditions, EMI/FRI exposure, ambient temperatures, etc. Further, the gauges are required to be NIST-traceable, calibrated periodically, and are designed to be used in tandem with the current referenced standards in this section.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No change to the cost of construction. Those that test backflow preventers may need to ensure that their gauge conforms with the standard.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1064-2006 (R2011), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

		Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities ^f	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink
2	Business	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses	1 per 25 for the first 50 and 1 per 50 for the remainder exceeding 50		1 per 40 for the first 80 and 1 per 80 for the remainder exceeding 80		—	1 per 100	1 service sink ^e
3	Educational	Educational facilities	1 per 50		1 per 50		—	1 per 100	1 service sink
4	Factory and industrial	Structures in which occupants are engaged in work fabricating,	1 per 100		1 per 100		—	1 per 400	1 service sink

		assembly or processing of products or materials					
5	Institutional	Custodial care facilities	1 per 10	1 per 10	1 per 8	1 per 100	1 service sink
		Medical care recipients in hospitals and nursing homes	1 per room ^c	1 per room ^c	1 per 15	1 per 100	1 service sink per floor
		Employees in hospitals and nursing homes ^b	1 per 25	1 per 35	—	1 per 100	—
		Visitors in hospitals and nursing homes	1 per 75	1 per 100	—	1 per 500	—
		Prisons ^b	1 per cell	1 per cell	1 per 15	1 per 100	1 service sink
		Reformatories, detention centers, and correctional centers ^b	1 per 15	1 per 15	1 per 15	1 per 100	1 service sink
		Employees in reformatories, detention centers and correctional centers ^b	1 per 25	1 per 35	—	1 per 100	—
		Adult day care and child day care	1 per 15	1 per 15	1	1 per 100	1 service sink
6	Mercantile	Retail stores, service stations, shops, salesrooms, markets and shopping centers	1 per 500	1 per 750	—	1 per 1,000	1 service sink ^e
7	Residential	Hotels, motels, boarding houses (transient)	1 per sleeping unit	1 per sleeping unit	1 per sleeping unit	—	1 service sink
		<u>Hostels (transient)</u>	<u>1 per 10</u>	<u>1 per 10</u>	<u>1 per 8</u>	<u>1 per 100</u>	<u>1 service sink</u>
		Dormitories, fraternities, sororities and boarding houses (not transient)	1 per 10	1 per 10	1 per 8	1 per 100	1 service sink
		Apartment house	1 per dwelling unit	1 per dwelling unit	1 per dwelling unit	—	1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per 20 dwelling units
		Congregate living facilities with 16 or fewer persons	1 per 10	1 per 10	1 per 8	1 per 100	1 service sink
		One- and two-family dwellings and lodging houses with five or fewer guestrooms	1 per dwelling unit	1 per dwelling unit	1 per dwelling unit	—	1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per dwelling unit
7	Residential	Congregate living facilities with 16 or fewer persons	1 per 10	1 per 10	1 per 8	1 per 100	1 service sink
8	Storage	Structures for the storage of goods, warehouses, storehouse and freight	1 per 100	1 per 100	—	1 per 1,000	1 service sink

Reason:

Hostels are not addressed in the code and they are unique in that they operate like a hotel/motel for transient stay as an R-1 occupancy but the restrooms facilities provided resemble the requirements for R-2 boarding houses where restroom facilities are shared as opposed to hotels and motels where each sleep unit must be provided with its own water closet, lavatory and tub or shower. This creates a problem when applying the provisions of I.B.C. Table 2902.1. The resolution would be to create another R-1 occupancy designation with a description of Hostels and place the requirements for plumbing fixtures from R-2 boarding houses into that classification. A precedent has already been established with two R-2 classifications one for boarding houses and another for apartments which have different requirements. Arbitrarily placing hostels in an R-2 occupancy group would also subject that use to the more restrictive accessibility requirements of I.B.C. Section 1106.2.2.1. While hostels are not that common in the U.S. they are quite common elsewhere in the world and the I.B.C. is an international code so this issue should be addressed.

Cost Impact

The code change proposal will decrease the cost of construction .

As the code is written, the hostel would be required to be classified as an R-1 occupancy and would required to have restrooms in each sleeping room. With the proposed change, the hostel classification would still remain an R-1 occupancy but the number of restrooms would decrease.

Analysis: Duplicated text in the IBC is not shown for brevity.

Internal ID: 2116

P14-18

IPC: 403.1.1

Proponent: Josephine Ortega, representing University of California

2018 International Plumbing Code

Revise as follows:

403.1.1 Fixture calculations. To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table 403.1. Fractional numbers resulting from applying the fixture ratios of Table 403.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

~~Exception~~ Exceptions:

1. The total occupant load shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Where multi-user facilities are designed to serve all genders, the minimum fixture count shall be calculated 100%, based on total occupant load. In such multi-user user facilities, each fixture type shall be in accordance with ICC A117.1 and each urinal that is provided shall be located in a stall.

Reason:

This proposal will permit designers to design gender specific facilities using either the men or women category. The proposal will also bridge the gap of designing for facilities that elect to install all-inclusive bathroom/restrooms.

Bibliography:

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply offers a different way to design toilet facilities. No fixtures are being added or subtracted therefore, there is no impact to the cost of construction.

Internal ID: 2348

P15-18

IPC: 403.1.1 (IBC [P] 2902.1.1), 403.1.2 (IBC [P] 2902.1.2), 403.2 (IBC [P] 2902.2)

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Plumbing Code

Revise as follows:

403.1.1 Fixture calculations. To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table 403.1. Fractional numbers resulting from applying the fixture ratios of Table 403.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

~~Exception~~ **Exceptions:**

1. The total occupant load shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Distribution of the sexes is not required where single-user water closets and bathing room fixtures are provided in accordance with Section 403.1.2.

403.1.2 Single-user toilet facility and bathing room fixtures. The plumbing fixtures located in single-user toilet ~~facilities~~ and bathing rooms, including family or assisted-use toilet and bathing rooms that are required by Section 1109.2.1 of the International Building Code, shall contribute toward the total number of required plumbing fixtures for a building or tenant space. Single-user toilet ~~facilities~~ and bathing rooms, and family or assisted-use toilet rooms and bathing rooms shall be identified for use by either sex.

The total number of fixtures shall be permitted to be based on the required number of separate facilities or based on the aggregate of any combination of single-user or separate facilities.

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required to be designated by sex where single-user toilets rooms are provided in accordance with Section 403.1.2.
6. Separate facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for use by both sexes and privacy for water closets are installed in accordance with Section 405.3.4.

Reason:

As part of the changes to the 2018 code provisions were added to allow single user toileting features to be counted toward the total number of fixtures required despite their designation by sex or family. This change is proposed to clarify how toilet rooms that are configured in such a manner to allow use by either sex can also be used. Many communities have been asking to use these provisions in advance of full adoption of the 2018 codes because of their need to address significant issues of gender and equality for access.

The codes only require the installation of family or assisted-use facilities in a limited number of occupancies. With this change the codes will allow the design of facilities that are available to those needing assistance by other assistants that are of an opposite gender without causing any discomfort by anyone.

Cost Impact

The code change proposal will decrease the cost of construction .

This change would reduce the cost of construction because the duplication of areas used for single sex facilities can

be eliminated saving unneeded floor area.

Analysis: Duplicated text in the International Building Code is not shown for brevity.

P16-18

IPC: 403.1.2 (IBC [P]2902.1.2)

Proponent: James P. Colgate, Esq., RA, CFM, Bryan Cave LLP, representing National Center for Transgender Equality (James.Colgate@bryancave.com); David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Plumbing Code

Revise as follows:

403.1.2 Single-user toilet facility and bathing room fixtures. The plumbing fixtures located in single-user toilet facilities and bathing rooms, including family or assisted-use toilet and bathing rooms that are required by Section 1109.2.1 of the International Building Code, shall contribute toward the total number of required plumbing fixtures for a building or tenant space. Single-user toilet facilities and bathing rooms, and family or assisted-use toilet rooms and bathing rooms shall be identified as being available for use by ~~either~~ all persons regardless of their sex.

Reason:

This proposal merely clarifies some of the ambiguous language in a previous change adopted by the Membership in the last code cycle. Pursuant to P40-15, Public Comment 2, Section 403.1.2 of the International Plumbing Code was revised to state that “toilet and bathroom facilities be identified for use by either sex.” The Membership’s stated reason for adopting Public Comment 2 was two-fold. First, the change allowed designers to adopt single-occupant toilet rooms, rather than grouped facilities. Second, and more importantly, the Membership adopted this change to alleviate some of the issues transgender individuals face.

Under the design scheme approved by P40-15, Public Comment 2, the same numbers of fixtures are provided, and waiting time is reduced by allowing either sex to use the toilet room. However, despite the Membership’s intention to alleviate some of the problems transgender people face, the adopted language “for use by either sex” remains vague and subject to competing interpretations. For example, a designer might interpret “identified for use by either sex” to mean that single-user, family, or assisted-use toilet facilities could be identified for use by men, or could be identified for use by women, but not necessarily be identified for use by both men and women.

In response to this ambiguity, the National Center for Transgender Equality urges the Committee to approve this code change proposal to clarify Section 403.1.2 of the International Plumbing Code by including language that bathroom identification be “available for use by all persons regardless of their sex.” This modification resolves the problem of ambiguous interpretations because it could not logically be construed that it is permissible for bathroom signage to exclude one gender over the other. In essence, this proposal more accurately reflects the Membership’s intention to permit certain facilities to be identified for use by any and all persons.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal has no cost impact. The Membership already adopted this proposal in the 2018 International Plumbing Code. Rather than impose additional design costs, this proposal merely seeks to make a clarification. This proposal would better reflect the Membership’s intention than the current code.

Analysis: Duplicated text in the International Building Code is not shown for brevity.

Internal ID: 1432

P17-18

IPC: 403.2 (IBC [P]2902.2)

Proponent: James P. Colgate, Esq., RA, CFM, Bryan Cave LLP, representing National Center for Transgender Equality (James.Colgate@bryancave.com); David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Plumbing Code

Revise as follows:

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required where all water closet compartments are provided with partitions, including the doors thereto, that extend to the floor and to the ceiling.

Reason:

Colleges across the United States, private businesses, membership clubs, and many establishments throughout Europe have adopted an alternative design for bathroom and toilet facilities that removes the requirement that such facilities be designated for use by a specific sex. This design has proven to be useful, effective, and economical.

NCTE's proposal would give designers the option of group toilet rooms regardless of sex, as long as each stall has partitions on all four sides that extend to the floor. Partitions ensure that the user's privacy is maintained. This proposal is advantageous because the partitions remove the embarrassment that many people face in a shared restroom facility. Additionally, group toilet facilities promote shorter wait times for the restroom and waste less space on a general bathroom waiting area.

It should be noted that this proposal does not trigger compliance with Exception 3 of IBC Section 1109.2, which requires that 50% of single-user toilet or bathing rooms clustered in a single location be accessible. The water closet compartments in this proposal need not contain a lavatory, and thus do not constitute a "toilet room" as such term is used in IPC Section 405.3.4 and IBC Sections 1109.2.1.2, 1109.2.2, and 1109.2.3. Rather, such "water closet compartments" are subject to the 5% rule of IBC Section 1109.2.2.

It should be noted that this proposal does not trigger compliance with Exception 2 of Section 1109.2 of the International Building Code, which requires that 50% of single-user toilet or bathing rooms clustered in a single location be accessible. Section 1109.2.1.2 of the International Building Code defines "toilet room" to include a water closet and a lavatory. Under NCTE's proposed design scheme, the partitioned stalls need not contain sinks or wash basins, and would therefore be treated as ordinary toilet compartments and subject to the 5% rule of Section 1109.2.2 of the International Building Code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The same numbers of fixtures are still required and waiting time will be reduced by allowing any sex to use any available water closet compartment. Further, the general waiting area and space required for two facilities will not be necessary in places with this design option. While that may save a small cost, an additional cost may be expended to create partitions on all four sides that extend to the floor.

Analysis: Duplicated text in the International Building Code is not shown for brevity.

P18-18

IPC: 403.2

Proponent: Josephine Ortega, representing University of California

2018 International Plumbing Code

Revise as follows:

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Where multi-user facilities are designed to serve all genders, the minimum fixture count shall be calculated 100% based on the total occupant load. In such facilities, each fixture type shall be in accordance with ICC A117.1. Urinals provided shall be located in a stall.

Reason:

This proposal will permit designers to design gender specific facilities using either the men or women category. The proposal will also bridge the gap of designing for facilities that elect to install all-inclusive bathroom/restrooms.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply offers a different way to design toilet facilities. No fixtures are being added or subtracted therefore, there is no impact to the cost of construction.

Internal ID: 2349

P19-18

IPC: 403.3.1 (IBC [P] 2902.3.1), 403.5 (IBC [P] 2902.5)

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Plumbing Code

Revise as follows:

403.3.1 Access. The route to the *public* toilet facilities required by Section 403.3 shall not pass through kitchens, storage rooms or closets. Access to the required facilities shall be from within the building or from the exterior of the building. ~~Routes shall comply with the accessibility requirements of the International Building Code.~~ The public shall have access to the required toilet facilities at all times that the building is occupied.

403.5 Drinking fountain location. Drinking fountains shall not be required to be located in individual tenant spaces provided that *public* drinking fountains are located within a distance of travel of 500 feet (152 m) of the most remote location in the tenant space and not more than one story above or below the tenant space. Where the tenant space is in a covered or open mall, such distance shall not exceed 300 feet (91 m). ~~Drinking fountains shall be located on an accessible route.~~

Reason:

Accessibility is addressed in Section 404 of the IPC, which includes specifics for accessible routes connecting accessible elements - including exceptions to the vertical route between levels that may contain toilets or drinking fountains. The language is redundant in Section 403.3.1 and is not needed. The language in Section 403.5 is also not consistent with 403.3.1 and could be interpreted to prohibit any drinking fountains to be installed on floors without elevator service. This is not the intent of the accessibility provisions.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal will eliminate possible conflicts between the IPC and accessibility requirements. The change is only correlative and contains, in itself, no substantive changes.

Analysis: Duplicated text in the International Building Code not shown for brevity.

Internal ID: 548

P20-18 Part I

IPC: 403.3.3 (IBC [P] 2902.3.3)

Proponent: Brian Tollisen, Division of Building Standards & Codes, New York State Dept. of State, representing Division of Building Standards and Codes, New York State Department of State (Brian.Tollisen@dos.ny.gov)

BOTH PARTS OF THIS PROPOSAL WILL BE HEARD BY THE IPC-IPSDC COMMITTEE. SEE HEARING AGENDA FOR THE IPC-IPSDC COMMITTEE.

2018 International Plumbing Code

Revise as follows:

403.3.3 Location of toilet facilities in occupancies other than malls.. In occupancies other than covered and open mall buildings, the required *public* and employee toilet facilities shall be located not more than one story above or below the space required to be provided with toilet facilities, and the path of travel to such facilities shall not exceed a distance of 500 feet (152 m).

Exception: ~~The location and maximum distances of travel~~ The location(s) of required employee plumbing fixtures are allowed to be located in adjacent structures under the same ownership, lease or control. The maximum travel distance to required employee facilities in factory and industrial occupancies, storage buildings and kiosks are permitted to exceed that required by this section, provided that the location and maximum distance of travel are approved. travel distance is approved.

Analysis: Duplicated text in the IBC is not shown for brevity.

Internal ID: 1357

P20-18 Part II

IPMC: 503.3

Proponent: Brian Tollisen, Division of Building Standards & Codes, New York State Dept. of State, representing Division of Building Standards and Codes, New York State Department of State (Brian.Tollisen@dos.ny.gov)

2018 International Property Maintenance Code

Revise as follows:

[P] 503.3 Location of employee toilet facilities.. Toilet facilities shall have access from within the employees' working area. The required toilet facilities shall be located not more than one story above or below the employees' working area and the path of travel to such facilities shall not exceed a distance of 500 feet (152 m). Employee facilities shall either be separate facilities or combined employee and public facilities.

Exception: ~~Facilities that are required for employees in storage structures or kiosks, which are~~ The location(s) of required employee plumbing fixtures are allowed to be located in adjacent structures under the same ownership, lease or control, shall not exceed a travel distance of 500 feet (152 m) from the employees' regular working area to the facilities. ~~control. The maximum travel distance to required employee facilities in factory and industrial occupancies, storage buildings and kiosks are permitted to exceed that required by this section, provided the travel distance is approved.~~

Reason:

The code sections currently are not coordinated with regards to the locations of employee plumbing facilities. This proposal brings consistency between the IPC and IPMC for the locations of employee toilet facilities. The spaces listed in the exception; factory and industrial occupancies, storage buildings and kiosks, are traditionally not provided with plumbing facilities due to the proximity to available facilities and due to the nature of their use. This change should also remove unnecessary violations issued due to the discrepancy in the current code language.

Cost Impact

The code change proposal will decrease the cost of construction .

Construction costs will decrease for the applicable occupancies by not requiring plumbing fixtures when adjacent facilities are approved.

Internal ID: 3394

P21-18

IPC: 403.3.3 (IBC [P]2902.3.3)

Proponent: Andrew Klein, representing Self Storage Association (andrew@asklein.com)

2018 International Plumbing Code

Revise as follows:

403.3.3 Location of toilet facilities in occupancies other than malls. In occupancies other than covered and open mall buildings, the required *public* and employee toilet facilities shall be located not more than one story above or below the space required to be provided with toilet facilities, and the path of travel to such facilities shall not exceed a distance of 500 feet (152 m).

Exception-Exceptions:

1. The location and maximum distances of travel to required employee facilities in factory and industrial *occupancies* are permitted to exceed that required by this section, provided that the location and maximum distance of travel are *approved*.
2. The location and maximum distances of travel to required public and employee facilities in Group S occupancies are permitted to exceed that required by this section, provided that the location and maximum distance of travel are approved

Reason:

This proposal adds exception #2, which builds on the existing exception for employee toilet facilities in factory and other industrial occupancies when approved by the code official. Because these types of occupancies have extremely low occupancy rates, it is not a cost-effective use of space or resources to require the same number of independent restrooms when they will rarely be utilized. The new exception for Group S facilities recognizes that even though there may be members of the public present in some S occupancies, the overall use of the building is similar to that of an industrial facility, where occupancy rates and dwell times are extremely low.

This proposal provides the code official the authority to increase the number of floors between restrooms from every other floor to something more appropriate in parking garages with attendants, self storage facilities, and other similar Group S buildings with low occupancy rates and dwell times.

Cost Impact

The code change proposal will decrease the cost of construction .

This code change proposal has the potential to decrease the cost of construction if the code official approves a reduction in the number of toilet facilities.

Analysis: Duplicated text in the IBC is not shown for brevity.

Internal ID: 1674

P22-18 Part I

IBC: 1109.2.1.7

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov)

THIS IS A TWO PART CODE CHANGE. BOTH PARTS OF THIS CODE CHANGE WILL BE HEARD BY THE PLUMBING CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows:

1109.2.1.7 Privacy. Doors to family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator.

Internal ID: 1436

P22-18 Part II

IPC: 403.3.7 (New); IBC: 2902.3.7 (New)

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov)

2018 International Plumbing Code

Add new text as follows:

403.3.7 Privacy. Doors to single-user toilet and bathing rooms and family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator.

2018 International Building Code

Add new text as follows:

2902.3.7 Privacy. Doors to single-user toilet and bathing rooms and family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator.

Reason:

This code change proposal will alleviate privacy and safety concerns by requiring the occupied indicator for single user restrooms. Without an occupied indicator, the only way for someone to see if the room is in use is to turn the handle. This causes safety and privacy concerns for the user. This can cause severe discomfort, even fear, for children or people who have suffered trauma. This proposal will proactively provide increased comfort and safety for everyone.

It is the intent of this proposal to have the added coordinate section IBC 2902.3.7, later scoped by CCC as "[P]" as everything else in Chapter 29 is [P] scoped.

Cost Impact

The code change proposal will increase the cost of construction .

Adding the occupied indicator to the already required privacy lock increases the cost of the hardware by no more than a few dollars per door.

Internal ID: 3488

P23-18

IPC: 403.6 (New)

Proponent: Eirene Knott, BRR Architecture, representing Metropolitan Kansas City Chapter of the ICC
(Eirene.Knott@brrarch.com)

2018 International Plumbing Code

Add new text as follows:

403.6 Service sink location. Service sinks shall not be required to be located in individual tenant spaces in a covered mall provided that service sinks are located within a distance of travel of 300 feet (91 m) of the most remote location in the tenant space and not more than one story above or below the tenant space. Service sinks shall be located on an accessible route.

Reason:

There were at least two attempts in the 2015/2016/2017 code development cycle to reduce or remove the requirement of a service sink. One proposal was to not require a service sink where the occupant load was 30 or less. The committee felt that raising the occupant threshold and applying that load across the board would result with some occupancies not having a sink but would need the sink for other regulations such as health code requirements.

The other proposed code changes came from the PMG CAC adding a new section for service sinks allowing for a service sink to be located in a central core of a building. The committee disapproved that code change because it called for a minimum outlet drain of 3 inches in diameter. The committee felt the 3-inch requirement was overkill and felt the proposed code change also superseded the requirements of Table 403.1.

Despite attempts during the public comment phase where both proposal were approved, both were disapproved in the final action process. Based on the action at the public comment phase, there is an understanding that some small tenant spaces, especially those within a mall, do not need to have the service sink in a readily accessible location. Since both drinking fountains and public toilets are allowed to be within 300 feet of a tenant space in a mall, the same travel distance seems reasonable for access to a service sink. I have opted to have this change apply only to tenants within a covered mall as in some parts of the country it may not be practical for tenants in an outdoor mall to push a mop bucket 300 feet in the snow.

For a small tenant that may not meet footnote e to Table 403.1, the addition of a service sink can take up much needed tenant space, let alone add an additional cost that can negatively impact the tenant space overall. Most small tenants do not need a service sink but knowing that one would be available to them, just like a public restroom and drinking fountain are available within the same travel distances, would provide a sense of security.

Cost Impact

The code change proposal will decrease the cost of construction .

This may reduce the cost of construction as each individual tenant would not be required to provide a service sink, reducing the cost of materials needed.

Internal ID: 112

P24-18

IPC: 404.1, 404.2, 404.3

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Plumbing Code

Revise as follows:

404.1 Where required. Accessible plumbing facilities and fixtures shall be provided in accordance with the International Building Code and ICC A117.1.

Delete without substitution:

~~**404.2 Accessible fixture requirements.** Accessible plumbing fixtures shall be installed with the clearances, heights, spacings and arrangements in accordance with ICC A117.1.~~

~~**404.3 Exposed pipes and surfaces.** Water supply and drain pipes under accessible lavatories and sinks shall be covered or otherwise configured to protect against contact. Pipe coverings shall comply with ASME A112.18.9.~~

Reason:

Section 404.2 and 404.3 were added by P42-12. They should be removed for multiple reasons. The reference to IBC would also get a reference to ICC A117.1 in Section 1101.2, however, if there is a concern that this may be missed by plumbing inspectors, the reference can be added in Section 404.1.

In Section 404.2, the laundry list is incomplete on what is required in the A117.1 for accessible plumbing fixtures. Since standards are only referenced to the extent the code sends you there (Section 102.8), this could be misinterpreted as intending to limit requirements that would be applicable in the standard. The requirement for pipe protection is a technical requirement for accessible lavatories, address in A117.1 Section 606.6, so it should not be repeated here. The ASME A112.18.9 standard addresses the requirements for heat transfer, not cold, therefore it only addresses half the issue associated with water, and not all the issues associated with accidental contact. The test for hot water is substantially hotter than tempered water which is required for public lavatories. Also, if the pipes are protected from contact by some type of shield as indicated in the photo, there is no exception for compliance with the standard, even if there is no contact with the pipes. If ASME A112.18.9 should be referenced, this standard should be reviewed through the ICC A117.1 process for technical issues associated with accessibility requirements. It does not belong in the IPC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is only clarification that will eliminate potential conflicts between the IPC and ICC A117.1.

Internal ID: 546

P25-18

IPC: 404.3, Chapter 15

Proponent: Howard Ahern, representing Plumberex Speciality Products

2018 International Plumbing Code

Revise as follows:

404.3 Exposed pipes and surfaces. Water supply and drain pipes under accessible lavatories and sinks shall be covered or otherwise configured to protect against contact. Pipe coverings shall comply with ASME A112.18.9 or ASTM C1822.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

C1822-2015:

Standard Specification for Insulating Covers on Accessible Lavatory Piping

Reason:

There is a new standard that has been developed specifically for insulating covers over water supply pipes and drain piping under accessible lavatories. The new standard is titled: ASTM C1822-2015 Standard Specification for Insulating covers on Accessible Lavatory Piping. The Standard was developed by the C16.40 Thermal Insulation Systems committee. The new standard covers all of ASME A112.18.9 requirements but is a more comprehensive standard than ASME A112.18.9 and has additional language covering requirements related to restrictions on cable tie fasteners associated with a Federal lawsuit.

This code modification allows both the ASME A112 18.9 standard and would also allow ASTM C1822 compliance. designers are able to comply with either standard . Both standards are needed for these products allowing compliance with either standard will help contractors and inspectors with compliance and identification, while also allowing greater compliance with Department of Justice 2010 Americans with Disability Act standard for Assessable Design Standard 606.5 and ANSI Standard A117.1.

Bibliography:

Howard Ahern representing Plumberex Speciality Products.

Member ASME A112. 18.9 standard

Chairman ASTM C1822 Standard Committee

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No cost increase would be associated with this modification as there are many under sink Insulation products sold nationwide which already complying with this standard that are of no increased cost to the industry.

Analysis: A review of the standard proposed for inclusion in the code, ASTM C1822-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1982

P26-18

IPC: 404.3 (New)

Proponent: Richard Anderson, None, representing Oklahoma ADAPT

2018 International Plumbing Code

Add new text as follows:

404.3 Accessible water closet personal hygiene device. Each accessible water closet shall be provided with a personal hygiene device in compliance with Section 412.9.

Reason:

Toilets with built in bidets are known to provide a cleaner and more hygienic experience after using the restroom. Many people install them in their homes because of the more soothing and comfortable wash they provide as opposed to dry toilet paper. However, bidet toilets can offer a lot more than just a more comfortable cleaning experience for those suffering from a variety of medical issues. Seniors and persons with disabilities have been known to have these in their homes (including me) to help with our bathroom usages due to the loss of muscle strength and gross motor skills.

Toilet bidets provides both physical and psychological relief, because it helps us go to the bathroom by ourselves again or for the first time in our life. However, this brilliant product that gives independence and a peace of mind for a lot of us hasn't made it to the ADA Guideline as far as public bathrooms are concern.

Personally, I'm scared of going out days, never knowing if you gonna have to go bad and if you are able to hold it til you get home. If you are able to transfer to the toilet, you shouldn't be thinking about how you going get clean when you can't wipe yourself (sorry to be blunt). It really amazes me the toilet bidets haven't already been added.

I would suggest hotels to have bidets in accessible rooms, any place that serves food, i.e. dinning in restaurants, stores that has dinning in restaurants in them, like wal-marts, malls which has restaurants in them, and concert/sporting venues be the major public bathrooms to have toilet with built-in bidets in accessible stalls

As you will notice, commercial bidet toilets costs a liittle more then a regular commercial toilets, but at the end, it will pay for itself and more, it will allow us to go on vacations, eat out, shop, etc. which puts more money back into the business, not to mention the economy.

Example

<https://www.houzz.com/photos/47714905/OVE-Decors-Smart-Toilet-contemporary-toilets>

Cost Impact

The code change proposal will increase the cost of construction .

As you will notice, commercial bidet toilets costs a liittle more then a regular commercial toilets, but at the end, **it will pay for itself and more**, it will allow us to go on vacations, eat out, shop, etc. which puts more money back into the business, not to mention the economy.

Internal ID: 583

P27-18

IPC: 405.3.1

Proponent: Daniel Gleiberman, SLOAN, representing SLOAN (dangleib@gmail.com)

2018 International Plumbing Code

Revise as follows:

405.3.1 Water closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition, vanity or other obstruction. ~~Where~~ For water closets, urinals, or bidets, where partitions or other obstructions do not separate adjacent fixtures, fixtures shall not be set closer than 30 inches (762 mm) center to center between adjacent fixtures. There shall be not less than a 21-inch (533 mm) clearance in front of a water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall be not less than 30 inches (762 mm) in width and not less than 60 inches (1524 mm) in depth for floor-mounted water closets and not less than 30 inches (762 mm) in width and 56 inches (1422 mm) in depth for wall-hung water closets.

Exception: An accessible children's water closet shall be set not closer than 12 inches (305 mm) from its center to the required partition or to the wall on one side.

Reason:

This code section is a subsection of Section 405 entitled "Installation of Fixtures". This code change proposal clarifies that lavatories must be installed to meet the 15 inch separation from the center of the fixture to any obstruction.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change only clarifies the current code requirement.

Internal ID: 1930

P28-18

IPC: 405.3.4

Proponent: Bruce Pitts, Self, representing Self (bhpbhp@yahoo.com)

2018 International Plumbing Code

Revise as follows:

405.3.4 Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with full-height walls or partitions and a solid door fully enclosing the fixtures to ensure privacy. The door shall close against seals on the top and sides, can be undercut up to 3/4 inches (19.05 mm) and shall not have a transfer grille.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.
4. Door undercut height limitations are not required for exterior water closet compartments.

Reason:

Full-height partitions can help the Paruresis community function in society.

Paruresis affects from 6.6% to 14.4% of the population who find it difficult or impossible to urinate in the presence of others. Restroom privacy is the issue.

Employment, commerce, productivity and well being are affected. Many cannot work in buildings with partial-partition group restrooms and can plan their days around facilities that have restroom privacy. Paruresis contributes to agoraphobia and even to suicide.

Expecting this many people to seek and pay for treatment, which may or may not help them, is not the way to remedy this matter. 21 million is the population of Florida. 46 million represents the combined populations of Florida, New York State and South Carolina.

A Study by Williams and Degenhart - Journal of General Psychology 51:19-29, 1954, found 14.4% of the population having Paruresis, equaling 46 million Americans, based upon the 2015 USA population of 320,098,857. A Harvard University Study - Social Phobia Subtypes in the National Comorbidity Study - American Journal of Psychiatry, 155:613-9, May 1998, found 6.6% of the population with Paruresis equalling 21 million Americans as of 2015.

Closing each full-height partition door against seals (and with minimal door undercut) provides privacy and sound attenuation.

A maximum door undercut is not required for exterior toilet compartments to avoid vagrancy.

In the attachment section, a cost differential is provided for partial versus full-height partitions.

Cost Impact

The code change proposal will increase the cost of construction .

The cost of full-height versus partial-height partitions (attached) is nominal in relation to improving the lives of millions of Americans.

Partial versus full height toilet partition cost differential
 Quotes based upon Aiken, SC 29803, by Bruce Pitts 1/8/17

2 toilets men's
 2 urinals men's (not applicable for these toilet partition enclosures) 4
 toilets women's

Six partial height stall quantity and prices for both men's and women's rooms

	Quantity	Cost Each	Amount
ADA partial height toilet stall men's	1.0	\$1,567.80	\$1,568
Standard partial height toilet stall men's	1.0	\$1,303.00	\$1,303
ADA partial height toilet stall women's	1.0	\$1,567.80	\$1,568
Standard partial height toilet stall women's	3.0	\$1,303.00	\$3,909
Total cost partial height toilet stalls			\$8,348

Six full-height stall quantity and prices for both men's and women's rooms

	Quantity	Cost Each	Amount
Full height partitions with full doors total cost, 2 ADA and 4 standard stalls (see Note 1)			14,384.00
Additional exhaust ductwork	9.0	\$40.00	\$360
	L.F.	cost per L.F.	
Additional exhaust duct takeoff per grille	4.0	\$13.52	\$54
Additional ceiling exhaust grille	4.0	\$15.54	\$62
Total cost full height toilet stalls			\$14,860
Additional cost multiplier for the full height stalls			1.78

Note

1) Basic grade full height partition, floor to 8' ceiling sides and fronts with 3/4" undercut doors for exhaust make-up air and 4" vertical floor bases. Full height partition estimate per manufacturer's quote times 1.25 for installation, includes 2 full height ADA toilet stalls and 4 standard full height toilet stalls.

P29-18

IPC: 405.3.6 (New)

Proponent: Gary Schenk, City of SeaTac, WA, representing Washington Association of Building Officials (gschenk@ci.seatac.wa.us); Gary Lampella, City of Seatac WA, representing Washington Association of Building Officials TDC (garyl@nwcodeprofessionals.com)

2018 International Plumbing Code

Add new text as follows:

405.3.6 Privacy. Public restrooms shall be visually screened from outside entry or exit doors to ensure user privacy within the restroom. This provision shall also apply where mirrors would compromise personal privacy.

Exception:Visual screening shall not be required for single-occupant toilet rooms with lockable doors.

Reason:

Although this section currently has provisions for sidewall or partition privacy within the restrooms, it does not address privacy from viewing the user at the fixture from outside the restroom. It also addresses the placement of mirror reflection viewing from the outside.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a minor design consideration that is typically addressed at the design stage. The change doesn't impact costs as the designers have been already considering this feature for a long time.

Internal ID: 2131

P30-18

IPC: 405.4.3, Chapter 15

Proponent: Angel Guzman Rodriguez, ASME, representing The American Society of Mechanical Engineers (ASME)

2018 International Plumbing Code

Revise as follows:

405.4.3 Securing wall-hung water closet bowls. Wall-hung water closet bowls shall be supported by a concealed metal carrier that is attached to the building structural members so that strain is not transmitted to the ~~closet fixture~~ connector or any other part of the plumbing system. The carrier shall conform to ASME A112.6.1M or ASME A112.6.2.

Add new standard(s) follows:

ASME

American Society of Mechanical
Engineers
Two Park Avenue
New York NY 10016-5990

A112.6.1M-1997 (R2017):

Floor Affixed Supports for Off-the-Floor Plumbing Fixtures for Public Use

Reason:

The ASME A112.6.1 Standard includes requirements for floor-affixed supports that can be used to secure off the floor water closets and urinals

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is only adding an optional type of carrier that can be used for securing a water closet bowl to a wall.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.6.1M-1997 (R2017), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1403

P31-18

IPC: 407.2

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Plumbing Code

Revise as follows:

407.2 Bathtub waste outlets and overflows. Bathtubs shall be equipped with a waste outlet ~~and an overflow outlet. The outlets shall be connected to waste tubing or piping that is~~ not less than 1½ inches (38 mm) in diameter. The waste outlet shall be equipped with a water-tight stopper. Where an overflow is installed, the overflow shall be not less than 1½ inches (38mm) in diameter.

Reason:

This proposal will coordinate the IRC requirements and IPC requirements for outlets from tubs. There are many bathtub designs that do not have overflow openings and the plumbing fixture standards do not require an overflow.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 562

P32-18

IPC: 408.1

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Plumbing Code

Revise as follows:

408.1 Approval. Bidets shall conform to ASME A112.19.2/CSA B45.1- or ASME A112.19.3/CSA B45.4.

Reason:

The current standard reference is only for ceramic plumbing fixture. The additional standard addresses stainless steel plumbing fixtures. The standard is already referenced in the IPC for other fixtures.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The addition of the standard provides more flexibility in choice of fixtures. A stainless steel bidet is not required to be installed; it is a choice that the designer can make.

Internal ID: 492

P33-18 Part I

IPC: 408.3

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

408.3 Bidet water temperature. The discharge water temperature from a bidet fitting shall be limited to not greater than 110°F (43°C) by a water-temperature-limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 ~~or CSA B125.3.~~

Internal ID: 2237

P33-18 Part II

IRC: P2721.2

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2018 International Residential Code

Revise as follows:

P2721.2 Bidet water temperature. The discharge water temperature from a bidet fitting shall be limited to not greater than 110°F (43°C) by a water-temperature-limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 ~~or CSA B125.3~~.

Reason:

In June of 2017, the CSA B125 Committee completed the project that removed the automatic compensating valve requirements from CSA B125.3. The reason for this was the publication of harmonized ASSE 1070/ASME A112.1070/CSA B125.70 standard.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal on removes a referenced standard from the code section.

Internal ID: 3436

P34-18

IPC: 408.3, 412.3, 412.4, 412.5, 412.7

Proponent: James Kendzel, representing American Supply Association (jkendzel@asa.net)

2018 International Plumbing Code

Revise as follows:

408.3 Bidet water temperature. The discharge water temperature from a bidet fitting shall be limited to not greater than 110°F (43°C) by a water-temperature-limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3. The water heater thermostat shall not be used to control the bidet fitting outlet water temperature.

412.3 Individual shower valves. Individual shower and tubshower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and shall be installed at the point of use. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions. In-line thermostatic valves shall not be utilized for compliance with this section. The water heater thermostat shall not be used to control the shower control outlet water temperature.

412.4 Multiple (gang) showers. Multiple (gang) showers supplied with a single-tempered water supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and is installed at the point of use. Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturers' instructions. The water heater thermostat shall not be used to control the shower outlet water temperature.

412.5 Bathtub and whirlpool bathtub valves. The *hot water* supplied to bathtubs and whirlpool bathtubs shall be limited to not greater than 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section 412.3. The water heater thermostat shall not be used to control the tub fixture fitting outlet water temperature.

412.7 Temperature-actuated, flow-reduction devices for individual fixture fittings. Temperature-actuated, flow-reduction devices, where installed for individual fixture fittings, shall conform to ASSE 1062. A temperature-actuated, flow-reduction device shall be an *approved* method for limiting the water temperature to not greater than 120° F (49° C) at the outlet of a faucet or fixture fitting. Such devices shall not be used alone as a substitute for the balanced-pressure, thermostatic or combination shower valves required in Section 412.3 or as a substitute for bathtub or whirlpool tub watertemperature-limiting valves required in Section 412.5. The water heater thermostat shall not be used to control the outlet water temperature from any fixture fitting.

Reason:

Added statement is intended to emphasize that a water heater thermostat is not a product covered by the referenced standards and is not intended for tempering water at the fixture.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Added language is to ensure proper interpretations of the sections and as it is a clarification statement only there is no cost associated with the revision.

Internal ID: 840

P35-18

IPC: 408.3, Chapter 15

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

408.3 Bidet water temperature. The discharge water temperature from a bidet fitting shall be limited to not greater than 110°F (43°C). The water temperature shall be regulated by a water temperature heater conforming to ASSE 1084 or by a limiting device conforming to either ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason:

A new standard, ASSE 1084, was developed for water heaters that limit the temperature of hot water similar to an ASSE1070 valve. The standard is comparable to ASSE 10710/ASME A112.1070/CSA B125.7. The water heater cannot produce a temperature of hot water exceeding 120° F. The water heater must be capable of shutting off the supply of hot water when the temperature exceeds the set limit. These water heaters may be installed in the close proximity of the fixtures they serve.

Cost Impact

The code change proposal will decrease the cost of construction .

The availability of more options to achieve code compliance usually results in lower construction costs.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1084 2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1162

P36-18

IPC: 410.1

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Plumbing Code

Revise as follows:

410.1 Approval. Drinking fountains shall conform to ASME A112.19.1/CSA B45.2 or ASME A112.19.2/CSA B45.1, or ASME A112.19.3/CSA B45.4 and *water coolers* shall conform to ASHRAE 18. Drinking fountains, *water coolers* and *water dispensers* shall conform to NSF 61, Section 9. Electrically operated, refrigerated drinking *water coolers* and *water dispensers* shall be listed and labeled in accordance with UL 399.

Reason:

The current standards reference ceramic, enameled cast iron and enameled steel plumbing fixtures. The additional standard addresses stainless steel plumbing fixtures. The standard is already referenced in the IPC for other fixtures.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The addition of the standard provides more flexibility in choice of fixtures. A stainless steel drinking fountain is not required to be installed; it is a choice that the designer can make.

Internal ID: 493

P37-18

IPC: 410.2, 410.4, TABLE 403.1

Proponent: James Kendzel, American Supply Association, representing American Supply Association (jkendzel@asa.net)

2018 International Plumbing Code

Revise as follows:

410.2 ~~Small occupancies.~~ Number of drinking fountains. ~~Drinking-~~The number of drinking fountains required shall not be required for an occupant load of 15 or fewer. be in accordance with Table 403.1.

Delete without substitution:

410.4 ~~Substitution.~~ ~~Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies where drinking fountains are required, *water dispensers* shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.~~

Revise as follows:

		One- and two-family dwellings and lodging houses with five or fewer guest rooms	1 per dwelling unit	1 per dwelling unit	1 per dwelling unit	—	1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per dwelling unit
8	Storage	Structures for the storage of goods, warehouses, storehouse and freight depots, Low and Moderate Hazard.	1 per 100	1 per 100	—	1 per 1,000	1 service sink

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the International Building Code.

- b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
- c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.
- d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- e. For business and mercantile classifications with an occupant load of 15 or fewer, service sinks shall not be required.
- f. The required number and type of plumbing fixtures for outdoor public swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.
- g. Drinking fountains shall not be required for an occupant load of 15 or fewer. Where drinking fountains are required, water dispensers shall be permitted to be substituted provided that not more than 50 percent of the required number of drinking fountains are substituted with water dispensers.

Reason:

Table 403.1 provides the minimum requirements for plumbing fixtures, including drinking fountains. The proposed changes move requirements and exceptions for drinking water fountains currently provided in section 410 and place them directly into the table.

Section 410.4 has been placed as a footnote in table 403.1 however, the first sentence of section 410.4, "Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants." This requirement does not appear to be enforceable and may change due to change of ownership over time and no requirement is in place to ensure that the consumer is aware that free water shall be provided by those restaurants not complying with the minimum number of drinking fountain requirements.

Cost Impact

The code change proposal will increase the cost of construction .

There is the potential for a minor increase in cost for restaurant construction due to the proposed elimination of the exception for restaurants that serve water in a container for free. However, the elimination of the exception ensures that drinking water is available in all restaurants prior to opening.

Internal ID: 1354

P38-18 Part I

IBC: 202, 1109.5, 2902.7 (New)

Proponent: Jenifer Gilliland, City of Seattle, Washington, representing City of Seattle, Washington
(jenifer.gilliland@seattle.gov)

THIS IS A 2 PART CODE CHANGE. PART I AND PART II WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new definition as follows:

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. This definition includes a freestanding apparatus for the same purpose that is not connected to the potable water distribution system and that is supplied with potable water from a container, bottle or reservoir.

Revise as follows:

~~1109.5 Drinking~~ High and low drinking fountains. Where drinking fountains are provided on an exterior site, on a floor or within a secured area, the drinking fountains shall be provided in accordance with Sections 1109.5.1 and 1109.5.2.

1109.5.1 Minimum number. Not fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.

Exceptions:

1. A single drinking fountain with two separate spouts that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.
2. Where drinking fountains are primarily for children's use, drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

1109.5.2 More than the minimum number. Where more than the minimum number of drinking fountains specified in Section 1109.5.1 is provided, 50 percent of the total number of drinking fountains provided shall comply with the requirements for persons who use a wheelchair and 50 percent of the total number of drinking fountains provided shall comply with the requirements for standing persons.

Exceptions:

1. Where 50 percent of the drinking fountains yields a fraction, 50 percent shall be permitted to be rounded up or down, provided that the total number of drinking fountains complying with this section equals 100 percent of the drinking fountains.
2. Where drinking fountains are primarily for children's use, drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

[P] 2902.6 Small occupancies. Drinking fountains shall not be required for an occupant load of 15 or fewer.

Add new text as follows:

2902.7 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies where more than two drinking fountains are required, water dispensers shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.

Staff Note: In Part I, the intent is for the text in the IPC for the definition of water dispenser and Section 410.4 to be copied verbatim into the IBC as a new definition and new Section 2902.7. The Code Correlation Committee will decide, prior to publication of the codes, whether a scoping designation will be applied to this new definition and new section in the IBC. The title change of IBC Section 1109.5 is only editorial.

Internal ID: 1172

P38-18 Part II

IPC: 410.3 (New), [BE]410.3, 410.3.2(New), 410.4

Proponent: Jenifer Gilliland, City of Seattle, Washington, representing City of Seattle, Washington
(jenifer.gilliland@seattle.gov)

2018 International Plumbing Code

SECTION 202 GENERAL DEFINITIONS

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. This definition includes a freestanding apparatus for the same purpose that is not connected to the potable water distribution system and that is supplied with potable water from a container, bottle or reservoir.

SECTION 410 DRINKING FOUNTAINS

410.2 Small occupancies. Drinking fountains shall not be required for an occupant load of 15 or fewer.

Add new text as follows:

410.3 High and low drinking fountains. Where drinking fountains are provided on an exterior site, on a floor or within a secured area, the drinking fountains shall be provided in accordance with Sections 410.3.1 and 410.3.2.

Revise as follows:

~~**[BE] 410.3 410.3.1 High and low drinking fountains Minimum number.**~~ ~~Where drinking fountains are required,~~ ~~not~~ Not fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.

Exceptions:

1. A single drinking fountain with two separate spouts that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.
2. Where drinking fountains are primarily for children's use, the drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

Add new text as follows:

410.3.2 More than the minimum number. Where more than the minimum number of drinking fountains specified in Section 1109.5.1 is provided, 50 percent of the total number of drinking fountains provided shall comply with the requirements for persons who use a wheelchair and 50 percent of the total number of drinking fountains provided shall comply with the requirements for standing persons.

Exceptions:

1. Where 50 percent of the drinking fountains yields a fraction, 50 percent shall be permitted to be rounded up or down, provided that the total number of drinking fountains complying with this section equals 100 percent of the drinking fountains.

2. Where drinking fountains are primarily for children's use, drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

Revise as follows:

410.4 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies where more than two drinking fountains are required, *water dispensers* shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.

Reason:

It is important for both the building official and the plumbing inspector to fully understand the requirements for drinking fountains including when they can be eliminated, switched out, and when high/low drinking fountains are required. Currently, only a portion of the information is available in the IPC and IBC.

The IPC does not have language addressing two important points needed for accessible drinking fountains:

- 1) The IPC doesn't include the requirements found in the IBC that are based on where the fountain is being provided - per floor, per secure area, or outside.
- 2) The IPC doesn't address high/low requirements for three or more drinking fountains.

This proposal adds the relevant sections currently found in IBC to IPC. The changes to the language are editorial for coordination only. Current IPC Section 410.3 has additional words at the beginning which are not in the IBC and are not correct. Accessibility provisions apply to drinking fountains where provided, not only where required.

There also appears to be a conflict between the IPC allowing half of the drinking fountains to be switched out starting at two drinking fountains, and the accessibility requirement requiring at least two. Adding "two or more" to the IPC Section 410.4 will eliminate that conflict. This information should be repeated in IBC Chapter 29 along with the information that small occupancies do not have to have drinking fountains.

There is another change proposal to change the definition in the IPC for water dispensers. This proposal is totally separate, but it is the intent for the revised definition to be in the IBC if that change is successful.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a coordination/clarification of existing requirements in the IBC and the IPC.

Staff note: In Part 2, the intent is for the text in the IBC Section 1109.5, 1109.5.1 and 1109.5.2 to be copied verbatim into the IPC as Sections 410.3, 410.3.1 and 410.3.2 . A [BE] is shown in front of the text to indicate this, however, code committee scoping will be officially determined at a later date. There is a revision to IPC Section 410.4.

Internal ID: 3452

P39-18

IPC: 410.4

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Plumbing Code

Revise as follows:

410.4 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies where three or more drinking fountains are required, *water dispensers* shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.

[BE] 410.3 High and low drinking fountains. Where drinking fountains are required, not fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.

Exceptions:

1. A single drinking fountain with two separate spouts that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.
2. Where drinking fountains are primarily for children's use, the drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

Reason:

IPC 410.4 allows up to 50% of required drinking fountains to be substituted with water dispensers, which could be water bottle fillers or bottled water. This change attempts to remove a "gotcha" situation—using the tradeoff for where only two drinking fountains would be required without considering the requirements for high/low drinking fountains. Allowing for such a tradeoff is in conflict with high/low requirements in the IPC 410.3 and IBC Section 1109.5.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal will eliminate possible conflicts between the IPC and accessibility requirements. The change is only correlative and contains, in itself, no substantive changes.

Internal ID: 542

P40-18

IPC: 411, 411.1, 411.2, 411.3

Proponent: Ronald George, representing Self (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Revise as follows:

411.2 Waste connection. Waste connections ~~shall not be required~~ or floor drains of adequate size and capacity shall be provided for for emergency showers and ~~eyewash stations~~ eye/facewash stations.

Exception: Waste connections or floor drains shall not be required where the code official determines that the flushing fluid will not cause structural damage and there will be no spread of chemicals or contaminants in the run-off.

SECTION 411 EMERGENCY SHOWERS AND ~~EYEWASH~~ EYE/FACE WASH STATIONS

411.1 Approval. Emergency showers and ~~eyewash~~ eye/facewash stations shall conform to ISEA Z358.1.

411.3 Water supply. Where hot and cold water is supplied to an emergency shower or ~~eyewash~~ eye/facewash station, the temperature of the water supply shall only be controlled by a temperature actuated mixing valve complying with ASSE 1071.

Reason:

Emergency fixtures will flow a minimum of 24 gallons per minute when a combination unit is activated. The units are required by the Industry Standard to flow for a minimum of 15 minutes. 15 minutes x 24 gallons per minute = 360 gallons of water or flushing fluid (that is equal to about seven, 55-gallon drums of liquid and chemicals spilling over for each fixture activated). 360 gallons of flushing fluid (water and chemicals) could cause significant damage to a building and in some cases it could be flushing of radioactive waste or other harmful chemicals that are in the run-off. If there are no drains provided for an emergency fixture, it also makes it difficult for a building owner to properly flush the fluid in the emergency fixture piping system on a weekly basis as recommended in the industry standard to eliminate stagnant water and bacteria from the piping system. Hospital utilize emergency fixtures in decontamination areas near the emergency room entrances, upstairs in the hospital labs they generally have emergency fixtures and research labs have them throughout. Those type of building could suffer significant damage and disruption for an emergency fixture activation when there is no waste connection or floor drain. Industrial facilities or warehouses, however typically have concrete floors and curbed containment areas which may not require a waste connection or floor drain. This code change allows the code official to make the decision of whether to allow an industrial facility to omit waste connections or drains when it is deemed not to be a structural damage hazard or chemical spread hazard for the building.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply clarifies what the industrial safety community already understands about the need for capture/containment of flush water from an emergency eye/face wash unit. Typically, the default is to provide a waste connection or floor drain for convenience of testing and easy cleanup after a actual event. However, in some circumstances, a waste connection or floor drain is not appropriate because the wastewater is "hazardous" to the drainage piping system or waste treatment processes downstream. In jurisdictions where code officials have forced waste connections or floor drains on every unit where the industrial safety experts don't want those connections, the exception allows for a cost decrease. In jurisdictions where where code officials don't see drainage provisions at a specific application and the industrial safety experts indicate that the wastewater is not hazardous to the typical drainage system, there will be a cost increase to add drainage means. On average, the overall industry-wide cost of construction is neither plus or minus because most builder designers are already doing the right thing.

Internal ID: 1869

P41-18

IPC: 411.3

Proponent: Ronald George, representing Self (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Revise as follows:

411.3 Water supply. Where hot and cold water is supplied to an emergency shower or ~~eyewash~~eye/facewash station, the temperature of the water supply shall only be controlled by a temperature actuated mixing valve complying with ASSE 1071. The maximum temperature of the flushing fluid used for an eye/facewash station shall be 100° F (37.7°C).

Reason:

Medical experts say the maximum water temperature of water or flushing fluid flowing from an eyewash or eye/facewash is 100 F. Any higher temperature could damage the eyes. This should be included as a maximum temperature limit imposed upon combination emergency showers and washes or eye/facewashes. There are many new technologies for either water heaters or emergency fixture mixing valves being installed together in various combinations of heating equipment and tempering valves that can be installed and many of these combinations are untested. By placing this temperature limit in the code it allows the code official to test the fixtures for a maximum temperature.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is just a temperature setting for the valve that is already required by the code.

Internal ID: 2363

P42-18

IPC: 411.3, Chapter 15

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

411.3 Water supply. Where hot and cold water is supplied to an emergency shower or eyewash station, the temperature of the water supply shall only be controlled by a temperature actuated mixing valve complying with ASSE 1071. Where water is supplied directly to an emergency shower or eyewash station from a water heater, the water heater shall comply with ASSE 1085.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1085-2018:

Performance Requirements for Water Heaters for Emergency Equipment

Reason:

A new standard, ASSE 1085, was developed for water heaters specifically designed for emergency fixtures. The standard is comparable to the valve standard, ASSE 1071. The water heater cannot produce a temperature of hot water exceeding 100° F. The water heater produces water within a minute at the tepid temperature range required for emergency fixtures. These water heaters are typically installed within the close proximity of the emergency fixture. This is an alternative methods for meeting the high flow rates for emergency showers without the need for adding to the hot water demand of the plumbing within the building.

Cost Impact

The code change proposal will decrease the cost of construction .

The availability of more options to achieve code compliance usually results in lower construction costs.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1085-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1165

P43-18

IPC: 412.2 (New)

Proponent: James Kendzel, American Supply Association, representing American Supply Association
(jkendzel@asa.net)

2018 International Plumbing Code

Add new text as follows:

412.2 Pre-rinse spray valves. Pre-rinse spray valves for commercial food service shall conform to ASME A112.18.1/CSA B125.1

Reason:

New section is being added to clarify that pre-rinse spray valves fall under the definition of fixture fitting and are covered under Section 412.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

New section is being added only to clarify the existing requirements of the IPC.

Internal ID: 911

P44-18 Part I

IPC: 412.3, 412.4, 412.5

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

412.3 Individual shower valves. Individual shower and tubshower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 ~~and. Such valves shall be installed at the point of use.~~ Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions to provide water at a temperature not to exceed 120°F. In-line thermostatic valves shall not be utilized for compliance with this section.

412.4 Multiple (gang) showers. Multiple (gang) showers supplied with a single-tempered water supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and that is installed at the point of use. Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturers' instructions to provide water at a temperature not to exceed 120°F. Access shall be provided to a ASSE 1069 or CSA B125.3 valve..

412.5 Bathtub and whirlpool bathtub valves. ~~The hot water supplied to bathtubs~~ Bathtubs and whirlpool bathtubs ~~bathtub valves shall be limited to not greater than 120°F (49°C) have or be supplied by a water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3, except where such protection is otherwise provided by a~~ valves are combination tub/shower valve valves in accordance with Section 412.3. The water temperature limiting device required by this section shall be equipped with a means to limit the maximum setting of the device to 120°F (49°C), and, where adjustable, shall be field adjusted in accordance with the manufacturer's instructions to provide hot water at a temperature not to exceed (120°F (49°C)). Access shall be provided to water temperature limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.

Exception: Access is not required for non-adjustable water temperature limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 and are integral with a fixture fitting, provided that the fixture fitting itself can be accessed for replacement..

P44-18 Part II

IRC: P2708.4, P2713.3

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

P2708.4 Shower control valves. Individual shower and ~~tub/shower~~tubshower combination valves shall be equipped with control valves of the ~~pressure-balance~~balanced-pressure, thermostatic ~~-mixing~~or combination ~~balanced-pressure-balance/thermostatic-mixing~~valve types with a high limit stop in accordance with ~~thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16. The high limit stop shall be set to limit the water temperature to not greater than 120°F (49°C). or ASME A112.18.1/CSA B125.1. Such valves shall be installed at the point of use. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions to provide water at a temperature not to exceed 120°F. In-line thermostatic valves shall not be used~~utilized for compliance with this section.

P2713.3 Bathtub and whirlpool bathtub valves. Hot water supplied to bathtubs ~~Bathtubs~~ and whirlpool ~~bathtubs~~bathtub valves shall be limited to a temperature of not greater than 120°F (49°C) ~~have or be~~ supplied by a water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3, except where such ~~protection is otherwise provided by a~~valves are combination tub/shower ~~valve~~valves in accordance with Section ~~P2708.4.4~~412.3. The water temperature³ limiting device required by this section shall be equipped with a means to limit the maximum setting of the device to 120°F (49°C), and, where adjustable, shall be field adjusted in accordance with the manufacturer's instructions to provide hot water at a temperature not to exceed (120°F (49°C)). Access shall be provided to water temperature limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.

Exception: Access is not required for non-adjustable water temperature limiting devices that conform to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 and are integral with a fixture fitting, provided that the fixture fitting itself can be accessed for replacement.

Reason:

These three sections were not specific about actually requiring field adjustment of the temperature limiting devices to a not-to-exceed temperature. The language only required that the device had to have the capability of being adjusted and that field adjustment is required. The revised language makes the intent clear.

Neither Section 412.4 or 412.5 required access for the temperature limiting devices. Although it would seem that installers would intuitively understand the need for access, too often these devices end up being concealed in a wall or behind a permanently installed tub apron. The revised language makes the need for access clear.

The language of Section 412.5 needs updated to recognize some newer designs of tub valves that have integral water temperature limiting devices that comply with ASSE 1070/ASME A112.1070/CSA B125.70. These new designs of tub valves are factory-adjusted to limit the discharge water temperature to 120°F(49°C). These valves are not field-adjustable and require entire valve replacement should the temperature limiting device fail to work as intended.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

412.3 Individual shower valves. Individual shower and tub-shower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and shall be installed at the point of use. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field-adjusted. ~~In-line thermostatic valves shall not be utilized for compliance with this section.~~ The means for regulating the maximum temperature shall be by one of following:

1. A field adjustment and setting of the maximum temperature limit means of the shower or tub-shower combination valve in accordance with the manufacturer's instructions.
2. A limiting device conforming to either ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
3. A thermostatic mixing valve conforming to ASSE 1017.
4. A water heater conforming to ASSE 1082.
5. A water heater conforming to ASSE 1084.
6. A temperature actuated flow reduction device conforming to ASSE 1062.

412.4 Multiple (gang) showers. Multiple (gang) showers supplied with a single-tempered water supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that ~~conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and is installed at the point of use. Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field-adjusted in accordance with the manufacturers' instructions.~~ complies with Section 412.3.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1082-18:

Performance Requirements for Water Heaters used as Temperature Control Devices for Hot Water Distribution Systems

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P45-18 Part II

IRC: P2708.4, Chapter 44

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Residential Code

Revise as follows:

P2708.4 Shower control valves. Individual shower and tub/shower combination valves shall be equipped with control valves of the pressure-balance, thermostatic-mixing or combination pressure-balance/thermostatic-mixing valve types with a high limit stop in accordance with ASSE 1016/ASME A112.1016/CSA B125.16. ~~The high limit stop~~ A means shall be set provided to limit the water temperature to not greater than 120°F (49°C). ~~In-line thermostatic valves shall not be used for compliance with this section.~~ The means for regulating the maximum temperature shall be by one of the following:

1. A field adjustment and setting of the maximum temperature limit means of the shower or tub-shower combination valve in accordance with the manufacturer's instructions.
2. A limiting device conforming to either ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
3. A thermostatic mixing valve conforming to ASSE 1017.
4. A water heater conforming to ASSE 1082.
5. A water heater conforming to ASSE 1084.
6. A temperature actuated flow reduction device conforming to ASSE 1062.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason:

The scald prevention requirements for a shower valve are by the requirement for a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves. The high temperature limit was originally added to protect children that play hot and cold while taking a shower. This was extended to protecting people who inadvertently turn up the temperature of the shower valve.

The current code only stipulates the setting of the limit stop on the fixture fitting or shower valve, however, other viable means are available for setting the maximum temperature. The other viable means are often superior to setting the limit stop on the fixture fitting.

When the limit stop is adjusted, it is based on the temperature setting of the water heater and the cold water temperature. If the cold water temperature drops, which happens in some areas during the winter months, the setting temperature drops. If the water heater is increased in temperature, the setting temperature rises. This phenomena does not occur when other means are used to regulate the high temperature.

Section 412.7 already permits the use of a TAFR complying with ASSE 1062 for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

For Section 412.4, there is no need to repeat all of the requirements in Section 412.3. If an individual shower valve is installed in gang showers, the requirements of Section 412.3 automatically apply. The revision merely emphasizes this requirement.

The changes to the Residential Code will make the requirements consistent with the Plumbing Code.

Cost Impact

The code change proposal will decrease the cost of construction .

The availability of more options to achieve code compliance usually results in lower construction costs.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1082-2018 and ASSE 1084-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 3497

P46-18 Part I

IPC: 412.3, 412.4

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

412.3 Individual shower valves. Individual shower and tubshower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and shall be installed at the point of use. Shower control valves shall be rated for the flow rate of the installed showerhead. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions. In-line thermostatic valves shall not be utilized for compliance with this section.

412.4 Multiple (gang) showers. Multiple (gang) showers supplied with a single-tempered water supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and is installed at the point of use. Where a showerhead is individually controlled, shower control valves shall be rated for the flow rate of the installed showerhead. Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturers' instructions.

Internal ID: 577

P46-18 Part II

IRC: P2708.4

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

P2708.4 Shower control valves. Individual shower and tub/shower combination valves shall be equipped with control valves of the pressure-balance, thermostatic-mixing or combination pressure-balance/thermostatic-mixing valve types with a high limit stop in accordance with ASSE 1016/ASME A112.1016/CSA B125.16. Shower control valves shall be rated for the flow rate of the installed showerhead. The high limit stop shall be set to limit the water temperature to not greater than 120°F (49°C). In-line thermostatic valves shall not be used for compliance with this section.

Reason:

The thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. The proposed text is consistent with similar requirements found in ASSE 1016/ASME A112.1016/CSA B125.16 and ASME A112.18.1/CSA B125.1. As manufacturers continue to innovate with more water- and energy-efficient showerheads, this proposal is needed to ensure that new buildings built to the code will safely accommodate the showerheads selected by the designer or builder. Note that this language does not require that the showerhead itself have a flow rate of less than 2.5 gpm, but simply that the flow rating of the shower valve matches the flow rate of the installed showerhead to provide the scald and thermal shock protection required by the recognized standard when the valve model is tested.

Note that the 2012 Uniform Plumbing Code, Section 408.3, contains a similar requirement for 'matching' the valve and showerhead flow rates as follows:

"Showers and tub-shower combinations shall be provided with individual control valves of the pressure balance, thermostatic, or combination pressure balance/thermostatic mixing valve type that provide scald and thermal shock protection for the rated flow of the installed showerhead."

The IPC and IRC should be no less protective of health and safety than the UPC.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Adoption of this proposal will have no effect on the cost of construction, because it calls for the installation of showerheads and shower mixing valves that are compatible, rather than calling for the installation of a particular showerhead or shower control valve that might carry a cost premium. Care in specification and installation is required, not a special product or special installation technique. As noted above, the proposal does not require that the showerhead itself have a flow rate of less than 2.5 gpm, and compliance can be achieved with minimally compliant valves and showerheads. If an architect or builder chooses to install a more efficient showerhead with a lower flow rate, there are control valves available at moderate price points that can accommodate the builder's decision.

P47-18 Part I

IPC: 412.5

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

412.5 Bathtub and whirlpool bathtub valves. The *hot water* supplied to bathtubs and whirlpool bathtubs shall be limited to not greater than 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 ~~or CSA B125.3~~, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section 412.3.

Internal ID: 2245

P47-18 Part II

IRC: P2713.3

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2018 International Residential Code

Revise as follows:

P2713.3 Bathtub and whirlpool bathtub valves. Hot water supplied to bathtubs and whirlpool bathtubs shall be limited to a temperature of not greater than 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 ~~or CSA B125.3~~, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section P2708.4.

Reason:

In June of 2017, the CSA B125 Committee completed the project that removed the automatic compensating valve requirements from CSA B125.3. The reason for this was the publication of harmonized ASSE 1070/ASME A112.1070/CSA B125.70 standard.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal only removes a referenced standard from the code section.

P48-18 Part II

IRC: P2713.3, Chapter 44

Proponent: Misty Guard, representing Bradley Corporation (Misty.Guard@bradleycorp.com)

2018 International Residential Code

Revise as follows:

P2713.3 Bathtub and whirlpool bathtub valves. Hot water supplied to bathtubs and whirlpool bathtubs shall be limited to a temperature of not greater than 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 or by a water heater complying with ASSE 1082 or ASSE 1084, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section P2708.4.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason:

There are two new standards for water heaters, ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the currently listed water-temperature limiting device.

Water heaters complying with either one of these standards can provide tempered water within a range of a few degrees depending on the flow rate. The temperature range is similar to the allowable temperature range for an ASSE 1070/ASME A112.1070/CSA B125.70 device. The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost associated with this change since the code change will merely provide other options for complying with the current requirements. There are no new mandatory requirements being added.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.

Exception:~~except~~Water temperature regulation by one of the items indicated in this section shall not be required where such regulation is~~Where such protection is otherwise provided by a combination tub/shower valve in accordance with Section 412.3.~~

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1082-2018:

Performance Requirements for Water Heaters used as Temperature Control Devices for Hot Water Distribution Systems

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason:

The requirement for regulating the maximum temperature of water for bathtubs and whirlpool bathtub is a scald prevention requirement. The current code allows the use of a device complying with ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3. This change identifies other viable methods of controlling the temperature of the hot water. The identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

The change to the Residential Code will make the requirements consistent with the Plumbing Code.

Cost Impact

The code change proposal will decrease the cost of construction .

The availability of more options to achieve code compliance usually results in lower construction costs.

IPC: 412.10, Chapter 15

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

412.10 Head shampoo sink faucets. Head shampoo sink faucets shall be supplied with hot water that is limited to not more than 120°F (49°C) ~~by a water temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.~~ Each faucet shall have integral check valves to prevent crossover flow between the hot and cold water supply connections. The means for regulating the maximum temperature shall be one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70.
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.
5. A temperature actuated flow reduction device conforming to ASSE 1062.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason:

The scald prevention requirements for head shampoo sink faucets is similar to the upper limit requirement for shower valves. There other viable means are available for setting the maximum temperature besides a device complying with ASSE 1070/ASME A112.1070/CSA B125.70. The other viable means of meeting the high temperature limit.

Section 412.7 already permits the use of a TAFR complying with ASSE 1062 for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

Cost Impact

The code change proposal will decrease the cost of construction .

The availability of more options to achieve code compliance usually results in lower construction costs.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P52-18

IPC: 412.11 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Plumbing Code

Add new text as follows:

412.11 Pre-rinse spray valve. Pre-rinse spray valves for commercial food service shall conform to ASME A112.18.1/CSA B125.1

Reason:

Currently the IPC does not address pre-rinse spray valves but these are in wide spread use for rinsing off dirty dishes prior to putting them through a commercial dishwasher. IPC Section 412.6 is not sufficiently clear enough as to whether it applies to pre-rinse spray valves. Therefore, this new section is needed.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Pre-rinse spray valves are not required to be installed. It is a choice by the designer. Requiring that these valves comply with a standard doesn't increase the cost because most manufacturers are making these valves to the standard so that interchangeability exists.

Internal ID: 498

P53-18

IPC: 413.5 (New)

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Add new text as follows:

413.5 Floor slope to floor and trench drains. The floor surface in the area or room served by a floor or trench drain shall have a slope to such drains at not less than one-fourth unit vertical in 12 units horizontal (2-percent slope).

Reason:

This is long overdue. Everyone has seen this issue at some point in their life. There is some emergency situation and although there is an emergency floor drain/trench drain in the room or area, some water remains on the surface (sometimes several inches) due to the fact there is no real requirement for the area to have slope to the drain. In many cases the highest point in the room or area is actually the inlet to the floor drain/trench drain. It does seem odd that it is covered in great detail when we look at the requirements for a shower liner, however, a floor surface somehow doesn't matter. What many have failed to realize by overlooking this issue is that even though the floor drain/trench drain may be located in a concrete floor (with or without floor covering of some type), there are other portions of the building that can be greatly impacted. For instance, the walls that make up the room. Some assume these would be CMU units, but construction would allow for many other materials. If the walls were metal studs with drywall for instance, the metal studs could be subjected to deterioration from rust caused by the water that remained at the base of the wall because the surface was not sloped correctly. The drywall often becomes a breeding ground for mold as well.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Sloping a floor to a floor or trench drain is simply a design call out for building drawings. The plumbing contractor already has to set the the top of the drains at the floor elevation called out on the drawings so there isn't any cost impact as no extra labor is necessary.

Internal ID: 2123

P54-18

IPC: 416.1

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

2018 International Plumbing Code

Revise as follows:

416.1 Approval. Domestic food waste disposers shall conform to ASSE 1008 and shall be listed and labeled in accordance with UL 430. Commercial food waste disposers shall be listed and labeled in accordance with UL 430. Food waste disposers shall not increase the *drainage fixture unit* load on the sanitary drainage system.

Reason:

The current code requires domestic food waste disposers to conform with UL 430. However, this standard applies to both domestic and commercial food waste disposers. A second sentence has been added to address commercial food waste disposers. It should be noted that ASSE 1008 only applies to domestic food waste disposers, hence the word "commercial" cannot be added to the first sentence.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Commercial disposers are already required to be listed. This merely adds reference to the correct standard for testing and listing.

Internal ID: 883

P55-18

IPC: 202, 419.1, 419.3

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBENGINEER@aol.com); Daniel Gleiberman, SLOAN, representing SLOAN

2018 International Plumbing Code

Add new definition as follows:

GROUP WASH FIXTURE A type of lavatory that allows more than one person to utilize the fixture at the same time. The fixture has one or more drains and one or more faucets.

Revise as follows:

419.1 Approval. Lavatories shall conform to ASME A112.19.1/CSA B45.2, ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124. Group wash ~~up equipment fixtures~~ shall conform to the requirements of Section 402. ~~Every~~ For determining the number of lavatories required by Table 403.1, every 20 inches (508 mm) of rim space of a group wash fixture shall be considered as one lavatory.

419.3 Lavatory waste outlets. Lavatories and group wash fixtures shall have a waste outlets-outlet not less than 1¹/₄ inches (32 mm) in diameter. A strainer, pop-up stopper, crossbar or other device shall be provided to restrict the clear opening of the waste outlet.

Reason:

The current code uses two terms to describe the same fixture. In Section 419.1 the term “group wash-up equipment” is used. In Section 419.5, the term “group wash fixture” is used. The proper term used in the plumbing industry is “group wash fixture.”

Definitions of group wash fixture is being added. The group wash fixture definition identifies what the fixture is, including that there could be one or more drains and one or more faucets connected with the fixture.

The changes to the subsections in Section 419 become editorial in nature with the addition of the definitions. There is also clarification added that the 20 inches of rim space is only used for determining number of lavatories that are specified in Table 403.1. This is the only application of the 20 inches of rim space.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change clarifies the current code requirement.

Internal ID: 1504

P56-18

IPC: 419.5

Proponent: Gary Klein, representing Self (gsmklein@comcast.net)

2018 International Plumbing Code

Revise as follows:

419.5 Tempered water ~~Water for public hand-washing facilities. Tempered water shall be delivered from lavatories~~ Lavatories and group wash fixtures located in public toilet facilities ~~provided for customers, patrons and visitors. Tempered water shall be delivered through an approved water temperature limiting shall be provided with cold water, tempered water, or both. Where tempered water is supplied to such fixtures, the temperature shall be limited to 125°F (52°C) by means of temperature control device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70, CSA B125.3 or ASSE 1017.~~

Reason:

The purpose of this code change proposal is to address the requirement to provide tempered water to public hand-washing facilities, to change the temperature of water delivered to public hand-washing facilities to a maximum of 125°F and to enable the use of either cold water or tempered water at public hand-washing facilities.

Most of the reasons supporting this proposal are discussed below. In addition, we are proposing that where tempered water is supplied to public hand-washing facilities its temperature can be controlled by either a local mixing valve (ASSE1070) or by a master mixing valve (ASSE 1017), depending on the configuration of the hot water distribution system.

Raising the maximum temperature for hand washing to 125F is still safe for scald prevention since people can easily remove their hands from water that is getting too hot too rapidly. It is also a better temperature to control the growth of Legionella in the hot water distribution system.

What follows is the reason statement that supports several code change proposals. There is one reason statement for these proposals because the topics are interrelated and a comprehensive discussion is most likely to result in the best outcome for protecting the public's health and safety.

Health and safety for public hand washing needs to include 1) scald prevention, 2) hand washing efficacy and 3) minimizing the risk of pathogen growth in the building's water distribution system.

We do not want the temperature of the water at public sinks to be too hot. We want the temperature of the water to be comfortable for the users of public sinks so that people will scrub their hands long enough to get them clean. We want to reduce the likelihood that pathogens will grow in the water distribution system. And, we would like to accomplish all of these health and safety functions in the most cost effective and sustainable manner possible.

At present, we believe that there are a few provisions in the IPC that inadvertently create a public health risk. Changing the temperature limits in this definition is one part of resolving this problem.

When the provisions in the current definitions and the related sections were first codified, Legionella was not a significant concern to public health; many items known today were unknown then. Now Legionella in building water systems has become a major concern for public health with the incidence of Legionnaires' disease growing by 500% from 0.4 cases per 100,000 people in 2000 to 2.0 cases per 100,000 people in 2015.¹

At the time these same provisions were codified, it used be thought that warm water was necessary for effective hand cleaning to control the spread of germs (bacteria). Science has since proven that the temperature of the water used for handwashing does not impact the efficacy of removing bacteria at all.^{2, 3, 4} While each of these three papers are very clear the CDC sums it up best with "The temperature of the water does not appear to affect microbe removal; however, warmer water may cause more skin irritation and is more environmentally costly"⁴ The most important variables for removing bacteria from ones hands are scrubbing and the use of soap. Neither of these criteria is within the purview of a building code.

When scald prevention was discussed as part of codifying these same provisions, the unintended consequences of lower water temperature on waterborne pathogen growth was not known. Accordingly temperature of 140°F originally proposed for scald control in home hot water heaters was lowered to 130°F and finally a recommendation of 120°F was made because if 140°F was OK it was thought that adding a huge safety margin would only be better, we now know that huge safety margin had serious and significant unintended consequences. A temperature of 120°F is considered an abundantly safe scald limit. However, setting water heaters this low results in much of the hot water distribution system being at temperatures that ideal for growing pathogens.

Since 1998 OSHA guidelines have stated that hot water should be stored at 140F and delivered at a temperature greater than 120F. In 2009, the CDC published a study documenting scalding cases resulting in hospital visits by the elderly from 2001-2006. The elderly are the highest risk population for Legionnaires' disease and one of the highest risk for scalding. They found that more than 80% of the scalding cases were due to cooking activities in the kitchen. Less than 3% (220 out of 8,620 cases) were plumbing related.¹³

We believe that it is time to use our current knowledge of these interrelated elements to improve health and safety by revising the a few of the temperature related provisions in the 2018 IPC and the 2018 IRC-P

In both the IPC and the IRC, hot water is required to be supplied to plumbing fixtures and plumbing appliances intended for bathing, washing, or culinary purposes. The 2018 IPC and IRC-P have two different maximum temperature thresholds, which some say are for scald prevention. The temperature at public hand washing sinks (lavatories), is limited to 110°F. With the exception of bidets and emergency fixtures, which are also limited to 110°F, all other fixtures are limited to 120°F. Please see the table below.

Water Temperature Provisions in the 2018 IPC and IRC-P

Fixture	Maximum Temperature	Section
Bidet	110F (43C)	IPC 408.3 IRC P2721.2
Emergency showers and eyewash stations	110F (43C)	IPC 411.1*
Individual shower valve	120F (49C)	IPC 412.3 IRC P2708.4
Multiple (gang) showers	120F (49C)	IPC 412.4
Temperature-actuated, flow-reduction devices for individual fixture fittings	120F (49C)	IPC 412.7
Public lavatories	110F (43C)	IPC 419.5
Bath tub and whirlpool tub	120F (49C)	IPC 412.5 IRC 2713.3
Head shampoo sink faucet	120F (49C)	IPC 412.10
Footbaths and pedicure baths	120F (49C)	IPC 423.3

* The maximum temperature is not shown in this IPC section, but rather in the referenced standard. This standard also has a minimum acceptable temperature of 60F for emergency fixtures. This lower number might be useful guidance for jurisdictions with cold incoming water temperatures that want to raise the temperature of cold water for hand washing during the winter months where only cold water is supplied to public lavatory faucets.

Bidets, emergency showers and eyewash stations and public lavatories are required to have tempered water supplied through a water temperature limiting device that conforms to the appropriate ASSE, ANSI or CSA standard. The upper limit of 110°F makes sense for bidets and emergency showers. It does not make sense for hand washing at public lavatories.

If 120°F is a safe temperature for showering, bathing, head shampooing, tubs, it is equally safe for hand washing at either public or private lavatory faucets. It does not make sense that the temperature is lower for hand washing than for tub bathing. If the water temperature rises quickly to an uncomfortably hot and unsafe number it is much easier to remove ones hands from the water coming out of the faucet than it is to get out of a bathtub or to get out of the way in a shower. There is no need to have a lower temperature supplied for hand washing than for showering or bathing. In fact this public lavatory temperature code is derived from ASHRAE 90.1 energy saving code, not safety.

In our research into this issue, we found that the 110°F temperature limitation for hand washing at public lavatories comes from an energy code, ASHRAE 90.1 (1989)⁵ "Energy Standard for Buildings Except Low-Rise Residential Buildings." Section 11.4.5.2 presents the provisions for lavatories in public facility restrooms (such as those in service stations, airports, train terminals, and convention halls). These include the requirement for low flow rates (the document preceded the 1990's era EPACT rules concerning public lavatory faucet flow rates) and for limiting the temperature to a maximum of 110°F.

In the very high use public toilets detailed in 90.1 (1989) the sinks are used many times per hour, and the combination of low temperature and low flow does not dramatically increase the health risks from waterborne pathogens; the very high turnover rates of the water in the piping brings in new disinfectant.

However, many toilet facilities currently classified as "public" are only used sporadically. The combination of low hot water temperature, low flow rate and infrequent usage, results in a very low turnover rate which in turn means that new disinfectant enters the piping very infrequently. This condition not only provides a localized incubation chamber for Legionella but once grown can result in contaminating the rest of the hot water system.

While the idea of establishing 85-110°F as a safe range for public hand washing seemed like a good idea at the time, it turns out this range is ideal for the growth of pathogens in the building's water distribution system. Pathogens that

affect humans grow in temperatures that are found in our bodies: 85-110°F. For example, Legionella reproduces at the highest rates in the range of 85-110°F. Legionnaires' disease, caused by Legionella growth in building water systems has become a major public health concern.

Adding to the risk due to temperature is the complexity of the internal components of the mixing valves and the lack of maintenance these valves typically receive. Such maintenance is relatively time consuming and costly and is often ignored. By way of comparison, Australian codes for health and safety purposes require these local mixing valves to be disassembled and disinfected annually^{6, 7, 8}

Conclusions and Recommendations:

If 120°F is safe enough to protect against scalding for bathing, it is safe enough for public hand washing. If this temperature is safe enough for Health Care Occupancies (IPC Section 609.3), it is safe enough for the other occupancies covered by the IPC.

Maintaining temperatures in the range of 85-110°F that is currently required in Section 419.5 is unsafe because it provides ideal conditions for the growth of pathogens, bacteria dangerous to humans. All Legionella guidelines including OSHA 1998⁹, ASHRAE 2000¹⁰, CDC 2003¹¹, and CDC 2016¹² recommend maintaining hot water temperatures at fixtures and in hot water return lines at or above 120°F.

It is not necessary to specify the temperature range for supplying water for hand washing in public lavatories, only the maximum temperature to prevent scalding.

We recommend that the maximum safe temperature for the discharge of hot water into public hand washing sinks be raised to 120°F.

We recommend moving the break point between tempered and hot water from 110°F to 120°F.

We recommend enabling the use of cold water only, or tempered water, or both at public hand washing sinks.

Cost Impact

The code change proposal will decrease the cost of construction .

Justification:

This proposal enables the use of cold water, tempered water, or both to public hand-washing facilities. If only cold water is supplied, it will decrease construction costs by eliminating the installation of a hot water distribution system to these faucets and by eliminating the installation of the associated ASSE 1070 mixing valves, reducing or eliminating the water heater for this hot water and eliminating the mechanical space used by this piping and equipment. It will also eliminate the costs of operations and maintenance by reducing expenditures on hot water and on the maintenance of the mixing valves.

In places where city cold water is above 60°F year round, allowing only cold water to be supplied to public lavatories will eliminate much if not all the hot water piping and associated equipment in many buildings.

By virtue of raising the allowable maximum temperature to 120F it will now be possible to use a master-mixing valve (ASSE 1017) for temperature control instead of installing ASSE 1070 valves at every faucet. One valve costs less than many valves. Having fewer valves also dramatically reduces operating and maintenance costs.

P58-18 Part I

IPC: 202, 419.5

Proponent: Tim Keane, self, representing self (timke@verizon.net)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

419.5 ~~Tempered water~~ Water for public hand-washing facilities.

~~Tempered water shall be delivered from lavatories~~ Lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. ~~Tempered water shall be delivered through an approved water-temperature-limiting shall be provided with cold water, tempered water, or both. Where tempered water is supplied to such fixtures, the temperature shall be limited to not greater than 120°F (49°C) by means of temperature control device that conforms to ASSE 1017, ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.~~

HOT WATER. Water at a temperature greater than or equal to ~~110°F~~ 120°F (43°C/49°C):-

TEMPERED WATER. ~~Water having a temperature range between 85°F (29°C) and 110°F (43°C)~~ that is heated or blended with hot water to a temperature that is not greater than 120°F (49°C).

Internal ID: 1490

P58-18 Part II

IRC: R202

Proponent: Tim Keane, representing self (timke@verizon.net)

2018 International Residential Code

Revise as follows:

[MP] HOT WATER. Water at a temperature greater than ~~or equal to~~ 110°F (43°C) ~~120°F (49°C)~~.

Reason:

The purpose of this code change proposal is to address the requirement to provide tempered water to public hand-washing facilities, to change the temperature of water delivered to public hand-washing facilities to a maximum of 120°F and to enable the use of either cold water or tempered water at public hand-washing facilities.

Most of the reasons supporting this proposal are discussed below. In addition, we are proposing that where tempered water is supplied to public hand-washing facilities its temperature can be controlled by either a local mixing valve (ASSE1070) or by a master mixing valve (ASSE 1017), depending on the configuration of the hot water distribution system.

What follows is the reason statement that supports several code change proposals. There is one reason statement for these proposals because the topics are interrelated and a comprehensive discussion is most likely to result in the best outcome for protecting the public's health and safety.

Health and safety for public hand washing needs to include 1) scald prevention, 2) hand washing efficacy and 3) minimizing the risk of pathogen growth in the building's water distribution system.

We do not want the temperature of the water at public sinks to be too hot. We want the temperature of the water to be comfortable for the users of public sinks so that people will scrub their hands long enough to get them clean. We want to reduce the likelihood that pathogens will grow in the water distribution system. And, we would like to accomplish all of these health and safety functions in the most cost effective and sustainable manner possible.

At present, we believe that there are a few provisions in the IPC that inadvertently create a public health risk. Changing the temperature limits in this definition is one part of resolving this problem.

When the provisions in the current definitions and the related sections were first codified, Legionella was not a significant concern to public health; many items known today were unknown then. Now Legionella in building water systems has become a major concern for public health with the incidence of Legionnaires' disease growing by 500% from 0.4 cases per 100,000 people in 2000 to 2.0 cases per 100,000 people in 2015.¹

At the time these same provisions were codified, it used be thought that warm water was necessary for effective hand cleaning to control the spread of germs (bacteria). Science has since proven that the temperature of the water used for handwashing does not impact the efficacy of removing bacteria at all.^{2, 3, 4} While each of these three papers are very clear the CDC sums it up best with "The temperature of the water does not appear to affect microbe removal; however, warmer water may cause more skin irritation and is more environmentally costly"⁴ The most important variables for removing bacteria from ones hands are scrubbing and the use of soap. Neither of these criteria is within the purview of a building code.

When scald prevention was discussed as part of codifying these same provisions, the unintended consequences of lower water temperature on waterborne pathogen growth was not known. Accordingly temperature of 140°F originally proposed for scald control in home hot water heaters was lowered to 130°F and finally a recommendation of 120°F was made because if 140°F was OK it was thought that adding a huge safety margin would only be better, we now know that huge safety margin had serious and significant unintended consequences. A temperature of 120°F is considered an abundantly safe scald limit. However, setting water heaters this low results in much of the hot water distribution system being at temperatures that ideal for growing pathogens.

Since 1998 OSHA guidelines have stated that hot water should be stored at 140F and delivered at a temperature greater than 120F. In 2009, the CDC published a study documenting scalding cases resulting in hospital visits by the elderly from 2001-2006. The elderly are the highest risk population for Legionnaires' disease and one of the highest risk for scalding. They found that more than 80% of the scalding cases were due to cooking activities in the kitchen. Less than 3% (220 out of 8,620 cases) were plumbing related.¹³

We believe that it is time to use our current knowledge of these interrelated elements to improve health and safety by revising the a few of the temperature related provisions in the 2018 IPC and the 2018 IRC-P

In both the IPC and the IRC, hot water is required to be supplied to plumbing fixtures and plumbing appliances intended

for bathing, washing, or culinary purposes. The 2018 IPC and IRC-P have two different maximum temperature thresholds, which some say are for scald prevention. The temperature at public hand washing sinks (lavatories), is limited to 110°F. With the exception of bidets and emergency fixtures, which are also limited to 110°F, all other fixtures are limited to 120°F. Please see the table below.

Water Temperature Provisions in the 2018 IPC and IRC-P

Fixture	Maximum Temperature	Section
Bidet	110F (43C)	IPC 408.3 IRC P2721.2
Emergency showers and eyewash stations	110F (43C)	IPC 411.1*
Individual shower valve	120F (49C)	IPC 412.3 IRC P2708.4
Multiple (gang) showers	120F (49C)	IPC 412.4
Temperature-actuated, flow-reduction devices for individual fixture fittings	120F (49C)	IPC 412.7
Public lavatories	110F (43C)	IPC 419.5
Bath tub and whirlpool tub	120F (49C)	IPC 412.5 IRC 2713.3
Head shampoo sink faucet	120F (49C)	IPC 412.10
Footbaths and pedicure baths	120F (49C)	IPC 423.3

* The maximum temperature is not shown in this IPC section, but rather in the referenced standard. This standard also has a minimum acceptable temperature of 60F for emergency fixtures. This lower number might be useful guidance for jurisdictions with cold incoming water temperatures that want to raise the temperature of cold water for hand washing during the winter months where only cold water is supplied to public lavatory faucets.

Bidets, emergency showers and eyewash stations and public lavatories are required to have tempered water supplied through a water temperature limiting device that conforms to the appropriate ASSE, ANSI or CSA standard. The upper limit of 110°F makes sense for bidets and emergency showers. It does not make sense for hand washing at public lavatories.

If 120°F is a safe temperature for showering, bathing, head shampooing, tubs, it is equally safe for hand washing at either public or private lavatory faucets. It does not make sense that the temperature is lower for hand washing than for tub bathing. If the water temperature rises quickly to an uncomfortably hot and unsafe number it is much easier to remove ones hands from the water coming out of the faucet than it is to get out of a bathtub or to get out of the way in a shower. There is no need to have a lower temperature supplied for hand washing than for showering or bathing. In fact this public lavatory temperature code is derived from ASHRAE 90.1 energy saving code, not safety.

In our research into this issue, we found that the 110°F temperature limitation for hand washing at public lavatories comes from an energy code, ASHRAE 90.1 (1989)⁵ “Energy Standard for Buildings Except Low-Rise Residential Buildings.” Section 11.4.5.2 presents the provisions for lavatories in public facility restrooms (such as those in service stations, airports, train terminals, and convention halls). These include the requirement for low flow rates (the document preceded the 1990’s era EPACT rules concerning public lavatory faucet flow rates) and for limiting the temperature to a maximum of 110°F.

In the very high use public toilets detailed in 90.1 (1989) the sinks are used many times per hour, and the combination of low temperature and low flow does not dramatically increase the health risks from waterborne pathogens; the very high turnover rates of the water in the piping brings in new disinfectant.

However, many toilet facilities currently classified as “public” are only used sporadically. The combination of low hot water temperature, low flow rate and infrequent usage, results in a very low turnover rate which in turn means that new disinfectant enters the piping very infrequently. This condition not only provides a localized incubation chamber for Legionella but once grown can result in contaminating the rest of the hot water system.

While the idea of establishing 85-110°F as a safe range for public hand washing seemed like a good idea at the time, it turns out this range is ideal for the growth of pathogens in the building’s water distribution system. Pathogens that affect humans grow in temperatures that are found in our bodies: 85-110°F. For example, Legionella reproduces at the highest rates in the range of 85-110°F. Legionnaires’ disease, caused by Legionella growth in building water systems has become a major public health concern.

Adding to the risk due to temperature is the complexity of the internal components of the mixing valves and the lack of maintenance these valves typically receive. Such maintenance is relatively time consuming and costly and is often ignored. By way of comparison, Australian codes for health and safety purposes require these local mixing valves to be disassembled and disinfected annually^{6, 7, 8}

Conclusions and Recommendations:

If 120°F is safe enough to protect against scalding for bathing, it is safe enough for public hand washing. If this temperature is safe enough for Health Care Occupancies (IPC Section 609.3), it is safe enough for the other occupancies covered by the IPC.

Maintaining temperatures in the range of 85-110°F that is currently required in Section 419.5 is unsafe because it provides ideal conditions for the growth of pathogens, bacteria dangerous to humans. All Legionella guidelines including OSHA 1998⁹, ASHRAE 2000¹⁰, CDC 2003¹¹, and CDC 2016¹² recommend maintaining hot water temperatures at fixtures and in hot water return lines at or above 120°F.

It is not necessary to specify the temperature range for supplying water for hand washing in public lavatories, only the maximum temperature to prevent scalding.

We recommend that the maximum safe temperature for the discharge of hot water into public hand washing sinks be raised to 120°F.

We recommend moving the break point between tempered and hot water from 110°F to 120°F.

We recommend enabling the use of cold water only, or tempered water, or both at public hand washing sinks.

Cost Impact

The code change proposal will decrease the cost of construction.

This proposal enables the use of cold water, tempered water, or both to public hand-washing facilities. If only cold water is supplied, it will decrease construction costs by eliminating the installation of a hot water distribution system to these faucets and by eliminating the installation of the associated ASSE 1070 mixing valves, reducing or eliminating the water heater for this hot water and eliminating the mechanical space used by this piping and equipment. It will also eliminate the costs of operations and maintenance by reducing expenditures on hot water and on the maintenance of the mixing valves.

In places where city cold water is above 60°F year round, allowing only cold water to be supplied to public lavatories will eliminate much if not all the hot water piping and associated equipment in many buildings.

By virtue of raising the allowable maximum temperature to 120F it will now be possible to use a master-mixing valve (ASSE 1017) for temperature control instead of installing ASSE 1070 valves at every faucet. One valve costs less than many valves. Having fewer valves also dramatically reduces operating and maintenance costs.

P59-18

IPC: 419.5, Chapter 15

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBENGINEER@aol.com)

2018 International Plumbing Code

Revise as follows:

419.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 or from a water heater complying with ASSE 1082 or ASSE 1084.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason:

There are two new standards for water heaters, ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the currently listed water-temperature limiting device.

Water heaters complying with either one of these standards can provide tempered water within a range of a few degrees depending on the flow rate. The temperature range is similar to the allowable temperature range for an ASSE 1070/ASME A112.1070/CSA B125.70 device.

Cost Impact

The code change proposal will decrease the cost of construction .

This change could lower the cost by the allowance of a water heater without the need for an additional valve.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P60-18

IPC: 419.5, Chapter 15

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

419.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. ~~Tempered~~ The tempered water shall be ~~delivered through an approved water temperature limiting device that conforms to~~ controlled by one of the following:

1. A temperature limiting device conforming to either ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.
5. A temperature actuated flow reduction device conforming to ASSE 1062.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason:

The requirements for public lavatories is out of date based on the changes made to the standard. Previously, ASSE 1070 was considered a thermostatic mixing valve standard with safety features. The standard was revised to be a safety standard without performance requirements for thermostatic mixing. Some valves are adjustable, while others are not.

The requirement for tempered water for public lavatories is a comfort requirement as well as a scald prevention requirement. However, comfort overrides the safety requirement since tempered water is limited to a maximum temperature of 110° F. Scalding temperatures are in excess of this temperature. Other viable means of tempering water to 110° F or less are an ASSE 1017 valve or a water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

The last device listed is a TAFR complying with ASSE 1062. Section 412.7 already permits the use of these devices for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

Cost Impact

The code change proposal will decrease the cost of construction .

The availability of more options to achieve code compliance usually results in lower construction costs.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

IPC: 419.5, Chapter 15

Proponent: Misty Guard, representing Bradley Corporation (Misty.Guard@bradleycorp.com)

2018 International Plumbing Code

Revise as follows:

419.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 or from a water heater complying with ASSE 1082 or ASSE 1084.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason:

There are two new standards for water heaters, ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the currently listed water-temperature limiting device.

Water heaters complying with either one of these standards can provide tempered water within a range of a few degrees depending on the flow rate. The temperature range is similar to the allowable temperature range for an ASSE 1070/ASME A112.1070/CSA B125.70 device.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost associated with this change since the code change will merely provide other options for complying with the current requirements. There are no new mandatory requirements being added.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 2251

P62-18

IPC: 421.1

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Plumbing Code

Revise as follows:

421.1 Approval. Prefabricated showers and shower compartments shall conform to ASME A112.19.1/CSA B45.2, ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124. Shower valves for individual showers shall conform to the requirements of Section 412.3.

Reason:

The current standards are only for ceramic and plastic type plumbing fixtures. Including standards for enameled cast iron, enameled steel plumbing fixtures and stainless steel fixtures provides for more flexibility in fixture selection. The added standards are already in the IPC.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The addition of the standards provides more flexibility in choice of fixtures. Enameled cast iron, enameled steel and stainless steel plumbing fixtures and stainless steel fixtures are not required to be installed; they are a choice that the designer can make.

Internal ID: 499

P63-18 Part I

IPC: 421.3.1 (New)

Proponent: Angel Guzman Rodriguez, ASME, representing The American Society of Mechanical Engineers (ASME)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Add new text as follows:

421.3.1 Waste Fittings. Waste fittings shall conform to ASME A112.18.2/CSA B125.2.

Internal ID: 1407

P63-18 Part II

IRC: P2708.2.1 (New)

Proponent: Angel Guzman Rodriguez, ASME, representing The American Society of Mechanical Engineers (ASME)

2018 International Residential Code

Add new text as follows:

P2708.2.1 Waste Fittings. Waste fittings shall conform to ASME A112.18.2/CSA B125.2

Reason:

Section 421.3 discusses the waste outlet requirements for showers but there is no mention of waste fittings. Waste fittings are only mentioned in 412.1.2 for faucets or 412 for floor and trench drain types. The latest version of ASME A112.18.2/CSA B125.2 contains specific requirements for typical shower drains and also linear type drains which are different from trench type. This standard also includes requirements for built up shower drain systems which are normally used in field fabricated shower systems.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only identifies the standard that the industry is already making these waste fittings comply with and be certified to. Thus, there will be no impact to material (or labor) cost because of this added requirement.

Internal ID: 1453

P64-18

IPC: 421.5.2

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Revise as follows:

421.5.2 Shower ~~lining~~ linings. Floors under shower compartments, except where prefabricated receptors have been provided, shall be lined and made water tight utilizing material complying with Sections 421.5.2.1 through 421.5.2.6. Such liners shall turn up on all sides not less than 2 inches (51 mm) above the finished threshold level. Liners shall be recessed and fastened to an *approved* backing so as not to occupy the space required for wall covering, and shall not be nailed or perforated at any point less than 1 inch (25 mm) above the finished threshold. Liners shall be pitched one-fourth unit vertical in 12 units horizontal (2-percent slope) and shall be sloped toward the fixture drains and be securely fastened to the waste outlet at the seepage entrance, making a water-tight joint between the liner and the outlet. For showers that are designed with a zero height threshold, a trench drain shall be provided that runs 2 inches beyond the full width of the shower compartment opening on both sides. The trench drain shall have a flashing clamp and the shower liner material shall be securely fastened to the waste outlet at the seepage entrance, making a water-tight joint between the liner and the outlet. The shower liner shall also be required to extend 2 inches above the floor level and 1 inch beyond the edges of the trench drain. If for some reason the trench drain cannot be accommodated, the entire room the shower is located in shall be considered part of the shower compartment and provided with a liner for the entire floor surface.

The completed liner shall be tested in accordance with Section 312.9.

Exceptions:

1. Floor surfaces under shower heads provided for rinsing laid directly on the ground are not required to comply with this section.
2. Where a sheet-applied, load-bearing, bonded, waterproof membrane is installed as the shower lining, the membrane shall not be required to be recessed.

Reason:

The plumbing code has not yet dealt with site built zero height threshold showers. These continue to be a problem for jurisdictions since the code provides no direction or parameters for how these should be constructed. We have seen installations end up causing substantial damage to a structure due to water migration between the floor covering and the sub floor. This proposal provides two possibilities which should result in adequate protection for the structure.

Cost Impact

The code change proposal will increase the cost of construction .

There will be the added material and labor cost of a trench drain or the added material and labor cost for a liner for the entire floor area of the room with the zero threshold shower.

Internal ID: 2207

P65-18

IPC: 423.3, Chapter 15

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

423.3 Footbaths and pedicure baths. The water supplied to specialty plumbing fixtures, such as pedicure chairs having an integral foot bathtub and footbaths, shall be limited to not greater than 120°F (49°C) ~~by a~~. The water - temperature-limiting device that conforms temperature shall be regulated by one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.
5. A temperature actuated flow reduction device conforming to ASSE 1062.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1082-2018:

Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason:

The requirement for regulating the maximum temperature of water for pedicure chairs having an integral foot bathtub, footbaths, and head shampoo sinks is a scald prevention requirement. The current code allows the use of a device complying with ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.

Section 412.7 already permits the use of a TARF complying with ASSE 1062 for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

Cost Impact

The code change proposal will decrease the cost of construction .

The availability of more options to achieve code compliance usually results in lower construction costs.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1082-2018 and ASSE 1084-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason:

There are two new standards for water heaters, ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the currently listed water-temperature limiting device.

Water heaters complying with either one of these standards can provide tempered water within a range of a few degrees depending on the flow rate. The temperature range is similar to the allowable temperature range for an ASSE 1070/ASME A112.1070/CSA B125.70 device.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost associated with this change since the code change will merely provide other options for complying with the current requirements. There are no new mandatory requirements being added.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

IPC: 423.3

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2018 International Plumbing Code

Revise as follows:

423.3 Footbaths and pedicure baths. The water supplied to specialty plumbing fixtures, such as pedicure chairs having an integral foot bathtub and footbaths, shall be limited to not greater than 120°F (49°C) by a water-temperature-limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 ~~or CSA B125.3.~~

Reason:

In June of 2017, the CSA B125 Committee completed the project that removed the automatic compensating valve requirements from CSA B125.3. The reason for this was the publication of harmonized ASSE 1070/ASME A112.1070/CSA B125.70 standard.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal only removes a referenced standard from the code section.

Internal ID: 2252

P68-18

IPC: 202, 425.1, 425.1.1 (New), 425.1.2 (New), 425.1.3 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Plumbing Code

Revise as follows:

425.1 Approval. Water closets shall conform to the water consumption requirements of Section 604.4 and shall conform to ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124. ~~Water closets shall conform to the hydraulic performance requirements of ASME A112.19.2/CSA B45.1. Water closet tanks shall conform to ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124. Electro-hydraulic water closets shall comply with ASME A112.19.2/CSA B45.1. Water closets equipped with a dual flushing device shall comply with ASME A112.19.14.~~

Add new text as follows:

425.1.1 Hydraulic performance. Water closets shall conform to the hydraulic performance requirements of ASME A112.19.2/CSA B45.1.

425.1.2 Water closet tanks. Water closet tanks shall conform to ASME A112.19.2/CSA B45.1, ASME A112.19.3/CSA B45.4 or CSA B45.5/IAPMO Z124.

425.1.3 Dual flush water closets. Water closets equipped with a dual flushing device shall comply with ASME A112.19.14.

Add new definition as follows:

DUAL FLUSHING DEVICE. A feature that allows the user to flush a water closet with either a reduced or full volume of water depending upon bowl contents.

Reason:

This proposal revises Section 425.1 so that it is more user friendly. Adding specific requirements to the IPC will assist the end user to know which standards apply to what fixture. The definition for dual flushing device is being added as code does not have a definition. The definition is consistent with the definition found in ASME A112.19.14.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is a clarification of existing requirements. No new materials or labor are required by this proposal thus, there is not a cost increase.

Internal ID: 502

P69-18

IPC: 501.2

Proponent: James Kendzel, American Supply Association, representing American Supply Association
(jkendzel@asa.net)

2018 International Plumbing Code

Revise as follows:

501.2 Water heater as space heater. Where a combination potable water heating and space heating system requires water for space heating at temperatures greater than 140°F (60°C), a master thermostatic mixing valve complying with ASSE 1017 shall be provided to limit the water supplied to the potable *hot water* distribution system to a temperature of 140°F (60°C) or less. The potability of the water shall be maintained throughout the system. Requirements for combination potable water heating and space heating systems shall be in accordance with the International Mechanical Code.

Reason:

There are requirements in the International Mechanical Code for combination water heating and space heating systems that are covered in the IMC and not covered in the IPC. The 2018 IMC provides a reference back to the IPC related to water heating and space heating systems and there should also be a link from the IPC back to the IMC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposed change is not substantive and does not change existing requirements.

Internal ID: 1350

P70-18

IPC: 501.2

2018 International Plumbing Code

Revise as follows:

501.2 Water heater as space heater. Where a combination potable water heating and space heating system requires water for space heating at temperatures greater than 140°F (60°C), a master thermostatic mixing valve complying with ASSE 1017 shall be provided to limit the water supplied to the potable *hot water* distribution system to a temperature of 140°F (60°C) or less. The potability of the water-water for the space heating system shall be maintained throughout the system, separated from the potable water system by use of a double wall heat exchanger.

Reason:

This code change still allows a single heating appliance to provide both the heating and domestic hot water for a building, however it requires a heat exchanger to separate the two fluid systems. This is because heating hot water systems can sit idle for up to 8 or 9 months per year in southern climates. This causes the water to sit stagnate for many months when the thermostat does not call for heat. This stagnant period is when bacteria grows in a biofilm to very high numbers until the thermostat calls for heat. Then the bacteria is pumped into the water heater where it is transmitted to people from showers and other aerosolizing fixtures. The potential for Legionellosis or Legionnaires' disease is very high. The control valve or zone circulating pump remains off and allows water treatment chemicals to dissipate and bacteria can growth to very high levels in an uncirculated heating circuit. In systems where they cycle the zone valve or circulating pump, it wastes energy and overheats the spaces during summer months. There are other issues that are outlined below.

Combined systems require someone very familiar with how both systems are supposed to operate to properly operate and maintain the system. Proper maintenance of the system can be a comfort or Legionella bacteria growth issue when the temperatures are low and a serious safety and scald issue when temperatures are high. A combined system is a hybrid system that utilizes a boiler or boilers to heat water for heating the building environment and it uses boiler water to heat the domestic hot water for bathing, washing and cleaning uses. There are two applications for these combined systems. One application is heating the building environment with heating hot water which generally needs to be at a very high temperature around 180F to 210F without using oversized heating coils. The other application is for bathing, showering and domestic hot water uses which generally use a lower temperature around 85F to 120F. If the water gets too hot, there are scalding dangers, so proper controls (thermostatic mixing valves) are very important for these types of systems. I have been investigating scald incidents with combined systems since the mid-1990s and I have seen a significant number of these combined systems involved in scald litigation cases because these systems are generally not designed, installed, operated or maintained properly. The following is a list of problems or pitfalls that I have found over the years that are related to combined heating hot water and domestic hot water systems.

Codes: There is very little code language on Combines heating hot water and domestic hot water systems. There are only two plumbing code sections in the model codes that mention these combined systems and they give important, but often overlooked requirements. One section calls for the piping and components in a combined system to be approved for use in potable water systems. The other code section calls for a thermostatic mixing valve if the system temperature exceeds 140 degrees Fahrenheit.

There are many more issues that need to be addressed to have a safe and properly designed system. If you can avoid these pitfalls you will have a much safer system:

Pitfall Number 1: Open System vs Closed System “Open systems” are systems with domestic hot water flowing from the city water supply through the heating hot water system components such as pumps, control valves and heating coils. Open systems introduce a lot of oxygen and minerals into the heating coil of the boiler and can cause corrosion and scale build-up issues on heating surfaces. Open systems often have scale build-up on the boiler heating surfaces in hard water areas. High Flue gas temperatures are a sign of scale build-up which minimizes heat transfer into the water and therefore the flue temperatures rise. “Closed Systems” are systems with a double wall heat exchanger separating the fluid of the heating hot water system and the domestic hot water. The boiler loop can be chemically treated and mineral build-up on heating surfaces is minimized. Closed loop systems generally require a double wall heat exchanger when boiler chemicals are used. Open systems provide a significant challenge because the fluid in the system must be potable water and it is difficult to circulate domestic hot water through many hydronic components without having scale, corrosion, build-up of air pockets and oxidation problems. Most hydronic systems have pumps, valves, coils and components that are not approved for drinking water service. Closed systems allow the heating

hot water to be chemically treated to prevent corrosion and scale build-up on heating surfaces. Closed hydronic heating systems are the preferred type of combined systems because it eliminates a lot of opportunities for systems problems. There are water heaters with hot water coils in the tank that can be used for this application or a plate and frame or shell and tube heat exchanger can be used for this application. Open systems often see corrosion problems in the components that are not compatible for domestic water systems.

Pitfall Number 2: System Operating Temperatures The next challenge is with the system operating temperatures.

Heating hot water systems are generally designed to operate between 180 degrees Fahrenheit and 210 degrees Fahrenheit. Domestic hot water systems are designed to operate between 85 degrees Fahrenheit for the lowest temperature of tempered water to 140 degrees Fahrenheit the highest hot water temperature for kitchens or laundries. "Tempered Water" is water having a temperature range between 85°F (29°C) and 110°F (43°C). "Hot Water" is water at a temperature greater than or equal to 110°F (43°C) and generally domestic hot water for bathing and showering is limited to a maximum of 120 degrees Fahrenheit in code language related to showers and bathtub facilities. Domestic hot water for dishwashing and laundries can be higher. Generally, domestic hot water systems operate at a maximum of 140 degrees Fahrenheit and heating hot water Systems operate best around 190 to 200 degrees Fahrenheit. If the combined-open heating hot water system is set to 120 degrees F the building will be cold in winter months because there will not be enough heat coming out of the heating units. If the system temperature is set to a higher temperature to satisfy the heating coils or baseboard heater requirements then there is a significant scald risk on the domestic hot water side of the system unless thermostatic mixing valves are used to limit hot water temperatures.

Pitfall Number 3 - Not including all of the required components in the combined systems A combined system has many components that are required for it to operate properly. If all of the components are not installed in the proper location, then the system will experience problems. These components include but are not limited to: The boiler, and expansion tank, isolation valves, unions, dielectric waterways, circulating pumps, air eliminators or air vents, control valves, relief valves, balancing valves, heating coils, fin tube radiators, thermostats, pressure gauges, temperature gauges, flushing connections, plumbing fixtures, drains, etc. All of these components must work in concert and be designed to work together as a system. If any one or several of the components are not installed, or if they are undersized, adjusted or installed improperly the problems and safety issues can occur.

Pitfall Number 4 - Seasonal Pumping and Pump Sizing In large centrally piped systems, when the winter heating season occurs all of the components in a combined heating hot water and domestic hot water system will require a simultaneous peak demand in the morning when it is showering time. So the circulating pump must be sized for the simultaneous peak heating and showering loads. During the winter months, it does not make sense to circulate a large quantity of water, so often I see a smaller circulating pump that is piped around the large circulating pump so it can be used in the winter months when the large circulators are not needed for building heating. This creates a large dead leg in the hot water piping where Legionellae bacteria can grow when the heating hot water pumps are shut down.

Pitfall Number 5 - Dead legs During the summer months the fan coil units and branches to baseboard heating units are shut off with a solenoid valve or the circulating pump on these branches does not run all summer long. It is not unusual for heating system to sit idle for over six months in southern climates. When the first call for heating is made there is usually a slug of brackish and foul tasting water that is high in debris, metals and bacteria content. Combined systems are by design creating very large dead legs which is a plumbing code violation in many plumbing codes. Controls on combined systems need to incorporate a periodic flushing of the zones by operating the solenoid valves and circulators on each zone on at least a bi-weekly basis if not more often. Chlorine dissipates in the domestic water over time and when heated. So dead legs are more susceptible to bacteria growth. In combined systems where a significant portion of the system is used seasonally for heating and the remainder of the system is being used year round for domestic hot water, combined systems are open systems that are susceptible to bacteria growth in stagnant sections of heating coil piping. Heating coils in the summer season are an area with huge potential for bacterial amplification when hydronic systems are coupled with domestic hot water systems and there is no physical barrier or heat exchanger to separate the fluids between the two systems.

Pitfall Number 6 - Peak load problems - Space heating and Shower loads simultaneously The early morning is the generally coldest time of day and it is also when guests at a hotel or an apartment building or condominium take their morning showers. Equipment, piping, pumps and valves must be sized to handle this simultaneous peak load. If the heating coils, pipe and pump equipment is not sized big enough the temperature of the space will drop and the shower water temperature will drop to an uncomfortable temperature. Either condition is likely to result in call and complaints about water temperatures or space temperatures being too low.

Pitfall Number 7 - Sizing Sizing problems can arise when engineers, owners or contractors try to be thrifty and save a few bucks by rounding down on their peak load calculations and downsizing pumps, piping, valves or coils. When this happens, you can bet the maintenance department phone will be ringing off the hook with complaints of spaces being too cold or not enough hot water for a shower during cold weather conditions. The maintenance men usually do what comes natural when they receive a call of not enough heat, they go to the boiler and turn the temperature up. When someone is scalded they always claim they never touched the thermostat. Turning up the temperature will not cause

problems for the heating coils, but it does significantly increase the risk of scalding if the maintenance man does not go around and re-adjust all of the maximum temperature limit stops in the showers and tub/shower valves. If the shower has an old two-handle or single handle non-compensating type shower valve that cannot compensate for changes in incoming temperature or pressure, then the risk of scalding is even greater. The best solution is to have a Thermostatic mixing valve on the hot water supply to the bathing and washing fixtures to limit the hot water to a safe temperature. If the hot water and heating water piping are still separated, and the system uses one boiler then a temperature actuated master thermostatic mixing valve conforming to ASSE 1017 or the appropriate CSA B-125 mixing valve can be located at the water heater to lower the hot water to a safe delivery temperature. If the combined system utilizes the same piping for heating hot water and domestic hot water then, a temperature limiting valve conforming to ASSE 1070 should be used in-line to mix cold water with hot water to provide a safe temperature of hot water for bathing or showering fixtures locally.

Pitfall Number 8 - Maintenance The main problem with a combined system is the system includes components and controls for two different mechanical trade disciplines. Often if there is a service call on one of these systems, the service technician may only be familiar with one system or the other. If the system was designed with a specific operating temperature it is not uncommon for a service tech familiar with only one system to set the temperature of the system to what he is accustomed to setting the temperature to. There are also many components in the system that one trade or the other may be unfamiliar with. For example in one case the owner called an HVAC technician to work on his combined system. The HVAC technician was used to setting hydronic system for building heating at 190 to 200 degrees Fahrenheit. The technician set the temperature to 190 degrees and later a woman was scalded when she got in her shower. The HVAC technician did not know he needed to reset the maximum temperature limit stop on all of the ASSE 1016 shower valves when he readjusted the boiler set point temperature. There are maintenance technicians that are trained and fully capable of working on combined systems, but they would need to have the design drawings, design operating temperatures and sequence of operations in order to properly maintain the system.

Pitfall Number 9 - Cast Iron Boiler on an Open System I have seen Cast iron boilers used on an open combined heating hot water and domestic hot water system. Cast iron boilers do not perform well with open systems because of the large quantities of water that introduces oxygen and minerals which cause rust stains, oxidation and fouling of the heating surfaces. This mistake does not take long to find because of the rust stains that appear in the sinks, bathtubs & showers. Cast iron boiler can work nicely, but they must have a separate closed loop of boiler water that is treated with corrosion inhibitors and other boiler chemicals as needed. The boiler water can then be piped to a coil in a hot water tank or to a heat exchanger to provide domestic hot water.

Pitfall Number 10 - No Hot Water Tank with Copper Fin Tube Boilers I have seen installation where someone thought they could save a few bucks by eliminating the storage tank and using the heating hot water main as the storage tank. This does not work in motels, hotels, apartment buildings and condos with large peak loads. In facilities like these there needs to be a stored volume of water ready for use in a dump load such as a morning shower period. Copper fin-tube boilers can only raise the temperature of the water 20 - 40 degrees Fahrenheit as the water flows through the boiler. If the water flows too slow, through the boiler, it will scale up and if the water flows too fast (in excess of five feet per second) the copper will erode away. These types of boilers work fine, they just need to have a storage tank for plumbing applications with a dump load. In heating applications the BTU input is matched to the heating load calculations and the system works fine. In a large domestic hot water or a combined heating hot water/domestic hot water system, copper fin-tube boilers should have an adjacent storage tank in order to work properly. If there is no storage tank, the system temperatures will drop off drastically during peak winter showering and building heating periods. The usual result is the maintenance personnel turn up the temperature and higher temperatures increase the risk of scalding.

Pitfall Number 11 - No Thermal Expansion Tank/Proper Thermal Expansion Tank Materials All heating hot water system and domestic hot water systems must have a thermal expansion tank. The thermal expansion tank should be sized for a system start-up from ambient to hot. Another problem I have encountered with these combined systems is usage of a hydronic expansion tank on a combined system. If the same water flows through the coils and to the plumbing fixtures, the system must have a thermal expansion tank rated for use in a potable water system. If the system has one boiler and two separate piping systems with a heat exchanger each piping system should have a thermal expansion tank.

Pitfall Number 12 - Scalding Injuries & Deaths Many designers, contractors and owners forget there are lives at stake when they design and build the combined heating hot water and domestic hot water systems. People have been scalded to death and people have been seriously injured when the systems are not designed, installed or maintained properly. This is more than just a savings on first-cost of an installation, it is a system that warrants serious attention because the public's safety is at stake. A properly sized and located thermostatic mixing valve conforming to ASSE 1017 or ASSE 1070 should be located in the combined system in accordance with the scoping requirements for each type of valve to prevent scalding. At shower locations an ASSE 1016 valve should be used and it should be properly set by the installer and/or the maintenance personnel to limit the maximum outlet temperature to 120 F or less.

Pitfall Number 13 - Litigation Combined systems are susceptible to problems. Problems can lead to injuries and

injuries can lead to litigation. If an open combined heating hot water and domestic hot water system cannot be properly maintained for the entire life of the system, don't design it, don't install it or don't request that it be installed because problems will arise. Combined systems require an extensive amount of work and oversight by a person with knowledge of both the heating water requirements and domestic hot water requirements to make sure the system works properly and to make sure someone does not get injured. You must document everything when working on a combined system because when someone gets injured, everyone will be named in the lawsuit.

Pitfall Number 14 - Code Requirements for Thermostatic Mixing Valves The 2009 International Plumbing Code has the following Language dealing with combined systems: 501.2 Water heater as space heater. Where a combination potable water heating and space heating system requires water for space heating at temperatures higher than 140°F (60°C), a master thermostatic mixing valve complying with ASSE 1017 shall be provided to limit the water supplied to the potable hot water distribution system to a temperature of 140°F (60°C) or less. The potability of the water shall be maintained throughout the system. The above code language limits the domestic hot water system to 140 degrees Fahrenheit, and in other code sections the temperature for showers and tub/shower combination units is limited to 120 degrees Fahrenheit. The 2009 International Plumbing code also has the following language addressing maximum water temperatures for instantaneous water heaters: 501.6 Water temperature control in piping from tankless heaters. The temperature of water from tankless water heaters shall be a maximum of 140°F (60°C) when intended for domestic uses. This provision shall not supersede the requirement for protective shower valves in accordance with Section 424.3.

Pitfall Number 15 - Engineered System vs Value Engineered systems I have seen where a value engineering option was offered by a contractor to combine the domestic hot water system with the heating hot water system. This was not a value to the owner and it was not engineered. During the evaluation process the owner decided to allow the contractor to combine the systems without the contractor providing engineered drawings. This decision gave the contractor the ability to use whatever he wanted to use since there were no engineered drawings. The owner got a system that did not work, and had black brackish water flushed out of the dead legs every fall when the heating system was turned on and the stagnant water was circulated through the domestic water piping. I submitted a report almost 200 pages long documenting the many problems in that system.

Pitfall Number 16 - Pipe Materials I have seen where a pipe material cost cutting option that was labeled as a value engineering option was given by a contractor. The option was accepted and the contractor simply eliminated the domestic hot water system and changed the hydronic system from black steel to galvanized steel piping. This was in a condominium building that had about 500 condos that sold in the neighborhood of 1 million dollars each. The galvanized pipe started to rust significantly within two years of service and rust stains were significant in all fixtures. The seasonal dead legs from the heating coils allowed rust barnacles to form until the first call for heat. When the flow in these dead leg branches would resume on the first call for heat in the fall it would flush rust, debris and iron oxide and stagnant water into the strainers of the control valves and into the domestic water system. Galvanized steel pipe should never be used on a domestic hot water system because domestic hot water in an open system connected to the city water main introduces a large quantity of oxygenated water into the system and causes rust. Oxygenated water will cause significant corrosion in ferrous metals such as black steel and galvanized pipe. All components of a combined system should be copper or another code approved non-ferrous material for domestic hot water service if they are in contact with the city water supply. Another thing I often see is iron valves installed in these combined systems. This is usually the result of a heating contractor installing or performing maintenance on the combined system and it is usually the result of the contractor not being familiar with the requirements in the code for all components to be all bronze and/or approved for domestic water use.

Pitfall Number 17 - Pumps When sizing pumps for a combined system there should be two separate systems. The closed system should have large circulating pumps designed for the heating hot water flows. The open system should have small circulator pumps to maintain hot water to the farthest fixture. It is also a good idea to split the load into two and use two smaller pumps to allow for some redundancy and allow for one pump to be maintained while the other is in service. It's a good idea to do this with the boilers also to provide some redundancy. The hydronic system should be a closed loop that can use large ductile iron bodied pumps. The domestic water system is an open system and should have an all bronze circulator. I have seen combined systems where it was an open system with large ductile iron pumps in the main piping before the boilers to provide an adequate flow of heating hot water in the winter months. Then because they did not want to run the large pumps just to maintain the domestic hot water temperature at the end of the system, a small bronze circulator was installed on a branch off of the main with check valves to prevent short circuiting the flow through the larger pumps. The problem with an open system is when the large pumps are shut down for sometimes over 6 months the pumps, and all hydronic circuits to heating coils and baseboard heaters become dead legs in the piping system. Dead legs are places where bacteria like Legionellae can grow and thrive. This is why there should be a separate closed piping circuit for the heating hot water system piping.

Pitfall Number 18 - Corrosion Ferrous piping in a domestic hot water system is not advisable. Although galvanized pipe is allowed by code for domestic hot water systems, it should never be used in a domestic hot water system if you intend for the building systems to last more than a couple of years. Hot water tends to accelerate corrosion in

galvanized piping systems. All domestic hot water piping should be copper or another approved non-ferrous material. Another problem with combined systems is the use of large cast iron and ductile iron hydronic heating circulating pumps that are installed in combined systems that were not approved for domestic water systems. I have seen galvanized steel pipes and even black steel pipe nipples used in domestic hot water systems. When the systems were first turned on in the fall large slugs of iron oxide laden water is forced into the domestic hot water distribution system. This generally results in sinks and bathtubs filled with black and orange rusty looking water until the entire system get flushed out significantly. The ferrous materials in the combined system typically lead to other problems with plugged strainers on control valves and other components. The iron oxide can also provide a surface for bacteria to grow.

Pitfall Number 19 - Corrosion inhibitors and other boiler water treatment chemicals I visited one building on the east coast where the combined system consisted of 8 inch galvanized water pipes. The galvanized pipes were corroding to the point where the hot water was very cloudy and orange. The building maintenance personnel chose to add an injection pump to inject chemicals into the domestic water main entering the building to raise the PH of the water and to intentionally build up a layer of scale inside the piping to minimize the amount of corrosion in the galvanized piping. The problem was the scale also formed on the heating surfaces and in the control valves causing them to fail. Upon inspection of the barrel of chemicals being injected into the water supply there were warning labels that stated the materials were toxic to humans. I reported this to the building owner to correct the situation immediately. This was another case of a heating contractor working on a plumbing system and not being familiar with plumbing code requirements. The solution he came up with would be a possible option for a hydronic system, but in a domestic water system that was a code violation and a health and safety issue.

Pitfall Number 20 - Loss of Both Systems When There is a Problem Another problem with combined systems is when there is a problem with a combined system that causes the system to shut down, both the domestic hot water system and the heating hot water system is out of service. If it is a boiler problem or another major problem the entire building could be without both systems for a long period of time. Combined system should have separate piping loops and redundant equipment to allow for some usage if one system or the other requires service.

Pitfall Number 21 - Legionellae Bacteria A research report in 1988 authored by Al Steele who was the president of the ASPE Research foundation at the time recommended storing domestic hot water between 135 degrees Fahrenheit and 140 degrees Fahrenheit to kill Legionellae bacteria and utilizing a thermostatic mixing valve to mix the hot water down to a safe delivery temperature below 120 degrees Fahrenheit to minimize scalding. The higher storage temperature around 140 degrees Fahrenheit was suggested because it is above the temperatures where Legionella bacteria can survive and multiply. With a storage temperature of 140 degrees Fahrenheit the Legionellae bacteria will die within 32 minutes.

Table -1 Legionellae Bacteria Growth and Disinfection Temperature Chart.

158 F and above F (70 C +): Legionellae Bacteria Disinfection range.

At 151 Degrees F (66 Degrees C): Legionellae die within 2 minutes.

At 140 Degrees F (60 Degrees C): Legionellae die within 32 minutes.

At 135 Degrees F (57.5 Degrees C) Legionellae die within 2 hours.

At 131 Degrees F (55 Degrees C): Legionellae die within 5 to 6 hours.

Above 122 Degrees F (50 Degrees C): They can survive but do not multiply.

95 to 115 Degrees F(35 to 46 Degrees C): Ideal Legionellae Bacteria growth range.

68 to 122 Degrees F (20 to 50 Degrees C): Legionellae Bacteria growth range.

Below 68 Degrees F (20 Degrees C): Legionellae can survive but are dormant.

The Legionellae bacteria cannot survive water temperatures above 131 degrees Fahrenheit (55 Degrees C) for more than five or six hours. The bacteria die instantly at temperatures above 158 degrees F (70 degrees C). General protection against the bacteria can be achieved by designing an operating water temperature of at least 140 degrees F (60 degrees C) or higher. As temperatures increase, so does the risk of scalding.

For system water temperatures below 140 Degrees F (60 Degrees C) special provisions are necessary to allow for cleaning and chemical treatment procedures for addressing the Legionellae Bacteria in the Domestic Hot Water System. Given a storage temperature of 140 degrees Fahrenheit that should be high enough to protect the water heater from the bacteria, but in open systems with Legionellae bacteria in the municipal water supply, it would continually re-seed the potable hot water system with high dosages of potentially Legionellae bacteria infested water. This is another reason why combined systems should have a closed loop for the heating hot water system.

Pitfall Number 22 - Leakage of Boiler Water. When boiler water is at a higher temperature than 140 degrees Fahrenheit, (180 to 210 degrees Fahrenheit) and it is allowed to leak through a faulty zone valve or solenoid valve if there is debris in the line or if the boiler water is allowed to flow by gravity circulation through a circulating pump that is

de-energized, there is the potential for overheating the domestic hot water. In these cases a system can have a thermostat set to de-energize the circulating pumps or close the solenoid valve and if they leak, the domestic hot water can rise above the set point to a temperature close to the boiler water temperature. A thermostat that controls a solenoid valve or circulating pumps on the water heater should never be used to control the temperature in a domestic hot water system because thermostats allow too much of a temperature variation from when it senses the water to turn on or off the pump or solenoid valve and there is potential for leakage and temperature creep. The best way to address this is to provide a thermostatic mixing valve that conforms to ASSE 1017 on the domestic hot water line coming from the hot water tank to provide a safe hot water distribution temperature. If you are considering a combined system, avoiding these pitfalls listed above should help keep your building warm and the occupants in a safe temperature of hot water. If you don't avoid these pitfalls you could find yourself in hot water. Another option would be to keep life simple and keep the systems separate. Then you will not have to worry about someone coming along later and messing up your system design with system modifications or poor maintenance that can create scalding issues then steer clear of combined heating hot water and domestic hot water systems and you will steer clear of potential litigation also.

Cost Impact

The code change proposal will increase the cost of construction .

A combination water heater/space heater equipment will cost more.

Internal ID: 2380

P71-18 Part I

IPC: 501.2, 607.2.2

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

501.2 Water heater as space heater. Where a combination potable water heating and space heating system requires water for space heating at temperatures greater than 140°F (60°C), a ~~master thermostatic temperature-actuated~~ mixing valve complying with ASSE 1017 shall be provided to limit the water supplied to the potable *hot water* distribution system to a temperature of 140°F (60°C) or less. The potability of the water shall be maintained throughout the system.

607.2.2 Piping for recirculation systems having ~~master thermostatic temperature-actuated~~ mixing valves. Where a ~~thermostatic temperature-actuated~~ mixing valve is used in a system with a hot water recirculating pump, the *hot water* or *tempered water* return line shall be routed to the cold water inlet pipe of the water heater and the cold water inlet pipe or the hot water return connection of the ~~thermostatic temperature-actuated~~ mixing valve.

Internal ID: 528

P71-18 Part II

IRC: P2802.1, P2803.2

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

P2802.1 Water temperature control. Where heated water is discharged from a solar thermal system to a *hot water* distribution system, a ~~thermostatic-temperature-actuated~~ mixing valve complying with ASSE 1017 shall be installed to temper the water to a temperature of not greater than 140°F (60°C). Solar thermal systems supplying *hot water* for both space heating and domestic uses shall comply with Section P2803.2. A temperature-indicating device shall be installed to indicate the temperature of the water discharged from the outlet of the mixing valve. The ~~thermostatic-temperature-actuated~~ mixing valve required by this section shall not be a substitute for water-temperature limiting devices required by Chapter 27 for specific fixtures.

P2803.2 Temperature control. Where a combination water heater-space heating system requires water for space heating at temperatures exceeding 140°F (60°C), a ~~master thermostatic-temperature-actuated~~ mixing valve complying with ASSE 1017 shall be installed to temper the water to a temperature of not greater than 140°F (60°C) for domestic uses.

Reason:

This proposal is almost editorial in nature as it is simply making the terminology (for the same component), consistent everywhere it is used in the code. The code currently uses different terminology to describe mixing valves complying with ASSE 1017: “master thermostatic valves” and “temper-actuated mixing valves”. There are also variations: “master thermostatic mixing valve,” “master thermostatic valves,” and “thermostatic mixing valve.” For consistency, the code needs to use the same terminology everywhere and that terminology should be aligned with title of the ASSE 1017 standard: “... Temperature-Actuated Mixing Valves for Hot Water Distribution Systems.” Note that IPC Section 613.1 and IRC P2724.1 already use the proposed terminology. Those sections indicate the location for such valves: at the hot water source. This aligns with manufacturer’s instructions and the listing for ASSE 1017 valves. Thus, there is no need for the ambiguous term of “master” in the code.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 3426

P72-18

IPC: 501.8

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Self (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Revise as follows:

501.8 ~~Temperature-Water heater thermostat controls.~~ Hot water supply systems-Water heaters shall be equipped with automatic temperature controls capable of adjustments from the lowest to the highest acceptable temperature settings for the intended temperature operating range. The water heater thermostat shall not be used by itself for scald prevention or to limit the hot water temperatures being delivered to the plumbing fixtures as required in Chapter 4 of this code.

Reason:

The water heater thermostat should not be relied upon to accurately control the hot water system delivery temperature. The thermostat is located in the bottom of the water heater and is intended to only sense the incoming cold water and anticipate the need for hot water by turning the burner "ON" and "OFF". There is no temperature sensor in the top of a storage type water heater and the combination gas control valve and thermostat cannot sense or control the temperature of the hot water in the top of the tank or the outlet temperature. When there are intermittent short draws of hot water, the short draws of cold water enter the bottom of the heater and cause the burner to cycle "ON". This creates a condition known as stacking where the already heated water in the top of the heater gets overheated with each consecutive intermittent burner cycle from a short draw of water. (2-3 gallons) The hot water can exceed the water heater thermostat setting and therefore, thermostat dial on the water heater cannot be relied upon to accurately control the outlet temperature of the water heater. In some cases the hot water temperature can be as much as 30 or more degrees hotter than the thermostat setting on a water heater. This is why the thermostat on the water heater should not be used as a system temperature controller. Water heater thermostats are not tested for accurate control of temperatures on the outlet of the water heater. There are some newer water heaters on the market with sophisticated controls, but there is currently no industry standard test for verifying the ability of a water heater to accurately control the outlet hot water temperature. At 120 F a person would have about 5 minutes to get out of harms way, but with the inaccuracy of 30 degrees you can have the heater set at 120 F and get 150 F or hotter water from the water heater. At 150 F a person would be scalded in about 1-1/2 seconds. That would not be enough time to realize what is happening, react and try to adjust the temperature or get out of harms way. Even if the temperature was readjusted, it would still flow out of a shower head at the current temperature for about 6-10 more seconds (depending on the shower head flow rate) at the scalding hot temperature before the cooler water flowed out of the shower head. This would surely lead to serious burn injuries. This is already a requirement in other parts of the code for specific applications. This code change is just clarifying the language and adding it to the water heater chapter. By changing the code here, it covers all fixtures where scalding can occur.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is already a requirement in other parts of the code for specific applications. This code change is just clarifying the language and adding it to the water heater chapter.

Internal ID: 1992

P73-18

IPC: 502.4 (New), 502.4

Proponent: Richard Houle, Reliance Worldwide Corporation, representing Reliance Worldwide Corporation (rich.houle@rwc.com)

2018 International Plumbing Code

Add new text as follows:

502.4 Supports. Tank type water heaters shall be laterally supported to prevent the water heater from tipping over. The support shall be attached on the upper 1/3 of the tank. The support shall not compromise the outer shell of the tank and shall not violate the water heater manufacturer's installation requirements.

Revise as follows:

~~502.4~~ **502.4.1 Seismic supports.** Where earthquake loads are applicable in accordance with the International Building Code, water heater supports shall be designed and installed for the seismic forces in accordance with the International Building Code.

Reason:

Heavy equipment, especially those with a high center of gravity such as is a storage water heater, can be knocked over accidentally. When they do:

- a. There is the potential for bodily injury or death, should the equipment tip over onto a person
- b. There is the potential for a fire and/or explosion, should a fuel gas line be damaged or ruptured due to the equipment's movement.

In the case of a water heater or similar large water containing vessel, a vital source of potable water storage can be lost if the tank tips over and drains out onto the ground. This code requirement currently exists in the building code for equipment weighing 400 lbs or more. A 40 gallon water heater will weigh close to 400 lbs when filled with water.

Cost Impact

The code change proposal will increase the cost of construction .

A restraint strap kit is only about \$20 and takes about 15 minutes to install.

Internal ID: 1510

P74-18

IPC: 502.6 (New)

Proponent: Ronald George, representing Self (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Add new text as follows:

502.6 Water Heater Replacement. When a water heater is replaced or repaired, all downstream hot water fixtures with temperature limit requirements, required in Chapter 4 of this code, shall be checked to make sure the maximum temperature limit-stops or other temperature limiting devices are properly adjusted to assure the maximum allowable temperature is not exceeded.
Where a downstream fixture has a non-code compliant shower or tub/shower valve, the valve shall be replaced with a code-compliant shower control, or other approved temperature control devices shall be installed to prevent scalding and thermal shock. The water heater thermostat shall not be used as a control for meeting this requirement.

Reason:

Many scald injuries are a result of a water heater replacement or water heater maintenance where the temperature is different upon completion of the work. It is a very important safety issue when a change has been made in the hot water distribution temperature to check all the maximum temperature limit-stop adjustments or temperature limiting devices downstream of the water heating equipment to prevent scalding incidents. Many scalding incidents occur even with code compliant shower valves or tempering valves when the incoming hot water temperature significantly changes to these devices. The American Society of Sanitary Engineering is working on a white paper addressing this issue. The white paper is intended to educate the industry about the issue, however, this code language is needed to mandate the checking and adjusting of the temperatures and allow enforcement of the issue. If this language is passed, an inspector can check fixtures downstream of a water heater after it is installed to assure the temperature limiting devices or temperature limit-stops have been adjusted properly in order to ensure a safe installation.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no material cost associated with this code change. this is simply giving the installer direction and the code official the authority to check for this very important and potentially deadly safety issue.

Internal ID: 1964

P75-18

IPC: 504.7

Proponent: Ronald George, representing Code Study & Development Committee of Southeast Michigan (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Revise as follows:

504.7 Required pan. Where a ~~storage tank type~~ water heater or a hot water storage tank is installed in a location where water leakage ~~from the tank~~ will cause damage, the ~~tank water heater~~ shall be installed in a pan constructed of one of the following:

1. Galvanized steel or aluminum of not less than 0.0236 inch (0.6010 mm) in thickness.
2. Plastic not less than 0.036 inch (0.9 mm) in thickness.
3. Other *approved* materials.

A plastic pan shall not be installed beneath a gas-fired water heater.

Exception: Drain pans shall not be required under tankless water heaters installed under lavatories or sinks in rooms having water impervious floors and where any leaks from the heater would be readily observable.

Reason:

During the last code change cycle, this section was changed to address drain pans for only tank-type water heaters. All water heaters can leak at some point and any water heater that can leak and cause water damage to a building structure should have a drain pan installed. The purpose of this section is to prevent water damage to the building. The code language as it currently is written does not provide protection for water heaters other than tank type heaters. Other types of water heaters, can fail and cause water damage to buildings, but the current code language only addresses tank type heaters. The proponent in the last code cycle tried to make tankless heaters exempt from drain pan and mentioned the intent was to not require drain pans under tankless water heaters in a bathroom. They should have proposed an exception addressing the tankless heaters. As written the section only applies to tank type water heater and does not distinguish a location. Tankless heaters, copper fin tube water heaters, instantaneous heaters, plate & frame heat exchangers and water tube boilers used as water heaters, and shell & tube heat exchangers used as water heaters are all not classified as tank type heaters. These larger style water heaters should have drain pans installed under them if they are installed in an attic or in another areas that could cause damage to the building from a leak. This code change proposal corrects this oversight and adds an exception for tankless heaters in bathrooms.

Cost Impact

The code change proposal will increase the cost of construction .

There will be the added cost and labor for some tankless water heater installations needing a pan (with a pan drain.)

Internal ID: 1109

P76-18

IPC: 202, 601.5

Proponent: Sidney Cavanaugh, representing LMK Technologies (sidneycavanaugh@yahoo.com)

2018 International Plumbing Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

PRESSURE PIPING REHABILITATION. The process of the scouring or cleaning the interior surface of pressure pipe or fittings followed by resurfacing with epoxy or epoxy resin to create a smooth interior service to restore the original performance to the pipes and fittings.

Revise as follows:

601.5 Rehabilitation of pressure piping systems. ~~Where pressure piping systems are rehabilitated using an~~The epoxy lining system , such lining system for pressure piping rehabilitation shall comply with ASTM F 2831.

Reason:

To add needed definition for rehabilitation as it relates to pressure piping systems to the IPC

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is simply a definition to clarify what rehabilitation of pressure piping is. Section 601.5 is only changed to make it agree with the new defined term.

Internal ID: 508

P77-18 Part I

IPC: 602.3.5

Proponent: Jeremy Brown, representing NSF International (brown@nsf.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

602.3.5 Pumps. Pumps shall be rated for the transport of potable water. Pumps in an individual water supply system shall be constructed and installed so as to prevent contamination from entering a potable water supply through the pump units. Pumps intended to supply drinking water shall conform to NSF 61. Pumps shall be sealed to the well casing or covered with a water-tight seal. Pumps shall be designed to maintain a prime and installed such that ready access is provided to the pump parts of the entire assembly for repairs.

Internal ID: 145

P77-18 Part II

IRC: P2903.3.1 (New)

Proponent: Jeremy Brown, representing NSF International (brown@nsf.org)

2018 International Residential Code

Add new text as follows:

P2903.3.1 Pumps handling drinking water. Pumps intended to supply drinking water shall conform to NSF 61.

Reason:

The code would be more protective of public health if it required pumps to meet requirements of NSF 61. NSF/ANSI Standard 61 Drinking Water System Components-Health Effects helps to ensure that products/materials will not contribute harmful levels of contaminants to drinking water. The current IPC and IRC already requires conformance to NSF 61 for pipes, fittings, faucets, valves and tanks intended to supply drinking water. This requirement should also apply to pumps.

Pumps are within the scope of NSF 61 (as are virtually all drinking water system components).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Because of the wide variety of NSF 61 certified pumps and most specifications requiring NSF 61 already, this change is not expected to increase the cost of construction.

Internal ID: 3422

P78-18

IPC: 604.1, CHAPTER 15

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Plumbing Code

Revise as follows:

604.1 General. The design of the water distribution system shall be in accordance with ASHRAE 188 and shall conform to *accepted engineering practice*. Methods utilized to determine pipe sizes shall be *approved*.

Add new standard(s) follows:

ASHRAE

ASHRAE
1791 Tullie Circle NE
Atlanta GA 30329

ASHRAE 188-2018:

Legionellosis: Risk Management for Building Water Systems (ANSI/ASHRAE Approved)

Reason:

ASHRAE Standard 188 was developed with the intent of providing code officials and building operators information on how to manage the risk of legionellosis. . ASHRAE Standard 188 was published on June 26, 2015, and is now publicly available as a final, published ANSI Standard. ASHRAE Standard 188 (2018) has been in continuous maintenance, and several addenda have been approved and published, as well as improvements in code compatible language which will be incorporated into the published 2018 standard. There are many design considerations in the ASHRAE standard that will help minimize Legionella bacteria growth in building water systems which can lead to Legionnaires Disease when water droplets are aerosolized from shower heads, and other building water systems and fixtures that aerosolize water droplets. Following the ASHRAE Standard will minimize the risk of a Person contracting Legionnaires' disease.

For more information on the standard, go here: <http://www.techstreet.com/ashrae/products/1897561>

Bibliography:

www.LegionellaPrevention.org

www.Plumb-TechLLC.com

Cost Impact

The code change proposal will increase the cost of construction .

The cost of construction of the plumbing system to eliminate dead legs and provide other design concepts to address temperature and stagnation is estimated to be about 10 - 15 percent more to comply with this standard, however it will provide for hygienic system designs that will minimize legionella bacteria growth and help prevent Legionnaires Disease. See www.LegionellaPrevention.org.

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 188-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 358

P79-18 Part I

IPC: 604.3, TABLE 604.3

Proponent: Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

604.3 Water distribution system design criteria. The water distribution system shall be designed, and pipe sizes shall be selected such that under conditions of sized for peak demand, the capacities at the fixture supply pipe outlets shall be not less than using the values shown in Table 604.3. The minimum flow rate and flow pressure provided to fixtures and appliances not listed in Table 604.3 shall be in accordance with the manufacturer's installation instructions.

TABLE 604.3
FLOW RATES AND PRESSURES FOR DESIGNING WATER DISTRIBUTION SYSTEM DESIGN CRITERIA REQUIRED
CAPACITY AT FIXTURE SUPPLY PIPE OUTLET SYSTEMS

FIXTURE SUPPLY OUTLET SERVING	FLOW RATE^a (gpm)	FLOW PRESSURE (psi)
Bathtub, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	4	20
Bidet, thermostatic mixing valve	2	20
Combination fixture	4	8
Dishwasher, residential	2.75	8
Drinking fountain	0.75	8
Laundry tray	4	8
Lavatory, private	0.8	8
Lavatory, private, mixing valve	0.8	8
Lavatory, public	0.4	8
Shower	2.5	8
Shower, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	2.5 ^b	20
Sillcock, hose bibb	5	8
Sink, residential	1.75	8
Sink, service	3	8
Urinal, valve	12	25
Water closet, blow out, flushometer valve	25	45
Water closet, flushometer tank	1.6	20
Water closet, siphonic, flushometer valve	25	35
Water closet, tank, close coupled	3	20
Water closet, tank, one piece	6	20

For SI: 1 pound per square inch = 6.895 kPa, 1 gallon per minute = 3.785 L/m.

- a. For additional requirements for flow rates and quantities, see Section 604.4.
- b. Where the shower mixing valve manufacturer indicates a lower flow rating for the mixing valve, the lower value shall be applied.

Internal ID: 1351

P79-18 Part II

IRC: P2903.1, TABLE P2903.1

Proponent: Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

2018 International Residential Code

Revise as follows:

P2903.1 Water supply system design criteria. The water service and water distribution systems shall be designed and ~~pipe sizes shall be selected such that under conditions of~~ sized for peak demand, ~~the capacities at the point of outlet discharge shall be not less than~~ using values shown in Table P2903.1.

TABLE P2903.1**REQUIRED CAPACITIES AT POINT OF OUTLET DISCHARGE FLOW RATE AND PRESSURES FOR DESIGNING PIPING SYSTEMS**

FIXTURE SUPPLY OUTLET SERVING	FLOW RATE (gpm)	FLOW PRESSURE (psi)
Bathtub, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	4	20
Bidet, thermostatic mixing valve	2	20
Dishwasher	2.75	8
Laundry tray	4	8
Lavatory	0.8	8
Shower, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	2.5 ^a	20
Sillcock, hose bibb	5	8
Sink	1.75	8
Water closet, flushometer tank	1.6	20
Water closet, tank, close coupled	3	20
Water closet, tank, one-piece	6	20

For SI: 1 pound per square inch = 6.895 kPa, 1 gallon per minute = 3.785 L/m.

- a. Where the shower mixing valve manufacturer indicates a lower flow rating for the mixing valve, the lower value shall be applied.

Reason:

The section and the table were intended to be used to set design capacities for the domestic water systems, not for field testing. With the emphasis on low flow fixtures and lower flow rating for mixing valves these numbers are causing confusion and misinterpretation in the field. Looking at the table what would be the health or safety reason for a bathtub to be required to flow at 4 gpm at 20 psi, or a water closet at 6 gpm at 20 psi or even 3 gpm at 20 psi as the table states? Balanced mixing valves are shown as 2.5 gpm at 20 psi or even lower if the manufacturer indicates. How does the inspector regulate the psi from 20 to 8 depending on the fixture being measured? These are all design specifications and not volumes to be measured at the fixture at differing psi.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification change that will not impact the cost of construction.

Internal ID: 1344

P80-18

IPC: 604.3.1 (New), Chapter 15

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Self (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Add new text as follows:

604.3.1 System design for building water safety. Design of water distribution systems shall comply with Chapters 1 through 8 of ASHRAE 188.

Add new standard(s) follows:

ASHRAE

ASHRAE
1791 Tullie Circle NE
Atlanta GA 30329

188-2015:

Legionellosis: Risk Management for Building Water Systems.

Reason:

Since the last code cycle, ASHRAE completed standard 188 titled: Legionellosis: Risk Management for Building Water Systems. Chapter 8 covers items that need to be considered during the design stage of a domestic water system. This is especially important since the water flow from plumbing fixtures have been reduced to about 20% of the flows prior to the 1992 Energy Policy Act which established maximum flow rates for plumbing fixtures. These lower flow rates are allowing "Aging Water" which is allowing water treatment chemicals (like Chlorine, Monochlorine, etc.) to dissipate to levels that are not capable of controlling bacteria growth in buildings. As other water conservation programs are enacted to further reduce flow rates, there are more and more reported cases of Legionellosis or Legionnaires' disease. This code change includes design considerations to control the risk of Legionella bacteria growth.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only offers direction to designers on how to better organize piping systems that are already required. Better piping organization doesn't cause any more or less cost for materials or labor.

Analysis: A review of the standard proposed for inclusion in the code, ASHRAE 188-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 2081

P81-18

IPC: TABLE 604.4

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Plumbing Code

Revise as follows:

**TABLE 604.4
 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS**

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY^b
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head ^a	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	1.0 0.5 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standards.

Reason:

Urinals account for a significant portion of indoor water usage in commercial and institutional settings. Manufacturers have responded with superior and better-performing urinals having a maximum flush rate of 0.5 gallons, without sacrificing performance.

All water flushing urinals produce calcite build-up in the urinal trapway and drain pipes caused by the bonding of the mineral ions in the flushing water with the sediment in urine. As such, build-up occurs in all water flushing urinals from 1.0 gpf down to 0.1 gpf and is not any greater for 0.5 gpf urinals.

Based on WaterSense product listings from January 2018, there are 160 models of flushing urinals from 20 brands and 239 models of urinal valves from 20 brands that meet the 0.5 gpf criterion, demonstrating widespread availability and commercial viability of more efficient urinals.

Bibliography:

EPA WaterSense - <https://www.epa.gov/watersense/urinals>

Considerations for Reduced Water Consumption Rates of Urinal Fixtures (Sloan Valve) - <https://www.sloan.com/sites/default/files/2016-01/hybrid-urinal-whitepaper.pdf>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no appreciable cost difference between urinal flush valves at 0.5gpf and 1.0 gpf .

Internal ID: 1530

P82-18 Part I

IPC: TABLE 604.4

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

**TABLE 604.4
 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS**

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY^b
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head ^{a,c}	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standards.
- c. Where a shower compartment is served by multiple shower heads, the concurrent discharge of all shower heads controlled by a single valve shall not exceed the maximum flow rate.

Internal ID: 556

P82-18 Part II

IRC: TABLE P2903.2

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Residential Code

Revise as follows:

TABLE P2903.2
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS^b

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	2.2 gpm at 60 psi
Shower head ^{a,c}	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A handheld shower spray shall be considered to be a shower head.
- b. Consumption tolerances shall be determined from referenced standards.
- c. Where a shower compartment is served by multiple shower heads, the concurrent discharge of all shower heads controlled by a single valve shall not exceed the maximum flow rate.

Reason:

This code change limits the combined shower head flow rate to 2.5 gpm where multiple heads are installed unless the shower is designed to allow only one shower head to operate at a time.

Multiple shower heads were not common when EAct was enacted 25 years ago to limit the flow rate of shower heads. Since then, shower compartments have trended towards multiple shower heads and body sprays.

This code change ensures that where a shower compartment is served by multiple shower heads, the maximum flow rate is 1) controlled by a single valve for each shower head, 2) designed to allow only one shower head to be in operation at a time or 3) controlled by a single valve for the combined flow rate of multiple heads not exceeding the maximum flow rate.

Shower compartments with multiple showering stations are typically provided with a separate valve for each shower head. Shared shower compartments with separate valve controls are common features and meet the intent of this code change.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change is based on the shower compartment design and number of installed shower heads. It does not require any additional fixtures or valves to be installed.

Polyvinyl chloride (PVC) plastic pipe	ASTM D 1785; ASTM D2241; ASTM D2672; CSA B137.3
Stainless steel pipe (Type 304/304L)	<u>ASTM A269</u> ; ASTM A312; ASTM A778
Stainless steel pipe (Type 316/316L)	<u>ASTM A269</u> ; ASTM A312; ASTM A778

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

A269/A269M-15a:

Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General

Reason:

Adding another standard for stainless steel piping into the code increases flexibility in choices of piping.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is a clarification of existing requirements. No new materials or labor are required by this proposal thus, there is not a cost increase.

Analysis: A review of the standard proposed for inclusion in the code, ASTM A269 / A269M - 15a, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 506

P84-18

IPC: TABLE 605.3

Proponent: Pennie L Feehan, Copper Development Association, representing Copper Development Association (penniefeehan@me.com)

2018 International Plumbing Code

Revise as follows:

**TABLE 605.3
WATER SERVICE PIPE**

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe	ASTM D1527; ASTM D2282
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM D2846; ASTM F441; ASTM F442; CSA B137.6
Chlorinated polyvinyl chloride/aluminum/chlorinated polyvinyl chloride (CPVC/AL/CPVC)	ASTM F2855
Copper or copper-alloy pipe	ASTM B42; <u>ASTM B43</u> , ASTM B302,
Copper or copper-alloy tubing (Type K, WK, L, WL, M or WM)	ASTM B75; ASTM B88; ASTM B251; ASTM B447
Cross-linked polyethylene (PEX) plastic pipe and tubing	ASTM F876; AWWA C904; CSA B137.5
Cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pipe	ASTM F1281; ASTM F2262; CSA B137.10
Cross-linked polyethylene/aluminum/high-density polyethylene (PEX-AL-HDPE)	ASTM F1986
Ductile iron water pipe	AWWA C151/A21.51; AWWA C115/A21.15
Galvanized steel pipe	ASTM A53
Polyethylene (PE) plastic pipe	ASTM D2239; ASTM D3035; AWWA C901; CSA B137.11
Polyethylene (PE) plastic tubing	ASTM D2737; AWWA C901; CSA B137.1
Polyethylene/aluminum/polyethylene (PE-AL-PE) pipe	ASTM F1282; CSA B137.9
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F2769; CSA B137.18
Polypropylene (PP) plastic pipe or tubing	ASTM F2389; CSA B137.11
Polyvinyl chloride (PVC) plastic pipe	ASTM D 1785; ASTM D2241; ASTM D2672; CSA B137.3
Stainless steel pipe (Type 304/304L)	ASTM A312; ASTM A778
Stainless steel pipe (Type 316/316L)	ASTM A312; ASTM A778

Reason:

When combining copper and copper alloy sections, this Standard ASTM B43 was accidentally removed from IPC Water Service Pipe Table 605.3. It is in IPC Water Distribution Pipe Table 605.4. It is also in the IRC Water Service Pipe Table 2906.4 and Water Distribution Pipe Table 2906.5. The IRC and the IPC need to correlate.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Only adding a standard reference to the table to clarify the code.

Internal ID: 450

P85-18

IPC: TABLE 605.4

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Code Study & Development Committee of Southeast Michigan (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Revise as follows:

**TABLE 605.4
WATER DISTRIBUTION PIPE**

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC) plastic pipe and tubing	ASTM D2846; ASTM F441; ASTM F442; CSA B137.6
Chlorinated polyvinyl chloride/aluminum/chlorinated polyvinyl chloride (CPVC/AL/CPVC)	ASTM F2855
Copper or copper-alloy pipe	ASTM B42; ASTM B302; ASTM B43
Copper or copper-alloy tubing (Type K, WK, L, WL, M or WM)	ASTM B75; ASTM B88; ASTM B251; ASTM B447
Cross-linked polyethylene (PEX) plastic tubing	ASTM F876; CSA B137.5
Cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pipe	ASTM F1281; ASTM F2262; CSA B137.10
Cross-linked polyethylene/aluminum/high-density polyethylene (PEX-AL-HDPE)	ASTM F1986
Ductile iron pipe	AWWA C151/A21.51; AWWA C115/A21.15
Galvanized steel pipe	ASTM A53
Polyethylene/aluminum/polyethylene (PE-AL-PE) composite pipe	ASTM F1282
Polyethylene of raised temperature (PE-RT) plastic tubing	ASTM F2769; CSA B137.158
Polypropylene (PP) plastic pipe or tubing	ASTM F2389; CSA B137.11
Stainless steel pipe (Type 304/304L)	ASTM A312; ASTM A778
Stainless steel pipe (Type 316/316L)	ASTM A312; ASTM A778

Reason:

Galvanized piping corrodes and causes water quality issues when it is installed in a potable water system. Galvanized piping also provides a rough surface for biofilm to cling to and flourish. This proposal is to remove galvanized piping as a pipe material for potable water systems. It can still be used in process water and non-potable water systems.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed changes will reduce the life cycle cost of the system because a system installed with galvanized pipe will need to be replaced after about 15 years or so, which is much shorter than the life expectancy for a typical building.

West Conshohocken PA 19428-
2959

F3226/F3226M-16:

Standard Specification for Metallic Press-Connect Fittings for Piping and Tubing

Reason:

ASTM F3226-16 Standard Specification for Metallic Press-Connect Fittings for Piping and Tubing Systems is now published and includes Carbon Steel, Stainless Steel, Copper and Copper-Alloy material grades. By including this standard will provide a reference standard for Stainless Steel Press-Connect Fittings and provide an additional Press-connect standard for Copper and copper alloy fittings.

Bibliography:

ASTM F3226 Standard Specification for Metallic Press-Connect Fittings for Piping and Tubing Systems

ASTM International

2016 edition

www.astm.org

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This standard is not the only standard that the pipe fittings can meet in accordance with the Pipe Fittings Table, this is just an alternative standard that some manufacturer's have tested their products to and would like to see recognized as an acceptable standard for pipe fittings. Testing to this standard is optional and no existing standards have been removed or replaced by the proposed addition of this standard.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F3226/F3226M-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Stainless steel (Type 30 ⁴ / _{304L}) pipe	ASTM A312; ASTM A778
Stainless steel (Type 31 ⁶ / _{316L}) pipe	ASTM A312; ASTM A778
Steel	ASME B16.9; ASME B16.11; ASME B16.28

Add new standard(s) follows:

F3226 F3226/F3226M—16e1:

Standard Specification for Metallic Press-Connect Fittings for Piping and Tubing Systems

Reason:

Press-connect joint fittings now have an ASTM standard that needs to be included in the code.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Press-connect joints are not required to be used-it is a designer or installer decision. No new materials or labor are required by this proposal thus, there is not a cost increase.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F3226/F3226M-16e1, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 3430

P88-18 Part I

IPC: 605.12.3, 605.13.6

Proponent: Jeremy Brown, representing NSF International (brown@nsf.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

605.12.3 Solder joints. Solder joints shall be made in accordance with ASTM B828. Cut tube ends shall be reamed to the full inside diameter of the tube end. Joint surfaces shall be cleaned. A flux conforming to ASTM B813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B32. The joining of water supply piping shall be made with *lead-free solder and fluxes*. "Lead free" shall mean a chemical composition equal to or less than 0.2-percent lead. Solder and flux joining pipe or fittings intended to supply drinking water shall conform to NSF 61.

605.13.6 Solder joints. Solder joints shall be made in accordance with the methods of ASTM B828. Cut tube ends shall be reamed to the full inside diameter of the tube end. Joint surfaces shall be cleaned. A flux conforming to ASTM B813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B32. The joining of water supply piping shall be made with *lead-free solder and flux*. "Lead free" shall mean a chemical composition equal to or less than 0.2-percent lead. Solder and flux joining pipe or fittings intended to supply drinking water shall conform to NSF 61.

Internal ID: 1232

P88-18 Part II

IRC: P2906.15

Proponent: Jeremy Brown, representing NSF International (brown@nsf.org)

2018 International Residential Code

Revise as follows:

P2906.15 Soldered and brazed joints. Soldered joints in copper and copper alloy tubing shall be made with fittings *approved* for water piping and shall conform to ASTM B828. Surfaces to be soldered shall be cleaned bright. Fluxes for soldering shall be in accordance with ASTM B813. Brazing fluxes shall be in accordance with AWS A5.31M/A5.31. Solders and fluxes used in potable water-supply systems shall have a lead content of not greater than 0.2 percent. Solder and flux joining pipe or fittings intended to supply drinking water shall conform to NSF 61.

Reason:

NSF/ANSI Standard 61 Drinking Water System Components-Health Effects helps to ensure that products/materials will not contribute harmful levels of contaminants to drinking water. The current IPC and IRC already requires conformance to NSF 61 for pipes, fittings, faucets, valves and tanks intended to supply drinking water. This requirement should also apply to solders and flux. The current requirements in this section address lead content only but do not address the potential for other chemical contaminants as NSF 61 does. The code would be more protective of public health if it required NSF 61.

Anyone wanting a copy of the standard for the purpose of reviewing this proposal may request a copy from brown@nsf.org.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Because there are many products on the market meeting this requirement, this is not expected to increase the cost of construction.

Internal ID: 3420

P89-18 Part I

IPC: 202, 605.13.7

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Add new definition as follows:

SECTION 202 GENERAL DEFINITIONS

PUSH-FIT FITTING

A mechanical fitting that joins pipes or tubes and achieves a seal by mating the pipe or tube into the fitting.

Revise as follows:

605.13.7 Push-fit fitting joints. Push-fit fitting joints shall conform to ASSE 1061 and shall be installed in accordance with the manufacturer's instructions.

Internal ID: 2220

P89-18 Part II

IRC: R202, P2906.21

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2018 International Residential Code

Revise as follows:

P2906.21 Push-fit fitting joints. Push-fit fitting joints shall be used only on copper-tube-size outside diameter dimensioned CPVC, PEX and copper tubing. Push-fit joints shall conform to ASSE 1061 and shall be installed in accordance with the manufacturer's instructions.

Add new definition as follows:

SECTION R202 DEFINITIONS

PUSH-FIT FITTING

A mechanical fitting that joins pipes or tubes and achieves a seal by mating the pipe or tube into the fitting.

Reason:

Adding the definition from the ASSE 1061 standard for Push-fit fittings.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Adding a definition does not affect the cost of construction.

Internal ID: 3438

P90-18

IPC: 605.23.1

Proponent: David Runnels, representing Select Ventures LLC (drunnels@selectventures.com)

2018 International Plumbing Code

Revise as follows:

605.23.1 Copper or copper-alloy tubing to ~~galvanized steel pipe, steel~~. Joints between copper pipe or tubing and ~~galvanized steel pipe, steel fittings or steel appliance connections~~ shall be made with a copper-alloy or dielectric fitting or a dielectric union conforming to ASSE 1079. The copper tubing shall be soldered to the fitting in an *approved* manner, and the fitting shall be screwed to the threaded ~~pipe~~ steel connection.

Reason:

This section as written requires the isolation of copper pipe from iron pipe. Without the isolation, electrolytic action will destroy the copper pipe and deposit copper inside the iron.

However, all of this will also occur if the copper pipe is in contact with ANYTHING iron - it need not be a pipe.

For this reason I am suggesting that the word "pipe" is supplemented to also include iron fittings and iron pumps and other appliances.

Furthermore, I am suggesting removal of the word "galvanized" from the section title and from the text of the section. The meaning is more clear, and the presence or absence of galvanizing is immaterial.

In our area (Tulsa, Oklahoma) we have a number of houses which were built in the early 1990s with copper water pipes under the floor slab. Those copper pipes on the hot water side are connected to an iron re-circulating pump and an (iron) water heater. The result is that the copper pipe deteriorates and leaks and the copper is deposited within the water heater. Ultimately, it is necessary to remove the slab and replace the pipe. Eventually it is also necessary to replace the water heater. In my house, we went through this entire process five times before I figured out the nature of the problem. The plumber never did notice.

Note that in these cases there is no iron pipe and nothing is galvanized. Technically our installation complies with the code!

Cost Impact

The code change proposal will increase the cost of construction .

This change will add to the construction cost the cost of one fitting (< \$10).

However, this change will reduce the cost of later repairs by approximately \$100,000.

P91-18

IPC: 606.1

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmann@jeffco.us)

2018 International Plumbing Code

Revise as follows:

606.1 Location of full-open valves. Full-open valves shall be installed in the following locations:

1. On the building water service pipe from the public water supply near the curb.
2. On the water distribution supply pipe at the entrance into the structure.
 - 2.1 In multiple tenant buildings, where a common water supply piping system is installed to supply other than one and two family dwellings, a main shutoff valve shall be provided for each tenant.
3. On the discharge side of every water meter.
4. On the base of every water riser pipe in occupancies other than multiple-family residential occupancies that are two stories or less in height and in one- and two-family residential occupancies.
5. On the top of every water down-feed pipe in occupancies other than one- and two-family residential occupancies.
6. On the entrance to every water supply pipe to a dwelling unit, except where supplying a single fixture equipped with individual stops.
7. On the water supply pipe to a gravity or pressurized water tank.
8. On the water supply pipe to every water heater.

Reason:

It is a needless inconvenience to have to shut down an entire building when tenants need to work on their own water piping or in the case of emergencies. For the minimal cost of a valve, it makes sense to isolate tenant spaces just as what is done for gas piping. Opening the system causes air in pipes in other units that they might not be aware of and possibly causing a water hammer situation that can have a negative effect on the piping.

Cost Impact

The code change proposal will increase the cost of construction .

The increase will be the cost of the valve and the labor to install it.

Internal ID: 118

P92-18

IPC: 606.5 (New), 606.5.1 (New)

Proponent: Richard Houle, Reliance Worldwide Corporation, representing Reliance Worldwide Corporation (rich.houle@rwc.com)

2018 International Plumbing Code

Add new text as follows:

606.5 Leak detection devices. A leak detection device shall be installed after the main water shut off valve and after the pressure reducing valve, where installed. The leak detection device shall be capable of measuring water flow down to 0.25 gpm. All water contact components shall be third party certified for compliance with NSF 61 and NSF 372. Where the device includes an automatic flow control valve, the valve shall comply with one of the standards indicated in Table 605.7. The leak detection system shall include an integrated automatic notification system for alerting users of potential leaks.

606.5.1 Automatic valves in fire suppression systems. Where a fire suppression system is installed, the automatic flow control valve shall be installed after the branch to the fire suppression system. Where a multi-purpose fire suppression system is installed, an automatic flow control valve shall not be installed.

Reason:

Water leaks in homes account for a significant amount of wasted water, whether it is from a leaking toilet, dripping faucet or a breach in the plumbing system. Water damages in homes is the number 1 cause of insurance claims. A leak in a home, whether caused from a nail penetrating one of the water distribution pipes or a leaking toilet can be the source of significant damage in a home requiring mold remediation, and significant repairs to a home. By detecting potential leaks early, not only can damage be minimized but also save a significant amount of one of our most precious resources. This device can also save significant water damage when installed during construction. Breaches to the plumbing system can be identified the minute a breach is made during the construction process. A new home can be turned over to the new owners with proof that the plumbing system has not been compromised during construction.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction \$200 - - \$1500 per unit depending on the system installed. There are several different manufacturer's of this type of system. The added cost of construction is outweighed by the benefits of this type of device. Early detection saves water and significant water damage.

Internal ID: 1507

P93-18

IPC: 606.7

Proponent: Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

2018 International Plumbing Code

Delete without substitution:

~~**606.7 Labeling of water distribution pipes in bundles.** Where water distribution piping is bundled at installation, each pipe in the bundle shall be identified using stenciling or commercially available pipe labels. The identification shall indicate the pipe contents and the direction of flow in the pipe. The interval of the identification markings on the pipe shall not exceed 25 feet (7620 mm). There shall be not less than one identification label on each pipe in each room, space or story.~~

Reason:

Current text is an unnecessary mandatory practice for flexible piping system, not required for any other piping system. The piping is all water distribution piping, so why mark it so? Marking the direction of flow is also unnecessary. The stencilling is not described and the interval seems arbitrary.

Cost Impact

The code change proposal will decrease the cost of construction .

Where labeling had to be field applied, there will be a minor decrease in label materials and the labor to apply.

Internal ID: 948

P94-18

IPC: 607.1

Proponent: Duane Jonlin, representing City of Seattle (duane.jonlin@seattle.gov)

2018 International Plumbing Code

Revise as follows:

607.1 Where required. In residential *occupancies*, *hot water* shall be supplied to plumbing fixtures and equipment utilized for bathing, washing, culinary purposes, cleansing, laundry or building maintenance. In nonresidential *occupancies*, *hot water* shall be supplied for culinary purposes, cleansing, laundry or building maintenance purposes. In nonresidential *occupancies*, *hot water* or *tempered water* shall be supplied for bathing and washing purposes.

Exception: Where the water serving public lavatories that are not served by separate hot and cold water pipes is not heated, or is heated with a water heating system that is not capable of heating the water to a temperature above 80° F, this section shall not apply.

Reason:

Use of 120-degree water for handwashing increases the risk of disease transmission, as well as wasting energy and increasing the cost and complexity of construction. Room temperature water provides equal handwashing hygiene, while not supporting the growth of legionella. This proposal makes hot water optional for lavatories, and provides significant cost savings: the hot water piping, circulation pumps, pipe insulation, tempering valves, mixing valves and numerous other components would become unnecessary, and little if any water heating would be required. Operational savings and risk reduction persist for the life of the building, with dramatically decreased energy, maintenance, and equipment replacement costs, and no growth of legionella.

Owners can still provide hot water for handwashing, but this proposal allows those concerned with cost, safety and disease control to opt out if they so choose.

Show Me the Science - How to Wash Your Hands, Centers for Disease Control and Prevention (2017), page 1, www.cdc.gov/handwashing/show-me-the-science-handwashing.html

The environmental cost of misinformation: why the recommendation to use elevated temperatures for handwashing is problematic, International Journal of Consumer Studies, Carrico, Amanda R., et al. (2013) page 2.

Cool Water as Effective as Hot for Removing Germs During Handwashing, Infection Control Today (2017) page 1

Water temperature as a factor in handwashing efficacy, Food Service Technology, Michaels, B, et al, (2002) pages 139-149

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal makes hot water for lavatories optional.

For those who choose to provide hot water for lavatories, there is no cost change.

For those who choose not to provide hot water for lavatories, there are significant cost savings in materials, labor and space usage, due to the elimination of an entire system serving those lavatories. In addition, operational savings for energy, maintenance and equipment replacement are dramatically reduced and in some cases eliminated for the building's water heating and distribution system.

Internal ID: 1183

P95-18

IPC: 607.1

Proponent: Tim Keane, representing self (timke@verizon.net)

2018 International Plumbing Code

Revise as follows:

607.1 Where required. In residential ~~and nonresidential~~ *occupancies, hot water or tempered water* shall be supplied to plumbing fixtures and equipment utilized for bathing, washing, culinary purposes, cleansing, laundry or building maintenance. ~~In nonresidential occupancies, hot water shall be supplied for culinary purposes, cleansing, laundry or building maintenance purposes. In nonresidential occupancies, hot water or tempered water shall be supplied for bathing and washing purposes.~~

Reason:

The purpose of this code change proposal is to simplify the code by recognizing that all purposes for using heated water need the same temperatures in residential and nonresidential occupancies.

What follows is the reason statement that supports several change proposals. There is one reason statement for these proposals because the topics are interrelated and a comprehensive discussion is most likely to result in the best outcome for protecting the public's health and safety

Health and safety for public hand washing needs to include 1) scald prevention, 2) hand washing efficacy and 3) minimizing the risk of pathogen growth in the building's water distribution system.

We do not want the temperature of the water at public sinks to be too hot. We want the temperature of the water to be comfortable for the users of public sinks so that people will scrub their hands long enough to get them clean. We want to reduce the likelihood that pathogens will grow in the water distribution system. And, we would like to accomplish all of these health and safety functions in the most cost effective and sustainable manner possible.

At present, we believe that there are a few provisions in the IPC that inadvertently create a public health risk. Changing the temperature limits in this definition is one part of resolving this problem.

When the provisions in the current definitions and the related sections were first codified, Legionella was not a significant concern to public health; many items known today were unknown then. Now Legionella in building water systems has become a major concern for public health with the incidence of Legionnaires' disease growing by 500% from 0.4 cases per 100,000 people in 2000 to 2.0 cases per 100,000 people in 2015.¹

At the time these same provisions were codified, it used be thought that warm water was necessary for effective hand cleaning to control the spread of germs (bacteria). Science has since proven that the temperature of the water used for handwashing does not impact the efficacy of removing bacteria at all.^{2, 3, 4} While each of these three papers are very clear the CDC sums it up best with "The temperature of the water does not appear to affect microbe removal; however, warmer water may cause more skin irritation and is more environmentally costly"⁴ The most important variables for removing bacteria from ones hands are scrubbing and the use of soap. Neither of these criteria is within the purview of a building code.

When scald prevention was discussed as part of codifying these same provisions, the unintended consequences of lower water temperature on waterborne pathogen growth was not known. Accordingly temperature of 140°F originally proposed for scald control in home hot water heaters was lowered to 130°F and finally a recommendation of 120°F was made because if 140°F was OK it was thought that adding a huge safety margin would only be better, we now know that huge safety margin had serious and significant unintended consequences. A temperature of 120°F is considered an abundantly safe scald limit. However, setting water heaters this low results in much of the hot water distribution system being at temperatures that ideal for growing pathogens.

Since 1998 OSHA guidelines have stated that hot water should be stored at 140F and delivered at a temperature greater than 120F. In 2009, the CDC published a study documenting scalding cases resulting in hospital visits by the elderly from 2001-2006. The elderly are the highest risk population for Legionnaires' disease and one of the highest risk for scalding. They found that more than 80% of the scalding cases were due to cooking activities in the kitchen. Less than 3% (220 out of 8,620 cases) were plumbing related.¹³

We believe that it is time to use our current knowledge of these interrelated elements to improve health and safety by revising the a few of the temperature related provisions in the 2018 IPC and the 2018 IRC-P

In both the IPC and the IRC, hot water is required to be supplied to plumbing fixtures and plumbing appliances intended for bathing, washing, or culinary purposes. The 2018 IPC and IRC-P have two different maximum temperature thresholds, which some say are for scald prevention. The temperature at public hand washing sinks (lavatories), is

limited to 110°F. With the exception of bidets and emergency fixtures, which are also limited to 110°F, all other fixtures are limited to 120°F. Please see the table below.

Water Temperature Provisions in the 2018 IPC and IRC-P

Fixture	Maximum Temperature	Section
Bidet	110F (43C)	IPC 408.3 IRC P2721.2
Emergency showers and eyewash stations	110F (43C)	IPC 411.1*
Individual shower valve	120F (49C)	IPC 412.3 IRC P2708.4
Multiple (gang) showers	120F (49C)	IPC 412.4
Temperature-actuated, flow-reduction devices for individual fixture fittings	120F (49C)	IPC 412.7
Public lavatories	110F (43C)	IPC 419.5
Bath tub and whirlpool tub	120F (49C)	IPC 412.5 IRC 2713.3
Head shampoo sink faucet	120F (49C)	IPC 412.10
Footbaths and pedicure baths	120F (49C)	IPC 423.3

* The maximum temperature is not shown in this IPC section, but rather in the referenced standard. This standard also has a minimum acceptable temperature of 60F for emergency fixtures. This lower number might be useful guidance for jurisdictions with cold incoming water temperatures that want to raise the temperature of cold water for hand washing during the winter months where only cold water is supplied to public lavatory faucets.

Bidets, emergency showers and eyewash stations and public lavatories are required to have tempered water supplied through a water temperature limiting device that conforms to the appropriate ASSE, ANSI or CSA standard. The upper limit of 110°F makes sense for bidets and emergency showers. It does not make sense for hand washing at public lavatories.

If 120°F is a safe temperature for showering, bathing, head shampooing, tubs, it is equally safe for hand washing at either public or private lavatory faucets. It does not make sense that the temperature is lower for hand washing than for tub bathing. If the water temperature rises quickly to an uncomfortably hot and unsafe number it is much easier to remove ones hands from the water coming out of the faucet than it is to get out of a bathtub or to get out of the way in a shower. There is no need to have a lower temperature supplied for hand washing than for showering or bathing. In fact this public lavatory temperature code is derived from ASHRAE 90.1 energy saving code, not safety.

In our research into this issue, we found that the 110°F temperature limitation for hand washing at public lavatories comes from an energy code, ASHRAE 90.1 (1989)⁵ “Energy Standard for Buildings Except Low-Rise Residential Buildings.” Section 11.4.5.2 presents the provisions for lavatories in public facility restrooms (such as those in service stations, airports, train terminals, and convention halls). These include the requirement for low flow rates (the document preceded the 1990’s era EPACT rules concerning public lavatory faucet flow rates) and for limiting the temperature to a maximum of 110°F.

In the very high use public toilets detailed in 90.1 (1989) the sinks are used many times per hour, and the combination of low temperature and low flow does not dramatically increase the health risks from waterborne pathogens; the very high turnover rates of the water in the piping brings in new disinfectant.

However, many toilet facilities currently classified as “public” are only used sporadically. The combination of low hot water temperature, low flow rate and infrequent usage, results in a very low turnover rate which in turn means that new disinfectant enters the piping very infrequently. This condition not only provides a localized incubation chamber for Legionella but once grown can result in contaminating the rest of the hot water system.

While the idea of establishing 85-110°F as a safe range for public hand washing seemed like a good idea at the time, it turns out this range is ideal for the growth of pathogens in the building’s water distribution system. Pathogens that affect humans grow in temperatures that are found in our bodies: 85-110°F. For example, Legionella reproduces at the highest rates in the range of 85-110°F. Legionnaires’ disease, caused by Legionella growth in building water systems has become a major public health concern.

Adding to the risk due to temperature is the complexity of the internal components of the mixing valves and the lack of maintenance these valves typically receive. Such maintenance is relatively time consuming and costly and is often ignored. By way of comparison, Australian codes for health and safety purposes require these local mixing valves to be disassembled and disinfected annually^{6, 7, 8}

Conclusions and Recommendations:

If 120°F is safe enough to protect against scalding for bathing, it is safe enough for public hand washing. If this temperature is safe enough for Health Care Occupancies (IPC Section 609.3), it is safe enough for the other

occupancies covered by the IPC.

Maintaining temperatures in the range of 85-110°F that is currently required in Section 419.5 is unsafe because it provides ideal conditions for the growth of pathogens, bacteria dangerous to humans. All Legionella guidelines including OSHA 1998⁹, ASHRAE 2000¹⁰, CDC 2003¹¹, and CDC 2016¹² recommend maintaining hot water temperatures at fixtures and in hot water return lines at or above 120°F.

It is not necessary to specify the temperature range for supplying water for hand washing in public lavatories, only the maximum temperature to prevent scalding.

We recommend that the maximum safe temperature for the discharge of hot water into public hand washing sinks be raised to 120°F.

We recommend moving the break point between tempered and hot water from 110°F to 120°F.

We recommend enabling the use of cold water only, or tempered water, or both at public hand washing sinks.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

This proposal enables the use of cold water, tempered water, or both to public hand-washing facilities. If only cold water is supplied, it will decrease construction costs by eliminating the installation of a hot water distribution system to these faucets and by eliminating the installation of the associated ASSE 1070 mixing valves, reducing or eliminating the water heater for this hot water and eliminating the mechanical space used by this piping and equipment. It will also eliminate the costs of operations and maintenance by reducing expenditures on hot water and on the maintenance of the mixing valves. In places where city cold water is above 60°F year round, allowing only cold water to be supplied to public lavatories will eliminate much if not all the hot water piping and associated equipment in many buildings. By virtue of raising the allowable maximum temperature to 120°F it will now be possible to use a master-mixing valve (ASSE 1017) for temperature control instead of installing ASSE 1070 valves at every faucet. One valve costs less than many valves. Having fewer valves also dramatically reduces operating and maintenance costs.

P96-18

IPC: 607.1.1, 607.1.2, Chapter 15

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

607.1.1 Temperature limiting means. A thermostat control for a water heater shall ~~not only~~ serve as the temperature limiting means for the purposes of complying with the requirements of this code for maximum allowable hot or tempered water delivery temperature at fixtures where the water heater complies with ASSE 1082, ASSE 1084, or ASSE 1085.

607.1.2 Tempered water temperature control. Tempered water shall be ~~supplied through a water temperature controlled by one the following:~~

1. ~~A limiting device that conforms~~ conforming to ASSE 1070/ASME A112.1070/CSA B125.70 and shall limit the tempered water to not greater than set to a maximum of 110°F (43°C).
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.

This provision shall not supersede the requirement for protective shower valves in accordance with Section 412.3.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1085-2018:

Performance Requirements for Water Heaters for Emergency Equipment

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason:

The restriction on the use of the water heater thermostat for regulating water temperature is based on standard water heaters. There are three new water heater standards that regulate the outlet temperature of the water heater. Hence, it is appropriate to use reference these standards as the only water heaters in which the water heater thermostat can be used to regulate the upper temperature limit.

Tempered water is a comfort requirement, as well as, a scald prevention requirement. However, comfort overrides the safety requirement since tempered water is limited to a maximum temperature of 110° F. Scalding temperatures are in excess of this temperature. Other viable means of controlling tempered water to 110° F or less are available in addition to a limiting device that complies with ASSE 1070/ASME A112.1070/CSA B125.70. The most common means of controlling tempered water is with a thermostatic mixing valve that complies with ASSE 1017.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 110° F are water heater meeting one of the three new water heater standards.

The three new standard for water heaters are ASSE 1082, ASSE 1084, and ASSE 1085. These water heaters are equivalent to ASSE 1017, ASSE 1070, and ASSE 1071 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve. While a water heater complying with ASSE 1071 is designed to supply tepid water for emergency fixtures, the tepid temperature range can also meet the tempered

temperature range. Hence, an ASSE 1085 water heater is also a viable option.

Cost Impact

The code change proposal will decrease the cost of construction .

The availability of more options to achieve code compliance usually results in lower construction costs.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1085-2018, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

IRC: TABLE P2902.3, P2902.3.3, P2902.5.1, Chapter 44

Proponent: Linda Soares, TACO COMFORT SOLUTIONS, Inc., representing Linda L. Soares (LinSoa@TacoComfort.com)

2018 International Residential Code

Revise as follows:

P2902.3.3 Backflow preventer with intermediate atmospheric vent~~vent~~. Backflow preventers with intermediate atmospheric vents shall conform to ASSE 1012, ASSE 1081, or CSA B64.3. These devices shall be permitted to be installed where subject to continuous pressure conditions. These devices shall be prohibited as a means of protection where any hazardous chemical additives are introduced downstream of the device. The relief opening shall discharge by *air gap* and shall be prevented from being submerged.

P2902.5.1 Connections to ~~boilers~~boilers. Where chemicals will not be introduced into a boiler, the potable water supply to the boiler shall be protected from the boiler by a backflow preventer with an intermediate atmospheric vent complying with ASSE 1012, ASSE 1081, or CSA B64.3. Where chemicals will be introduced into a boiler, the potable water supply to the boiler shall be protected from the boiler by an *air gap* or a reduced pressure principle backflow prevention assembly complying with ASSE 1013, CSA B64.4 or AWWA C511.

**TABLE P2902.3
APPLICATION FOR BACKFLOW PREVENTERS**

DEVICE	DEGREE OF HAZARD^a	APPLICATION^b	APPLICABLE STANDARDS
Backflow Prevention Assemblies			
Double-check backflow prevention assembly and double-check fire protection backflow prevention assembly	Low hazard	Backpressure or backsiphonage Sizes $\frac{3}{8}$ " - 16"	ASSE 1015, AWWA C510, CSA B64.5, CSA B64.5.1

Other Means Or Methods			
Air gap	High or low hazard	Backsiphonage only	ASME A112.1.2
Air gap fittings for use with plumbing fixtures, appliances and appurtenances	High or low hazard	Backsiphonage or backpressure	ASME A112.1.3

For SI: 1 inch = 25.4 mm.

- a. Low hazard-See Pollution (Section R202). High hazard-See Contamination (Section R202).
- b. See Backpressure (Section R202). See Backpressure, Low Head (Section R202). See Backsiphonage (Section R202).

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448
US

1081-2014:

Performance Requirements for Backflow Preventers with Integral Pressure Reducing Boiler Feed Valve and Intermediate Atmospheric Vent Style for Domestic and Light Commercial Water

Reason:

ASSE 1081 covers devices that have combined products compliant to both ASSE 1003 and ASSE 1012. These devices have different hydrodynamic needs, hence the new standard for the device. They can be used in lieu of an ASSE 1012-compliant device with respect to boiler feed applications.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

An ASSE 1081 device can be used interchangeably with an ASSE 1012 or CSA B64.3 device. Options for code compliance usually result in lower cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1081-2014, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 3424

P98-18 Part I

IPC: 608.15.2.1

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBEngineer@aol.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

608.15.2.1 Relief port piping. The termination of the piping from the relief port or *air gap* fitting of a backflow preventer shall discharge to an *approved* indirect waste receptor or to the outdoors where it will not cause damage or create a nuisance. The indirect waste receptor and drainage piping shall be sized to drain the maximum discharge flow rate from the relief port as published by the backflow preventer manufacturer.

Internal ID: 1315

P98-18 Part II

IRC: P2902.6.3

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBEngineer@aol.com)

2018 International Residential Code

Revise as follows:

P2902.6.3 Relief port piping. The termination of the piping from the relief port or air gap fitting of the backflow preventer shall discharge to an *approved* indirect waste receptor or to the outdoors where it will not cause damage or create a nuisance. The indirect waste receptor and drainage piping shall be sized to drain the maximum discharge flow rate from the relief port as published by the backflow preventer manufacturer.

Reason:

It is not uncommon to find in the field a 4 inch reduced pressure principle backflow preventer relief port discharging to a 2 inch floor drain. When the relief port opens at the full flow rate published by the manufacturer, the room where the backflow preventer is located will fill with water in a short period of time.

It is important that the indirect waste receptor and drain be properly sized to accommodate the maximum flow rate from a relief port. When multiple backflow preventers are located in the same room, the indirect waste receptor and drain only has to be sized for the largest backflow preventer. There is never an assumption of multiple relief ports opening at the same time. That would indicate a multiple failure scenario which is not how the Plumbing Code evaluates failures.

The manufacturers are required to publish the flow rates through the backflow preventer relief port in their specification sheets. This information is readily available. The drain can be easily sized for the discharge in the manufacturer's published data.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The manufacturers require drainage for the discharge from the relief port. This addition reinforces the requirements already stated in the manufacturer's literature.

Internal ID: 3501

P99-18

IPC: 609.2

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmcmann@jeffco.us)

2018 International Plumbing Code

Revise as follows:

609.2 Water service. Hospitals shall have two water service pipes installed in such a manner so as to minimize the potential for an interruption of the supply of water in the event of a water main or water service pipe failure. Each water service pipe shall enter the building independently and shall be sized in accordance with Section 603.1.

Reason:

This Section lacks some specificity and doesn't provide much guidance. The intent is to eliminate the possibility of water service interruption. There needs to be a separation distance for the two water lines that designers can employ based the the situation. No specific number has been submitted as each situation will require analysis by the designers

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is editorial in nature and isnt requiring anything in addition to whats already required.

Internal ID: 109

P100-18

IPC: 609.2

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Plumbing Code

Revise as follows:

609.2 Water service for Group I-2, Condition 2. ~~Hospitals Group I-2, Condition 2 facilities shall have a minimum of two water service pipes installed in such a manner so as to minimize the potential for an interruption of the supply of water in the event of a water main or water service pipe failure, sized such that with the loss of the largest service pipe, the remaining service pipes will meet the water demand for the entire facility. Each water service shall have a shut off valve in the building and a shut off valve at the utility-provided point of connection to the water main or other source of potable water.~~

Reason:

The existing language is not specific and could lead to several different required piping configurations. The proposed change provides needed clarity to the code and provides jurisdiction a reasonable means of enforcement. Existing language creates a overly burdensome requirement for hospitals on remote sites. The proposed language sets specific requirements for the service lines into the building, with directions for capacity redundancy. Also clarifies a design configuration that provides maximum flexibility in event of failure of a single service line.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The existing language is ambiguous to the degree that it is difficult to understand how facilities are consistently enforcing the section. If anything the proposal reduces cost for providers and purveyors.

Internal ID: 705

P101-18

IPC: 609.2.1 (New)

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmann@jeffco.us)

2018 International Plumbing Code

Add new text as follows:

609.2.1 Tracer. A yellow insulated copper tracer wire or a product designed for that purpose or other approved conductor shall be installed adjacent to underground nonmetallic piping serving as a water service for a hospital. Access shall be provided to the tracer wire or the tracer wire shall terminate above ground at each end of the nonmetallic piping. The tracer wire size shall be not less than 18 AWG and the wire insulation type shall be suitable for direct burial.

Reason:

It would be prudent for Hospitals to have the ability to locate their water service piping when utilizing non-metallic piping underground. This provides the ability to locate the pipes without having to excavate which can be an enormous cost savings. Locating the service pipes is critical to eliminate the possibility of damaging the pipes avoiding the usual methods of doing so.

Cost Impact

The code change proposal will increase the cost of construction .

The cost increase will be the cost of the wire itself and locating the ends of of the wire in a suitable fashon.

Internal ID: 117

P102-18

IPC: 202, 611, 611.1, 611.2, 611.3, 611.4 (New), 611.5 (New), Chapter 15

Proponent: Vincent Kent, Abendroth Water Conditioning, representing Abendroth Water Conditioning (vince@abendrothwater.com)

2018 International Plumbing Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

POINT-OF-ENTRY (POE) WATER-CONDITIONING OR -TREATMENT DEVICE A water treatment device serving the water distribution system of a building for the purposes of altering, modifying, adding, or removing minerals, chemicals, contaminants, and suspended solids in the water that is distributed throughout the building. Outdoor hose bibbs are typically excluded from being served by conditioned or treated water.

POINT-OF-USE (POU) WATER-CONDITIONING OR -TREATMENT DEVICE A water treatment device installed to serve a single atmospheric outlet such as a faucet for the purposes of altering, modifying, adding, or removing any minerals, chemicals, contaminants, and suspended solids in water supplied to the outlet. POU treatment is often used to treat water only for drinking and cooking.

WATER CONDITIONING OR TREATMENT DEVICE. A point-of-use (POU) or point-of-entry (POE) original equipment appliance, appurtenance, fixture, or a combination thereof designed to treat potable water so as to alter, modify, add, or remove any minerals, chemicals, contaminants, and suspended solids contained in the source water. Example technologies include but are not limited to softeners, filters and reverse osmosis systems.

Revise as follows:

SECTION 611 ~~DRINKING-WATER-CONDITIONING or TREATMENT UNITS-DEVICES~~

~~611.1 Design-General system approvals.~~ Point-of-use reverse osmosis drinking water treatment units shall comply with NSF 58 or CSA B483.1. Drinking water treatment units shall meet the requirements of and point-of-entry water-conditioning or -treatment systems shall comply with ASSE 1087, NSF 42, NSF 44, NSF 53, NSF 55, NSF 58, NSF 62 or NSF 401 CSA 483.1.

~~611.2 Reverse osmosis systems-Drain discharge.~~ The drain discharge from a reverse osmosis drinking water treatment unit water-conditioning or -treatment device shall enter the drainage system through by means of an air gap in accordance with Table 608.16.1, a backflow prevention device in accordance with ASSE 1087, an appropriate backflow prevention device in accordance with Table 608.1, or an air gap device that meets the requirements of NSF 58, CSA B483.1 or IAPMO PS 65.
The building drainage system shall be capable of handling the additional discharge load of the water-conditioning or -treatment device.

~~611.3 Connection tubing-Plumbing connections.~~ The tubing-Pipe, tubing, and pipe fittings supplying water to and from drinking water treatment units shall be of a size and material as recommended by the manufacturer. The tubing shall comply with NSF 14, NSF 42, NSF 44, NSF 53, NSF 58 or NSF 61.a point-of-use or point-of-entry water-conditioning or -treatment device shall comply with NSF 14 or NSF 61. The interconnection tubing within a device shall comply with the requirements of NSF 14, NSF 61 or Section 611.1.

Pipe, tubing, and pipe fittings used downstream of point-of-use and point-of entry water-conditioning or -treatment devices shall be compatible with the treated water. The manufacturer's instructions shall be followed for the recommended compatible materials for pipe, tubing, and pipe fittings for the treated water. Copper tubing shall not be used for water treated by a reverse osmosis device.

Add new text as follows:

611.4 Sizing of Point-of-Entry Water-Conditioning or Treatment Devices. Third-party certified pressure loss characteristics shall be provided with all devices. The pressure loss through such devices shall be included in the pressure loss calculations of the system, and the water supply pipe and meter shall be adequately sized to provide for such a pressure loss.

611.5 Sizing of Point-of-Use Water-Conditioning or Treatment Devices. Point-of-use water-conditioning or

treatment devices that provide potable water to appliances, fittings, or appurtenances that require a minimum pressure and flow rate demand shall be sized, designed, and installed to meet the downstream appliance, fitting, or appurtenance manufacturer's specifications so as to not cause improper operation.

Add new standard(s) follows:

CHAPTER 15 REFERENCED STANDARDS

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

ASSE 1087-2018:

Performance Requirements for Commercial and Food Service Water Treatment Utilizing Drinking Water

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario CA 91761 USA

PS 65-2002:

Material and Property Standard for Airgap Units for Water Conditioning Equipment Installation

NSF

NSF International
789 N. Dixboro Road P.O. Box
130140
Ann Arbor MI 48105

NSF/ANSI 401 - 2017:

Drinking Water Treatment Units - Emerging Compounds/Incidental Contaminants

NSF/ANSI 55 - 2017:

Ultraviolet Microbiological Water Treatment Systems

Reason:

202 - There currently are no definitions for a water treatment device, nor for point-of-use or point-of-entry treatment devices. These are generally accepted definitions.

611.0 - Changing the heading of the section to be consistent with what is used and installed in the industry today.

611.1 - These standards do not deal with design of the products, but rather the safety, structural integrity, and performance requirements. Updated language to describe the current standards for all POE and POU treatment devices. ASSE 1087 is a new standard developed to specifically address commercial water treatment equipment.

611.2 - Drain discharge applies to all treatment devices, not just reverse osmosis systems. Further, the type of backflow prevention device may be varied in order to ensure protection of the potable water supply, even though the most common ones used are air gaps and air gap devices. Finally, it is critical that the drain system be able to accept the volume of discharge from the device.

611.3 - The title "Connections" is more appropriate as there are connections both to and from a device as well as within the device. Described the appropriate standards for each of these use cases. When the connections are within a device covered by a standard, the connections need to meet the requirements of that device's standard. Also, as an example, the low pH or minimal total dissolved solids from the product water of a reverse osmosis system will cause pitting and corrosion of downstream copper tubing. Some consideration needs to be made for this when a system is designed and installed.

611.4 & 611.5 - This language is missing from section 611 as questions arise frequently in the field as to how to size a system when water conditioning and treatment units are involved. Documentation on losses is not always available which may lead to over- or under-sized systems. This is a more accurate representation of how to properly size any water distribution system, and is consistent with the existing language in Appendix E.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These changes clarify how water conditioning and treatment products are used. The additional sections codifies information that should be given to the designer and installer anyway for proper sizing.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1087—2018, NSF 401-2017, NSF 55-2017 and IAPMO PS 65-2002 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

D2680 - 01(2014):

Standard Specification for Acrylonitrile-Butadiene-Styrene (ABS) and Poly(Vinyl Chloride) (PVC) Composite Sewer Piping

Reason:

A new standard for ABS piping is being added to increase flexibility in piping choices for building sewers.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

ABS piping is not required to be used-it is a designer or installer decision. No new materials or labor are required by this proposal thus, there is not a cost increase.

Internal ID: 3472

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

2018 International Plumbing Code

Revise as follows:

702.6 Chemical waste drainage system. A chemical waste drainage system, including its vent system, shall be completely ~~separated independent~~ from ~~the any~~ sanitary drainage system. The pipes and fittings of a chemical waste drainage system shall conform to any of the applicable standards indicated in Table 702.6. The pipe and fitting material shall be recommended by the manufacturers of the pipe and fittings for the temperatures, types and concentrations of chemicals that the system is designed for. The drainage in a chemical waste drainage system shall be treated in accordance with Section 803.2 before discharging to the a sanitary drainage system. Separate drainage systems for chemical wastes and vent pipes shall be of an approved material that is resistant to corrosion and degradation for the concentrations of chemicals involved.

Add new text as follows:

**TABLE 702.6
CHEMICAL DRAINAGE SYSTEM PIPE AND FITTINGS**

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC)	ASTM F2618
High silicon iron	ASTM A518/A518M
Polypropylene (PP)	ASTM F1412
Polyvinylidene fluoride (PVDF)	ASTM F1673
Chemical-resistance glass	ASTM C1053
Stainless steel drainage systems	ASME A112.3.1

Revise as follows:

901.3 Chemical waste ~~vent systems~~ drainage system venting. The vent system for a chemical waste drainage system shall be independent of the sanitary vent system and shall terminate separately any vent system for a sanitary drainage system. The termination of a vent system for a chemical waste drainage system shall be through the roof to the outdoors or to an air admittance valve that complies with ASSE 1049. Air admittance valves for chemical waste drainage systems shall be constructed of materials ~~approved~~ in accordance with Section 702.6 and shall be tested for chemical resistance in accordance with ASTM F1412.

Add new text as follows:

902.1.1 Chemical waste drainage system vents. The pipe and fitting materials for the vent system of a chemical waste drainage system shall be in accordance with Section 702.6. The methods utilized for construction and installation of such venting system shall be in accordance with the pipe and fitting manufacturers' instructions.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959

F2618-15:

Standard Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Pipe and Fittings for Chemical Waste Drainage Systems

C1053-00 (2015):

Standard Specification for Borosilicate Glass Pipe and Fittings for Drain, Waste, and Vent (DWV) Applications

A518/A518M -99 (2012):

Standard Specification for Corrosion-Resistant High-Silicon Iron Castings

Reason:

Chemical waste drainage is very different from sanitary drainage applications included in Chapter 7. Chemical waste applications require pipe and fitting systems that are specifically designed to convey waste that may be harmful to other piping materials as well as the health and safety of the public. The code currently provides direction on allowable materials for sanitary drainage systems in tables 702.1, 702.2, 702.3 and 702.4 but is not as specific regarding chemical waste in 702.6.

Since the code requires chemical waste systems to be completely separated from the sanitary system in section 702.6 and provides direction on system design in section 803.2, it should also include a table to provide direction on allowable materials for these applications. Currently, section 702.6 requires an "approved" material, which by definition in Chapter 2, means that the material should be "acceptable to the code official." The removal of this statement and the addition of the proposed table will eliminate any confusion regarding appropriate materials for chemical waste drainage applications. Since there is no single piping system available that is impervious to every chemical, manufacturers recommendations regarding suitability for temperature and chemical resistance should be referenced

when choosing a material for a specific application.

Materials used for vents in these systems should exhibit the same physical characteristics regarding temperature and chemical resistance and therefore should be held to the same requirements.

This code change proposal includes all materials either currently manufactured or available in the market that are manufactured to standards specifically for corrosive or laboratory waste drainage applications.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal will not increase or decrease the cost of construction because it is intended to clarify allowable third party certified products appropriate for chemical waste drainage applications.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F2618-15, ASTM C1053-00 (2015), and ASTM A518/A518M -99 (2012) with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

A112.4.4-2017:

Plastic Push Fit Drain, Waste, and Vent (DWV) Fittings

Reason:

Adding this section along with the consensus standard for Push-fit DWV fittings will give code officials direction on inspecting push-fit fitting installations and installers direction on installing push-fit fittings.

Adding this section is consistent with 'push-fit joints" sections in chapter 6.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Use of push-fit DWV fittings is an option. More options in the code usually result in an overall lowering of costs of construction because of increased flexibility for adapting to varying project situations.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.4.4-2017, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

IPC: 705.3.3.1 (New)

Proponent: Richard Houle, Reliance Worldwide Corporation, representing Reliance Worldwide Corporation (rich.houle@rwc.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Add new text as follows:

705.3.3.1 Restraint of hubless joints. Hubless joints shall be restrained to withstand a thrust force associated with 40 feet of water head pressure (17.3 psi) (119.6 kPa) in accordance with CISPI 301 or CISPI 310. Restraint systems shall be third party certified to this requirement. Such restraints shall be installed in accordance with manufacturer's instructions.

Reason:

This proposal brings forward the language currently included in Chapter 3 with the addition of a prescriptive requirement that is not currently included in the CISPI 301 and 310 standards, The Thrust Force Tables are included but no specific requirements for the restraint systems to meet. This proposal also includes the third party certification requirement for restraint systems. Manufactures of the hubless system currently support the installation of these systems to be in accordance with CISPI 301 and CISPI 310. This proposal would ensure that all systems would be installed uniformly throughout the US.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is clarifying the code language already included in the code. It brings language forward from Section 303.5.

P110-18

IPC: 706.3, TABLE 706.3

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Self (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Revise as follows:

706.3 Installation of fittings. Fittings shall be installed to guide sewage and waste in the direction of flow. Change in direction shall be made by fittings installed in accordance with Table 706.3. Change in direction by combination fittings, side inlets or increasers shall be installed in accordance with Table 706.3 based on the pattern of flow created by the fitting. Horizontal building drains shall have all branch connections rolled up as close to the building drain connection as possible so that the invert elevation of the branch connection is at least as high as the centerline of the building drain at the point of connection. Double sanitary tee patterns shall not receive the discharge of back-to-back water closets and fixtures or appliances with pumping action discharge.

Exception: Back-to-back water closet connections to double sanitary tees shall be permitted where the horizontal *developed length* between the outlet of the water closet and the connection to the double sanitary tee pattern is 18 inches (457 mm) or greater.

**TABLE 706.3
FITTINGS FOR CHANGE IN DIRECTION**

TYPE OF FITTING PATTERN	CHANGE IN DIRECTION		
	Horizontal to vertical	Vertical to horizontal	Horizontal to horizontal
Sixteenth bend	X	X	X
Eighth bend	X	X	X
Sixth bend	X	X	X
Quarter bend	X	X ^a	X ^a
Short sweep	X	X ^{a,b}	X ^a
Long sweep	X	X	X
Sanitary tee	X ^c	—	—
Wye	X	X	X ^d
Combination wye and eighth bend	X	X	X ^d

For SI: 1 inch = 25.4 mm.

- a. The fittings shall only be permitted for a 2-inch or smaller fixture drain.
- b. Three inches or larger.
- c. For a limitation on double sanitary tees, see Section ~~706.3~~ 706.3
- d. Rolled up to above the centerline of the downstream horizontal drain where connected to the horizontal building drain.

Reason:

This code change is necessary in order to maintain the hydraulic depth of flow in the main building drain and to prohibit waste from flowing back into building drain branches from the main building drain flow which causes a loss in the hydraulic depth of flow in the main building drain each time a water line flows past a branch drain and some of the mainline waste flows into to horizontal branches.

Excerpt fro an Article in Plumbing Engineer Magazine:

Energy and Water Savings Mandates are Contributing "Dry-Drains"

In 1992, the federal Energy Policy Act, was passed, and has since undergone various amendments. The broad focus of this law is to increase clean energy use and improve overall energy efficiency in the United States. Mandates for the reduction of water usage by residential and commercial users were included in this law based upon the understanding that the production and distribution of water requires energy. The law sets minimum efficiency standards for flow rates for water closets, urinals, faucets and showerheads, (except emergency fixture showerheads) that are distributed in commerce for personal use or commercial use or consumption.

The minimum efficiency standards for water closets, urinals faucets and showerheads set forth in the 1992 Energy Policy Act, section 123, are covered in in Title 42 USC section 6295(j) and , 6295 (k).

42 USC section 6295(k)(1)(A) Except as provided in subparagraph (B), the maximum water use allowed in gallons per flush for any of the following water closets manufactured after January 1, 1994, is the following:

Gravity tank-type toilets	1.6 gpf.
Flushometer tank toilets	1.6 gpf.
Electromechanical hydraulic toilets	1.6 gpf.
Blowout toilets	3.5 gpf.

42 USC section 6295(k)(1)(B)

The maximum water use allowed for any gravity tank-type white 2-piece toilet which bears an adhesive label conspicuous upon installation consisting of the words "Commercial Use Only" manufactured after January 1, 1994, and before January 1, 1997, is 3.5 gallons per flush.

42 USC section 6295(k)(1)(C)

The maximum water use allowed for flushometer valve toilets, other than blowout toilets, manufactured after January 1, 1997, is 1.6 gallons per flush.

42 USC section 6295(k)(2)

The maximum water use allowed for any urinal manufactured after January 1, 1994, is 1.0 gallon per flush.

There are similar maximum flow requirements for faucets and showers in section (j). These flow rate reductions have led to an increased the number of drainline transport problems for older plumbing systems when they were combined with poorly designed and poorly performing plumbing fixtures at the time. Manufacturers had to spend great sums of money to redesign water closets to flush with better performance. We are approaching the point where manufacturers cannot make many more improvements to plumbing fixture performance at these very low flow rates. There is a minimum amount of water required to maintain a hydraulic depth of flow in a drain and for drains to flow and perform properly. When low-flow plumbing fixtures are installed on older plumbing systems that have existing larger drains installed at the minimum slope, the lower flows create a lower hydraulic depth of flow in the drain and solids will do not transport down the drain as well. They tend to pile up and form a dam over time. The dam creates a pond in from of the dam where flow velocities are interrupted allowing solids to settle out in the pond that is formed in the drain pipe. Over a period of time, the solids plug up the existing oversized drain lines. This necessitates a call for a drain cleaning service technician.

Many of us may have heard about problems in drains and sewers following the advent of the 1992 Energy Policy Act and the mandated water flow reductions. Since then, the plumbing product manufacturers have invested a lot of money redesigning their fixtures to perform better at lower flows, however there is a limit to the possible

improvements with respect to performance. The Plumbing Industry Research Coalition (PERC) was formed and has been doing research to learn more about the drainline transport issues using low-flow fixtures. Their funding has been limited, and more research is needed, to address issues with flushable wipes, flushable toilet seat covers, and feminine products in the drain line. The research they have provided so far has been valuable with respect to understanding the limitations of plumbing fixtures and drain line transport at lower flow rates. For information on the PERC research see the following website: <http://www.plumbingefficiencyresearchcoalition.org/> (Phase 1, Phase 2 and Phase 2.1).

Studies by two engineers, Bill Gauley and John Koeller, show when various models of 1.6 and 1.28 Gallon per flush GPF water closet's were tested, tests showed drainline transport of solids is generally less in 1.28 GPF water closets when compared to 1.6 GPF water closets. There was a reduction in the drainline transport of about at 37 percent when reducing flows from 1.6 to 1.28 GPF. The transport distance was reduced from 36 feet on average to about 23 feet on average. (See Figure 4). With even lower flows being proposed, it will be difficult if not impossible for larger horizontal drainage systems to transport solids. Drain blockages will become more common at lower flow rates. In high-rise vertical buildings, it should be relatively easy to transport the waste a short distance to a vertical stack if the stack is within about 15 feet of the fixtures. There should be enough additional uses of water in the stack in a high-rise building to provide sufficient drainline transport at the lowest level in the horizontal building drain.

In a remote restroom in a large horizontal building, with no other branches providing drainage flow, there will be drainline transport problems and an increase in drainline blockages. The energy expended after cleaning up after a sewage back-ups could easily exceed the cost associated with having an adequate drain flow in the original system design. When you consider the energy and expenses associated with:

Cleaning the drain lines,

Removing moldy drywall and finishes

Repairing damage to the building

Healthcare costs associated with the spread of disease, bacteria and mold

The small amount of energy and water that may be saved will be offset by far with remediation costs. Another consideration that I have experienced is, when people realize the drains block-up on a regular basis because of inadequate flow, people will be trained to flush twice or three times to ensure the waste goes down the drain. I have seen signs in many restrooms asking users to flush multiple times if there are solids in the bowl. There is a minimum sustainable drainline flow rate and more research is needed to understand these limitations before we arbitrarily pick lower flow rates in order to gain points for an energy and environmental, water conservation program.

Figure 7c: 4" Pipe, 1% Slope, Minimum Drop Height

Figure 4 - Illustration Showing Drainline Transport Distance at various flow rates

Source: Evaluation of Low-Flush-Volume Toilet Technologies to Carry Waste in Drainlines, February 2005, by: Bill Gauley, P.Eng., and John Koeller, P.E.

The 'Dry Drains' Phenomenon

Dry drains is a phenomenon being brought about because of aggressive energy and water conservation efforts. Energy and water conservation code changes continue to be proposed for further reductions of water consumption for

plumbing fixtures beyond the requirements in the Energy Policy Act of 1992. These water flow reduction proposals are what I have referred to in the past as the “water conservation limbo. How low can we go?” Using the Manning Formula, and from various drainage research that is available, we have a basic understanding of the minimum flow required for each pipe size and pipe slope for various drain loadings. Despite this available knowledge, people still propose code change submittals based on simple math of water savings based on a lower flow over a fixture use period. There is no consideration of the impact on other parts of the plumbing system. Many code change proposals don't consider the laws of physics. Many code changes seem to be on the edge of violating or maybe violate the laws of physics. However, plumbing systems should perform properly with health and safety being more important than energy and water conservation. The International code change process has a button to click that asks if the proposed code change will add cost to building construction. I would like to see a button that asks: Will this code change potentially cause a decrease in system performance? I would also like to see a button for: Will this code change cause a health and Safety Issue? Code changes should be provided with technical support and research that shows no adverse effect on system performance, and the health and safety issues. The problem is complex and a simple request to save water comes with many other performance and health & safety ramifications that are not always contemplated by code change proponents with the good intentions of saving water.

Drain flows are getting to the point where the flows are insufficient to transport solids down the drain. If drain flows are reduced, and the drain pipes are the same size, then the hydraulic depth of flow will be less. In older buildings, there will likely be more problems than in newer buildings that can be designed with smaller drains with more slope.

To compound the issue, when a greywater reuse system collects discharged water from fixtures for reuse to flush water closets or for sub-surface irrigation purposes, it is taking water away from the sanitary drainage system. (See Figure 4). The wastewater flow needs to be maintained at a level to keep the hydraulic depth of flow sufficient for proper water velocities and drain line transport.

Figure 5 - Illustration showing Less Water in Drains Due to Water Conservation

Loss of Hydraulic Depth in Building Drains from Flow into Horizontal Branch Drains

There has been research done in Australia that was reported on at the Dry Drains conference that addressed flows in horizontal building drains with horizontal branch connections. The study showed when building drain branches are connected horizontally to the building drain, they allow waste to divert or back-up into each branch as the waste flows by each branch. This lowers the hydraulic depth of flow in the main. (See Figure's 5, 6 & 7) This illustrates the need to consider code requirements to roll up branches up on a 45-degree angle to prevent the waste from entering the branches (and further reducing the drainline transport capacity for drains that are already at or near minimum flow rates for proper drainline transport for ultra-low flow fixtures).

The research also confirmed a drain should not drop from directly overhead into a horizontal drain. Waste usually would be directed upstream from a vertical stack dropping into a horizontal drain. This allowed solids to settle in the horizontal pipe upstream of the connection

and reduced the hydraulic depth of flow because of the diversion of waste. The stack should use a 45 and a Y fitting rolled to allow a rolled up 45-degree entry into the horizontal drain.

Some of these are already required in our codes. We should also be more aware of using directional drainage pattern fittings as water closet flow rates are further reduced. An interesting thing of note is the fact that the minimum slope in Australia is 1.67 percent and in the U.S., the minimum slope is 1.0104 percent (1/8 inch per foot) because they generally use smaller drain pipes.

Figure 6 - Less Water in Drains Due to flow into Horizontal Branch Connections

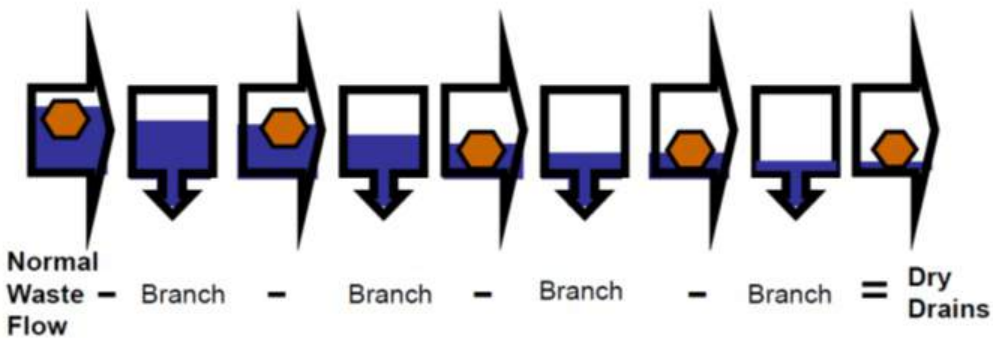

Figure 7 - Less Water in Drains Due to flow into Multiple Horizontal Branch Connections

Figure 8 - Rolled Up Branch Drain to Assist with Transport of Solids.

Figure 9 - Large Pipe with Low Flow Fixtures = Low hydraulic depth and Drainline Transport Problems

Figure 10 - Small Pipe with Low Flow Fixtures = Good Hydraulic Depth and Drainline Transport (Smaller pipes may require increased slope)

As a member of a water utility, we were experiencing water quality problems at the ends of the water distribution network because of aging water. We were also dealing with blockages in the sewer mains because there was not enough flow in the sewers. We ended up flushing fire hydrants every couple of weeks and directing the flow into sewer manholes to address the water quality and simultaneously flushing the sewers. How is this accounted for in the energy and water conservation calculations? Sadly it is not. We need to determine what the minimum flows are in order to maintain safe and properly performing plumbing systems.

I am hoping the water quality studies associated with water conservation programs at Drexel University and Purdue University look at these issues. Dumping water to keep water treatment chemical residuals up and low flow fixtures contributing to drain line transport issues seems counter-productive if we continue to make cuts in water use without knowing what are the minimum sustainable flows for each pipe size.

Ron George, CPD is president of Plumb-Tech Design & Consulting Services he has over 40 years' experience designing plumbing systems.

Cost Impact

The code change proposal will increase the cost of construction .

This code change will only address branch connections to the building drain. It is needed for health and safety.

Internal ID: 2181

P111-18

IPC: 706, 706.3 (New), 706.3, Table 706.3, 706.3.2 (New), 706.3.3 (New), 706.34 (New)

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Revise as follows:

SECTION 706 CONNECTIONS BETWEEN DRAINAGE PIPING AND FITTINGS SYSTEMS

Add new text as follows:

706.3 Installation. Drainage systems shall be installed in accordance with 706.3.1 thru 706.3.4.

Revise as follows:

~~**706.3**~~**706.3.1 Installation of fittings.**~~**Fittings.**~~ Fittings shall be installed to guide sewage and waste in the direction of flow. Change in direction shall be made by fittings installed in accordance with Table 706.3. Change in direction by combination fittings, side inlets or increasers shall be installed in accordance with Table ~~706.3~~706.3.1 based on the pattern of flow created by the fitting. ~~Double sanitary tee patterns shall not receive the discharge of back-to-back water closets and fixtures or appliances with pumping action discharge.~~

~~**Exception:** Back-to-back water closet connections to double sanitary tees shall be permitted where the horizontal *developed length* between the outlet of the water closet and the connection to the double sanitary tee pattern is 18 inches (457 mm) or greater.~~

**TABLE 706.3-706.3.1
FITTINGS FOR CHANGE IN DIRECTION**

TYPE OF FITTING PATTERN	CHANGE IN DIRECTION		
	Horizontal to vertical	Vertical to horizontal	Horizontal to horizontal
Sixteenth bend	X	X	X
Eighth bend	X	X	X
Sixth bend	X	X	X
Quarter bend	X	X ^a	X ^a
Short sweep	X	X ^{a,b}	X ^a
Long sweep	X	X	X
Sanitary tee	X ^e	—	—
Wye	X	X	X
Combination wye and eighth bend	X	X	X

For SI: 1 inch = 25.4 mm.

- a. The fittings shall only be permitted for a 2-inch or smaller fixture drain.
- b. Three inches ~~or~~ larger.
- c. ~~For a limitation on double sanitary tees, see Section 706.3.~~

Add new text as follows:

706.3.2 Fixture drains. ~~Fixture drains shall discharge to a horizontal branch drain, stack or building drain.~~

706.3.3 Branch drains. ~~Branch drains, horizontal or vertical, shall discharge to a stack or a building drain.~~

706.3.4 Building drain. ~~Building drains shall discharge to a building sewer.~~

Reason:

We have been witnessing a decline in the understanding of good plumbing practices. Unfortunately, many do not seem to understand that the base knowledge for the code is derived from the definitions. The definitions in the codes are the most important item in the code to understand, for without a clear understanding of the definitions you could not reasonably understand the intent of the code sections. This is the reason when a word included in the definitions is used in the code text, it is **italicized**. This provides a clear road sign back so people will refer back to the definition when developing their interpretation of the code.

Unfortunately this doesn't seem to be happening like it should. From my experience many jurisdictions will adopt some form of the ICC Building Codes, though many will also amend the code based on local submissions or adopted legislation (including my own). For my State, this has resulted in the "road signs" disappearing because someone felt it was better to italicize our changes. The end result as I have stated is many now do not apply the definitions when developing designs. This is a problem that is not centralized to design professionals in my jurisdiction, we have seen it from design professionals all across the United States.

Horizontal branch drains are intended to serve as a collector for fixture discharge and convey the discharge to a stack or the building drain. The horizontal branch drain is intended to receive waste from the same floor level that requires little time to settle in a non-turbulent horizontal flow. The discharge of a stack into a horizontal branch drain results in the discharge affecting fixtures attached to the horizontal branch drain. The waste from a stack reaches terminal velocity resulting in "hydraulic jump" when the waste reached the base of the stack and transitions to a horizontal flow pattern.

In simple terms, if we look at different plumbing items as though they were part of the transportation infrastructure, we could identify **fixture drains** as neighborhood streets, **horizontal branch drains** as North/South, East /West connector streets (Main St., High St.), **stacks** and **building drains** as State Routes, and the **building sewers** and **public sewers** as the InterState Highways. Applying that logic, we can see we don't typically have the higher traffic roads discharging through the smaller roads. The plumbing code was designed the same way if people would apply the definitions.

Clearly this was something that was initially in people's minds when the code was developed and revised over the years as there are multiple instances where code language was written in such a way to prevent a stack from discharging to; a wet vent, a circuit vented horizontal branch drain, a combination waste and vent system. That language really just tiptoes around the issue though and has lead to a very blurred line.

Since as stated before, design professionals often are not applying the definitions, the same holds true for many plans examiners, inspectors and contractors. The intent of this proposal is to clearly define how the waste should be collected in each point of the process as it makes its way to the end point of disposal.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is a simple clarification as to how a drainage system is built. This doesn't result in any change in code requirements and thus no impact to the costs of construction.

Internal ID: 2050

P112-18

IPC: 707.1

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Revise as follows:

707.1 Prohibited joints. The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Mastic or hot-pour bituminous joints.
3. Joints made with fittings not *approved* for the specific installation.
4. Joints between different diameter pipes made with elastomeric rolling O-rings.
5. Solvent-cement joints between different types of plastic pipe except where provided for in Section 705.16.4.
6. Saddle-type fittings.
7. Double pattern fittings shall not be used in sanitary drains.

Reason:

We receive constant complaints about double pattern fittings from the service industry. Everyone who has ever ran a snake for any amount of time can attest to the issue with a double cross. We have all heard stories where a technician has pulled back a shower curtain from an adjacent restroom, even from an adjacent apartment. The service contractors are reporting issues where double pattern combination Wye & 1/8th bend and double pattern Wye's have been used in a horizontal configuration on a building drain. Videos have shown that waste is flowing straight across and blocking one of the branches causing backups to occur. Additionally, when they run snakes through the branches, as it reaches the double pattern fitting, often times the snake will go through to the other branch instead of turning in the intended direction of flow. This is a needless nuisance for a building owner and the occupants. These connections can be made simply by using a wye then upstream of the wye, a combination wye & 1/8th bend or just using another wye. The issue for the owners/occupants goes away and should result in a savings in maintenance costs for the owner.

Cost Impact

The code change proposal will increase the cost of construction .

There will be a small cost impact associated with this proposal as it will require an additional fitting and slightly more labor. These costs will be offset by the savings in maintenance costs.

Internal ID: 2019

P113-18 Part I

IPC: 708.1, 708.1.6 (New)

Proponent: Janine Snyder, City of Thornton, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net); Guy Tomberlin, Fairfax County, VA, representing Fairfax County Building Division (guy.tomberlin@fairfaxcounty.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Add new text as follows:

708.1.6 Cleanout equivalent. A fixture trap or a fixture with integral trap, removable without altering concealed piping, shall be acceptable as a cleanout equivalent.

Revise as follows:

708.1 Cleanouts required. Cleanouts shall be provided for drainage piping in accordance with Sections 708.1.1 through ~~708.1.11~~708.1.12.

Analysis: The change in the section number in 708.1 is the result of adding new Section 708.1.6 which renumbers subsequent sections.

Internal ID: 2070

P113-18 Part II

IRC: P3005.2 P3005.2.10.1 (New)

Proponent: Janine Snyder, City of Thornton, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net); Guy Tomberlin, Fairfax County, VA, representing Fairfax County Building Division (guy.tomberlin@fairfaxcounty.gov)

2018 International Residential Code

Add new text as follows:

P3005.2.10.1 Cleanout Equivalent. A fixture trap or a fixture with integral trap, removable without altering the concealed piping shall be acceptable as a cleanout equivalent.

Revise as follows:

P3005.2 Cleanouts required. Cleanouts shall be provided for drainage piping in accordance with Sections P3005.2.1 through ~~P3005.2.11~~P3005.2.12.

Reason:

This is a companion change to the 2018 IRC subsection reintroduction of cleanout equivalents that was mistakenly left out during the reorganization of the cleanout section in the 2015 IRC. This is a viable option for cleanout equivalents in the IPC as well which is why the addition of the language is being proposed to match the IRC language.

Cost Impact

The code change proposal will decrease the cost of construction .

This will reduce the cost of construction by allowing fixtures such as water closets to be utilized as cleanouts, as have been allowed in the past.

Internal ID: 1362

P114-18

IPC: 708.1.8, Chapter 15

Proponent: Sidney Cavanaugh, representing LMK Technologies (sidneycavanaugh@yahoo.com)

2018 International Plumbing Code

Revise as follows:

708.1.8 Installation arrangement. The installation arrangement of a cleanout shall enable cleaning of drainage piping only in the direction of drainage flow.

Exceptions:

1. Test tees serving as cleanouts.
2. A two-way cleanout installation that is *approved* for meeting the requirements of Section 708.1.3.
3. A small bore vacuum excavation saddle installed in accordance with ASTM F3097.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

F3097-17:

Standard Practice for Installation of an Outside Sewer Service Cleanout through a Minimally Invasive Small Bore Vacuum Excavation

Reason:

This change is needed to recognize a less costly and invasive means of installing a clean out which may be used for maintenance and rehabilitation of building sewer and sewer service lateral.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This type of cleanout is not required and therefore doesn't result in an increase in the cost of construction. Use of this type of cleanout could actually decrease the cost as the building sewer line does not have to be excavated to install a cleanout (tee).

Analysis: A review of the standard proposed for inclusion in the code, ASTM F3097-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 925

P115-18 Part I

IPC: 717 (New), Chapter 15

Proponent: Guy Tomberlin, Fairfax County, VA, representing The Virginia Plumbing and Mechanical Inspectors Assco. and the Virginia Building and Code Officials Assco Code Committee (guy.tomberlin@fairfaxcounty.gov); Janine Snyder, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Add new text as follows:

717 RELINING BUILDING SEWERS AND BUILDING DRAINS

717.1 General. This section shall govern the relining of existing *building sewers and building drainage piping*.

717.2 Applicability. The relining of existing *building sewer* and building drainage piping shall be limited to gravity drainage piping, 4 inches (102 mm) in diameter and larger. The relined piping shall be of the same nominal size as the existing piping.

717.3 Pre-installation requirements. Prior to commencement of the relining installation, the existing piping sections to be relined shall be descaled and cleaned. After the cleaning process has occurred and water has been flushed through the system, the piping shall be inspected internally by a recorded video camera survey.

717.3.1 Pre-installation recorded video camera survey. The video survey shall include verification of the project address location. The video shall include notations of the cleanout and fitting locations, and the approximate depth of the existing piping. The video shall also include notations of the length of piping at intervals no greater than 25 feet.

717.4 Permitting. Prior to permit issuance, the code official shall review and evaluate the pre-installation recorded video camera survey to determine if the piping system is capable to be relined in accordance with the proposed lining system manufacturer's installation requirements and applicable referenced standards.

717.5 Prohibited applications.

Where review of the pre-installation recorded video camera survey reveals that piping systems are not installed correctly or defects exist, relining shall not be permitted. The defective portions of piping shall be exposed and repaired with pipe and fittings in accordance with this code. Defects shall include, but are not limited to, backgrade or insufficient slope, complete pipe wall deterioration or complete separations such as from tree root invasion or improper support.

717.6 Relining materials. The relining materials shall be manufactured in compliance with applicable standards and certified as required in Section 303. Fold -and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.

717.7 Installation. The installation of relining materials shall be performed in accordance with the manufacturer's installation instructions, applicable referenced standards and this code.

717.7.1 Material data report. The installer shall record the data as required by the relining material manufacture and applicable standards. The recorded data shall include but is not limited to the location of the project, relining material type, amount of product installed and conditions of the installation. A copy of the data report shall be provided to the code official prior to final approval.

717.8 Post-installation recorded video camera survey. The completed relined piping system shall be inspected internally by a recorded video camera survey after the system has been flushed and flow tested with water. The video survey shall be submitted to the the *code official* prior to finalization of the permit. The video survey shall be reviewed and evaluated to provide verification that no defects exist. Any defects identified shall be repaired and replaced in accordance with this code.

717.9 Certification. A certification shall be provided in writing to the code official, from the permit holder, that the

relining materials have been installed in accordance with the manufacturer's installation instructions, the applicable standards and this code.

717.10 Approval. Upon verification of compliance with the requirements of Sections 717.1 through 717.9, the code official shall approve the installation.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box

Proponent: Guy Tomberlin, Fairfax County, VA, representing The Virginia Plumbing and Mechanical Inspectors Assco. and the Virginia Building and Code Officials Assco Code Committee (guy.tomberlin@fairfaxcounty.gov); (janine.snyder@cityofthorton.net)

2018 International Residential Code

Revise as follows:

~~SECTION P3011 REPLACEMENT RELINING OF UNDERGROUND BUILDING SEWERS BY PVC FOLD AND FORM METHODS BUILDING DRAINS~~

~~P3011.1 General.~~ This section shall govern the ~~replacement relining of existing building sewer piping by PVC Fold and Form methods; and building drainage piping.~~

~~P3011.2 Applicability.~~ The ~~replacement relining of existing building sewer piping by PVC fold and form methods and building drainage piping~~ shall be limited to gravity drainage piping 4 inches (102 mm) ~~to 18 inches (457 mm).~~ The ~~replacement in diameter and larger.~~ The relined piping shall be of the same nominal size as the existing piping.

~~P3011.3 Preinstallation inspection Pre-installation Requirements.~~ ~~The Prior to commencement of the relining installation, the existing piping sections to be replaced relined shall be descaled and cleaned. After the cleaning process has occurred and water has been flushed through the system, the piping shall be inspected internally by a recorded video camera survey. The survey shall include notations of the position of cleanouts and the depth of connections to the existing piping.~~

Add new text as follows:

P3011.3.1 Pre-installation recorded video camera survey. The video survey shall include verification of the project address location. The video shall include notations of the cleanout and fitting locations, and the approximate depth of the existing piping. The video shall also include notations of the length of piping at intervals no greater than 25 feet.

P3011.4 Permitting. Prior to issuing a permit for relining, the building official shall review and evaluate the pre-installation recorded video camera survey to determine whether the piping system is capable to be relined in accordance with the proposed lining system manufacturer's installation requirements and applicable referenced standards.

Delete and substitute as follows:

~~3011.4 Pipe.~~ ~~The replacement piping shall be manufactured in compliance with ASTM F1504 or ASTM F1871.~~

~~3011.5 Prohibited applications.~~ ~~Where review of the pre-installation recorded video camera survey reveals that piping systems are not installed correctly, or defects exist, relining shall not be permitted. The defective portions of piping shall be exposed and repaired with pipe and fittings in accordance with this code. Defects shall include, but are not limited to, backslope or insufficient slope, complete pipe wall deterioration or complete separations such as from tree root invasion or improper support.~~

~~3011.5 Installation.~~ ~~The piping sections to be replaced shall be cleaned and flushed. Remediation shall be performed where there is groundwater infiltration, roots, collapsed pipe, dropped joints, offsets more than 12 percent of the inside pipe diameter or other obstructions.~~

~~3011.6 Relining materials.~~ ~~The relining materials shall be manufactured in compliance with applicable standards and certified as required in Section P2609. Fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.~~

Add new text as follows:

P3011.7.1 Material data report. The installer shall record the data as required by the relining material manufacture and applicable standards. The recorded data shall include but is not limited to the location of the project, relining material type, amount of product installed and conditions of the installation. A copy of the data report shall be provided to the building official prior to final approval.

Delete and substitute as follows:

~~**3011.6 Cleanouts.** Where the existing *building sewer* did not have cleanouts meeting the requirements of this code, cleanout fittings shall be installed as required by this code.~~

~~**P3011.7 Installation.** The installation of relining materials shall be performed in accordance with the manufacturer's installation instructions, applicable referenced standards and this code.~~

~~**3011.7 Post-installation inspection.** The completed replacement piping shall be inspected internally by a recorded video camera survey. The video survey shall be reviewed and *approved* by the *building official* prior to pressure testing of the replacement piping system.~~

~~**P3011.8 Post-installation recorded video camera survey.** The completed relined piping system shall be inspected internally by a recorded video camera survey after the system has been flushed and flow tested with water. The video survey shall be submitted to the *code official* prior to finalization of the permit. The video survey shall be reviewed and evaluated to provide verification that no defects exist. Any defects identified shall be repaired and replaced in accordance with this code.~~

Delete without substitution:

~~**P3011.8 Pressure testing.** The replacement piping system as well as the connections to the replacement piping shall be tested in accordance with Section P2503.4.~~

Add new text as follows:

P3011.9 Certification. A certification shall be provided in writing to the building official, from the permit holder, that the relining materials have been installed in accordance with the manufacturer's installation instructions, the applicable standards and this code.

P3011.10 Approval. Upon verification of compliance with the requirements of Sections P3011.1 through P3011.9, the building official shall approve the installation.

Reason:

To date there has been limited to no code reference for all the technologies currently available to the reline piping systems. Many localities across the country are accepting it as an alternate material and method with no code guidance. This proposal is not an endorsement of any particular method or process. It does not promote or require relining. It simply provides installation and acceptance criteria when the application is encountered. This language will provide consistent application for all materials and technologies for the industry, including the code official and installers alike. Pipe relining technology has been successfully used for many years. It began with larger utility piping systems and has progressed into smaller piping systems that are privately owned and fall within the purview of the plumbing code. The process reduces the impact of open trench excavation's and thereby reduces repair cost according to industry data.

Cost Impact

The code change proposal will decrease the cost of construction .

Reducing open trench excavation, assisting with preservation of the natural environment and limiting destruction of private property will reduce the cost of plumbing repairs.

Internal ID: 1867

P116-18

IPC: 717 (New), 717.1 (New), Chapter 15

Proponent: Sidney Cavanaugh, representing LMK Technologies (sidneycavanaugh@yahoo.com)

2018 International Plumbing Code

Add new text as follows:

717 BUILDING SEWER AND SEWER SERVICE LATERAL REHABILITATION

717.1 Building sewer and sewer service lateral rehabilitation. Any rehabilitation of building sewer piping and sewer service lateral piping shall be in accordance with ASTM F2599. Any rehabilitation of building sewer and sewer service lateral pipe and its connection to the main sewer pipe shall be in accordance with F2561. All rehabilitation of building sewer piping and sewer service laterals shall include the use of hydrophilic rings or gaskets meeting ASTM F3240 to assure water tightness and elimination of ground water penetration.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959

F2599-16:

Standard Practice for The Sectional Repair of Damaged Pipe By Means of An Inverted Cured-In-Place Liner

F2561-17:

Standard Practice for Rehabilitation of a Sewer Service Lateral and Its Connection to the Main Using a One Piece Main and Lateral Cured-in-Place Liner

F3240-17:

Standard Practice for Installation of Seamless Molded Hydrophilic Gaskets (SMHG) for Long-Term Watertightness of Cured-in-Place Rehabilitation of Main and Lateral Pipelines

Reason:

To add necessary requirements for rehabilitation of building sewers and sewer service laterals that are currently missing from IPC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

In most cases this method would decrease cost of repair of existing piping because there would be no need to dig up and replacing existing piping.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F2599-16, ASTM F2561-17, ASTM F3240- 17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Tesla (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

903.1 Roof extension-Vent terminal required. ~~Open vent pipes that extend through a roof shall be terminated not less than [NUMBER] inches (mm) above the roof. Where a roof is to be used for assembly or as a promenade, observation deck, sunbathing deck or similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof. The vent pipe shall terminate by extending to the outdoors through the roof or the side wall in accordance with one of the methods identified in Section 903.1.1 through 903.1.4.~~

Add new text as follows:

903.1.1 Roof extension unprotected. Open vent pipes that extend through a roof shall be terminated not less than [NUMBER] inches (mm) above the roof.

903.1.2 Roof used for recreational or assembly purposes. Where a roof is to be used as a promenade, restaurant, bar, observation deck, sunbathing deck, or similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.

903.1.3 Protected vent terminal. Where an open vent pipe terminates above a sloped roof and is covered by either a roof-mounted panel (such as a solar collector or photovoltaic panel mounted over the vent opening) or a roof element (such as an architectural feature or a decorative shroud), the vent pipe shall terminate not less than 2 inches (51 mm) above the roof surface. Such roof elements shall be designed to prevent the adverse effects of snow accumulation and wind on the function of the vent. The placement of a panel over a vent pipe and the design of a roof element covering the vent pipe shall provide for an open area for the vent pipe to the outdoors that is not less than the area of the pipe, as calculated from the inside diameter of the pipe. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening.

903.1.4 Sidewall vent terminal. Vent terminals extending through the wall shall terminate not less than 10 feet (3048 mm) from the lot line and 10 feet (3048 mm) above the highest adjacent grade within 10 feet (3048 mm) horizontally of the vent terminal. Vent terminals shall not terminate under the overhang of a structure with soffit vents. Side wall vent terminals shall be protected to prevent birds or rodents from entering or blocking the vent opening.

Delete without substitution:

903.6 Extension through the wall. ~~Vent terminals extending through the wall shall terminate at a point not less than 10 feet (3048 mm) from a lot line and not less than 10 feet (3048 mm) above average ground level. Vent terminals shall not terminate under the overhang of a structure with soffit vents. Side wall vent terminals shall be protected to prevent birds or rodents from entering or blocking the vent opening.~~

Reason:

A similar change was proposed during the last cycle. There was concern regarding the wording used in the proposed code text. Those issues have been addressed with revised wording. A similar change was approved for inclusion in the International Residential Code-Plumbing Section.

The proposed change reorganizes vent terminal requirements. There are currently three options for a vent terminal, extending the vent (number) inches or more above the roof, extending the vent more than 7 feet above the roof when the roof is used for entertainment, or extending the vent through the side wall. However, the three requirements are separated between multiple sections. This makes the requirement readily identifiable in a section that presents all the options in one main section.

A fourth option for terminating the vent has been included. The fourth option would allow the vent to terminate 2 inches above a sloped roof when protected by a covering. This would allow photovoltaic solar collectors to be installed over vent terminals. It would also allow other protected vent terminals, such as architectural features that hide the vent for aesthetic purposes.

The size, length, and location of vent terminals has been a subject matter that has been greatly discussed over the last century. There are many myths, innuendoes, theories, and hypothesis regarding vent terminals. One of the most

complete papers on vent terminals was published by the National Bureau of Standards (NBS) in 1954, entitled, "Frost Closure of Roof Vents in Plumbing Systems," authored by Nerbert Eaton and Robert Wyly. Most of the current code requirements originate from the recommendations of this paper.

The NBS paper investigated plumbing roof vents and their termination throughout North America. Identified as a major concern is the frost closure of the vent terminal. Other concerns included snow blockage, shearing off of the vent terminal, and rainwater entrance.

Prior to this paper, it was largely alluded that the reason for a minimum size of 1-1/4 inch and a termination above the roof surface was to prevent a bird from building a nest and laying an egg to block off the vent. To this day, birds building nests in vents is a concern. However, that concern is more related to side wall venting that provides an easy opening for a bird to build a nest.

When a vent terminates lower to the roof, measures must be taken to prevent a bird from building a nest around the vent pipe and blocking it off. Increasing the size of the vent is one means used to avoid a bird's nest. Screening and vent covers also are used to prevent birds from building a nest.

The more pressing issue is how far above the roof a vent should terminate. Two issues of importance are water tightness of the flashing and preventing rainwater entrance into the plumbing vent. Modern day flashings can make the roof penetration water tight at much lower heights, including a termination 2 inches above the roof.

The NBS report suggested a minimum of 2 inch penetration above the roof to prevent rainwater from entering the plumbing vent. It is recognized that a flat roof can have a greater accumulation of water hence the need for the vent to be at a higher elevation. Typically secondary roof drains are located between 2 and 4 inches above the roof. Thus, the vent terminal would have to be located at a higher height which is the reason for maintaining a minimum of inserting the appropriate number of inches above the roof for a flat roof.

The NBS report identified a vent terminal used in Saskatoon, Canada that terminates at the sloped roof. There was no extension above the roof. This was found to be extremely effective in preventing frost closure. As the NBS report states, the closer the vent terminates to the roof, the lower the possibility of frost closure. The report also found that by making the vent a minimum of 3 inch in diameter, frost closure that impacts the performance of the venting system was avoided.

Snow accumulation has been a subject of more recent discussions regarding vent terminals. However, snow accumulation was addressed in the NBS report. The NBS report found that while snow may completely cover the vent terminal, the snow eventually melts from the heated vapors emanating out of the vent. Prior to the snow melting, the NBS report found that the snow cover did not impact the performance of the vent. This makes sense since the purpose of the vent is to balance the pressure in the drainage system with atmospheric pressure. The snow cover is not dense enough to prevent the balancing of pressure in the piping system.

The current code requires the vent to terminate at a height specified by the jurisdiction. The Residential Code requires the termination to be 6 inches above the anticipated snow cover. The requirement add the local value remains intact. However, when the vent is covered, such as by a solar panel or architectural feature, it cannot be covered by snow such that the vent doesn't perform properly. Thus, the vent could terminate at a 2 inch height above a sloped roof.

In the mountain west, shearing of the roof vent is a problem when the snow and ice melt and slide off of sloped roofs. By extending the vent higher through the roof, there is a greater force applied on the vent that can result in the pipe being sheared off. If the vent is lowered, the force on the vent during snow and ice slides is also lowered. This may reduce the shearing incidents of vent pipes. However, that is not part of the reason for lowering the vent terminal height. The vent would be protected if installed at a lower height. Hence, the snow and ice slides would have little to no impact on the vent since it is covered.

Plumbing contractors in the mountain west with heavy snow and ice accumulations have found that the more practical solution is to extend the vent through the roof closer to the peak of the roof. Thus, the force from sliding snow and ice is lowered. This has not been addressed in this code change and is more of a regional issue addressed by knowledgeable local contractors.

The remaining issue that is not often addressed for vent terminals is the impact of wind. During windy conditions, the vent terminal can create a reduced pressure zone that siphons the trap seal. This is often called a Venturi effect. The other concern is downdrafts that can increase the pressure in the drainage system. However, downdrafts have not had a major impact on the drainage system based on the termination height above the roof. While the possibility exists that a lower vent termination height could result in higher wind downdrafts, this has not proven to be the case. However, the code requirement addresses downdrafts by requiring the covering to prevent any adverse impact from wind.

What the plumbing profession must acknowledge is that solar is a viable source of energy for a building. As such, accommodations must be made to allow for the maximum area of roof coverage with solar panels. This may require the adjustment in the height of the vent terminal.

While accommodations must be made, there cannot be a sacrifice of public health. The lowering of the vent terminal to 2 inches on a sloped roof will not impact public health. This was proven by the NBS study published in 1954. Furthermore, modern building practices will result in a water tight vent terminal that will perform as intended.

Bibliography:

“Frost Closure of roof Vents in Plumbing Systems,” Herbert N. Eaton and Robert S. Wyly, BMS Report 142, published 1954, United States Department of Commerce, National Bureau of Standards.

National Plumbing Code Handbook, Standards and Design Information, Vincent T. Manas, P.E., copyright 1957, McGraw-Hill Book Company

Cost Impact

The code change proposal will decrease the cost of construction .

Options for vent termination will be provided. This will lower the cost of construction.

Internal ID: 1311

P118-18

IPC: 915.1

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

2018 International Plumbing Code

Revise as follows:

915.1 Type of fixtures. A *combination waste and vent system* shall not serve fixtures other than floor drains, sinks, lavatories and drinking fountains. *Combination waste and vent systems* shall not receive the discharge from a ~~food waste disposer or~~ clinical sink.

Reason:

The ASPE Research Foundation did a study on food waste disposers discharging through a combination waste and vent system. There was no problem found with the installation of a combination waste and vent system connecting a food waste disposer. Testing was performed with both residential and commercial food waste disposers. A copy of the ASPE Research Foundation report is included with this submittal. This paper documents why this current code restriction is unnecessary.

A series of videos taken during the research project can be viewed at: <https://aspe.org/FoodDisposerTestVideos>.

A similar restriction in the Residential Code Plumbing Section was removed during the last code change cycle. This IPC should be consistent with the IRC plumbing requirements.

Cost Impact

The code change proposal will decrease the cost of construction .

This will allow a lower cost venting system where a food waste disposer is installed.

P119-18

IPC: 202, 919 (New), 919.1 (New), 919.2 (New), Chapter 15

Proponent: Ronald George, representing IPS corporation (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Add new definition as follows:

POSTIVE PRESSURE REDUCTION DEVICE A device that is connected to a drainage or vent stack to attenuate pressure waves and reduce pressure fluctuations in the sanitary waste & vent system to within acceptable levels.

Add new text as follows:

919 POSITIVE PRESSURE REDUCTION DEVICES

919.1 General. Positive pressure reduction devices used in vent systems shall comply with ASSE 1030.

919.2 Installation. The installation of positive pressure reduction devices in sanitary drainage and vent systems shall be in accordance with the device manufacturer's instructions.

Add new standard(s) follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1030-2016:

Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Reason:

This proposal adds a definition for positive pressure reduction devices and a standard for such devices. Positive pressure reduction devices (hereafter referred to as "device") are to be used in building drainage waste and vent (DWV) systems. They are intended to reduce the impact of short duration air pressure transients that arise in DWV stacks through use. The device consists of a variable volume reservoir contained within a ventilated rigid outer casing with an inlet connection by which the reservoir inflates when subjected to positive pressure. In its inactive state, the flexible reservoir is deflated. Expansion only occurs in response to an increase in line pressure at the entrance to the device. This expansion provides a variable volume reservoir for air. The device connects to the drainage network via an airtight seal to prevent the diversion of airflow from entering the reservoir. As a result, the reservoir becomes an integral part of the drainage network.

P.A.P.A.™ - Positive Air Pressure Attenuator

The P.A.P.A. device is the perfect complement to Studor Air Admittance Valves. Together they form an Engineered System known as "Studor Single Pipe System (SSPS)", a total solution to building venting requirements. The Studor AAVs deal with negative pressure in the system while the P.A.P.A. effectively deals with the positive pressure transients. The combination of the two maintains the perfect system balance quickly and efficiently throughout the system preventing siphonage and blowing of traps.

- For Commercial use
- The P.A.P.A. can be used in conjunction with a conventional DWV system
- ASSE 1030 - Positive Pressure Reduction Devices for Sanitary Drainage Systems

Weight: 5 pounds

Bibliography:

Pages 29 through 44 & 49 of Studor Technical Manual, 9th Edition

Web Link: http://ipscorp.com/pdf/studor/Studor_Technical_Manual.pdf

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is only an option that is not required to be used. When used in single stack drainage systems, it can decrease the cost of construction, however these devices can be used in any sanitary waste and vent system that is experiencing pressure fluctuations and it will attenuate pressure waves.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P120-18

IPC: 1002.1

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Revise as follows:

1002.1 Fixture traps. Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.3.3. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
- ~~3. A grease interceptor intended to serve as a fixture trap in accordance with the manufacturer's installation instructions shall be permitted to serve as the trap for a single fixture or a combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the *developed length* of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm).~~
- ~~4.3.~~ Floor drains in multilevel parking structures that discharge to a building storm sewer shall not be required to be individually trapped. Where floor drains in multilevel parking structures are required to discharge to a combined *building sewer* system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.

Reason:

This is an error in the code that has been present since the change was made to section 802.1.7 requiring that utensil/pot/pan sinks to be indirectly connected. Previously a direct connection was also permissible, which promulgated exception # 3. Since a direct connection is no longer permissible for these type of sinks, exception # 3 would be in direct violation of 802.1.7

Bibliography:

2018 International Plumbing Code

PUB. - 08/31/2017

802.1.7 Food utensils, dishes, pots and pans sinks.

Sinks, in other than dwelling units, used for the washing, rinsing or sanitizing of utensils, dishes, pots, pans or service ware used in the preparation, serving or eating of food **shall discharge indirectly through an air gap or an air break to the drainage system.**

1002.1 Fixture traps.

Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.3.3. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.

3. A grease interceptor intended to serve as a fixture trap in accordance with the manufacturer's installation instructions shall be permitted to serve as the trap for a single fixture or a combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the developed length of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm).

4. Floor drains in multilevel parking structures that discharge to a building storm sewer shall not be required to be individually trapped. Where floor drains in multilevel parking structures are required to discharge to a combined building sewer system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There will be no cost impact due to the fact that the requirement is already in chapter 8 for an indirect connection.

Internal ID: 1533

P121-18

IPC: 1002.4.1.1

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)

2018 International Plumbing Code

Revise as follows:

1002.4.1.1 Potable water-supplied trap seal primer valve. A potable water-supplied trap seal primer valve shall supply water to the trap. Water-supplied trap seal primer valves shall conform to ASSE 1018-, and shall be of the type that uses not more than 30 gallons per year per trap. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal on the inlet side of the trap.

Reason:

A water-supplied trap seal primer that is unrestricted can discharge 300 to 500 gallons a year to a trap. By comparison, a 2-inch trap, for example, actually requires less than 1/2 gallon per year to maintain the trap seal. Trap seal primer valves that limit the amount of water discharged to 8 gallons per year have been on the market for several years.

The maximum of 30 gallons of discharge per year in this proposal is contained in both the 2015 International Green Construction Code (IgCC) and the 2015 IAPMO Green Plumbing and Mechanical Code Supplement. It is time to bring this common-sense requirement into the IPC to prevent an unnecessary waste of drinking water.

Bibliography:

2015 International Green Construction Code, International Code Council, 2015, sec. 702.8.2.

2015 Green Plumbing and Mechanical Code Supplement, International Association of Plumbing and Mechanical Officials, 2015, sec. 415.1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal applies to only one of four available compliance paths where trap seal protection is required, and thus will not increase the cost of construction.

Internal ID: 1621

P122-18

IPC: 1002.4.1.5 (New), 1002.4.1

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Add new text as follows:

1002.4.1.5 Fixture drain connection for trap priming. A fixture drain from a lavatory or hand sink shall serve as a method of providing trap seal protection for an emergency floor drain, a trench drain, or a floor sink where such fixtures are located in the same room. A fixture drain from a drinking fountain shall serve as a method of providing trap seal protection for an emergency floor drain, a trench drain, or a floor sink where such fixtures are in the same room or in a room adjacent to the room having the drinking fountain. The fixture drain shall not be routed on or above the surface of the floor and shall connect to the floor drain, trench drain, or floor sink at a point that is below the flood level rim and above the inlet to the trap of the receiving fixture.

Revise as follows:

1002.4.1 Trap seal protection. Trap seals of *emergency floor drain* traps and trap seals subject to evaporation shall be protected by one of the methods in Sections 1002.4.1.1 through ~~1002.4.1.4~~1002.4.1.5.

Reason:

This is a method of providing trap seal protection that can lower the owner's overall cost of maintenance and requires no special or certified product to do so.

Currently the 2018 International Plumbing Code allows for reclaimed or gray water supplied trap primer devices that comply with ASSE 1018, as well as a waste water supplied device that complies with ASSE 1044. The proposed method simply removes the need for any "certified" product. Experience has proven that the ASSE 1018 devices don't typically have a record of providing long service, maintenance issues have also been reported with the 1044 devices. When owners decide to go back to using gel type soaps even though the manufacture specifically states the need for foaming soap, the 1044 device have a tendency to plug up with the gel soaps over time which requires maintenance intervention. The maintenance for the 1018 device is even more problematic, often we would be replacing these devices within 6-12 months of installation. This proposed method is essentially already something that is allowed by the code. We have used this method since before I entered into the plumbing trade and have never had a complaint about it failing or creating an unsafe/serious condition for an occupancy.

2018 International Plumbing Code

PUB. - 08/31/2018

1002.4.1.2 Reclaimed or gray water-supplied trap seal primer valve.

A reclaimed or gray water-supplied trap seal primer valve shall supply water to the trap. Water-supplied trap seal primer valves shall conform to ASSE 1018. The quality of reclaimed or gray water supplied to trap seal primer valves shall be in accordance with the requirements of the manufacturer of the trap seal primer valve. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal, on the inlet side of the trap.

1002.4.1.3 Waste water-supplied trap primer device.

A waste water-supplied trap primer device shall supply water to the trap. Waste water-supplied trap primer devices shall conform to ASSE 1044. The discharge pipe from the trap seal primer device shall connect to the trap above the trap seal on the inlet side of the trap

Cost Impact

The code change proposal will decrease the cost of construction .

This method should actually result in a decrease cost of construction because no special trap priming devices are required. The fixture drain already has to be piped, it is just piped to the fixture needing trap priming. This will also save maintenance costs because trap priming devices will not need repaired/replaced.

Internal ID: 1534

P123-18

IPC: 1003.3.2

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

2018 International Plumbing Code

Revise as follows:

1003.3.2 Food waste disposers restriction. A food waste disposer shall not discharge to a grease interceptor.

Exception: A two or three compartment sink that is required to discharge to a grease interceptor shall be permitted to have a food waste disposer provided that the disposer rating is not greater than 1.0 horsepower.

Reason:

The commercial food handling industry has requested that small food waste disposers be permitted on two or three compartment sinks to handle the incidental food waste that accumulates in the wash sink after cleaning. The food waste disposer would not be the typical commercial food waste disposer unit handling all of the food waste from the establishment. It would only account for a small portion of food waste remaining during the washing operation.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The allowance for having a small disposer discharging to a grease interceptor could save the cost of materials and labor of needing a separate sink just for a small disposer and the need for separate drainage piping to connect that sink downstream of the interceptor.

Internal ID: 1882

P124-18

IPC: 1003.3.2.1 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

2018 International Plumbing Code

Add new text as follows:

1003.3.2.1 Existing installations. For existing installations where the food waste disposer discharges through the grease interceptor, the grease interceptor shall be properly sized to include the discharge from the food waste disposer. The sizing of the grease interceptor shall be based on the continuous flow from the food waste disposer.

Reason:

The code was revised to add the prohibition for the discharge of food waste disposers through grease interceptors. However, there are many existing installations where the food waste disposer discharges through the grease interceptor. When the grease interceptor is replaced, the sizing must include the increase load from the food waste disposer.

It is common practice to have the food waste disposer operating in a food handling establishment. When connected to a grease interceptor, this can add a greater load than normal dishwashing sinks. This additional load must be considered when sizing the replacement grease interceptor. The time interval between cleaning of the grease interceptor must also be considered.

In a recently published paper, "A critical review of fat, oil, and grease (FOG) in sewer collection systems: Challenges and control," the importance of properly sizing and maintaining a grease interceptor was identified as a means of reducing the problems of FOG build up in public sewer systems. This proposed change will provide guidance in the proper sizing when an existing system has a food waste disposer discharging to a grease interceptor. This will reduce the contributions of FOG to the public sewer system.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This addresses existing installations and has no impact on the cost.

IPC: 1106.2, 1106.2.1 (New), TABLE 1106.2.1 (New), 1106.2.1.1 (New), 1106.2.1.2 (New), 1106.2.2 (New), 1106.2.2.1 (New)

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

~~**1106.2 Size of storm drain piping.** Storm drain pipe sizing. Vertical and horizontal. The storm drain drainage piping shall be sized based on the flow rate through the roof drain. The flow rate in storm drain piping shall not exceed that specified in Table 1106.2 in accordance with Section 1106.2.1 or Section 1106.2.2.~~

Add new text as follows:

1106.2.1 Roof drainage. The rainwater drainage flow rate from the roof surface shall be determined based on the rainfall rate of a 60 minute storm with a 100 year return period and the area of the roof being drained in accordance with Table 1106.2.1.

**TABLE 1106.2.1
ROOF AREA DRAINAGE FLOW RATE**

Roof Drainage Area (sq. ft.)	Drainage Flow Rate (gpm)					
	Based on Rainfall Rates (in/hr)					
	1	2	3	4	5	6
500	5	10	16	21	26	31
1000	10	21	31	42	52	62
1500	16	31	47	62	78	94
2000	21	42	62	83	104	125
2500	26	52	78	104	130	156
3000	31	62	94	125	156	187
3500	36	73	109	145	182	218
4000	42	83	125	166	208	249
4500	47	94	140	187	234	281
5000	52	104	156	208	260	312
5500	57	114	171	229	286	343
6000	62	125	187	249	312	374
6500	68	135	203	270	338	405
7000	73	145	218	291	364	436
7500	78	156	234	312	390	468
8000	83	166	249	332	416	499
9000	94	187	281	374	468	561
10000	104	208	312	416	519	623
11000	114	229	343	457	571	686
12000	125	249	374	499	623	748

1106.2.1.1 Roof drain. The flow rate used for sizing the roof drainage system shall be not less than the roof drain manufacturer's published flow rate based on a head height of 4 inches (102 mm) of water ponding. Storm drainage piping shall be sized in accordance with Table 1106.2.

1106.2.1.2 Secondary roof drainage. The opening for the secondary roof drainage shall be not less than 2 inches (51 mm) and not more than 5 inches (76 mm) above the bottom opening of the primary roof drain.

1106.2.2 Engineered Roof Drain Flow Rate. Vertical and horizontal storm drain piping shall be sized based on the flow rate through the roof drain. The flow rate used for sizing the storm drainage piping shall be based on the maximum anticipated ponding at the roof drain based on a rainfall rate of a 60 minute storm with a 100 year return period and a 5 minute storm with a 10 year return period. The flow rate used for sizing the storm drainage piping system shall be the manufacturer's published flow rate for the roof drain based on the established maximum anticipated water ponding height. The storm drainage piping shall be sized in accordance with Table 1106.2.

1106.2.2.1 Secondary roof drainage. The discharge through the secondary roof drain shall not be considered when establishing the maximum height of ponding at the primary roof drain. The opening for the secondary roof drainage shall be not less than 2 inches (51 mm) above the bottom opening of the primary roof drain.

Reason:

The code was revised a few cycles ago to reflect the research published by the ASPE Research Foundation. ASPE RF and IAPMO cosponsored research on the performance of roof drains in storm drainage systems. There has been a number of requests for a fast sizing method that does not require engineering calculations. The change adds such a fast, cook-book method of sizing the storm drainage piping system.

The ASPE RF research report states the problem associated with a storm drainage system is the improper sizing of the storm drainage pipe. The old sizing method did not account for the high quality of the roof drain. The research report is included with the submittal and can be downloaded at no cost at www.aspe.org.

The code change identifies two methods for sizing the storm drainage system. The first sizing method listed in Section 1106.2.1 Roof Drainage, is the quick sizing method. When using this method, the storm drain pipe may be sized large

than the engineered sizing method. The quick method will not result in smaller diameter pipe for the storm drainage system.

These requirements respond to the request by inspectors, contractors, and engineers. The first sizing method identified was developed to provide a cookbook method of sizing rather than conducting a full engineering design analysis. The sizing of the storm drainage system still relies on the values published by the roof drain manufacturers. This data identifies the flow rate based on head height through the roof drain.

Because the method takes a cookbook approach, the secondary roof drainage must be considered. For that reason, secondary roof drainage is required to be between 2 inch and 5 inches above the primary roof drainage. This is calculated into the flow rate sizing values in Table 1106.2.1. It will assure that the system will not exceed the ponding height determined in flow calculations.

The second method, identified as Section 1106.2.2 Engineered Roof Drain Flow Rate, is the current sizing method required by the code. One change has been added to the engineered sizing method. The engineered sizing will require the evaluation of the roof drainage system for a microburst, which is a 5-minute storm with a 10-year return period. While a 100-year storm may appear to be the most drastic storm for sizing a system, a microburst can overpower the storm drainage piping resulting in failure of the piping system. The microburst will typically not have a significant impact on the roof loading compared to a 100-year storm of 60-minute duration. The ASPE RF research report recommends the evaluation of both a 100-year storm of 60 minutes duration and a 10-year storm of 5-minute duration.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This provides an option for sizing the storm drainage system and options usually lower the cost of construction.

P126-18

IPC: 1102.6, Chapter 15

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Froet Industries (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows:

1102.6 Roof Drains. Roof drains shall conform to ASME A112.6.4 or ASME A112.3.1. Roof drains, other than siphonic roof drains, shall be tested and rated in accordance with ASME A112.6.4 or ASPE/IAPMO Z1034.

Add new standard(s) follows:

ASPE

American Society of Plumbing
Engineers
6400 Shafer Ct., Suite 350
Rosemont IL 60018-4914

ASME/IAPMO 21034-2015:

Test Method for Evaluating Roof Drain Performance

Reason:

ASPE/IAPMO Z1034 is the consensus standard for testing and rating roof drains for their flow rate at different ponding heights. The current code requires the manufacturer to publish their flow rates. The flow rates are determined by testing to either of the two standards referenced.

Siphonic roof drains are rated differential with the system designed in accordance with ASPE 45 and the roof drain tested in accordance with ASME A112.6.9.

The testing requirements in the standard are consistent with the results published in the ASPE Research Foundation Roof Drainage Research Report. There are third party laboratories currently testing and certifying roof drains to the ASPE/IAPMO Z1034 standard.

Cost Impact

The code change proposal will increase the cost of construction .

There is a cost associated with the testing of roof drains.

Analysis: A review of the standard proposed for inclusion in the code, ASPE/IAPMO 21034-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1173

P127-18

IPC: 1105.1

Proponent: Mark Jelinske, representing Self (mjelinske@rmhgroup.com)

2018 International Plumbing Code

Delete without substitution:

~~**1105.2 Roof drain flow rate.** The published roof drain flow rate, based on the head of water above the roof drain, shall be used to size the storm drainage system in accordance with Section 1106. The flow rate used for sizing the storm drainage piping shall be based on the maximum anticipated ponding at the roof drain.~~

Reason:

Recent (Dec 2017) conversations and correspondence with major roof drain manufacturers have indicated that there is no published flow data for roof drains, no recognized standards for testing the flow rate of roof drains, and no industry initiative to develop such testing programs.

While a good idea, this provision is premature until there are recognized standards developed, and until the manufacturers have developed the performance data from these standards.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This has no cost impact since there is no practical method to comply with the provisions of this section anyway. If anything, this proposal will reduce cost for the unlucky project forced to comply, since at present, a construction project would have to fund the development of a testing standard, fund a laboratory to perform such testing, and fund the publication of the data.

Internal ID: 1143

P128-18

IPC: 1105.2

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Revise as follows:

1105.2 Roof drain flow rate. The published roof drain flow rate, based on the head of water above the roof drain, shall be used to size the storm drainage system in accordance with Section 1106. The flow rate used for sizing the storm drainage piping shall be based on the ~~maximum anticipated ponding height water~~ at the roof drain should not exceed with regard to the weight of ponding water equal to the acceptable threshold established by the structural engineer.

Reason:

The previous revision to this code section left no real direction or parameters for design professionals. This proposal is simply suggesting at the minimum height of water that should be used when calculating the flow rate through the roof drain should be equal to the height ponding water would reach yet stay below the maximum weight threshold as established by the structural engineer.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is only providing providing direction for minimum safety.

Internal ID: 2358

P129-18

IPC: 1106.2, 1106.2.1 (New)

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Self (Ron@Plumb-TechLLC.com)

2018 International Plumbing Code

Revise as follows:

1106.2 Size of storm drain piping. Vertical and horizontal storm drain piping shall be sized based on the flow rate through the roof drain. The flow rate, as calculated in accordance with Section 1106.2.1, shall be checked against the roof drain manufacturer's published flow rate for the specific roof drain model and size to verify that the selected roof drain will handle the anticipated flow. The flow rate in storm drain piping shall not exceed that specified in Table 1106.2.

Add new text as follows:

1106.2.1 Rainfall rate conversion method. The rainfall rate falling on a roof surface shall be converted to a gallons per minute flow rate in accordance with Equation 11-1.

GPM = R • A • 0.0104 (Equation 11-1)

where,

R = Rainfall intensity in inches per hour

A = Roof area in square feet

Reason:

The flow rates for various pipe sizes in the roof drain sizing table were changed from square feet (SF) to gallons per minute (GPM). This code change simply adds a calculation from SF to GPM.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change only adds a calculation method and a caution about selecting an appropriate roof drain model.

Internal ID: 2246

P130-18

IPC: TABLE 1106.2

Proponent: Mark Jelinske, representing Self (mjelinske@rmhgroup.com)

2018 International Plumbing Code

Revise as follows:

**TABLE 1106.2
STORM DRAIN PIPE SIZING**

PIPE SIZE (inches)	CAPACITY ^a (gpm)				
	VERTICAL DRAIN	SLOPE OF HORIZONTAL DRAIN			
		$\frac{1}{16}$ inch per foot	$\frac{1}{8}$ inch per foot	$\frac{1}{4}$ inch per foot	$\frac{1}{2}$ inch per foot
2	34	15	22	31	44
3	87	39	55	79	111
4	180	81	115	163	231
5	311	117	165	234	331
6	538	243	344	487	689
8	1,117	505	714	1,010	1,429
10	2,050	927	1,311	1,855	2,623
12	3,272	1,480	2,093	2,960	4,187
15	5,543	2,508	3,546	5,016	7,093

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 gallon per minute = 3.785 L/m.

a. Values based on PVC piping. For cast iron pipe other than 5 inches, multiply the indicated capacity by 0.75.

Reason:

When this table was added to the 2015 IPC, it was based on PVC pipe, except for 5" which was based on cast iron. See the ICC 2012/2013 Code Development Cycle Group A Proposal P219-12. This is the smoothest pipe allowed by the IPC. Cast Iron is still a commonly used material, but is a rougher pipe, and therefore has a different flow capacity.

Gravity flow through a pipe is governed by the Gauckler–Manning formula. A roughness coefficient is used to account for the different roughness of materials. Flow is directly proportional to this roughness factor.

The roughness factor is generally given as 0.009 for PVC , and as 0.012 for cast iron. Since flow is directly proportional to roughness for the same diameter and slope, cast iron pipe is $0.009/0.012 = 0.75$ the capacity of PVC.

Using the smoothest possible pipe as the basis of the code will result in undersized pipe if not corrected for rougher pipe.

Since codes usually assume a worst case in establishing minimum requirements, an alternate method would be to modify the table with cast iron as the basis and allowing a $0.012/0.009 = 1.33$ credit if PVC is used.

It is recognized that there are other materials allowed, but PVC and cast iron are overwhelmingly dominant. Cast iron is the roughest, and PVC is the smoothest. In the interest of keeping this table simple, this proposal is just establishing the range of options, a designer can document alternate factors for other materials if desired.

Bibliography:

INTERNATIONAL CODE COUNCIL 2012/2013 CODE DEVELOPMENT CYCLE Group A (2012) PROPOSED CHANGES TO THE 2012 EDITIONS OF THE INTERNATIONAL PLUMBING CODE

P219 - 12

Pages 283-285

https://cdn-web.iccsafe.org/wp-content/uploads/05_IPC1.pdf

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will not increase the cost of correctly sized cast iron storm drainage systems. This will avoid the potential costs involved with an undersized cast iron system if a designer does is not aware of the limitations of the table. The above statement is based on the assumption that many designers are not aware that the table will undersize a cast iron system.

IRC: P2912.1.1 (New), Chapter 44

Proponent: Dave Cantrell, representing The Joint CSA/ICC Rainwater System Design and Installation Consensus Committee (dave.cantrell.codes@gmail.com)

2018 International Residential Code

Add new text as follows:

P2912.1.1 Alternate compliance path. Systems for nonpotable uses that comply with CSA B805/ICC 805 are deemed to comply with Section P2912.

Add new standard(s) follows:

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

CSA B805-18/ICC 805-2018:

Rainwater Harvesting Systems

Reason:

This proposal adds the CSA B805/ICC 805 Standard as an alternate compliance path for rainwater to be used in nonpotable applications. The Canadian Standards Association and the International Code Council jointly formed the Rainwater System Design and Installation Consensus Committee (IS-RCSDI) in order to create a Rainwater Harvesting Standard for use in North America. Nonpotable rainwater harvesting systems that conform to this Standard will comply with Chapter 13 (IRC Section P2912), thus providing a far more comprehensive guidance document as an alternate compliance path.

While this new Standard addresses rainwater for potable use and stormwater for nonpotable use, neither of which are addressed in Chapter 13 (IRC P2912), including this Standard in Chapter 14 (IRC Chapter 44) would not mandate such uses. However, it will provide code officials with the guidance needed for reviewing and inspecting these types of water reuse systems that are becoming more common with ever-increasing water conservation measures.

Here are some necessary provisions that the committee felt obligated to include in this Standard:

1. This Standard addresses roof surface rainwater and stormwater being used as source water. It addresses rainwater intended for use in nonpotable applications as well as potable applications.
2. Recognizing that the risk to public health increases with the number of persons using a rainwater harvesting system, this Standard provides different methods for protecting water based on the influent water quality, the system, and the application. Stormwater runoff is expected to have a higher likelihood of contamination as a result of its flowing overland. Therefore, this Standard specifies additional treatment process requirements for stormwater runoff and does not cover its use for potable water applications.
3. In order to ensure the consideration of the wide range of variables associated with each site, location, design, and application, this Standard requires that a water safety plan be developed for all rainwater harvesting systems. The water safety plan considers the specific challenges and risks presented by the site and associated impact on source water quality, operation of system components, and the risk associated with the end use.
4. Applications for harvested rainwater are separated into four end use tiers that consider the exposure potential through ingestion, inhalation, and skin contact. It further separates these tiers into two groups, one for single-family residential and one for multifamily, commercial and public facilities.
5. This Standard specifies minimum performance criteria for each end use tier in consideration of the health risk and identifies possible treatment process options to meet the specified performance criteria.
6. Based on the expected source water quality, this Standard establishes suitable water quality parameters that are used to substantiate that the treatment process is operating as intended to produce safe water for the specified end use.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed alternate compliance path is an option provided to the user, not a requirement. Therefore, no added cost is mandated to the user of the code.

Analysis: A review of the standard proposed for inclusion in the code, CSA B805-18/ICC 805-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P132-18 Part II

IRC: P2912.1.1 (New), Chapter 44

Proponent: Dave Cantrell, representing The Joint CSA/ICC Rainwater System Design and Installation Consensus Committee (dave.cantrell.codes@gmail.com)

2018 International Residential Code

Add new text as follows:

P2912.1.1 Alternate compliance path. Systems designed for potable uses shall comply with CSA B805/ICC 805.

Add new standard(s) follows:

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

CSA B805-18/ICC 805-18:

Rainwater Harvesting Systems

Reason:

This proposal adds the CSA B805/ICC 805 Standard as an alternate compliance path for rainwater to be used in both potable and nonpotable applications. The Canadian Standards Association and the International Code Council jointly formed the Rainwater System Design and Installation Consensus Committee (IS-RCSDI) in order to create a Rainwater Harvesting Standard for use in North America, one that will provide further guidance for rainwater to serve both potable and nonpotable uses.

Chapter 13 (IRC Section P2912) does not address rainwater for potable use, nor does it contain provisions for the use of stormwater for nonpotable use. This Standard provides code officials the guidance needed for reviewing and inspecting these types of water reuse systems that are becoming more common with ever-increasing water conservation measures. For this reason this Standard should be referenced in Chapter 14 (IRC Chapter 44) . It should further be noted that nonpotable rainwater harvesting systems that conform to this Standard will comply with Chapter 13 (Section P2912), thus providing a far more comprehensive guidance document as an alternate compliance path.

Here are some necessary provisions that the committee felt obligated to include in this Standard:

1. This Standard addresses roof surface rainwater and stormwater being used as source water. It addresses rainwater intended for use in nonpotable applications as well as potable applications.
2. Recognizing that the risk to public health increases with the number of persons using a rainwater harvesting system, this Standard provides different methods for protecting water based on the influent water quality, the system, and the application. Stormwater runoff is expected to have a higher likelihood of contamination as a result of its flowing overland. Therefore, this Standard specifies additional treatment process requirements for stormwater runoff and does not cover its use for potable water applications.
3. In order to ensure the consideration of the wide range of variables associated with each site, location, design, and application, this Standard requires that a water safety plan be developed for all rainwater harvesting systems. The water safety plan considers the specific challenges and risks presented by the site and associated impact on source water quality, operation of system components, and the risk associated with the end use.
4. Applications for harvested rainwater are separated into four end use tiers that consider the exposure potential through ingestion, inhalation, and skin contact. It further separates these tiers into two groups, one for single-family residential and one for multifamily, commercial and public facilities.
5. This Standard specifies minimum performance criteria for each end use tier in consideration of the health risk and identifies possible treatment process options to meet the specified performance criteria.
6. Based on the expected source water quality, this Standard establishes suitable water quality parameters that are used to substantiate that the treatment process is operating as intended to produce safe water for the specified end use.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed alternate compliance path is an option provided to the user, not a requirement. Therefore, not added cost is mandated to the user of the code.

Analysis: A review of the standard proposed for inclusion in the code, CSA B805-18/ICC 805-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows:

CHAPTER 14 SUBSURFACE ~~LANDSCAPE IRRIGATION GRAY WATER SOIL ABSORPTION~~ SYSTEMS

1401.1 Scope. The provisions of this chapter shall govern the materials, design, construction and installation of subsurface ~~landscape irrigation graywater soil absorption~~ systems connected to nonpotable water from on-site water reuse systems.

1401.2 Materials. Above-ground drain, waste and vent piping for subsurface ~~landscape irrigation graywater soil absorption~~ systems shall conform to one of the standards listed in Table 702.1. Subsurface ~~landscape irrigation graywater soil absorption~~ systems, underground building drainage and vent pipe shall conform to one of the standards listed in Table 702.2.

1401.3 Tests. Drain, waste and vent piping for subsurface ~~landscape irrigation graywater soil absorption~~ systems shall be tested in accordance with Section 312.

1401.4 Inspections. Subsurface ~~landscape irrigation graywater soil absorption~~ systems shall be inspected in accordance with Section 107.

1401.5 Disinfection. Disinfection shall not be required for on-site nonpotable water reuse for subsurface ~~landscape irrigation graywater soil absorption~~ systems.

1401.6 Coloring. On-site nonpotable water reuse for subsurface ~~landscape irrigation graywater soil absorption~~ systems shall not be required to be dyed.

1402.1 Sizing. The system shall be sized in accordance with the sum of the output of all water sources connected to the subsurface ~~irrigation gray water soil absorption~~ system. Where gray water collection piping is connected to subsurface landscape irrigation systems, gray water output shall be calculated according to the gallons-per-day-per-occupant number based on the type of fixtures connected. The gray water discharge shall be calculated by the following equation:

$$C = A \times B \text{ (Equation 14-1)}$$

where:

A = Number of occupants:

Residential-Number of occupants shall be determined by the actual number of occupants, but not less than two occupants for one bedroom and one occupant for each additional bedroom.

Commercial-Number of occupants shall be determined by the International Building Code.

B = Estimated flow demands for each occupant:

Residential-25 gallons per day (94.6 lpd) per occupant for showers, bathtubs and lavatories and 15 gallons per day (56.7 lpd) per occupant for clothes washers or laundry trays.

Commercial-Based on type of fixture or water use records minus the discharge of fixtures other than those discharging gray water.

C = Estimated gray water discharge based on the total number of occupants.

1402.3 Subsurface ~~landscape irrigation graywater soil absorption~~ site location. The surface grade of all soil absorption systems shall be located at a point lower than the surface grade of any water well or reservoir on the same or adjoining lot. Where this is not possible, the site shall be located so surface water drainage from the site is not directed toward a well or reservoir. The soil absorption system shall be located with a minimum horizontal distance

between various elements as indicated in Table 1402.3. Private sewage disposal systems in compacted areas, such as parking lots and driveways, are prohibited. Surface water shall be diverted away from any soil absorption site on the same or neighboring lots.

**TABLE 1402.3
LOCATION OF SUBSURFACE IRRIGATION-GRAYWATER SOIL ABSORPTION SYSTEM**

ELEMENT	MINIMUM HORIZONTAL DISTANCE	
	Storage tank (feet)	Absorption field (feet)

Proponent: Brent Mecham, Irrigation Association, representing Irrigation Association (brentmecham@irrigation.org)

2018 International Residential Code

Revise as follows:

SECTION P3009 SUBSURFACE ~~LANDSCAPE IRRIGATION~~ GRAY WATER SOIL ABSORPTION SYSTEMS

P3009.1 Scope. The provisions of this section shall govern the materials, design, construction and installation of subsurface ~~landscape irrigation~~ gray water soil absorption systems connected to nonpotable water from on-site water reuse systems.

P3009.2 Materials. Above-ground drain, waste and vent piping for subsurface ~~landscape irrigation~~ gray water soil absorption systems shall conform to one of the standards indicated in Table P3002.1(1). Subsurface ~~landscape irrigation~~ gray water soil absorption, underground building drainage and vent pipe shall conform to one of the standards indicated in Table P3002.1(2).

P3009.3 Tests. Drain, waste and vent piping for subsurface ~~landscape irrigation~~ gray water soil absorption systems shall be tested in accordance with Section P2503.

P3009.4 Inspections. Subsurface ~~landscape irrigation~~ gray water soil absorption systems shall be inspected in accordance with Section R109.

P3009.5 Disinfection. Disinfection shall not be required for on-site nonpotable reuse water for subsurface ~~landscape irrigation~~ gray water soil absorption systems.

P3009.6 Coloring. On-site nonpotable reuse water used for subsurface ~~landscape irrigation~~ gray water soil absorption systems shall not be required to be dyed.

P3009.7 Sizing. The system shall be sized in accordance with the sum of the output of all water sources connected to the subsurface ~~irrigation system~~ gray water soil absorption system. Where gray-water collection piping is connected to subsurface ~~landscape~~ gray water soil absorption irrigation systems, gray-water output shall be calculated according to the gallons-per-day-per-occupant (liters per day per occupant) number based on the type of fixtures connected. The gray- water discharge shall be calculated by the following equation:

$$C = A \times B$$

(Equation 30-1)

where:

A = Number of occupants:

Number of occupants shall be determined by the actual number of occupants, but not less than two occupants for one bedroom and one occupant for each additional bedroom.

B = Estimated flow demands for each occupant:

25 gallons (94.6 L) per day per occupant for showers, bathtubs and lavatories and 15 gallons (56.7 L) per day per occupant for clothes washers or laundry trays.

C = Estimated gray-water discharge based on the total number of occupants.

P3009.9 Subsurface ~~landscape irrigation~~ gray water soil absorption system site location. The surface grade of soil absorption systems shall be located at a point lower than the surface grade of any water well or reservoir on the same or adjoining lot. Where this is not possible, the site shall be located so surface water drainage from the site is not directed toward a well or reservoir. The soil absorption system shall be located with a minimum horizontal distance between various elements as indicated in Table P3009.9. Private sewage disposal systems in compacted areas, such as parking lots and driveways, are prohibited. Surface water shall be diverted away from any soil absorption site on the same or neighboring lots.

**TABLE P3009.9
LOCATION OF SUBSURFACE IRRIGATION GRAY WATER SOIL ABSORPTION SYSTEM**

ELEMENT	MINIMUM HORIZONTAL DISTANCE	
	STORAGE TANK(feet)	IRRIGATION DISPOSAL ABSORPTION FIELD(feet)
Buildings	5	2
Lot line adjoining private property	5	5
Water wells	50	100
Streams and lakes	50	50
Seepage pits	5	5
Septic tanks	0	5
Water service	5	5
Public water main	10	10

For SI: 1 foot = 304.8 mm.

P3009.10 Installation. Absorption systems shall be installed in accordance with Sections P3009.10.1 through P3009.11 ~~to provide landscape irrigation without surfacing of water.~~

Reason:

The proposed changes better identifies the content of the chapter from irrigation systems to soil absorption systems. The technical requirements can remain as written.

While gray water is a good source of water for maintaining plants, the provisions in this section do not adequately describe the technical aspects for use in an irrigation system. The technical requirements are addressing the soil's ability to absorb water and percolate into the soil. There are no requirements mentioned about considering the needs of plants which is an essential part of an irrigation system.

When gray water is to be used for irrigation, then chapters that are in the International Green Construction Code include better technical requirements for irrigation systems and those should be followed.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed changes only better identify the name of the chapter and do not include any technical changes that would affect construction costs

Internal ID: 3503

IPSDC: 101.2, 101.3, 107.2, 107.2.1, 107.2.2, 1 (New), 304, 304.1, 304.1.1, 304.2, 304.3, 304.4, 304.5, 304.6, 504.5, 802.1, 802.4, 802.5, 802.10, 805.3, 805.6, Chapter 11, 1101.1, 1101.2, 1202.4, Chapter 14

Proponent: Dennis Hallahan, Infiltrator Water Technologies, representing National Onsite Wastewater Recycling Association (dhallahan@infiltratorwater.com)

2018 International Private Sewage Disposal Code

Revise as follows:

[A] 101.2 Scope. Septic tank and effluent absorption systems or other treatment tank and effluent disposal systems shall be permitted where a public sewer is not available to the property served. ~~Unless specifically approved, the private sewage disposal system of each building shall be entirely separate from and independent of any other building.~~ The use of a common system or a system on a parcel other than the parcel where the structure is located shall be subject to the full requirements of this code as for systems serving public buildings.

[A] 101.3 Public sewer connection. Where public sewers become available to the premises served, the use of the *private sewage disposal system* shall be discontinued within that period of time required by law, but such period shall not exceed one year. The building sewer shall be disconnected from the *private sewage disposal system* and connected to the public sewer.

Exception: Where approved by the code official for such reasons as excessive cost or project difficulty, or where the existing system does not pose a health threat or is code compliant, then connection to the public sewer shall not be required.

[A] 107.2 Special inspections. Special inspections of alternative ~~engineered~~-design *private sewage disposal systems* shall be conducted in accordance with Sections 107.2.1 and 107.2.2.

[A] 107.2.1 Periodic inspection. The registered design professional or designated inspector shall periodically inspect and observe the alternative ~~engineered~~-design to determine that the installation is in accordance with the approved plans. Discrepancies shall be brought to the immediate attention of the *private sewage disposal system* contractor for correction. Records shall be kept of all inspections.

[A] 107.2.2 Written report. The registered design professional shall submit a final report in writing to the code official upon completion of the installation, certifying that the alternative ~~engineered~~-design conforms to the approved construction documents. A notice of approval for the *private sewage disposal system* shall not be issued until a written certification has been submitted.

SECTION 304 ALTERNATIVE ~~ENGINEERED~~-DESIGN

304.1 Alternative ~~engineered~~ design. The design, documentation, inspection, testing and approval of an alternative ~~engineered~~-design *private sewage disposal system* shall comply with Sections 304.1.1 through 304.6.

304.1.1 Design criteria. An alternative ~~engineered~~-design shall conform to the intent of the provisions of this code and shall provide an equivalent level of quality, strength, effectiveness, fire resistance, durability and safety. Material, equipment or components shall be designed and installed in accordance with the manufacturer's instructions.

304.2 Submittal. The registered design professional shall indicate on the permit application that the *private sewage disposal system* is an alternative ~~engineered~~-design. The permit and permanent permit records shall indicate that an alternative ~~engineered~~-design was part of the approved installation.

304.3 Technical data. The registered design professional shall submit sufficient technical data to substantiate the proposed alternative ~~engineered~~-design and to prove that the performance meets the intent of this code.

304.4 Construction documents. The registered design professional shall submit to the code official two complete sets of signed and sealed construction documents for the alternative ~~engineered~~-design.

304.5 Design approval. Where the code official determines that the alternative ~~engineered~~-design conforms to the intent of this code, the *private sewage disposal system* shall be approved. If the alternative ~~engineered~~-design is not approved, the code official shall notify the registered design professional in writing, stating the reasons therefor.

304.6 Inspection and test. The alternative ~~engineered~~ design shall be inspected in accordance with the requirements of Section 107.

Add new text as follows:

504.5 Thermoplastic Tanks. Thermoplastic tanks shall conform to IAPMO Z1000, IAPMO IGC 262-2013 or CSA B66-16.

Revise as follows:

504.5 6 Manholes. ~~Manhole collars and extensions shall be of the same material as the tank. Manhole covers shall be of concrete, steel, cast iron,~~ thermoplastic or other approved material.

802.1 General. Septic tanks shall be fabricated or constructed of welded steel, monolithic concrete, fiberglass, thermoplastic or an approved material. Tanks shall be water tight and fabricated to constitute an individual structure, and shall be designed and constructed to withstand anticipated loads. The design of prefabricated septic tanks shall be approved. Plans for site-constructed concrete tanks shall be approved prior to construction.

805.3 Construction. Holding tanks shall be constructed of welded steel, monolithic concrete, glass-fiber-reinforced polyester, thermoplastic or other approved materials.

802.4 Manholes. Each compartment of a tank shall be provided with not fewer than one manhole opening located over the inlet or outlet opening, and such opening shall be not less than 24 inches (610 mm) square or 24 inches (610 mm) in diameter. Where the inlet compartment of a septic tank exceeds 12 feet (3658 mm) in length, an additional manhole shall be provided over the baffle wall. Manholes shall terminate not greater than 6 inches (152 mm) below the ground surface. ~~Manholes shall be of the same material as the tank. Steel tanks shall have not less than a 2-inch (51 mm) collar for the manhole extensions permanently welded to the tank. The manhole extension on fiberglass tanks shall be of the same material as the tank and an integral part of the tank. The collar shall be not less than 2 inches (51 mm) high.~~

802.5 Manhole covers. Manhole risers shall be provided with a fitted, water-tight cover of concrete, steel, cast iron, thermoplastic or other approved material capable of withstanding all anticipated loads. Manhole covers terminating above grade shall have an approved locking device.

805.6 Manholes. Each tank shall be provided with either a manhole not less than 24 inches (610 mm) square or with a manhole having a 24-inch (610 mm) inside diameter extending not less than 4 inches (102 mm) above ground. Finished grade shall be sloped away from the manhole to divert surface water from the manhole. Each manhole cover shall have an effective locking device or tamper resistant screw fastener. Service ports in manhole covers shall be not less than 8 inches (203 mm) in diameter and shall be 4 inches (102 mm) above finished grade level. The service port shall have an effective locking cover or a brass cleanout plug.

802.10 Manhole riser joints. Joints on concrete risers and manhole covers shall be tongue-and-groove or shiplap type and sealed water tight using neat cement, mortar or bituminous compound. Joints on steel risers shall be welded or flanged and bolted and water tight. Steel manhole extensions shall be bituminous coated both inside and outside. Methods of attaching fiberglass and thermoplastic risers shall be water tight and approved.

CHAPTER 11 ~~RESIDENTIAL~~ ADVANCED WASTE-WATER TREATMENT SYSTEMS

1101.1 Scope. The provisions of this chapter shall govern ~~residential~~ advanced wastewater treatment systems.

1101.2 ~~Residential~~ Advanced waste-water treatment systems. The regulations for materials, design, construction and performance shall comply with NSF 40, NSF 245 or NSF 350, as applicable.

1202.4 Other inspections. In addition to the required inspection prior to backfilling, the code official shall conduct any other inspections deemed necessary to determine compliance with this code. Including inspections to verify adequate ongoing performance of the system as required.

Add new standard(s) follows:

NSF

NSF International
789 N. Dixboro Road
Ann Arbor MI 48105

PSD2

NSF/ANSI 245 - 2013:

Wastewater Treatment Systems - Nitrogen Reduction

NSF/ANSI 350-2014:

Onsite Residential and Commercial Water-Reuse Treatment Systems

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

B602—15:

Mechanical Couplings for Drain, Waste, and Vent Pipe and Sewer Pipe

B66-16:

Design, material, and manufacturing requirements for prefabricated septic tanks and sewage holding tanks

IAPMO IAPMO/ANSI Z1000-2013 Prefabricated Septic Tanks

IAPMO IAPMO IGC 262-2013 Corrugated Thermoplastic Tanks

Reason:

101.1 Cluster system designs are very common, can serve more than one building, and allow additional solutions to protect public health.

101.3 A private sewage treatment system can provide wastewater treatment similar to a public sewer.

107.2, 107.2.1, 304, 304.1, 304.1.1, 304.2, 304.3, 304.4, 304.5, 304.6:

In the 2015 International Private Sewage Disposal Code, the phrase Alternative Engineered Design is stated 16 times, including the table of contents and the index, therefore there are additional locations to remove this term. The Code does not define an "Alternative Engineered Design", nor does it provide guidance as to what constitutes an Alternative Engineered Design. Many states, provinces, and international programs allow registered sanitarians or environmental specialists to design sewage treatment systems, hence NOWRA requests that the term "engineered" be removed from this section and others.

New Section 504.5 Thermoplastic tanks are approved by all 50 states and provinces and are common internationally.

504.5 (this section number should be moved up to 504.6) Thermoplastic collars and extensions are approved by all 50 states. It is common practice to have materials differing than the tank. For example, thermoplastic extensions are cast into concrete tanks.

802.1 Thermoplastic tanks are approved by all 50 states and provinces and are common internationally.

802.4 Thermoplastic collars and manhole extensions are approved by all 50 states and provinces. It is common practice to have materials differing than the tank.

802.5, 802.10, & 805.3 Thermoplastic materials have been in use for many years and are approved in all states and provinces.

805.6 Tamper resistant screws are standard practice are approved in many state and provincial codes.

11 The title is proposed to change to Advanced Waste-Water Treatment Systems because this is the most common industry term. The term "Residential" is removed because the facilities served can be residential or commercial.

1101.1 Change consistent with Section 11 above.

1101.2 The term Residential is removed to be consistent with Section 11 above. Available new standards are NSF 245 and NSF 350 to address nutrient removal and reuse.

1202.4 As the decentralized wastewater industry progresses, many states, provinces, and counties require operational permits for private sewage treatment systems, both conventional and/or advanced waste-water treatment systems.

Cost Impact

The code change proposal will decrease the cost of construction .

101.1 By allowing other solutions to be considered the cost may be lowered.

101.3 The private sewage treatment system option may have a lower cost.

107.2, 107.2.1, 304, 304.1, 304.1.1, 304.2, 304.3, 304.4, 304.5, & 304.6:

Allowing other certified professionals to design systems will increase choices and may lower costs.

New Section 504.5 The inclusion of Thermoplastic tanks will increase choices and may offer cost savings in materials and labor.

504.5 The inclusion of thermoplastic collars and extensions will increase choices and may offer cost savings.

802.1 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

802.4 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

802.5 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

802.10 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

805.3 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

805.6 The inclusion of tamper resistant screws will increase choices and may offer cost savings.

11 The code change proposal will have no impact on the cost of construction.

1101.1 The code change proposal will have no impact on the cost of construction.

1101.2 For the jurisdictions that require treatment in accordance with these standards, the code change proposal will have no impact on the cost of construction.

1202.4 For the jurisdictions that require operational permits, the code change proposal will have no impact on the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 245-2013, IAPMO Z1000-2013, IAPMO IGC 262-2013 and CSA B66-16 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018. The referenced standard, NSF 350-2014, is currently referenced in other 2018 I-codes.

Internal ID: 1277

PSD2-18

IPSDC: 504.2.1, 504.2.2 (New), 504.2.3 (New), 504.5, 504.2.1 (New), Chapter 14

Proponent: William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Eric Carleton, representing National Precast Concrete Association (ecarleton@precast.org)

2018 International Private Sewage Disposal Code

Revise as follows:

504.2.1 Precast concrete and site-constructed tanks. Precast concrete septic tanks and square or rectangular holding tanks shall conform to ASTM ~~C913~~C1227. The floor and sidewalls of a site-constructed concrete tank shall be monolithic, except a construction joint is permitted in the lower 12 inches (305 mm) of the sidewalls of the tank. The construction joint shall have a keyway in the lower section of the joint. The width of the keyway shall be approximately 30 percent of the thickness of the sidewall with a depth equal to the width. A continuous water stop or baffle not less than 56 inches (1422 mm) wide shall be set vertically in the joint, embedded one-half its width in the concrete below the joint with the remaining width in the concrete above the joint. The water stop or baffle shall be copper, neoprene, rubber or polyvinyl chloride designed for this specific purpose. Joints between the concrete septic tank and the tank cover and between the septic tank cover and manhole riser shall be tongue and groove or shiplap-type and sealed water tight using cement, mortar or bituminous compound. Connections between concrete septic tanks and holding tanks shall conform to ASTM C1644

Add new text as follows:

504.2.2 Precast Circular Concrete. Pre-cast circular concrete;manhole riser sections, collars circular dosing or pump chambers, and holding tanks shall conform to ASTM C478

504.2.3 Pre-cast square or rectangular concrete. Precast square or rectangular concrete; riser sections, collars, dosing or pump chambers shall conform to ASTM C913

Revise as follows:

504.5 Manholes. ~~Manhole collars and extensions shall be of the same material as the tank. Manhole covers shall be of concrete, steel, cast iron or other approved material.~~an approved material that maintains a watertight seal.

Add new text as follows:

504.2.1 Manhole Covers. Manhole covers shall be of an approved material that maintains a watertight seal. When required by the jurisdiction having authority each manhole cover shall have an effective locking device.

Add new standard(s) follows:

CHAPTER 14 REFERENCED STANDARDS

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959

C478-15a:

Specification for Circular Precast Reinforced Concrete Manhole Sections

C1644-06:

Specification for Resilient Connectors Between Reinforced Concrete On-Site Wastewater Tanks and Pipes

Reason:

Section 504.2 Precast concrete and site-constructed tanks - because it is suggested to reference the specific components based on their shape, function and individual ASTM reference, it was felt that separate sections for each precast concrete shape helped clarify the code references and applications.

Section 504.2.1. The current edition specifies the ASTM C913 Specification for Precast Concrete Water and Wastewater Structures standard, which may be appropriate for many precast structures utilized for water and wastewater applications including other precast items within this code. However, the suggested ASTM C1227 Specification for Precast Concrete Septic Tanks provides the specific requirements for septic tank materials, fabrication and quality testing. Additionally, the provisions within C1227 are appropriate for the sewage holding tank applications described within Section 805. To provide best uniform assurance of water tightness a resilient connector between tank and pipe is required. The standard for this product is ASTM C1644 Specification for Resilient Connectors Between Reinforced Concrete On-Site Wastewater Tanks and Pipes.

Section 504.2.2 Included within this code are precast concrete components that are circular shaped. Those components are referenced as risers for tanks or holding structures. Consequently, the appropriate ASTM standard for describing these components are best defined and included within ASTM C478 Specification for Circular Precast Reinforced Concrete Manhole Sections.

Section 504.2.3 Additionally, there are available precast risers, collars, dosing or pump chambers which are not circular nor a septic tank. These components are best described and fall under the umbrella of ASTM c913 Specification for Precast Concrete Water and Wastewater Structures.

Section 504.5 Manholes - The existing language requires the use of the same materials for the extension sections (collars, risers, etc.) upon the flattop lid. Current septic tank fabrication methods have successfully fabricated hybrid systems which utilize precast concrete for the tank chamber for the attributes it possesses and other materials which are directly cast into the flattop lid as the riser section. Such materials could be cast-iron frames, or virgin resin pvc components.

Section 504.5.1. This new provision clarifies the cover is also to be watertight like the balance of the system and not the weak link. Additional language is added as a response to an identified safety issue regarding unauthorized access to septic systems, primarily by children, leading to dangerous or life-threatening situations. The proposed language as similarly described within section 805.6, provides guidance and authority for local agencies to require locking apparatus on septic tank access covers if deemed appropriate for their jurisdiction.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only clarifies the code by referring to the correct reference standard and separates circular from square or rectangular pre-cast components.

Analysis: A review of the standard proposed for inclusion in the code, ASTM C478a-15a and ASTM ASTM C1644-06, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018. The standard ASTM C1227-13 is already in the current edition of the code.

Internal ID: 663

PSD3-18

IPSDC: 802.1

Proponent: William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Eric Carleton, National Precast Concrete Association, representing National Precast Concrete Association (ecarleton@precast.org); Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

2018 International Private Sewage Disposal Code

Revise as follows:

802.1 General. Septic tanks shall be fabricated or constructed of welded steel, monolithic concrete, fiberglass or an approved material. Tanks shall be water tight and fabricated to constitute an individual structure, and shall be designed and constructed to withstand anticipated ~~loads.~~ hydraulic and structural loads including soil, hydrostatic, flotation and traffic when conditions exist. When required by the code official, the design of septic tanks shall be by a registered professional engineer within the state or province of the septic tank installation. The design of prefabricated septic tanks shall be approved. Plans for site-constructed concrete tanks shall be approved prior to construction.

Reason:

Section 802.1 General. The current language ignores clarifying that the critical components of septic tank design is both hydraulic for correct sizing and structural for continued function of the tank without failure. The listing of specific loads is for the benefit of the reviewer to be aware that each site is unique and requires the designer to be aware and acknowledge those variable conditions have been analyzed.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed language is only a clarification of the code requirements and therefore, does not impact the cost of construction.

Internal ID: 669

PSD4-18

IPSDC: 802.4

Proponent: William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org); Eric Carleton, National Precast Concrete Association, representing National Precast Concrete Association (ecarleton@precast.org)

2018 International Private Sewage Disposal Code

Revise as follows:

802.4 Manholes. Each compartment of a tank shall be provided with not fewer than one manhole opening located over the inlet or outlet opening, and such opening shall be not less than 24 inches (610 mm) square or 24 inches (610 mm) in diameter. Where the inlet compartment of a septic tank exceeds 12 feet (3658 mm) in length, an additional manhole shall be provided over the baffle wall. Manholes shall terminate not greater than 6 inches (152 mm) below the ground surface. ~~Manholes shall be of the same material as the tank.~~ Steel tanks shall have not less than a 2-inch (51 mm) collar for the manhole extensions permanently welded to the tank. The manhole extension on fiberglass tanks shall be of the same material as the tank and an integral part of the tank. The collar shall be not less than 2 inches (51 mm) high.

Reason:

Same as section 504.5, the existing language requires the use of same materials for the extension sections upon the flattop lid. Current septic tank fabrication methods have successfully fabricated hybrid systems which utilize precast concrete for the tank chamber for the attributes it possesses and other materials which are directly cast into the flat top lid for the riser section such as cast-iron frames and covers.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed language is only a clarification of the code requirements and therefore, does not impact the cost of construction.

PSD5-18

IPSDC: Chapter 11, SECTION 1101, 1101.1, 1101.2, 1101.3 (New), 1101.4 (New), 1101.5 (New), 1101.5.1 (New), 1101.5.2 (New), 1101.5.3 (New), 1101.5.4 (New), 1101.6 (New), 1101.7 (New), 1101.7.1 (New), 1101.7.2 (New), SECTION 1102 (New), 1102.1 (New), 1102.2 (New), 1102.2.1 (New), 1102.2.2 (New), 1102.2.3 (New), 1102.2.4 (New), 1102.2.5 (New), SECTION 1103 (New), 1103.1 (New), 1103.2 (New), 1103.2.1 (New), 1103.2.2 (New), 1103.2.3 (New), 1103.2.4 (New), 1103.2.5 (New), 1103.3 (New), 1103.4 (New), Chapter 14

Proponent: Scott Hetrick, representing Norweco, Inc. (shetrick@norweco.com)

2018 International Private Sewage Disposal Code

Revise as follows:

CHAPTER 11 ADVANCED RESIDENTIAL WASTE-WATER-WASTEWATER TREATMENT SYSTEMS

SECTION 1101 GENERAL

1101.1 Scope. The provisions of this chapter shall govern advanced residential waste-water-wastewater treatment systems.

~~1101.2 Residential waste-water treatment systems.~~ Advanced residential wastewater treatment systems (ATUs). The regulations for materials, design, construction and performance of advanced residential wastewater treatment systems shall comply with NSF 40, 46, 245 or 350 as applicable. Products certified to these standards shall be considered for use where residential building lots have size or soil limitations that prevent the use of septic tanks, the existing onsite system has failed and is causing a public health nuisance, or the building owner wants improved wastewater treatment.

Advanced residential wastewater treatment systems or any other product that displays and promotes the NSF Mark shall be subject to required service obligations under the provisions of the NSF listing, regardless of the treatment technology.

Add new text as follows:

1101.3 Treatment tank construction. Advanced treatment system tankage for residential use shall be manufactured from precast concrete, plastic or fiberglass.

1101.4 Description. Where soils are not ideal for leaching such as soils having high perched water tables or limiting layers both of which negatively affect the transport of treated effluent into the ground, advanced residential wastewater treatment (ATU) systems shall be considered for overcoming soil limitations or inadequate lot size. Advanced residential wastewater treatment systems shall include pretreatment followed by secondary treatment. Tertiary treatment and disinfection shall be required where soil limitations necessitate a greater level of treatment.

1101.5 Daily design flow. The owner or owner's agent shall provide information to the Board of Health or system designer about the source of sewage from the dwelling or structures to be served by an advanced residential wastewater treatment system so as to document system design flow and waste strength . Where required by the Board of Health, building and plumbing plans including plumbing fixture details and other information shall be submitted. The daily design flow estimate for an advanced wastewater treatment system shall comply with Sections 1101.5.1 through 1101.5.4, as applicable.

1101.5.1 Flow per bedroom. The daily design flow for an advanced residential wastewater treatment system shall be 150 gallons per bedroom per day and not less than a total of 300 gallons per day except where conditions described in Sections 1101.5.2 or 1101.5.3 require greater or lesser flow, respectively.

1101.5.2 Non-residential use systems. For an advanced wastewater treatment system for non-residential use, daily design flow shall be determined in accordance with Table 802.7.2 of this code or an alternative daily design flow established by the Board of Health. Where required by the Board of Health, flow monitoring data in addition to or in place of the minimum daily design flow requirements in Table 802.7.2 shall be provided. Where flow monitoring is used as the method of determining daily design flows, the daily design flow shall be not less than 1.5 times the measured average daily flows.

For non-residential use systems, effluent storage shall be permitted to avoid exceeding 1,500 gallons per day daily design loading provided that the peak design flow does not exceed 6,000 gallons per day. Where effluent is stored to avoid exceeding the 1,500 gallons per day daily design flow limit, the design shall use timed dosing and the

appropriate tank capacity to store effluent during peak flows.

1101.5.3 Anticipated increased flows. An increase in the daily design flow for an advanced wastewater treatment system shall be required by the Board of Health where there is an indication that the flows established in accordance with Sections 1101.5.1 or 1101.5.2 of the code will be exceeded. Any required increase in daily flow shall be documented on the installation permit and operation permit.

1101.5.4 Anticipated decreased flows. A reduction in the daily design flow for an advanced wastewater treatment system shall be permitted to be approved by the Board of Health provided that information is submitted indicating conditions that justify reduced flows such as low flow fixtures, alternative toilets or other circumstances that support a reduction in daily design flow. Justification for a proposed reduction in daily design flow shall be included in the site review application and, if approved, shall be documented on the installation permit and operation permit. Where actions are taken to reduce the flows to an advanced wastewater treatment system, the design shall address increased waste strength caused by the reduced flows.

1101.6 Influent wastewater strength. The influent wastewater strength for an advanced residential wastewater treatment system shall be determined for design purposes. Wastewater shall be considered typical residential strength where the 30 day averages have all of the following parameters:

1. BOD₅ not exceeding 300 mg/l.
2. TSS not exceeding 350 mg/l.
3. Fats, oils and grease (FOG) not exceeding 25 mg/l.

Wastewater strength estimates for non-residential use treatment systems shall be determined by the Board of Health or system designer using information provided by the owner or the owner's agent.

1101.7 System design. Designers and designs of sewage treatment system (STS) shall be in accordance with Sections 1101.7.1 and 1101.7.2.

1101.7.1 Preparation and submittal. STS designs shall be prepared and submitted by persons capable of reviewing the soil evaluation, site conditions, information provided by the building owner. Such designs shall be in accordance with this code and shall facilitate the choice of an appropriate, site specific STS and complete the STS design in compliance with Section 1101.7.2. Designers shall be knowledgeable of the requirements of this section and obtain education as necessary or required by manufacturer for all STS technologies they are responsible for designing. Designers shall complete the STS design either while acting as an agent of a Board of Health, or acting as an independent agent of the building owner. A Board of Health employing staff qualified to prepare STS designs shall be permitted to charge a fee for the preparation of the design including associated costs before or after the design is created.

1101.7.2 Required tasks. For the purposes of this section, STS designers shall demonstrate the ability to perform the following tasks required for STS designs through the submission of complete and accurate designs to the Board of Health by performing all of the following, where necessary:

1. Estimate STS flows including daily design flows and any expected variations, and estimate pollutant concentrations and mass loads exceeding typical residential sewage strength.
2. Interpret and evaluate all site-specific information including the soil evaluation, site conditions, site prohibitions and information provided by the owner to determine feasible STS options that will meet the requirements of this section.
3. Evaluate site hydraulics and understand how the proposed STS integrates with the site topography and grade to site the STS.
4. Select devices and components capable of meeting performance requirements based on knowledge of these rules and STS technologies approved by the director of health.
5. Provide approximate installation and operation costs of feasible STS options to assist the owner in selection of the STS to design.
6. Prepare a detailed design which fully complies with this section.
7. Delineate by staking or flagging the proposed soil absorption areas on the site as they relate to topography and contour.
8. Be available to clarify any questions with and make adjustments to the system design, layout or operational concerns. Be available to meet with the owner, soil scientist, installer, service provider

or local health department during, prior and after the installation.

9. Either perform a site visit or have his designee perform a site visit where the STS is to be located during the design process.

SECTION 1102 EFFLUENT QUALITY FOR SOIL-BASED DISCHARGE

1102.1 General. Advanced residential wastewater treatment systems shall be permitted for use in conjunction with any soil based disposal method including gravity pipe and stone, chambers, sand mounds, pressurized mounds, at grade mounds, drip irrigation, spray irrigation, constructed wetlands and any other soil based dispersal system that has been reviewed and approved by the Board of Health.

1102.2 Effluent quality standards. Advanced residential wastewater treatment systems shall comply with the performance based effluent quality standards in Sections 1102.2.1 through 1102.2.5, as applicable, before the system can be considered for approval by the director or Board of Health for reductions in soil absorption area sizing, soil depth credits, nutrient reduction or reduction of high strength waste before distribution to a soil absorption component. A soil absorption component meeting the requirements of this code shall be installed after the advanced residential wastewater treatment system.

1102.2.1 CBOD₅ and TSS.

Treatment system effluent quality shall comply the following requirements for carbonaceous 5-day biochemical oxygen demand (CBOD₅) and total suspended solids (TSS) as demonstrated by 30 day averages in an NSF 40 certification report:

1. CBOD₅ not exceeding 25 mg/l.
2. TSS not exceeding 30 mg/L.

1102.2.2 Fecal coliform and E. coli. Soil depth credits for the disposal system shall be granted based on the following 30 day geometric mean effluent requirements:

1. Fecal coliform not exceeding 10,000 CFU/100ml, or E. coli not exceeding 5,150 CFU/100ml for a 12 inch soil depth credit.
2. Fecal coliform not exceeding 1,000 CFU/100ml, or E. coli not exceeding 515 CFU/100ml for a 24 inch soil depth credit.
3. Fecal coliform not exceeding 200 CFU/100ml, or E. coli not exceeding 103 CFU/100ml for surface application.

1102.2.3 Nutrient reduction. The director or Board of Health shall establish nutrient reduction standards for pretreatment components where there is a significant risk of nutrient contamination to surface or ground water because of risk factors identified in the site review or other types of water quality assessments, or because of risks involved with the proximity to local, state, or federally recognized nutrient sensitive environments.

1102.2.3.1 Total nitrogen reduction. Where total nitrogen reduction is required, pretreatment components shall be capable of not less than a fifty percent reduction in the total nitrogen concentration based on average influent and effluent total nitrogen concentrations as demonstrated by NSF 245 or CAN/BNQ 3680-600. The actual reduction percentage for the pretreatment component shall be indicated.

1102.3.2.2 Other nutrients. The director or Board of Health shall develop standards for areas requiring greater reductions of other nutrients such as nitrogen or phosphorus.

1102.2.4 High strength waste. he director or Board of Health shall establish standards for the reduction of high strength waste or systems receiving sewage from sources producing or expected to produce sewage of a higher strength than typical residential sewage.

1102.2.5 Deemed to comply. The system shall be deemed to comply with the effluent quality standards provided that the system is operated and maintained in accordance with the permit approval documents. The system shall include one or more advanced treatment components for the removal of CBOD₅ and TSS before the wastewater is discharged to the receiving waters, common collector or ground or surface. A treatment component classified as "deemed to comply" shall be assumed to comply with the adopted standard without requiring effluent sampling during system operation.

SECTION 1103 EFFLUENT QUALITY FOR OFF-LOT DISCHARGE

1103.1 General. Advanced residential wastewater treatment systems shall be permitted to be used for off-lot discharges provided that circumstances do not allow for discharge of effluent to a soil based disposal field.

1103.2 Effluent quality standards. Advanced residential wastewater treatment systems shall comply with the performance based effluent quality standards in Sections 1103.2.1 through 1103.2.5, as applicable, in order to be considered for approval by the director for off-lot discharge.

1103.2.1 CBOD₅ and TSS. Treatment system effluent quality shall comply with both of the following 30 day average requirements for carbonaceous 5-day biochemical oxygen demand (CBOD₅) and total suspended solids (TSS).

1. CBOD₅ not exceeding 15 mg/l.
2. TSS not exceeding 18 mg/l.

1103.2.2 NH₃ ammonia. Treatment system effluent quality shall comply with both of the following 30 day average requirements for NH₃ ammonia.

1. NH₃ ammonia not exceeding 2 mg/l (summer).
2. NH₃ ammonia not exceeding 4 mg/l (winter).

1103.2.3 Dissolved oxygen. Treatment system effluent dissolved oxygen shall be not less than 6 mg/l.

1103.2.4 Fecal coliform and E. coli. Treatment system effluent fecal coliform shall not exceed 200 CFU/100ml.

1103.4 Effluent sample collection.

This section shall apply where periodic effluent sampling is required to determine whether an advanced residential wastewater treatment system is working properly, Collection of effluent shall be performed by a qualified service provider who is trained on the treatment technology. Samples shall be collected from the location and sample port approved by the system manufacturer. Effluent sample collection shall address all of the following guidelines:

1. Effluent shall not contain settleable solids above prescribed standards.
2. Color and odor shall be reduced to below discernable levels.
3. Effluent shall not contain floating debris, visible oil, grease, scum or sludge solids.
4. Fecal coliform bacteria concentration shall not exceed 200 CFU/100ml.
5. Any surface discharging system installed, repaired, renovated or replaced shall have a sample port downstream of and within a reasonable distance of the treatment tankage prior to discharge off-lot. For systems that are repaired or replaced and are connected to an existing effluent discharge line, one acceptable sampling port design shall be an inline cross fitting 4 inches (102 mm) in diameter with one branch extending deep enough to accept a sample bottle. For new construction, the sampling port design shall allow for collection of a free falling sample without the sample being tainted by existing flow in the port's sump.
6. A surface discharging system shall discharge to a roadside ditch, stream, pond, lake or other body of water with some method of disinfection.
7. Where samples are collected, they shall be analyzed in accordance with approved methods.

1103.2.5 Deemed to comply. The system shall be deemed to comply with the effluent quality standards provided that the system is operated and maintained in accordance with the permit approval documents. The system shall include one or more advanced treatment components for the removal of CBOD₅ and TSS before the wastewater is discharged to the receiving waters, common collector or ground surface. A treatment component shall be classified as deemed to comply because it complies with the adopted standard without requiring effluent sampling during system operation.

1103.3 Effluent discharges. Systems complying with NSF 245, Class R or C per NSF 350, Class I per NSF 40, or any department approved or accepted system shall discharge to any one of the following:

1. A receiving stream, river, lake or pond that provides greater than a 5:1 dilution of the effluent, based on the 7-day, 10-year low flow rate. A discharge within 10 feet of one of these receiving bodies of water shall be considered to be a discharge to the receiving body of water. Discharges to a lake or pond shall be limited to 2 discharges per surface acre of water. Where more than 2

discharges occur per individual surface acre of water, the total number of discharges to total surface acres of water shall not exceed a ratio of 2:1. Where discharges are not equally distributed around a lake or pond, the department or local authority shall be consulted to assure that nuisance conditions are not created.

2. A common collector, provided that the collector does not discharge within one mile upstream from a public water supply intake, public bathing beach, or to any public use area such as any area frequently used by the public.
3. The ground surface, where the discharge points of private sewage disposal systems with surface discharges do not exceed an average of one per acre and the effluent does not pond or create a nuisance condition.

Add new standard(s) follows:

NSF

NSF International
789 N. Dixboro Road
Ann Arbor MI 48105

NSF/ANSI 46 - 2016:

Evaluation of Components and Devices Used in Wastewater Treatment Systems

NSF/ANSI 245 - 2013:

Wastewater Treatment Systems - Nitrogen Reduction

CAN/BNQ Bureau De Normalisation Du Quebec CAN/BNQ 3680-600/2009 Onsite Residential Wastewater Treatment Technologies including Modification 1 dated March 16, 2017

Reason:

Currently, Chapter 11 only contains two very brief sections to cover a very complex topic. As currently written, no real guidance regarding Advanced Residential Treatment Systems is provided in Chapter 11. The language that I have proposed includes the details necessary to properly specify a treatment system for a residential application. The majority of the information included in this draft has been modeled after existing state codes that are currently being used. By adding additional details, this code will be valuable to regulators and will be more likely to be adopted.

Cost Impact

The code change proposal will increase the cost of construction .

As compared to the current version of the International Private Sewage Disposal Code, the proposed changes may result in increased costs, but the anticipated increased cost of advanced treatment technology may be offset by a reduction in the cost of the soil based disposal footprint for that particular technology. The current version of the code is limited and does not provide adequate guidance regarding the installation, maintenance and inspection of Advanced Residential Wastewater Treatment systems. In reality, most regulatory agencies responsible for onsite system installations have implemented their own sewage disposal codes, but these codes vary widely from state to state. There is significant value in publishing an International Private Sewage Disposal Code with detailed guidelines that could be adopted by these regulatory agencies in lieu of their existing codes. Harmonization of codes between regulatory agencies would allow manufacturers to focus their design efforts and not be restricted by provincial attitudes and practices. If a regulatory agency decides to adopt the International Private Sewage Disposal Code in place of their existing code, the actual cost impact would depend on the code being replaced. In its present form, the International Private Sewage Disposal Code only recognizes 19th and 20th Century onsite technology, and does not properly address the challenges of 21st Century site development.

The proposed changes will provide usable guidelines that regulatory agencies can use to assure that Advanced Residential Wastewater Treatment systems are installed, maintained and inspected in a manner that protects the public. The proposed changes are not intended to specify a particular treatment technology. There are many treatment technologies commercially available that meet the proposed guidelines, and these technologies vary in price depending on their complexity. Some simpler technologies may be available at pricing that is comparable to a conventional septic tank, while other more complex technologies could result in an additional \$5,000 to \$20,000. The more complex technologies are typically used in applications with very stringent effluent and/or monitoring requirements.

Analysis: A review of the standard proposed for inclusion in the code, CAN/BNQ 3680-600/2009 including Mod1 March 16, 2017, NSF 46-2016 and NSF 245-13, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28)

will be posted on the ICC website on or before April 2, 2018.

The referenced standard, NSF 350-2014, is currently referenced in other 2018 I-codes.

2018 International Private Sewage Disposal Code

Add new text as follows:

SECTION 1203 SYSTEM MAINTENANCE

1203.1 General. An ongoing maintenance program shall be required for advanced residential wastewater treatment systems or any onsite system installation with a mechanical component. Periodic maintenance must be provided to the treatment system on an annual basis in the form of a renewable maintenance contract. The yearly maintenance visits shall be conducted by a service provider that has been trained by the system manufacturer or distributor.

1203.2 Installation. All components of advanced residential wastewater treatment systems shall be installed at the time of the original installation. If this is not possible, a solid end cap shall be securely placed over the end of the discharge line until the system can be completed to prevent the discharge of raw sewage to the ground surface.

1203.3 Accessibility for inspection and maintenance. Advanced residential wastewater treatment systems shall be equipped with ground-level access ports that are sized and located to facilitate the installation, removal, sampling, examination, maintenance, and servicing of components and compartments that require routine maintenance and inspection.

1203.3.1 Access port size and location. Ground-level access ports shall be of sufficient size and located so as to allow for the following:

1. Visual inspection and removal of all mechanical or electrical components.
2. Periodic cleaning or replacement of components and removal of residuals.
3. Visual inspection and sampling, including a means for collecting a representative effluent sample and determining the need for residuals removal.
4. Removal of collected residuals as required by the manufacturer in the operations and maintenance manual. If the operations and maintenance manual describes a means to determine the need to remove residuals from a chamber without ground-level access, then only the ability to install ground-level access shall be required. Systems without ground-level access to a chamber shall be equipped with a means to locate the opening to the chambers. This information shall be provided on or in a ground-level access opening.

1203.3.2 Access port protection. Access ports larger than 6 inches (152 mm) in diameter shall be protected against unauthorized intrusions. Acceptable protective measures include, but are not limited to:

1. A padlock.
2. A cover that can be removed only with specialized tools. Cover fasteners shall have tamper-resistant heads. Hex head, flat groove or Phillips head fasteners shall be prohibited.
3. A cover having a minimum net weight of 65 lb. (29.5 kg).

1203.4 Service. Advanced residential wastewater treatment systems shall require periodic maintenance to achieve performance consistent with demonstrated capabilities. Assured professional service is imperative to ensure system performance. A two-year initial service policy shall be furnished to the owner by the manufacturer or the authorized representative. The cost of the initial service policy shall be included in the original purchase price.

1203.5 Initial service policy. The private sewage disposal installation contractor, through the manufacturer or the distributor of the advanced residential wastewater treatment system, shall furnish a two-year initial service policy to the purchaser. This policy shall cover the requirements in Sections 1203.5.1 through 1203.5.3.

1203.5.1 Service calls. The policy shall include four inspection and service calls, not less than one every six months.

The call shall include inspection, adjustment and servicing of the mechanical and the applicable component parts to ensure proper function.

1203.5.2 Effluent quality inspection. The policy shall include an effluent quality inspection consisting of a visual check for color, turbidity, scum overflow, and an examination for odors.

1203.5.3 Homeowner reporting. The policy shall include immediate reporting to the owner about any improper operation that cannot be corrected at the time of the inspection or service call.

1203.6 Continuing service policy. Each manufacturer of a system shall make available for purchase by the owner, a continuing service policy with terms equal to the initial service policy.

1203.7 Standby parts. The local distributor shall stock standby mechanical and electrical component parts for use where the plant's mechanical or electrical components are required to be removed from the site for repairs.

1203.8 Component parts. The mechanical and electrical component parts shall be guaranteed against any defects in materials and workmanship as warranted.

1203.9 Service. Service shall be available within two working days following a request.

1203.10 Owner's manual. The manufacturer shall provide an owner's manual with each unit. The manual shall include the following information:

1. Model numbers
2. Functional description of unit, including a statement of minimum performance requirements as established by test
3. Design and flow diagrams
4. Warranty
5. Replacement policy and service policy
6. Installation instructions
7. Detailed operation and maintenance requirements including user responsibility, parts and service
8. Rated service flow in GPM (gallons per minute) or GPD (gallons per day)
9. Energy source and energy required for proper operation of the plant
10. Specification of models tested in accordance with NSF 40.

1203.11 Service label. A clearly visible, permanently attached label or plate giving instructions for obtaining service shall be placed at the audible and visual alarm.

1203.12 Responsibility of property owner. The property owner shall be responsible for maintaining and operating the system in accordance with this code and the manufacturer's specifications.

1203.13 Maintenance. If a routine service call indicates an electrical, mechanical or performance failure or malfunction or if routine laboratory test results indicate improper treatment, the property owner shall immediately take action to bring the advanced residential wastewater treatment system into compliance with this section.

1203.14 Non-residential use. Advanced residential wastewater treatment systems certified to comply with Class I requirements of NSF 40 by an ANSI accredited third-party certification agency shall be considered for use to serve a non-residential property, provided that all of the following are met:

1. Total daily flows from the wastewater source into the plant are at least 75% of the rated hydraulic capacity and do not exceed the rated hydraulic capacity of the plant.
2. Wastewater influent does not exceed the manufacturer's design specifications for BOD₅ loading as established by the ANSI accredited third-party certification agency to determine compliance with NSF 40 during testing of the system.

1203.15 Certification compliance. Private sewage disposal installation contractors or building owners who maintain or service wastewater treatment systems that have been certified to the NSF standards shall be required to maintain the integrity of the seal of the ANSI accredited third-party certification agency that has certified the

compliance with the appropriate standard. Only component parts approved by the manufacturer for use in an individual system shall be used. No design changes or component part changes shall be made that will void compliance with the appropriate standard. Any person who voids the compliance with the appropriate standard shall be responsible for repairing the system so it can bear the seal of the ANSI accredited third-party certification agency that has certified compliance or the person shall replace the plant with an approved residential wastewater treatment system.

Reason:

Currently, Chapter 12 does not provide much detail regarding the actual inspection of a private sewage disposal system. In addition, maintenance and service is typically performed in conjunction with routine service inspections. It makes sense to include language in this chapter that provides some direction for the maintenance and service of private sewage treatment systems. The majority of the information included in this draft has been modeled after existing state codes that are currently being used. By adding additional details, this code will be valuable to regulators and will be more likely to be adopted.

Cost Impact

The code change proposal will increase the cost of construction .

As compared to the current version of the International Private Sewage Disposal Code, the proposed changes may result in increased costs, but the anticipated increased cost of advanced treatment technology may be offset by a reduction in the cost of the soil based disposal footprint for that particular technology. The current version of the code is limited and does not provide adequate guidance regarding the installation, maintenance and inspection of Advanced Residential Wastewater Treatment systems. In reality, most regulatory agencies responsible for onsite system installations have implemented their own sewage disposal codes, but these codes vary widely from state to state. There is significant value in publishing an International Private Sewage Disposal Code with detailed guidelines that could be adopted by these regulatory agencies in lieu of their existing codes. Harmonization of codes between regulatory agencies would allow manufacturers to focus their design efforts and not be restricted by provincial attitudes and practices. If a regulatory agency decides to adopt the International Private Sewage Disposal Code in place of their existing code, the actual cost impact would depend on the code being replaced. In its present form, the International Private Sewage Disposal Code only recognizes 19th and 20th Century onsite technology, and does not properly address the challenges of 21st Century site development.

The proposed changes will provide usable guidelines that regulatory agencies can use to assure that Advanced Residential Wastewater Treatment systems are installed, maintained and inspected in a manner that protects the public. The proposed changes are not intended to specify a particular treatment technology. There are many treatment technologies commercially available that meet the proposed guidelines, and these technologies vary in price depending on their complexity. Some simpler technologies may be available at pricing that is comparable to a conventional septic tank, while other more complex technologies could result in an additional \$5,000 to \$20,000. The more complex technologies are typically used in applications with very stringent effluent and/or monitoring requirements.

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL PROPERTY MAINTENANCE CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some PM code change proposals may not be included on this list, as they are being heard by another committee.

IPMC: SECTION 202, 202 (New)

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Self (Ron@Plumb-TechLLC.com)

2018 International Property Maintenance Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

HAZARD. Any condition that could cause harm or a serious life threatening injury or death at any time, including but not limited to a trip hazard, slip hazard or scald hazard. An exposure to danger or risk that can be harmful.

Reason:

The word hazard has been included in a code change proposal. This definition will assist inspectors with enforcing safe conditions related to what a hazard is.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is just adding a definition for the term "Hazard"

Internal ID: 1851

PM2-18

IPMC: 202, 202 (New)

Proponent: Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Self (Ron@Plumb-TechLLC.com)

2018 International Property Maintenance Code

Add new definition as follows:

SECTION 202 GENERAL DEFINITIONS

SAFE. Free of hazards or any condition that could cause harm or a serious life threatening injury or death at any time, including but not limited to trip hazards, slip hazards or scald hazards. Protected from or not exposed to danger or risk; not likely to be harmed.

Reason:

The term "safe" is used in the property maintenance code in many locations and there is no definition. This definition will assist inspectors with enforcing safe conditions.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

A safe condition is already required, this is just defining "Safe".

Internal ID: 1802

PM3-18

IPMC: SECTION 202, 202 (New), 302.4

Proponent: Francis McAndrew, representing New York State Department of State, Division of Building Standards and Codes (francis.mcandrew@dos.ny.gov)

2018 International Property Maintenance Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

WEEDS. Uncultivated vegetation such as grasses, brush, briars, and annual plants, excluding trees and cultivated vegetation, such as shrubs, flowers, gardens, and vegetation used for agricultural purposes.

Revise as follows:

302.4 Weeds. ~~Premises and exterior property~~ Except as provided for in statute, local law, ordinance, or other regulations, all developed areas of a premises that are intended to be used by building occupants or the public shall be maintained free from weeds or plant growth in excess of [JURISDICTION TO INSERT HEIGHT IN INCHES]. Noxious weeds shall be prohibited. Weeds shall be defined as all grasses, annual plants and vegetation, other than trees or shrubs provided; however, this term shall not include cultivated flowers and gardens. Upon failure of the *owner* or agent having charge of a property to cut and destroy weeds after service of a notice of violation, they shall be subject to prosecution in accordance with Section 106.3 and as prescribed by the authority having jurisdiction. Upon failure to comply with the notice of violation, any duly authorized employee of the jurisdiction or contractor hired by the jurisdiction shall be authorized to enter upon the property in violation and cut and destroy the weeds growing thereon, and the costs of such removal shall be paid by the *owner* or agent responsible for the property.

Reason:

This code change proposal is intended to correct the following shortcomings:

1. It removes the definition of “weeds” from this code section and places it in Section 202 with the remainder of the definitions.
2. The definition of “weeds” is modified to make a distinction between cultivated and uncultivated vegetation, and vegetation used for agricultural purposes.
3. It provides an avenue for jurisdictions to more readily modify the maintained area of a premises and weed height requirement (“except as provided for in statute, local law, ordinance or other regulation”).
4. Requiring the entire premises to be maintained weed free is unrealistic and overly burdensome for undeveloped parcels, parcels that are only partially developed, and rural areas. This proposal requires only developed areas of a premises that are intended to be used by building occupants or the public to be maintained weed free. Allowing taller weed growth and plant diversity in undeveloped and undisturbed areas of a premises maintains the site's natural pre-developed conditions thereby promoting groundwater recharge, which is required by many (if not most) stormwater management regulations. Allowing taller weed growth and plant diversity also ensures habitat for wildlife.
5. This approach is more practical for undeveloped parcels, parcels that are only partially developed, and rural areas. Vacant land is currently required to be “maintained in a clean, safe, secure and sanitary condition as provided herein so as not to cause a blighting problem or adversely affect the public health or safety”, pursuant to IPMC Section 301.3.

Cost Impact

The code change proposal will decrease the cost of construction .

This code change will reduce the maintenance burden by not requiring the entire premises to be maintained weed free, but instead only the developed portions of a premises used by building occupants or the public.

Internal ID: 1348

PM4-18

IPMC: 302.8

Proponent: Francis McAndrew, representing New York State Department of State, Division of Building Standards and Codes (francis.mcandrew@dos.ny.gov)

2018 International Property Maintenance Code

Revise as follows:

302.8 Motor vehicles. Except as provided for in statute, local law, ordinance, or other regulations, not more than one inoperative or unlicensed motor ~~vehicles~~~~vehicle~~ shall ~~not~~ be parked, kept, or stored on any *premises*, and vehicles shall not at any time be in a state of major disassembly, ~~disrepair~~, or in the process of being stripped or dismantled. Painting of vehicles is prohibited unless conducted inside an *approved* spray booth.

Exception: A vehicle of any type is permitted to undergo major overhaul, including body work, provided that such work is performed inside a structure or similarly enclosed area designed and *approved* for such purposes.

Reason:

The existing code section uses the phrase: "Except as provided for in other regulations" in an attempt to provide an avenue for an adopting jurisdiction to modify the number of vehicles stored on a property. Unfortunately, the word "regulations" may have different meanings in different jurisdictions across the country, thereby requiring modification of this code section by the adopting jurisdiction. The proposed code change generalizes the word "regulations", and inserts the words "statute", "local law", and "ordinance" to accommodate the variations of rule making across the country, thereby making this code section more of a true model code.

Notwithstanding the exception, the current code prohibits inoperative or unlicensed motor vehicles from being stored on a premises. This requirement is overly burdensome because not all home owners have access to a "structure or similarly enclosed area" (garage) to repair a motor vehicle as required by the exception. Because not everyone has access to a garage, this code section infringes on the rights and abilities of homeowners from being able to perform a minor repair on their "motor vehicle", thereby rendering it operable. Examples include replacing a starter, brakes, or belts, all of which are generally not considered a "major overhaul" as provided for in the exception. Furthermore, a "motor vehicle" could be something as simple as a motor scooter, all-terrain vehicle (ATV/four wheeler), recreational vehicle, or farm equipment, since the term "motor vehicle" has different legal definitions across the country. The proposed code change alleviates this burden by allowing not more than one vehicle, but maintains that this requirement can be overruled by a jurisdiction via statute, local law, ordinance, or other regulations. The proposed code change removes the word "disrepair" to ensure that a motor vehicle stored on a premises can be repaired, but also ensures that vehicles are not in a major state of disassembly or stripped, thereby preventing a junk yard appearance.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed code modification does not alter a standard for construction, but instead clarifies the intent of the code as it relates to the storage of motor vehicles. Consequently, the proposed code change will neither increase nor decrease the cost of construction.

Internal ID: 1238

PM5-18

IPMC: 304.1.1, 305.1.1, 306.1.1

Proponent: Michael Fillion, representing Existing Buildings Subcommittee, National Council of Structural Engineers Association (mrf.structure@verizon.net)

2018 International Property Maintenance Code

Revise as follows:

304.1.1 Unsafe conditions. ~~The following Unsafe conditions shall be determined as unsafe and shall be repaired or replaced to comply with the International Building Code or in compliance with the International Existing Building Code as required for existing buildings: Code.~~

- ~~1. The nominal strength of any structural member is exceeded by nominal loads, the load effects or the required strength.~~
- ~~2. The anchorage of the floor or roof to walls or columns, and of walls and columns to foundations is not capable of resisting all nominal loads or load effects.~~
- ~~3. Structures or components thereof that have reached their limit state.~~
- ~~4. Siding and masonry joints including joints between the building envelope and the perimeter of windows, doors and skylights are not maintained, weather resistant or water tight.~~
- ~~5. Structural members that have evidence of *deterioration* or that are not capable of safely supporting all nominal loads and load effects.~~
- ~~6. Foundation systems that are not firmly supported by footings, are not plumb and free from open cracks and breaks, are not properly *anchored* or are not capable of supporting all nominal loads and resisting all load effects.~~
- ~~7. Exterior walls that are not anchored to supporting and supported elements or are not plumb and free of holes, cracks or breaks and loose or rotting materials, are not properly *anchored* or are not capable of supporting all nominal loads and resisting all load effects.~~
- ~~8. Roofing or roofing components that have defects that admit rain, roof surfaces with inadequate drainage, or any portion of the roof framing that is not in good repair with signs of *deterioration*, fatigue or without proper anchorage and incapable of supporting all nominal loads and resisting all load effects.~~
- ~~9. Flooring and flooring components with defects that affect serviceability or flooring components that show signs of *deterioration* or fatigue, are not properly anchored or are incapable of supporting all nominal loads and resisting all load effects.~~
- ~~10. Veneer, cornices, belt courses, corbels, trim, wall facings and similar decorative features not properly anchored or that are anchored with connections not capable of supporting all nominal loads and resisting all load effects.~~
- ~~11. Overhang extensions or projections including, but not limited to, trash chutes, canopies, marquees, signs, awnings, fire escapes, standpipes and exhaust ducts not properly *anchored* or that are anchored with connections not capable of supporting all nominal loads and resisting all load effects.~~
- ~~12. Exterior stairs, decks, porches, balconies and all similar appurtenances attached thereto, including *guards* and handrails, are not structurally sound, not properly *anchored* or that are *anchored* with connections not capable of supporting all nominal loads and resisting all load effects.~~
- ~~13. Chimneys, cooling towers, smokestacks and similar appurtenances not structurally sound or not properly *anchored*, or that are anchored with connections not capable of supporting all nominal loads and resisting all load effects.~~

Exceptions:

1. Where substantiated otherwise by an *approved* method.
2. Demolition of unsafe conditions shall be permitted where *approved* by the *code official*.

305.1.1 Unsafe conditions. ~~The following Unsafe conditions shall be determined as unsafe and shall be repaired or replaced to comply in compliance with the International Building Code or the International Existing Building Code as required for existing buildings:~~

- ~~1.The nominal strength of any structural member is exceeded by nominal loads, the load effects or the required strength.~~
- ~~2.The anchorage of the floor or roof to walls or columns, and of walls and columns to foundations is not capable of resisting all nominal loads or load effects.~~
- ~~3.Structures or components thereof that have reached their limit state.~~
- ~~4.Structural members are incapable of supporting nominal loads and load effects.~~
- ~~5.Stairs, landings, balconies and all similar walking surfaces, including *guards* and handrails, are not structurally sound, not properly *anchored* or are *anchored* with connections not capable of supporting all nominal loads and resisting all load effects.~~
- 6.Foundation systems that are not firmly supported by footings are not plumb and free from open cracks and breaks, are not properly *anchored* or are not capable of supporting all nominal loads and resisting all load effects.

Code.

2.

3.

4.

5.

6.

Exceptions:

1. Where substantiated otherwise by an *approved* method.
2. Demolition of unsafe conditions shall be permitted where *approved* by the *code official*.

306.1.1 Unsafe conditions. Where any of the following conditions cause the component or system to be beyond its limit state, the component or system shall be determined as unsafe and Unsafe components and systems shall be repaired or replaced to comply with the International Building Code or in compliance with the International Existing Building Code. as required for existing buildings:

1. ~~Soils that have been subjected to any of the following conditions:~~
 - 1.1. ~~Collapse of footing or foundation system.~~
 - 1.2. ~~Damage to footing, foundation, concrete or other structural element due to soil expansion.~~
 - 1.3. ~~Adverse effects to the design strength of footing, foundation, concrete or other structural element due to a chemical reaction from the soil.~~
 - 1.4. ~~Inadequate soil as determined by a geotechnical investigation.~~
 - 1.5. ~~Where the allowable bearing capacity of the soil is in doubt.~~
 - 1.6. ~~Adverse effects to the footing, foundation, concrete or other structural element due to the ground water table.~~
2. ~~Concrete that has been subjected to any of the following conditions:~~
 - 2.1. ~~*Deterioration.*~~
 - 2.2. ~~*Ultimate deformation.*~~
 - 2.3. ~~Fractures.~~
 - 2.4. ~~Fissures.~~
 - 2.5. ~~Spalling.~~
 - 2.6. ~~Exposed reinforcement.~~
 - 2.7. ~~*Detached, dislodged or failing connections.*~~
3. ~~Aluminum that has been subjected to any of the following conditions:~~
 - 3.1. ~~*Deterioration.*~~
 - 3.2. ~~Corrosion.~~

- 3.3. ~~Elastic deformation.~~
- 3.4. ~~Ultimate deformation.~~
- 3.5. ~~Stress or strain cracks.~~
- 3.6. ~~Joint fatigue.~~
- 3.7. ~~Detached, dislodged or failing connections.~~
- 4. ~~Masonry that has been subjected to any of the following conditions:~~
 - 4.1. ~~Deterioration.~~
 - 4.2. ~~Ultimate deformation.~~
 - 4.3. ~~Fractures in masonry or mortar joints.~~
 - 4.4. ~~Fissures in masonry or mortar joints.~~
 - 4.5. ~~Spalling.~~
 - 4.6. ~~Exposed reinforcement.~~
 - 4.7. ~~Detached, dislodged or failing connections.~~
- 5. ~~Steel that has been subjected to any of the following conditions:~~
 - 5.1. ~~Deterioration.~~
 - 5.2. ~~Elastic deformation.~~
 - 5.3. ~~Ultimate deformation.~~
 - 5.4. ~~Metal fatigue.~~
 - 5.5. ~~Detached, dislodged or failing connections.~~
- 6. ~~Wood that has been subjected to any of the following conditions:~~
 - 6.1. ~~Ultimate deformation.~~
 - 6.2. ~~Deterioration.~~
 - 6.3. ~~Damage from insects, rodents and other vermin.~~
 - 6.4. ~~Fire damage beyond charring.~~
 - 6.5. ~~Significant splits and checks.~~
 - 6.6. ~~Horizontal shear cracks.~~
 - 6.7. ~~Vertical shear cracks.~~
 - 6.8. ~~Inadequate support.~~
 - 6.9. ~~Detached, dislodged or failing connections.~~
 - 6.10. ~~Excessive cutting and notching.~~

Exceptions:

- 1. Where substantiated otherwise by an *approved* method.
- 2. Demolition of unsafe conditions shall be permitted where *approved* by the *code official*.

Reason:

This proposal corrects errors and removes duplication in the IPMC of provisions already covered more appropriately in the IBC and IEBC.

Unsafe conditions are rare and represent extreme situations. As such, they are outside the general scope (see Section 101.2) and intent (101.3) of the IPMC. Rather, they are more properly addressed by the IBC and IEBC, which already define unsafe conditions to include "inadequate maintenance" and provide remedial administrative procedures (IBC Section 116, IEBC Section 115). In fact, the IPMC relies on the IEBC definitions of unsafe and dangerous, as it does not provide its own definitions in Chapter 2.

Consider the many references in these three sections to structural elements and their resistance to "nominal loads" and "all load effects." Nominal loads include full Wind and Earthquake loads. Applying these provisions as currently written would cause every building more than about 20 years old to be labeled dangerous and unsafe even in the absence of deterioration or damage. Further, by referencing structural loads and capacities, simple implementation of

the IPMC would require regular assessment by a structural engineer, which is certainly beyond the code's intent.

Consider the many references to structural "soundness." This term is undefined and unenforceable. Provisions requiring structurally sound conditions were removed from the IBC and IEBC for this reason over the last several code cycles.

Consider the several references to a component's "limit state." These references are inappropriate because, as defined in the IBC, there are multiple possible limit states. Merely exceeding a serviceability limit state (especially as contemplated by Section 306.1.1) almost never makes a building or component unsafe.

Consider the many references to deterioration. Deterioration is indeed a sign that maintenance is needed, but it is not a reason to label a building or component unsafe. Similarly, corrosion, elastic deformation, sapling, and cracks (especially as listed in Section 306.1.1) are often normal and are not of themselves reason to label a building or component unsafe. (The IEBC definition of unsafe includes "inadequate maintenance," meaning "not enough to maintain health, safety, and welfare," not merely non-compliant or imperfect maintenance.)

Despite the deletion of these long lists, the proposal results in no loss of substance. As noted, unsafe conditions are already defined and addressed in the IEBC. More specifically, each of the items proposed for deletion is already covered elsewhere in the IPMC. Considering the list in Section 304.1.1:

- Items 1, 2, 3, 5, 6, and 7 address structural elements and thus are already covered by the IEBC

and IBC definition of dangerous.

- Item 4 is addressed in Section 304.6.

- Item 8 is addressed in Section 304.7.

- Item 9 does not even belong in Section 304 but is addressed in Section 305.4

- Item 10 is addressed in Section 304.8.

- Item 11 is addressed in Section 304.9.

- Item 12 is addressed in Section 304.10.

- Item 13 is addressed in Section 304.1.

Considering the list in Section 305.1.1: Items 1 through 6 address structural elements and thus are already covered by the IBC and IEBC definition of dangerous. Item 5 is additionally addressed by Section 305.4.

Considering the list in Section 306.1.1: Items 1 through 6 address components in terms of their structural materials and properties and thus are already covered by the IBC and IEBC definition of dangerous.

Finally, in addition to removing the inappropriate lists, the proposal requires compliance only with the IEBC, not the IBC, because the IPMC by definition relates to existing buildings, and the IBC no longer has existing building provisions for repair or removal of unsafe conditions.

If approved, a coordinated proposal will be made in Group B to address further duplication and overlap in IPMC Section 108.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal merely removes duplicate provisions already found in the other applicable codes.

Internal ID: 2278

PM6-18

IPMC: 305.3

Proponent: Sean Glasscock, representing City of Claremont New Hampshire, Building Inspector and Deputy Health Officer (sglasscock@claremontnh.com)

2018 International Property Maintenance Code

Revise as follows:

305.3 Interior surfaces. Interior surfaces, including walls, ceilings, floors, windows and doors, shall be maintained in good, clean and sanitary condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster, decayed wood, water damage and staining, and other defective surface conditions shall be corrected.

Reason:

The current version of the Interior Surfaces section of the International Property Maintenance code gives the reader the implication that it is "including windows and doors" and not speaking to the other interior surfaces. Adding additional language clarifies the requirement that all interior surfaces shall be maintained in good, clean and sanitary condition. Citing section 305.3 for other than windows and doors in its current state could be challenged as incorrect interpretation of the code. It must be changed to be clarified.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is a clarification and will not effect the cost of construction.

Internal ID: 1445

PM7-18

IPMC: 305.4

Proponent: Sean Glasscock, City of Claremont NH, representing City of Claremont New Hampshire, Building Inspector and Deputy Health Officer (sglasscock@claremontnh.com)

2018 International Property Maintenance Code

Revise as follows:

305.4 ~~Stairs~~ Walking surfaces and walking surfaces flooring. Every ~~stair~~walking surface, ramp~~including stairs,~~ landing~~ramps, balcony~~landings, porch, deck or balconies, porches, decks, and other walking surface~~surfaces~~ shall be maintained in sound condition and good repair. All interior flooring and floor covering including laminate, tile, carpet, hardwood and/or manufactured composite flooring shall be maintained in good repair.

Reason:

The current version of the International Property Maintenance Code lacks clear and concise language about the condition of interior flooring which is a major concern for the safety of residents and visitors. Flooring condition is often cited during a property maintenance inspection as being in poor condition. The current language does not adequately address the issue and may become an enforcement problem if challenged.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cost impact will be negligible because flooring condition is already cited, this code change just strengthens the language.

Internal ID: 1410

PM8-18 Part I

IPMC: SECTION 310 (New), 310.1 (New), 310.2 (New), 310.3 (New), 310.4 (New), ordinal

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPMC COMMITTEE. PART II WILL BE HEARD BY THE IFC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2018 International Property Maintenance Code

Add new text as follows:

SECTION 310 STORM SHELTERS

310.1 Inspection and maintenance. Storm shelters required by Section 423 of the International Building Code, Section 1106 of the International Existing Building Code, or otherwise legally required in a jurisdiction shall be inspected and maintained in accordance with this section.

310.2 Door function. Storm shelter doors, and door hardware, shall be maintained to ensure proper door operation as required by ICC 500.

310.3 Damage or missing components. Storm shelters shall be maintained in accordance with ICC 500 so that walls and roofs are intact and undamaged. Any damage to the storm shelter or its impact-protective systems shall be repaired or replaced in accordance with ICC 500. Missing equipment or components shall be replaced.

310.4 Replacement components. Where it is necessary to replace impact-protective systems, including certified doors, shutters, windows or their frames, hardware, and closing mechanisms, replacements shall comply with applicable ICC 500 requirements.

Add new standard(s) follows:

ICC

International Code Council
500 New Jersey Avenue, NW 6th
Floor
Washington DC 20001
US

ICC 500-2014:

ICC/NSSA Standard for the Design and Construction of Storm Shelters

Analysis: The referenced standard, ICC 500-2014, is currently referenced in other 2018 I-codes.

Internal ID: 1314

PM8-18 Part II

IFC: 301.1, SECTION 320 (New), 320.1 (New), 320.2 (New), 320.3 (New), 320.4 (New), ordinal

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Fire Code

Revise as follows:

301.1 Scope. The provisions of this chapter shall govern the occupancy and maintenance of all structures and premises for precautions against fire and the spread of fire and general requirements of fire and life safety.

Add new text as follows:

SECTION 320 STORM SHELTERS

320.1 Inspection and maintenance. Storm shelters required by Section 423 of the International Building Code, Section 1106 of the International Existing Building Code, or otherwise legally required in a jurisdiction shall be inspected and maintained in accordance with this section.

320.2 Door function. Storm shelter doors and door hardware shall be maintained to ensure proper door operation as required by ICC 500.

320.3 Damage or missing components. Storm shelters shall be maintained in accordance with ICC 500 so that walls and roofs are intact and undamaged. Any damage to the storm shelter or its impact-protective systems shall be repaired or replaced in accordance with ICC 500. Missing equipment or components shall be replaced.

320.4 Replacement components. Where it is necessary to replace impact-protective systems, including certified doors, shutters, windows or their frames, hardware, and closing mechanisms, replacements shall comply with applicable ICC 500 requirements.

Add new standard(s) follows:

ICC

International Code Council, Inc.
500 New Jersey Avenue, NW 6th
Floor
Washington DC 20001
US

ICC 500-2014:

ICC/NSSA Standard for the Design and Construction of Storm Shelters

Reason:

Storm shelters are relied upon to protect citizens in communities prone to tornadoes, hurricanes, or other similar extreme weather events. It is important to make sure that the shelters, in particular the impact protection systems, doors, and latching components are maintained in an operable condition so they will provide shelter when needed. This proposal includes basic safety requirements for maintaining desired protection.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change would not result in any increase in the initial construction cost, but could be a minimal increase for the inspection, maintenance, and repairs, especially if the storm shelter is damaged by an inclement weather event.

Analysis: The referenced standard, ICC 500-2014, is currently referenced in other 2018 I-codes.

Internal ID: 1308

PM9-18

IPMC: 404.4, 404.4.1, 404.5, TABLE 404.5

Proponent: Gerard Hathaway, NYS Dept. of State, Div. of Building Standards and Codes, representing New York State Department of State, Division of Building Standards and Codes (gerard.hathaway@dos.state.ny.us)

2018 International Property Maintenance Code

Revise as follows:

404.4 ~~Bedroom~~ Habitable room and living room-bedroom requirements. Every habitable room and bedroom ~~and living room~~ shall comply with the requirements of Sections 404.4.1 through 404.4.5.

404.4.1 Room area. Every ~~living room~~ shall contain not less than ~~120 square feet (11.2 m²)~~ and every bedroom habitable room shall contain not less than 70 square feet (6.5 m²) and every bedroom occupied by more than one person shall contain not less than 50 square feet (4.6 m²) of floor area for each occupant thereof.

404.5 Overcrowding. Dwelling units shall not be occupied by more occupants than permitted by the minimum area requirements of Table 404.5.

**TABLE 404.5
MINIMUM AREA REQUIREMENTS**

SPACE	MINIMUM AREA IN SQUARE FEET		
	1-2 occupants	3-5 occupants	6 or more occupants
Living room ^{a, b}	120-70	120	150
Dining room ^{a, b}	No requirement	80	100
Bedrooms	Shall comply with Section 404.4.1		

For SI: 1 square foot = 0.0929 m².

- See Section 404.5.2 for combined living room/dining room spaces.
- See Section 404.5.1 for limitations on determining the minimum occupancy area for sleeping purposes.

Reason:

The purpose of this code change is to coordinate the minimum room area requirements found in the International Property Maintenance Code (IPMC) with those found in the International Residential Code (IRC) and the International Building Code (IBC). We have received technical support questions on this subject in New York State, and nationally it has been discussed in industry related online chat rooms.

IPMC 404.4.1 requires that every living room contain not less than 120 square feet (11.2 m²) and every bedroom contain not less than 70 square feet (6.5 m²). The IBC has similar language which is somewhat compatible with the IPMC, requiring that every dwelling unit shall have not less than one room (not specifically a living room) that shall have not less than 120 square feet (11.2 m²) of net floor area, and that other habitable rooms (not only but including bedrooms) shall have a net floor area of not less than 70 square feet (6.5 m²). However, IRC R304.1 simply requires that habitable rooms (including living rooms, bedrooms, etc.) shall have a floor area of not less than 70 square feet (6.5 m²).

Possible scenarios: A dwelling unit could be constructed under the IRC or IBC with a 70 square foot living room as allowed by both the IRC and IBC, receive a Certificate of Occupancy, and they would not be in compliance with the 2018 IPMC, which requires a minimum 120 square foot living room.

The proposed changes to IPMC 404.4 and 404.4.1 are meant to use language (the term "habitable rooms") which is compatible with both the IRC and IBC for consistency. Also, to allow small dwellings to have the minimum 70 square foot living rooms as intended by both the IRC and IBC.

This code change proposal also includes a change in IPMC 404.5 Overcrowding, specifically Table 404.5 Minimum Area Requirements. The "Living Room"/"1-2 occupants" cell of the table has been changed to delete the minimum 120 square foot requirement, and allow a minimum 70 square foot Living Room for 1-2 occupants in small dwellings constructed under either the IRC or IBC.

This change continues the effort to allow smaller dwellings built under the IRC and IBC to be compatible with the IPMC

once they are completed. Code change proposal RB106-13 (R304.1, R304.2), approved for the 2015 IRC, removed the requirement that every dwelling unit have at least one room not less than 120 square feet. One of the prime reasons given for that code change proposal was to allow small dwellings to be built under the IRC.

Cost Impact

The code change proposal will decrease the cost of construction .

Allowing small homes to be built, without forcing them to provide a 120 square foot living room, will decrease cost.

Internal ID: 1363

PM10-18

IPMC: 602.2

Proponent: Kelly Kirk, City of Norfolk, representing City of Norfolk; Christina Jackson, City of Norfolk, representing City of Norfolk

2018 International Property Maintenance Code

Revise as follows:

602.2 Residential occupancies. Dwellings shall be provided with heating facilities capable of maintaining a room temperature of 68°F (20°C) in all habitable rooms, *bathrooms* and *toilet rooms* based on the winter outdoor design temperature for the locality indicated in Appendix D of the International Plumbing Code. Cooking appliances shall not be used, nor shall portable unvented fuel-burning space heaters be used, as a means to provide required heating. Additionally, the installation of one or more portable space heaters shall not be used to achieve compliance with this section.

Exception: In areas where the average monthly temperature is above 30°F (-1°C), a minimum temperature of 65°F (18°C) shall be maintained.

Reason:

This proposed change is submitted with the intent to bring the IPMC 602.2 verbiage in line with the current IRC R303.9 verbiage so that these I-Codes cohesively reflect the intent of the ICC as currently written in the IRC R303.9.

Bibliography:

2015 IPMC, Section 602.2 - Heating Facilities, Residential Occupancies; ICC; Fourth Printing, December 2015; Page 2.

2015 IRC, Section R303.9 - Required Heating; ICC; Second Printing, January 2016; Page 56.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal merely clarifies existing code requirements by aligning the requirements of IPMC with the IRC.

Internal ID: 2119

PM11-18

IPMC: 703.8 (New)

Proponent: Sean Glasscock, representing City of Claremont New Hampshire, Building Inspector and Deputy Health Officer (sglasscock@claremontnh.com)

2018 International Property Maintenance Code

Add new text as follows:

703.8 Flammable insulation material. All paper faced insulation and foam insulation shall be protected as required elsewhere in the International Codes. Paper faced insulation and foam insulation shall not be left exposed to the interior of the building.

Exception:Where approved documentation is submitted to the building official showing the material meets the requirements for exposed interior finishes elsewhere in the International Codes.

Reason:

The current version of the International Property Maintenance Code does not contain clear and concise language regarding the condition of exposed flammable insulation material. Commonly found during inspections is paper faced insulation or foam plastic insulation exposed to the interior of the building which creates a significant fire hazard. Often, it should not have been installed and left in the exposed condition but rather appropriately covered according to the manufacturer's installation instructions that are printed on the material. This code change will simply clarify that requirement and allow for more effective enforcement.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is already required in new construction. The concern is older existing construction. There are multiple cost effective ways of dealing with this hazard including removing the paper faced insulation, or covering with the appropriate material.

IRC Building Code Change Proposals

The following code change proposals are labeled as structural code change proposals because they are proposals for changes to sections in chapters of the International Building Code that are designated as the responsibility of the IRC-Building Code Development Committee (see page ix of the Introductory pages of this monograph), which meets in the Group B cycle in 2019. However the changes included in this Group A code development cycle are to sections of the code that are the responsibility of a different IRC Code Development Committee— either the IRC-Mechanical or the IRC-Plumbing Committee.

The committee assigned for each code change proposal is indicated in a banner statement near the beginning of the proposal. Both the IBC-Fire Safety and the IBC-General hearing orders are include here for your reference.

RB1-18

IRC: R303.4

Proponent: Mike Moore, representing Broan-NuTone (mmoore@newportventures.net)

2018 International Residential Code

Revise as follows:

R303.4 Mechanical ventilation. Where the air infiltration rate of a *dwelling unit* is 5 air changes per hour or less where tested with a blower door at a pressure of 0.2 inch w.c (50 Pa) in accordance with Section N1102.4.1.2, the *dwelling unit* shall be provided with whole-house mechanical ventilation and local exhaust for kitchens in accordance with ~~Section M1505.4.~~ Chapter 15.

Reason:

Kitchens are typically the largest source of indoor air pollution in U.S. homes. During cooking, harmful pollutants are released in concentrations that have been shown to increase the frequency of cancer, lung disease, heart disease, asthma aggravation, and hospital visits. In residential kitchens, concentrations of these pollutants frequently exceed maximum safe levels set by the World Health Organization and U.S. National Ambient Air Quality Standards. According to research cited by the World Health Organization, "long-term exposure to PM_{2.5} (particulate matter with a diameter of 2.5 microns or less, see graphic below for relative size) is associated with an increase in the long-term risk of cardiopulmonary mortality by 6–13% per 10 µg/m³ of PM_{2.5}." Without kitchen exhaust, residential kitchens regularly see concentrations that are easily hundreds of µg/m³ higher than outdoor levels (see Chart 1).

Cooks (all of us and our spouses if we're so fortunate) face the highest exposure to cooking pollutants, but if not captured at the source, these pollutants quickly find their way to bedrooms in far corners of the home. In tight homes, the concentration and associated damage caused by cooking pollutants can increase dramatically, as pollutants have nowhere to go. Opening a window can help to reduce kitchen pollutant levels, but it's as likely to spread the pollutants to other corners of the home as it is to exhaust them to the outdoors. In these locations, pollutants are deposited on surfaces, and re-enter the breathing zone when disturbed. All considered, building homes tight without providing mechanical kitchen exhaust presents an enormous liability for the industry and a disservice to the families that buy homes.

Builders are doing a great job constructing tight homes. But this shouldn't happen to the detriment of home owner health and safety. The IRC's charge in Section R101.3 is to IRC to "safeguard public safety, health, and general welfare through...ventilation" (among other methods). Approve this proposal to ensure that our ventilation systems are keeping pace with today's tight construction.

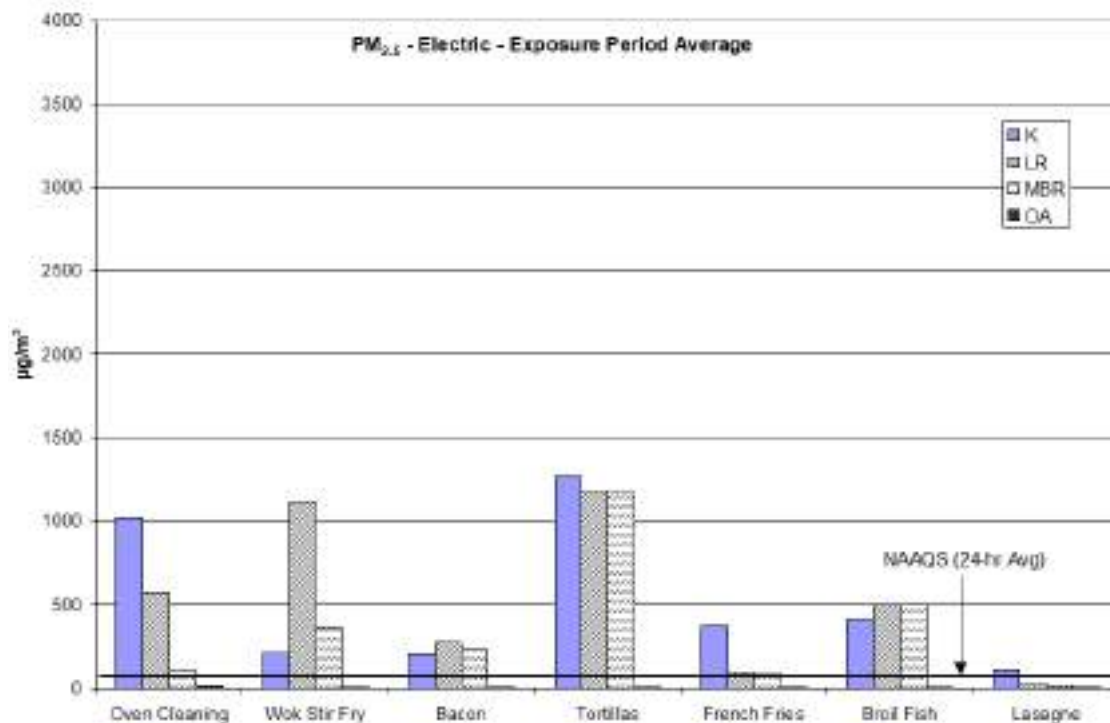

Chart 1. Concentration of PM_{2.5} (particulate matter with a diameter < 2.5 microns: the most harmful cooking pollutant)

during various cooking events in a test home. According to the World Health Organization, "long-term exposure to PM_{2.5} is associated with an increase in the long-term risk of cardiopulmonary mortality by 6–13% per 10 µg/m³ of PM_{2.5} (8–10)." Chart data sourced from Fortmann et al.

Figure 1. Size of particulate matter. Source: <https://www.epa.gov/pm-pollution/particulate-matter-pm-basics>.

Cost Impact

The code change proposal will increase the cost of construction .

For those units that do not already install kitchen exhaust, the cost of construction will increase, depending on equipment selection. Exhaust hoods start around \$50 retail (e.g., Broan economy hood #403001, 2-speed, moving 160 cfm, priced on zoro.com at \$47.60 with tax and shipping on January 11, 2018). Installed cost to the GC for ducting is estimated at ~\$9.85 per linear foot for 3.25"x10" galvanized sheet metal duct (RS Means, 2015, Section 23 31 13.13.0500), and a damper would cost about \$15 retail.

Internal ID: 1949

RB2-18

IRC: R303.4

Proponent: Mike Moore, Newport Ventures, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Residential Code

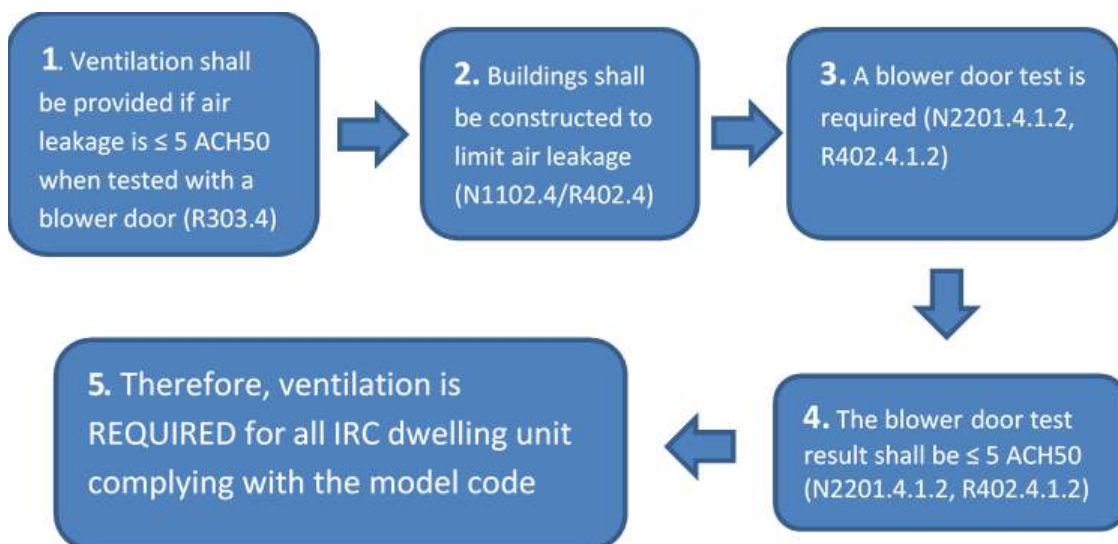

Revise as follows:

R303.4 Mechanical ventilation. ~~Where the air infiltration rate of a dwelling unit is 5 air changes per hour or less where tested with a blower door at a pressure of 0.2 inch w.c (50 Pa) in accordance with Section N1102.4.1.2, the dwelling unit is served by space-heating or cooling equipment, it shall be provided with whole-house mechanical ventilation in accordance with Section M1505.4.~~

Reason:

Building tight dwelling units has benefits of energy efficiency; improved comfort; and improved odor, rodent, and sound control. Tight buildings are typically the byproduct of better fire and smoke control as well. Beginning with the 2012 IRC, building tight has been code minimum practice, which is good. However, we learned in the 1970s that building tight without mechanically ventilating results in sick building syndrome.

So, since 2012, the code has required tight dwelling units to also be provided with mechanical ventilation. The problem is that we've heard from ICC staff, code officials, builders, and design professionals that it's hard to follow the code language requirements. Currently, we have a 5-step process to identify that mechanical ventilation is required for all IRC dwelling units that introduces needless confusion. Here's what the process looks like:

Instead of a 5-step process, we can simplify the code and enforcement by jumping straight to the conclusion: ventilation is required for all dwelling units. This proposal does exactly that. Additionally, this proposal introduces an exception for the mechanical ventilation requirement in climates and situations where natural ventilation is expected to provide all of the climate control and ventilation needed (i.e., when no space-heating or cooling equipment is provided). A similar exception exists in ASHRAE 62.2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Ventilation is already required for IRC dwelling units, so this proposal will not increase the cost of construction. For dwelling units without heating or cooling (e.g., seasonal cabins), this code change proposal will decrease the cost of construction.

Internal ID: 531

RB3-18

IRC: R303.1

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net)

2018 International Residential Code

R303.1 Habitable rooms. Habitable rooms shall have an aggregate glazing area of not less than 8 percent of the floor area of such rooms. Natural *ventilation* shall be through windows, skylights, doors, louvers or other *approved* openings to the outdoor air. Such openings shall be provided with ready access or shall otherwise be readily controllable by the building occupants. The openable area to the outdoors shall be not less than 4 percent of the floor area being ventilated.

Exceptions:

1. The For habitable rooms other than kitchens, the glazed areas need not be openable where the opening is not required by Section R310 and a whole-house mechanical *ventilation* system or a mechanical ventilation system capable of producing 0.35 air changes per hour in the habitable rooms is installed in accordance with Section M1505.
2. For kitchens, the glazed areas need not be openable where the opening is not required by Section R310 and a local exhaust system is installed in accordance with Section M1505. Where the openable glazing area is less than 4 percent of the kitchen floor area, ductless kitchen exhaust shall not be permitted.
- ~~2.3.~~ The glazed areas need not be installed in rooms where Exception 1 is satisfied and artificial light is provided that is capable of producing an average illumination of 6 footcandles (65 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.
- ~~3.4.~~ Use of sunroom and patio covers, as defined in Section R202, shall be permitted for natural ventilation if in excess of 40 percent of the exterior sunroom walls are open, or are enclosed only by insect screening.

Reason:

Prior to 2012, this section permitted users to specify "mechanical ventilation systems capable of producing 0.35 air changes per hour" or whole-house mechanical ventilation systems where an openable area of at least 4% of the habitable room's floor area is not provided. This proposed change would reintroduce the option for room-based mechanical ventilation systems, which are especially useful for additions or remodels. The proposed change is also consistent with Chapter 15's recognition that kitchens have different ventilation requirements than other habitable rooms. Namely, local exhaust, not whole-house mechanical ventilation that could be located in a far corner of the house, is needed for kitchens to ensure that cooking pollutants generated in the kitchen are captured and exhausted at their source. This language clarifies that IF the builder chooses to not provide the minimum openable glazing area in a kitchen, the kitchen shall be provided with ducted local exhaust in compliance with Chapter 15.

If approved, this change will provide more flexibility and can introduce cost savings for builders and buyers.

Cost Impact

The code change proposal will decrease the cost of construction .

This change adds options that can reduce cost and clarifies that if a kitchen range hood is installed in lieu of natural ventilation, the kitchen range hood shall be ducted to the exterior.

Internal ID: 1654

RB4-18

IRC: R202

Proponent: Janine Snyder, City of Thornton, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net); Guy Tomberlin, Fairfax County, VA, representing Fairfax County Building Division (guy.tomberlin@fairfaxcounty.gov)

2018 International Residential Code

Revise as follows:

[MP] CLEANOUT. An access opening in the drainage system ~~used~~ utilized for the removal of possible obstruction and ~~located to allow for access~~ of obstructions. Types of cleanouts include a removable plug or cap, and a removable fixture or fixture trap.

Reason:

By adding the text from the cleanout definition in the International Plumbing Code will not only add clarity by adding the types of cleanouts into the definition in International Residential Code, but will also maintain consistency between the two code definitions.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal will decrease the cost of construction by not requiring additional cleanouts to be installed where a water closet may be utilized.

Internal ID: 1372

RB5-18

IRC: R105.2

Proponent: Jim Tidwell, Tidwell Code Consulting, representing Honeywell (jimtiddwell@tccfire.com)

2018 International Residential Code

Revise as follows:

R105.2 Work exempt from permit. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

- Building:
 1. One-story detached *accessory structures*, provided that the floor area does not exceed 200 square feet (18.58 m²).
 2. Fences not over 7 feet (2134 mm) high.
 3. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge.
 4. Water tanks supported directly upon *grade* if the capacity does not exceed 5,000 gallons (18 927 L) and the ratio of height to diameter or width does not exceed 2 to 1.
 5. Sidewalks and driveways.
 6. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
 7. Prefabricated swimming pools that are less than 24 inches (610 mm) deep.
 8. Swings and other playground equipment.
 9. Window awnings supported by an exterior wall that do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
 10. Decks not exceeding 200 square feet (18.58 m²) in area, that are not more than 30 inches (762 mm) above *grade* at any point, are not attached to a dwelling and do not serve the exit door required by Section R311.4.
- Electrical:
 1. *Listed* cord-and-plug connected temporary decorative lighting.
 2. Reinstallation of attachment plug receptacles but not the outlets therefor.
 3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
 4. Electrical wiring, devices, *appliances*, apparatus or *equipment* operating at less than 25 volts and not capable of supplying more than 50 watts of energy.
 5. Minor repair work, including the replacement of lamps or the connection of *approved* portable electrical *equipment* to *approved* permanently installed receptacles.
- Gas:
 1. Portable heating, cooking or clothes drying *appliances*.
 2. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
 3. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.
- Mechanical:
 1. Portable heating *appliances*.
 2. Portable ventilation *appliances*.
 3. Portable cooling units.
 4. Steam, hot- or chilled-water piping within any heating or cooling *equipment* regulated by this code.
 5. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment*

unsafe.

6. Portable evaporative coolers.
 7. Self-contained refrigeration systems containing 10 pounds (4.54 kg) or less of ~~refrigerant or non-flammable (A-1) refrigerant.~~
 8. Self-contained refrigeration systems containing non-flammable (A-1) refrigerants that are actuated by motors of 1 horsepower (746 W) or less.
 - ~~8.9.~~ Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.
- Plumbing:
 1. The stopping of leaks in drains, water, soil, waste or vent pipe; provided, however, that if any concealed trap, drainpipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
 2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures, and the removal and reinstallation of water closets, provided such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Reason:

The existing exemption for permitting residential size HVAC systems is founded on the fact that all refrigerants used in these systems have been non-flammable up until now. Changing out a system historically hasn't presented a significant risk. That changes with the introduction of flammable refrigerants. Changing out a system now may require significantly more design work to assure a safe installation. In addition, piping may need to be re-routed or replaced in some cases. If flammable refrigerants are used, it is no longer a simple equipment replacement, but a much more complex issue with significant safety risk. Requiring a permit will provide the jurisdiction with the opportunity to address that risk during the review and inspection process.

Cost Impact

The code change proposal will increase the cost of construction .

While the actual cost of construction isn't impacted, the requirement for a permit will add to the final cost.

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL RESIDENTIAL CODE – MECHANICAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some RM code change proposals may not be included on this list, as they are being heard by another committee.

IRC: Chapter 21, 202 (New)

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Residential Code

CHAPTER 21 HYDRONIC PIPING

Add new definition as follows:

PRESS-CONNECT JOINT A permanent mechanical joint incorporating an elastomeric seal or an elastomeric seal and corrosion-resistant grip or bite ring. The joint is made with a pressing tool and jaw or ring approved by the fitting manufacturer.

Reason:

Currently the IRC does not include the definition of Press-Connect Joint which is used in the text of the code in IRC section M2103.3. Including this definition will align the definitions as similarly provided for in the IMC and IPC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed definition will not increase or decrease cost of construction as it defines a pipe joining method already referenced in the code.

IRC: M1305.1.4 (New), M1305.1.4.1 (New), M1305.1.4.2 (New)

Proponent: Brent Ursenbach, representing Salt Lake County Planning and Development Services
(bursenbach@slco.org)

2018 International Residential Code

Add new text as follows:

M1305.1.4 Equipment and appliances on roofs or elevated structures. Where equipment requiring access or appliances are located on an elevated structure or the roof of a building such that personnel will have to climb higher than 16 feet (4877 mm) above grade to access such equipment or appliances, an interior or exterior means of access shall be provided. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) in height or walking on roofs having a slope greater than four units vertical in 12 units horizontal (33-percent slope). Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall. Roof access shall not require the use of portable ladders except where roof access is from the building interior through an attic space, or through a hatch in the roof assembly, and the height necessary to climb on such portable ladder does not exceed 16 feet. Roof hatches used for access shall comply with the dimension requirements for an attic access. Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).
2. Ladders shall have rung spacing not to exceed 14 inches (356 mm) on center. The uppermost rung shall be not greater than 24 inches (610 mm) below the upper edge of the roof hatch, roof or parapet, as applicable.
3. Ladders shall have a toe spacing not less than 6 inches (152 mm) deep.
4. There shall be not less than 18 inches (457 mm) between rails.
5. Rungs shall have a diameter not less than 0.75-inch (19.1 mm) and be capable of withstanding a 300-pound (136 kg) load.
6. Ladders over 30 feet (9144 mm) in height shall be provided with offset sections and landings capable of withstanding 100 pounds per square foot (488 kg/m²). Landing dimensions shall be not less than 18 inches (457 mm) and not less than the width of the ladder served. A guard rail shall be provided on all open sides of the landing.
7. Climbing clearance. The distance from the centerline of the rungs to the nearest permanent object on the climbing side of the ladder shall be not less than 30 inches (762 mm) measured perpendicular to the rungs. This distance shall be maintained from the point of ladder access to the bottom of the roof hatch. A minimum clear width of 15 inches (381 mm) shall be provided on both sides of the ladder measured from the midpoint of and parallel with the rungs except where cages or wells are installed.
8. Landing required. The ladder shall be provided with a clear and unobstructed bottom landing area having a minimum dimension of 30 inches (762 mm) by 30 inches (762 mm) centered in front of the ladder.
9. Ladders shall be protected against corrosion by approved means.
10. Access to ladders shall be provided at all times.

Catwalks installed to provide the required access shall be not less than 24 inches (610 mm) wide and shall have railings as required for service platforms.

M1305.1.4.1 Sloped roofs. Where appliances, equipment, fans or other components that require service are installed on a roof having a slope of three units vertical in 12 units horizontal (25-percent slope) or greater and having an edge more than 30 inches (762 mm) above grade at such edge, a level platform shall be provided on each side of the appliance or equipment to which access is required for service, repair or maintenance. The platform shall be not less than 30 inches (762 mm) in any dimension and shall be provided with guards. The guards shall extend not less than 42 inches (1067 mm) above the platform, shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in this code. Access shall not require walking on roofs having a slope greater than four units vertical in 12 units horizontal (33-percent slope). Where access involves obstructions greater than 30 inches (762 mm) in height, such obstructions shall be provided with ladders installed in accordance with Section M1305.1.4 or stairways installed in accordance with the requirements specified in this code in the path of travel to and from appliances, fans or equipment requiring service.

M1305.1.4.2 Electrical requirements. Electrical requirements. A receptacle outlet shall be provided at or near the equipment location in accordance with Section E3901.12.

Reason:

The IRC and IMC have always included provisions for the safe access to appliances and equipment, for inspection, maintenance, repair and replacement, in rooms, attics and under-floor spaces. The IMC has also included requirements for appliances located on roofs or elevated structures, the location where the greatest hazards exist; however, the IRC is silent on access to appliances and equipment on roofs or elevated structures.

It's not logical to have a code which protects safety of those servicing commercial HVAC systems located on roofs and ignores the safety of those servicing HVAC equipment located roofs of SFD, duplexes and townhouses. Homeowners often perform annual maintenance on their own HVAC systems. Is their safety less important than the safety of the HVAC technician?

This proposal is similar to the requirements from the IMC; however this proposal allows the use of a portable ladder, for use inside the dwelling, for access to the attic or directly on the roof through roof rafters and a roof access.

This has become a significant issue in recent years with the trend of building 2 and 3 story townhouses, with RTU's or condensing units located on the roof. Many of these projects have roof more than 30' above grade.

-

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction only in situations where HVAC systems are installed on roofs or elevated structures higher than 16 feet.

Internal ID: 1444

RM3-18

IRC: M1307.7 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Add new text as follows:

M1307.7 Prohibited support. Gypsum board shall not be used as a support base under an appliance.

Reason:

If appliances are installed resting on gypsum board, the board can compress, degrade from heat, moisture and vibration and crumble, with the result being movement and settling of the appliance which would put stress on gas piping, vent connectors, chimney connectors, electrical connections and ductwork. Gypsum board is not intended to be a support base for vertical deadloads.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 379

RM4-18

IRC: M1308.3 (New)

Proponent: Howard Ahern, representing Airex Manufacturing (howard.ahern@airexmf.com)

2018 International Residential Code

Add new text as follows:

M1308.3 Wall Penetration Sealing. Where pipe penetrates a building envelope wall, the annular space between the outside of the pipe and the inside of a pipe sleeve and the annular space between the outside of a pipe sleeve and the opening in a building envelope wall shall be sealed with caulking material or closed with a gasketing system. Caulking materials, and gasketing systems shall allow for expansion and contraction of material and mechanical vibration, shall be designed for the conditions at the location of the penetration, and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Annular spaces created by pipes penetrating fire-resistance-rated assemblies or membranes of such assemblies shall be sealed or closed in accordance with this code

Reason:

There are no sections for sealing wall pipe penetrations for mechanical systems.

This change provides for the annular sealing of pipe penetrations for mechanical systems, some mechanical piping may vibrate and this change shall allow for the proper sealing of these penetrations.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Sealing of the pipe wall penetration should be part of standard construction practice, and not lead to increased cost , however sealing of refrigerant piping should not increase cost , also the IBC requires rodent proofing as well

Internal ID: 385

RM5-18

IRC: M1309 (New)

Proponent: Craig Conner, representing self (craig.conner@mac.com); Jani Palmer (Palmer.Janise@epa.gov)

2018 International Residential Code

Add new text as follows:

M1309 Radon testing. Radon testing shall be performed for radon zone 1, as defined in Appendix F. This section requires that tests be performed and the results be provided to the owner, but does not require a specific test result..

Exceptions:

1. Testing is not required where the authority having jurisdiction has defined the radon zone as Zone 2 or 3.
2. Testing is not required where the occupied space is located above an open space.

Testing shall be performed as specified in items 1 through 10:

1. Testing shall be performed after the dwelling passes its air tightness test.
2. Testing shall be performed after the radon control system installation is complete. If the system has an active fan, the residence shall be tested with the fan operating.
3. Testing shall be performed at the lowest floor level that will be occupied, whether or not the space is finished. Spaces that are physically separated and served by different HVAC systems shall be tested separately.
4. Testing shall not be performed in a closet, hallway, stairway, laundry room, furnace room, bathroom or kitchen.
5. Testing shall be performed with a commercially available radon test kit or with a continuous radon monitor that can be calibrated. Testing with test kits shall include two tests, and the test results shall be averaged. Testing shall be in accordance with the testing device manufacturer's instructions.
6. Testing shall be performed by the builder, a registered design professional, or an approved third party.
7. Testing shall be conducted over a period of not less than 48 hours or not less than the period specified by the testing device manufacturer, whichever is longer. The initial testing shall begin prior to occupancy, but need not be completed prior to occupancy.
8. Test results shall be provided directly to the owner by the test lab or testing party and shall be delivered either before or after occupancy.
9. An additional pre-paid test kit shall be provided to the owner to utilize at the owner's discretion. The test kit shall include mailing or emailing the results from the testing lab to the owner.
10. The owner or registered design professional shall be notified in writing prior to occupancy, stating one of the following:
 - 10.1. A radon test result of 4 pCi/L or above is the 'action level' set by EPA. The EPA recommends radon reduction measures to lower radon levels below 4 pCi/L."
 - 10.2. For a radon test result of 4 pCi/L or above [name of builder or authority having jurisdiction] recommends radon reduction measures to lower radon levels below 4 pCi/L."

Reason:

Radon tests are the only way to know if a residence has significant levels of radon. The test kits are inexpensive and easy to use. This change is designed not to delay the sale or occupancy of the home. Testing in radon zone 1 provides information for areas that tend to have higher levels of radon.

Cost Impact

The code change proposal will increase the cost of construction .

Multiple companies make inexpensive radon test kits. This change would require two tests which are averaged, plus a third test kit to be left with the owners. Three tests including pre-paid testing, postage and tax will cost less than \$80, often less than \$50.

RM6-18

IRC: M1305.1.4.4 (New)

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gcmann@jeffco.us); Troy Jones, representing Jefferson County Division of Building Safety (tjones@jeffco.us)

2018 International Residential Code

Add new text as follows:

M1305.1.4.4 Ladder Required. Where mechanical equipment or appliances that require servicing are located in under floor spaces that are greater than 30 inches in depth below the floor level, the access openings to such spaces shall be equipped with an approved, permanently affixed ladder capable of withstanding a 300-pound (136.1 kg) load. Such ladders shall be securely fastened to the structure at the top and bottom, shall have a rung spacing of not less than 14 inches (356 mm) on center and a rail spacing of not less than 18 inches (457 mm) between rails. Ladders constructed of dimensional lumber shall be not less than nominal two by four members. Fasteners shall be in accordance with Table R602.3 (1) item 16 for end nailing or other approved fastening methods.

Reason:

The code tells us how to go up but it doesn't tell us how to go down. Ladders constructed of wood in many instances lack the quality in construction to support the weight imposed on them. Often the rungs break exposing the fasteners that can seriously wound the person accessing the ladder. There needs to be a ladder capable of withstanding the repeated use that accessing appliances and equipment in crawlers and under floor spaces require. The spacing requirements are the same as found in the IMC along with the loading requirements. This proposal provides much flexibility in construction. Guidance for using wood has been provided. Other methods of construction shall be up for approval by the AHJ.

Cost Impact

The code change proposal will increase the cost of construction .

This requirement may increase cost as it has not been required to install a ladder in a under floor access opening to date although many just do it anyway in a haphazard way.

Internal ID: 170

RM7-18

IRC: M1401.1

Proponent: David Bixby, Air Conditioning Contractors of America (ACCA), representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

2018 International Residential Code

M1401.1 Installation. Heating and cooling *equipment* and *appliances* shall be installed in accordance with the manufacturer's instructions and the requirements of this code. HVAC systems shall be installed in compliance with ACCA 5 QI.

Reason:

ACCA 5 QI details nationally-recognized minimum criteria for the proper installation of HVAC systems in new and existing residential and commercial buildings. This Standard provides a universally accepted definition for quality installation across a broad spectrum of the HVAC industry (e.g., manufacturers, distributors, contractors, user groups, customers, utilities, efficiency advocates, trade associations, professional societies, and governmental agencies). In this Standard, the QI elements focus on the application and how well the system is selected and actually installed. ACCA 5 QI is also a consensus-based ANSI standard. A proposal to add ACCA 5 QI to Chapter 44, Referenced Standards, has also been submitted.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cost impacts for using ACCA 5 QI would be minimal, other than some extra time involved. Installers will have to perform calculations for ventilation, heat loss/gain, ensure proper equipment sizing and selection, in order to comply. This is a guide for making sure the industry performs quality installations based on current industry practice. Code officials will have to verify and document compliance.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1873

RM8-18

IRC: M1404.1

Proponent: Jim Tidwell, representing Honeywell (jimtidwell@tccfire.com)

2018 International Residential Code

Revise as follows:

M1404.1 Compliance. Refrigeration cooling *equipment* shall comply with Section M1411 and ANSI/ASHRAE 15.

Reason:

ASHRAE 15 is the accepted standard for the installation of refrigeration equipment, and should be referenced by the IRC. We believe this was an oversight, and this change corrects that oversight. The IMC references this standard as well.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change may change the cost of construction, either by increasing it or decreasing it depending upon the system being installed. Referencing a national standard for installation criteria should streamline the overall process.

Internal ID: 2258

RM9-18

IRC: M1411.3.1.2 (New)

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gcmcmann@jeffco.us)

2018 International Residential Code

Add new text as follows:

M1411.3.1.2 Appliance, equipment and insulation in pans. Where appliances, equipment or insulation are subject to water damage when auxiliary drain pans fill, that portion of the appliance, equipment and insulation shall be installed above the rim of the pan. Supports located inside of the pan to support the appliance or equipment shall be water resistant and approved.

Reason:

This is editorial in nature and is missing from this code. This can be found in the IMC Section 307.2.3.2 and in the IPC. This addition will make the IRC consistent with the other codes.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is editorial in nature.

Internal ID: 152

RM10-18

IRC: M1411.6

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

M1411.6 Insulation of refrigerant piping. Piping and fittings for refrigerant vapor (suction) lines shall be insulated with insulation having a thermal resistivity of not less than R-~~4~~3 and having external surface permeance not exceeding 0.05 perm [2.87 ng/(s • m² • Pa)] when tested in accordance with ASTM E96.

Reason:

This change is simply for consistency with the Chapter 11 energy provisions. The two insulation requirements did not match and caused confusion.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 484

RM11-18

IRC: M1411.8 (New)

Proponent: Howard Ahern, Airex Manufacturing, representing Airex Manufacturing (howard.ahern@airexmfg.com)

2018 International Residential Code

Add new text as follows:

M1411.8 Support of Refrigerant piping. Refrigerant piping & tubing shall be securely fastened to a permanent support within 6 feet of the compressor and within 3 feet of each subsequent bend or angle.

Reason:

This proposal will require support of the Refrigerant piping which vibrates and that can lead to damage of piping and joints from vibration and stress. Unfortunately many refrigerant pipes are not supported from the condenser, or the only support is foam , caulking in the walls penetration. This proposal will require supporting of the piping to ensure safety, reduce piping ,and joints damage from vibration and stress.

Bibliography:

Howard Ahern

representing Airex Manufacturing

National Sales and Technical Manager

Cost Impact

The code change proposal will decrease the cost of construction .

The piping should already be supported .

Internal ID: 2362

RM12-18

IRC: M1503.3

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net)

2018 International Residential Code

M1503.3 Exhaust discharge. Domestic cooking exhaust equipment shall discharge to the outdoors through a duct. The duct shall have a smooth interior surface, shall be air tight, shall be equipped with a backdraft damper and shall be independent of all other exhaust systems. Ducts serving domestic cooking exhaust equipment shall not terminate in an attic or crawl space or areas inside the building.

Listed and labeled ductless range hoods shall not be required to discharge to the outdoors where all of the following conditions are met:

~~**Exception:** Where installed in accordance with the manufacturer's instructions, and where mechanical or natural ventilation is otherwise provided, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.~~

1. The equipment is installed in accordance with the manufacturer's instructions.
2. Mechanical or natural ventilation is otherwise provided in the cooking area.
3. The equipment is installed in a newly constructed dwelling unit other than single family, or is installed in an existing kitchen not having an existing range hood exhaust duct to the outdoors.

Reason:

Cooking is typically the largest source of indoor air pollution in homes, with concentrations of key pollutants frequently exceeding U.S. National Ambient Air Quality Standards. Over time, exposure to these pollutants has been shown to reduce length and quality of life. Clearly, kitchen ventilation is needed to comply with the purpose of the IRC to "safeguard public safety, health, and general welfare through...ventilation" (among other means). Unless captured and exhausted at the source, cooking pollutants spread rapidly through a home and deposit themselves on surfaces, only to be released again into the breathing zone when disturbed at a later time. For new construction in detached buildings, where the builder elects to install a range hood, requiring that the range hood be ducted is a very low-cost item with high returns in terms of occupant health. For reasons of constructability and cost sensitivity (not health), this proposal would only permit ductless range hoods when they are installed in an attached dwelling unit of new construction or when they are installed in an existing kitchen that doesn't have an pre-existing range hood exhaust duct.

Cost Impact

The code change proposal will increase the cost of construction .

Where builders are already installing ducts with range hoods, there will not be any increase in the cost of construction. Where new, single-family dwelling units are not currently provided with ducts for their range hoods, this proposal would increase the cost of construction. Installed duct costs can be estimated at ~ \$9.85 per linear foot for 3.25"x10" galvanized sheet metal (RS Means, 2015, Section 23 31 13.13.0500), and a damper would cost about \$15 retail.

Internal ID: 1744

RM13-18

IRC: M1502.3

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

M1502.3 Duct termination. Exhaust ducts shall terminate on the outside of the building. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into buildings including openings in ventilated soffits. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination.

Reason:

The code does not address ventilated soffits as building openings, which indeed they are.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 529

RM14-18

IRC: 1502.3.2 (New)

Proponent: Rick Harpenau, representing self (rick@dryerbox.com)

2018 International Residential Code

Add new text as follows:

1502.3.2 Animal Grills. Where grilles are provided on dryer exhaust duct terminals to prevent entry of animals, the grille shall consist entirely of vertical slots without horizontal or diagonal members, the slots shall have a width of not less than 5/8 inch, and the total open area of the grille shall be not less than 4 times the opening area of the exhaust duct.

Reason:

Rural areas across our country experience sufficient intrusion of squirrels, rodents and birds. So much so that homeowners seek or create their own protection. Many resort to mechanical cloth wraps with wire spacing of less than 1/2". Plastic grilles are common as well but due to the lack of material strength, the grill partitions are large and flat promoting accelerated lint build up. Some plastic wall vent hoods incorporate an integral defensive grill. Generally, this design does not provide an adequate area spread and aperture size of each opening is insufficient to allow the lint accumulation to release and exit.

Currently Section 1502.3 clearly indicates screens shall not be installed at the duct termination. Grills and screens could be considered equivalent in description causing confusion. A separate section defining acceptable grills seems logical and removes the equal comparison argument for grills and screens and their use at or near the dryer termination.

Vertical bars resist accelerated lint build up.

The text simply lays out criteria for cages to feature vertical bars.

Bibliography:

Inventor of the Dryerbox. Owner of In-O-Vate Technologies Inc.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

A rodent/bird defensive grill or cage is an owner/occupant discretionary item.

Wording is necessary to distinguish grills from disallowed screens.

Internal ID: 426

RM15-18

IRC: M1502.4.2

Proponent: Rick Harpenau, representing self (rick@dryerbox.com)

2018 International Residential Code

Revise as follows:

M1502.4.2 Duct installation. Exhaust ducts shall be supported at intervals not to exceed ~~12-4~~ feet (~~3658-1219~~ mm) and shall be secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Exhaust duct joints shall be sealed in accordance with Section M1601.4.1 and shall be mechanically fastened. Ducts shall not be joined with screws or similar fasteners that protrude more than $\frac{1}{8}$ inch (3.2 mm) into the inside of the duct. Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such cavities shall allow the installation of the duct without deformation.

Reason:

12 feet spacing does not provide adequate support for sections of pipe that feature a maximum length of 5 feet. Also, for consistency, the Mechanical Code requires 4 feet support intervals. For the most part, the Res and Mech codes mirror themselves except for the support intervals. These images show the importance of both mechanical fastening, seam taping and 4 foot interval support spacing.

Bibliography:

Inventor of the Dryerbox receptacle, president of In-O-Vate Technologies Inc

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarification and consistency between the Res and Mech codes.

Internal ID: 323

RM16-18

IRC: M1502.4.2

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

M1502.4.2 Duct installation. Exhaust ducts shall be supported at intervals not to exceed ~~12-4~~ feet (3658 mm) and shall be secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Exhaust duct joints shall be sealed in accordance with Section M1601.4.1 and shall be mechanically fastened. Ducts shall not be joined with screws or similar fasteners that protrude more than $\frac{1}{8}$ inch (3.2 mm) into the inside of the duct. Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such cavities shall allow the installation of the duct without deformation.

Reason:

This proposal will correlate the IRC provision with that of the IMC. 12 foot spacing is not allowed in the IMC and could cause light gage ducts to fail during duct cleaning operations. A 12 foot run of dryer exhaust duct would have one or more joints in it, thus compromising duct integrity where supports are at 12 foot intervals.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will increase the cost of construction .

Additional hangars/supports will be required based on shorter intervals.

Internal ID: 482

RM17-18

IRC: M1504.3

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Residential Code

Revise as follows:

M1504.3 Exhaust openings. Air exhaust openings shall terminate as follows:

1. Not less than 3 feet (914 mm) from property lines.
2. Not less than 3 feet (914 mm) from gravity air intake openings, operable windows and doors.
3. Not less than 10 feet (3048 mm) from mechanical air intake openings except where either of the following apply:
 - 3.1. The exhaust opening is located not less than 3 feet (914 mm) above the air intake opening.
 - 3.2. The exhaust opening is part of a factory-built intake/exhaust combination termination fitting installed in accordance with the manufacturer's instructions, and the exhaust air is drawn from a living space.
4. Openings shall comply with Sections R303.5.2 and R303.6.

Reason:

This proposal is very similar to a PMGCAC proposal on the same subject. The only difference is that this proposal does not include the word "approved" in front of "factory-built intake/exhaust termination combination fitting". In some jurisdiction, equipment or products requiring approval will trigger an "alternative means and methods" process to secure a permit. As explained in the reason statement below, these products have been determined to perform well across manufacturers and models. With good performance and insignificant deviation across products, there is no need to further scrutinize these products or delay permits for dwelling units that specify them. This is the position of the Home Ventilating Institute.

The rest of the reason statement echoes that in the PMGCAC proposal:

Intake/exhaust combination terminations are regularly installed with heating and energy recovery ventilators (H/ERVs) used for dwelling units. Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water.

Manufacturer tests conducted by Natural Resources Canada (NRC) have demonstrated that use of intake/exhaust combination terminations results in minimum cross-contamination of airflows (i.e., not exceeding 4%; see NRC report A1-007793¹). These results are aligned with ASHRAE 62.2 approval of such devices which limits cross-contamination to 10%, as verified by the manufacturer. If approved, this proposed modification to the IRC would limit application of intake/exhaust combination terminations to "approved", "factory-built" units. Approval of this proposed modification is expected to result in more affordable and architecturally-flexible terminations.

Note: The IRC defines living space as, "space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes". The use of the term "environmental air" was also considered, but was abandoned because "environmental air" can also include exhaust air from parking garages and clothes dryers, which we want to exclude from this exception.

For a copy of the report, please contact the proponent at the email address provided. Additional reports are available from the proponent upon request.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal can reduce the number of intake and exhaust penetrations required for a dwelling unit, thereby reducing the cost of construction.

Internal ID: 1899

RM18-18

IRC: M1505.4.1

Proponent: Joseph Hill, representing New York State Department of State, Division of Building Standards and Codes (Joseph.Hill@dos.ny.gov)

2018 International Residential Code

Revise as follows:

M1505.4.1 System design. The whole-house ventilation system shall consist of one or more supply or exhaust fans, or a combination of such, and associated ducts and controls. Local exhaust or supply fans are permitted to serve as a part of such a system. Outdoor air ducts connected to the return side of an air handler shall be considered as providing supply ventilation. Where building infiltration provides all or a portion of the outdoor air intake for whole-house ventilation, such air intake shall be demonstrated by calculations, otherwise, the whole-house ventilation system shall be designed to provide outdoor air intake by means other than building infiltration.

Reason:

The use of exhaust only ventilation has been the subject of intense debate in the industry, whether exhaust only ventilation can effectively exchange indoor air with outdoor air as is the defined purpose of a Whole House Mechanical Ventilation System. In the case of supply air supplied by building infiltration only, it is hard to justify supply air provided by means of building infiltration only, especially at the rates of infiltration which single family dwellings are required to be tested. When a single-family residence is tested at less than 5 Air Changes per hour, at ACH 50, Code Section R303.4 indicates that Mechanical ventilation is required. All climate design zones throughout the United States are required to be tested at 5 or less air changes per hour. It is the learned opinion of many in the building science industry that exhaust only ventilation does not work to provide the fresh air required by code, and additionally, may be the cause of increasing indoor contaminants, rather than alleviating them.

This science is not very complex, by adding an exhaust fan any given dwelling, you effectively decrease the internal pressure. This will cause an increase in infiltration, drawing with it any contaminants held within the building envelope, as well as a very likely increase radon. The following reasoning may illustrate this point and rationalize the need for this modification. The following quotation are in support this statement;

From Green Builder magazine (September 2009): "Because exhaust-only ventilation pulls air through the building envelope, this approach can bring contaminants from the garage, dust from attics, pesticides from the outdoors, mold spores, and even radon into the house."¹

From NSERDA's "Homeowner's Guide to Ventilation": "Exhaust-only ventilation is a good choice for homes that do not have existing ductwork to distribute heated or cooled air. However, if there is radon in the soil around the house, this method can increase indoor radon levels."¹

From Chapter 9 of the Alaska Residential Building Manual: "Exhaust-only ventilation systems, because they depressurize the house, may increase the amount of radon that enters the living space."¹

Section M1507 Mechanical Ventilation was introduced into the 2012 IRC, being a derivation of the requirements of ASHRAE 62.2 -2004 Ventilation and Acceptable Indoor Air Quality In Residential Buildings. There are additional provisions of ASHRAE 62.2 which require the determination of infiltration air, thereby **allowing** (not requiring) a portion of the supply air for the mechanical ventilation systems to be provided by building infiltration. There is no allowance that can be found within 62.2 which allows for 100% of the supply air for mechanical ventilation systems to be provided by building infiltration. The following calculations are present within ASHRAE 62.2 -2016 which require the determination for the allowable amount of building infiltration air which can be utilized by the mechanical ventilation system.

Section 4.1.2 Infiltration Credit states that if a blower door test has been performed, then a credit for estimated infiltration may be taken for non-attached dwelling units using the procedure in Section 4.1.2 (a) ²

4.1.2 (a) Effective Annual Average Infiltration Rate (O inf) shall be calculated using the normalized leakage calculated from measurements of envelope leakage using either ASTM E779, or CGSB 149.10. The authority having jurisdiction may approve other means of calculating effective leakage area (ELA), such as RESNET Mortgage Industry National; Home Energy Systems Standard.²

The procedure described by 62.2-2016 is represented by Equation 4.2 which states;

$$^2 \text{ ELA} = (\text{Lpress} + \text{Ldepress}) / 2$$

The reference, or test pressure = 4 Pa

Where ELA = effective leakage area, ft²

L press= leakage area from pressurization , ft²

L depress= leakage area from depressurization , ft²

2 Normalized Leakage

Normalized Leakage shall be calculated using Equation 4.4

Equation 4.4- $NL = 1000 \times ELA/A_{\text{floor}} \times [H/H_r]^Z$

NL= Normalized Leakage

ELA= effective leakage area, ft²

A floor= Floor area of Residence

H= Vertical Distance between the lowest and highest above grade points within the pressure boundary, in feet.

H_r= Reference height, 8.2 feet

Z= 0.4

2 The Effective Annual Average Infiltration Rate (Q inf)

The Effective annual average infiltration rate (Q inf) shall be calculated using Equation 4.5a (or 4.5b)

Equation 4.5a - $Q_{\text{inf}} (\text{cfm}) = NL \times WSF \times A_{\text{floor}}/7.3$

NL= Normalized Leakage

WSF= Weather shielding Factor (Normative Appendix B)

A floor= Floor area of Residence

Cost Impact

The code change proposal will increase the cost of construction .

The Code change may require the addition of ducts and mechanical and/or gravity damper's.

Internal ID: 1845

RM19-18

IRC: M1505.4.4

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Residential Code

Revise as follows:

M1505.4.4 Local exhaust rates. *Local exhaust* systems shall be designed to have the capacity to exhaust the minimum airflow rate determined in accordance with Table M1505.4.4. Intermittently operated exhaust fans in bathrooms and toilet rooms shall be provided with a delay-shutoff timer or humidity sensor control.

Exception: A delay-shutoff timer or humidity sensor control switch is not required for exhaust fans that function as a component of a programmed whole-house ventilation system.

Reason:

This code change provides compliance options for intermittently operated exhaust fans when the bathroom is occupied (manual or humidity sensor activation) and for a limited period of time after the user leaves the room (delay timer or humidity sensor deactivation). Delay timer and humidity sensor exhaust fan controls are a consistent and effective means of removing indoor moisture and pollutants.

During a bath or shower, the humidity level in a bathroom can be a perfect breeding ground for mold, mildew and microorganisms that can negatively impact occupant health. Excess moisture has tremendous potential for damaging the structure. It cracks and peels paint, ruins gypsum wallboard, causes exterior paint failure, warps doors and rusts cabinets and fixtures. It can cause deterioration of joists and framing. As it condenses on windows, walls, ceilings and cabinets, it attracts dirt. It encourages mildew on tile grout and generally provides an environment for increased bacterial growth.

According to the Home Ventilation Institute, an intermittently operated exhaust fan needs to run at least 20 minutes after each shower to sufficiently remove moisture from an average size bathroom. Bathroom exhaust systems reduce the risk of mildew and mold growth, which is a sanitation and durability concern in all homes, regardless of climate. Delay timer and moisture sensor controlled exhaust fans are more effective than a manually operated fan or an operable window that is usually left closed during the winter and summer months of the year.

Automatic shut-off controls help to ensure exhaust fan operates when the bathroom is in use and for a limited period of time after the user leaves the room. Automatic controls also save energy by ensuring fans don't run unnecessarily after removal of moisture and pollutants.

Bibliography:

ASHRAE 62.2-2016 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings
Home Ventilating Institute - <http://www.hvi.org/publications/HowMuchVent.cfm>

Cost Impact

The code change proposal will increase the cost of construction .

A basic dial delay timer switch costs \$15, while a basic humidity sensor switch costs \$46. Timer and moisture controlled exhaust fans reduce the potential of making costly moisture damage repairs to correct problems that is easy to avoid with adequate local exhaust.

Internal ID: 550

RM20-18

IRC: SECTION M1505, 1505.5 (New)

Proponent: Craig Conner, representing self (craig.conner@mac.com)

2018 International Residential Code

SECTION M1505 MECHANICAL VENTILATION

Add new text as follows:

1505.5 Combustion venting into conditioned space. Permanently installed combustion devices that are designed to vent combustion products into conditioned space shall be approved by a licensed design professional.

Exception: Section 1505.5 shall not apply to stoves, ovens and pilot lights.

Reason:

Combustion devices which are designed to vent combustion products into the conditioned space are high risk from the perspective of indoor air quality. These devices also increase interior moisture and can add contaminants such as NO_x (nitrous oxides).

Cost Impact

The code change proposal will increase the cost of construction .

There will likely be a cost associated with the review by a licensed design professional. However, it is also possible that the design professional will be less expensive than correcting any problem resulting from routinely venting combustion products into conditioned space.

Internal ID: 2010

RM21-18

IRC: M1505.4.3

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingscience.com)

2018 International Residential Code

Revise as follows:

M1505.4.3 Mechanical ventilation rate. The whole house mechanical ventilation system shall ~~provide~~be capable of providing outdoor air at a minimum continuous rate as determined in accordance with Table M1505.4.3(1) or Equation 15-1.

~~Ventilation rate in cubic feet per minute = $0.01 \times \text{total square foot area of house} + 7.5 \times \text{number of bedrooms} + 1$~~
Ventilation rate in cubic feet per minute = $(0.01 \times \text{total square foot area of house}) + [7.5 \times (\text{number of bedrooms} + 1)]$ **(Equation 15-1)**

Exception: The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25 percent of each 4-hour segment and the ventilation rate prescribed in Table M1505.4.3(1) or in accordance with Equation 15-1 is multiplied by the factor determined in accordance with Table M1505.4.3(2).

Reason:

This code change contains a number of improvements that clarify the intent and requirements of whole-house mechanical ventilation rates.

First, the ventilation system must “be capable of providing” the necessary ventilation air. A “manual override” (on/off switch) must be provided as defined in M1505.4.2. So, as written, if the system is switched off, the house would be out of code compliance.

Second, the ventilation rates are minimum values and it should be clearly stated in the code.

Third, the term “total square foot area of house” is not a defined term and could easily be interpreted to include unconditioned spaces (e.g. basements, garages, enclosed porches). “conditioned floor area” is a defined term and is appropriate for determining ventilation rates.

Last, Exception 1 intermittent ventilation rates should be able to be determined by either the table or the equation. Last code cycle the equation (15-1) was added to determine the ventilation rate, but was missed in the exception. This change fixes this omission.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change will clarify the code language as described in the "reason".

Internal ID: 1628

RM22-18

IRC: 202 (New), M1505.4.3

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingscience.com)

2018 International Residential Code

BALANCED VENTILATION. Any combination of concurrently operating mechanical exhaust and mechanical supply whereby the total mechanical exhaust airflow rate and the total mechanical supply airflow rate are substantially the same.

Revise as follows:

M1505.4.3 Mechanical ventilation rate. The whole house mechanical ventilation system shall provide outdoor air at a continuous rate as determined in accordance with Table M1505.4.3(1) or Equation 15-1.

Ventilation rate in cubic feet per minute = $(0.01 \times \text{total square foot area of house}) + [7.5 \times (\text{number of bedrooms} + 1)]$

(Equation 15-1)

Exception-Exceptions:

1. The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25 percent of each 4-hour segment and the ventilation rate prescribed in Table M1505.4.3(1) is multiplied by the factor determined in accordance with Table M1505.4.3(2).
2. The minimum mechanical ventilation rate determined in accordance with Table M1505.4.3(1) or Equation 15-1 shall be reduced by 25%, provided that all of the following conditions apply:
 - 2.1. A ducted system supplies recirculated air directly to each bedroom and the largest common area.
 - 2.2. For continuously operating systems, not less than 70% of the air volume in the conditioned space is recirculated each hour through a ducted system, or for intermittently operating systems, an equivalent air recirculation is provided during each four hour period.
 - 2.3. The whole-house ventilation system is a balanced ventilation system.

Reason:

This code change credits the better performance of whole-building dilution ventilation systems that are distributed, mixed and balanced.

Distributed, mixed and balanced ventilation is more effective at controlling indoor contaminants than typical exhaust ventilation that provides no distribution and mixing. Ventilation with effective distribution and mixing prevents or minimizes high levels of contaminant concentration in various spaces within houses, especially rooms where people spend a lot of time with doors closed such as bedrooms. Distribution and mixing homogenizes interior conditions reducing potentially harmful high intermittent contaminant concentrations in interior spaces. Complex field testing and contaminate transport software analysis have shown that 70% mixing combined with a 25% reduced balanced ventilation is equally as effective as a typical exhaust ventilation.

This code change does not penalize exhaust ventilation, it justifiably credits balanced ventilation. Exhaust only ventilation should not be given the same indoor air quality credit in energy rating calculations since typical exhaust ventilation systems result in less air change than balanced ventilation systems and do not provide as effective control of contaminants. This code change rectifies that inequity.

Technical justification for this proposed code change can be found in the following links:

https://buildingscience.com/sites/default/files/migrate/pdf/CP-0909_ASHRAE_Calibrated_Multizone_Airflow.pdf

https://buildingscience.com/sites/default/files/migrate/pdf/CP-0908_ASHRAE_Modifying_Ventilation_Airflow.pdf

https://buildingscience.com/sites/default/files/migrate/pdf/CP-0802_Field_Test_Room_to_Room.pdf

<http://www.nrcan.gc.ca/energy/efficiency/housing/home-improvements/18633>

https://www.nrc-cnrc.gc.ca/ctu-sc/files/doc/ctu-sc/ctu-n15_eng.pdf

Cost Impact

The code change proposal will decrease the cost of construction .

Choosing to use a more effective type of ventilation will result in a lower ventilation rate which could reduce both construction and operating costs.

Internal ID: 1631

RM23-18

IRC: TABLE M1505.4.4

Proponent: Mike Moore, representing Broan-NuTone (mmoore@newportventures.net)

2018 International Residential Code

Revise as follows:

TABLE M1505.4.4
MINIMUM REQUIRED LOCAL EXHAUST RATES FOR ONE- AND TWO-FAMILY DWELLINGS

AREA TO BE EXHAUSTED	EXHAUST RATES ^a
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms-Toilet Rooms	Mechanical exhaust capacity of 50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m³/s.

a. The listed exhaust rate for bathrooms-toilet rooms shall equal or exceed the exhaust rate at a minimum static pressure of 0.25 inch wc in accordance with Section M1505.3.

Reason:

To ensure that exhaust fans provide the minimum CFM required by the IRC, the IRC was amended in recent cycles to require prescriptive duct sizing for exhaust rates taken at a static pressure of 0.25 inch water column (see Table M1504.2). For consistency, this change will align the flow rate requirements of Table 1505.4.4 with the duct sizing requirements of Table M1504.2 and the equipment listing requirements of Section M1505.3.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The prescriptive duct sizing requirements of M1504.2 require that ducts be sized for flows taken at 0.25 in w.c. in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51. Because this change is a simple clarification of existing requirements, no change to construction cost is expected.

Internal ID: 1761

RM24-18

IRC: 202 (New), M1505.1, M1505.4.3

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Residential Code

Add new text as follows:

BALANCED VENTILATION SYSTEM. A ventilation system where the total supply airflow and total exhaust airflow are simultaneously within 10% of their average. The balanced ventilation system airflow is the average of the supply and exhaust airflows.

Revise as follows:

M1505.1 General. Where local exhaust or whole-house mechanical ventilation is provided, the ~~equipment-ventilation system~~ shall be designed in accordance with this section.

M1505.4.3 Mechanical ventilation rate. The whole house mechanical ventilation system shall provide outdoor air at a continuous rate ~~as not less than that~~ determined in accordance with Table M1505.4.3(1) or ~~not less than that~~ determined by Equation 15-1.

Ventilation rate in cubic feet per minute = $(0.01 \times \text{total square foot area of house}) + [7.5 \times (\text{number of bedrooms} + 1)]$

(Equation 15-1)

Exceptions:

1. Ventilation rate credit. Where a whole-house mechanical balanced ventilation system is provided, the whole-house mechanical ventilation system rate shall be permitted to be adjusted by multiplying the ventilation rate determined in accordance with Table M1505.4.3(1) or by Equation 15-1 by 0.7.
2. Programmed intermittent operation. The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25 percent of each 4-hour segment and the ventilation rate prescribed in Table M1505.4.3(1), by Equation 15-1, or by Exception 1 is multiplied by the factor determined in accordance with Table M1505.4.3(2).

Reason:

This proposal is very similar to a PMGCAC proposal that also proposes a ventilation rate credit for balanced systems. The only difference between the proposals is that this proposal does not reference ASHRAE 62.2 as an optional path.

Balanced mechanical ventilation systems provide superior ventilation to unbalanced systems, and should not be required to provide the same rate as less effective, unbalanced systems to provide equivalent ventilation. This proposed credit for balanced ventilation is a simplified version that was derived from ASHRAE 62.2-2016 Equation 4.2 (published in addendum s). The ASHRAE equation adjusts the balanced whole house ventilation flow rate as a function of building air leakage, building height, and weather and shielding factor (which approximates climate zone). To simplify application of the ASHRAE calculation, we developed a one-size-fits-all balanced system factor using the following methodology:

1. Define a typical new, single-family detached home. The home characteristics were as follows: 2600 ft²; 3-bedroom; heights of 8, 17, and 26 feet above grade for one-, two- and three-story versions of the typical home; and leakage rate of 4.5 ACH50 in CZ 1-2 and 2.5 ACH50 in CZ 3-8. Note: Higher values for air leakage provide larger credits for balanced ventilation systems. To be conservative, we assumed that the average home was slightly tighter than the 2018 IECC maximum leakage rates of 5 ACH50 in CZ 1-2 and 3 ACH50 in CZ 3-8 (i.e., 4.5 ACH50 instead of 5 ACH50 in CZ 1-2 and 2.5 ACH50 instead of 3 ACH50 in CZ 3-8).

2. Calculate the average weather and shielding factor across each climate zone using over 1000 weather stations catalogued in Appendix B of ASHRAE 62.2.

3. Calculate the ASHRAE 62.2-2016 flow rates for balanced and unbalanced systems in the one-, two-, and three-story versions of the typical home across all IECC climate zones using Equation 4.2 and the average weather and shielding factors calculated in step 2.

4. Calculate the percent reduction in the balanced system ventilation rate versus the unbalanced systems' ventilation rate for each case. Apply weightings to the percent reductions for one-, two-, and three-story cases in each climate zone based on average U.S. Census Data (i.e., 44% are assumed to be one-story; 52% are assumed to be two-story; 4% are assumed to be 3-story in each climate zone). Sum the weighted percent reductions for the various stories to develop an estimated percent reduction for each climate zone.

Following is a table that summarizes interim and aggregate results of these steps used to calculate the balanced ventilation system multiplier of 0.7. The weighted average percent reduction in flow rate for balanced systems across each climate zone varied from 22% to 41%. The average percent reduction in flow rate for balanced systems across all scenarios for the typical home is ~30%, resulting in a multiplier of 0.7 in this proposal.

Percent Reduction Possible in Ventilation Fan Flow Rate When Specifying Balanced vs. Unbalanced: 4.5 ACH50 in CZ 1-2 & 2.5 ACH50 in CZ 3-8				
CZ	Stories and Distribution			Weighted Average Across All Stories
	44% 1-story	52% 2-story	4% 3-story	
1A	31%	42%	50%	38%
2A	30%	41%	49%	37%
2B	34%	46%	55%	41%
3A	18%	25%	29%	22%
3B	20%	27%	32%	24%
3C	21%	28%	34%	25%
4A	20%	27%	32%	24%
4B	24%	33%	39%	29%
4C	23%	31%	36%	27%
5A	23%	31%	37%	28%
5B	24%	33%	39%	29%
6A	25%	34%	40%	30%
6B	27%	37%	44%	33%
7	29%	39%	46%	35%
8	34%	46%	54%	41%
Average of weighted averages				31%

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal may decrease the cost of construction by approving specification of balanced systems with lower flow rates.

RM25-18

IRC: M1505.1, 44

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Residential Code

Revise as follows:

M1505.1 General. Where local exhaust or whole-house mechanical ventilation is provided, the equipment-ventilation system shall be designed in accordance with this section, or the ventilation system shall be designed in accordance with ASHRAE 62.2.

Add new standard(s) follows:

ASHRAE

ASHRAE
1791 Tullie Circle NE
Atlanta GA 30329
US

62.2-2016:

Ventilation and Acceptable Indoor Air Quality in Residential Buildings with Addenda b, d, k, l, q, and s.

Reason:

This proposed modification would provide builders with the OPTION of using ASHRAE Standard 62.2 to comply with the ventilation requirements of the IRC without requiring builders to use the standard. ASHRAE 62.2 is the ANSI standard for establishing minimum acceptable indoor air quality for dwelling units. There are several reasons that builders may want to use ASHRAE 62.2 instead of the IRC for compliance, including: greater flexibility for specifying climate-appropriate ventilation controls, ability to achieve energy and cost savings for homeowners by shifting operation of the ventilation system to times when ambient temperature and humidity are favorable, flexibility to specify innovative systems that can be demonstrated to provide equivalent exposure to pollutants, ability to down-size and save money on balanced ventilation equipment versus what may be required by the code, 62.2's use by code-plus programs such as ENERGY STAR and LEED, and ability to size the system as a function of measured dwelling unit air leakage instead of a one-size-fits-all approach.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Use of this standard is proposed as an OPTIONAL path. Costs associated with using 62.2 versus other compliance paths will vary based on the application. As such, this proposal will neither decrease nor increase the cost of construction.

IMC: 202 (New); IRC: M1505.1, M1505.4.3, ordinal

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Mechanical Code

Add new definition as follows:

BALANCED VENTILATION SYSTEM. A ventilation system where the total supply fan airflow is within 20 percent of the total exhaust fan airflow. The balanced system airflow is the average of the supply and exhaust airflows.

2018 International Residential Code

Revise as follows:

M1505.1 General. Where local exhaust or whole-house mechanical ventilation is provided, the ~~equipment ventilation system~~ shall be designed in accordance with this ~~section~~ section, or the ventilation system shall be designed in accordance with ASHRAE 62.2.

M1505.4.3 Mechanical ventilation rate. The whole house mechanical ventilation system shall provide outdoor air at a continuous rate ~~as not less than that~~ determined in accordance with Table M1505.4.3(1) or ~~not less than that~~ determined by Equation 15-1.

Ventilation rate in cubic feet per minute = $(0.01 \times \text{total square foot area of house}) + [7.5 \times (\text{number of bedrooms} + 1)]$

(Equation 15-1)

~~Exception:~~Exceptions:

1. Ventilation rate credit. Where a balanced whole-house mechanical ventilation system is provided, the whole-house mechanical ventilation system rate shall be permitted to be adjusted by multiplying the mechanical ventilation rate determined in accordance with Table M1505.4.3(1) or by Equation 15-1 by 0.7.
2. Programmed intermittent operation. The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25 percent of each 4-hour segment and the ventilation rate prescribed in Table M1505.4.3(1) , by Equation 15-1, or by Exception 1 is multiplied by the factor determined in accordance with Table M1505.4.3(2).

Add new standard(s) follows:

ASHRAE

ASHRE
1791 Tullie Circle NE
Atlanta GA 30329
US

62.2-2016:

Ventilation and Acceptable Indoor Air Quality in Residential Buildings with Addenda b, d, k, l, g, and s

Reason:

Balanced mechanical ventilation systems provide superior ventilation to unbalanced systems, and should not be required to provide the same rate as less effective, unbalanced systems to provide equivalent ventilation. This proposed credit for balanced ventilation is a simplified version that was derived from ASHRAE 62.2-2016 Equation 4.2 (published in addendum s). The ASHRAE equation adjusts the balanced whole house ventilation flow rate as a function of building air leakage, building height, and weather and shielding factor (which approximates climate zone). To simplify application of the ASHRAE calculation for the IRC, we developed a one-size-fits-all balanced system factor using the following methodology:

1. Define a typical new, single-family detached home. The home characteristics were as follows: 2600 ft²; 3-bedroom; heights of 8, 17, and 26 feet above grade for one-, two- and three-story versions of the typical home; and leakage rate of 4.5 ACH50 in CZ 1-2 and 2.5 ACH50 in CZ 3-8. Note: Higher values for air leakage provide larger credits for balanced ventilation systems. To be conservative, we assumed that the average home was slightly tighter than the 2018 IECC

maximum leakage rates of 5 ACH50 in CZ 1-2 and 3 ACH50 in CZ 3-8 (i.e., 4.5 ACH50 instead of 5 ACH50 in CZ 1-2 and 2.5 ACH50 instead of 3 ACH50 in CZ 3-8).

2. Calculate the average weather and shielding factor across each climate zone using over 1000 weather stations catalogued in Appendix B of ASHRAE 62.2.
3. Calculate the ASHRAE 62.2-2016 flow rates for balanced and unbalanced systems in the one-, two-, and three-story versions of the typical home across all IECC climate zones using Equation 4.2 and the average weather and shielding factors calculated in step 2.
4. Calculate the percent reduction in the balanced system ventilation rate versus the unbalanced systems' ventilation rate for each case. Apply weightings to the percent reductions for one-, two-, and three-story cases in each climate zone based on average U.S. Census Data (i.e., 44% are assumed to be one-story; 52% are assumed to be two-story; 4% are assumed to be 3-story in each climate zone). Sum the weighted percent reductions for the various stories to develop an estimated percent reduction for each climate zone.

Following is a table that summarizes interim and aggregate results of these steps used to calculate the balanced ventilation system flow rate multiplier of 0.7. The weighted average percent reduction in flow rate for balanced systems across each climate zone varied from 22% to 41%. The average percent reduction in flow rate for balanced systems across all scenarios for the typical home is ~30%, resulting in a multiplier of 0.7 in this proposal.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Percent Reduction Possible in Ventilation Fan Flow Rate When Specifying Balanced vs. Unbalanced: 4.5 ACH50 in CZ 1-2 & 2.5 ACH50 in CZ 3-8				
CZ	Stories and Distribution			Weighted Average Across All Stories
	44%	52%	4%	
	1-story	2-story	3-story	
1A	31%	42%	50%	38%
2A	30%	41%	49%	37%
2B	34%	46%	55%	41%
3A	18%	25%	29%	22%
3B	20%	27%	32%	24%
3C	21%	28%	34%	25%
4A	20%	27%	32%	24%
4B	24%	33%	39%	29%
4C	23%	31%	36%	27%
5A	23%	31%	37%	28%
5B	24%	33%	39%	29%
6A	25%	34%	40%	30%
6B	27%	37%	44%	33%
7	29%	39%	46%	35%
8	34%	46%	54%	41%
Average of weighted averages				31%

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 569

RM27-18

IRC: M1504.3

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

M1504.3 Exhaust openings. Air exhaust openings shall terminate as follows:

1. Not less than 3 feet (914 mm) from property lines.
2. Not less than 3 feet (914 mm) from gravity air intake openings, operable windows and doors.
3. Not less than 10 feet (3048 mm) from mechanical air intake openings except where either of the following apply:
 - 3.1. the exhaust opening is located not less than 3 feet (914 mm) above the air intake opening.
 - 3.2. The exhaust opening is part of an approved factory-built intake/exhaust combination termination fitting installed in accordance with the manufacturer's instructions, and the exhaust air is drawn from a living space.
4. Openings shall comply with Sections R303.5.2 and R303.6.

Reason:

Intake/exhaust combination terminations are regularly installed with heating and energy recovery ventilators (H/ERVs) used for dwelling units. Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water.

Manufacturer tests conducted by Natural Resources Canada (NRC) have demonstrated that use of intake/exhaust combination terminations results in minimum cross-contamination of airflows (i.e., not exceeding 4%; see NRC report A1-007793¹). These results are aligned with ASHRAE 62.2 approval of such devices, which limits cross-contamination to 10%, as verified by the manufacturer. If approved, this proposed modification to the IRC would limit application of intake/exhaust combination terminations to “approved”, “factory-built” units. Approval of this proposed modification is expected to result in more affordable and architecturally flexible terminations.

Note: The IRC defines living space as, “space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes”.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

RM28-18

IRC: M1503.4

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

M1503.4 Duct material. Ducts serving domestic cooking exhaust equipment shall be constructed of ~~galvanized steel, stainless steel or copper,~~ smooth-wall metal of thicknesses consistent with Table M1601.1.1.

Exception: Ducts for domestic kitchen cooking *appliances* equipped with down-draft exhaust systems shall be permitted to be constructed of schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:

1. The duct is installed under a concrete slab poured on grade.
2. The underfloor trench in which the duct is installed is completely backfilled with sand or gravel.
3. The PVC duct extends not more than 1 inch (25 mm) above the indoor concrete floor surface.
4. The PVC duct extends not more than 1 inch (25 mm) above grade *outside of the building*.
5. The PVC ducts are solvent cemented.

Reason:

There is no reason why black steel and aluminum ducts can't be used. It is important that the ducts be metal and smooth-wall. A reference to the duct wall thickness table was missing.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

RM29-18

IRC: M1505.4.2

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

M1505.4.2 System controls. The whole-house mechanical ventilation system shall be provided with controls that enable manual override. Controls shall include text or a symbol indicating their function.

Reason:

Tight dwelling units are being outfitted with code-mandated outdoor air/"whole-house" mechanical ventilation systems. These systems are often simply a bathroom exhaust fan expected to run continuously. The problem is that without a label indicating the system's function, occupants have no idea of the purpose of these systems and are likely to turn them off - thereby increasing the rate of accumulation of harmful indoor pollutants without their knowledge. At a minimum, these systems should be labeled to indicate that they are different than a typical bath fan. This proposed language would echo language in ASHRAE 62.2 and also within the 2018 IMC as follows: "403.3.2.4 System controls. Where provided within a dwelling unit, controls for outdoor air ventilation systems shall include text or a symbol indicating the system's function." The language is intended to be flexible enough to allow multiple options for the text or symbol, provided it achieves the intention of conveying that the control is for a system that is not merely a standard bath fan. For example, the Home Ventilating Institute (an industry association representing over 90% of the manufacturers of residential ventilating products in the U.S.), recently developed the following logo for this purpose:

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction because a label will be required on a switch cover.

RM30-18

IRC: M1505.3

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows:

M1505.3 Exhaust equipment. Exhaust equipment serving single dwelling units fans and whole-house mechanical ventilation fans shall be *listed* and *labeled* as providing the minimum required airflow in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.

Reason:

Industry experience and research have shown that "for advertised airflows that are not certified, the actual installed airflow can be a small fraction of the advertised value".¹ The 2018 IMC and IRC now require listing and labeling flows in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51 for exhaust equipment serving single dwelling units. This requirement should be expanded to all fans under the scope of the ANSI standard to ensure that flows are reported on an equivalent basis. AMCA and HVI maintain listings of products tested in accordance with the standard.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

RM31-18

IRC: M1601.1.1

Proponent: David Bixby, Air Conditioning Contractors of America (ACCA), representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

2018 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA *HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
 - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
 - 7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
 - 7.3. Stud wall cavities shall not convey air from more than one floor level.
 - 7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
 - 7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.
9. Zoned duct systems shall be designed and installed in accordance with ACCA Manual Zr.

Reason:

Currently there is no coverage in the residential code to address the design of zoned duct systems. ACCA Manual Zr provides procedures for designing zoned comfort systems for single family detached homes, duplex and triplex homes, row houses, town houses, and large multi-family structures that are compatible with ACCA Manual J procedures for residential load calculations. In addition, use of Manual Zr will avoid the potential for an improperly designed zoned duct system to adversely impact the safe operation and durability of the heating/cooling equipment. For code officials, Manual Zr has three normative sections to determine clear compliance. Manual Zr is also a consensus-based ANSI standard.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cost impacts for using Manual Zr would be minimal, other than some extra time involved. Installers will have to ensure the installation of equipment and zoning devices complies with OEM installation instructions, as well as documenting such. Code officials will have to verify and document airflow rates, set-points for operation and safety controls, which will involve minimal time.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced

standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

RM33-18

IRC: M1601.1.1.7 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Add new text as follows:

M1601.1.1.7 Sealing. Building cavities used as plenums shall be sealed.

Reason:

Where stud cavities and joist cavities are used for return air, the negative pressure in the cavities can draw in outdoor air at any point where the cavities abut attic spaces, crawl spaces and outside walls. Sealing of the interface with attics, crawls and outside walls will reduce unwanted infiltration of outdoor air and will improve system efficiency.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction because additional labor and sealants are required

Internal ID: 381

RM34-18

IRC: M1802.4 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Add new text as follows:

M1802.4 Blocked vent switch. The venting system for oil-fired appliances shall be equipped with a device that will stop burner operation in the event that the venting system is obstructed. Such device shall have a manual reset, and shall be installed in accordance with the manufacturer's instructions.

Reason:

Such devices can save lives in the event that a chimney or Type L vent is blocked by debris, decaying masonry or dead animals. Gas furnaces are equipped with thermal and/or pressure devices that will sense failure of the venting system, but such is not known to be required for oil-fired appliances. Such devices have been installed for many decades, but not necessarily required. These devices are typically provided for or are an option for draft regulators that are commonly installed in the vent of oil-fired appliances.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction because an additional device is mandated beyond what is currently required by the code.

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Add new text as follows:

M2101.11 Used materials. Used pipe, fittings, valves, and other materials shall not be reused in hydronic systems.

M2101.21.6 Expansion tanks. Shutoff valves shall be installed at connections to nondiaphragm-type expansion tanks.

M2101.20.4 Electrofusion joints. Joints shall be of the electrofusion type. Joint surfaces shall be clean and free from moisture and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer and joined. The joint shall remain undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F105..

M2101.21 PVC plastic pipe. Joints between PVC plastic pipe or fittings shall be solvent-cemented in accordance with Section P2906.9.1.4. Threaded joints between fittings and PVC plastic pipe shall be in accordance with Section M2101.16.1.

M2101.21 Shutoff valves. Shutoff valves shall be installed in ground-source loop piping systems in the locations indicated in Sections M2101.21.1 through M2101.21.6.

M2101.21.1 Heat exchangers. Shut off valves shall be installed on the supply and return side of a heat exchanger.

Exception: Shutoff valves shall not be required where heat exchangers are integral with a boiler or are a component of a manufacturer's boiler and heat exchanger packaged unit and are capable of being isolated from the hydronic system by the supply and return valves required by Section M2001.3.

M2101.21.2 Central systems. Shutoff valves shall be installed on the building supply and return of a central utility system.

M2101.21.3 Pressure vessels. Shutoff valves shall be installed on the connection to any pressure vessel.

M2101.21.4 Pressure-reducing valves. Shutoff valves shall be installed on both sides of a pressure-reducing valve.

M2101.21.5 Equipment and appliances. Shutoff valves shall be installed on connections to mechanical equipment and appliances. This requirement does not apply to components of ground-source loop systems such as pumps, air separators, metering devices, and similar equipment.

M2101.22 Reduced pressure. A pressure relief valve shall be installed on the low-pressure side of a hydronic piping system that has been reduced in pressure. The relief valve shall be set at the maximum pressure of the system design. The valve shall be installed in accordance with Section M2002.

M2101.20.2 PE-RT-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PE-RT pipe or tubing.

M2101.23 Installation. Piping, valves, fittings, and connections shall be installed in accordance with the manufacturer's instructions.

M2101.24 Protection of potable water. Where hydronic systems have a connection to a potable water supply,

the potable water system shall be protected from backflow in accordance with Section P2902.

M2101.25 Pipe penetrations. Openings for pipe penetrations in walls, floors and ceilings shall be larger than the penetrating pipe. Openings through concrete or masonry building elements shall be sleeved. The annular space surrounding pipe penetrations shall be protected in accordance with Section P2606.1.

M2101.26 Clearance from combustibles. A pipe in a piping system having an exterior surface temperature exceeding 250°F (121°C) shall have a clearance of not less than 1 inch (25 mm) from combustible materials.

M2101.27 Contact with building material. A piping system shall not be in direct contact with building materials that cause the piping or fitting material to degrade or corrode, or that interfere with the operation of the system.

M2101.28 Strains and stresses. Piping shall be installed so as to prevent detrimental strains and stresses in the pipe. Provisions shall be made to protect piping from damage resulting from expansion, contraction and structural settlement. Piping shall be installed so as to avoid structural stresses or strains within building components.

M2101.28.1 Flood hazard. Piping located in a flood hazard area shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the design flood elevation.

M2101.29 Chemical compatibility. Antifreeze and other materials used in the system shall be chemically compatible with the pipe, tubing, fittings and mechanical systems.

M2101.20.3 Heat-fusion joints. Heat-fusion joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, and shall be joined in accordance with ASTM D2657. Joint surfaces shall be clean and free from moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall remain undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D2683 or ASTM D3261.

M2101.20.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

M2101.12 Material rating. Pipe and tubing shall be rated for the operating temperature and pressure of the system. Fittings shall be suitable for the pressure applications and recommended by the manufacturer for installation with the pipe and tubing material installed. Where used underground, materials shall be suitable for burial.

M2101.17 Cross-linked polyethylene (PEX) plastic tubing. Joints between cross-linked polyethylene plastic tubing and fittings shall comply with Sections M2101.17.1 and M2101.17.2. Mechanical joints shall comply with Section M2101.15.1.

M2101.13 Joints and connections. Joints and connections shall be of an approved type. Joints and connections shall be tight for the pressure of the system. Joints used underground shall be approved for such applications.

M2101.13.1 Joints between different piping materials. Joints between different piping materials shall be made with approved transition fittings.

M2101.14 Preparation of pipe ends. Pipe shall be cut square, reamed, and shall be free of burrs and obstructions. CPVC, PE, and PVC pipe shall be chamfered. Pipe ends shall have full-bore openings and shall not be undercut.

M2101.15 Joint preparation and installation. Where required by Sections M2101.16 through M2101.18, the preparation and installation of mechanical and thermoplastic-welded joints shall comply with Sections M2101.15.1 and M2101.15.2.

M2101.15.1 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

M2101.15.2 Thermoplastic-welded joints. Joint surfaces for thermoplastic-welded joints shall be cleaned by an approved procedure. Joints shall be welded in accordance with the manufacturer's instructions.

M2101.16 CPVC plastic pipe. Joints between CPVC plastic pipe or fittings shall be solvent-cemented in accordance with Section P2906.9.1.2. Threaded joints between fittings and CPVC plastic pipe shall be in accordance with Section M2101.16.1

M2101.16.1 Threaded joints. Threads shall conform to ASME B1.20.1 The pipe shall be Schedule 80 40 or heavier plastic pipe and shall be threaded with dies specifically designed for plastic pipe. Thread lubricant, pipe-joint compound or tape shall be applied on the male threads only and shall be approved for application on the piping material.

M2101.17.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

M2101.20 Raised temperature polyethylene (PE-RT) plastic tubing. Joints between raised temperature polyethylene tubing and fittings shall comply with Sections M2101.20.1 through M2101.20.4. Mechanical joints shall comply with Section M2101.15.1.

M2101.17.2 Plastic-to-metal. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to plastic pipe or tubing.

M2101.18 Polyethylene plastic pipe and tubing. Joints between polyethylene plastic pipe and tubing or fittings for systems shall be heat-fusion joints complying with Section M2101.18.1, electrofusion joints complying with Section M2101.18.2, or stab-type insertion joints complying with Section M2101.18.3.

M2101.18.1 Heat-fusion joints. Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, and joined in accordance with ASTM D2657. Joint surfaces shall be clean and free from moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall remain undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D2683 or ASTM D3261.

M2101.18.2 Electrofusion joints. Joints shall be of the electrofusion type. Joint surfaces shall be clean and free from moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall remain undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F1055.

M2101.18.3 Stab-type insert fittings. Joint surfaces shall be clean and free from moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F1924.

M2101.19 Polypropylene (PP) plastic. Joints between PP plastic pipe and fittings shall comply with Sections M2101.19.1 and M2101.19.2.

M2101.19.1 Heat-fusion joints. Heat-fusion joints for polypropylene (PP) pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings, electrofusion polypropylene fittings or by butt fusion. Joint surfaces shall be clean and free from moisture. The joint shall remain undisturbed until cool. Joints shall be made in accordance with ASTM F2389.

M2101.19.2 Mechanical and compression sleeve joints. Mechanical and compression sleeve joints shall be installed in accordance with the manufacturer's instructions.

M2101.30 Makeup water. The transfer fluid shall be compatible with the makeup water supplied to the system.

Reason:

This proposal fills a gap in the code coverage for hydronic piping. The new text is simply borrowed from Section M1205 which is specific to ground-source heat-pump loop piping. The same requirements also need to apply to all hydronic piping systems under Section M2101, not just ground-source heat-pump systems. This proposal provides the same coverage for general hydronic systems as is currently required for ground-source heat-pump systems.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

2018 International Residential Code

Revise as follows:

**TABLE M2105.4
GROUND-SOURCE LOOP PIPE**

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC)	ASTM D2846; ASTM F437; ASTM F438; ASTM F439; ASTM F441; ASTM F442; CSA B137.6
Cross-linked polyethylene (PEX)	ASTM F876; CSA B137.5; <u>CSA C448</u>
High-density polyethylene (HDPE)	ASTM D2737; ASTM D3035; ASTM F714; AWWA C901; CSA B137.1; CSA C448; NSF 358-1
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM F1282; AWWA C 903; CSA B137.9
Polypropylene (PP-R)	ASTM F2389; CSA B137.11, NSF 358-2
Polyvinyl chloride (PVC)	ASTM D1785; ASTM D2241; CSA 137.3
Raised temperature polyethylene (PE-RT)	ASTM F2623; ASTM F2769, CSA B137.18; <u>CSA C448</u>

Reason:

This proposal is on behalf of the International Ground Source Heat Pump Association (IGSHPA); Mark Metzner - President of IGSHPA Canada and the Chairman of ANSI/CSA/IGSHPA C448; and The Plastics Pipe Institute.

ANSI/CSA/IGSHPA C448-16 “Design and installation of ground source heat pump systems for commercial and residential buildings” is an ANSI designated bi-national consensus standard for the design and installation of ground source heat pump systems. It was first published in February 2016.

ANSI/CSA/IGSHPA C448-16 replaces the original version known as CSA C448-02. ANSI/CSA/IGSHPA C448-16 is a greatly enhanced system standard which includes the industry knowledge of ground source geothermal systems gained since 2002.

ANSI/CSA/IGSHPA C448-16 contains specific requirements for HDPE, PEX and PE-RT piping systems (pipe and fittings) for use as ground loop piping systems. By adding reference to C448 in these rows, this will indicate that these materials (PEX and PE-RT) are explicitly approved in ANSI/CSA/IGSHPA C448-16.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction because it is simply identifying another industry consensus standard (C448) to which existing materials PEX and PE-RT can comply.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 2263

2018 International Residential Code

Revise as follows:

M2105.17 Installation. Piping, valves, fittings, and connections shall be installed in accordance with ANSI/CSA/IGSHPA C448 and the manufacturer's instructions.

Reason:

This proposal is on behalf of the International Ground Source Heat Pump Association (IGSHPA); Mark Metzner - President of IGSHPA Canada and the Chairman of ANSI/CSA/IGSHPA C448; and The Plastics Pipe Institute.

ANSI/CSA/IGSHPA C448-16 "Design and installation of ground source heat pump systems for commercial and residential buildings" is an ANSI designated bi-national consensus standard for the design and installation of ground source heat pump systems. It was first published in February 2016.

ANSI/CSA/IGSHPA C448-16 is the first ANSI approved consensus standard for the design and installation of ground source systems.

ANSI/CSA/IGSHPA C448-16 replaces the original version known as CSA C448-02. ANSI/CSA/IGSHPA C448-16 is a greatly enhanced system standard which includes the industry knowledge of ground source geothermal systems gained since 2002. Ground loop piping system installations should be in accordance with the requirements of this standard.

The Standard includes performance-based criteria that provides a consistent application of requirements and best practices throughout the United States and Canada. This Standard will ensure that stakeholders in the ground source heat pump systems market sector will supply and receive ground source heating / cooling systems that perform to design efficiency expectations and deliver true, long-term value.

This Standard was developed by a Binational Technical Committee which comprised of the industry's leaders from Canada and USA, including representatives of the following industry associations:

American Society for Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

Geothermal Exchange Organization (GEO)

International Ground Source Heat Pump Association (IGSPHA)

International Ground Source Heat Pump Association Canada (IGSPHA - Canada)

National Ground Water Association (NGWA)

The Plastics Pipe Institute (PPI)

Geothermal National & International Initiative (GEONII)

Heating, Refrigeration and Air Conditioning Institute of Canada (HRAI)

ANSI/CSA/IGSHPA C448-16 includes performance-based minimum requirements for industrial, commercial, institutional and residential applications. It addresses the following items related to ground source heat pump systems:

equipment and material selection (including ground loop piping)

site survey - geological and hydrogeological

open and closed loop ground source heat pump system design / engineering

direct expansion (DX) systems

installation

testing and verification

documentation

commissioning and decommissioning

ANSI/CSA/IGSHPA C448-16 applies to all ground source heat pump systems using outdoor ground loop heat exchangers as a thermal source or sink for heating and cooling, with or without supplementary heating or cooling source/s. The types of outdoor heat exchangers covered by this Standard include:

ground heat exchangers - vertical and horizontal

open-loop systems - drilled well and surface water

submerged closed loop systems - fresh water and sea water

standing column wells

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction because it is simply clarifying that ground loop pipes must be installed correctly, in accordance with the latest version of this industry consensus standard which is already referenced in the IMC and IRC.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Add new standard(s) follows:

NSF

NSF International
789 N. Dixboro Road P.O. Box
130140
Ann Arbor MI 48105
US

NSF 358-4-2017:

Polyethylene of raised temperature (PE-RT) pipe and fittings for water-based ground-source (geothermal) heat pump systems

Reason:

At the proposal deadline, NSF 358-4 was still a draft standard, but it is expected to be published prior to the public hearing. The balloted draft standard will be submitted with the proposal. Anyone may receive a complimentary copy of this draft standard for the purpose of reviewing this proposal by emailing brown@nsf.org.

These tables contain the acceptable materials for geothermal ground loop pipe and fittings. PE-RT piping and associated fittings are already accepted materials with referenced standards. NSF 358-4 is a proposed ANSI standard written specifically to contain requirements for PE-RT geothermal piping and fittings. Companion standards NSF 358-1 (PE) and NSF 358-3(PP) are already approved in this table. NSF 358-4 addresses performance pressure testing, long term strength, chemical resistance, constant tensile load joint testing, suitability for burial and marking specific to geothermal PE-RT piping systems.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Providing an additional option is cost neutral.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

For SI: °C = [(°F)-32]/1.8.

- a. Use code:
 1. Above ground.
 2. Embedded in radiant systems.
 3. Temperatures below 180°F only.
 4. Low temperature (below 130°F) applications only.
 5. Temperatures below 160°F only.
- b. Standards as listed in Chapter 44.

Reason:

ASTM's committee on plastics piping recently completed a new Standard, F3253 - Standard Specification for Crosslinked Polyethylene (PEX) Tubing with Oxygen Barrier for Hot - and Cold - Water Hydronic Distribution Systems. This new system standard covers both the oxygen barrier PEX tubing as well as the performance and material requirements for the fittings. While this standard essentially mirrors the existing ASTM F876 and F877 PEX standards from a dimensional standpoint and existing fittings interchangeability, it also mandates the inclusion of an oxygen barrier layer with defined pass/fail criteria essentially equal with the industry's long accepted norm of DIN 4726 concerning allowed oxygen permeation. This new standard also requires a minimum pull-out strength test for the fittings not included in ASTM F877 today. The inclusion of this new standard in no way changes the acceptance of the existing ASTM F876 and F877 which will remain in the mechanical hydronics code for the foreseeable future.

This standard's project has been in works for nearly 4 years and represents the work and input from nearly all of the PEX tubing manufacturers in North America. Your support of this proposal is most appreciated.

A similar proposal is being submitted for Chapter 12 of the IMC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The addition of this new standard simply offers an alternative product that uses products which are relatively identical in cost today to existing pipe and fitting materials.

Internal ID: 1762

RM42-18

IRC: M2105.7

Proponent: Gary Morgan, representing Viega LLC (gary.morgan@viega.us)

2018 International Residential Code

M2105.7 Preparation of pipe ends. Pipe shall be cut square, ~~reamed,~~ and shall be free of burrs and obstructions. ~~CPVC, PE and PVC pipe shall be chamfered.~~ Pipe ends shall have full-bore openings and shall ~~not be undercut.~~ be prepared in accordance with the pipe manufacturer's instructions.

Reason:

This section is specific to plastic pipes and some of the existing language refers to terms such as "reamed" and "undercut" which only apply to metallic pipes. The revised language is more appropriate by including reference to preparing pipe ends in accordance with manufacturer's instructions which will be specific to that particular type of plastic pipe.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is only a clarification of existing language and will not result in any increased cost of construction.

Internal ID: 1829

RM43-18

IRC: M2202.1

Proponent: Mark Fasel, Viega, representing Viega LLC (mark.fasel@viega.us)

2018 International Residential Code

Revise as follows:

M2202.1 Materials. Piping shall consist of steel pipe, copper and copper-alloy pipe and tubing, steel tubing conforming to ASTM A539 or stainless steel tubing conforming to ASTM A254 or ASTM A539-A269. Aluminum tubing shall not be used between the fuel-oil tank and the burner units.

Reason:

Stainless steel tubing is an accepted material in accordance with NFPA 31 Standard for the Installation of Oil-Burning Equipment section 8.2.2.1 and is widely used in these applications due to its corrosion-resistance.

Bibliography:

® NFPA

NFPA 31 Standard for the Installation of Oil-Burning Equipment

Section 8.2.2.1

2016

Page 24

<http://www.nfpa.org/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply adds stainless steel pipe as an additional piping material that can be used for these applications and therefore will not increase the costs of construction.

Internal ID: 768

RM44-18

IRC: Chapter 22, M2202.2

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Residential Code

CHAPTER 22 SPECIAL PIPING AND STORAGE SYSTEMS

Revise as follows:

M2202.2 Joints and fittings. Piping shall be connected with standard fittings compatible with the piping material. Cast-iron fittings shall not be used for oil piping. Unions requiring gaskets or packings, right or left couplings, and sweat fittings employing solder having a melting point less than 1,000°F (538°C) shall not be used for oil piping. Threaded joints and connections shall be made tight with a lubricant or pipe thread compound. Press-Connect joints shall be listed and labeled and shall be installed in accordance with the manufacturer's instructions.

Reason:

Press-Connect joints have been tested and listed for use in fuel oil piping systems and are referenced in the International Mechanical Code in Chapter 13 Fuel Oil Piping and Storage.

Bibliography:

UL 180 Standard for Liquid-Level Indicating Gauges for Oil Burner Fuels.

Underwriters Laboratories

Published 2012

www.ul.com

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This standard is not the only standard the pipe fittings can meet in accordance with the Pipe Fittings Table, this is just an alternative standard that some manufacturer's have tested their products to and would like to see recognized as an acceptable standard for pipe fittings. Testing to this standard is optional and no existing standards have been removed or replaced by the proposed addition of this standard

M2202.2 Joints and fittings. Piping shall be connected with ~~standard~~ fittings compatible with the piping material. Cast-iron fittings shall not be used for oil piping. Unions requiring gaskets or packings, right or left couplings, and sweat fittings employing solder having a melting point less than 1,000°F (538°C) shall not be used for oil piping. Threaded joints and connections shall be made tight with a lubricant or pipe thread compound.

Reason:

Editorial: The term "standard fittings" is not used in any International codes and has no definition. There is no reason to state the word "standard".

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The removal of the term standard fittings has no cost implications due to the fact this terminology has no requirements for listings or required testing associated with this proposal to remove this vague undefined terminology.

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL RESIDENTIAL BUILDING CODE – PLUMBING

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some RP code change proposals may not be included on this list, as they are being heard by another committee.

IRC: P2503.4

Proponent: Gary Kozan, Ridgeway Plumbing, representing Ridgeway Plumbing (garyk@ridgewayplumbing.com)

2018 International Residential Code

Revise as follows:

P2503.4 Building sewer testing. The *building sewer* shall be tested by insertion of a test plug at the point of connection with the public sewer, filling the *building sewer* with water and pressurizing the sewer to not less than a ~~10~~5-foot (3048 mm) head of water. The test pressure shall not decrease during a period of not less than 15 minutes. The *building sewer* shall be water tight at all points.

A forced sewer test shall consist of pressurizing the piping to a pressure of not less than 5 psi (34.5 kPa) greater than the pump rating and maintaining such pressure for not less than 15 minutes. The forced sewer shall be water tight at all points.

Reason:

For consistency with P2503.5.1, which requires a 5-foot head test for interior DWV systems. There is no reason for outside drainage piping to be tested differently than inside piping.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is only a change in test pressure. There is no extra labor or extra materials required that would impact the cost of construction.

Internal ID: 274

RP2-18

IRC: P2503.5.1

Proponent: Janine Snyder, City of Thornton, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

2018 International Residential Code

P2503.5.1 Rough plumbing. DWV systems shall be tested on completion of the rough piping installation by water or, for piping systems other than plastic, by air, without evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough-in piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than 5-10 feet (~~1524-3048~~ mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

Reason:

In the 2015 cycle, the IRC was changed to reduce the DWV water test pressure from 10 feet of head to 5 feet of head, yet the air test pressure remains at the equivalent of 10 feet of head or 5 psi. Since it is important enough to maintain the equivalent air test pressure for the 10 feet of head then why are we creating a conflict within the same code section between water and air tests. The DWV material performs in the exact same manner in an IRC building as it does in an IPC building, and the pipe used for DWV systems in an IRC building is the same pipe allowed for use in an IPC building. Furthermore, the integrity of the 10 feet of head test was important enough for the IPC committee to disapprove the reduction in the water test pressure in the 2015 and 2018 codes, so why are we risking a compromise to the IRC structures by allowing a reduced test pressure that allows leaks in the system to go undetected until they cause damage. This code change corrects the conflict between the air and water test within the IRC requirements, and this code change will also address the conflicting test pressures between the IPC and the IRC for the water test.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The test is already a requirement within the code and a change in test pressure doesn't impact labor or materials.

IRC: P2705.1, P2708.6 (New), P2713.4 (New), SECTION P2726 (New), P2726.1 (New), P2726.2 (New), P2726.2.1 (New), P2726.2.2 (New), P2726.3 (New), P2726.4 (New), P2726.4.1 (New), P2726.4.2 (New), P2726.4.3 (New), P2726.5 (New), P2726.6 (New)

Proponent: Jake Pauls, representing Jake Pauls Consulting Services (bldguse@aol.com)

2018 International Residential Code

Revise as follows:

P2705.1 General. The installation of fixtures shall conform to the following:

1. Floor-outlet or floor-mounted fixtures shall be secured to the drainage connection and to the floor, where so designed, by screws, bolts, washers, nuts and similar fasteners of copper, copper alloy or other corrosion-resistant material.
2. Wall-hung fixtures shall be rigidly supported so that strain is not transmitted to the plumbing system.
3. Where fixtures come in contact with walls and floors, the contact area shall be water tight.
4. Plumbing fixtures shall be usable including safety of users of showers, bathtubs and bathtub-shower combinations in accordance with R301.1, R306, R307, R308, R311, R320, P2701, P2708, P2713, and P2726.
5. Water closets, lavatories and bidets. A water closet, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition or vanity or closer than 30 inches (762 mm) center-to-center between adjacent fixtures. There shall be a clearance of not less than 21 inches (533 mm) in front of a water closet, lavatory or bidet to any wall, fixture or door.
6. The location of piping, fixtures or equipment shall not interfere with the operation of windows or doors.
7. In flood hazard areas as established by Table R301.2(1), plumbing fixtures shall be located or installed in accordance with Section R322.1.6.
8. Integral fixture-fitting mounting surfaces on manufactured plumbing fixtures or plumbing fixtures constructed on site, shall meet the design requirements of ASME A112.19.2/CSA B45.1 or ASME A112.19.3/CSA B45.4.

Add new text as follows:

P2708.6 Grab Bars and Stanchions for Showers and Bathtub-Shower Combinations. Showers and bathtub-shower combinations shall provide stanchions or similar vertically-oriented, handholds typically not attached to walls, and grab bars in accordance with P2726.

P2713.4 Grab Bars and Stanchions for Bathtubs and Bathtub-Shower Combinations. Bathtubs and bathtub-shower combinations shall provide grab bars or stanchions in accordance with P2726.

SECTION P2726 GRAB BARS FOR BATHTUBS AND SHOWERS.

P2726.1 General. Grab Bars and Stanchions for Bathtubs, Bathtub-Shower Combinations, and Showers. Bathtubs, bathtub-shower combinations, and showers not required to be accessible shall be provided with grab bars or stanchions complying with P2726.1 through P2726.6. Dimensions specified are to the centerline of the grab bar or stanchion.

P2726.2 Grab Bars or Stanchions for Bathtubs and Bathtub-Showers. Grab bars or stanchions complying with P2726.2.1 and P2726.2.2 shall be provided at bathtubs and bathtub-shower combinations.

P2726.2.1 Vertical Grab bar or Stanchion. A vertical grab bar or stanchion shall be provided and shall comply with the following criteria.

1. Approach. The grab bar or stanchion shall be located so that it is usable without any obstruction. An unobstructed clear floor space 21 inches (533 mm) wide minimum and 21 inches (533 mm) deep minimum, measured from the outer side of the bathtub, shall be provided and shall be located within 12 inches (305 mm) of the grab bar or stanchion.

2. Length. The grab bar or stanchion shall be 36 inches (914 mm) long minimum.
3. Position. The grab bar or stanchion shall be positioned in accordance with the following criteria:
 - 3.1. The lower end of the grab bar or stanchion shall be 24 inches (610 mm) minimum and 27 inches maximum above the finished floor.
 - 3.2. Grab bars located inside a combination bathtub-shower compartment shall have their centerline 6 inches (152 mm) minimum, measured horizontally, to the shower curtain rod and 8 inches (200 mm) maximum, measured horizontally from the outer side of the bathtub.
 - 3.3. Grab bars and stanchions shall be permitted within 6 inches (152 mm) outside of the outer side of the bathtub complying with P2726.2.1.1

P2726.2.2 Horizontal Grab Bar. A 24-inch (610 mm) long minimum grab bar shall be provided on the long, non-entry side of bathtubs and bathtub-shower combinations. The grab bar shall be installed in a horizontal position and shall be centered, plus or minus two inches, along the length of the tub. The horizontal grab bar shall be located 8 inches (205 mm) minimum and 10 inches (255 mm) maximum above the tub rim.

Exception: A diagonal grab bar or, with 24 inches (610 mm) minimum length is permitted if installed with its higher end 12 inches (305mm) maximum from the control wall. The higher end of the grab bar shall be 25 inches (635 mm) minimum and 27 inches (685 mm) maximum above the tub rim. The lower end shall be located 8 inches (205 mm) minimum and 10 inches (255 mm) maximum above the tub rim.

P2726.3 Vertical Grab Bar or Stanchion for Showers. A vertical grab bar or stanchion shall be provided for showers. The vertical grab bar or stanchion shall be located either interior to or outside the shower compartment, within 3 inches (76 mm) of the compartment access and egress opening. The grab bar or stanchion shall be 24 inches (610 mm) long minimum with its lower end 39 inches (991 mm) maximum above the finished floor.

P2726.4 Other Details. Grab bars and stanchions shall comply with P2726.4

P2726.4.1 Cross Section. Grab bars and stanchions shall be circular in cross section having an outside diameter of 1.25 inches (32 mm) minimum and 2 inches (51 mm) maximum.

P2726.4.2 Spacing. The space between the grab bar or stanchion and adjacent surfaces plus water controls shall be 1.5 inches (32 mm) minimum.

P2726.4.3 Surface Hazards. Grab bars, stanchions and adjacent surfaces shall be free of sharp or abrasive elements. Edges shall be rounded with a minimum radius of 0.25 inch (6 mm).

P2726.5 Structural Characteristics. Allowable stresses shall not be exceeded for materials used when a vertical or horizontal force of 250 pounds (1112 N) is applied at any point on the grab bar, stanchion, fasteners, mounting device or supporting structure. Grab bars and stanchions shall not rotate within their fittings.

P2726.6 Design and Installation for Water. Grab bars, stanchions, fasteners, mounting device or supporting structure shall be designed and installed in accordance with P2701.1, with suitable materials, to withstand effects of water, including corrosion and other deterioration through their service life.

Reason:

“Reason Statement” or Justification for Grab Bars and Stanchions for Bathtubs, Bathtub-Shower Combinations and Showers

Complying with New Requirements in IRC, especially Section P2726

Proposed by Jake Pauls, BArch, CPE, HonDSc

Introduction

Points of Control. Grab bars, handrails and stanchions are important building components providing—in combination with our hands and our feet—what are called (in ergonomics) “points of control” to maintain balance and aid in ambulation and other movement activities that are crucial to utilizing means of egress for safety generally (in both normal and emergency conditions) and which pose dangers of injurious falls, the leading source of injuries in most countries, including the USA.

A brief digression to explain “stanchions.” You see them routinely on transportation vehicles such as subway trains and city buses. They are the **vertical** assemblies of graspable tubing that are fixed between ceilings, horizontal handrails just above head height, seats, floors, etc. usually located between seating and passageways or aisles. The term,

stanchions is used in ADA requirements for transportation vehicles and for this context Wikipedia has the following description: “On board most buses and trams/subways, vertical supports to provide stability when passengers are standing. They are located throughout most city buses and are connected to seats, floor, roof, etc.” This term is used in contexts similar to those for the “poles” referred to in NFPA’s recent adoption of new requirements for grab bars or poles for new bathtubs, bathtub-shower combinations and showers.

Examples of Points of Control in Specific Contexts. The starred, central cell of Table 1. shows the equity, with points of control—**shown in bold italics**—achieved with now-proposed grab bars, handrails and stanchions being required, in Section 1003, in the same way that handrails are required for stairs in the rest of the IBC.

Table 1. Minimum Number of Points of Control Provided with New (★) or Currently Imposed Rules or Practices

Number of Points of Control Via Hands or Feet	≤1	1	2	3	3-4
Standard walker for older adult with altered gait.					✓
Occupational settings with risk of worker falls from heights. Also, stairs where users can use two handrails simultaneously, one on each side.				✓	
Stairs where users have only a single handrail. <i>Grab bar(s) usable for bathtub/shower entry/egress.</i>			✓ ★		
Bathtubs/showers with slip resistant underfoot surfaces when wet.		✓			
Bathtubs/showers without slip resistant underfoot surfaces when wet, the common condition currently.	✓				

The Problems To Be Solved with A New Requirement for Grab bars, handrails and stanchions. The central and most important point of this code change proposal is to respond to the relatively high risk of injurious falls when entering and exiting bathing/showering facilities, in all new settings where they occur. Such risks exceed those for stairs on an exposure-adjusted basis. That is, the time during which one is stepping into or out of a bathtub or shower is more risky than a similar stepping behavior on a stair. The former result in about 25 percent of the injuries as do falls on stairs. This is based on about 300,000 US hospital emergency room visits per year for bathtubs and showers versus about 1.2 million US hospital emergency room visits per year for stairs, using comparably serious injury data for 2010 (discussed by Lawrence, et al., 2015 in the journal Injury Prevention). The societal cost of these injuries, plus about two and a half times additional, medically treated injuries, was (for 2010) about 20 billion dollars for US bathtubs and showers and about 93 billion dollars for US stairs with the greatest risk for both being in homes, where bathing/showering is a near daily activity for most people in the US (Lawrence, et al, 2015). (See also the annex to this justification for details of injuries documented by the US Consumer Product Safety Commission, CPSC.)

Table 1 depicts the current inequity as well as the increased equity that will be achieved when bathtubs and showers are subject to the same principle about availability of points of control (usable by ones hands or feet) that are crucial to our stability in utilizing those portions of the means of egress that entail elevation differences, changes of slope, and changes in slip resistance. The current—at best—one point of control provided with typical bathtubs and showers (i.e., one foot in a stable placement on a slip-resistant surface) would be augmented by one point of control available reliably to one hand. This achieves equity of safety with stairs where we can count on one foot planted on a tread and one hand on a handrail. For some situations, involving bathtubs used for immersion bathing (with occupants seated or lying on the bottom of the tub) two points of control, utilizing grab bars, handrails or stanchions—one for each hand—are needed for this equity and, more practically, to accomplish the relatively difficult stand-to-sit and sit-to-stand transfers within the tub.

Size of the Problem with Bathtubs and Showers Compared to Other Large Problems. Figure 1, a pie chart, shows the approximate scales of the nonfatal injury problem for three dangers to building occupants. In the US, the traditional danger of fire-related injuries is far smaller than that from bathing/showering and even smaller in relation to stair-related injuries. Right now, in the I-Codes, the segment for bathing/showering is not addressed while many, many pages of the I-Codes deal with fire-related injury prevention. Again, the proposal for grab bars and other points of control to be provided equitably, will provide a major improvement to injury prevention that, heretofore, has been largely ignored in code development and in practice except in some hotel properties where no more than half of the grab bars, handrails or stanchions to be required under the new proposal are provided for bathtubs.

Figure 1. Comparing three dangers resulting in injuries in buildings

There is an inverse relationship between these epidemiological insights and the extent of coverage of the great dangers of stairs and baths/showers in building codes and housing codes plus leading healthy homes literature.

International Codes, Scientific/Technical/Policy/Managerial Perspectives

Precedent Set by NFPA Codes. The foregoing is the philosophical and epidemiological foundation for the proposed addition of requirements for grab bars, handrails and stanchions in Section 1003 of the IBC and, in future or elsewhere, in the I-Codes generally. There is also the precedent taken in NFPA 101 and NFPA 5000 in their 2018 editions where grab bars (alternatively poles which are given the more-technical name “stanchions” in this IBC proposal) were proposed and almost completely adopted (with the exception of health care, discussed below) for new bathtubs and showers in buildings regulated by these codes. The new requirements were mostly noncontroversial and it is hoped that the same will be true with the proposals now submitted to the I-Codes. The justification for the new requirements far outweigh the opposition to them as the ergonomic, biomechanics, epidemiological, etiological and economic aspects have been carefully considered and addressed to the satisfaction of many people who know building codes and safety standards well and whose votes on the many committees considering the issue attest to the multiple justifications for this new feature of building codes and safety standards.

Parallel Code Development Activity in Canada. A proposal, comparable to what NFPA has adopted, is being addressed by a Grab Bar Task Group for the National Building Code of Canada and, when its next cycle commences, will also be proposed for action by the ICC A117 Committee for a new section, on mainstreamed grab bar, handrail and stanchion features for the A117.1 standard. Leaders in the standards and codes field, conversant with the value of grab bars, handrails and stanchions have been discussing such mainstreaming since early 2016, at an international meeting of experts on bathing/showering safety held in Toronto and partly available for study in a free streaming video that is available with several other streaming videos addressing points of control, grab bars, cost-benefit issues, etc., that are all listed in the Bibliography provided with this proposal. So a lot of the groundwork has been laid and different perspectives have been elicited and discussed.

Survey of Existing Facilities. Centered on hotels, health care facilities**, airport airline club shower facilities*, and homes, the proponent for this code change has been conducting a personal, opportunity-based survey of bathing/showering facilities worldwide, including the following countries where his work on building use and safety has taken him in recent years or his work is followed by other professionals, including public health authorities.

- Canada**
- USA* **
- UK*

- Sweden**
- Finland
- Netherlands
- Italy
- Singapore*
- Australia**
- New Zealand
- Japan

The survey is documented in many hours of video and thousands of photographs plus many measurements, in residential occupancies, of three-, four-, five-piece bathrooms ranging in size from a few square meters (20 square feet) to spaces big enough to park an automobile, occasionally with tubs and showers almost that big. Generally, the more compact the bathroom, the easier it is to provide the needed points of control—and with very substantial cost savings.

Hotels Surveyed. They were operated by Marriott, Sheraton, Intercontinental, Holiday Inn, Best Western, Hyatt, Hilton in almost of the countries listed above. In some of them, meetings were held with hotel managers and those responsible for risk management.

Detailed Justifications for Specific New Sections in IRC

P2705.1 already has the heart of the proposal in its item 4, “Plumbing fixtures shall be usable.” The proposal simply fleshes this out with sufficient detail to implement this objective.

P2708. The new text, for the Section for Showers, clarifies, for Showers, that stanchions (sometimes termed “poles,” as in NFPA’s requirements) are equivalent to required grab bars of the conventional sort. It directs IRC users to a new P2726 for requirements.

P2713. 4. The new text, for the section on Bathtubs, directs users to a new P2726 for requirements.

P2726.1. This new text introduces the detailed requirements and clarifies that dimensions (taken at right angles to the grab bar or stanchion) are to the centerline of the device.

P2726.2. These detailed requirements, here for vertical points of control, are based on research findings and recommendations described below and are roughly similar to what NFPA adopted for the 2018 edition of NFPA 101 and NFPA 5000. They are also being considered currently for the National Building Code of Canada.

In these detailed requirements for the vertical points of control, the first thing is to establish where within the plan of the bathroom, they will adequately serve users. This is based on Section R307 of the IRC which, along with Figure R307.1, sets the required minimum 21-inch (533 mm) clearances in front of fixtures (toilet, lavatory and tub), the areas through which bathers need to move reasonably unobstructed to access the tub and to exit the tub. The required points of control have to be within 12 inches (905 mm), measured horizontally, of these clear areas.

The dimensions shown here, plus the general superiority of vertical grab bars for ambulatory transfers, are based on extensive Canadian research over the last two decades as well as a meeting of US and Canadian experts in early 2016 that is partially available—for its presentations of Principal Investigators—on free steaming video (with links also provided in the Bibliography). An example of a vertical pole that is recognized as at least equivalent to the conventional vertical grab bar is shown in Figure 2, above, along with relevant discussion that supports the superiority of a properly installed stanchion which can be more easily positioned where the tub is most likely to be accessed. These dimensions are generally similar to what NFPA adopted for its 2018 editions of NFPA 101 and NFPA 5000. They are stated slightly differently in the IBC proposal to take better account of bathtubs that do not have walls on one to three sides. As in the NFPA-adopted requirements, P2726.2.1.3(2) addresses the often-missed issue of a wall-mounted conventional, vertical grab bar interfering with the shower curtain getting a good seal on the end wall.

Figure 2. Demonstration set up of both conventional grab bars (nominally meeting the length and location criteria of proposed IRC requirements and a stanchion plus a horizontally-fixed section—like a handrail—of the same tubing used for the stanchion (both completely meeting the length, location and structural strength requirements of proposed IRC requirements (which are consistent with IBC, ICC A117.1 and NFPA requirements)

Besides aesthetic advantages, the stanchion and the full-tub-length bars /tubing are clearly superior in placement flexibility—as they do not require walls for attachment—and better performance for a wider range of users and uses including here, especially for the stanchion, serving a use that is not addressed in P2726 for stand-to-sit and sit-to-stand transfers for toilet users that might be a bonus benefit used more frequently than would be uses related to bathing and showering. This is especially the case in small, residential-use bathrooms such as serving dwellings, where (for space and plumbing efficiency reasons) often have bathtubs and toilets in close proximity. This is addressed further in the Cost Impact section of the justification.

Note that the straight tubing based stanchion and the horizontal bar/tubing are not held by mere compression fit; they are held by adhesive that is permanent and waterproof. The lower part of the stanchion was tested at sustained loads of 300 pounds of horizontal, shearing force without any indication of failure. Its fixing plate shear area exceeds the shear area of conventional grab bar screws by a factor of six and unlike the case for conventional grab bar screws there is no issue with water intrusion and corrosion as well as deterioration of the structural backing for the screws. (See the section below describing field observations of serious deterioration of conventional grab bars fixing details that are often not designed for water intrusion.) Here it should be noted that automobiles, today, utilize high-performance adhesives where, in the past, screws were the norm but these, and the necessary perforations in parts, performed poorly from a corrosion perspective. Water pumps as well as body panels and headlamp plus taillight assemblies are examples of how modern automobiles are built with waterproof, automotive-grade adhesives. Examples of greater use of modern adhesives are also found increasingly in building construction.

Here it must be emphasized that grab bars and stanchions have to be structurally installed; some of the products available in the marketplace, e.g., suction-cup grab bars—that have a temporary and precarious adhesion to smooth tiles—and compression-fit (via a jackscrew mechanism) temporary transfer poles do not meet the structural requirements imposed in the proposed new requirements, the same structural performance requirements applied—withstanding loads of 250 pounds—currently applicable to conventional grab bars in the IBC. In Figure 2, below, the photograph shows a demonstration bathtub-shower combination with a redundant set of both conventional (vertical and diagonal) grab bars and (vertical and horizontal, straight lengths of tubing fixed at their ends)—the latter easily meet the 250-pound structural load criterion.

P2726.2.2 Horizontal Grab Bar. As with the vertical grab bar, described above (for P2726.2.1), the dimensions and

need for this second grab bar are based on Canadian research identified in the Bibliography and is addressed in the video of the presentation by Dr. Nancy Edwards, Principal Investigator of the early Canadian work which also addressed the option of a diagonal grab bar provided via the exception to 2726.2. Note that the base requirement covers installations where the bathtub is not enclosed on one or more sides with a wall. Such horizontal grab bars are intended for use by persons using the tub for immersion bathing which requires stand-to-sit and sit-to-stand transfers that utilize a horizontal or diagonal grab bar (and might also utilize a vertical grab bar or pole addressed by 27.2.1). 2726.2.2 permits horizontal handrails, which could be the same tubing used for the stanchion, to be used in a horizontal orientation. These could be longer (e.g., full tub length) than conventional, horizontal grab bars which need a parallel wall for support, unlike the horizontal tubing fixed between end walls only.

P2726.2.3. Vertical Grab Bar or Stanchion for Showers. Because of the variety of dedicated showers, especially in plan shape and size, this requirement is stated in a relatively flexible fashion relying more on a performance approach than specific dimensions, other than the minimum length and lower end position that takes into account various statures of users as well as the possibility there might be a seat in the shower. The inclusion of a stanchion takes into account the structural differences between bathtubs and free-standing showers; the latter would be good candidates for a stanchion positioned between the ceiling and the floor just outside the shower entrance.

2726.4. Other Details. Generally the requirements referenced here are based mostly on current requirements of ICC A117.1-2017 and with a new provision that addresses often-seen issues of water damage to conventional grab bars that range from the cosmetic to the catastrophic.

27.26.4.1 Cross Section. This is the same as ICC A117.1-2017 without an exception for noncircular sections which are rarely seen within bathrooms.

P2726.4.2. Spacing. This is based on a simplified version of ICC A117.1-2017.

P2726.4.3. Surface Hazards. This expands on a requirement, P2701.1.

P2726.5. Structural Characteristics. This is based on current requirements of ICC A117.1

2726.6. Design and Installation for Water. This last section is new and it addresses a serious problem with a non-trivial number of grab bars that have been seen in hotels, especially in the USA and Canada. Many are not designed, installed and maintained to address deterioration and corrosion problems with conventional, wall-mounted grab bars due to easy water intrusion and entrapment between conventional grab bar mounting plates and the covers fastened over them. Often, when water is entrapped here, there is no way for it to drain out, particularly from the lower portion of the enclosed space.

Problems Found in the Field with Conventional Grab Bars

Here follows some detail on what has been observed in the field on two large problems addressed in 2726.6 as well as in 2726.2.1.3(2).

During the course of his opportunity-based survey of grab bars provided for bathrooms in hotel guest rooms the proponent of this code change has found two problems with many installations.

The first, affecting over 50 percent of the surveyed bathtub-shower combinations, comes from placement of vertical grab bars underneath—and within a few inches horizontally of the end bracket for shower curtains. This makes sealing the shower curtain against the end wall of the bathtub-shower combination very difficult so that the danger of water getting outside the bathtub, on the adjacent floor is heightened unreasonably and needlessly. The proposed section 1003.8.2.1.3(3) addresses this problem as follows: “If attached to a wall, a grab bar or handrail shall be located inside the bathtub or combination bathtub-shower compartment and shall be no closer than 6 inches (152 mm), measured horizontally to the shower curtain rod.”

A much more worrying problem is found with a smaller percentage of conventional, wall-mounted grab bar installations, specifically grab bars which have cover plates over the screw plate onto which the tube of the grab bar is welded. There is invariably a space between the hole in the cover plate through which the tubing (grasped) portion of the grab bar passes and the tubing itself. Water can easily enter here and get trapped by the cover plate thus creating a pool of water and debris (hair, shampoo residue, etc.) from the showering process.

Aside from the hygiene problem here, there is a greatly heightened risk of two structural problems. One is water intrusion into the wall, around the fixing screws—typically two or three for each end of the grab bar, causing deterioration of the backing material so the screws become loose enough to be extractable with ones fingers. The second problem is equally worrisome especially as the quality of the steel used in (off-shore) grab bars is relatively poor in terms of corrosion of the screws and, less often, the mounting plates. The worst case seen recently had the heads of all the screws holding a grab bar so corroded that their heads were completely deteriorated and the grab bar could be pulled away from the walls with little force by one hand—clearly far, far less than the stipulated load of 250 pounds that codes in the US stipulate for structural strength.

The proponent has many photographs of these problems as well as a few videos showing how loose the grab bars have become due to corrosion as well as backing deterioration from water. One such photograph is provided in Figure

3, below; it is not the worst situation seen in the field.

Figure 3. Corrosion behind grab bar cover plate

Clearly such examples need to be addressed in several ways including stronger inspection by authorities and improved management of facilities. Improved design and manufacture of conventional grab bars would help too but, until that occurs, this proposal offers the stanchion options as well as mounting locations that keep the important “points of control” in relatively dry locations, for example at the exterior of a shower enclosure, but still near enough to the entrance to be usable from both outside and inside the enclosure. Proposed Section 2726.2.3 contains the provision, for the grab bar or stanchion to be located either interior to or outside of the shower compartment. . . .

Annexes

Annex 1: Representative sample of narratives of actual bathtub/shower-related injuries that led to US hospital emergency department visits, and for about one in ten of such visits led to hospital admission, **Annex 2**, (plus an additional 30 percent who went directly to hospital admission without an ED visit) in 2010. These are collected and published by the US Consumer Product Safety Commission (CPSC) National Electronic Injury Surveillance System (NEISS) and many more can be downloaded from the CPSC/NEISS Web site, <https://www.cpsc.gov/Research--Statistics/NEISS-Injury-Data>. Accessed January 8, 2018.

Annex 1: US CPSC NEISS: First 112 Sample Narratives (of 6,946 cases) for Product Code 0611 Injuries in 2010 - ER released w/wo treatment

(Product Code 611 covers bathtubs or showers including fixtures or accessories; excluding enclosures, faucets, spigots and towel racks)

41 YOM FRACTURED A RIB BY SLIPPING IN THE BATHTUB & FALLING AGAINST THE TOILET AT HOME.

53 YOF SUSTAINED A CONTUSION OF A SHIN BY BUMPING IT WHILE SHOWERING AT HOME.

18 YOF SPRAINED HER LOWER BACK BY FALLING IN THE SHOWER AT SCHOOL.

02 YOF SUSTAINED A LACERATION OF THE CHIN BY FALLING IN THE BATHTUB AT HOME.

18 YOF SUSTAINED A HEAD INJURY BY FALLING IN A SHOWER AT HOME.

80 YOM DISLOCATED A HIP BY LIFTING LEG IN SHOWER.

86 YOF SUSTAINED A LACERATION OF THE SCALP BY TRIPPING ON A RUG IN THE SHOWER AT HOME.

71 YOF SUSTAINED A HEAD INJURY BY FALLING FROM TOILET AGAINST THE BATHTUB AT HOME.

68 YOF SPRAINED AN ANKLE BY FALLING IN A SHOWER.
47 YOF FRACTURED A KNEE BY FALLING IN THE SHOWER AT HOME.
02 YOF SUSTAINED A LACERATION OF THE CHIN BY FALLING IN THE BATHTUB.
22 YOM SPRAINED A FOOT WHILE STEPPING OUT OF A SHOWER AT JAIL.
23 YOF SUSTAINED A CONTUSION OF A FOOT BY TRIPPING ON A RUG & STRIKING AGAINST A TUB AT HOME.
40 YOM SUSTAINED A LACERATION OF THE NOSE FROM BEING STRUCK BY THE SHOWER HEAD IN THE SHOWER AT HOME.
21 MOM RUPTURED AN EAR DRUM WITH A COTTON-TIPPED SWAB WHILE BATHING IN TUB AT HOME.
48 YOF SUSTAINED A CONTUSION OF THE NECK BY FALLING IN THE BATHTUB AT HOME.
04 YOF SLIPPED IN BATHTUB FELL AND INJURED FACE DX/ FACIAL LAC L KNEE STR
10 YOF FELL OUT OF SHOWER AND INJURED L KNEE. HAS ABRASION TO KNEE ALSO
80 YOF FELL IN SHOWER AT HOME HIT HEAD. DX/ HEAD INJURY
94 YOM SLIPPED AND FELL IN SHOWER AND HIT FACE ON FLOOR. DX/ FACIAL FX
55 YOM SLL LEG HEMATOMA
72 YOF CAUGHT FOOT IN TUB, INJURING LOWER LEG. NOW HAS HEMATOMA AND INCREASING PAIN.
22 YOF AT HOME FAINTED WHILE IN SHOWER AND FELL CUTTING FOREHEAD.
26 YOF SLIPPED AND FELL IN TUB DX: KNEE STRAIN
90 YOF GETTING OUT OF SHOWER WITH WALKER SLIPPED ON THE FLOOR AND HIT HEAD DX/ SCALP ABRASION
30 YOM SLIPPED AND FELL INTO TUB DX: CONTUSION TO BACK
51 YOF SLIPPED IN TUB AND HIT HEAD DX/ SCALP LAC
60 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO COCCYX
44 YOM FELL AND HIT ABDOMEN ON BATHTUB AT HOME. DX/ ABDOMINAL CONTUSION
04 YOM WITH CUT TO FACE FELL IN TUB DX: LACERATION TO FACE
51 YOF AT HOME FELL AT 5PM WHEN LOST BALANCE AND HIT L SIDE OF RIBS ON BATHTUB.
33 YOF SLIPPED AND FELL IN TUB DX: HEAD LACERATION
23 MOM FELL IN BATHTUB AT HOME AND HIT CHIN CAUSING LACERATION.
62 YOM WITH BACK PAIN FELL INTO TUB DX; CONTUSION TO LOWER BACK
63 YOF FELL INTO BATHTUB / NO INJURIES OR COMPLAINTS
54 YOM SLIPPED AND FELL IN TUB DX: RIB FRACTURE
02 YOM SLIPPED IN TUB AT HOME AND INJURED FACE DX/ CHIN LAC
25 YOF WITH CHEST PAIN AFTER FALL INTO TUB DX: CONTUSION TO CHEST
84 YOM FELL OUT OF SHOWER ON TO THE FLOOR AT HOME HIT HEAD DX/ HEAD INJURY
85 YOF SLIPPED AND FELL IN TUB AND HIT HEAD AT HOME DX/ HEAD INJURY
06 YOM AT HM WAS TAKING A BATH & SWIMMING IN TUB WHEN HE STRUCK HIS HEAD AGAINST FAUCET CAUSING HEAD LACERATION.
28 YOM AT HOME FELL IN SHOWER. WAS RESPONSIVE PER EMS.
26 YOF SLIPPED / FELL IN THE SHOWER DX: R EAR LAC. / HEAD & R SHOULDER CONTUSION
36 YOF THIS AM SLIPPED WHILE TRYING TO GET OUT OF BATHTUB AND LANDED ON BUTTOCKS.
28 YOF RIPPED FINGER NAIL OFF WHEN SLIPPED IN THE SHOWER AND THE NAIL BENT BACKWARDS.
26 YOF INJURED KNEE STEPPING OUT OF SHOWER DX/ RIGHT KNEE SPRAIN
50 YOM FELL IN BATHTUB AND HIT CHEST DX/ RIB FX
83 YOM CUT SCROTUM FELL IN TUB DX: LACERATION TO SCROTUM
71 YOF FELL OUT OF BATHTUB AT HOME AND HIT HEAD ON THE FLOOR DX/ HEAD INJURY
89 YOF FELL IN TUB HITTING HEAD DX: CLOSED HEAD INJURY
69 YOF WAS IN SHOWER AND FELL BACKWARDS STRIKING HER BACK.
08 YOF AT HOME LACERATED FACE ABOVE R ORBITAL. HIT HER HEAD ON SOAP DISH WHILE SHOWERING. NO LOC.

40 YOM SLIPPED AND FELL IN SHOWER AND INJURED CHEST. DX/ RIB FX
17 YOF FELL IN TUB HURT NECK DX: NECK STRAIN
23 YOM INJURED LOWER BACK BENDING OVER IN SHOWER AT HOME DX/ LUMBAR STRAIN
83 YOF FELL IN THE TUB AT ASSISTED LIVING AND INJURED SHOULDER DX/ RT SHOULDER CONTUSION
02 YOM HIT FACE ON BATHTUB AT HOME DX/ FACIAL LAC
74 YOM FELL AND HIT HEAD IN TUB DX: CONTUSION TO HEAD
85 YOF SLIPPED AND FELL GETTING OUT OF TUB DX: CONTUSION TO HIP
58 YOF SLIPPED AND FELL INTO TUB HIT HEAD DX: CLOSED HEAD INJURY
13 MOM AT HOME FELL IN BATHTUB AND HIT FOREHEAD AND MOUTH.
06 YOM SLIPPED IN BATHTUB AND HIT HEAD DX/ HEAD CONTUSION
78 YOM SLIPPED AND FELL IN TUB DX: LACERATION TO HEAD
08 YOM SLIPPED IN TUB TWISTED ANKLE DX: ANKLE STRAIN
51 YOF HIT HEAD ON SOAP DISH IN SHOWER 2 TIMES THIS WEEK HAS HEADACHE DX/ CONCUSSION
51 YOF SLIPPED IN SHOWER AND INJURED KNEE AT HOME DX/ RIGHT KNEE CONTUSION
83 YOM SLIPPED AND FELL IN THE SHOWER LAST NIGHT AND INJURED BACK DX/ BACK PAIN
31 YOM HIT EYE WITH TOWEL WHILE GETTING OUT OF THE SHOWER AT HOME DX/ RIGHT EYE CORNEAL ABRASION
24 YOF FELL GETTING OUT OF SHOWER HIT HEAD DX/ SCALP LAC
48 YOF SLIPPED IN SHOWER HIT HEAD + LOC DX/ HEAD INJURY
11 YOM SLIPPED IN SHOWER AND INJURED LEG. DX/ LEFT LEG CONTUSION
30 YOF SLIPPED AND FELL INTO TUB DX: CONTUSION TO HIP
18 MOM FELL IN TUB DX: LACERATION TO FACE
46 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO LOWER BACK
30 YOM CUT HAND ON BROKEN SOAP DISH AT HOME. DX// RIGHT HAND LAC
70 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO CHEST
31 YOM CUT THUMB ON SHOWER DRAIN THIS AM.
62 YOF SLIPPED IN THE SHOWER AND FELL ON THE FLOOR AT HOME DX/ LEFT WRIST SPRAIN
67 YOM FELL GETTING OUT OF SHOWER HIT HEAD ON TUB AT HOME DX/ SCALP CONTUSION
45 YOF PASSED OUT IN SHOWER AT GROUP HOME HIT HEAD. DX/ HEAD INJURY
04 YOF FELL IN BATHTUB AND HIT MOUTH DX/ LIP LAC
43 YOM SLIPPED IN BATHTUB AND INJURED KNEE DX/ LEFT KNEE CONTUSION
15 YOM TAKING SHOWER AND SHOWER DOOR SHATTERED AND PT FEET WERE CUT WITH THE GLASS AT HOME DX/ BILAT
FOOT LAC
73 YOF AT 9AM TODAY WAS GETTING OUT OF TUB AND SLIPPED AND BUMPED L RIBS ON THE TUB. C/O RIB PAIN.
87 YOF BENT DOWN TO PUT SCALE AWAY FELL AND HIT INTO TUB AT HOME DX/ LEFT HIP CONTUSION22 YOM FELL IN TUB
AT HOME AND INJURED CHEST DX/ RIB FX
40 YOF SLIPPED GETTING OUT OF BATHTUB AND INJURED LOWER BACK DX/ LOW BACK PAIN
34 YOM FELL AND HIT TUB DX: SHOULDER STRAIN
70 YOF SLIPPED FELL HIT CHEST ON SIDE OF TUB DX: CONTUSION TO CHEST
89 YOF SLIPPED AND FELL IN THE SHOWER LAST NIGHT AT NURSING HOME INJURED CHEST DX/ CHEST CONTUSION
44 YOM FELL IN TUB AND HIT CHEST DX.CHEST CONTUSION
36 YOF SLIPPED AND FELL IN TUB DX: LACERATION TO FACE
56 YOM CUT WRIST ON BROKEN SHOWER KNOB AT HOME DX/ LEFT WRIST LAC
88 YOF FELL AT HOME IN SHOWER AND HIT HEAD ON TUB DX/ SCALP CONTUSION
51 YOM SLIPPED AND FELL IN TUB DX: NECK STRAIN
23 YOM FELL IN BATH TUB AND INJURED CHEST DX/ CHEST CONTUSION

59 YOM FELL IN SHOWER AND INJURED SHOULDER DX/ LEFT SHOULDER FX
46 YOM HAD FALL HIT TUB DX: CONTUSION TO FACE
78 YOF FELL AT HOME AND HIT FACE ON BATHTUB DX/ FACIAL CONTUSION
29YOF WITH BACK PAIN AFTER FALL IN TUB DX: LOW BACK STRAIN
31 YOF FELL GETTING OUT OF TUB AT HOME INJURED FLANK DX/ FLANK CONTUSION
72 YOF AT HOME FELL WHEN SLIPPED ON URINE IN BATHROOM AND HIT HEAD ON SIDE OF BATH TUB.
19 YOF SLIPPED AND FELL INTO TUB DX: CONTUSION TO LOWER BACK
08 YOM FELL IN THE SHOWER AT HOME AND HIT EAR DX/ LEFT EAR LAC
62 YOM SLIPPED / FELL IN THE SHOWER. DX: RIB CONTUSION
09 YOF FELL IN TUB AND HIT LIP. DX/ LIP LAC
56 YOF WITH SHOULDER PAIN AFTER USING BATHBRUSH IN SHOWER DX: SHOULDER STRAIN
75 YOF AT HOME FELL OFF HASSOCK APPROX 30 MIN AGO HITTING HEAD AND L ARM ON BATHTUB. DENIES LOC.
62 YOF SLIPPED IN TUB HITTING FOOT DX: CONTUSION TO FOOT
04 YOM SLIPPED IN THE BATHTUB AND HIT CHIN DX/ CHIN LAC
34 YOM FELL IN THE SHOWER AT HOME INJURED BACK DX/ BACK SPRAIN
25 YOF + ETOH BAL 313 FELL IN SHOWER AND HIT HEAD DX/ HEAD CONTUSION

Annex 2: US CPSC NEISS: First 48 Sample Narratives (of 630 cases) for Product Code 0611 Injuries in 2010 - ER treated & Then Admitted to Hospital

(Product Code 611 covers bathtubs or showers including fixtures or accessories; excluding enclosures, faucets, spigots and towel racks)

89 YOF GETTING OUT OF THE SHOWER THE NEXT THING SHE KNEW SHE WAS ON THE FLOOR WITH HEAD AND SHOULDER INJURY; SHOULDER AND HEAD CONTUSION
69 YOM WAS WASHING HIMSELF IN SHOWER, FELL ONTO BLUNT PART OF BATHTUB, IMMEDIATELY HAD PAIN & TROUBLE BREATHING. DX - MULTIPLE RIB FXS
56 YOF SLIPPED IN THE SHOWER AND FELL FORWARD HITTING HER FACE & INJURING HER RT ARM- DX- MECHANICAL FALL W/ FRACTURE RT SHOULDER
78 YOF FAMILY FOUND HER ON THE FLOOR BETWEEN TOILET AND BATHTUB, SHE STATED SHE PASSED OUT WHEN SHE WAS IN SHOWER; SHOULDER INJURY
47 YOM HAD A WET SHEETROCK FALL ON HEAD WHILE IN SHOWER, +LOC, WAS CONFUSED. DX - BLUNT HEAD TRAUMA W/BRIEF LOC
62 YOM HAD A SYNCOPAL TODAY AT HOME IN THE SHOWER INJURING EYE AREA- DX- LACERATION TO FACE(EYE)
78 YOF PRESENT TO ER FROM HOME WHEN SHE WAS TAKING A BATH AND COLLAPSED - DX- CARDIAC ARREST, RESUSCITAED
43 YOM PRESENT TO ER AFTER HE WAS IN THE BATHTUB AND SLIP AND FELL GETTING OUT HITTING HEAD ON FLOOR- DX- BLUNT HEAD TRAUMA
81 YOM PRESENT TO ER AFTER A FALL IN THE SHOWER AT HOME TODAY INJURING THE HEAD AREA- DX- BLUNT HEAD TRAUMA
41 YOM FELL OUT OF SHOWER AT ASSISTED LIVING HOME YESTERDAY ONTO RT SIDE C/O RT HIP & RT LEG PAIN. DX - RT HIP FRACTURE
80 YOF TRYING TO GET OUT OF BATHTUB ACCIDENTLY FELL INJURED LOWER BACK; BACK CONTUSION AND AMBULATORY DYSFUNCTION
92 YOM PRESENT TO ER AFTER A FALL IN BATHTUB THIS MORNING INJURING RT HIP-DX- FRACTURE RT LOWER TRUNK (HIP)
88 YOF PRESENT TO ER AFTER A FAL IN BATH TUB AT SNF INJURING LT HIP- DX - FRACTURE LT LOWER TRUNK (HIP)
88 YOF WAS GETTING OUT OF SHOWER, FELT DIZZY & FELL STRIKING BACK OF HEAD ON FLOOR INJURING LT ARM. DX - SKIN TEAR LACERATION
88 YOF GETTING OUT OF BATHTUB THIS MORNING FELL TRIED TO BRACE HERSELF INJURED SHOULDER; SHOULDER FRACTURE

71 YOF WAS FOUND DOWN BY SON IN BATHTUB AT HOME, HAS INJURY TO LT EYE & FOREHEAD, IS REPETITIVE. DX - BLUNT HEAD TRAUMA, +ETOH

86 YOF LOST BALANCE WHEN SHE TURNED AROUND & FELL INTO BATHTUB C/O LOW BACK PAIN. DX - LOW BACK PAIN, POSS FX VS CONTUSION

80 YOF HUSBAND DID NOT WANT HER SMOKING IN HOUSE, WENT TO BATHROOM STOOD ON THE TOILET, OPENED WINDOW, SLIPPED BETWN TOILET/TUB; PELVIC FX

44 YOF FELL IN SHOWER TODAY SUSTAINING HEAD INJURY. DX - SCALP LACERATION

37 YOF SUSTAINED A MECHANICAL FALL IN SHOWER ONTO RT UPPER EXTREMITY, C/O RT SHOULDER PAIN. DX - RT DISTAL CLAVICLE FX

37 YOM HAD A GROUND LEVEL FALL IN BATHROOM STRIKING LOWER BACK ON BATHTUB. DX - SPINAL CONTUSION

84 YOF HAD SYNCOPAL EPISODE IN SHOWER AND FELL. DX: L 10TH RIB FX, INABILITY TO AMBULATE.

87 YOF FELL IN SHOWER. DX: RHABDOMYOLYSIS.

93 YOF FELL IN SHOWER AT ASSISTED LIVING. DX: L DISTAL HUMERUS FX.

79 YOM FELL IN SHOWER. DX: A FIB W/RAPID VENTRICULAR RESP, SYNCOPE, SDH, SAH, ELEVATED INR.

84 YOF FELL WHILE GETTING OUT OF BATHTUB SUSTAINING A FRACTURE TO HER LUMBAR SPINE

90 YOF SLIPPED IN BATHTUB AND GRAZED HEAD ON SHELF AT ASSISTED LIVING. DX: R KNEE STRAIN W/POSS INTERNAL DERANGEMENT, CLOSED HEAD INJURY.

82 YOF WITH NO INJ FROM FALL IN TUB

85 YOM WITH NO IN, FELL IN BATHTUB, ADMITTED FOR OTHER REASONS

52 YOM W/ALS FELL AND BECAME STUCK BETWEEN TOILET AND TUB. DX: RHABDOMYOLYSIS STATUS POST FALL, NASAL FX.

95 YOF FELL IN SHOWER SUSTAINING CHEST CONTUSION

71 YOF SLIPPED AND FELL IN SHOWER. DX: SYNCOPE, LARGE HEAD LAC, COAGULOPATHY, HYPOKALEMIA, LONT QT, ALCO

79 YOF FELL IN SHOWER SUSTAINING A FRACTURED KNEE

87 YOF WITH RIB FRACTURE FROM FALL IN TUB

79 YOM WITH LOWER BACK STRAIN FROM FALL IN SHOWER

81 YOF TURNED IN SHOWER AND FELL SUSTAINING A FRACTURED HIP

97 YOF FELL IN THE SHOWER AT NURSING HOME. DX: TRAUMATIC SDH, AGGITATION.

70 YOF FELL IN SHOWER AT HOME AND WAS UNABLE TO GET UP, SUSTAINED CHI, BACK CONTUSIONS

88 YOF FELL AGAINST BATHTUB AND WALL AT ASSISTED LIVING. DX: BACK/SHOUL PX, SYNCOPE, STAGE I THORACIC DECUBITUS ULCER, MULT OLD THORACIC FX'S.

88 YOF SLIPPED ON WET FLOOR GETTING OUT OF SHOWER AT NURSING HOME. DX: BACK CONT, PNEUMONIA, HYPOXEMIA, PLEURAL EFFUSION.

41YOF WITH NO INJURIES FROM FALL IN SHOWER, WAS ADMITTED

83 YOM FELL IN THE SHOWER. DX: TRAUMATIC ICH, FACIAL LAC, CONCUSSION W/O LOC, RENAL FAILURE.

94 YOM FELL GETTING OUT OF THE SHOWER AND HIT HEAD SUSTAINING A LACERATION

79 YOM FELL ON SIDE OF BATHTUB. DX: SYNCOPE, CHEST WALL CONT.

55 YOM SLIPPED AND FELL IN BATHTUB. DX: R HEMOTHORAX/PNEUMOTHORAX, MULT R RIB FX'S.

86 YOF FELL BACKWARDS INTO BATHTUB & HIT HEAD AT HOME DX: LACERATION TO SCALP/ ACUTE DEHYDRATED

95 YOF TRIPPED OVER THROW RUG WHILE GETTING INTO SHOWER AT HOME DX; AVULSION TO FACE/ MALIGNANT HYPERTENSION

53 YOF SLIPPED IN SHOWER AND FELL HITTING HIP ON TOILET AT HOME DX: STRAINED RIGHT HIP/ UNCONTROLABLE DIABETES

Bibliography:

Bibliography

Approximately 50 internationally-produced scientific and technical references, on bathing/showering safety, were

compiled by the proponent, in 2016, for an American Public Health Association (APHA) draft policy highlighting, especially two Canadian research studies that also are addressed in video presentations by Principal Investigators (Dr. Nancy Edwards, Dr. Alison Novak) for the research and posted, for free streaming viewing at, <https://vimeo.com/164239941> Accessed January 8, 2018. Additional videos covering technical aspects of bathing and showering safety (including cost impact and benefit issues*) are found at the following links (all of which are available, with descriptions, at www.bldguse.com, the proponent's Professional Practice Website, Accessed January 8, 2018.).

Accessed January 8, 2018. (In referring to sit-to-stand transfers, as from a toilet, this article uses the term, “transfer poles,” to describe the configuration and location of “poles” referred to in the code change proposal.)

Cost Impact

The code change proposal will increase the cost of construction .

Cost Impact

The code change proposal will increase the cost of residential construction, but that increased cost pales in comparison to the benefits of enhanced usability and reduction of fall injuries, the majority of which occur in residential settings, especially homes.

The additional material in the form of conventional grab bars or poles plus their fixings is about 50 dollars per grab bar or pole (using retail prices for the components confirmed as recently as 2017) and with a conventional three-fixture bathroom with a bathtub there would be a need for two such grab bars or poles or one of each. Labor to install these would be about one hour for each. Thus an overall, installed cost is on the order of \$200 per bathroom. The service life would be on the order of two or more decades.

Against this added cost of an installed single grab bar or two per bathroom there are the ongoing benefits of enhanced normal (non-injury) uses which, for a typical US household for a 20-year period, for example, number about 7,000 per person or on the order of 20,000 per household. Those enhanced uses, with grab bars, have an economic value that is larger than the benefit of averted injuries from falls.

Currently without grab bars, our bathtubs and showers are the site of injuries serious enough to require professional medical attention at a rate, annually (using 2010 data) of about 1 million per 110 billion uses or about one in 110,000 uses. Every one of those non-injury uses has a value. By comparison, for stairs this ratio is about one professionally treated fall injury for every million flight uses in home settings and one such injury for every ten million flight uses in public settings where, under the IBC and more-detailed inspection procedures, stairs are nearly one order of magnitude safer than those nominally constructed under the IRC. See the video presentation by Jake Pauls to the April 2017 meeting, “The Impact of Building Codes and Standards in Public Health and Safety,” held in Melbourne, Australia, in connection with the 15th World Congress on Public Health. The streaming video containing this presentation, which

includes the “Injury Pyramids” used for the above stair safety calculation, is available freely at <https://vimeo.com/239276202> (as listed in the first part of the Bibliography accompanying this proposal) accessed Jan 8, 2018.

The injuries-averted benefit, over twenty years, has a value, in 2010 dollars, about 6.5 times greater than the installation cost, based on the very reasonable assumption that half the falls are averted with the specified grab bars or poles. For the vertical poles that also enhance and make safer the use of toilets that, being adjacent to a bathtub, can serve stand-to-sit and sit-to-stand transfers for toileting, this benefit increases by about 35 percent to nearly 9 times greater than the installation cost. These projections are based on the injury economic data provided by the 2015 paper in the respected journal, *Injury Prevention*, by Lawrence, Spicer and Miller (see Bibliography for details).

The bottom line is that the benefits of both enhanced normal uses, in the tens of thousands per household over a 20-year period, combined with the benefit of averted injuries, is on the order of at least 20 or more times the cost of providing the grab bars, especially if they take the form of vertical poles serving bathtub-shower combination users as well as toilet users in a three-piece bathroom provision that is very common in homes and hotels, for example. For hotels, while the lavatory sink(s) may be in a separate space, the toilet and bathtub-shower combination are usually close together so that a single pole can serve transfers for both. Thus the cost impact of grab bar or pole installations is very small in relation to the benefits and that cost of installation is very small in relation to the overall price of a dwelling unit or hotel guest room for example.

Internal ID: 2120

RP4-18

IRC: P2709.4.1 (New)

Proponent: Angel Guzman Rodriguez, ASME, representing The American Society of Mechanical Engineers (ASME)

2018 International Residential Code

Add new text as follows:

P2709.4.1 Waste Fittings. Flanged drains shall conform to ASME A112.18.2/CSA B125.2.

Reason:

Section P2709.4 mentions flanged drain requirements and these drains must be approved but to what standard. The latest version of ASME A112.18.2/CSA B125.2 contains specific requirements for flanged drains. This standard also includes requirements for built up shower drains systems which are normally used in field fabricated shower systems.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only identifies the standard that the industry is already making these waste fittings comply with and be certified to. Thus, there will be no impact to material (or labor) cost because of this added requirement.

Internal ID: 1454

RP5-18

IRC: P2904.2.1

Proponent: Jeffrey Shapiro, representing IRC Fire Sprinkler Coalition (jshapiro@ircfiresprinkler.org)

2018 International Residential Code

Revise as follows:

P2904.2.1 Temperature rating and separation from heat sources. Except as provided for in Section P2904.2.2, sprinklers shall have a temperature rating of not less than 135°F (57°C) and not more than ~~170°F (77°C)~~ 225°F (107°C). Sprinklers shall be separated from heat sources as required by the sprinkler manufacturer's installation instructions.

Reason:

NFPA 13D (Section 7.5.6.1 in the 2016 edition) allows intermediate temperature sprinklers to be used in lieu of ordinary temperature sprinklers in dwelling units, even where elevated ambient temperatures are not expected. So long as the sprinkler used qualifies as a residential sprinkler based on the Response Time Index (RTI) and passing the UL1626 fire test, there is no reason for activation temperature to be limited. Permitting intermediate temperature sprinklers to be used in lieu of ordinary temperature sprinklers can help to avoid the risk of mixing up sprinklers during installation and can ensure that intermediate temperature sprinklers will be present in locations where elevated ambient temperatures may or may not have been anticipated.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Residential sprinklers of ordinary or intermediate temperature range are typically the same cost, and this proposal does not require the use of a different sprinkler. It simply allows flexibility.

Internal ID: 1346

RP6-18

IRC: P2904.2.3

Proponent: Jeffrey Shapiro, representing IRC Fire Sprinkler Coalition (jshapiro@ircfiresprinkler.org)

2018 International Residential Code

Revise as follows:

P2904.2.3 Freezing areas. Piping shall be protected from freezing as required by Section P2603.5. or by using a dry pipe automatic sprinkler system that is listed for residential occupancy applications. Where sprinklers are required in areas that are subject to freezing, dry-side-wall or dry-pendent sprinklers extending from a nonfreezing area into a freezing area shall be installed.

Reason:

Listed dry pipe residential sprinkler systems are available, are recognized by NFPA 13D, and are a viable option for freeze protection in lieu of other methods that are currently permitted.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal allows an additional alternative to current requirements for freeze protection as an option. There is no mandatory requirement being added.

Internal ID: 1194

RP7-18

IRC: P2904.3.2

Proponent: Jeffrey Shapiro, representing IRC Fire Sprinkler Coalition (jshapiro@ircfiresprinkler.org)

2018 International Residential Code

Revise as follows:

P2904.3.2 Shutoff valves prohibited. With the exception of shutoff valves for the entire water distribution system or a single master control valve for the automatic sprinkler system that is locked in the open position, valves shall not be installed in any location where the valve would isolate piping serving one or more sprinklers.

Reason:

The proposal will correlate with an allowance in NFPA 13D to have a control valve on a standalone sprinkler system. Although NFPA 13D allows such valves to be electronically monitored in lieu of locking, this proposal requires that the valve be locked open, which could be accomplished by simply providing a nylon strap to secure the valve handle. If an owner also wants to electronically monitor the valve, that would be permitted in addition to securing the valve to discourage tampering.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal adds an allowance to have a master control valve, but there is no mandate to include one.

Internal ID: 1352

RP8-18

IRC: P2904.4, P2904.4.1, P2904.4.1.1 (New), P2904.4.1.2 (New), P2904.4.1.3 (New), P2904.4.2

Proponent: Jeffrey Shapiro, representing IRC Fire Sprinkler Coalition (jshapiro@ircfiresprinkler.org)

2018 International Residential Code

Revise as follows:

P2904.4 Determining system design flow. ~~The flow for sizing the sprinkler piping system shall be based on the flow rating of each sprinkler in accordance with Section P2904.4.1 and the calculation in accordance with Section P2904.4.2. Sections P2904.4.1 through P2904.4.2.~~

P2904.4.1 Determining required flow rate for each sprinkler. The minimum required flow for each sprinkler shall be determined using the sprinkler manufacturer's published data for the specific sprinkler model based on all of the following:

1. The area of coverage.
2. The ceiling configuration, in accordance with Section P2904.4.1.1 through P2904.4.1.3.
3. The temperature rating.
4. Any additional conditions specified by the sprinkler manufacturer.

Add new text as follows:

P2904.4.1.1 Ceiling configurations. Manufacturer's published flow rates for sprinklers tested under an 8 ft (2.4 m) high ceiling, in accordance with the sprinkler listing, shall be used for the following ceiling configurations, provided that the ceiling surface does not have significant irregularities, lumps or indentations and is continuous in a single plane.

1. Ceilings that are horizontal or that have a slope not exceeding 8 units vertical in 12 units horizontal (67%), without beams, provided that the ceiling height, measured to the highest point, does not exceed 24 ft (7.3 m) above the floor. Where the slope exceeds 2 units vertical in 12 units horizontal (17%), the highest sprinkler installed along the sloped portion of a ceiling shall be positioned above all communicating openings connecting the sloped ceiling compartment with an adjacent space.
2. Ceilings that are horizontal or that have a slope not exceeding 8 units vertical in 12 units horizontal (67%), with beams, provided that the ceiling height, measured to the highest point, does not exceed 24 ft (7.3 m) above the floor. Beams shall not exceed 14 in. (350 mm) in depth, and pendent sprinklers shall be installed under the beams as described at the end of this section. The compartment containing the beamed ceiling shall not exceed 600 ft² (56 m²) in area. Where the slope does not exceed 2 units vertical in 12 units horizontal (17%), the highest sprinkler in the compartment shall be above all communicating openings connecting the compartment with an adjacent space. Where the slope exceeds 2 units vertical in 12 units horizontal (17%) the highest sprinkler installed along the sloped portion of a ceiling shall be positioned above all communicating openings connecting the sloped ceiling compartment with an adjacent space.
3. Ceilings that have a slope exceeding 2 units vertical in 12 units horizontal (17%) but not exceeding 8 units vertical in 12 units horizontal (67%), with beams of any depth, provided that the ceiling height, measured to the highest point, does not exceed 24 ft (7.3 m) above the floor. Sidewall or pendent sprinklers shall be installed in each pocket formed by beams. The compartment containing the sloped, beamed ceiling shall not exceed 600 ft² (56 m²) in area.

Pendent, recessed pendent, and flush-type pendent sprinklers installed directly under a beam having a maximum depth of 14 inches shall have the sprinkler deflector located not less than 1 inch or more than 2 inches below the bottom of the beam. Pendent sprinklers installed adjacent to the bottom of a beam having a maximum depth of 14 inches shall be positioned such that the vertical centerline of the sprinkler is no more than 2 inches from the edge of the beam, with the sprinkler deflector located not less than 1 inch or more than 2 inches below the bottom of the beam. Pendent sprinklers shall also be permitted to be installed less than 1 inch below the bottom of a beam where in accordance with manufacturer's instructions for installation of flush sprinklers.

P2904.4.1.2 Ceiling configurations with special sprinkler listings. For ceiling configurations not specified in Section 2904.4.1.1, the manufacturer's published flow rate for sprinklers that have been listed for protection of such

configurations shall be used.

P2904.4.1.3 Other Ceiling Configurations. For ceiling configurations not addressed by Sections P2904.4.1.1 or P2904.4.1.2, the flow rate shall be subject to approval by the fire code official.

Revise as follows:

P2904.4.2 System design flow rate. The design flow rate for the system shall be based on the following:

1. The design flow rate for a room having only one sprinkler shall be the flow rate required for that sprinkler, as determined by Section P2904.4.1.
2. The design flow rate for a room having two or more sprinklers and a ceiling configuration specified in Section P2904.4.1.1 shall be determined by identifying the sprinkler in that room with the highest required flow rate, based on Section P2904.4.1, and multiplying that flow rate by 2.
3. ~~Where the sprinkler manufacturer specifies different criteria for ceiling configurations that are not smooth, flat and horizontal, the required~~ The design flow rate for that room shall comply with the ~~sprinkler~~ a room having two or more sprinklers and a ceiling configuration covered by Section P2904.4.1.2 shall be in accordance with the manufacturer's instructions.
4. The design flow rate for a room having two or more sprinklers and a ceiling configuration covered by Section P2904.4.1.3 shall be subject to approval by the fire code official.
5. The design flow rate for the sprinkler system shall be the flow required by the room with the largest flow rate, based on Items 1, 2 and 3 through 4.
6. For the purpose of this section, it shall be permissible to reduce the design flow rate for a room by subdividing the space into two or more rooms, where each room is evaluated separately with respect to the required design flow rate. Each room shall be bounded by walls and a ceiling. Openings in walls shall have a lintel not less than 8 inches (203 mm) in depth and each lintel shall form a solid barrier between the ceiling and the top of the opening.

Reason:

These revisions are intended to correlate with NFPA 13D and current installation practices for residential sprinklers protecting spaces with sloped and/or beamed ceilings.

The current Section P2904.4.2 (3) sends the user to the manufacturer's data sheets for special design information related to sloped and/or beamed ceilings, but data sheets for most residential sprinklers no longer provide guidance for these conditions. A 2010 Fire Protection Research Foundation study helped to standardize sprinkler protection criteria for ceilings with slopes and beams by determining that many sloped and beamed ceilings can be sufficiently protected using the same design criteria that apply to horizontal ceilings. This prompted NFPA to add model design criteria to their sprinkler standards and manufacturers are now amending cut sheets to delete criteria for ceiling configurations that are covered by NFPA's standards. Without this revision to Section P2904, the IRC will no longer provide sufficient guidance for protection of sloped or beamed ceilings, and that could be improperly interpreted as only allowing smooth, flat, horizontal ceiling configurations in sprinklered dwellings.

Cost Impact

The code change proposal will decrease the cost of construction .

The sprinkler rules in the IRC, as written, would not allow for sloped ceilings which made the installation of sprinkler systems much more costly than need be.

Internal ID: 421

RP9-18

IRC: TABLE P2904.6.2(2)

Proponent: Jeffrey Shapiro, representing IRC Fire Sprinkler Coalition (jshapiro@ircfiresprinkler.org)

2018 International Residential Code

Revise as follows:

**TABLE P2904.6.2(2)
MINIMUM WATER METER PRESSURE LOSS (PLm)a**

FLOW RATE (gallons per minute, gpm)^b	⁵/₈-INCH METER PRESSURE LOSS (pounds per square inch, psi)	³/₄-INCH METER PRESSURE LESS (pounds per square inch, psi)	1-INCH METER I LOSS (pounds per sq
8	2 <u>3</u>	1 <u>3</u>	1
10	3	1 <u>3</u>	1
12	4	1 <u>3</u>	1
14	5 <u>6</u>	2 <u>5</u>	1
16	7	3 <u>6</u>	1
18	9	4 <u>7</u>	1 <u>2</u>
20	11	4 <u>9</u>	2
22 <u>23</u>	NP <u>14</u>	5 <u>11</u>	2 <u>3</u>
24	NP	5	2
26	NP <u>18</u>	6 <u>14</u>	2 <u>3</u>
28	NP	6	2
30 <u>31</u>	NP <u>26</u>	7 <u>22</u>	2 <u>4</u>
32 <u>39</u>	NP <u>38</u>	7 <u>35</u>	3 <u>6</u>
34	NP	8	3
36 <u>52</u>	NP	8 <u>NP</u>	3 <u>10</u>

For SI: 1 inch = 25.4 mm, 1 pound per square inch = 6.895 kPa, 1 gallon per minute = 0.063 L/s.

NP = Not permitted unless the actual water meter pressure loss is known.

- a. Table P2904.6.2(2) establishes conservative values for water meter pressure loss or installations where the water meter loss is unknown. Where the actual water meter pressure loss is ~~known~~ published and available from the meter manufacturer, P_m shall be the actual loss published pressure loss for the selected meter.
- b. Flow rate from Section P2904.4.2. Add 5 gpm to the flow rate required by Section P2904.4.2 where the water service pipe supplies more than one dwelling.

Reason:

This proposal revises the water meter table in the IRC to better correlate with the water meter table in NFPA 13D, which was updated in the 2013 edition based on research that was published in an Fire Protection Research Foundation Report titled, " Residential Fire Sprinklers - Water Usage and Water Meter performance Study" in 2011. The revised IRC table will include NFPA 13D correlated values for 5/8-inch, 3/4-inch and 1-inch meters, and it retains entries for flows less than 18 gpm, which have been adjusted to reflect findings from the Fire Protection Research Foundation study. NFPA 13D does not include these lesser flows, but the IRC has always included them since low-flow systems are an option for affordable housing. This proposal does not add values for 1 1/2-inch and 2-inch meters, which are included in NFPA 13D, because these meter sizes are excessive and unnecessary for flow demands associated with home fire sprinkler systems. Including them in the table could be taken as a basis of validation for water purveyors looking to justify local requirements for larger, more expensive meters.

Bibliography:

<http://www.nfpa.org/News-and-Research/Fire-statistics-and-reports/Research-reports/Suppression/Residential-Fire-Sprinklers>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No expected cost consequences are anticipated to be associated with this proposal in most cases since actual meter pressure loss values are typically available. The prescriptive table values are only included in the code for rare occasions where actual values cannot be ascertained.

Internal ID: 1055

RP10-18

IRC: P2905.3 (New)

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Residential Code

Add new text as follows:

P2905.3 Hot water supply to fixtures. The developed length of hot water piping, from the source of hot water to the fixtures that require hot water, shall not exceed 50 feet (15 240 mm). Water heaters and recirculating system piping shall be considered to be sources of hot or tempered water.

Reason:

This change adds a new section to limit the hot water supply line length from the source of hot water to the fixtures that require hot or tempered water. This provision is replicated from existing IPC Section 607.2.

Hot water supply lines greater than 50 feet waste water (proportional to pipe size) while occupants wait for hot water to reach fixtures for bathing, washing and culinary purposes. Even though hot water supply lines are insulated, the hot water remaining in the lines between demand periods cools down. Limiting the length and consequent volume of heated water in the supply lines reduce the amount of wasted water and occupant waiting time.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cost is based on proximity of hot water source to point of use.

Internal ID: 552

RP11-18

IRC: P2906.21

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2018 International Residential Code

Revise as follows:

P2906.21 Push-fit joints. Push-fit joints shall be used only on copper-tube-size outside diameter dimensioned CPVC, PEX, PE-RT, and copper tubing. Push-fit joints shall conform to ASSE 1061 and shall be installed in accordance with the manufacturer's instructions.

Reason:

Table P2906.6 lists ASSE 1061 fittings as acceptable to be used with polyethylene of raised temperature (PE-RT) plastic tubing. ASSE 1061 does contain testing requirements for use with PE-RT tubing.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is only a clarification as Table P2906.6 already indicates ASSE 1061 fittings for PE-RT tubing.

Internal ID: 1750

RP12-18

IRC: P2909.1, 44

Proponent: Jeremy Brown, NSF International, representing NSF International (brown@nsf.org)

2018 International Residential Code

Revise as follows:

P2909.1 Design.. Drinking water treatment units shall meet the requirements of NSF42, NSF 44, NSF 53, NSF ~~60~~62 or CSA B483.1.

Add new standard(s) follows:

NSF

NSF International
789 N. Dixboro Road
Ann Arbor MI 48105

62-2015:

Drinking Water Distillation Systems

Reason:

The current text of the IRC references an incorrect standard. NSF 60 is Drinking Water Chemicals-Health Effects. This is unrelated to Drinking Water Treatment Units.

The origin of this standard in this code goes back to 2009 when a proposal to add CSA 483.1 also incorrectly added NSF 60. It is believed that the actual intent was to add NSF 62- Drinking Water Distillation Systems.

NSF 62 is an appropriate drinking water treatment technology and this is the American National Standard for this technology. This standard is already referenced in the International Plumbing Code in the corresponding section 611.1 with the same language.

This standard establishes minimum materials, design and construction, and performance requirements for point-of-use and point-of-entry drinking water distillation systems and the components used in these systems. Distillation systems covered by this standard are designed to reduce specific chemical contaminants from potable drinking water supplies. Systems covered under this standard may also be designed to reduce microbiological contaminants, including bacteria, viruses, and cysts, from potable drinking water supplies.

A copy of NSF 62 was submitted with this code change and may be obtained free of charge by anyone considering this code change proposal by emailing brown@nsf.org.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This creates an additional option for water treatment but does not mandate the use of this technology so is cost neutral.

Analysis: The referenced standard, NSF 62-2015, is currently referenced in the 2018 IPC-2015 in a section that is coordinate in subject matter to the proposed revised section.

Internal ID: 144

RP13-18

IRC: P3110 (New), P3110.1 (New), P3110.2 (New), P3110.2.1 (New), P3110.3 (New), P3110.3.1 (New), P3110.3.2 (New), P3110.3.3 (New)

Proponent: Jane Malone, American Association of Radon Scientists and Technologists, representing American Association of Radon Scientists and Technologists, National Policy Director

2018 International Residential Code

Add new text as follows:

SECTION P3110 SOIL GAS VENT PIPING

P3110.1 Scope. The provisions of this section shall govern the materials, construction, and installation of soil gas vent pipe and connectors.

P3110.2 Soil gas vent pipe. A gas-tight pipe of 3-inch [76 mm] nominal size or larger shall be extended from below the slab or crawl space through the interior of the building and exit the roof. The pipe shall be centered in a cylindrical space which is located in the attic below the roof, is not adjacent to an eave or wall, and has a vertical height of not less than 48 inches [122 cm] and diameter of not less than 21 inches [53 cm]. Materials used shall comply with Section P3002.

P3110.2.1 Soil gas vent pipe termination. The vent pipe shall terminate vertically upward not less than 12 inches [305 mm] above the roof in a location not less than 10 feet [3048 mm] away from any window, air intake, or other opening into the conditioned spaces of the building that is less than 2 feet [610 mm] below the exhaust point. The vent pipe shall terminate not less than 10 feet [3048 mm] from window or other opening in adjoining or adjacent buildings.

P3110.3 Soil gas vent pipe connector. A tee fitting or equivalent method shall be installed to secure the soil gas vent pipe to the perforated piping or geotextile matting from which soil gas is collected.

P3110.3.1 Crawl spaces. In a building with a crawl space, a soil gas vent pipe connector shall be installed with not less than 10 feet [3048 mm] of perforated pipe or geotextile matting connected to each of the two horizontal openings of the connector. The connector and pipe or geotextile matting shall be located below a soil gas membrane complying with ASTM Class A, B, or C.

P3110.3.2 Slab-on-grade and basements. In buildings with a basement or slab-on-grade, a soil gas vent pipe connector of 4-inch [102 mm] nominal diameter shall be installed with not less than 4 feet [1219 mm] of perforated pipe or geotextile matting connected to each of the two horizontal openings of the connector.

P3110.3.3 Drain tile systems. Where an interior drain tile system is present, the two horizontal openings of the soil gas vent pipe connector shall be connected to the drain tile system.

Reason:

Chapter 31 governs the piping, tubing and fittings for vents in one- and two-family dwellings. Soil gas vents are commonly installed by plumbers yet there is no information about soil gas vents in Chapter 31 or elsewhere in the plumbing sections of the IRC. Sections 401 through 701 of ANSI AARST CCAH-2013, Reducing Radon in New Construction of One and Two Family Dwellings describe the pipe-related (and other) requirements for soil gas vents. This proposed code change concisely adds the standard's requirements for such vents, which will ensure that plumbers have the correct information within the IRC plumbing chapter on vents. This change does not add a requirement to provide a soil gas vent but rather delivers the specification for how to provide one when a building project requires one.

Bibliography:

[ANSI AARST CCAH-2013, Reducing Radon in New Construction of One and Two Family Dwellings] [AARST Consortium on Radon Standards] [2013] [<http://aarst-nrpp.com/wp/america-national-radon-standards/>]

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The provisions are not required for every home. They only apply to homes where the builder or buyer includes soil gas vent pipe.

Proponent: Ronald George, representing Wavin Ltd. (Ron@Plumb-TechLLC.com)

2018 International Residential Code

Add new text as follows:

P3201.3 Non-liquid seal devices. Each non-liquid seal, drainage sealing device shall conform to ASME A112.18.8 and shall be an alternative to a liquid seal type trap. Such devices shall be installed only on 1-1/4 inch (31.8mm) and 1-1/2 inch (38.1 mm) tubular drains. Where devices conforming to ASME A112.18.8 are installed on the outlet of food waste disposers, the devices shall be installed in the vertical, downward flow orientation. These devices shall be protected from back pressure by one of the same approved venting methods as for a liquid seal trap, in accordance with Section P3101. Non-liquid seal devices shall not be installed on the outlet of a urinal. Where installed, the devices shall be installed only in the vertical downward orientation or in horizontal waste branches in accordance with Section P3005.3. The devices shall be installed in accordance with the manufacturer's instructions and shall be accessible.

Revise as follows:

P3201.1 Design of traps-Liquid Seal Traps. Traps relying on a liquid seal shall be of standard design, shall have smooth uniform internal waterways, shall be self-cleaning and shall not have interior partitions except where integral with the fixture. Traps shall be constructed of lead, cast iron, copper or copper alloy or *approved* plastic. Copper or copper-alloy traps shall be not less than No. 20 gage (0.8 mm) thickness. Solid connections, slip joints and couplings shall be permitted to be used on ~~the liquid seal type trap inlets, liquid seal type trap outlet~~ inlets, liquid seal type trap outlet, or within the liquid seal type trap seal. Slip joints shall be permitted on non-liquid seal devices conforming to Section P3201.3. Traps and other approved devices having slip-joint connections shall comply with Section P2704.1.

P3201.2 Trap seals-Liquid seal traps. Each fixture trap with a liquid seal shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm).

Exception: Sealing devices not relying on a liquid seal shall conform to the requirements in Section P3201.3.

P3201.3P3201.4 Liquid Seal Trap setting and protection. ~~Traps-Liquid seal traps~~ shall be set level with respect to their water or other liquid seals and shall be protected from freezing. Trap seals shall be protected from siphonage, aspiration or back pressure by an *approved* system of venting (see Section P3101).

Exception: Sealing devices not relying on a liquid seal shall conform to the requirements in P3201.3.

P3201.4P3201.5 Building traps. Building traps shall be prohibited.

P3201.5P3201.6 Prohibited trap designs. The following types of traps are prohibited:

1. Bell traps.
2. Separate fixture traps with interior partitions, except those lavatory traps made of plastic, stainless steel or other corrosion-resistant material.
3. "S" -traps.
4. Drum traps.
5. Trap designs with moving parts.

Exception: Non-Liquid seal type devices conforming to ASME A112.18.8 and in accordance with Section P3201.3

P3201.6P3201.7 Number of fixtures per trap. Each plumbing fixture shall be separately trapped by a water seal ~~trap-trap~~ or a device conforming to the requirements in Section P3201.3. The vertical distance from the fixture outlet to the trap weir of a liquid seal trap or the inlet of a device meeting the requirements of Section P3201.3 shall not exceed 24 inches (610 mm) and the horizontal offset distance of a liquid seal trap shall not exceed 30 inches (762 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section P2706.1.2. Fixtures shall not be double ~~trapped-trapped~~ with liquid seal traps and/or devices covered under section P3201.3.

Exceptions:

1. Fixtures that have integral traps.
2. A single trap or non-liquid seal device shall be permitted to serve two or three like fixtures limited to kitchen sinks, laundry tubs and lavatories. Such fixtures shall be adjacent to each other and located in the same room with a continuous waste arrangement. The trap shall be installed at the center fixture where three fixtures are installed. Common trapped fixture outlets shall be not more than 30 inches (762 mm) apart.
3. Connection of a laundry tray waste line into a standpipe for the automatic clothes-washer drain shall be permitted in accordance with Section P2706.1.2.1.

P3002.3.1 Drainage. Drainage fittings shall have a smooth interior waterway of the same diameter as the piping served. Fittings shall conform to the type of pipe used. Drainage fittings shall not have ledges, shoulders or reductions that can retard or obstruct drainage flow in the piping. Threaded drainage pipe fittings shall be of the recessed drainage type, black or galvanized. Drainage fittings shall be designed to maintain one-fourth unit vertical in 12 units horizontal (2-percent slope) grade. This section shall not be applicable to tubular waste fittings used to convey vertical flow upstream of the trap liquid seal liquid level of a fixture trap or a device conforming to P3201.3.

P3005.2.5 Cleanout size. Cleanouts shall be the same size as the piping served by the cleanout, except cleanouts for piping larger than 4 inches (102 mm) need not be larger than 4 inches (102 mm).

Exceptions:

1. A removable P-trap or non-liquid seal type device conforming to Section P3201.3 with slip- or ground-joint connections can serve as a cleanout for drain piping that is one size larger than the P-trap-tubular drain size.
2. Cleanouts located on stacks can be one size smaller than the stack size.
3. The size of cleanouts for cast-iron piping can be in accordance with the referenced standards for cast iron fittings as indicated in Table P3002.3.

P2704.1 Slip joints. Slip-joint connections shall be installed only for tubular waste piping and only between the trap outlet tailpiece of a fixture and traps, within traps, on devices conforming to section P3201.3, and on the connection to between tubular fixture drains and the drainage piping. piping system. Slip-joint connections shall be made with an approved elastomeric sealing gasket. Slip-joint connections shall be accessible. Such access shall provide an opening that is not less than 12 inches (305 mm) in its smallest dimension.

P2717.2 Sink and dishwasher. The combined discharge from a dishwasher and a one- or two-compartment sink, with or without a food-waste disposer, shall be served by a trap or device conforming to section P3201.3 of not less than 1½ inches (38 mm) in outside diameter. The dishwasher discharge pipe or tubing shall rise to the underside of the counter and be fastened or otherwise held in that position before connecting to the head of the food-waste disposer or to a wye fitting in the sink tailpiece.

Add new standard(s) follows:

ASME

American Society of Mechanical
Engineers
Two Park Avenue
New York NY 10016-5990

ASME A112.18.8-2009 (R2014) :

In-Line Sanitary Waste Valves for Plumbing Drainage Systems

Reason:

ASME standard A112.18.8-2009 (Re-affirmed in 2014) titled: "In-Line Sanitary Waste Valves for Plumbing Drainage" was developed for sanitary waste devices for use in lieu of p-traps for applications prone to liquid seal loss from evaporation, siphoning or freezing. They are certified by a third-party testing lab to the testing requirements in the ASME A112.18.8 Standard listed below. The devices are limited to tubular drains in sizes 1-1/4 inch or 1-1/2 inch outside diameter (OD).

This proposal is to add these non-liquid seal devices as an alternative to liquid seal traps for applications where evaporation, siphoning or freezing can be a problem. These devices will not fail from evaporation associated with long periods of non-use as would occur with a water filled p-trap or from negative pressures in the drainage systems that would siphon a p-trap, or from freezing which can crack or damage p-traps and p-trap joints. These devices

conform to ASME A112.18.8 and they are non-liquid sealing devices not traps or p-traps. They are an alternative to, and a better means of complying with the requirements of preventing sewer gases from entering a building. They fulfill the same function of a p-trap to not allowing sewer gases to pass into the building. These devices are approved and widely used in Europe and other international markets.

These devices are ideally suited for situations where plumbing fixtures experience only occasional use and can evaporate, like seasonal occupancy dwellings, vacation homes, guest bathrooms, cabins, on bar sinks, in low humidity conditions, or in persistent high temperature conditions. They also offer protection in freezing conditions and where there are limited or confined space conditions where a p-trap can conflict with structural or other building components. Other common uses for this type of device are in recreational vehicles and ships or boats

These devices have performed reliably for many years in millions of installations worldwide. They offer a better, more reliable option to a liquid seal p-trap especially in cases where evaporation, siphoning or freezing conditions exist.

The testing and performance requirements in the Standard for these devices are very stringent. P-Traps do not have a standard and are not tested. The tests for this device meet and exceed the performance capabilities of a p-trap. The tests in the standard include the following:

1. Seal materials shall meet various listed standards
2. Valve inlet/Outlet dimensions
3. Threaded connection dimensions
4. Gas-tight seal tests
5. Minimum flow rate tests for various tubing sizes/fixtures
6. One-way sealing performance tests
7. Airway flow rate tests
8. Thermal cycling Test
9. Long term cyclic fatigue tests
10. Grease/lard test
11. Resistance to cleaning chemicals and solvents test
12. Resistance to household substances and solids tests
13. Drop tests

The scope of the ASME A112.18.8 Standard establishes minimum requirements for materials in the construction of the devices for use as an alternate to tubular p-traps, and prescribes the minimum test requirements for the performance of the valve. In addition, the standard requires the methods of permanent marking and identification of the product. The standard also states that these devices are not intended to be used for urinals or water closets.

Below is an example of the type of valve that complies with the Standard:

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change is for a device that is an option to a p-trap. It is not required and therefore, will not cause an increase in construction. P-traps are still allowed. However, this code change allows for a better performing product as an approved option for areas where evaporation associated with seldom use of a fixture, siphoning or freezing may be an issue.

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.18.8-2009(R2014), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

- a. This table indicates manufacturing standards for plastic piping materials that are suitable for use in the applications indicated. Such applications support green and sustainable building practices. The system designer or the installer of piping shall verify that the piping chosen for an application complies with local codes and the recommendations of the manufacturer of the piping.
- b. Fittings applicable for the piping shall be as recommended by the manufacturer of the piping.
- c. Piping systems for fire sprinkler applications shall be listed for the application.

Reason:

This change is to add CSA B137.18 to the various applications in Table AG 101.1. CSA B137.18 is already included in the I Codes and is referenced in Chapter 44 - Reference Standards of the 2018 IRC.

Bibliography:

CSA B137.18 Polyethylene of Raised Temperature (PE-RT) Tubing Systems for Pressure Applications

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This standard is only another option to choose from. More options generally result in a lowering of the costs of construction.

Internal ID: 1045

RP16-18

IRC: Appendix U (New)

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)

2018 International Residential Code

Add new text as follows:

APPENDIX U **Water Efficiency**

AU101.1 Scope. This appendix shall apply to:

1. New buildings.
2. Additions to existing buildings.
3. Alterations to existing buildings.

SECTION AU102 DEFINITIONS

AU102.1 General. The following words and terms, for purposes of this appendix, shall have the meanings shown herein. Chapter 2 shall be referred to for general definitions.

Add new definition as follows:

AUTOMATIC. Self-acting, operating by its own mechanism when actuated by some impersonal influence, such as a change in current strength, pressure, temperature, or mechanical configuration.

AUTOMATIC IRRIGATION CONTROLLER. A timing device used to remotely control valves that operate an irrigation system.

REGENERATION. The maintenance process that restores a medium in a system so that it can continue to perform its water treatment function.

RUNOFF. Water that is not absorbed by the soil or landscape to which it is applied and flows from the landscape area.

SUBMETER. A meter installed subordinate to a utility service meter.

WATER SOFTENER. A pressurized water treatment device in which hard water is passed through a bed of cation exchange media (either inorganic or synthetic organic) for the purpose of exchanging calcium and magnesium ions for sodium or potassium ions, thus producing a softened water that is more desirable for laundering, bathing, and dishwashing.

AU103 PLUMBING FIXTURES AND FIXTURE FITTINGS

AU103.1 Maximum flow and water consumption. The maximum water consumption flow rates and quantities for plumbing fixtures and fittings shall be in accordance with Table AU103.1.

TABLE AU103.1

MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS^b

PLUMBING FIXTURE OR FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	1.5 gpm at 60 psi
Shower head ^a	2.0 gpm at 80 psi
Sink faucet ^c	1.8 gpm at 60 psi
Water closet	1.28 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa

a. A handheld shower spray shall be considered to be a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Kitchen faucets shall be permitted to have a temporary increase in flow to not exceed 2.2 gpm provided that upon either the user's physical release of the increased flow activation mechanism or the user's closure of the faucet valve, the faucet reverts to the flow indicated in the table.

AU104 WATER SOFTENERS AND TREATMENT DEVICES

AU104.1 Water softeners. Water softeners shall be listed and labeled in accordance with NSF 44 and shall comply with Sections AU104.1.1 through AU104.1.3.

AU104.1.1 Demand-initiated regeneration. Water softeners shall be equipped with demand-initiated regeneration control systems. Such control systems shall automatically initiate the regeneration cycle after determining the depletion, or impending depletion, of softening capacity.

AU104.1.2 Water consumption. Water softeners shall have a maximum water consumption during regeneration of 4 gallons per 1,000 grains of hardness removed as measured in accordance with NSF 44.

AU104.1.3 Salt efficiency. Water softeners shall have a rated salt efficiency of not less than 4,000 grains of total hardness exchange per pound of salt, based on sodium chloride equivalency.

AU104.2 Reverse osmosis water treatment systems. Point-of-use reverse osmosis systems shall be equipped with an automatic shutoff valve that prevents the production of reject water when there is no demand for treated water.

AU105 AUTOMATIC IRRIGATION SYSTEMS

AU105.1 Automatic irrigation controllers. Where installed as part of a permanent landscape irrigation system, irrigation controllers shall regulate irrigation based on weather, climatological, or soil moisture status data. The controller shall have an integrated or separate sensor to suspend irrigation events during rainfall.

AU105.2 Misdirection and runoff prohibited. Automatic irrigation systems shall not direct water onto building exterior surfaces, foundations, exterior paved surfaces, or adjoining lots. Systems shall not generate runoff.

AU105.3 Landscape water measurement. A submeter shall be installed to separately record the volume of all water supplied to an outdoor landscape with an irrigated area of 5,000 square feet or greater served by an automatic irrigation system.

Exception: Where a utility service meter is installed to record the volume of all water supplied to the landscape through a service connection dedicated to irrigation.

Reason:

This proposal adds a short, voluntary appendix to the IRC containing requirements that will enhance the water efficiency of dwellings subject to the code. The language of this appendix is NOT mandatory unless, and to the extent, specifically referenced in the adopting ordinance or regulation of the jurisdiction.

The purpose of the proposal is to offer enhanced water efficiency provisions applicable to one- and two-family homes in code language for consideration by jurisdictions using the IRC. The ICC offers enhanced or "stretch code" provisions for large buildings in the International Green Construction Code (IgCC), but the IgCC does NOT apply to low-rise residential buildings. The ICC also offers "green" building standards for residential buildings of all sizes in ICC 700, the National Green Building Standard. However, ICC 700 is a points-based rating system, NOT code language, and the practices in its chapter on water efficiency are not mandatory. This new appendix will fill this gap, allowing jurisdictions that customarily use the IRC the opportunity to consider enhanced water efficiency requirements in familiar code format.

The proposal is intentionally brief, focusing on three areas of water consumption where enhanced performance criteria are well-known, and that together are responsible for the great majority of single-family residential water use in nearly all jurisdictions -- plumbing products, water softening, and landscape irrigation.

* Plumbing products: Requirements are based on performance levels established by the US EPA WaterSense Program for water closets, lavatory faucets, and showerheads, and by the 2016 California Green Building Standards Code (CalGreen) for kitchen faucets. These provisions are all found in IgCC 2015 as well, in Table 702.1, applicable to

residential occupancies covered by that code.

* Water softeners and treatment devices: These requirements for water use and salt efficiency (an important consideration for maintaining water quality and the ability to beneficially recycle municipal wastewater) were all included in section 704 of IgCC 2015, and are adopted here for applicability to the one- and two-family homes covered by the IRC. Water consumption during regeneration and salt efficiency are considered "elective performance claims" under NSF 44, and must be verified by test procedures laid out in section 711 of that standard. The requirements for demand-initiated regeneration and salt efficiency have been mandatory requirements for all residential water softeners installed in California since 2002.

* Automatic irrigation systems: These requirements are also drawn from the IgCC, where landscape metering requirements are specified in section 701.2.1 and other irrigation system requirements are laid out in section 404.1.2. Although the IgCC requires separate metering for irrigated landscapes of all sizes, a less stringent requirement may be appropriate for single-family residences. This proposal limits the metering requirement to residential landscapes of 5,000 square feet or more, the threshold of applicability for landscape metering contained in the California Code of Regulations, Title 23, Chapter 2.7, also known as the Model Water Efficient Landscape Ordinance (MWELO). MWELO also requires that irrigation controllers in all newly permitted landscape installations in California be either weather-based or soil moisture sensor-based, as required in this proposal. Note that the requirements of section AU105 are only applicable to permanent irrigation systems with automatic controls, and have no applicability to hose-end sprinklers.

Terms that are not otherwise defined in the IRC are included in a definitions section of the appendix. The definitions have been drawn variously from the IgCC, MWELO, the IAPMO Green Plumbing and Mechanical Code Supplement, and NSF 330.

It should be noted that when considering this voluntary appendix, adopting jurisdictions are free to adopt the appendix in its entirety, but may adopt any individual provision of their choosing that they find most relevant to local conditions and most practical for enforcement. Each element of the proposal stands on its own. The scope of the proposal has also been drafted in such a way as to highlight its applicability to project types (new buildings, additions to buildings, and alterations) and allow adopting jurisdictions full latitude to narrow the scope in that regard should they so choose.

Each successive year brings new evidence of the impacts of our changing climate, and significant among these impacts are greater extremes and frequency of both droughts and floods. The hydrological record of the last 100 years has become less useful as a predictor of water supply reliability. Few can doubt that efficient water use will become even more important in the decades ahead than it is today. Residential water use typically constitutes 60 to 65% of all publicly supplied drinking water, and the majority of residential use is found in single-family homes. For all these reasons, the IRC would be made more valuable to jurisdictions throughout the country if it included enhanced water efficiency criteria in clear code language for voluntary adoption.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal offers enhanced water efficiency specifications for voluntary adoption by jurisdictions using the IRC. As such, there is no general impact on users of the IRC.

The content of this voluntary appendix establishes enhanced efficiency criteria for plumbing products, water softeners, and certain landscape irrigation equipment.

Regarding plumbing products, products are widely available from multiple manufacturers. Based on US EPA WaterSense product listings, as of September 2017 there are over 3,100 models of tank-type toilets, over 15,000 models of lavatory faucets, and nearly 6,000 models of showerheads that meet the criteria in this proposal. Although prices for plumbing products vary widely, based on considerations of style, color, and trim, there is no price premium attached to higher water use efficiency per se. See, for example, the staff reports of the California Energy Commission on standards for lavatory faucets and showerheads that found no price premium for products performing at the level proposed in this voluntary appendix.

Regarding water softeners, costs vary widely, but much of this difference is due to capacity, rather than efficiency of performance. The key criteria in this proposal have been statewide requirements for residential water softeners in California since 2002. As such, compliant products are widely available from multiple manufacturers. By way of illustration, as of this writing, the least expensive residential cation exchange water softener now available from Lowes fully complies with all criteria in this proposal (http://pdf.lowes.com/installationguides/090259891214_install.pdf), as does the least expensive cation exchange water softener available from Home Depot (<https://www.homedepot.com/b/Kitchen-Water-Filters-Water-Softeners/N-5yc1vZaq3y/Ntk-semanticsearch/Ntt-water+softener?NCNI-5>).

Regarding irrigation controllers, prices also vary widely, with a major driver being the number of zones controlled by the controller. Some 800 models of irrigation controllers have been certified to the WaterSense specification for weather-based irrigation controllers, so supply and choice of compliant products are ample. Smart controllers are now required for all newly permitted landscape installations in California, ensuring continued competitive interest in this product area. The prevailing price differential between a timer-based controller and a smart controller meeting the criteria of this proposal has been around \$100. But several products are on the market that cut this differential in half, and at least one weather-based irrigation controller is now on the market at a price comparable to a timer-based controller.

When products meet enhanced criteria for water efficiency, costs are typically recouped by savings on water and/or sewer charges over the life of the product. According to the 2016 Water and Wastewater Rate Survey, over the last decade, water charges have annually increased by 5.34 % and wastewater charges have annually increased by 5.98 %, far exceeding the annual inflation rate of 2.07 % for that period. These trends are expected to continue, underscoring the cost-effectiveness of installation of water-efficient products.

Country Club Hills, IL

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL SWIMMING POOL AND SPA CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some SP code change proposals may not be included on this list, as they are being heard by another committee.

ISPSC: 202

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Revise as follows:

SWIMOUT. An underwater seat area that is placed completely outside of the ~~perimeter shape~~ diving envelope of the pool. Where located at the deep end, swimouts are permitted to be used as the deep-end means of entry or exit to the pool.

Reason:

A swimout is not required to be outside of the perimeter shape of a pool. Many times they are located on those areas but they are not required to be. This revised wording agrees with Figure 322.2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only clarifies the original intent and normal practice of where swimouts are installed.

Internal ID: 1785

SP2-18

ISPSC: 202

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

SWIMOUT. An underwater ~~seat area shelf~~ shelf located in deep water that is placed completely outside of the perimeter shape of the pool. ~~Where located at the deep end, swimouts are permitted to be used as the deep end means of entry or exit to the pool with stairs leading to the deck.~~

Reason:

The definition was changed to clarify the differences between swimouts and underwater seats. The definition of the swimout was changed to better align with its intent as a entry to and exit from the deep end of a pool. The code does not recognize a swimout in shallow water as one of the required entry/exit from the pool, so in shallow water it is simply an underwater bench/seat and should be constructed accordingly.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This clarifies the definition of a swimout but the requirements for a swimout are addressed in another section of the code so this change in definition does not increase or decrease the cost of construction.

Internal ID: 1600

SP3-18

ISPSC: 202

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

UNDERWATER SEAT-BENCH. ~~An underwater ledge that is seat that can be recessed into the pool wall or placed completely inside the perimeter shape of the pool, generally located in the shallow end of the pool.~~

Reason:

The current code refers to both underwater seats and benches but only an "underwater seat" is defined. It is more common to call a seat within a pool or spa simply as an "underwater bench", which would be consistent with the Model Aquatic Health Code. The definition should be changed from "underwater seat" to "underwater bench". Underwater benches are commonly recessed into the pool wall or placed completed inside the perimeter shape of the pool.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is simply clarifying the definition of an underwater bench (seat) . Any requirements for the underwater bench are addressed separately within the code.

Internal ID: 1652

SP4-18

ISPSC: 305.1

Proponent: Tommy Moberg, Town of Acton, representing Town of Acton

2018 International Swimming Pool and Spa Code

Revise as follows:

305.1 General. The provisions of this section shall apply to the design of barriers for restricting entry into areas having pools and spas. Where spas a spa or hot tubs are tub is equipped with a lockable safety cover complying with ASTM F1346 and swimming pools are the areas where the spa or hot tub are located shall not be required to comply with Sections 305.2 through 305.7.Where a swimming pool is equipped with a powered safety cover that complies with ASTM F1346, and such cover is equipped with an occupant sensor to close the cover automatically when the swimming pool is not in use after 20 minutes, or is equipped with smart controller that alerts the pool owner when the pool cover has been opened, closed, and the amount of time the cover is open, the areas where those spas, hot tubs or pools are located shall not be required to comply with Sections 305.2 through 305.7.

Reason:

In the years leading up to the 2015 IPSC there has been a requirement for a passive barrier system. A design of that system was such that forgetting to close a gate, or close a door to the pool area was taken out of the day to day practice of pool safety. Install your barrier fence, self closing gates, alarms if needed and use your pool. But the new language only consists of an active system, and relies on the owner to uncover and recover the hazard after every use. This system has a high potential of failure. There needs to be some additional safety measures that will assist the owner to insure that the pool is safe when they forget to close the power safety.

Cost Impact

The code change proposal will increase the cost of construction .

The cost of the WIFI controller is around \$340.00 US.

Internal ID: 1139

SP5-18

ISPSC: 305.1.1 (New)

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

305.1.1 Construction fencing required. The construction sites for in-ground swimming pools and spas shall be provided with construction fencing to surround the site from the time that any excavation occurs up to the time that the permanent barrier is completed. The fencing shall be not less than 4 feet in height.

Reason:

Usually, a pool contractor is not responsible for the fencing whether permanent or temporary during construction of a pool. A pool can be under construction for several weeks (or more) which presents a fall hazard/drowning hazard where there is not some type of barrier in place. Sometimes a pool is completed and the builder has moved onto the next job without any barrier around the completed pool. This new section requires a temporary barrier until the permanent barrier is erected. The specifics about what type of barrier is acceptable are left up to the contractor with oversight by the code official. It is not the intent of this proposal to require a temporary barrier to be constructed to the same way as the code's requirements for a permanent barrier.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will increase the cost of construction .

Rental of temporary construction fencing and its installation will add cost to a pool project for those contractors who have not already been taking precautions to secure the excavation/pool construction site. One national average for rental installation for 120' x 6 foot high of chain link fencing panels and bases for 1 month is \$480. Job site conditions and project site location could greatly affect the cost.

Internal ID: 523

SP6-18

ISPSC: 305.2.9

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Swimming Pool and Spa Code

Revise as follows:

305.2.9 Clear zone. ~~There shall be a clear zone of~~ Where equipment, including pool equipment such as pumps, filters and heaters, is on the same lot as a pool or spa and such equipment is located outside of the barrier protecting the pool or spa, such equipment shall be located not less than 36 inches (914 mm) ~~between from the exterior of the barrier and any permanent structures or equipment such as pumps, filters and heaters that can be used to climb outside of~~ the barrier.

Reason:

When the ISPSC was drafted, the origin of the current language was the APSP standard covering on-ground pools. From the perspective of a 48 inch (or taller) wall of an on-ground pool serving as the barrier to entry into the pool and the fact that pumps, filters and heaters for on-ground pools are always on the outside of the pool wall, the current language has clear intent: don't locate such equipment (that can be climbed on top of) any closer than 36 inches from the outside of the pool wall.

However, as this section is located in the General Regulations chapter, the clear zone requirement applies to all pool types, including in-ground pools and spas that are required to have a separate barrier such as a fence. Although the requirement for not locating pool equipment in close proximity (less than 36 inches) to outside of the barrier (fence) is no less important, the possible locations of the barrier (fence) on the lot where the pool or spa is located creates enforcement difficulties. For example, where the barrier (fence) is located on one or more lot lines, the pool or spa owner has no legal control (over his neighbor) as to what the neighbor might place (within 36 inches) of the outside of the barrier (fence) nor can the code official enforce this code section on the neighbor (who is not the permit holder.) This has resulted in some building departments requiring that any pool (or spa) barriers (fences) be set back from any lot line by 36 inches so that pool owner (the lot owner) has the legal control over the 36 inch strip between the lot line and the pool barrier (fence.) The unfortunate results of this are: 1) for small lots, pools (or spas) cannot be as large or might not be feasible to build, 2) adjacent neighbors having pools will each have a barrier (fence) resulting in an unusable 6 feet wide strip of land between the fences, or 3) the presence of existing "permanent structures" on adjacent (neighboring) lots may preclude the installation of a pool or spa.

The original intent of the section was never intended to address any situation that was outside the confines of the lot on which the pool or spa is installed or constructed. Therefore, the revised language specifically addresses the required clearance with respect to pool equipment on the lot and not anything that is on the neighbor's side of the lot lines.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Internal ID: 524

SP7-18

ISPSC: 305.2.4.1 (New), 305.2.10

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

305.2.4.1 Setback for mesh fences. The inside of a mesh fence shall be not closer than 20 inches (508mm) to the nearest edge of the water of a pool or spa.

Delete without substitution:

~~**305.2.10 Poolside barrier setbacks.** The pool or spa side of the required barrier shall be not less than 20 inches (508 mm) from the water's edge.~~

Reason:

This proposal clarifies the original intent of section 305.2.10, which was to apply only to mesh fences, which are removable child barriers otherwise known as "baby barriers." The setback requirement was never intended to apply to walls, screen enclosures, other types of fencing, etc. The way the code is currently written it could be construed as applying to all types of barriers and not just the mesh fencing as intended. Therefore, this proposal simply deletes section 305.2.10 and then places this setback requirement as a subsection of the mesh fencing section, so it is applicable to only that type of barrier fence, as was always the original intent of this language.

Bibliography:

See 6th edition (2017) Florida Building Code, Section R4501.17.1.13 and any previous editions, which provide this language for mesh barriers:

R4501.17.1.13

Removable child barriers must be placed sufficiently away from the water's edge to prevent a young child or medically frail elderly person who may manage to penetrate the barrier from immediately falling into the water. Sufficiently away from the water's edge shall mean no less than 20 inches (508 mm) from the barrier to the water's edge. Dwelling or nondwelling walls including screen enclosures, when used as part or all of the "barrier" and meeting the other barrier requirements, may be as close to the water's edge as permitted by this code.

See 2007 Florida Building Code, Commentary for what was then section R4101.17.1.13, which provides commentary that clearly notes the intent of the setback is only for mesh fencing.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This will not increase the cost of construction, as it simply clarifies the original intent of the code provision.

Internal ID: 1754

SP8-18

ISPS: 305.3, 305.3.1, 305.3.2, 305.3.3, 305.3.4 (New), 305.4

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Swimming Pool and Spa Code

Revise as follows:

305.3 Gates—Doors and gates. ~~Access—Doors and gates in barriers shall comply with the requirements of Sections 305.3.1 through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access doors and gates shall open outward away from the pool or spa, shall be self-closing and shall have a self-latching device.~~

305.3.1 Utility or service doors and gates. ~~Gates—Doors and gates not intended for pedestrian use, such as utility or service doors and gates, shall remain locked when not in use.~~

305.3.2 Double or multiple doors and gates. ~~Double doors and gates or multiple doors and gates shall have not fewer than one leaf secured in place and the adjacent leaf shall be secured with a selflatching device. The gate and barrier shall not have openings larger than $\frac{3}{4}$ inch (12.7 mm) within 18 inches (457 mm) of the latch release mechanism. The self-latching device shall comply with the requirements of Section 305.3.3.~~device.

Delete and substitute as follows:

305.3.3 Latches. ~~Where the release mechanism of the self-latching device is located less than 54 inches (1372 mm) from grade, the release mechanism shall be located on the pool or spa side of the gate not less than 3 inches (76 mm) below the top of the gate, and the gate and barrier shall not have openings greater than $\frac{3}{4}$ inch (12.7 mm) within 18 inches (457 mm) of the release mechanism.~~

305.3.3 Latch release. For doors and gates in barrier, the door and gate latch release mechanisms shall be in accordance with the following:

1. Where door and gate latch release mechanisms are accessed from the outside of the barrier and are not of the self-locking type, such mechanism shall be located above the finished floor or ground surface in accordance with the following:
 - 1.1. At public pools and spas, not less than 52 inches (1219 mm) and not greater than 54 inches (1372 mm).
 - 1.2. At residential pools and spas, not less 54 inches (1372 mm)
2. Where door and gate latch release mechanisms are of the self-locking type such as where the lock is operated by means of a key, an electronic opener or the entry of a combination into an integral combination lock, the lock operation control and the latch release mechanism shall be located above the finished floor or ground surface in accordance with the following:
 - 2.1. At public pools and spas, not less than 34 inches and not greater than 48 inches (1219 mm).
 - 2.2. At residential pools and spas, at not greater than 54 inches (1372 mm).
3. At private pools, where the only latch release mechanism of a self-latching device for a gate is located on the pool and spa side of the barrier, the release mechanism shall be located at a point that is at least 3 inches (76 mm) below the top of the gate.

Add new text as follows:

305.3.4 Barriers adjacent to latch release mechanisms. Where a latch release mechanism is located on the inside of a barrier, openings in the door, gate and barrier within 18 inches (457 mm) of the latch, shall not be greater than $\frac{1}{2}$ inch (12.7 mm) in any dimension.

Revise as follows:

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the barrier and where doors, gates or windows provide direct access to the pool or spa through that wall, one of the following shall be required:

1. Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor, ~~doors and doors-gates~~ shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and *labeled* as a water hazard entrance alarm in accordance with UL 2017.
2. In dwellings ~~or structures~~ not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located at not less than 54 inches (1372 mm) or more above the finished floor.
3. In dwellings ~~or structures~~ that are required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.
4. In structures other than dwellings, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1220 mm) above the finished floor.
- ~~2-5.~~ A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the pools and spas.
- ~~3-6.~~ An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.

Reason:

Section 305.3.3 deals with latches for all gates providing access to a pool. Section 305.4 deals with alarms for doors and windows in a barrier. The current text seems to be applicable more for residential pools than public pools.

There are several reason for this proposal. Pools can be interior or exterior, so latch provisions should apply to doors as well as gates. The last sentence of 305.3.2 is not needed since Section 305.3 requires compliance with the whole section. Section 305.3.3 is dealing with a situation where you reach over a gate to open the latch. Fences around public pools are typically much higher. The requirements for latches should follow the IBC Section 1010.1.9.2. This section includes an exception for operable parts of manual latches to be above 48" so that they latch is outside the reach of children.

Section 305.4 Item 1 deals with the deactivation switch for alarms on doors or windows in a pool barrier. The same allowance for height protection for children is permitted. Dwelling units are separated from structures because this wall could be on a common corridor or in another building for pools that serve hotels, apartment buildings or other community buildings. In public areas these alarm shut offs must be accessible or addressed as employee only elements under Section 1103.2.2.

2018 IBC

1010.1.9.2 Hardware height. Door handles, pulls, latches, locks and other operating devices shall be installed 34 inches (864 mm) minimum and 48 inches (1219 mm) maximum above the finished floor. Locks used only for security purposes and not used for normal operation are permitted at any height.

Exception: Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to have operable parts of the release of latch on self-latching devices at 54 inches (1370 mm) maximum above the finished floor or ground, provided the self-latching devices are not also self-locking devices operated by means of a key, electronic opener or integral combination lock.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification of the height for pool latches and alarms only. There is no change to the cost for construction.

Internal ID: 551

SP9-18

ISPSC: 305.3.3, 305.4

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Revise as follows:

305.3.3 Latches. ~~Where Operable parts of the latch release mechanism of for the self-latching device is located that are located on the side of the gate away from the pool or spa shall be located not less than 54 inches (1372 mm) from grade, the release mechanism shall be above the finished floor or ground, whichever is higher. For public pools and public spas, such latch release shall be located at 54 inches (1372 mm) above the finished floor or ground, whichever is higher. For residential pools and residential spas, where the latch release of the self-latching device is located on the pool or spa side of the gate and is less than 54 inches (1372 mm) above the finished floor or ground, the latch release shall be located not less than 3 inches (76 mm) below the top of the gate, and the gate and barrier shall not have openings greater than 1/2 inch (12.7 mm) within 18 inches (457 mm) of the release mechanism.~~ latch release.

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the barrier and where doors or windows provide direct access to the pool or spa through that wall, one of the following shall be required:

1. Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor and doors shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and *labeled* as a water hazard entrance alarm in accordance with UL 2017. ~~In dwellings or structures dwelling units not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located 54 inches (1372 mm) or more above the finished floor. In dwellings or structures dwelling units required to be Accessible units, Type A units or Type B units, or in structures where the swimming pool is required to be accessible, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.~~
2. A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the pools and spas.
3. An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.

Reason:

The intent of the changes is to coordinate locking arrangements on gates and doors to public pools with the allowances worked out in the IBC as part of the coordination with ADA. At the same time, the language is being proposed to ensure that the latch is not under 54 inches, as this should not be permitted for safety reasons (all existing barrier codes and standards require a minimum 54 inches from the ground or floor to ensure a child cannot access the pool or spa without adult supervision). The definition for public pool and residential pool would determine where accessibility is appropriate.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, or devices are mandated beyond what is currently required by the code.

Internal ID: 1782

SP10-18

ISPSC: 305.8 (New)

Proponent: Timothy Pate, representing Colorado Chapter Code Change Committee (tpate@broomfield.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

305.8 Means of Egress. Outdoor public pools provided with barriers shall have means of egress as required by Chapter 10 of the International Building Code.

Reason:

I am proposing to add this new section that will give direction for outdoor public pools provided with barriers to have means of egress as required by Chapter 10 of the IBC. This will give direction as to how to figure out occupant loads along with required size and location of exits from pool and pool area. It will give direction for when you need doors or gates to swing in direction of travel and have panic hardware (when occupant load is 50 or more).

This is important in order to provide a safe exit system in the event of a weather event of possible chemical leak from pool chemical storage areas that may be adjacent to the pool areas.

I attempted to put language into section 305.3 during the 2015 code change cycle to calculate occupant load using the IBC and you would need to meet exit requirements from IBC for swing and panic hardware. The Committee had concerns that this would apply to both public and private pools and could also limit exits to only gates and not doors.

I brought it back to final action hearings by adding a new section in 305 and adding language to only apply to public pools.. I was not successful getting the required 2/3 vote to overturn the Committee recommendation for disapproval.

I would also clarify that this proposal is not adding any requirements to use the occupant load to determine required number of plumbing fixtures - only for means of egress requirements. Sections 403 and 410 have requirements for determining bather loads for Class B and C pools.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is just to clarify existing code requirements

Internal ID: 1181

SP11-18

ISPSC: 307.1.2.1 (New), Chapter 11

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

307.1.2 Colors and finishes. For other than *residential* pools and *residential* spas, the colors, patterns, or finishes of the pool and spa interiors shall not obscure objects or surfaces within the pool or spa.

307.1.2.1 Interior finishes. The interior finish coating on floors and walls shall be comprised of a non-pigmented white or pastel cementitious binder component together with a sand/aggregate component. The finish coating shall have an overall dry lightness level (CIE L* value) of 80.0 or greater and an overall wet luminous reflectance value (CIE Y value) of 50.0 or greater, as determined by test results provided by the manufacturer, utilizing testing methodology from ASTM D4086, ASTM E1477 and ASTM E1347.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor, P.O. Box C700
West Conshohocken PA 19428-
2959

D4086 - 92a(2012):

Standard Practice for Visual Evaluation of Metamerism

E1477 - 98a(2017):

Standard Test Method for Luminous Reflectance Factor of Acoustical Materials by Use of Integrating-Sphere Reflectometers

E1347 - 06(2015):

Standard Test Method for Color and Color-Difference Measurement by Tristimulus Colorimetry

Reason:

This proposal creates a quantifiable standard for allowable public pool and spa surface colors. The dry Lightness (CIE L* value) represents the whiteness of the dry finish surface when compared on a grey scale, where 0 = black and 100 = white. The wet Luminous Reflectance Value (CIE Y value) represents the brightness and/or contrast of the wet finish surface as a perceived visual response of the human eye. While neither value is a true representation, knowing both values allows additional insight into the finishes true aesthetic characteristics when placed in a water-submersion environment.

Bibliography:

Section 454.1.2.4 of the 6th edition (2017) Florida Building Code

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

A finish is always required; this just puts parameters on what finishes are allowed; therefore, it does not increase the cost.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D4086 - 92a(2012), ASTM E1477 - 98a(2017), and ASTM E1347 - 06(2015) with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

2018 International Swimming Pool and Spa Code

307.1.2 Colors and finishes. For other than *residential* pools and *residential* spas, the colors, patterns, or finishes of the pool and spa interiors shall not obscure objects or surfaces within the pool or spa.

Add new text as follows:

307.1.2.1 Munsell Color Value. Finishes shall be not less than 6.5 on the Munsell color value scale.

Exceptions: The following shall not be required to comply with this section:

1. Competitive lane markings.
2. Floors of dedicated competitive diving wells.
3. Step or bench edge markings.
4. Pools shallower than 24 inches (609.6 mm).
5. Water line tiles.
6. Wave and surf pool depth change indicator tiles.
7. Depth change indicator tiles where a rope and float line is provided.
8. Features such as rock formations, as approved.

Reason:

The Munsell color system looks at color purity, hue, and lightness to assign a value. This change will provide additional guidance on finish requirements for public pools and spas that will ensure consistency with the same requirements found in the Model Aquatic Health Code and in various state public pool codes regulated by health departments. This system is also used in other industries.

Bibliography:

Sections 4.5.11.1.1 - 4.5.11.1.3 of the Model Aquatic Health Code

ISPSC: 307.1.4, Chapter 11

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Swimming Pool and Spa Code

Revise as follows:

307.1.4 Accessibility. An accessible route to public pools and spas shall be provided in accordance with the International Building Code. Accessibility within public pools and spas shall be provided as required by the accessible recreational facilities provisions of the International Building Code. Pool and spa lifts providing an accessible means of entry into the water shall be listed and labeled in accordance with UL 60335-2-1000 and be installed in accordance with ICC A117.1 and NFPA 70.

Add new standard(s) follows:

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062

60335-2-1000:

Standard for Household and Similar Electrical Appliances: Particular Requirements for Electrically Powered Pool Lifts, with revisions through September 29, 2017

Reason:

Accessibility to public pools and spas is required by the American Disabilities Act and the International Building Code. Underwriters Laboratories (UL) has developed a new ANSI standard for pool and spa lifts that provides electrical and mechanical loading requirements, and complies with the prescriptive requirements in ANSI/ICC A117.1.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

Analysis: A review of the standard proposed for inclusion in the code, UL 60335-2-1000 September 29, 2017, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

ISPSC: 105.1, 307.2.5 (New), Chapter 11

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

307.2.5 Plaster. The plastering of pools and permanently installed concrete spas shall be in accordance with APSP/NPC/ICC-12.

Revise as follows:

[A] 105.1 When required. Any owner, or owner's authorized agent who desires to construct, enlarge, alter, repair, move, or demolish a pool or spa or to erect, install, enlarge, alter, repair, remove, convert or replace any system, the installation of which is regulated by this code, or to cause any such work to be performed, shall first make application to the code official and obtain the required permit for the work. A permit shall not be required for replastering or resurfacing of an existing pool or spa.

Add new standard(s) follows:

APSP

Error creating auto-diffed output.
(0x1)

The Association of Pool & Spa
Professionals
2111 Eisenhower Avenue, Suite 500
Alexandria VA 22314

ANSI/APSP/NPC/ICC 12 - 16:

American National Standard for the Plastering of Swimming Pools

Reason:

The Association of Pool & Spa Professionals, in conjunction with the National Plasters Council and ICC have developed the ANSI/APSP/NPC/ICC-12 American National Standard for the Plastering of Swimming Pools. This Standard provides clear requirements when plastering a swimming pool or a permanently installed concrete spa, in both residential and commercial settings. A proposal to add it to the reference standard list will also occur during the Group B cycle.

Plastering is the final coating applied to the shell of a concrete pool or spa. White is the most common, but it can be tinted to other colors by using pigmented aggregate. Pool plaster adds a watertight seal and makes the surface of the pool smoother for contact with swimmers than the underlying rough concrete shell. The pool plaster is a key element for the aesthetic and overall enjoyment of the pool or spa and this standard will ensure that it is applied properly.

The addition of the language under Section 105.1 is to ensure that there is no confusion as to how this standard would be applied upon its adopting into the ISPSC. The intent of the standard was never to require a permit for a replaster of an existing pool or spa; rather, it is for new construction.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction; rather, it will help ensure a proper plaster was put on the pool, decreasing the costs to consumers associated with having to redo a bad plaster job.

Analysis: A review of the standard proposed for inclusion in the code, APSP/NPC/ICC-12- 16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1758

SP15-18

ISPSC: 311.3, 311.3.1 (New), 311.3.2 (New)

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Revise as follows:

311.3 Water velocity. ~~The water velocity in return lines suction and return piping shall comply with either Section 311.3.1 or 311.3.2. The water velocity in copper and copper alloy piping shall not exceed 8 feet-fps (2.4 m) per second. The mps). All water velocity in suction piping shall be as required by Section 310.~~ calculations shall be based on the design flow rate specified for each recirculation system.

311.3.1 Public pools and spas. For public pools and spas, suction piping water velocity shall not exceed 6 fps (1.8 mps) and return piping water velocity shall not exceed 8 fps (2.4 mps).

311.3.2 Residential pools and spas. For residential pools and spas, the water velocity in suction piping and return piping shall not exceed 8 fps (2.4 mps).

Reason:

The proposed changes clarify water velocity related requirements by locating them in one location, Section 311.3.

Return piping water velocity limits are addressed in Section 311.3 of all versions of the ISPSC code, while suction piping water velocity limits are addressed in APSP 7 - 2006 (referenced in ISPSC-2012 only), but not APSP 7 - 2013 (referenced by ISPSC 2015 and 2018).

This was a technical reference glitch associated with the transfer of APSP-16, standard for suction outlet fitting assemblies moving from the American Society of Mechanical Engineers (ASME) to the Association of Pool and Spa Professionals (APSP). The suction piping water velocity provided in this proposal did not change and remains consistent with ANSI/APSP-1, -2, -3 and -5, pool and spa construction standards as well as the CDC's Model Aquatic Health Code (MAHC).

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction because additional labor and materials beyond what is currently required by the code. Specifically, in some cases, the suction piping might have to be larger in order to control the velocity through the suction piping.

Gas-fired water heater	ANSI Z21.56/CSA 4.7a
Heat pump water heater	UL 1995, AHRI 1160, CSA C22.2 No. 236

Add new text as follows:

**TABLE 316.2(2)
WATER HEATING SYSTEMS AND COMPONENTS**

SYSTEM	STANDARD
<u>Solar water heater</u>	<u>ICC/APSP 902/SRCC 400</u>

316.4 Installation. Heaters shall be installed in accordance with the manufacturer's specifications and the International Fuel Gas Code, International Mechanical Code, International Energy Conservation Code, NFPA 70 or International Residential Code, as applicable in accordance with Section 102.7.1. ~~Solar thermal-water heaters~~ heating systems shall be installed in accordance with Section 316.6.

316.6 ~~Solar thermal-water heaters~~ heaters systems. ~~Solar thermal heaters~~ water heating systems utilized for pools and spas shall comply with Sections 316.6.1 through ~~316.6.2-316.6.3.~~

316.6.1 Installation. Solar thermal water heaters shall be installed in accordance with the International Mechanical Code or International Residential Code, as applicable in accordance with Section 102.7.1.

316.6.2 ~~Collectors and panels~~ Certification of collectors. Solar thermal collectors ~~and panels~~ shall be listed and labeled in accordance with ICC 901/SRCC 100 ~~or ICC 900/SRCC 300.~~ ~~Collectors and panels shall be permanently marked with the manufacturer's name, model number, and serial number. Such markings shall be located on each collector in a position that is readily viewable after installation of the collector or panel.~~

316.6.3 Marking of Collectors and modules. Solar thermal collectors and photovoltaic modules shall be permanently marked with the manufacturer's name, model number, and serial number. Such markings shall be located on each collector in a position that is readily viewable after installation.

Add new standard(s) follows:

ICC

International Code Council, Inc.
500 New Jersey Avenue, NW 6th
Floor
Washington DC 20001

ICC 902/APSP 902/SRCC 400-2018:

Solar Pool and Spa Heating System Standard

Reason:

SRCC has recently completed a standard titled ICC/APSP 902/SRCC 400 (“SRCC 400”), Solar Pool and Spa Heating System Standard. This standard addresses full solar pool heating systems, not just the collectors. Previously the code cited ICC 901/SRCC 100 for solar thermal collectors and ICC 900/SRCC 300 for systems. While ICC 900/SRCC 300 included solar pool heating systems in its scope, they were not addressed in the 2015 edition. Therefore, no standards were in place for solar pool heating systems (except the collectors) in the ISPSC. The insertion of the new standard fills this gap and removes ICC 900/Standard 300, which does not contain any material for pools.

The new standard also addresses a wide range of safety topics related to these systems including material compatibility, high temperature and suction entrapment safety. These are of particular importance since solar pool heating systems are often retrofitted to existing pools and spas, and therefore are not integrated by the original recirculation system designer. It is critical to ensure that they do not degrade the performance or safety of the pool itself, or introduce new hazards.

The SRCC 400 standard allows for the use of solar water heating using photovoltaic modules. These modules are electrical rather than thermal. As a consequence, the term “solar thermal water heaters” has been replaced with the universal phrase “solar water heating systems” throughout the proposal. The new term addresses both thermal and photovoltaic systems in a manner consistent with the standard. Additionally, the term “panel” has been changed to more universal term “module” to properly refer to these devices.

Existing Table 316.2 has been re-cast as two separate tables. New Table 316.2(1) (modified existing table 316.2) proposes to reference the appropriate standards for factory-built, appliance-type water heaters that can be wholly listed and labeled to demonstrate compliance. In contrast, new Table 316.2(2) addresses water heating systems with solar water heaters, which are generally, but not always, site-assembled. Heat exchangers, a component of water heating systems, are addressed in Table 316.2(2) along with the reference to the new SRCC 400 standard.

The titles of Sections 316.2 and 316.6.2 have been changed to make each consistent with terminology used in the ISPSC, specifically Section 1001.4. Section 316.6 is modified to reflect the use of SRCC 400. Section 316.6 also has been broken into multiple sections to enhance clarity.

Cost Impact

The code change proposal will increase the cost of construction .

Any costs of certification will be borne by the heater and collector manufacturers. This may marginally increase the cost of heaters and panels. Pool system manufacturers participated in the creation of the standard and are aware of the potential certification cost implications.

Analysis: A review of the standard proposed for inclusion in the code, ICC 902/APSP 902/SRCC 400-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1383

SP17-18

ISPSC: Table 316.2, Chapter 11

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Swimming Pool and Spa Code

Revise as follows:

**TABLE 316.2
WATER HEATERS**

DEVICE	STANDARD
Electric water heater	UL 1261, UL 1563 or CSA C22.2 No. 218.1
Gas-fired water heater	ANSI Z21.56/CSA 4.7a
Heat exchanger	AHRI 400
Heat pump water heater	AHRI 1160 <u>and one of the following:</u> UL 1995, CSA C22.2 No. 236 <u>or</u> <u>UL/CSA 60335-2-40</u>

Add new standard(s) follows:

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062

UL/CSA 60335-2-40-17:

Standard for Safety for Household and Similar Electrical Appliances - Safety - Part 2-40: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers.

Reason:

The UL Standard for Safety for Heating and Cooling Equipment, UL 1995 will be phased out by the year 2020, and will be replaced by UL 60335-2-40, the Standard for Safety for Household and Similar Electrical Appliances, Part 2-40: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers. UL 60335-2-40 is harmonized with requirements in Canada and Europe. These requirements include provisions for the most current technology and use of flammable refrigerants, and is currently being used to list new products.

The word "or" is added where there are multiple standards for different types of heaters, because only one standard needs to be used, except for AHRI 1160. AHRI 1160 is a performance standard, not a safety standard.

Reference:

[http://ahrinet.org/App_Content/ahri/files/standards%20pdfs/ANSI%20standards%20pdfs/ANSI_AHRI_Standard_1160_\(I-P\)-2014.pdf](http://ahrinet.org/App_Content/ahri/files/standards%20pdfs/ANSI%20standards%20pdfs/ANSI_AHRI_Standard_1160_(I-P)-2014.pdf)

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

For new products, there will not be a cost increase. For existing products, manufacturers will need to have those products evaluated to the new requirements.

Analysis: A review of the standard proposed for inclusion in the code, UL 60335-2-40-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 429

SP18-18

ISPSC: 317.1

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

317.1 General. This section applies to devices and systems that induce or allow air to enter ~~pools and~~ spas either by means of a powered pump or passive design.

Reason:

As originally written the ISPSC was allowing devices and systems that induce or allow air to enter pools. Air that is entrained in the water obscures the visibility into the water as light is refracted.

While air is allowed in spas, the depth of spas is more closely regulated and the patrons are intended to be walking into and seated while the spa is in use. Generally the duration of the air is also limited by a timer at which point visibility into the spa is returned as the air dissipates.

Where hydrotherapy jets have been installed in pools it has been observed that the air introduced through the jets can obscure the visibility into large portions of the pool and the jets typically never shut down. The patrons may be able to walk or depending on the depth they may need to swim. It has been observed that the hydrotherapy jets in pools can induce a current making it difficult for young children to safely return to the side/handhold of the pool.

In the definition of air induction system it means a system where air is introduced into hollow ducting built into a spa floor, bench, or hydrotherapy jets. A pool was not included in the definition of an air induction system.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal would strike "pool" from the general requirements for air blower and air induction systems. This aligns the code requirements with the definition. This would decrease the construction cost by the cost of the air blowers or air induction system which vary significantly based by the size and scope of the project from several hundred dollars to tens of thousand of dollars.

Internal ID: 1408

SP19-18

ISPSC: 319, 319.2, 508, 508.1

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Revise as follows:

SECTION 319 SANITIZING EQUIPMENT AND CHEMICAL FEEDERS

319.2 Chemical feeders. ~~Where installed, chemical~~ Public pools and spas shall be equipped with chemical feed equipment such as flow-through chemical feeders, electrolytic chemical generators, mechanical chemical feeders, chemical feed pumps, and automatic controllers that are listed and labeled in compliance with NSF 50. Chemical feed systems shall be installed in accordance with the manufacturer's specifications. Chemical feed pumps shall be wired so that they cannot operate unless there is adequate return flow to disburse the chemical throughout the pool or spa as designed.

Delete without substitution:

~~SECTION 508 SANITIZING, OXIDATION EQUIPMENT AND CHEMICAL FEEDERS~~

~~508.1 Automatic controllers.~~ ~~Where an automatic controller is installed on a spa or hot tub for public use, the controller shall be installed with an automatic pH and an oxidation-reduction potential controller *listed and labeled* in compliance with NSF 50.~~

Reason:

The changes clarify that chemical feeder systems are required in public pools and spas and what type of systems are allowed. The change then removes what is found in Chapter 5 as it would contradict the new language in Section 319.

The addition of the chemical feeder requirement is consistent with the Model Aquatic Health Code.

Bibliography:

See section 4.7.3 of the Model Aquatic Health Code

<https://www.cdc.gov/mahc/editions/current.html>

Cost Impact

The code change proposal will increase the cost of construction .

For jurisdictions that do not currently require chemical feed systems in public pools and spas, this would increase the cost by requiring such systems.

Internal ID: 1526

SP20-18

ISPSC: 321.2.3

Proponent: John Kelly, representing self (john.kelly@idph.iowa.gov)

2018 International Swimming Pool and Spa Code

Revise as follows:

321.2.3 Underwater lighting. Underwater lighting shall provide not less than 8 horizontal foot-candles (8 lamp lumens per square foot) [86 lux] at the pool water surface area, or not less than a total wattage of $\frac{3}{2}$ watt/ft² (5.4 watts/m²) of pool water surface for incandescent underwater lighting where the fixtures and lamps are rated in watts/area.

Exception: The requirement of this section shall not apply where overhead lighting provides not less than 15 foot-candles (15 lumens per square foot) [161 lux] of *maintained illumination* at the pool water surface, the overhead lighting provides visibility, without glare, of all areas of the pool, and the requirements of Section 321.2.2 are met or exceeded.

Reason:

It is unnecessary and inconsistent to provide separate requirements (watts/sqft) for incandescent lighting versus (lamp lumens/sqft) for other forms of lighting as both incandescent lighting and other forms of lighting (i.e. LED lighting) are rated based on the light output of the lamp in lumens. Historically the total installed wattage of the underwater lighting was used as it was more easily measured, but as more efficient lighting (i.e. LED's, etc.) have become available the light output of the lamps in lumens has replaced requirements based on wattage as the light output is more relevant.

As originally written in the code, the requirement for the underwater lighting establishes a minimum lighting level in footcandles at the pool water surface. Overhead lighting is designed to provide a minimum lighting level (i.e. footcandles) at the pool water surface, as a significant amount of the light directed at the water surface penetrates the water surface to light the bottom and sides of the pool. Please note however that the underwater lighting is already located below the water surface and it is undesirable to direct the underwater lighting at the water surface, rather it is designed to be directed at the pool walls and the bottom of the pool. The design for underwater lighting is not based on a minimum light level (i.e. footcandles) at the water surface, rather it is designed based on the total installed lamp output in lumens divided by the area of the pool in square feet and is generally provided through multiple lights positioned evenly around the pool to light the walls and floor of the swimming pool. The requirement should be updated to avoid confusion and require a minimum total lamp lumens of the installed underwater lighting divided by the total water surface area in square feet.

As examples, the Bibliography refers to underwater lighting requirements in the Model Aquatic Health Code (MAHC) and Iowa Swimming Pool and Spa rules.

Bibliography:

Iowa Administrative Code-Swimming Pools and Spas

https://idph.iowa.gov/Portals/1/userfiles/120/641_15.pdf Page 35, Para. (2),k,(1)

2016 Model Aquatic Health Code

<https://www.cdc.gov/mahc/pdf/2016-mahc-code-final.pdf> Page 87 Para. 4.6.1.5.1

Cost Impact

The code change proposal will decrease the cost of construction .

The code as written would require more lighting as it is requiring 8 footcandles (lumen per square foot) at the water surface rather than simply a total of 8 lamp lumens per square foot of pool water surface area. The intent of underwater lighting is not to light the water surface, rather the lighting should be directed at the pool walls and bottom.

Internal ID: 1439

SP21-18

ISPSC: 322.3.1

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Revise as follows:

322.3.1 Wall clearance. There shall be a clearance of not less than 3 inches (76 mm) and not greater than ~~6~~4 inches (~~152~~101.6 mm) between the pool wall and the ladder.

Reason:

This change is being proposed to address safety concerns, as a smaller opening will help prevent arms and legs from getting stuck behind the rails. The 4 inch max standard is the same for railings, fences, playground equipment, etc.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change should not increase or decrease the cost of construction as some manufacturers of ladders will only have to make a small adjustment to the design of their product so that when the product is installed, the ladder can comply with the revised maximum allowance of wall clearance.

Internal ID: 1518

2018 International Swimming Pool and Spa Code

SECTION 202 DEFINITIONS

Add new definition as follows:

CHEMICAL STORAGE SPACE A space in an aquatic facility used for the storage of pool or spa chemicals such as acids, salt, or corrosive or oxidizing chemicals.

EQUIPMENT ROOM A space intended for the operation of pool pumps, filters, heaters, and controllers. This space is not intended for the storage of hazardous pool or spa chemicals.

INDOOR AQUATIC FACILITY A physical place that contains one or more pools or spas and the surrounding bather and spectator/stadium seating areas within a structure that meets the definition of building in the International Building Code. It does not include equipment, chemical storage, or bather hygiene rooms or any other rooms with a direct opening to the aquatic facility. Also known as a natatorium.

Add new text as follows:

SECTION 324 EQUIPMENT ROOMS

324.1 General. The provisions of this section apply to public pools and spas and aquatic recreation facilities.

324.2 Requirements. The equipment area or room floor shall be of concrete or other suitable material having a smooth slip resistant finish and have positive drainage, including a sump drain pump, if necessary. Floors shall have a slope toward the floor drain and/or sump drain pump adequate to prevent standing water at all times. The opening to the equipment room or area shall be designed to provide access for all anticipated equipment. At least one hose bibb with backflow preventer shall be located in the equipment room or be accessible within an adequate distance of the equipment room so that a hose can service the entire room.

324.3 Construction. The size of the equipment room or area shall provide working space to perform routine operations and equipment service. Equipment rooms also intended for storage shall have adequate space provided for such storage, without reducing the working spaces. Equipment rooms or areas shall be lighted to provide 30 foot candles (323 lux) of illumination at floor level.

324.4 Electrical. All electrical wiring shall be installed in accordance with NFPA 70.

324.5 Ventilation. Equipment room ventilation shall address:

1. Combustion requirements,
2. Heat dissipation from equipment,
3. Humidity from surge or balance tanks,
4. Ventilation to the outside, and
5. Air quality.

324.6 Markings. All piping in the equipment room shall be permanently identified by its use and the pool or spa it serves. Identification shall be provided for:

1. Main drains and skimmer lines,
2. Filtered water,
3. Make-up water,

4. Chlorine (or disinfection) feeds.
5. Acid (or pH) feeds.
6. Compressed air lines.
7. Gutter lines.
8. Chemical sample piping, and
9. Pool heating lines.

All piping shall be marked with directional arrows as necessary to determine flow direction and all valves shall be clearly identified by number with a brass tag, plastic laminate tag or permanently affixed alternate. Valves shall be described as to their function and referenced in the operating instruction manual.

324.7 Separation from Chemical Storage Spaces. Combustion equipment, air-handling equipment, and electrical equipment shall not be exposed to air contaminated with corrosive chemical fumes or vapors. Spaces containing combustion equipment, air handling equipment, and/or electrical equipment and spaces sharing air distribution with spaces containing such equipment shall not be used as chemical storage spaces at the same time unless the equipment is listed and labeled for use in that atmosphere. Spaces containing combustion equipment, air handling equipment, or electrical equipment and spaces sharing air distribution with spaces containing such equipment shall be isolated from chemical storage space air.

324.7.1 Doors and openings. A door or doors shall not be installed in a wall between such equipment rooms and an interior chemical storage space. There shall be no ducts, grilles, pass-throughs, or other openings connecting such equipment rooms to chemical storage spaces, except as permitted by the International Fire Code. Spaces containing combustion equipment, air-handling equipment, and/or electrical equipment and spaces sharing air distribution with spaces containing such equipment shall be isolated from indoor aquatic facility air unless the equipment is listed for the atmosphere. There shall be no ducts, grilles, pass-throughs, or other openings connection such spaces to an indoor aquatic facility. Ducts which connect the indoor aquatic facility to the duct connections of air handlers shall not be construed as connecting the air-handler space to the indoor aquatic facility unless HVAC equipment is rated for indoor aquatic facility atmosphere and serves only that indoor aquatic facility. Where building construction leaves any openings or gaps between floors and walls, or between walls and other walls, or between walls and ceilings, such gaps shall be permanently sealed against air leakage.

324.7.2 Indoor Aquatic Facility Access. Where a door or doors are installed in a wall between an equipment room and an indoor aquatic facility, the floor of the equipment room shall slope back into the equipment room in such a way as to prevent any equipment room spills from running under the door into the indoor aquatic facility. This requirement shall be accomplished by one of the following:

1. A floor all of which is at least 4 inches below the level of the nearest part of the indoor aquatic facility floor.
2. A continuous dike not less than 4 inches high located entirely within the equipment room, which will prevent spills from reaching the indoor aquatic facility floor.

324.7.2.1 Automatic closer and lock. A door between an equipment room and an indoor aquatic facility shall be equipped with an automatic closer and automatic lock. The door, frame, and automatic closer shall be installed so as to ensure that the door closes completely and latches without human assistance. The automatic lock shall require a key or combination to open from the indoor aquatic facility side. The lock shall be designed and installed to be opened by one hand from the inside of the room under all circumstances, without the use of a key or tool. Such doors shall be equipped with permanent signage warning against unauthorized entry. All sides of such doors shall be equipped with a gasket. The gasket shall be installed to prevent the passage of air, fumes, or vapors when the door is closed.

324.8 Chemical storage space. A least one space dedicated to chemical storage space shall be provided to allow safe storage of pool and spa chemicals. In all chemical storage spaces, an emergency eyewash station shall be provided. The construction of a chemical storage space shall take into account foreseeable hazards and protect the stored materials against tampering, wild fires, unintended exposure to water and the transfer of fumes into any interior space of a building intended for occupation. Any walls, floors, doors, ceilings, and other building surfaces of an interior chemical storage space shall join each other tightly. If chemicals are to be stored outdoors, they shall be stored in a well-ventilated protective area with an installed barrier to prevent unauthorized access. Exterior chemical storage spaces not joined to a wall of a building shall be completely enclosed by fencing that is at least 6 feet high. Fencing shall be equipped with a self-closing and self-latching gate having a permanent locking device.

324.8.1 Chemical storage space doors. All doors opening into chemical storage spaces shall be equipped with

permanent signage:

1. Warning against unauthorized entry, and
2. Specifying the expected hazards, and
3. Specifying the location of the associated safety data sheet forms, and
4. Product chemical hazard NFPA chart.

Where a single door is the only means of egress from a chemical storage space, the door shall be equipped with an emergency-egress device. Where a chemical storage space door must open to an interior space, spill containment shall be provided to prevent spilled chemicals from leaving the chemical storage space and the door shall not open to a space containing combustion equipment, air-handling equipment, or electrical equipment.

324.8.1.2 Interior opening. Where a chemical storage space door must open to an interior space, such door shall have all of the following requirements:

1. Constructed of corrosion-resistant materials.
2. Equipped with a corrosion-resistant, automatic lock to prevent unauthorized entry.
 - 2.1. Such lock shall require a key or combination to open from the outside into the chemical storage space.
 - 2.2. Such lock shall be designed and installed as to be capable of being opened by one hand from the inside of the chemical storage space without the use of a key or tool.
3. Supported on corrosion-resistant hinges, tracks, or other supports.
4. Equipped with suitable gaskets or seals on the top and all sides to minimize air leakage between the door and the door frame.
5. Equipped with a floor or threshold seal to minimize air leakage between the door and the floor or threshold.
6. Equipped with an automatic door closer that will completely close the door and latch without assistance and close the door completely against the specified difference in air pressure.
7. Equipped with a limit switch and an alarm that will sound if the door remains open for more than 30 minutes. The alarm shall have a minimum output level of 85 dbA at 10 feet.

324.8.2 Interior chemical storage spaces. There shall be no transfer grille, pass-through grille, louver, or other device or opening that will allow air movement from the chemical storage space into any other interior space of a building intended for occupancy or into another chemical storage space. Interior chemical storage spaces that share any building surface with any other interior space shall be equipped with a ventilation system that operates continuously and insures that all air movement is from all other interior space and toward the chemical storage space. Interior chemical storage spaces that share an electrical conduit system with any other interior space shall be equipped with a ventilation system that operates continuously and insures that all air movement is from all other interior spaces and toward the chemical storage space. This pressure difference shall be maintained by a continuously operated exhaust system used for no other purpose than to remove air from that one chemical storage space. Where more than one chemical storage space is present, a separate exhaust system shall be provided for each chemical storage space. The exhaust airflow rate shall be the amount specified in the International Mechanical Code. The function of this exhaust system shall be monitored continuously by an audible differential-pressure alarm system which shall sound if the specified differential air pressure is not maintained for a period of thirty minutes. This alarm shall have a minimum output level of 85 dbA at 10 feet and shall require manual reset to silence it.

324.8.2.1 Air ducts in interior chemical storage spaces. No duct shall allow air movement from the chemical storage space into any other interior space of a building intended for occupation or into any other chemical storage space. Air ducts shall not enter or pass through an interior chemical storage space unless it is a corrosion-resistant duct used for no other purpose than to exhaust air from the chemical storage space. This corrosion-resistant duct must exhaust to the exterior and must end at a point on the exterior of the building, at least 20 feet from any air intake for breathing air, cooling air, or combustion air. A duct used for no other purpose than to supply makeup air to the chemical storage area shall be acceptable. This makeup air supply duct must end at a point on the exterior of the building, at least 20 feet from any air intake for breathing air, cooling air, or combustion air. Any other ducts specifically allowable by the International Mechanical Code where such ducts are corrosion-resistant and joint-free to the extent feasible shall be acceptable.

324.8.2.2 Pipes and tubes in interior chemical storage spaces. Pipes and tubes shall not enter or pass

through an interior chemical storage space.

Exceptions:

1. As required to service devices integral to the function of the chemical storage space, such as pumps, vessels, controls, freeze protection, and safety devices.
2. As required to allow for automatic fire suppression.
3. As required for drainage.

Piping, tubes, drain bodies, grates, and attachment and restraint devices shall be corrosion-resistant and rated for the chemical environment(s) present including floor drain bodies and grates. All wall penetrations shall be sealed air-tight and commensurate with the rating of the wall assembly. Sealing materials shall be compatible with the wall assembly and the chemical environment(s) present.

324.8.2.3 Combustion equipment in interior chemical storage. No combustion device or appliance shall be installed in a chemical storage space, or in any other place where it will be exposed to the air from a chemical storage space.

Exceptions: A combustion device or appliance which meets all of the following requirements shall be acceptable:

1. The device or appliance is required for one or more processes integral to the function of the room, such as space heat, and
2. The device is listed for such use, and
3. The device as installed is approved.

324.9 Ozone rooms. An ozone equipment room shall not be used for storage of chemicals, solvents, or any combustible materials, other than those required for the operation of the recirculation and ozone generating equipment. Rooms which are designed to include ozone equipment shall be equipped with an emergency ventilation system capable of 6 air changes per hour. The exhaust intake shall be located 6 inches from the floor, on the opposite side of the room from the make-up air intake. The emergency ventilation system shall be so arranged as to run on command of an ozone-leak alarm or on command of a manual switch. The manual emergency ventilation switch shall be located outside the room and near the door to the ozone room. Ozone rooms which are below grade shall be equipped with force-draft ventilation capable of 6 changes per hour. The exhaust intake shall be located 6 inches from the floor, on the opposite side of the room from the make-up air intake. Such ventilation shall be so arranged as to:

1. Run automatically concurrent with the ozone equipment and for at least a time allowing for 15 air changes after the ozone equipment is stopped,
2. Run upon activation of the ozone detection and alarm system, and
3. Run on command of a manual switch.

The manual ventilation switch shall be located outside the room and near the door to the ozone room.

324.9.1 Signage. In addition to the signs on all chemical storage areas, a sign shall be posted on the exterior of the entry door, stating "DANGER - GASEOUS OXIDIZER -- OZONE" in lettering not less than 4 inches high.

324.9.2 Alarm system. Rooms containing ozone generation equipment shall be equipped with an audible and visible ozone detection and alarm system. The alarm system shall consist of both an audible alarm capable of producing at least 85 decibels at 10 feet distance and a visible alarm consisting of a flashing light mounted in plain view of the entrance to the ozone-equipment room. The ozone sensor shall be located at a height of 18-24 inches above floor level. The ozone sensor shall be capable of measuring ozone in the range of 0-2 ppm. The alarm system shall alarm when the ozone concentration equals or exceeds 0.1 ppm in the room. Activation of the alarm system shall shut off the ozone generating equipment and turn on the emergency ventilation system.

324.10 Gaseous chlorination space. Use of compressed chlorine gas shall be prohibited for new construction and after substantial alteration to existing facilities.

324.11 Windows. When installed in an interior wall, ceiling, or door of a chemical storage space, such window shall have the following components:

1. Tempered or plasticized glass,
2. A corrosion-resistant frame, and
3. Incapable of being opened or operated.

When installed in an exterior wall or ceiling, such window shall:

1. Be mounted in a corrosion-resistant frame and
2. Be so protected by a roof, eave, or permanent awning as to minimize the entry of rain or snow in the event of window breakage.

324.12 Sealing and blocking materials. Materials used for sealing and blocking openings in an interior chemical storage space shall:

1. Minimize the leakage of air, vapors, or fumes from the chemical storage space,
2. Be compatible for use in the environment, and
3. Commensurate with the fire rating assembly in which they are installed.

Reason:

The ISPSC has no detailed requirements for equipment rooms, chemical storage facilities, etc. The proposal provides the requirements found in the Model Aquatic Health Code in order to have consistency between the codes.

Further, major aspects of public pool and spa, and aquatic recreational facility construction are missing in the current ISPSC. Providing these types of additions may encourage a jurisdiction that currently finds the public pool portion of the ISPSC as deficient, to adopt this code in its entirety.

Bibliography:

Section 4.9 of the Model Aquatic Health Code

<https://www.cdc.gov/mahc/editions/current.html>

Cost Impact

The code change proposal will increase the cost of construction .

If a jurisdiction does not already have equipment and chemical storage room requirements for public facilities, then these changes could increase the cost of construction.

Internal ID: 1528

SP23-18

ISPSC: 324 (New), 324.1 (New), Chapter 11

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

324 INDOOR AIR QUALITY

324.1 General. Indoor pool and spa air handling system design, construction, and installation shall comply with ASHRAE 62.1.

Add new standard(s) follows:

ASHRAE ASHRAE 62.1-2016 Ventilation for Acceptable Air Quality

Reason:

By requiring air handling systems to be designed and installed in compliance with ASHRAE Standard 62.1 2013, Ventilation for Acceptable Indoor Air Quality, an indoor pool or spa will have minimum ventilation rates to ensure the indoor air quality is acceptable to human occupants so to minimize adverse health effects.

This also provides consistency with the Model Aquatic Health Code published by the Centers for Disease Control and Prevention, which requires compliance with the ASHRAE Standard when addressing indoor pool or spa air handling systems.

Bibliography:

See sections 4.2.2.3.3 & 4.6.2 of the Model Aquatic Health Code, which reference and require compliance with the ASHRAE 62.1 Standard.

<https://www.cdc.gov/mahc/editions/current.html>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction because these indoor pool facilities already have to meet the ASHRAE 62.1 Standard. This simply aligns the ISPSC with what is already required via other codes, including the MAHC.

Analysis: The referenced standard, ASHRAE 62.1-2016, is currently referenced in the 2018 IMC.

Internal ID: 1514

SP24-18

ISPSC: 402.13, 402.14

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

402.13 Ladders ~~Stairways~~ for diving equipment. ~~Ladders Stairways shall be provided with two grab rails or two handrails. There shall be a uniform distance between ladder treads, with a 7-inch to access diving equipment. Stair riser heights shall be 7 inches (178 mm) minimum distance and a 12-inch (305 mm) maximum distance. maximum and 4 inches (102 mm) minimum with a minimum tread depth of 11 inches. Handrails shall be provided with a handrail height measured vertically from the leading edge of tread nosing of not less than 34 inches (864 mm) and not more than 38 inches (965 mm). Guards shall be located along open sided stairs. Required guards shall not be less than 42 inches (1067 mm) high measured vertically from the leading edge of tread nosing. Required guards shall not have openings which allow passage of a sphere 4 inches (102 mm) in diameter from the walking surface to the required guard height.~~

Exception: ~~The distance between treads for the top and bottom riser can vary but shall be not less than 7 inches (178 mm) and not greater than 12 inches (305 mm).~~

Exception: Diving boards shall be permitted to be accessed to by a ladder provided that the diving board is located not greater than 39 inches (1000 mm) above the deck and the ladder has two grab rails or two handrails.

402.14 Springboard fall protection guards. ~~Springboards located at a height greater than 5-feet-39 inches (1524-1000 mm) above the pool deck shall have a fall protection guard on each side of the springboard. The design and the selection of the materials of construction of the fall protection guards shall be determined by the manufacturer of the springboard support structure. The installation and maintenance of the fall protection guards shall be in accordance with the fall protection guard manufacturer's instructions. springboard to the point at which the board cantilevers over the water. Required guards shall be not less than 42 inches (1067 mm) high measured vertically from the diving board surface. Required guards shall not have openings which allow passage of a sphere 4 inches (102 mm) in diameter from the diving board to the required height.~~

Reason:

Fixed vertical ladders are not an appropriate method for access to 3 meter diving stands. They present an unreasonable and unnecessary risk of injury due to falls from the ladders and boards to the concrete swimming pool deck below contributing to deaths and other significant injuries particularly among children.

Ladders should not be used without proper footwear and/or if wet or contaminated with oils. Aquatic environments are generally wet the patrons are barefoot and their bodies are often covered by oils (i.e. sunscreen).

Fixed ladder use is typically restricted to areas that allow access by worker for maintenance such as roof access, radio masts, wind turbines, industrial machines, and underground shafts and pits.

The International Building Code only allows a fixed lass as one of two required exits at heliports, boiler, incinerator and furnace rooms and also for egress at stage (technical production areas) and for emergency escape from a window well.

The DOL recognizes the hazards associated with falls from ladders and prohibit young workers (14 and 15 years olds) from jobs requiring the use of ladders.

The CPSC recognized injuries associated with falls from diving boards and in 1996 set up a meeting with industry representatives to encourage the industry to consider voluntary standards requiring the use of resilient surfacing similar to that found in playground standards.

ASTM standards relating to aquatic facilities such as ASTM F2376 (Waterslides) and ASTM F2461 (Aquatic Play

Equipment) require stairs or ramps complete with guardrails and handrails to provide access and egress from platforms that are more than 21 inches above the surrounding terrain.

Two attachments have been included. One of the attachments includes news articles of injuries or deaths associated with falls from ladders leading to 3 meter diving boards or from the boards themselves to the pool deck below. The second attachment provides an expanded presentation of the specific hazards associated with vertical ladders.

Bibliography:

See the attachments for any articles or studies referenced

Cost Impact

The code change proposal will increase the cost of construction .

There is an added cost to requiring stairways in lieu of ladders to access diving boards. The cost will may be offset over time by reduced insurance claims and lawsuits associated with significant injuries and deaths associated with falls from the ladders.

Internal ID: 1358

SP25-18

ISPSC: 405.7 (New)

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Add new text as follows:

405.7 Barrier. Where a wading pool is within 50 feet of a swimming pool, the wading pool shall have a barrier separating the wading pool from the swimming pool. Such barrier shall comply with Sections 305.2.1 through 305.7.

Reason:

The intent of a wading pool is to provide young non-swimmers access to recreational water of a depth they can stand in and that does not require swimming. Direct access to swimming pools by these young non-swimmers increase the risk of drowning.

Where a wading pool is adjacent to a swimming pool they should be separated by sufficient distance to intercept a child before reaching the swimming pool and/or a physical barrier to prevent the child from reaching the swimming pool.

The Iowa Swimming Pool and Spa Rules (see Bibliography) requires that if a wading pool is within 50 feet of a swimming pool the wading pool shall have a barrier separating it from the swimming pool. These separation distances or physical barriers restrict the young non-swimmers from accessing the swimming pool to reduce the risk of drowning.

The ISPSC should adopt requirements establishing a minimum separation distance and/or physical barriers between swimming pools and wading pools.

Bibliography:

Iowa Administrative Code

Swimming Pools and Spas

https://idph.iowa.gov/Portals/1/userfiles/120/641_15.pdf Page 34, Para. (5),i,(4)

Cost Impact

The code change proposal will increase the cost of construction .

Providing a barrier or increasing the separation distance between a wading pool and an adjacent swimming pool will increase the cost of construction to reduce the risk of drowning among young non-swimmers.

Internal ID: 1799

SP26-18

ISPSC: 407.3 (New), 407.3.1 (New)

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

407.3 Continuous water removal. The design of a gutter system shall accommodate continuous removal of water from the pool's upper surface at a rate of not less than 125 percent of the required total recirculation flow rate as determined by the design professional.

407.3.1 Gutter outlets. At a gutter flow condition of not less than 125 percent of the total recirculation flow as determined by the design professional, gutter outlets such as drop boxes, converters, return piping, or flumes shall be designed to prevent flooding of the gutter that would result in skimmed water re-entering the pool.

Reason:

A value of 125 percent of the total recirculation flow rate chosen by the designer is recommended for hydraulic flexibility. As patrons swim, play, dive and splash, they create waves that exceed the normal recirculation one might see when the pool is empty. Upsizing the gutter system allows capture of the waves without flooding the gutter, which would make the gutter ineffective. This does not apply to suction piping. Proposed 407.3 and 407.3.1 only apply to gutter systems.

This is consistent with the requirements found in the Model Aquatic Health Code and many state public pool code requirements.

Bibliography:

See sections 4.7.1.4.2.1 and 4.7.1.4.3 of the Model Aquatic Health Code

<https://www.cdc.gov/mahc/editions/current.html>

Cost Impact

The code change proposal will increase the cost of construction .

In a jurisdiction that does not already require gutter systems to follow this design criteria, it could increase the cost, but this simply aligns with requirements found in many jurisdictions today.

Internal ID: 1525

SP27-18

ISPSC: 407.3 (New), 407.3.1 (New), 407.3.2 (New), 407.3.3 (New), 407.3.4 (New)

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

407.3 Pool circulation. The filtration circulation system shall be designed with sufficient flexibility to achieve a hydraulic apportionment that will ensure effective distribution of treated water throughout the pool.

407.3.1 Inlets. Effective distribution of treated water shall be accomplished by either a continuous perimeter overflow system with integral inlets or by means of directionally adjustable inlets adequate in design, number, and location.

407.3.2 Adequate mixing. Pools shall have wall or floor inlets or both to provide for adequate mixing. Inlets shall be hydraulically sized to provide the design flow rates for each area of the pool proportional to the turnover rate and the area covered by the inlet.

407.3.3 Floor inlets. Floor inlets shall be required for pools that are greater than 50 feet (15.2 m) width. The spacing between floor inlets shall not exceed 20 feet (6.1 m). Pools having only floor inlets shall have such inlets located within 15 feet (4.6 m) of the perimeter waterline. Where wall inlets are used in combination with floor inlets, the floor inlets shall be located not greater than 25 feet (7.6 m) from the nearest side walls.

407.3.4 Wall inlets. The spacing between wall inlets shall not exceed 20 feet (6.1 m), measured along the perimeter water line.

Reason:

The ISPSC public pool requirements do not currently include detailed guidelines for assuring adequate in-pool distribution of sanitizers and filtered water. The proposal provides directional inlet requirements found in APSP-15 and additional spacing details from the Model Aquatic Health Code in order to have consistency between the codes and APSP standards.

Further, this is a major aspect of public pool circulation system performance missing in the current ISPSC. Providing these types of additions may encourage a jurisdiction that currently finds the public pool portion of the ISPSC as deficient, to adopt this code in its entirety.

Bibliography:

Section 4.7.1.3 of the Model Aquatic Health Code

<https://www.cdc.gov/mahc/editions/current.html>

Cost Impact

The code change proposal will increase the cost of construction .

The proposal will increase the cost of construction where a jurisdiction does not already have inlet spacing requirements that require as many inlets as this new language requires.

Internal ID: 2324

SP28-18

ISPSC: 409.5 (New), 409.5.1 (New)

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Add new text as follows:

409.5 Rope and float line. A rope and float line shall be provided for all of the following situations:

1. Separation of activity areas
2. Identification of a break in floor slope at water depths of less than 5 ft (1524 mm).
3. Identification of a water depth greater than 3 ft (914 mm).
4. Identification of a water depth greater than 5 ft (1524 mm).

409.5.1 Location. The rope and float line shall be located 1 foot (305 mm) toward the shallow end in each location.

Reason:

As currently written it does not appear that the ISPSC has any requirements for rope and float lines at pools public pools regulated under Chapter 4. The ISPSC does require rope and float lines in pools regulated under Chapter 6 and in residential pools regulated under Chapter 8.

Rope and float lines are a common safety element required in swimming pools to mark a change of pool floor slope, and to segregate different users, activities, and water depths. The proposal is based on adding requirements to Chapter 4 that are similar to the requirements for pools regulated under Chapter 6.

This includes a float line to mark the separation of activity areas, to mark a break in floor slope at water depths of less than 5 ft, to mark water depth greater than 3 ft, and to mark the transition to deep water at 5 ft.

The float lines at 3 ft and 5 ft mark the limits of the water depths at which most drowning incidents in pools occur (see attachment). The float line at 3 ft provides a visible physical marker to aid parents and lifeguards keeping children in water depths more appropriate to their size and abilities.

Cost Impact

The code change proposal will increase the cost of construction .

Adding float lines will slightly increase the cost of construction.

Internal ID: 1661

SP29-18

ISPSC: 410.1

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

410.1 Toilet Dressing space, cleansing showers and toilet facilities. ~~Class A and B pools~~ Cleansing showers and toilet facilities shall be provided with toilet facilities having the required number of plumbing fixtures in accordance with Section 609 and shall be installed in accordance with the International Building Code or the International Plumbing Code. A dressing space or room shall be provided. Cleansing showers and dressing spaces shall be either separate from or within toilet facilities.

Exception: Pools accessory to dwelling units or sleeping units of Group R-1 or R-2 occupancies shall not be required to be provided with dressing areas or cleansing showers.

Reason:

As currently written it appears the ISPSC does not reference the minimum required plumbing fixtures of the IBC/IPC, rather it only is referencing only the plumbing fixtures found within toilet facilities. This would leave out other relevant requirements such as drinking fountains and service sinks. The requirements of the IBC/IPC are the appropriate requirements for the minimum required plumbing fixtures and are based on the occupancy type and design occupant load and are widely accepted, applied, and proven across many different jurisdictions for various occupancy type and design occupant loads. The ISPSC should remain consistent with the requirements of the IBC/IPC for the minimum number of plumbing fixtures.

For some reason while it appears that the requirement for showers has been included for Aquatic Recreation Facilities under Chapter 6 it appears it has been omitted for competition pools, public pools, and instruction, play, or therapy pools under Chapter 4. Given that many patrons share a common body of water in swimming pools, in addition to the plumbing fixtures required by the IBC/IPC, it is appropriate to require both cleansing showers and rinse showers to reduce the transmission of recreational water illnesses and to reduce the development of chloramines. The requirement for showers at public pools under Chapter 4 and aquatic recreational facilities under Chapter 6 should be consistent as they present similar risks. It is appropriate to allow pools serving living units (i.e. hotels, apartments, etc.) to be exempt from the requirement for dressing areas and cleansing showers as the patrons can take a cleansing shower and get dressed in the comfort and privacy of their living unit on-site. (The IBC Group Classifications for R-1 and R-2 are shown at the end of this reason statement.)

The Model Aquatic Health Code (MAHC) provides requirements for the number of cleansing showers under section 4.10.4.2.1 and rinse showers under section 4.10.4.3.1. As the number of showers are related to health concerns associated with transmission of recreational water illnesses and the health effects associated with chloramines, the ISPSC should be changed to be consistent with the requirements of the MAHC in relation to the minimum number of showers required. A separate proposal aligned the number of required showers for Aquatic Recreational Facilities with the requirements of the Model Aquatic Health Code. This proposal ensures that requirements remain consistent between Chapter 4 and Chapter 6.

310.2 Residential Group R-1. Residential Group R-1 occupancies containing *sleeping units* where the occupants are primarily *transient* in nature, including:

- Boarding houses (transient)* with more than 10 occupants
- Congregate living facilities (transient)* with more than 10 occupants
- Hotels (transient)*
- Motels (transient)*

310.3 Residential Group R-2. Residential Group R-2 occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:

- Apartment houses
- Congregate living facilities (nontransient)* with more than 16 occupants
 - Boarding houses (nontransient)*
 - Convents
 - Dormitories*
 - Fraternities and sororities
 - Monasteries
- Hotels (nontransient)
- Live/work units*
- Motels (nontransient)
- Vacation timeshare properties

Cost Impact

The code change proposal will increase the cost of construction .

The proposal will increase the cost of construction at facilities that did not already provide showers for their swimming pools. Showers at competitive pools, public pools, instructional and therapy pools are needed to reduce the risk for transmission of recreational water illnesses and the development of chloramines.

Internal ID: 1673

SP30-18

ISPSC: 411.2.1, 411.2.2, 411.2.3

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

411.2.1 Tread dimensions and area. Treads shall be not less than 24 inches (607 mm) wide at the leading edge. Treads shall have an unobstructed surface area of not less than ~~240-264~~ square inches (0.154-0.170 m²) and ~~an a~~ uniform unobstructed horizontal depth of not less than ~~10-11~~ inches (254-279 mm) at the centerline.

411.2.2 Risers. Risers, except for the bottom riser, shall have a uniform height of not greater than ~~12-7~~ inches (305-178 mm) and not less than 4 inches (102 mm) measured at the centerline. The bottom riser height is allowed to vary to the floor.

411.2.3 Top tread. The vertical distance from the pool coping, deck, or step surface to the uppermost tread shall be not greater than ~~12-7~~ inches (305-178 mm).

Reason:

The tread riser heights and tread depths requirements in the ICC IBC & ISPSC are inconsistent. The tread riser heights allowed in the ISPSC are excessive and the allowable tread depths have been reduced from that found in the IBC which together will increase the risks of slips, trips, and falls at the stairs in swimming pools and spas.

The 12 in. riser height currently allowed in the ISPSC far exceeds the 7 in riser maximum height found in the ICC and even exceeds the maximum 9.5 in. riser height allowed by OSHA under 1910.25(c)(2) for walking and working surfaces in general industry.

A study (see attachment) on stairway falls has found that risers higher than 7.5 in. require excessive energy for most people to climb and may increase loss of balance when descending. This is compounded by reduced tread depths and a lack in uniformity of the tread riser heights and tread depths.

For swimming pools and spas this is further compounded due to the reduce friction available at the stairs due to their wetted condition and potential for biofilm and/or algae growth on the stairs themselves.

The requirements relating to the stair riser heights and tread depths within the ISPSC shall be changed to be consistent with the requirements found in the IBC. The 12 in. maximum riser height currently allowed in the ISPSC is excessive and will contribute to injuries from slips, trips, and falls at swimming pool and spa stairs particularly among children, elderly, and overweight patrons.

Bibliography:

Cohen, J., LaRue, C. S., & Cohen, H. H. (2009). Stairway falls: An ergonomics analysis of 80 cases. Professional Safety, 54, 1, 27-32.

<http://www.nsc.org/ConventionsDocuments/TSCE/Tools-Resources/Stairway-Falls-Cohen.pdf>

OSHA

https://www.osha.gov/pls/oshaweb/owadis.show_document?p_table=STANDARDS&p_id=9717 Para. 1910.25(b)(3)

Cost Impact

The code change proposal will increase the cost of construction .

Reducing the tread riser height and increasing the tread depth will theoretically increase the number of treads required by code and the associated cost. In practice the tread risers and tread depths commonly observed in new public swimming pools and spas more closely match that as proposed rather than those allowed in the ISPSC so I would anticipate minimal cost impact for all but the smallest spas.

Internal ID: 140

SP31-18

ISPSC: 411.1.3

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

411.1.3 Deep area. The means of entry and exit in the deep area of pools shall consist of one of the following:

1. Steps/stairs.
2. Ladders.
3. Grab rails with recessed treads.
4. Ramps. Swimouts
5. ~~Beach entries.~~
6. ~~Swimouts.~~
7. ~~Other designs that provide the minimum utility as specified in this code.~~

Reason:

In deep water the ramp or beach entry would not terminate at the bottom of the pool as in shallow water, but would end at the pool wall with an abrupt drop off to the bottom of the pool in deep water. Ramps are undefined in the code. The code addresses beach entry which is defined as a sloping entry. Beach entries or sloping entries are commonly used for patrons in wheel chairs to entry the pool. If beach or sloping entries were allowed in deep water this could allow a wheel chair to drop off into the bottom of the pool in the deep water.

The requirements for shallow end beach and sloping entries are addressed under 411.3. There are no requirements listed for deep water. If the requirements of 411.3 were applied to deep water, it would require a handrail at the vertical drop as the sloping entry reached the pool wall. This would render the entry unusable as it would be blocked off. If the requirements of 411.3 were not applied to deep water, there would not be limits to the slopes of the entry or requirement that it be slip resistant which would create a slip, trip, and falls hazard.

Cost Impact

The code change proposal will decrease the cost of construction .

Beach entries or ramps would be more costly to provide entry to or exiting from deep water than stairs, ladders, recessed treads, or swimouts.

Internal ID: 1655

SP32-18

ISPSC: 411.2.5 (New)

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new text as follows:

411.2.5 Outlined Edges. The leading horizontal and vertical edges of stair treads shall be outlined with slip-resistant contrasting tile or other permanent marking of not less than 1 inch (25.4 mm) and not greater than 2 inches (50.8 mm).

Reason:

Provides for additional safety for a patron when entering or exiting a public swimming pool. Conforms with the requirement found in the Model Aquatic Health Code.

Bibliography:

See section 4.5.4.2 of the Model Aquatic Health Code, <https://www.cdc.gov/mahc/editions/current.html>

Cost Impact

The code change proposal will increase the cost of construction .

A slight increase in cost could occur when providing slip-resistance contrasting tile or some other permanent marking.

Internal ID: 1517

SP33-18

ISPSC: 411.2.5 (New)

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Add new text as follows:

411.2.5 Handrails. A handrail shall be provided for each set of stairs. Stairs wider than 5 ft (1.5 m) shall have at least one additional handrail for every 12 ft (3.7 m) of stair width. Handrails at pool stairs shall comply with Section 323.2.

Reason:

Handrails are required at stairs to prevent injuries from slips, trips, and falls. Currently the ISPSC required handrails at steps on the deck but overlooked the steps into the pool. Falls are more likely on stairs leading into the pool than on the deck as currently the code allows greater riser heights and reduced tread depths on the stairs leading into the pool. This is further compounded by reduced coefficient of friction on the wetted pool stairs and on conditions that are favorable for the growth of biofilms and/or algae on pool stairs.

Requiring one handrail for each 12 ft in width was based on the requirements found in the Model Aquatic Health Code

Cost Impact

The code change proposal will increase the cost of construction .

Added a requirement for a handrail. Cost for a handrail in the neighborhood of \$200 and up depending on stair configuration. A handrail is necessary at the stairs to reduce injuries from slips, trips, and falls at the stairs.

Internal ID: 2260

SP34-18

ISPSC: 411.3.3

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

411.3.3 Surfaces. Beach and sloping entry walking surfaces at water depths up to 36 inches (914 mm) shall be ~~of slip-resistant materials~~resistant.

Reason:

Submerged walking surfaces in pools must be constructed with a slip resistant surface to reduce slips, trips and falls. The wetted walking surfaces begin with a reduced coefficient of friction and this is further compounded as conditions can be favorable for the growth of biofilms and algae. The 3 ft depth was chosen to be consistent with the requirements of the Model Aquatic Health Code (see attachment)

Bibliography:

2016 Model Aquatic Health Code

<https://www.cdc.gov/mahc/pdf/2016-mahc-code-final.pdf> Page 63 Para. 4.2.1.8

Cost Impact

The code change proposal will increase the cost of construction .

The cost will increase as more of the bottom of the pool will be required to be slipresistant. The cost is minimal as some materials of construction are naturally slipresistant but some require the addition of treatment to the finishes.

Internal ID: 2275

SP35-18

ISPSC: 411.5.1

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

411.5.1 Swimouts. Swimouts ~~, located in either the deep or shallow area of a pool,~~ shall comply with all of the following:

1. The horizontal surface shall be not greater than 20 inches (508 mm) below the waterline.
2. An unobstructed surface shall be provided that is equal to or greater than that required for the top tread of the pool stairs in accordance with Section 411.2.
3. ~~Where used as an entry and exit access, swimouts~~ Swimouts shall be provided with steps and handrails that comply with the pool stair requirements of Section 411.2 and Section 411.2.323.2.
4. The leading edge shall be visibly set ~~apart~~ apart by a stripe having a width of not less than 3/4 inch (19 mm) and not greater than 2 inches (51 mm). The stripe shall be of a contrasting color to the adjacent surfaces.

Reason:

Clarified and simplified language and coordinated language for swimouts at public pools addressed under Chapter 4 and Chapter 6. Clarified the need for a handrail at the stairs from a swimout.

Cost Impact

The code change proposal will increase the cost of construction .

Added a requirement for a handrail. Cost for a handrail in the neighborhood of \$200 and up depending on stair configuration. A handrail is necessary at the steps from a swimout to reduce injuries from slips, trips, and falls at the stairs.

Internal ID: 1594

SP36-18

ISPSC: 411.5.2

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

411.5.2 Underwater seats and benches. Underwater seats and benches, whether used alone or in conjunction with pool stairs, shall comply with all of the following:

1. The horizontal surface of the bench shall be not greater than 20 inches (508 mm) below the waterline.
2. An unobstructed surface shall be provided that is not less than 10-16 inches (406 mm) in depth and not greater than 22 inches (559 mm) in depth and not less than 24-26 inches (607-660 mm) in width.
3. Underwater seats and benches shall not be used as the required for entry and exit access.
4. ~~Where underwater seats are located in the deep area of the pool where manufactured or constructed diving equipment is installed, such seats shall be located outside of the minimum diving water envelope for diving equipment.~~ Underwater benches shall only be located in areas where the pool water depth does not exceed 5 ft (1.5 m).
5. The leading edge shall be visually set apart by a stripe having a width of not less than 3/4 inch (19 mm) and not greater than 2 inches (51 mm). The stripe shall be of a contrasting color to the adjacent surfaces.
6. ~~The horizontal surface shall be at or below the waterline.~~ The top surface of the bench shall be slip resistant.
7. ~~A tanning ledge or sun shelf used as the required entry and exit access shall be located not greater than 12 inches (305 mm) below the waterline.~~

Reason:

This proposal addresses dimensions of underwater seats and benches and their location. It also removes references to "tanning ledge" or "sun shelf" as they are undefined but clearly are not within the intent for of not underwater seats and benches as benches can not be used as a required entry/access where it appears based on the stricken language that the shelves are allowed to serve as an entry/exit.

It is not clear where the 10 inch bench surface originated as that would have been too small for patrons. The dimensions were updated based on anthropometric data for men and woman to ensure that dimensions of an underwater bench was large enough for patron use for seating as intended.

The proposal clarified that benches not only couldn't count toward a required point of access but that the shall not be used for entry and exits. While the surface is required to be slip resistant, the step from the bench surface to the deck it too large and there is no handrail so it would be unsafe to step to or from the deck.

The proposal also attempted to align the marking requirements for benches at public pools under Chapter 4 and Chapter 6.

Finally, the benches were restricted to a maximum pool depth of 5 feet to be consistent with the requirements of the Model Aquatic Health Code (MAHC) . The Annex of the MAHC states:

"4.5.16.3 Maximum Water Depth. The five foot (1.5 m) depth restriction is to address the potential SAFETY issue of stepping or otherwise moving off a bench into deep water. The seat depth below the water line is limited to 20 inches (50.8 cm) maximum so a non-swimmer may be comfortable at that depth but once they move from the bench into a greater water depth it may exceed their comfort and/or skill level."

Bibliography:

Excerpts from :Gordon, Claire C. et. al 1988 Anthropometric Survey of U.S. Personnel: Summary Statistics Interim Report. March 1989.

<https://multisite.eos.ncsu.edu/www-ergocenter-ncsu-edu/wp-content/uploads/sites/18/2016/06/Anthropometric->

Cost Impact

The code change proposal will increase the cost of construction .

This proposal increases the size of the benches based on anthropometric data so they better can serve their intended purpose. It also clarifies the marking required for the benches. In both cases there were cost associated with forming the bench and marking the bench so the cost associated with the clarification of the marking of the bench and the depth and width of the bench would be minimal.

Internal ID: 1592

SP37-18

ISPSC: 411.5.2

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

411.5.2 Underwater seats and benches. Underwater seats and benches, whether used alone or in conjunction with pool stairs, shall comply with all of the following:

1. The horizontal surface shall be not greater than 20 inches (508 mm) below the waterline.
2. An unobstructed surface shall be provided that is not less than 10 inches (254 mm) in depth and not less than 24 inches (607 mm) in width.
3. Underwater seats and benches shall not be used as the required entry and exit access.
4. Where underwater seats are located in the deep area of the pool where manufactured or constructed diving equipment is installed, such seats shall be located outside of the minimum diving water envelope for diving equipment.
5. The leading edge shall be visually set apart.
6. The horizontal surface shall be at or below the waterline.
7. ~~A tanning ledge or sun shelf used as the required entry and exit access shall be located not greater than 12 inches (305 mm) below the waterline.~~

Reason:

Currently a tanning ledge or sun shelf is undefined in the ISPSC. It is clear however that a tanning ledge or sun shelf is not an underwater seat or bench. As such they should not be included under the section providing requirements for underwater seat or benches. Underwater seats and benches are not designed for standing and walking and be the code shall not be used as the required entry and exit access, but as written a tanning ledge or sun shelf can be used as the required entry and exit. This is in conflict with 411.1.2 which limits the means of entry and exit from shallow water to stairs, a ramp, or a beach entry and 411.1.3.

Under 401.5 the slope of the floor in the shallow area of a pool is limited based on the pool type. While a bench is not the floor of the pool (i.e. not intended to walk on), there are a few states that allow tanning ledges or sun shelves in which the floor of the pool abruptly drops off from a depth of approximately 12 inches to depths typically ranging from 3 ft to 5 ft. This abrupt change in slope of the bottom of the pool violated the sloping requirements of 401.5, creates an unsafe walking surface, creates a visual obstruction obscuring view of the bottom of the swimming pool and the abrupt change in depth presents a drowning hazard particularly to young non-swimmers that are at the highest risk of drowning in a swimming pool. See attachment for additional information.

If a tanning ledge or sun shelf is to be included in the ISPSC, they should be defined so the intent is clear and a new section should be added with the provisions necessary to protect the safety of the patrons.

Cost Impact

The code change proposal will decrease the cost of construction .

Tanning shelves increase the cost of construction.

Internal ID: 1795

SP38-18

ISPSC: 503.2

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

503.2 Multilevel seating. Where multilevel seating is provided, the maximum water depth of any seat or sitting bench shall be ~~28-26~~ inches (~~711-660~~ mm) measured from the *design waterline* to the lowest measurable point.

Reason:

The 28 inch depth is too deep for seating. The sitting shoulder height of a 99th percentile male is only 26.16 inches and the sitting shoulder height of a 99th percentile woman is only 24.54 inches.

Bibliography:

Excerpts from :Gordon, Claire C. et. al 1988 Anthropometric Survey of U.S. Personnel: Summary Statistics Interim Report. March 1989.

<https://multisite.eos.ncsu.edu/www-ergocenter-ncsu-edu/wp-content/uploads/sites/18/2016/06/Anthropometric-Detailed-Data-Tables.pdf> Page 3

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only sets the limit on depth of seating so there would not be an impact to the construction cost.

Internal ID: 2063

SP39-18

ISPSC: 504.2 (New)

Proponent: John Kelly, representing self (john.kelly@idph.iowa.gov)

2018 International Swimming Pool and Spa Code

Add new text as follows:

504.2 Timer. The operation of the hydrotherapy jets shall be limited by a cycle timer having a maximum setting of 15 minutes. The cycle timer shall be located not less than 5 feet away, adjacent to, and within sight of the spa.

Reason:

The ISPSC allows spas to operate at a temperature of up to 104 degrees F. The elevated temperature allowed for spas increases the risk of deaths from hyperthermia and drowning and the jet currents further increase the heat transfer rate.

A study on "The Health Hazards of Saunas and Spas and How to Minimize Them" noted that many people should limit their stays in spas to 5 or 10 minutes and that even healthy adults would be well advised not to stay in spas for more than 10 to 15 minutes.

Under Section 4.12.1.10 of the Model Aquatic Health Code the agitation system shall be connected to a timer to limit the cycle to 15 minutes. This is consistent with requirements found in many state and local health codes.

The ISPSC should recognize the risk of hyperthermia particularly with the elevated temperatures it allows for spas and given the increased heat transfer created by the hydrotherapy jets and limit the jet cycle accordingly and consistent with the Model Aquatic Health Code.

Bibliography:

The Health Hazards of Saunas and Spas and How to Minimize Them

Edward Press, MD, MPH <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1405706/pdf/amjph00208-0084.pdf>

American Journal of Public Health, August 1991, Volume 81, No. 8

2016 Model Aquatic Health Code, 2nd Edition, July 2016

U.S. Department of Health and Human Services, Centers for Disease Control and Prevention

<https://www.cdc.gov/mahc/pdf/2016-mahc-code-final.pdf>

Cost Impact

The code change proposal will increase the cost of construction .

The Model Aquatic Health Code and most state and local health codes already contain a requirement for a timer so for most areas there will be no added cost. In areas with no state or local requirement there would be a small cost associated with the installation of the timer. Including the requirement within the ISPSC will provide consistency in the requirements and help address the risk in those areas where no health codes are in place.

Internal ID: 178

SP40-18

ISPSC: 509.2

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

509.2 Operational signs. Operational signs shall include, but not be limited to, the following messages as required by the local jurisdiction:

- ~~1.~~ Children under age 5 and persons using alcohol or drugs that cause drowsiness shall not use spas.
- ~~2.~~ Pregnant women and persons with heart disease, high blood pressure or other health problems should not use spas without prior consultation with a health provider.
- ~~3.~~ Children under 14 years of age shall be supervised by an adult.
- ~~4.~~ Use of the spa when alone is prohibited (if no lifeguards on site).
- ~~1-5.~~ Do not allow the use of or operate spa if the suction outlet cover is missing, damaged or loose.
- ~~2-6.~~ Check spa temperature before each use. Do not enter the spa if the temperature is above 104°F (40°C).
- ~~3-7.~~ Keep breakable out of the spa area.
- ~~4-8.~~ Spa shall not be operated during severe weather conditions.
- ~~5-9.~~ Never place electrical appliances within 5 feet (1524 mm) of the spa.
- ~~6-10.~~ No diving.

Reason:

The spa signage currently required by the ISPSC does not contain any language warning those particularly vulnerable to injury or death associated with the elevated temperature of the spa.

The spa signage in the Model Aquatic Health Code (see attachment) places warnings and restrictions on those that are particularly vulnerable to the elevated temperature of a spa. The annex of the Model Aquatic Health Code notes that "Small children are still developing internal temperature regulation, and infants in particular have a small body mass compared to body surface area." It also notes that spa seating is not designed to accommodate younger children in a seated position. As such children under the age of 5 should not use a spa and children under the age of 14 should be supervised by an adult.

A study on health hazards of spas (see attachment) noted that when analyzing deaths associated with spas the chief risk factors identified were alcohol ingestion, heart disease, seizure disorders, and cocaine ingestion. These factors accounted for about 45% of the fatalities. It further noted that 61 of the 151 spa related deaths occurred in children under 12 years of age.

Bibliography:

The Health Hazards of Saunas and Spas and How to Minimize Them

Edward Press, MD, MPH <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC1405706/pdf/amjph00208-0084.pdf>

American Journal of Public Health, August 1991, Volume 81, No. 8

2016 Model Aquatic Health Code

<https://www.cdc.gov/mahc/pdf/2016-mahc-code-final.pdf> Page 281, Para. 6.4.2.2.4

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The signage is already required. The proposal only changes what it stated on the sign.

Internal ID: 2084

SP41-18

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Delete without substitution:

~~**603.3 Shallow-to-deep-end rope and float line.** Where a pool has a water depth ranging from less than 5 feet (1524 mm) to greater than 5 feet (1524 mm), a rope and float line shall be located 1 foot (305 mm) horizontally from the 5-foot (1524 mm) depth location, toward the shallow end of the pool.~~

Reason:

Ropes and float line requirements are addressed under section 605.2. Creating additional rope and float line requirements in a separate section creates confusion and one or the other requirements will more likely be overlooked. Based on the requirements it appears that for type D-2 pools a rope line would be required at both 4-1/2 ft depth under 605.2.3 and 5 ft depth under 603.3. If the pool is sloping at 1 ft vertically in 12 ft horizontally there would be only 6 ft between these two required float lines.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal eliminates the duplication of the requirements for float lines which are addressed in both section 603.3 and section 605.2.

Internal ID: 1558

SP42-18

ISPSC: 605.2

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

605.2 Rope and float line. A rope and float line shall be provided for all of the following situations:

1. Separation of activity areas.
2. Identification of a break in floor slope at water depths of less than 5 feet (1524 mm).
3. Identification of a water depth greater than ~~4¹/₂~~ 3 feet (~~1372-914~~ mm) in constant floor slope in Class D-2 pools.
4. Identification of a water depth greater than 5 ft (1524 mm).

Exception: Class D-1 pools or any other pool where the ~~designer~~ code official indicates that such a ~~line is not required or that the line would constitute a hazard.~~

Reason:

Rope and float lines are a common safety element required in swimming pools to mark a change of pool floor slope, and to segregate different users, activities, and water depths. The proposal is based on combining the requirements for rope and float lines into a single section.

This includes a float line to mark the separation of activity areas, to mark a break in floor slope at water depths of less than 5 ft, to mark water depth greater than 3 ft, and to mark the transition to deep water at 5 ft.

The float lines at 3 ft and 5 ft mark the limits of the water depths at which most drowning incidents in pools occur (see attachment). The float line at 3 ft provides a visible physical marker to aid parents and lifeguards keeping children in water depths more appropriate to their size and abilities.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change only combines the requirements for rope and float lines into a single section and shifts the location of one rope and float line.

Internal ID: 1556

SP43-18

ISPSC: SECTION 609, 609.1, 609.2, 609.2.1, 609.2.2, 609.3, 609.3.1, 609.3.2, 609.3.3, 609.4, 609.4.1, 609.7

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

SECTION 609 TOILET ROOMS DRESSING AND BATHROOMS SANITARY FACILITIES

609.1 General. ~~Toilet Dressing and bath sanitary~~ sanitary facilities shall be provided in accordance with the minimum requirements of the International Building Code and International Plumbing Code and Sections 609.2 through 609.9.~~609.9.~~

609.2 Number of fixtures. ~~Pools shall have toilet facilities with the number of fixtures in accordance with Section 609.2.1 or 609.2.2.~~ The minimum number of required water closets, urinals, lavatory, and drinking fountain fixtures shall be provided as required by the International Building Code and International Plumbing Code and the dressing facilities and number of cleansing and rinse showers shall be provided in accordance with Sections 609.2.1, 609.2.2, and 609.3.1.

609.2.1 Water area less than ~~7500~~ 4000 square feet. Facilities that have less than ~~7500~~ 4000 gross square feet (~~697-372~~ m²) of water area available for bather access shall have dressing facilities and not less than ~~one water closet for males, one urinal for males, one lavatory for males, one~~ one cleansing shower for males, ~~two water closets for females, one lavatory for females and one~~ cleansing shower for females.

609.2.2 Water area ~~7500~~ 4000 square feet or more. Facilities that have ~~7500~~ 4000 gross square feet (~~697-372~~ m²) or more of water area available for bather access shall have dressing facilities and not less than ~~0.7 water closet for males, one urinal for males, 0.85 lavatory for males, one~~ one cleansing shower for males, ~~two water closets for females, one lavatory for females and one~~ cleansing shower for females for every 7500-4000 square feet (~~697-372~~ m²) or portion thereof. Where the result of the fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

609.3 Showers. Showers shall be in accordance with Sections 609.3.1 through ~~609.3.5~~ 609.3.5.

609.3.1 ~~Deck Rinse~~ shower. ~~Not in addition to the requirement for cleansing showers in 609.2.1 and 609.2.2, not less than one and not more than half of the total number of showers required by Section 609.2~~ rinse shower shall be located ~~provided~~ on the deck of or at the entrance of each pool.

Delete without substitution:

609.3.2 Anti-scald device. ~~Where heated water is provided to showers, the shower water supply shall be controlled by an anti-scald device.~~

609.3.4 Flow rate. ~~Each showerhead shall have a water flow of not less than 2 gallons per minute (7.6 lpm).~~

Revise as follows:

609.3.5 Temperature. At each cleansing showerhead, the heated shower water temperature shall be not less than 90°F (32°C) and not greater than 120°F (49°C). Water supplied to rinse showers shall not be required to be heated.

609.4 Soap dispensers. Soap dispensers shall be in accordance with ~~Sections 609.4.1 and 609.4.2.~~ Section 609.4.1.

609.4.1 Liquid or powder. Soap dispensers shall be provided ~~in each toilet facility, at each lavatory and cleansing shower.~~ Soap dispensers shall dispense liquid or powdered soap. Reusable cake soap is prohibited. Soap dispensers and soap shall not be provided at rinse showers.

609.7 Sanitary napkin receptacles. Sanitary napkin receptacles shall be provided in each water closet compartment for females and in the area of the cleansing showers for female use only.

Reason:

The minimum number of plumbing fixtures required by the IBC/IPC and the ISPSC are inconsistent. The requirements of the IBC/IPC are the appropriate requirements and are based on the occupancy type and design occupant load and are

widely accepted, applied, and proven across many different jurisdictions for various occupancy type and design occupant loads. The ISPSC should be change to be consistent with the requirements of the IBC/IPC.

Given that many patrons share a common body of water in swimming pools and spa, in addition to the plumbing fixtures required by the IBC/IPC, it is appropriate to require both cleansing showers and rinse showers to reduce the transmission of recreational water illnesses and to reduce the development of chloramines.

The Model Aquatic Health Code (MAHC) provides requirements for the number of cleansing showers under section 4.10.4.2.1 and rinse showers under section 4.10.4.3.1. As the number of showers are related to health concerns associated with transmission of recreational water illnesses and the health effects associated with chloramines, the ISPSC should be changed to be consistent with the requirements of the MAHC in relation to the minimum number of showers required.

Bibliography:

2016 Model Aquatic Health Code, 2nd Edition, July 2016

U.S. Department of Health and Human Services, Center for Disease Control and Prevention

<https://www.cdc.gov/mahc/pdf/2016-mahc-code-final.pdf>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Typically Swimming Pools and Spas must already meet building code, plumbing code, and health code requirements so it will eliminate confusion caused by inconsistencies between the applicable codes but should not change the number of fixtures installed.

Internal ID: 179

SP44-18

ISPSC: 610.4.4

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

610.4.4 Slip-resistant surfaces. Beach and sloping entry walking surfaces at water depths up to ~~18~~36 inches (~~457~~914 mm) shall be slip resistant.

Reason:

Submerged walking surfaces in pools must be constructed with a slip resistant surface to reduce slips, trips and falls. The wetted walking surfaces begin with a reduced coefficient of friction and this is further compounded as conditions can be favorable for the growth of biofilms and algae.

The 3 ft depth was chosen to be consistent with the requirements of the Model Aquatic Health Code (see attachment)

Bibliography:

2016 Model Aquatic Health Code

<https://www.cdc.gov/mahc/pdf/2016-mahc-code-final.pdf> Page 63 Para 4.2.1.8

Cost Impact

The code change proposal will increase the cost of construction .

The cost will increase as more of the bottom of the pool will be required to be slip resistant. The cost is minimal as some materials of construction are naturally slip resistant but some require the addition of treatment to the finishes.

Internal ID: 2268

SP45-18

ISPSC: 610.5.1, 610.5.2, 610.5.5, 610.5.6

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

610.5.1 Uniform height of 9 inches riser height. Except for the bottom riser, risers at the centerline shall have a maximum uniform height of ~~9-7~~ inches (~~229-178~~ mm) and a minimum uniform height of 4 inches (102 mm). The bottom riser height shall be permitted to vary from the other risers.

610.5.2 Distance from coping or deck. The vertical distance from the pool coping, deck, or step surface to the uppermost tread shall be not greater than ~~9-7~~ inches (~~229-178~~ mm).

610.5.5 Tread horizontal depth. Treads shall have ~~an~~ a uniform unobstructed horizontal depth of not less than 11 inches (279 mm).

610.5.6 Tread surface area. Treads shall have an unobstructed surface area of not less than ~~240-264~~ square inches (~~0.17-0.170~~ m²).

Reason:

As currently written the stair construction requirements within pools at aquatic recreation facilities covered under Chapter 6 do not match the stair construction requirements within pools addressed under Chapter 4, and neither of these requirements match the requirements for stair construction under the IBC. These variations in stair construction increase the risks of slips, trips, and falls at pool stairs.

The 9 inch riser height in Chapter 6 exceed the 7 inch riser height found in the IBC. A study attached has found that risers higher than 7.5 in. require excessive energy for most people to climb and may increase the risk of loss of balance when descending. This is compounded by a lack of requirements for uniform tread depths in Chapter 6.

For swimming pools and spas the risk of slips, trips, and falls, due to irregularity in the stair construction is further compounded due to the reduced friction available at the stairs due to their wetted condition and potential for biofilm and/or algae growth on the stairs themselves.

The requirements relating to stair riser heights and tread depths within the ISPSC shall be changed to be consistent with the requirements found in the IBC. The irregularity of the stair construction based on the current requirements of the ISPSC will increase the risks of slips, trips, and falls associated with the pool stairs.

Bibliography:

Cohen, J., LaRue, C. S., & Cohen, H. H. (2009). Stairway falls: An ergonomics analysis of 80 cases. Professional Safety, 54, 1, 27-32.

<http://www.nsc.org/ConventionsDocuments/TSCE/Tools-Resources/Stairway-Falls-Cohen.pdf>

OSHA

https://www.osha.gov/pls/oshaweb/owadis.show_document?p_table=STANDARDS&p_id=9717 Para. 1910.25(b)(3)

Cost Impact

The code change proposal will increase the cost of construction .

Reducing the tread riser height will theoretically increase the number of treads required by code and the associated cost. In practice the tread risers and tread depths commonly observed in new public swimming pools and spas more closely match that as proposed rather than those allowed in the ISPSC so I would anticipate minimal cost impact for all but the smallest of spas.

Internal ID: 1464

SP46-18

ISPSC: 610.5.7 (New)

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Add new text as follows:

610.5.7 Handrails. A handrail shall be provided for each set of stairs. Stairs wider than 5 ft (1.5 m) shall have at least one additional handrail for every 12 ft (3.7 m) of stair width. Handrails at pool stairs shall comply with Section 323.2.

Reason:

Handrails are required at stairs to prevent injuries from slips, trips, and falls. Currently the ISPSC required handrails at steps on the deck but overlooked the steps into the pool. Falls are more likely on stairs leading into the pool than on the deck as currently the code allows greater riser heights and reduced tread depths on the stairs leading into the pool. This is further compounded by reduced coefficient of friction on the wetted pool stairs and on conditions that are favorable for the growth of biofilms and/or algae on pool stairs.

Requiring one handrail for each 12 ft in width was based on the requirements found in the Model Aquatic Health Code

Bibliography:

2016 Model Aquatic Health Code

<https://www.cdc.gov/mahc/pdf/2016-mahc-code-final.pdf> Page 71, Para 4.5.5

Cost Impact

The code change proposal will increase the cost of construction .

Added a requirement for a handrail. Cost for a handrail in the neighborhood of \$200 and up depending on stair configuration. A handrail is necessary at the stairs to reduce injuries from slips, trips, and falls at the stairs.

Internal ID: 2262

SP47-18

ISPSC: 610.6, 610.6.1, 610.6.2, 610.6.3, 610.6.4

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

610.6 Swimouts. Swimouts shall be located completely outside of the water current or wave action of the pool or spa and can be located in shallow or deep areas of water. pool.

610.6.1 Surface area. An unobstructed surface equal to or greater than that required for the top tread of the pool stairs shall be provided in accordance with Sections 610.5.5 and 610.5.6.

610.6.2 Step required. Where a swimout is used as an entry and exit access point, it shall be provided with ~~a step that meets the pool stair requirements (see Section 610.5).~~ steps and handrails that comply with Section 610.5 and Section 323.2.

610.6.3 Maximum depth. The horizontal surface of a swimout shall be not greater than 20 inches (508 mm) below the waterline.

610.6.4 Color marking. The leading edge of a swimout shall be visually set apart by a stripe having a width of not less than $\frac{3}{4}$ inch (19 mm) and not greater than 2 inches (51 mm). The stripe shall be of a contrasting color to the adjacent surfaces.

Reason:

Clarified and simplified language and coordinated language for swimouts at public pools addressed under Chapter 4 and Chapter 6. Clarified the need for a handrail at the stairs from a swimout.

Cost Impact

The code change proposal will increase the cost of construction .

Added a requirement for a handrail. Cost for a handrail in the neighborhood of \$200 and up depending on stair configuration. A handrail is necessary at the steps from a swimout to reduce injuries from slips, trips, and falls at the stairs.

Internal ID: 2256

SP48-18

ISPSC: 610.7, 610.7.1, 610.7.2, 610.7.3, 610.7.4, 610.7.5, 610.7.6

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows:

610.7 Underwater seats and benches. Underwater seats and benches shall comply with this section.

610.7.1 Prohibited location. ~~Location.~~ Underwater seats shall not be located in the diving water envelope. benches shall only be located in areas where the pool water depth does not exceed 5 ft (1.5 m).

610.7.2 Surface dimensions. Underwater ~~seats~~ benches shall have an unobstructed surface dimension of not less than ~~10-16 inches (254-406 mm)~~ and not greater than 22 inches (559 mm) in depth measured front to back and not less than ~~24-26 inches (610-660 mm)~~ in width.

610.7.3 Not an entry or exit. Underwater ~~seats and benches~~ shall not be used as an entry or exit for a pool ~~but can be located in shallow or deep areas of water.~~ pool.

610.7.4 Depth. The horizontal surface of ~~seats and benches~~ shall be not greater than 20 inches (508 mm) below the waterline.

610.7.5 Color marking. The leading edge of ~~seats and benches~~ shall be visually set apart by a stripe having a width not less than $\frac{3}{4}$ inch (19 mm) and not greater than 2 inches (51 mm). The stripe shall be of a contrasting color to the adjacent surfaces.

610.7.6 Slip resistant. The top surface of ~~seats and benches~~ shall be slip resistant.

Reason:

This proposal addresses dimensions of underwater seats and benches and their location.

It is not clear where the 10 inch bench surface originated as that would have been too small for patrons. The dimensions were updated based on anthropometric data for men and woman to ensure that dimensions of an underwater bench was large enough for patron use for seating as intended.

The proposal clarified that benches not only couldn't count toward a required point of access but that they shall not be used for entry and exits. While the surface is required to be slip resistant, the step from the bench surface to the deck is too large and there is no handrail so it would be unsafe to step to or from the deck.

Finally, the benches were restricted to a maximum pool depth of 5 feet to be consistent with the requirements of the Model Aquatic Health Code.

From the ANNEX of the 2016 Model Aquatic Health Code:

"4.5.16.3 Maximum Water Depth. The five foot (1.5 m) depth restriction is to address the potential SAFETY issue of stepping or otherwise moving off a bench into deep water. The seat depth below the water line is limited to 20 inches (50.8 cm) maximum so a non-swimmer may be comfortable at that depth but once they move from the bench into a greater water depth it may exceed their comfort and/or skill level."

Bibliography:

Excerpts from: Gordon, Claire C. et. al 1988 Anthropometric Survey of U.S. Personnel: Summary Statistics Interim Report. March 1989.

2016 Model Aquatic Health Code

<https://www.cdc.gov/mahc/pdf/2016-mahc-code-final.pdf>

Cost Impact

The code change proposal will increase the cost of construction .

This proposal increases the size of the benches based on anthropometric data so they better can serve their intended purpose. It also clarifies the marking required for the benches. In both cases there were costs associated with forming the benches and marking the benches so the cost associated with the clarification of the marking of the benches and the depth and width of the benches would be minimal.

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new definition as follows:

INTERACTIVE WATER PLAY FEATURES. Any indoor or outdoor structure designed to allow for public recreational activities with recirculated, filtered, and treated water that includes sprayed, jetted or other water sources contacting bathers and not incorporating standing or captured water as part of the bather activity area. These installations are also known as splash pads, spray pads, and wet decks.

Add new text as follows:

612 INTERACTIVE WATER PLAY FEATURES

612.1 General. Interactive water play features shall comply with Section 612.1 through 612.7.

612.2 Safety hazards. Parts of the interactive water play feature that can be accessed by the users of the feature shall be designed and constructed to not present safety hazards to the users.

612.3 Decking. A deck of not less than 4 feet (1296 mm) in width shall be provided around the perimeter of the interactive water play feature. The deck shall be sloped away from the interactive water play feature.

612.4 Splash pad zone. The splash pad zone shall comply with Section 612.4.1 through 612.4.4.

612.4.1 Surface. Splash pad zone surfaces shall have a slip-resistant and cleanable surface. The manufacturer of manufactured zone surfaces shall certify that such surfacing is suitable for aquatic and chlorinated environments. Direct suction outlets from interactive water play features shall be prohibited.

612.4.2 Slope and water collection. Splash pad zone surfaces shall slope to one or more drain points so that only water from the splash pad zone flows back to a gravity fed collection tank. The slope shall prevent the accumulation or pooling of water and shall not exceed 1/2 inch per foot. Drain openings in the splash pad zone surfaces that can be accessed by users shall not allow a 1/2 inch (12.7 mm) diameter dowel rod to be inserted into the opening. Drain covers in splash pad zone surfaces shall be flat and flush with the zone surface and shall require tools for removal. The manufacturer of such drain covers shall certify that the covers comply with the physical testing and finger-and-limb entrapment requirements in Sections 3 and 6 respectively, of APSP 16.

612.4.3 Nozzles within the interactive water play feature splash pad zone. Nozzles that spray water from the interactive water play feature splash pad zone shall be flush with the zone surface. Openings in such nozzles shall not allow a 1/2 inch (12.7 mm) diameter dowel rod to be inserted into the opening. The water velocity from the orifice of any water nozzle shall not exceed 20 feet (6.1 m) per second.

612.4.4 Other nozzles. Nozzles, other than those on walking surfaces within the interactive water play feature splash pad zone, shall be designed to be clearly visible.

612.5 Water sanitation. The water sanitation shall consist of the equipment covered in Sections 612.5.1 through 612.5.5.

612.5.1 Water collection and treatment tank. Interactive water play features shall drain to a collection and treatment tank. The inside of the tank shall be accessible for cleaning and inspection. The access hatch or lid shall be locked or require a tool to open. The tank capacity shall be not less than 1000 gallons or ten times the number of gallons in a minute when all nozzles are operating simultaneously, whichever is greater. The volume water in the tank, at the design water level, shall not decrease more than 15% of that volume when all pumps and discharge piping fill with water to the discharge points of all nozzles. Tanks shall be provided with a means to empty all water in the tank for the purposes of servicing or cleaning.

612.5.2 Filtration pump. The filtration pump shall be sized to turnover the surge basin capacity in 30 minutes or less. The intake for the pump shall be located to draw water from the lowest elevation in the treatment tank.

612.5.3 Spray nozzle and water feature water disinfection. Spray nozzles and water features shall be supplied by water from the water collection and treatment tank that is equipped with filtration and sanitizing equipment required by Chapter 3 and this Section. Where separate water feature pumps are installed, controls shall prevent those pumps from operation when the filtration pump is not operating.

612.5.4 Disinfection system. In addition to any filtration and sanitizing equipment requirements of Chapter 3 and this Chapter, all water supplied to spray nozzles or other water that can be accessed by a user, shall pass through a secondary disinfection system before discharge to the user. The secondary disinfection system shall be listed and labeled to NSF 50 as having a single-pass, three-log reduction of the cryptosporidium surrogate.

612.5.5 Make-up water system. The water collection and treatment tank shall be provided with a make-up water system that is supplied with potable water.

612.6 Operating instructions. In addition to the documentation and instructions requirements of Chapter 1 and 3, the operating instructions for an interactive water play feature shall require that the circulation system be operated continuously for not less than 4 turnovers prior to operation of the pumps for the spray nozzles and other water features systems.

612.7 Lighting. Where a interactive water play feature will be in operation at night or during periods of inadequate natural lighting, artificial lighting shall be provided in accordance with the same requirements for pool deck area lighting in Section 321.2.2.

Reason:

In previous cycles a similar proposal has been submitted, but committee members had concerns with either the term previously proposed for these type of features or some of the requirements found within the proposal. These highly popular water play areas that are rapidly becoming an alternative to some public swimming pools in many jurisdictions across the country needs to be addressed in the ISPSC in order to provide standards on how they are built in jurisdictions that currently have none and to bring alignment with some state codes that currently have such requirements, as well as requirements in the Model Aquatic Health Code for such features.

In previous code cycles, there was no disagreement that a code language addressing these type of features is needed and we believe based on the input previously provided in past code cycles, this proposal has addressed previous concerns and aligns with industry best practices in the area of interactive water play features (also known as spray pads, splash pads, etc.).

Additional background:

Waterparks have included these attractions in their array of fun things to do for many years. As large waterparks are highly focused on safety and cleanliness of all water used at the park, regulations did not seem to be as necessary for these attractions -- the waterparks knew what to do, how to do it and have an excellent track record. However, as these types of attractions move into the public sector such as at town public parks, many people who are responsible for choosing and operating this equipment might be lacking the waterpark's knowledge about what is critical for a safe installation. Those involved in the pool and spa industry and those involved in operating public pools in jurisdictions across the country are well aware of water contamination occurrence in these type of features.

The ISPSC is the best place to install these requirements within the I-code family of codes as attractions involve circulated and filtered water (similar to what a pool or spa use) for recreational use even though such attractions do not involve users immersing themselves in bodies of water. The California Building Code as well as the Florida Building Code is reflective of many of the proposed concepts and details of the language in this proposal, and these standards exist within the pool and spa sections of their codes.

Bibliography:

Section 5.12.5 of the Model Aquatic Health Code; <https://www.cdc.gov/mahc/editions/current.html>

6th edition (2017) Florida Building Code, Section 454.1

California Building Code: Title 24, Chapter 31B Pool Code

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction because additional labor, materials, equipment, and devices are mandated beyond what is currently required by the code. Specifically, the code is currently silent about these types of

attractions which means that any supplier of these attractions could provide any kind of equipment (of safe design or not). In some cases, having these regulations will make the cost of some suppliers' attraction packages be more than if they did not have to comply with these minimum safety requirements. For other suppliers, these requirements are already included in their standard packages.

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL FIRE CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some F code change proposals may not be included on this list, as they are being heard by another committee.

IWUC: 202 (New)

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2018 International Wildland-Urban Interface Code

Add new definition as follows:

ROOF ASSEMBLY. A system designed to provide weather protection and resistance to design loads. The system consists of a roof covering and roof deck or a single component serving as both the roof covering and the roof deck. A roof assembly includes the roof deck, underlayment and roof covering, and can also include a thermal barrier, ignition barrier, insulation or a vapor retarder.

ROOF COVERING. The covering applied to the roof deck for weather resistance, fire classification or appearance.

ROOF COVERING SYSTEM. See "Roof assembly".

ROOF DECK. The flat or sloped surface not including its supporting members or vertical supports.

Reason:

This proposal adds four definitions into chapter 2 of the IWUC.

The terms "roof covering", "roof assembly" and "roof decking" and "roof deck" are used in the code but are not defined. It appears that the terms "roof decking" and "roof deck" are used interchangeably. The term "roof covering" is used in instances (for example when dealing with fire performance) where it actually means the roof assembly (or roof covering system). This proposal takes the definitions from the IRC and incorporates them into Chapter 2 of the IWUC. Separate proposals recommend terminology changes in the code for consistency.

For information, the IRC and IBC definitions follow:

IRC:

[RB] ROOF ASSEMBLY. A system designed to provide weather protection and resistance to design loads. The system consists of a roof covering and roof deck or a single component serving as both the roof covering and the roof deck. A roof assembly includes the roof deck, underlayment and roof covering, and can also include a thermal barrier, ignition barrier, insulation or a vapor retarder. For the definition applicable in Chapter 11, see Section N1101.6.

[RB] ROOF COATING. A fluid-applied, adhered coating used for roof maintenance or roof repair, or as a component of a roof covering system or roof assembly.

[RB] ROOF COVERING. The covering applied to the roof deck for weather resistance, fire classification or appearance.

[RB] ROOF COVERING SYSTEM. See "Roof assembly."

[RB] ROOF DECK. The flat or sloped surface not including its supporting members or vertical supports.

IBC:

[BS] ROOF ASSEMBLY (For application to Chapter 15 only). A system designed to provide weather protection and resistance to design loads. The system consists of a roof covering and roof deck or a single component serving as both the roof covering and the roof deck. A roof assembly can include an underlayment, a thermal barrier, insulation or a vapor retarder.

[BS] ROOF COATING. A fluid-applied, adhered coating used for roof maintenance or roof repair, or as a component of a roof covering system or roof assembly.

[BS] ROOF COVERING. The covering applied to the roof deck for weather resistance, fire classification or appearance.

ROOF COVERING SYSTEM. See "Roof assembly".

[BS] ROOF DECK. The flat or sloped surface constructed on top of the exterior walls of a building or other supports for the purpose of enclosing the story below, or sheltering an area, to protect it from the elements, not including its supporting members or vertical supports.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change just adds definitions for clarity.

Internal ID: 774

WUIC2-18

IWUIC: 504.2, 505.2, 506.2

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Wildland-Urban Interface Code

Revise as follows:

504.2 Roof ~~covering-assembly~~. Roofs shall have a roof assembly that complies with a Class A rating when tested in accordance with ASTM ~~E-108-E108~~ or UL 790. For roof ~~coverings-assemblies~~ where the profile allows a space between the roof covering and roof ~~decking-deck~~, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM ~~D-3909-D3909~~ installed over the combustible ~~decking-roof deck~~.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry or an exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a roof deck on noncombustible framing.
3. Class A roof assemblies include minimum 16 oz/sq. ft. (0.0416 kg/m²) copper sheets installed over combustible roof decks.

505.2 Roof ~~covering-assembly~~. Roofs shall have a roof assembly that complies with not less than a Class B rating when tested in accordance with ASTM E108 or UL 790, or an *approved noncombustible roof covering*. For roof ~~coverings-assemblies~~ where the profile allows a space between the roof covering and roof ~~decking-deck~~, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of 72- pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible ~~decking-roof deck~~.

506.2 Roof ~~covering-assembly~~. Roofs shall have a roof assembly that complies with not less than a Class C rating when tested in accordance with ASTM E108 or UL 790 or an *approved noncombustible roof covering*. For roof ~~coverings-assemblies~~ where the profile allows a space between the roof covering and roof ~~decking-deck~~, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of 72- pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible ~~decking-roof deck~~.

Reason:

The terms “roof covering”, “roof assembly” and “roof decking” and “roof deck” are used in the code but are not defined. It appears that the terms “roof decking” and “roof deck” are used interchangeably. The term “roof covering” is used in instances (for example when dealing with fire performance) where it actually means the roof assembly (or roof covering system). A separate proposal takes the definitions from the IRC and incorporates them into Chapter 2 of the IWUIC. This proposal recommend terminology changes in the code for consistency.

This proposal simply cleans up terminology in the roofing section (504.2, 505.2 and 506.2) and does it consistently with the definitions of the terms in the IRC. It is associated with a parallel proposal that adds the IRC definitions into the IWUIC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply clarifies terms as defined in the IRC (and as proposed for definition in the IWUIC).

Internal ID: 778

WUIC3-18

IWUIC: 503.2

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Wildland-Urban Interface Code

Revise as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on ~~all sides the front and back faces either with the extended~~ ASTM E84 (UL 723) test ~~or ASTM E 2768, except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of $\frac{1}{8}$ inch (3.2 mm). Materials that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723, extended~~ for a test period of 30 minutes, or with ASTM E ~~2768~~E2768, and shall comply with the following:
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding ~~25 and shall not show evidence of progressive combustion following the extended 30-minute test.~~25.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than $10\frac{1}{2}$ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test. This shall be considered evidence of no significant progressive combustion.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A "Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results.
Exception: ~~Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.~~
2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Reason:

This proposal makes 4 changes, discussed below:

First:

It makes no sense to test "all sides" of a product when it becomes physically impossible to distinguish between the ends and no ASTM E84 specimen (which is 24 feet long by 2 feet wide) can be obtained from the ends. When a specimen is presented for testing, if all sides look the same, a lab can't tell which is a second side. Testing front and back is feasible but other sides are not (because the maximum ASTM E84 thickness is 4 inches). In order to test a "2 by 4" specimen a simple calculation is that you would have to cut it into 864 pieces that are 2 x 4, and 4 inches thick, and somehow fasten them together: that is obviously ridiculous. It makes perfect sense to test the front and the back

sides to ensure that the same fire performance is present on each side and that requirement is proposed to be retained.

Second:

The requirement to test with a rip or gap is not contained in either ASTM E84 or ASTM E2768 and is simply supposed to differentiate between fire retardant treated wood materials and coated materials. However, there is evidence that impregnation with fire retardant (as for fire retardant treated wood or FRTW) is not a guarantee that the additive penetrates uniformly throughout the wood and yet FRTW is not required to be tested on more than one side or with a gap or rip. That makes no sense. In fact, also, some coated products will be able to meet the requirements with the gap or rip so nothing is gained by adding that requirement. If there is concern about the implications of using coated wood products exceptions can (and should) be placed where the use of coated products is inappropriate, especially as decking materials.

Third:

ASTM E2768 was developed by ASTM E05 (committee on fire standards) specifically for the purpose of giving instructions on how to conduct ASTM E84 when extended to 30 minutes. In fact ASTM E84 states that materials required to be tested to meet the extended ASTM E84 to a 30-minute duration are covered by ASTM E2768. No other standard or code requirement explains how to test for "significant progressive combustion".

ASTM E2768 contains a section that explains how to assess the pass/fail criteria and it states as follows under "conditions of classification":

13.1 The test method has the following conditions of classification for a material or product to be classified as meeting the requirements of this standard:

13.1.1 The flame spread index shall be 25 or less as determined for the initial 10 min test period,

13.1.2 The flame front shall not progress more than 10.5 ft (3.2 m) beyond the centerline of the burners at any time during the 30 min test period. This is considered evidence of no significant progressive combustion in this test method.

13.2 For materials or products that are not homogeneous or symmetrical about their longitudinal axis, only surfaces that have been individually tested shall be eligible to be classified and reported as meeting the conditions of classification of this standard.

Consequently, the changes proposed to items 1.1 and 1.2 are consistent with the statements in ASTM E84 and ASTM E2768.

Fourth:

The exception is proposed to be eliminated because it is unnecessary if the requirement to test with a rip or gap is deleted.

A report on ASTM E2768 tests conducted by a fire test lab (QAI) is attached and it shows that when the flame front does not progress more than 10.5 ft beyond the centerline of the burners this is considered evidence of no significant progressive combustion. Also, no rip or gap used, because that is not what is required by ASTM E2768. Two pages of a similar report (title page and page 7) from another fire test lab (Intertek) also shows that the same criterion is used for both issues.

Cost Impact

The code change proposal will decrease the cost of construction .

This will eliminate unnecessary testing that represents a barrier without adding fire safety.

WUIC4-18

IWUIC: 503.2

Proponent: Thomas Meyers, Building Intuition, LLC, representing Self (codeconsultant@gmail.com)

2018 International Wildland-Urban Interface Code

Revise as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on all sides with the extended ASTM E84 (UL 723) test or ASTM E 2768, except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of $\frac{1}{8}$ inch (3.2 mm). Materials that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E 2768, comply with the following:
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding 25 and shall not show evidence of progressive combustion following the extended 30-minute test.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than $10\frac{1}{2}$ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A "~~Test-~~Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire ~~Testing~~-Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results.

~~**Exception:** Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.~~

2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Reason:

Recent cladding fires involving metal composite materials (MCM's), such as the Grenfell Tower in London, raises questions about the validity of allowing materials to be evaluated contrary to actual end use conditions. MCM's are frequently installed with exposed cores at joints, intersections, and corners. The effect of the exposed core on potential ignition and fire spread should be part of the testing evaluation as it realistically represents actual construction practices.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No cost change anticipated for existing, compliant products. Additional costs applied to certain products requiring retesting may occur at manufacturer discretion.

WUIC5-18

IWUIC: 503.2

Proponent: Tim Earl, GBH International, representing self (tearl@gbhinternational.com)

2018 International Wildland-Urban Interface Code

Revise as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on ~~all sides~~ the front and back faces either with the extended ASTM E84 (UL 723) test, extended for a test period of 30 minutes, or ASTM E 2768, except panel products shall be permitted to test only the front and back faces, with ASTM E2768. Panel products shall be tested with a ripped or cut longitudinal gap of $\frac{1}{8}$ inch (3.2 mm). ~~Materials that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E 2768, shall comply with the following:~~
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding ~~25 and shall not show evidence of progressive combustion following the extended 30-minute test.~~ 25.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than $10\frac{1}{2}$ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test. This shall be considered evidence of no significant progressive combustion.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A "Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results.

Exception: Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.
2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Reason:

It makes no sense to test "all sides" of a product when it becomes physically impossible to distinguish between the ends and no ASTM E84 specimen (which is 24 feet long by 2 feet wide) can be obtained from the ends. When a specimen is presented for testing, if all sides look the same, a lab can't tell which is a second side. Testing front and back is feasible but other sides are not (because the maximum ASTM E84 thickness is 4 inches). In order to test a "2 by 4" specimen a simple calculation is that you would have to cut it into 864 pieces that are 2 x 4, and 4 inches thick, and somehow fasten them together: that is obviously ridiculous. It makes perfect sense to test the front and the back sides to ensure that the same fire performance is present on each side and that requirement is proposed to be retained.

ASTM E2768 was developed by ASTM E05 (committee on fire standards) specifically for the purpose of giving instructions on how to conduct ASTM E84 when extended to 30 minutes. In fact ASTM E84 states that materials required to be tested to meet the extended ASTM E84 to a 30-minute duration are covered by ASTM E2768. ASTM E2768 contains a section that explains how to assess the pass/fail criteria and it states as follows under "conditions of classification":

13.1 The test method has the following conditions of classification for a material or product to be classified as meeting the requirements of this standard:

13.1.1 The flame spread index shall be 25 or less as determined for the initial 10min test period,

13.1.2 The flame front shall not progress more than 10.5 ft (3.2 m) beyond the centerline of the burners at any time during the 30 min test period. This is considered evidence of no significant progressive combustion in this test method.

13.2 For materials or products that are not homogeneous or symmetrical about their longitudinal axis, only surfaces that have been individually tested shall be eligible to be classified and reported as meeting the conditions of classification of this standard.

Consequently, the changes proposed to items 1.1 and 1.2 are consistent with the statements in ASTM E84 and ASTM E2768.

No other standard contains information on how to assess "no significant progressive combustion".

Cost Impact

The code change proposal will decrease the cost of construction .

This will reduce the amount of testing required by eliminating unnecessary tests on all sides of homogeneous wood specimens.

Internal ID: 1046

WUIC6-18

IWUIC: 504.5, 504.5.1 (New), 07

Proponent: David Tyree, American Wood Council, representing American Wood Council (dtyree@awc.org)

2018 International Wildland-Urban Interface Code

Delete and substitute as follows:

~~**504.5 Exterior walls.** Exterior walls of buildings or structures shall be constructed with one of the following methods:~~

- ~~1. Materials *approved* for not less than 1-hour fire-resistance-rated construction on the exterior side.~~
- ~~2. *Approved noncombustible* materials.~~
- ~~3. Heavy timber or log wall construction.~~
- ~~4. Fire-retardant treated wood on the exterior side. The fire-retardant treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~
- ~~5. Ignition-resistant materials complying with Section 503.2 on the exterior side.~~

~~Such material shall extend from the top of the foundation to the underside of the roof sheathing.~~

~~**504.5 Exterior walls.** Exterior walls of buildings or structures shall be tested in accordance with ASTM E2707 with the conditions of acceptance in Section 504.5.1.~~

~~**Exception:** Any of the following shall be deemed to meet the assembly performance requirement of this section.~~

- ~~1. One layer of 5/8" gypsum sheathing applied behind the exterior wall covering or cladding on the exterior side of the framing;~~
- ~~2. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side of the wall assembly when tested in accordance with ASTM E119.~~

~~Exterior wall coverings shall have a class B flame spread index and shall extend from the top of the foundation to the underside of the roof sheathing.~~

Add new text as follows:

~~**504.5.1 Conditions of Acceptance when tested in accordance with ASTM E2707.** The test shall be conducted in accordance with ASTM E2707 and the conditions of acceptance in items 1 and 2 below shall be met.~~

- ~~1. Absence of flame penetration through the wall assembly at any time.~~
- ~~2. Absence of glowing combustion on the unexposed side of the assembly at any time during the 70-min test.~~

Add new standard(s) follows:

ASTM

ASTM International

E2707-15:

~~**Standard Test Method for Determining Fire Penetration of Exterior Wall Assemblies Using a Direct Flame Impingement Exposure**~~

Reason:

This proposal includes a wall assembly fire performance requirement by adding ASTM consensus standard, ASTM E2707, "Standard Test Method for Determining Fire Penetration of Exterior Wall Assemblies Using a Direct Flame Impingement Exposure" as the ASTM test method for the acceptable fire performance of exterior wall assemblies in WUI areas. Exterior sides of wall assemblies that meet 1-hour fire resistance rating in accordance with ASTM E119 is proposed to be left as currently referenced. All other requirements that are not based on an exterior wall fire performance test are proposed to be deleted. WUI exterior wall fire performance is dependent on the cladding on the wall as well as its method of installation. Requiring the exterior wall systems to be tested in accordance with

ASTM E2707 or ASTM E119 would add the method of installation, including joints, to compliance criteria.

ASTM E2707 test method measures the ability of the wall system to resist fire penetration from the exterior into the wall cavity or unexposed side of the test assembly under the conditions of exposure. This test method was developed in response to recommendations developed by the California Office of the State Fire Marshal (SFM) and the International Wildland-Urban Interface Code (IWUIC) regarding the enhancement of exterior fire protection of structures in a wildland fire (exterior wildfire exposure). This proposal establishes performance criteria for materials to be used on the exterior buildings, structures, and detached accessory structures. While this test method is intended to address one component of an exterior wildfire exposure, that is, exterior walls exposed to direct flame impingement the proposal goes on to regulate the flame spread of the materials applied to the exterior wall. The purpose of this standard is to provide a definitive set of procedures for the evaluation and measurement of the resistance to fire penetration of exterior wall structures. The test is a practical attempt to simulate the case where ignition of flammable materials (plants, trash, a deck or shed, etc.) might be adjacent to a building.

Exterior sides of wall assemblies that meet 1-hour fire resistance rating in accordance with ASTM E119 is proposed to be left as currently referenced. A second option of providing a layer of 5/8" gypsum sheathing is consistent with this requirement but gives a prescriptive solution to requiring the test. All other requirements that are not based on an exterior wall fire test ASSEMBLIES are proposed to be deleted. WUI exterior wall fire performance is dependent on the cladding material as well as its method of installation. Requiring that exterior wall systems be tested in accordance with ASTM E2707 or ASTM E119 would add the method of installation to compliance criteria.

A 10-min 150-kW exposure was used for the siding-sheathing combinations, followed by an additional 60- min observation to detect any smoldering combustion. The use of infrared photography of the back of the test wall was used to reveal development of increasing temperatures or persisting hot spots. Other tests were run on solely cladding or sheathing, where the burner was left on until failure to determine the weak points in various materials. Most of the siding-sheathing assemblies exhibited acceptable performance. However, the hardboard siding failed because it burned and warped away from the sheathing, exposing it to flames. For the siding-only tests flame penetration occurred at joints for "combustible" siding. The nature of the siding joints had a substantial effect on relative performance. Most vulnerable was the plain bevel, while rabbeted and shiplap joints were increasingly resistant to flame-through. Tests on different types of siding materials including but not limited to; combustible, heavy timber, fire retardant treated wood and ignition resistant materials should also require testing in accordance with this standard since they were grandfathered in with the exceptions and have never been tested in our knowledge. It is thought that the type of joints using these construction materials will also have a questionable response depending of construction procedure and should also be tested to gain acceptance.

Additionally, it is recognized that the flame spread of the wall material is also very important to the wall performance in Wildland Urban Interface events. With this proposal BOTH the fire penetration through the exterior wall covering assembly into the wall cavity, and surface flame spread of wall covering material are taken into consideration. The current requirement pertains to exterior wall covering material without consideration of the exterior wall assembly performance. Qualifying just the wall covering material may not necessarily assure the safety from a wildland fire exposure. It has been shown that joints are a real weakness in the WUI envelope protection and this proposal addresses that concern. The exception to have an exterior wall assembly tested in accordance with ASTM E2707 is to allow assemblies approved for not less than 1-hour fire-resistance construction applied to the exterior side of the wall assembly or provide a layer of gypsum board as a part of the exterior wall covering assembly.

It is also reasonable to assume that accelerated aging/weathering tests will be required by an AHJ or listing agency as it is important to evaluate the permanence of the fire retardant properties of the product. The aging process will be defined by the intended end-use application and the materials content of the product being tested. Since the proposed test method is applicable to a wide range of products or assemblies, it is not reasonable to assume that all materials should be subjected to the same accelerated aging/weathering process. Test Method ASTM D2898 has long been used as an accelerated weathering process with fire retardant treated lumber products where leaching of chemicals may be an issue. For a product comprised of 100 % plastic, where leaching may not be an issue, some other test method may be appropriate. There are several different accelerated aging/ weathering procedures available. The effectiveness of these procedures vary with changes in the composition of the materials being aged. The language within the standard is worded so that accelerated aging/weathering is not required in all cases, but is required where such results are a condition of acceptance for a product to be used in a code regulated application. As such, the language provides the flexibility needed for the range of materials being used for exterior wall applications.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal adds an ASTM standard which allows wall assemblies to be tested and approved for WUI exterior wall construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2707-15 Standard Test Method for

Determining Fire Penetration of Exterior Wall Assemblies Using a Direct Flame Impingement Exposure, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

WUIC7-18

IWUIC: 504.7

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Wildland-Urban Interface Code

Revise as follows:

504.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be not less than 1-hour fire- resistance-rated construction, heavy timber construction or constructed of one of the following:

1. *Approved noncombustible* materials.
2. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
3. Ignition-resistant building materials in accordance with Section 503.2.

Exception: Coated materials shall not be used as the walking surface of decks.

Reason:

It is possible to create ignition-resistant materials that are the result of coating the front and back of certain panels (such as wood panels) and that meet the requirements. Such materials are typically fully suitable for use in most applications where ignition resistant materials are called for except for walking surfaces because of the probability of erosion after a certain period of use.

Therefore, if the coating is being eroded, the fire safety will decrease.

Cost Impact

The code change proposal will increase the cost of construction .

It is unlikely that coated materials are being used for decking but if they are used, this proposal will eliminate an option.

E2632/E2632M-13e1:

Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials

Reason:

This proposal includes a fire performance requirement by adding a ANSI Consensus Standard specifically developed to qualify exterior decks for Wildland-Urban Interface fire performance. ASTM E2632, "Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials". This test method was developed in response to recommendations developed by the California Office of the State Fire Marshal (OSFM) regarding the performance of decking materials in a wildland fire (exterior wildfire exposure). The ASTM E2632 test method addresses the case where a brand is blown or a surface fire extends under a deck and onto combustible material causing flaming combustion that may lead to penetration through the siding or some other vulnerable point of the main structure. The test is a practical attempt to simulate the case where combustible material resides beneath a structure and can become involved in a wildland fire event.

The major concern about the ignition of decking is the hazard that it presents to the habitable structure. Decking is usually configured so that it is capable of being threatened by two potential sources of ignition: brands on the surface of the decking and flaming material underneath the structure. It has been shown that in a typical Wildland-Urban Interface fire, burning brands can land on a deck causing combustion leading to flaming combustion. The flames impinge on the wall of the structure causing penetration at a vulnerable point into the structure. This proposal not only requires the decking material to be limited to a peak heat release rate of 25kw per square foot but adds additional requirements to provide non-combustible and ignition resistant construction to a height of 24 inches above the deck and 12 inches below the deck to protect the structure from any flaming caused by a burning brand landing on an

exterior deck surface. The additional requirement requiring a Class A covering material to a height of 24 inches above the walking surface and 12 inches below, have been added to specifically address recent testing conducted to examine potential vulnerabilities of wood decks to continuous, wind-driven firebrand showers. ASTM E2632 test method provides for several conditions that must be met to pass the performance criteria including: a limited heat release rate (HHR); absence of sustained flaming or glowing combustion; and absence of structural failure of the deck board. Smaller values of heat release rate reflect lower combustibility than larger values. This proposal uses the same acceptance criteria as the State of California SFM office which specifies a maximum net peak heat release of (no more than) 25 kW/ft² [269 kW/m²] for deck boards. For comparison, the HHR for a large juniper bush can be as high as 1000 kW.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal allows different materials to be testing to comply with the WUI decking standards and will not increase the cost of construction over current required methods of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2632 Standard Test Method for Evaluating the Under-Deck Fire Response of Deck Materials, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

E2632/E2632M-13e1:

Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials

Reason:

This proposal aligns with current requirements of the California Chapter 7A, and includes an option where wall material may be required to be either noncombustible or ignition-resistant.

This proposal seeks to introduce practical and realistic performance requirements for materials used for the walking surfaces of unenclosed accessory structures (i.e. exterior decks) in wildland-urban interface areas. This proposal introduces ASTM E2632, commonly known as the under-deck fire test, to the IWUIC.

The requirements rely on a fire test specifically designed to test and evaluate the performance of decking when constructed as a deck assembly in simulated WUI fire exposure. While this is different than the ASTM E84 test of Section 503.2 for ignition-resistant building materials, the test configuration and test requirements of ASTM E2632 were developed specifically for deck materials in WUI applications.

The ASTM E2632 test procedure requires constructing a small deck structure (joists and deck boards) consistent with the manufacturer's installation instructions and then this deck structure is placed over a burner. The flames and heat from the ignited burner are designed to simulate combustibles burning under a deck which frequently occurs during a WUI fire. The test deck structure is subject to the intense flame and heat from the burner for 3 minutes, and the fire performance of the decking is evaluated for the next 40 minutes to determine the response of the decking.

It is our understanding that based on testing of many decking products using the ASTM E2632 test method, it has been consistently observed that products meeting the conditions of acceptance as referenced in the proposed code change (an effective peak heat release rate not more than 25 kW/ft² (269 kW/m²) produce a limited level of heat release

during the flame exposure, with flames self-extinguishing shortly after the flame source is removed. This test method and acceptance criteria successfully differentiates "passing" products from those where sustained flaming and progressive fire growth occurs, presenting an unacceptable ignition hazard to the adjoining structure.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal includes what may be considered "right sized" fire performance requirements for exterior decking products (walking surfaces of unenclosed accessory structures). As such, additional decking products may become available in the market and the cost of decking products may be reduced.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2632/E2632M-13e1 Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 2364

WUIC11-18

IWUIC: 505.2

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Wildland-Urban Interface Code

Revise as follows:

505.2 Roof covering. Roofs shall have a roof assembly that complies with not less than a Class ~~B~~A rating when tested in accordance with ASTM E108 or UL 790, or an *approved noncombustible roof covering*. For roof coverings where the profile allows a space between the roof covering and roof decking, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of 72- pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible decking.

Reason:

Recent wildfires have demonstrated that burning embers are the key reason for transmission of fire from building to building. The key concern are clearly surfaces that are horizontal (such as decks or some roofs) or at a relatively small angle (such as roofs). Therefore, it is important that roof assemblies in wildland urban interface areas exhibit the best fire classification. This proposal requires that roofs in Class 2 ignition-resistant construction should have a Class A rating in accordance with ASTM E108. There can never be assurance, of course, that a better fire classification will ensure that fires don't spread but it is clear that the probability of fire spread will be lower if the fire performance of the roof assembly is better.

A separate proposal handles the terminology associated with this section, which is inconsistent but this proposal is of a technical nature.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will require that roof assemblies meet a more severe fire rating in accordance with ASTM E108.

E2707-15:

Standard Test Method for Determining Fire Penetration of Exterior Wall Assemblies Using a Direct Flame Impingement Exposure

Reason:

This proposal includes a wall assembly fire performance requirement by adding ASTM consensus standard, ASTM E2707, "Standard Test Method for Determining Fire Penetration of Exterior Wall Assemblies Using a Direct Flame Impingement Exposure" as the ASTM test method for the acceptable fire performance of exterior wall assemblies in WUI areas. Exterior sides of wall assemblies that meet 1-hour fire resistance rating in accordance with ASTM E119 is proposed to be left as currently referenced. All other requirements that are not based on an exterior wall fire performance test are proposed to be deleted. WUI exterior wall fire performance is dependent on the cladding on the wall as well as its method of installation. Requiring the exterior wall systems to be tested in accordance with

ASTM E2707 or ASTM E119 would add the method of installation, including joints, to compliance criteria.

ASTM E2707 test method measures the ability of the wall system to resist fire penetration from the exterior into the wall cavity or unexposed side of the test assembly under the conditions of exposure. This test method was developed in response to recommendations developed by the California Office of the State Fire Marshal (SFM) and the International Wildland-Urban Interface Code (IWUIC) regarding the enhancement of exterior fire protection of structures in a wildland fire (exterior wildfire exposure). This proposal establishes performance criteria for materials to be used on the exterior buildings, structures, and detached accessory structures. While this test method is intended to address one component of an exterior wildfire exposure, that is, exterior walls exposed to direct flame impingement the proposal goes on to regulate the flame spread of the materials applied to the exterior wall. The purpose of this standard is to provide a definitive set of procedures for the evaluation and measurement of the resistance to fire penetration of exterior wall structures. The test is a practical attempt to simulate the case where ignition of flammable materials (plants, trash, a deck or shed, etc.) might be adjacent to a building.

Exterior sides of wall assemblies that meet 1-hour fire resistance rating in accordance with ASTM E119 is proposed to be left as currently referenced. A second option of providing a layer of 5/8" gypsum sheathing is consistent with this requirement but gives a prescriptive solution to requiring the test. All other requirements that are not based on an exterior wall fire test ASSEMBLIES are proposed to be deleted. WUI exterior wall fire performance is dependent on the cladding material as well as its method of installation. Requiring that exterior wall systems be tested in accordance with ASTM E2707 or ASTM E119 would add the method of installation to compliance criteria.

A 10-min 150-kW exposure was used for the siding-sheathing combinations, followed by an additional 60- min observation to detect any smoldering combustion. The use of infrared photography of the back of the test wall was used to reveal development of increasing temperatures or persisting hot spots. Other tests were run on solely cladding or sheathing, where the burner was left on until failure to determine the weak points in various materials. Most of the siding-sheathing assemblies exhibited acceptable performance. However, the hardboard siding failed because it burned and warped away from the sheathing, exposing it to flames. For the siding-only tests flame penetration occurred at joints for "combustible" siding. The nature of the siding joints had a substantial effect on relative performance. Most vulnerable was the plain bevel, while rabbeted and shiplap joints were increasingly resistant to flame-through. Tests on different types of siding materials including but not limited to; combustible, heavy timber, fire retardant treated wood and ignition resistant materials should also require testing in accordance with this standard since they were grandfathered in with the exceptions and have never been tested in our knowledge. It is thought that the type of joints using these construction materials will also have a questionable response depending of construction procedure and should also be tested to gain acceptance.

Additionally, it is recognized that the flame spread of the wall material is also very important to the wall performance in Wildland Urban Interface events. With this proposal BOTH the fire penetration through the exterior wall covering assembly into the wall cavity, and surface flame spread of wall covering material are taken into consideration. The current requirement pertains to exterior wall covering material without consideration of the exterior wall assembly performance. Qualifying just the wall covering material may not necessarily assure the safety from a wildland fire exposure. It has been shown that joints are a real weakness in the WUI envelope protection and this proposal addresses that concern. The exception to have an exterior wall assembly tested in accordance with ASTM E2707 is to allow assemblies approved for not less than 1-hour fire-resistance construction applied to the exterior side of the wall assembly or provide a layer of gypsum board as a part of the exterior wall covering assembly.

It is also reasonable to assume that accelerated aging/weathering tests will be required by an AHJ or listing agency as it is important to evaluate the permanence of the fire retardant properties of the product. The aging process will be defined by the intended end-use application and the materials content of the product being tested. Since the proposed test method is applicable to a wide range of products or assemblies, it is not reasonable to assume that all materials should be subjected to the same accelerated aging/weathering process. Test Method ASTM D2898 has long been used as an accelerated weathering process with fire retardant treated lumber products where leaching of chemicals may be an issue. For a product comprised of 100 % plastic, where leaching may not be an issue, some other test method may be appropriate. There are several different accelerated aging/ weathering procedures available. The effectiveness of these procedures vary with changes in the composition of the materials being aged. The language within the standard is worded so that accelerated aging/weathering is not required in all cases, but is required where such results are a condition of acceptance for a product to be used in a code regulated application. As such, the language provides the flexibility needed for the range of materials being used for exterior wall applications.

This proposal places the ASTM decking performance standards into a lower Wildland-Urban Interface Fire classification, Class 2 Ignition-Resistant Construction. The first step to determining the Fire Hazard Severity is to determine if the site is in Low, Moderate,

High or Extreme Hazard Area. Most fire departments have a fire hazard map. Next you determine if a conforming water supply and a defensible space are provided. Then you take this information and apply it to Table 503.1 to determine the required ignition-resistant construction. Depending on nonconforming or conforming water supply and defensible

space you may be able to modify your ignition resistant construction requirements. Upon examination of Table 503.1, Class 2 Ignition Resistant Construction is only permitted in moderate hazard areas with a conforming water supply or a conforming defensible space. In high hazard areas,

Class 2 Ignition Resistant Construction is only permitted where a conforming water AND defensible space is provided. In an extreme hazard area, you must have a conforming water supply and 1.5 times the required defensible space. Materials used for construction are only one consideration in wildland-urban interface fires.

Other considerations which are equally or more important are providing an adequate water supply and defensible space. Without either of these other considerations, the structures have little or no chance of survival regardless of construction. Per Section 502.2 of the International Wildland-Urban Interface Code, Fire Hazard Severity can be reduced by implementing an approved Vegetation Management Plan. Vegetation management plans shall be provided describing all actions that will be taken to prevent a fire from being carried toward or away from the building. Elements of the plan should include removal of slash, snags, vegetation that may grow into overhead electrical lines, other ground fuels, ladder fuels and dead trees, and the thinning of live trees. Additionally, a plan for maintaining the proposed fuel reduction measures should be provided. Defensible space plans must be submitted to the code official for review and approval as part of the plans required for a permit. In other words, these considerations must be considered to provide a structure that can withstand a WUI fire.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal places an ASTM WUI Standard for exterior walls in the code and will not increase or decrease the cost of construction in these areas.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2707-15 Standard Test Method for Determining Fire Penetration of Exterior Wall Assemblies Using a Direct Flame Impingement Exposure, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

WUIC13-18

IWUIC: 505.7

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Wildland-Urban Interface Code

Revise as follows:

505.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be not less than 1-hour fire-resistance-rated construction, heavy timber construction or constructed of one of the following:

1. *Approved noncombustible* materials.
2. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
3. Ignition-resistant building materials in accordance with Section 503.2.

Exception: Coated materials shall not be used as the walking surface of decks.

Reason:

It is possible to create ignition-resistant materials that are the result of coating the front and back of certain panels (such as wood panels) and that meet the requirements. Such materials are typically fully suitable for use in most applications where ignition resistant materials are called for except for walking surfaces because of the probability of erosion after a certain period of use.

Therefore, if the coating is being eroded, the fire safety will decrease.

Cost Impact

The code change proposal will increase the cost of construction .

It is unlikely that coated materials are being used as decking materials, but if they are used, the proposed change would eliminate an option.

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959

E2632/E2632M-13e1:

Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials

Reason:

This proposal includes a fire performance requirement by adding a ANSI Consensus Standard specifically developed to qualify exterior decks for Wildland Urban Interface fire performance. ASTM E2632, "Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials". This test method was developed in response to recommendations developed by the California Office of the State Fire Marshal (OSFM) regarding the performance of decking materials in a wildland fire (exterior wildfire exposure). The ASTM E2632 test method addresses the case where a brand is blown or a surface fire extends under a deck and onto combustible material causing flaming combustion that may lead to penetration through the siding or some other vulnerable point of the main structure. The test is a practical attempt to simulate the case where combustible material resides beneath a structure and can become involved in a wildland fire event. The major concern about the ignition of decking is the hazard that it presents

to the habitable structure. Decking is usually configured so that it is capable of being threatened by two potential sources of ignition: brands on the surface of the decking and flaming material underneath the structure. It has been shown that in a typical Wildland Urban Interface fire, burning brands can land on a deck causing combustion leading to flaming combustion. The flames impinge on the wall of the structure causing penetration at a vulnerable point into the structure. This proposal not only requires the decking material to be limited to a peak heat release rate of 25kw per square foot but adds additional requirements to provide noncombustible and ignition resistant construction to a height of 24 inches above the deck and 12 inches below the deck to protect the structure from any flaming caused by a burning brand landing on an exterior deck surface. The additional requirement requiring a Class A covering material to a height of 24 inches above the walking surface and 12 inches below, have been added to specifically address recent testing conducted to examine potential vulnerabilities of wood decks to continuous, wind-driven firebrand showers. ASTM E2632 test method provides for several conditions that must be met to pass the performance criteria including: a limited heat release rate (HHR); absence of sustained flaming or glowing combustion; and absence of structural failure of the deck board. Smaller values of heat release rate reflect lower combustibility than larger values. This proposal uses the same acceptance criteria as the State of California SFM office which specifies a maximum net peak heat release of (no more than) 25 kW/ft² [269 kW/m²] for deck boards. For comparison, the HHR for a large juniper bush can be as high as 1000 kW.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal allows different materials to be testing to comply with the WUI decking standards and will not increase the cost of construction over current required methods of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2632/E2632M-13e1 Standard Test Method for Evaluating the Under-Deck Fire Test Response of Deck Materials, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1065

WUIC16-18

IWUIC: 506.2

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2018 International Wildland-Urban Interface Code

Revise as follows:

506.2 Roof covering. Roofs shall have a roof assembly that complies with not less than a Class ~~C~~B rating when tested in accordance with ASTM E108 or UL 790 or an *approved noncombustible roof* covering. For roof coverings where the profile allows a space between the roof covering and roof decking, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of 72- pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible decking.

Reason:

Recent wildfires have demonstrated that burning embers are the key reason for transmission of fire from building to building. The key concern are clearly surfaces that are horizontal (such as decks or some roofs) or at a relatively small angle (such as roofs). Therefore, it is important that roof assemblies in wildland urban interface areas exhibit the best fire classification. This proposal requires that roofs in Class 3 ignition-resistant construction should have a Class B rating in accordance with ASTM E108. This proposal acknowledges that Class 3 ignition-resistant construction provides less protection than Class 1 or 2 and, therefore, recommends that it be changed from Class C roof fire classification to Class B roof fire classification and not to Class A. There can never be assurance, of course, that a better fire classification will ensure that fires don't spread but it is clear that the probability of fire spread will be lower if the fire performance of the roof assembly is better.

A separate proposal handles the terminology associated with this section, which is inconsistent but this proposal is of a technical nature.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will require that roof assemblies meet a more severe fire rating in accordance with ASTM E108.

Internal ID: 789

CCC-F11-18

IFC: 3806.2

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

3806.2 Hazardous materials storage and use. Storage and use of hazardous materials within *control areas* in new and existing laboratories equipped with an *automatic sprinkler system* shall be in accordance with this section and Chapters 50 through 67, as applicable.

Exception: Existing laboratories in buildings equipped throughout with an automatic sprinkler system meeting requirements for laboratory suites are permitted to comply with Section 3804.

Reason:

This is an editorial change to correct the term for "automatic sprinkler system."

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is editorial.

Internal ID: 2355

CCC-F4-18

IFC: 2311.8.4.4

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

2311.8.4.4 Clear space. Motor vehicle repair booths shall be installed so that all parts of the booth ~~provide~~ are provided with ready access for cleaning. A clear area of not less than 3 feet (914 mm) wide shall be maintained on all sides of the motor vehicle repair booth. This clear area shall be kept free of any storage or combustible construction.

Exceptions:

1. This requirement shall not prohibit locating a motor vehicle repair booth closer than 3 feet (914 mm) to or directly against an interior partition, wall or floor/ceiling assembly that has a fire-resistance rating of not less than 1 hour, provided that the motor vehicle repair booth can be adequately maintained and cleaned.
2. This requirement shall not prohibit locating a motor vehicle repair booth closer than 3 feet (914 mm) to an exterior wall or a roof assembly, provided that the wall or roof is constructed of noncombustible material and the motor vehicle repair booth can be adequately maintained and cleaned.

Reason:

This revision clarifies the application of this section.

The booth does not "provide" access; the booth is "provided with" access. This revision clarifies this section.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is clarification. There is no change in code requirements.

Internal ID: 2332

CCC-F8-18

IFC: 3805.2, 3805.3

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

3805.2 ~~Nonsprinklered laboratories~~ Maximum allowable quantities. The maximum allowable quantities of hazardous materials in storage and use in *control areas* in laboratories located in buildings not equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be in accordance with Tables 5003.1.1(1), 5003.1.1(2) and 5003.8.3.2, except as modified by Sections 3805.2.1 and 3805.2.2.

3805.3 ~~Restricted materials automatic~~ Automatic fire detection. An automatic fire detection system shall be installed in all existing laboratories in nonsprinklered buildings in accordance with this section. Detectors shall be connected to the building's fire alarm control unit where a fire alarm system is provided. Detector initiation shall activate the occupant notification system in accordance with Section 907.5 where connected to the building's fire alarm control unit. Activation of the detection system shall sound a local alarm in buildings not equipped with a fire alarm notification system.

Reason:

These revisions are simply to have the section title more appropriately depict the section content.

All of Section 3805 addresses Nonsprinklered Laboratories, so the title of Section 3805.2 is revised to Maximum Allowable Quantities since that is what is regulated in that section.

Section 3805.3 is revised by deleted the words "Restricted Materials" since they do not apply the section at all.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no change in requirements.

Internal ID: 2314

CCC-E5-18

IBC: 1029.16.1 (IFC[BE] 1029.16.1)

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows:

1029.16.1 Discontinuous mid-aisle handrails. Where there is seating on both sides of the aisle, the mid-aisle *handrails* shall be discontinuous with gaps or breaks at intervals not exceeding five rows to facilitate access to seating and to permit crossing from one side of the *aisle* to the other. These gaps or breaks shall have a clear width of not less than 22 inches (559 mm) and not greater than 36 inches (914 mm), measured horizontally, and the mid-aisle *handrail* shall have rounded terminations or bends.

Reason:

This merely clarifies the code section.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This changes simply clarifies the code provision.

Internal ID: 1061

CCC-P1-18

IPC: 705.2.1

Proponent: Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

2018 International Plumbing Code

Revise as follows:

705.2.1 Mechanical joints. Mechanical joints on drainage ~~pipes~~ pipe shall be made with an elastomeric seal conforming to ASTM C1173, ASTM D3212, or CSA B602. Mechanical joints shall not be installed ~~only in underground~~ above-ground systems unless otherwise *approved*. Joints shall be installed in accordance with the manufacturer's instructions.

705.10.1 Mechanical joints. Mechanical joints on drainage pipe shall be made with an elastomeric seal conforming to ASTM C1173, ASTM D3212 or CSA B602. Mechanical joints shall not be installed in above-ground systems, unless otherwise *approved*. Joints shall be installed in accordance with the manufacturer's instructions.

Reason:

Getting the ABS and PVC sections to correlate. There is slightly different language used.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This wording change is essentially editorial and does not change technical requirements.

Internal ID: 983

CCC-G2-18

IBC: 202

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org); Ed Kullik, Chair, representing ICC Building Code Action Committee (BCAC@iccsafe.org)

2018 International Building Code

Delete without substitution:

~~**[BG] CABLE-RESTRAINED, AIR-SUPPORTED STRUCTURE.** A structure in which the uplift is resisted by cables or webbings which are anchored to either foundations or dead men. Reinforcing cable or webbing is attached by various methods to the membrane or is an integral part of the membrane. This is not a cable-supported structure.~~

Reason:

The words **CABLE-RESTRAINED, AIR-SUPPORTED STRUCTURE** are not used anywhere in IBC or IFC, except in the definition. The term "air-supported" is defined separately, the term "cable-restrained" is intuitive. The last sentence of the definition is present to make a clear distinction between "cable-restrained", and "cable-supported", yet the term "cable-supported" is also neither defined nor used.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply deletes an obsolete definition.

Internal ID: 345

CCC-FS5-18

IBC: 715

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

SECTION 715 FIRE-RESISTANT JOINT SYSTEMS JOINTS AND VOIDS

Reason:

Section 715 covers more than just fire-resistant rated joint systems, it actually covers both joints and voids. This editorial title change is consistent with the concept of Section 714, entitled Penetrations.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply changes the title of the Section.

Internal ID: 324
