INTRODUCTION

This 2018 Group A Cycle kicks off the second full cycle (2018 Group A and 2019 and Group B) which is utilizing the new cdpACCESS system. This system allows stakeholders to collaborate on potential code changes and to submit code changes online via the system.

As utilized during the 2015 and 2016 Cycles, code change modifications will be submitted and presented for committee and public viewing at the Committee Action Hearing through the cdpACCESS system. Detailed instructions for modifications will be available at the cdpACCESS website. In addition, printed instructions will be supplied at the CAH hearings. See page vi for details on the modification submittal process.

The proposed changes published herein have been submitted in accordance with established procedures [Council Policy 28 Code Development (CP 28)] (see page xxxvi) and are posted for review. The publication of these changes constitutes neither endorsement nor question of them but is in accordance with established procedures so that any interested individuals may make their views known to the relevant code committee and others similarly interested. In furtherance of this purpose, the committee will hold an open public hearing at the date and place shown below for the purpose of receiving comments and arguments for or against such proposed changes. Those who are interested in testifying on any of the published changes are expected to be represented at these hearings.

This compilation of code change proposals is available in electronic form only. ICC no longer prints and distributes this document. The compilation of code change proposals is posted on two locations on the ICC website: the customary posting which is linked from the [Code Development](#) webpage and from the [cdpACCESS](#) webpage.

2018 – 2019 CODE GROUPINGS

Codes to be considered in Group A Cycle:

- IBC – Egress
- IBC – Fire Safety
- IBC – General
- IFC
- IFGC
- IMC
- IPC
- IPMC
- IPSDC
- IRC – Mechanical
- IRC – Plumbing
- ISPSC
- IWUIC
- IZC

See page ix for the 2018 – 2019 ICC Code Development Schedule

2018 ICC COMMITTEE ACTION HEARINGS

These proposed changes will be discussed in public hearings to be held on April 15 – 23, 2018 at the Greater Columbus Convention Center, Columbus, OH. The code committees will conduct their public hearings in accordance with the schedule shown on page xlvi.

MEMBERSHIP COUNCILS TO MEET PRIOR TO THE HEARINGS

Prior to the hearings, some of the Membership Councils will be holding meetings during the Saturday, April 14th /Sunday morning, April 15th time period. This has been identified on the hearing schedule that was posted February 20th. Be sure to consult the [Membership Councils](#) webpage for details as they become available.

ADVANCED REGISTRATION AND VOTING

Assembly floor motions will be allowed following the committee action, however, the motion will be voted online following the hearings. All ICC members will be allowed to vote online on assembly floor motions. ICC members in attendance will still be allowed to vote on procedural “points of order” in accordance with Section 5.4.7 of CP 28 (see page xxii) **For identification purposes, all hearing participants must register. There is no cost to register or participate in the hearings.**

You are encouraged to advance register. [Click here](#) to register online.

The registration desk will be open in the lobby of the convention center according to the following schedule:

Sunday, April 15 th through Saturday, April 21 st	7:30 am to 5:00 pm
Sunday, April 22 nd	9:30 am to 12:00 pm
Monday, April 23 rd	7:30 am to 5:00 pm

CP 28 requires that ICC’s membership records regarding ICC members reflect the eligible voters 30 days prior to the start of the Committee Action Hearings. This process includes new members as well as changes to voting status. This applies to all ICC Members - Governmental Members and non Governmental Members. Applicable CP 28 sections noted below:

5.7.4 Eligible Online Assembly Motion Voters: All members of ICC shall be eligible to vote on online assembly floor motions. Each member is entitled to one vote, except that each Governmental Member Voting Representative may vote on behalf of its Governmental Member. Individuals who represent more than one Governmental Member shall be limited to a single vote. Application, whether new or updated, for ICC membership must be received by the Code Council 30 days prior to the first day of the Committee Action Hearing. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

9.2 Applications: Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

As such, new membership applications as well as renewal applications must be received by ICC’s Member Services Department by March 16, 2018. These records will be used to verify eligible voter status. Members are strongly encouraged to review their membership records for accuracy well in advance of the hearings so that any necessary changes are made prior to the March 16th deadline. For information on application for new membership and membership renewal, [click here](#) or call ICC Member Services at 1-888-ICC SAFE (422-7233)

ASSEMBLY ACTION PROCESS

Some important items to note regarding assembly consideration are:

- After the committee decision on a code change proposal is announced by the moderator, anyone in the assembly may make a floor motion for assembly action (5.7.1).
- After a floor motion for assembly action is made and seconded, the moderator will accept the motion and notify the attendees that the motion will be considered via an online voting process by all ICC members (5.7.2 and 5.7.4). No additional testimony will be permitted.
- Assembly floor motions will be voted on via an online process following the hearing (5.7.2).
- The online voting process will include the ability to view the video of the hearing testimony, committee deliberations and committee action (5.7.3). Each member, including Governmental Member Voting Representatives, gets only one vote (5.7.4). A successful assembly action requires a majority of votes cast and will result in an automatic public comment (5.7.5).
- A code change proposal that receives a successful assembly action will be placed on the Public Comment Agenda for individual consideration. The initial motion at the Public Comment Hearing will be the committee's action (7.4).

2018 GROUP A CODE DEVELOPMENT COMMITTEE RESPONSIBILITIES

Some sections of the International Codes have a letter designation in brackets in front of them. Code change proposals submitted for such code sections that have a bracketed letter designation in front of them will be heard by the respective committee responsible for such code sections. Because different committees will meet in different years, some proposals for a given code will be heard by a committee in a different year than the year in which the primary committee for this code meets.

For instance, Section 1505.10 of the IBC has a [BF] in front of it, meaning that this section is the responsibility of the IBC – Fire Safety Code Development Committee. However, the technical content of Chapter 15 is generally structural and as such, code change proposals are designated with the structural designation: IBC – S. In this current 2018 Group A Cycle, there are 13 such IBC – S proposals, to be heard by either the IBC – Fire Safety, IBC – General, or the IPC Code Development Committee. Be sure to consult the Cross Index of Proposed Code Changes on page xxxvi and the respective Tentative Order of Discussion for the individual committees.

A complete summary of the 2018 – 2019 Group A and Group B Code Development Committees' responsibilities can be viewed at the [ICC Website](#).

ANALYSIS STATEMENTS

Various proposed changes published herein contain an "analysis" that appears after the proponent's reason. These comments do not advocate action by the code committees or the voting membership for or against a proposal. The purpose of such comments is to identify pertinent information that is relevant to the consideration of the proposed change by all interested parties, including those testifying, the code committees and the voting membership. Staff analyses customarily identify such things as: conflicts and duplication within a proposed change and with other proposed changes and/or current code text; deficiencies in proposed text and/or substantiation; text problems such as wording defects and vagueness; background information on the development of current text; and staff's review of proposed reference standards for compliance with the Procedures. Lack of an analysis indicates neither support for, nor opposition to a proposal.

NEW REFERENCE STANDARDS

Proposed changes that include the addition of a reference to a new standard (a standard that is not currently referenced in the current edition of the I-Codes) will include in the proposal the number, title and edition of the proposed standard. This identifies to all interested parties the precise document that is being proposed and which would be included in the referenced standards chapter of the code if the proposed change is approved. Section 3.6.3.1 of CP 28 requires that a code change proposal will not be processed unless a consensus draft of the standard has been provided. Proponents of code changes which propose a new standard have been directed to provide copies of the standard to the code

development committee. An analysis statement will be posted on the ICC website providing information regarding standard content, such as enforceable language, references to proprietary products or services, and references to consensus procedure. The analysis statements for referenced standards will be posted on or before April 2, 2018. This information will also be published and made available at the hearings.

Proposed new reference standards must be completed and readily available prior to the 2018 Public Comment Hearing in accordance with Section 3.6.3.1 of CP28.

REFERENCED STANDARDS UPDATES

Updates to currently referenced standards in any of the 2018 Codes will be considered by the Administrative Code Development Committee in the 2019 Group B Cycle.

Note that based on recent changes to Section 3.6.3.1 of CP28, updates to existing referenced standards that are part of a code change proposal that includes technical revisions to code text to coordinate with such proposed standard(s) update are to be processed as proposed new standards in accordance with Sections 3.4 and 3.6.3.1.2 of CP28. Accordingly, drafts of the revisions would have needed to be supplied at the time of the code change submittal and the standard update will be required to be completed and published on or before the Public Comment Hearing for this 2018 Cycle, October 24, 2018.

It should be noted that, in accordance with Section 4.6 of CP 28, standards promulgators will have until December 1, 2020 to finalize and publish any updates to standards in the administrative update. If the standard update is not finalized and published by December 1, 2020, the respective I-Codes will be revised to reference the previously listed year edition of the standard.

ICC WEBSITE

This document is posted on the [ICC Website](#). While great care has been exercised in the publication of this document, errata to proposed changes may occur. Errata, if any, will be identified in updates posted prior to the Committee Action Hearing. Users are encouraged to periodically review the [ICC Website](#). Additionally, analysis statements for code changes which propose a new referenced standard will be updated and posted to reflect the staff review of the standard for compliance with Section 3.6 of the Procedures.

PROPONENT CONTACT INFORMATION

In accordance with procedures, proponents are under no obligation to provide an email address for their posted proposal. For most of the code change proposals, an email address for the proponent has been provided. In an effort to continue to provide for proponent's privacy and at the same time allow an initial contact between an interested party and the proponent, new to this 2018 Cycle we will be utilizing cdpACCESS to allow an interested party to initiate contact with the proponent without identifying the proponent's email address. The process is follows:

- Interested party logs into cdpACCESS and searches for the subject code change.
- Interested party locates the button "Contact the Proponent" to request that cdpACCESS contact the proponent, providing the interested party's name and email address.
- cdpACCESS uses the proponent email address on file and sends a notification to the proponent indicating the name of the interested party and their email address and that the interested party would like to discuss the code change.
- The interested party receives an email noting that the cdpACCESS system has sent the request to the proponent.
- It is up to the proponent to determine if they would like to respond and contact the interested party.
- The proponent is under no obligation to respond to the cdpACCESS request for contact or to contact the interested party. The proponent's contact information is not revealed to the interested party as part of this initial contact.

Screen shots for the process noted above are under development and will be posted on the [ICC website](#).

HEARING ORDER CHANGES AND TABLING OF PROPOSALS

The Code Change Agenda that places the code change proposals in a logical order for each hearing committee is shown at the beginning of the respective committee's group of code change proposals. In accordance with Section 5.4.4 of CP28, any attendee at the hearing is allowed make a motion to revise the hearing order at any time during the hearings except while a code change is being discussed, but usually as the first order of business at the hearing. Preference is given to grouping like subjects together, and moving items back to a later position on the agenda.

This motion is considered in order unless the proponent(s) of the moved code change proposals are in attendance and object to the move. If there is objection to the move, the motion is ruled out of order by the Moderator. This ruling is final and not debatable. If the motion is not ruled out of order, the motion is subject to a 2/3 vote of those present.

New for these hearings, a motion to table a code change proposal is allowed in accordance with Section 5.4.5 of CP28. Just as with a motion to move a code change proposal in the hearing order, this motion is in order only if there is no objection from the proponent(s) in attendance at the hearing. When the proponent(s) object, the motion to table is ruled out of order by the Moderator. The ruling is final and not subject to debate. The motion to table must identify the location to where the code change proposal consideration will be resumed by either identifying a specific date and time within the timeframe of the Code Change Agenda for the group of code change proposals under consideration or by designating a specific location in the Code Change Agenda.

FLOOR MODIFICATIONS

With the implementation of the new cdpACCESS online system, CP 28 was revised to reflect that floor modifications would be submitted electronically at the Committee Action Hearing (CAH).

The only aspect of the modification process that has changed is the way the modification is submitted and viewed. It is required to be submitted electronically via cdpACCESS. All other aspects of the modification process are unchanged. As in the past, the proponent of the modification must be in attendance at the CAH to present the modification as part of his/her testimony.

Those who are submitting a modification for consideration by the respective Code Development Committee are required to sign a Copyright Release in order to have their modification(s) considered (Section 3.3.5.5 of CP 28). This feature is built into cdpACCESS similar to the way the release is executed for code change and public comment submittals.

The Chair rules the modification in or out of order. Note that this is a procedural ruling to determine if the modification is to be permitted to be considered at the hearing. It is not a technical ruling. The ruling is final, with no challenge allowed.

The modification proponent is required to identify the specific text of the code change proposal that is being revised and the revision itself. In this way, it is very similar to the public comment process and that is the way cdpACCESS was developed to process modifications.

Example:

Original code change proposal.

The original code change proposal requested the following change to Section 305.3 of the IPMC: (Note that the example is fictional.)

**PM10-18
305.13**

Proponent: John West representing self

Revise as follows:

305.3 Interior surfaces. All interior surfaces, including windows and doors, shall be maintained in good and clean condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster, ~~decayed wood~~ and other defective surface conditions shall be corrected. Surfaces of porous materials made of or containing organic materials, such as but not limited to wood, textiles, paint, cellulose insulation, and paper, including paper-faced gypsum board, that have visible signs of mold or mildew shall be removed and replaced or remediated in an approved manner.

Exception: Porous materials that do not contain organic materials, such as clean unpainted bricks and concrete.

Proposed modification:

A modification to the code change proposal is proposed:

1. To add “and sanitary” after “clean” in the first sentence.
2. To add “or water permeable” after “porous” in the third sentence.
3. Delete “in an approved manner.” in the last sentence.
4. Delete the proposed new exception.

The cdpACCESS system will provide the text of the original code change proposal with the proposed change incorporated into the text. Using the cdpACCESS system, the proponent of the modification locates the original change in the system.

The proponent of the modification will need to manually install strikethrough (ex:” ~~delete~~) and underline (ex: add) formatting showing the additional revisions to the original proposal.

cdpACCESS will show the modification as follows:

**PM10-13
305.13**

Modification Proponent: Sam Sumter representing self

Modify the proposal as follows:

305.3 Interior surfaces. All interior surfaces, including windows and doors, shall be maintained in good, ~~and~~ clean and sanitary condition. Peeling, chipping, flaking or abraded paint shall be repaired, removed or covered. Cracked or loose plaster and other defective surface conditions shall be corrected. Surfaces of porous or water permeable materials made of or containing organic materials, such as but not limited to wood, textiles, paint, cellulose insulation, and paper, including paper-faced gypsum board, that have visible signs of mold or mildew shall be removed and replaced or remediated ~~in an approved manner.~~

~~Exception:~~ ~~Porous materials that do not contain organic materials, such as clean unpainted bricks and concrete.~~

Among the benefits of using cdpACCESS to submit modifications are:

- Modification proponents will be able to access the system in advance of the hearings to develop their modification (see “Detailed Steps of the Modification Submission Process via cdpACCESS” on the following pages).
- The collaboration features will allow modification proponents to collaborate before submitting.
- 20 hard copies of the modification for distribution to the committee are no longer required.
- You can preview your modification at any time by downloading a pdf via cdpACCESS.

OVERVIEW OF THE MODIFICATION PROCESS (see CP28 Section 5.5.2 on page xxiii)

1. **NEW.** Modification submitted electronically via cdpACCESS. As in the past, this submittal is required well in advance of the code change proposal being brought to the floor.

2. The code change proposal is brought to the floor by the Moderator.

IMPORTANT NOTE: ONCE A CODE CHANGE PROPOSAL IS BROUGHT TO THE FLOOR, ALL MODIFICATIONS MUST BE IN THE cdpACCESS SYSTEM. SEE NOTE 1.

3. Modification proponent suggests the modification from the floor at the hearing.

4. **NEW.** Modification posted to cdpACCESS for public viewing (including the hearing room via WiFi) and committee viewing.

5. Modification displayed on the screen in the hearing room.

6. Chair rules the modification in or out of order.

7. If ruled in order, testimony on the modification is initiated.

EDITORIAL CODE CHANGES - CODE CORRELATION COMMITTEE

In a typical code change cycle, there are code change proposals that are considered strictly editorial. Section 4.4 of CP 28 (see below) establishes a process by which the Code Correlation Committee (CCC) considers such proposals.

4.4 Editorial Code Change Proposals. When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate code development committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate code development committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the Committee Action Hearing. Code Correlation Committee proposals that are not added to a code development committee hearing agenda shall be published in the next edition of the code with no further consideration.

There are 7 such proposals in the current 2018 Cycle. They are both proposals to the IEBC and are posted as the first code changes in the IEBC's agenda. They are identified by code change numbers CCC1 through CCC7.

As noted in Section 4.4, anyone may request that either of these proposals be added to the hearing agenda. The deadline to make such a request is 11: 59 pm Pacific on Sunday, April 1, 2018 via email. Be sure to identify the code change number noted above. Such requests must be sent to:

Dave Bowman
Manager, Codes
dbowman@iccsafe.org

2018/2019 ICC CODE DEVELOPMENT SCHEDULE

(February 10, 2017)

STEP IN CODE DEVELOPMENT CYCLE	DATE	
	2018 – Group A Codes IBC- E, IBC - FS, IBC -G, IFC, IFGC, IMC, IPC, IPMC, IPSDC, IRC – M, IRC- P, ISPSC, IWUIC, IZC	2019 – Group B Codes Admin, IBC-S, IEBC, IECC-C, IECC-R/IRC-E, IgCC (Ch. 1), IRC – B
2018 EDITION OF I-CODES PUBLISHED	Fall/2017 (except 2018 IgCC, see Group B Codes on page x)	
DEADLINE FOR RECEIPT OF APPLICATIONS FOR ALL CODE COMMITTEES	June 1, 2017 for the 2018/2019 Cycle. Call for committee posted in February /2017.	
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF CODE CHANGE PROPOSALS	January 8, 2018 (Extended to January 11, 2018)	January 7, 2019
WEB POSTING OF “PROPOSED CHANGES TO THE I-CODES”	February 28, 2018 [*]	March 4, 2019 [*]
COMMITTEE ACTION HEARING (CAH)	April 15 – 23, 2018 Greater Columbus Convention Center Columbus, OH	April 28 – May 8, 2019 Albuquerque Convention Center Albuquerque, NM
ONLINE CAH ASSEMBLY FLOOR MOTION VOTE	Starts approx. two weeks after last day of the CAH. Open for 2 weeks.	Starts approx. two weeks after last day of the CAH. Open for 2 weeks.
WEB POSTING OF “REPORT OF THE COMMITTEE ACTION HEARING”	May 30, 2018	June 11, 2019
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF PUBLIC COMMENTS	July 16, 2018	July 24, 2019
WEB POSTING OF “PUBLIC COMMENT AGENDA”	August 31, 2018 [*]	September 4, 2019 [*]
PUBLIC COMMENT HEARING (PCH) ANNUAL CONFERENCE DATES NOTED BY AC	October 24 – 31, 2018 Greater Richmond Convention Center Richmond, VA AC: October 21 – 23	October 23 – 30, 2019 Clark County, NV AC: October 20 - 22
ONLINE GOVERNMENTAL CONSENSUS VOTE (OGCV)	Starts approx. two weeks after last day of the PCH. Open for 2 weeks.	Starts approx. two weeks after last day of the PCH. Open for 2 weeks.
WEB POSTING OF FINAL ACTION	Following Validation Committee certification of OGCV and ICC Board confirmation.	Following Validation Committee certification of OGCV and ICC Board confirmation.

^{*} Web posting of the “Proposed Changes to the I-Codes” and “Public Comment Agenda” will be posted no later than scheduled. ICC will make every effort to post these documents earlier, subject to code change/public comment volume and processing time.

2018 Group A Codes/Code committees:

- IBC-E: IBC Egress provisions. Chapters 10 and 11.
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC. See notes.
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33.
- IFC: The majority of IFC Chapter 10 is maintained by IBC-E. See notes.
- IFGC
- IMC
- IPC
- IPMC (code changes heard by the IPM/ZC (IPMC & IZC) code committee)
- IPSDC (code changes heard by the IPC code committee)
- IRC-M: IRC Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP code committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC - MP code committee)
- ISPSC
- IWUIC (code changes heard by the IFC code committee)
- IZC (code changes heard by the IPM/ZC (IPMC & IZC) code committee)

2019 Group B Codes/Code committees:

- Admin: Chapter 1 of all the I-Codes except the IECC, IgCC and IRC. Also includes the update of currently referenced standards in all of the 2018 Codes, except the IgCC.
- IBC-S: IBC Structural provisions. IBC Chapters 15 – 25 and IEBC structural provisions. See notes.
- IEBC: IEBC Non-structural provisions. See notes.
- IECC-C: IECC Commercial energy provisions.
- IECC-R/IRC-E: IECC Residential energy provisions and IRC Energy provisions in Chapter 11.
- IgCC: Chapter 1 of the IgCC. Remainder of the code is based on the provisions of ASHRAE Standard 189.1 *Standard for the Design of High-Performance Green Buildings, Except Low-Rise Residential Buildings*. The 2018 IgCC is scheduled to be published in the Summer/2018.
- IRC-B: IRC Building provisions. Chapters 1 – 10.

A 2020 Group C cycle is not scheduled.

Notes:

- Be sure to review the document entitled “2018/2019 Code Committee Responsibilities” which will be posted. This identifies responsibilities which are different than Group A and B codes and committees which may impact the applicable code change cycle and resulting code change deadline. As an example, throughout Chapter 9 of the IBC (IBC- Fire Safety), there are numerous sections which include the designation “[F]” which indicates that the provisions of the section are maintained by the IFC code committee. Similarly, there are numerous sections in the IEBC which include the designation “[BS]”. These are structural provisions which will be heard by the IBC – Structural committee. The designations in the code are identified in the Code Committee Responsibilities document.
- I-Code Chapter 1: Proposed changes to the provisions in Chapter 1 of the majority of the I-Codes are heard in Group B (see Admin above for exceptions). Be sure to review the brackets ([]) of the applicable code.
- Definitions. Be sure to review the brackets ([]) in Chapter 2 of the applicable code and the Code Committee Responsibilities document to determine which code committee will consider proposed changes to the definitions.
- Proposed changes to the ICC Performance Code will be heard by the code committee noted in brackets ([]) in the section of the code and in the Code Committee Responsibilities document

CP #28-05 CODE DEVELOPMENT

Approved: 9/24/05
Revised: 12/08/17

1.0 Introduction

- 1.1 **Purpose of Council Policy:** The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).
- 1.2 **Objectives:** The ICC Code Development Process has the following objectives:
 - 1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.
 - 1.2.2 The open discussion of code change proposals by all parties desiring to participate.
 - 1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation or enforcement of laws, ordinances, rules or regulations relating to the public health, safety and welfare and by honorary members.
 - 1.2.4 The increased participation of all parties desiring to participate through an online submittal and voting process that includes opportunities for online collaboration.
- 1.3 **Code Publication:** The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.
 - 1.3.1 **Code Correlation:** The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. A Code Scoping Coordination Matrix shall determine which Code shall be the primary document, and therefore which code development committee shall be responsible for maintenance of the code text where a given subject matter or code text could appear in more than one Code. The Code Scoping Coordination Matrix shall be administered by the Code Correlation Committee as approved by the ICC Board. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 4.5.
- 1.4 **Process Maintenance:** The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which Codes are developed embodies core principles of the organization. One of those principles is that the final content of the Codes is determined by a majority vote of the governmental and honorary members. It is the policy of the ICC Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.

- 1.5 Secretariat:** The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals and public comments shall be addressed to the Secretariat. The Secretariat shall have the authority to facilitate unforeseen situations which arise in the implementation of this council policy. Staff shall maintain a record of such actions.
- 1.6 Recording:** Individuals requesting permission to record any meeting or hearing, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that ICC shall retain sole ownership of the recording, and that they have insurance coverage for liability and misuse of recording materials. Equipment and the process used to record shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the recording. An unedited copy of the recording shall be forwarded to ICC within 30 days of the meeting. Recordings shall not otherwise be copied, reproduced or distributed in any manner. Recordings shall be returned to ICC or destroyed upon the request of ICC.

2.0 Code Development Cycle

- 2.1 Intent:** The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 3.5) and ending with publication of the Final Action on the code change proposals (see Section 10.4).
- 2.2 New Editions:** The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the previous edition.
- 2.3 Supplements:** The results of code development activity between editions may be published.
- 2.4 Emergency Action Procedures:**
- 2.4.1 Scope:** Emergency actions are limited to those issues representing an immediate threat to health and safety that warrant a more timely response than allowed by the Code Development Process schedule.
- 2.4.2 Initial Request:** A request for an emergency action shall be based upon perceived threats to health and safety and shall be reviewed by the Codes and Standards Council for referral to the ICC Board for action with their analysis and recommendation.
- 2.4.3 Board and Member Action:** In the event that the ICC Board determines that an emergency amendment to any Code or supplement thereto is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the ICC Board.

The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the Governmental Member Voting Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the

reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting authority.

2.5 Code Development Record. The code development record shall include the official documents and records developed in support of the given code development cycle. This includes the following:

1. Code Change Agenda (Section 4.8)
2. Audio and video recording of the Committee Action Hearing (Section 5.1)
3. The Online Assembly Floor Motion Ballot (Section 5.7.3)
4. Report of the Committee Action Hearing (Section 5.8)
5. Public Comment Agenda (Section 6.6)
6. Public Comment Hearing results (Section 7.5.8.10)
7. Audio and video recording of the Public Comment Hearing (Section 7.1)
8. The Online Governmental Consensus Ballot (Section 8.2)
9. Final Action results (Section 10.4)
10. Errata to the documents noted above

The information resulting from online collaboration between interested parties shall not be part of the code development record.

3.0 Submittal of Code Change Proposals

3.1 Intent: Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

3.2 Withdrawal of Proposal: A code change proposal may be withdrawn by the proponent (WP) at any time prior to membership action on the consent agenda at the Public Comment Hearing or prior to testimony on the code change proposal on the individual consideration agenda at the Public Comment Hearing. All actions on the code change proposal shall cease immediately upon the withdrawal of the code change proposal.

3.3 Form and Content of Code Change Submittals: Each code change proposal shall be submitted separately and shall be complete in itself. Each submittal shall contain the following information:

3.3.1 Proponent: Each code change proposal shall include the name, title, mailing address, telephone number, and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.

3.3.1.1 If a group, organization or committee submits a code change proposal, an individual with prime responsibility shall be indicated.

3.3.1.2 If a proponent submits a code change proposal on behalf of a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated.

- 3.3.2 Code Reference:** Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.
- 3.3.2.1** If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.
 - 3.3.2.2** If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.
- 3.3.3 Multiple Code Change Proposals to a Code Section.** A proponent shall not submit multiple code change proposals to the same code section. When a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 4.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.
- 3.3.4 Text Presentation:** The text of the code change proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.
- 3.3.4.1** A charging statement shall indicate the referenced code section(s) and whether the code change proposal is intended to be an addition, a deletion or a revision to existing Code text.
 - 3.3.4.2** Whenever practical, the existing wording of the text shall be preserved with only such deletions and additions as necessary to accomplish the desired change.
 - 3.3.4.3** Each code change proposal shall be in proper code format and terminology.
 - 3.3.4.4** Each code change proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.
 - 3.3.4.5** The proposed text shall be in mandatory terms.
- 3.3.5 Supporting Information:** Each code change proposal shall include sufficient supporting information to indicate how the code change proposal is intended to affect the intent and application of the Code.
- 3.3.5.1 Purpose:** The proponent shall clearly state the purpose of the code change proposal (e.g. clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.)
 - 3.3.5.2 Reasons:** The proponent shall justify changing the current Code provisions, stating why the code change proposal is superior to the current provisions of the Code. Code change proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such code change proposals will improve the Code.
 - 3.3.5.3 Substantiation:** The proponent shall substantiate the code change proposal based on technical information and

substantiation. Substantiation provided which is reviewed in accordance with Section 4.2 and determined as not germane to the technical issues addressed in the code change proposal may be identified as such. The proponent shall be notified that the code change proposal is considered an incomplete proposal in accordance with Section 4.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with the policy of the ICC Board. The burden of providing substantiating material lies with the proponent of the code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the reason statement. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

3.3.5.4 Bibliography: The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change proposal and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing. Supporting documentation may be provided via a link to a website provided by the proponent and included in the bibliography. The reason statement shall include the date the link was created.

3.3.5.5 Copyright Release: The proponent of code change proposals, floor modifications and public comments shall sign a copyright release developed and posted by ICC.

3.3.5.6 Cost Impact: The proponent shall indicate one of the following regarding the cost impact of the code change proposal:

- 1) The code change proposal will increase the cost of construction;
- 2) The code change proposal will decrease the cost of construction; or
- 3) The code change proposal will not increase or decrease the cost of construction.

The proponent shall submit information which substantiates such assertion. This information will be considered by the code development committee and will be included in the published code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the cost substantiation statement. The cost substantiation statement shall include the date the link was created.

Any proposal submitted which does not include the requisite cost impact information shall be considered incomplete and shall not be processed.

3.4 Online Submittal: Each code change proposal and all substantiating information shall be submitted online at the website designated by ICC. Two copies of each proposed new referenced standard in hard copy or one copy in electronic form shall

be submitted. Additional copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the code development committee. Where such additional copies are requested, it shall be the responsibility of the proponent to send such copies to the respective code development committee.

3.5 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the code change deadline. Each code change proposal shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a code change proposal is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

3.6 Referenced Standards: In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

3.6.1 Code References:

3.6.1.1 The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.

3.6.1.2 The need for the standard to be referenced shall be established.

3.6.2 Standard Content:

3.6.2.1 A standard or portions of a standard intended to be enforced shall be written in mandatory language.

3.6.2.2 The standard shall be appropriate for the subject covered.

3.6.2.3 All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition.

3.6.2.4 The scope or application of a standard shall be clearly described.

3.6.2.5 The standard shall not have the effect of requiring proprietary materials.

3.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.

3.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.

3.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.

3.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.

3.6.2.10 The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.

3.6.2.11 The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

3.6.3 Standard Promulgation:

3.6.3.1 Code change proposals with corresponding changes to the code text which include a reference to a proposed new standard or a proposed update of an existing referenced standard shall comply with this section.

3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in

accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing. If the committee action at the Committee Action Hearing is Disapproval, further consideration on the Public Comment Agenda shall include a recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing.

3.6.3.1.2 Update of Existing Standards. Code change proposals which include technical revisions to the code text to coordinate with a proposed update of an existing referenced standard shall include the submission of the proposed update to the standard in at least a consensus draft form in accordance with Section 3.4. If the proposed update of the existing standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal, including the update of the existing referenced standard, shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the updated standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing. If the committee action at the Committee Action Hearing is Disapproval, further consideration on the Public Comment Agenda shall include a recommendation stating that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing.

Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 4.6.

3.6.3.2 The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

4.0 Processing of Code Change Proposals

4.1 Intent: The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published code change proposal accurately reflects that proponent's intent.

- 4.2 Review:** Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, number of copies, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple parts which fall under the maintenance responsibilities of different code committees, the Secretariat shall determine the code committee responsible for determining the committee action in accordance with Section 5.6 and the Code Scoping Coordination Matrix (see Section 1.3.1).
- 4.3 Incomplete Code Change Proposals:** When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected code change proposal after the final date, the proposal shall be held over until the next code development cycle. Where there are otherwise no deficiencies addressed by this section, a code change proposal that incorporates a new referenced standard shall be processed with an analysis of the referenced standard's compliance with the criteria set forth in Section 3.6.
- 4.4 Editorial Code Change Proposals.** When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate code development committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate code development committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the Committee Action Hearing. Code Correlation Committee proposals that are not added to a code development committee hearing agenda shall be published in the next edition of the code with no further consideration.
- 4.5 Copy Editing Code Text:** The Chief Executive Officer shall have the authority at all times to make editorial style and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. Such editorial style or format changes shall not affect the scope or application of the Code requirements.
- 4.6 Updating Standards Referenced in the Codes:** Standards referenced by the Codes that do not require coordination with a code change proposal to the code text shall be updated administratively by the Administrative Code Development Committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.
- 4.7 Preparation:** All code change proposals in compliance with these procedures shall be prepared in a standard manner by the Secretariat and be assigned separate,

distinct and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 3.3.2 to facilitate the hearing process.

- 4.8 Code Change Agenda:** All code change proposals shall be posted on the ICC website at least 30 days prior to the Committee Action Hearing on those proposals and shall constitute the agenda for the Committee Action Hearing. Any errata to the Code Change Agenda shall be posted on the ICC website as soon as possible. Code change proposals which have not been published in the original posting or subsequent errata shall not be considered.

5.0 Committee Action Hearing

- 5.1 Intent:** The intent of the Committee Action Hearing is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The code development committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals. At the conclusion of the code development committee deliberations, the committee action on each code change proposal shall be placed before the hearing assembly for consideration in accordance with Section 5.7.

- 5.2 Committee:** The Codes and Standards Council shall review all applications and make committee appointment recommendations to the ICC Board. The Code Development Committees shall be appointed by the ICC Board.

5.2.1 Chairman/Moderator: The Chairman and Vice-Chairman shall be appointed by the Codes and Standards Council from the appointed members of the committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Committee Action Hearing.

5.2.2 Conflict of Interest: A committee member shall withdraw from and take no part in those matters with which the committee member has an undisclosed financial, business or property interest. The committee member shall not participate in any committee discussion or any committee vote on the matter in which they have an undisclosed interest. A committee member who is a proponent of a code change proposal shall not participate in any committee discussion on the matter or any committee vote. Such committee member shall be permitted to participate in the floor discussion in accordance with Section 5.5 by stepping down from the dais.

5.2.3 Representation of Interest: Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the committee.

5.2.4 Committee Composition: The committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the committee members shall be regulators.

- 5.3 Date and Location:** The date and location of the Committee Action Hearing shall be announced not less than 60 days prior to the date of the hearing.

- 5.4 General Procedures:** *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Committee Action Hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the committee.

- 5.4.1 Chair Voting:** The Chairman of the committee shall vote only when the vote cast will break a tie vote of the committee.
- 5.4.2 Open Hearing:** The Committee Action Hearing is an open hearing. Any interested person may attend and participate in the floor discussion and assembly consideration portions of the hearing. Only code development committee members may participate in the committee action portion of the hearings (see Section 5.6). Participants shall not advocate a position on specific code change proposals with committee members other than through the methods provided in this policy.
- 5.4.3 Presentation of Material at the Public Hearing:** Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 5.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 3.3.5.3 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the code development committee at the public hearing.
- 5.4.4 Agenda Order:** The Secretariat shall publish a Code Change Agenda for the Committee Action Hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another code change proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.
- 5.4.4.1 Proponent Approval:** A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance in the hearing room and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to change the hearing order is not debatable.
- 5.4.4.2 Revised Agenda Order Approved:** A motion to revise the agenda order is subject to a 2/3 vote of those present.
- 5.4.5 Tabling:** Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Code Change Agenda for the code change proposals under

- consideration, or
2. To a specific location in the Code Change Agenda for the code change proposals under consideration.

5.4.5.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

5.4.5.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 5.4.5 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

5.4.6 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on by the committee in accordance with Section 5.6.

5.4.7 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

5.4.7.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

5.4.7.2 Proponent Testimony: The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

5.4.8 Points of Order: Any person participating in the public hearing may challenge a procedural ruling of the Moderator or the Chairman. A majority vote of ICC Members in attendance shall determine the decision.

5.5 Floor Discussion: The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

5.5.1 Discussion Order:

1. Proponents. The Moderator shall begin by asking the proponent and then others in support of the code change proposal for their comments.
2. Opponents. After discussion by those in support of a code change proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. Rebuttal in support. Proponents shall then have the opportunity to rebut

points raised by the opponents.

4. Re-rebuttal in opposition. Opponents shall then have the opportunity to respond to the proponent's rebuttal.

5.5.2 Modifications: Modifications to code change proposals may be suggested from the floor by any person participating in the public hearing. The person proposing the modification, or his/her designee, is deemed to be the proponent of the modification.

5.5.2.1 Submission. All modifications shall be submitted electronically to the ICC Secretariat in a format determined by ICC unless determined by the Chairman to be either editorial or minor in nature. The modification will be forwarded electronically to the members of the code development committee during the hearing and will be projected on the screen in the hearing room.

5.5.2.2 Criteria. The Chairman shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be ruled out of order if it:

1. changes the scope of the original code change proposal; or
2. is not readily understood to allow a proper assessment of its impact on the original code change proposal or the Code.

The ruling of the Chairman on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 5.4.8.

5.5.2.3 Testimony. When a modification is offered from the floor and ruled in order by the Chairman, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 5.5.1.

5.6 Committee Action: Following the floor discussion of each code change proposal, one of the following motions shall be made and seconded by members of the committee:

1. Approve the code change proposal As Submitted (AS) or
2. Approve the code change proposal As Modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to code development committee members. If a committee member proposes a modification which had not been proposed during floor discussion, the Chairman shall rule on the modification in accordance with Section 5.5.2.2. If a committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the committee discussion and shall reopen the floor discussion for comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume committee discussion.

The code development committee shall vote on each motion with the majority dictating the committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each committee vote shall be supported by a reason.

The code development committee shall maintain a record of its proceedings including the action on each code change proposal.

5.7 Assembly Consideration: At the conclusion of the committee's action on a code change proposal and before the next code change proposal is called to the floor, the Moderator shall ask for a motion from the public hearing attendees who may object to the committee's action. If a motion in accordance with Section 5.7.1 is not brought forward on the committee's action, the results of the Committee Action Hearing shall be established by the committee's action.

5.7.1 Assembly Floor Motion: Any attendee may raise an objection to the committee's action in which case the attendee will be able to make a motion to:

1. Approve the code change proposal As Submitted from the Floor (ASF), or
2. Approve the code change proposal As Modified from the Floor (AMF) with a specific modification that has been previously offered from the floor and ruled in order by the Chairman during floor discussion (see Section 5.5.2) or has been offered by a member of the Committee and ruled in order by the Chairman during committee discussion (see Section 5.6), or
3. Disapprove the code change proposal from the floor (DF).

5.7.2 Assembly Floor Motion Consideration: On receipt of a second to the floor motion, the Moderator shall accept the motion and the second and notify the attendees that the motion will be considered in an online ballot following the hearing in accordance with Section 5.7.3. No additional testimony shall be permitted.

5.7.3 Online Assembly Floor Motion Ballot: Following the Committee Action Hearing, all assembly floor motions which received a second shall be compiled into an online ballot. The ballot will include:

1. The code change proposal as published.
2. The committee action and reason from the Committee Action Hearing.
3. The floor motion, including modifications which are part of the floor motion.
4. Access to the audio and video of the Committee Action Hearing proceedings.
5. Identification of the ballot period for which the online balloting will be open.

5.7.4 Eligible Online Assembly Motion Voters: All members of ICC shall be eligible to vote on online assembly floor motions. Each member is entitled to one vote, except that each Governmental Member Voting Representative may vote on behalf of its Governmental Member. Individuals who represent more than one Governmental Member shall be limited to a single vote. Application, whether new or updated, for ICC membership must be received by the Code Council 30 days prior to the first day of the Committee Action Hearing. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

5.7.5 Assembly Action: A successful assembly action shall be a majority vote of the votes cast by eligible voters (see Section 5.7.4). A successful assembly action results in an automatic public comment to be considered at the Public

Comment Hearing (see Section 7.4).

- 5.8 Report of the Committee Action Hearing:** The results of the Committee Action Hearing, including committee action and reason, online assembly floor motion vote results and the total vote count for each assembly floor motion shall be posted on the ICC website not less than 60 days prior to the Public Comment Hearing, except as approved by the ICC Board.

6.0 Public Comments

- 6.1 Intent:** The public comment process gives attendees at the Public Comment Hearing an opportunity to consider specific objections to the results of the Committee Action Hearing and more thoughtfully prepare for the discussion for public comment consideration. The public comment process expedites the Public Comment Hearing by limiting the items discussed to the following:

1. Consideration of items for which a public comment has been submitted; and
2. Consideration of items which received a successful assembly action.

- 6.2 Deadline:** The deadline for receipt of a public comment to the results of the Committee Action Hearing shall be announced at the Committee Action Hearing but shall not be less than 30 days subsequent to the availability of the Report of the Committee Action Hearing (see Section 5.8).

- 6.3 Withdrawal of Public Comment:** A public comment may be withdrawn by the public commenter at any time prior to public comment consideration of that comment. A withdrawn public comment shall not be subject to public comment consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 7.5.5, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 7.5.5, the proposal shall continue as part of the individual consideration agenda in accordance with Section 7.5.6, however the public comment shall not be subject to public comment consideration.

- 6.4 Form and Content of Public Comments:** Any interested person, persons, or group may submit a public comment to the results of the Committee Action Hearing which will be considered when in conformance to these requirements. Each public comment to a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

- 6.4.1 Public comment:** Each public comment shall include the name, title, mailing address, telephone number and email address of the public commenter. Email addresses shall be published with the public comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal, committee action or successful assembly action. Public comments which are determined as not within the scope of the code change proposal, committee action or successful assembly action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public

comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 3.3.5.5 shall be provided with the public comment.

6.4.2 Code Reference: Each public comment shall include the code change proposal number.

6.4.3 Multiple public comments to a code change proposal. A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 6.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

6.4.4 Desired Final Action: In order for a public comment to be considered, the public comment shall indicate the desired Final Action as one of the following:

1. Approve the code change proposal As Submitted (AS), or
2. Approve the code change proposal As Modified by the committee modification published in the Report of the Committee Action Hearing (AM) or published in a public comment in the Public Comment Agenda (AMPC), or
3. Disapprove the code change proposal (D)

6.4.5 Supporting Information: The public comment shall include a statement containing a reason and justification for the desired Final Action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 6.5 and determined as not germane to the technical issues addressed in the code change proposal or committee action may be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in accordance with the policy of the ICC Board. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Public Comment_Hearing. Supporting documentation may be provided via a link to a website provided by the public commenter and included in the reason statement and bibliography. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

6.4.6 Cost Impact: The proponent of the public comment shall indicate one of the following regarding the cost impact of the public comment to the code change proposal:

- 1) The net effect of the public comment and code change proposal will increase the cost of construction;
- 2) The net effect of the public comment and code change proposal will decrease the cost of construction; or
- 3) The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

The public commenter shall submit information which substantiates such assertion. This information will be considered at the Public Comment Hearing and will be included in the published public comment. Supporting documentation may be provided via a link to a website provided by the public commenter and included in the cost substantiation statement. The cost substantiation statement shall include the date the link was created.

Any public comment submitted which does not include the requisite cost impact information shall be considered incomplete and shall not be processed.

6.4.7 Online submittal: Each public comment and substantiating information shall be submitted online at the website designated by ICC. Additional copies may be requested when determined necessary by the Secretariat.

6.4.8 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the public comment deadline. Each public comment shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

6.5 Review: The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 4.2).

6.5.1 Incomplete Public Comment: When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.

6.5.2 Duplications: On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for public comment consideration. Each public commenter shall be notified of this action when it occurs.

6.5.3 Deadline: Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the public comment consideration. This deadline shall not apply to public comments submitted by the Code Correlation Committee. In order to correlate submitted public comments with action taken at the Committee Action Hearing on code change proposals that did receive a public comment, the Code Correlation Committee, in conjunction with staff processing of public comments, shall review the submitted public comments and submit the necessary public comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Public Comment Agenda as required in Section 6.6.

6.6 Public Comment Agenda: The Committee Action Hearing results on code change proposals that have not received a public comment and code change proposals which received public comments or successful assembly actions shall constitute the Public Comment Agenda. The Public Comment Agenda shall be posted on the

ICC website at least 30 days prior the Public Comment Hearing. Any errata to the Public Comment Agenda shall be posted on the ICC website as soon as possible. Code change proposals and public comments which have not been published in the original posting or subsequent errata shall not be considered.

7.0 Public Comment Hearing

- 7.1 Intent:** The Public Comment Hearing is the first of two steps to make a final determination on all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 9.0). The second step, which follows the Public Comment Hearing, is the Online Governmental Consensus Vote that is conducted in accordance with Section 8.0.
- 7.2 Date and Location:** The date and location of the Public Comment Hearing shall be announced not less than 60 days prior to the date of the hearing.
- 7.3 Moderator:** The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Public Comment Hearing.
- 7.4 Public Comment Agenda:** The Public Comment Consent Agenda shall be comprised of code change proposals which have neither a successful assembly action nor public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a successful assembly action or public comment (see Section 6.1).
- 7.5 Procedure:** *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Public Comment Hearing except as these Rules of Procedure may otherwise dictate.
- 7.5.1 Open Hearing:** The Public Comment Hearing is an open hearing. Any interested person may attend and participate in the floor discussion.
- 7.5.2 Agenda Order:** The Secretariat shall publish a Public Comment Agenda for the Public Comment Hearing, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any code change proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.
- 7.5.2.1 Proponent Approval:** A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance at the hearing and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to change the hearing order is not debatable.
- 7.5.2.2 Revised Agenda Order Approved:** A motion to revise the agenda order is subject to a 2/3 vote of those present.
- 7.5.3 Tabling:** Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of

order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Public Comment Agenda for the code change proposals under consideration, or
2. To a specific location in the Public Comment Agenda for the code change proposals under consideration.

7.5.3.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

7.5.3.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 7.5.3 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

7.5.4 Presentation of Material at the Public Comment Hearing: Information to be provided at the hearing shall be limited to verbal presentations. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 6.4.5 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.

7.5.5 Public Comment Consent Agenda: The Public Comment Consent Agenda (see Section 7.4) shall be placed before the assembly with a single motion for Final Action in accordance with the results of the Committee Action Hearing. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion. This action shall not be subject to the Online Governmental Consensus Vote following the Public Comment Hearing (see Section 8.0).

7.5.6 Public Comment Individual Consideration Agenda: Upon completion of the Public Comment Consent Agenda vote, all code change proposals not on the Public Comment Consent Agenda shall be placed before the assembly for individual consideration of each item (see Section 7.4).

7.5.7 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on in accordance with Section 7.5.9.

7.5.8 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

7.5.8.1 Time Keeping: Keeping of time for testimony by an individual

shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

7.5.9 Discussion and Voting: Discussion and voting on code change proposals being individually considered shall be in accordance with the following procedures and the voting majorities in Section 7.6:

7.5.9.1 Proponent testimony: The Proponent of a public comment is permitted to waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

7.5.9.2 Points of Order: Any person participating in the public hearing may challenge a procedural ruling of the Moderator. A majority vote of ICC Members in attendance shall determine the decision.

7.5.9.3 Eligible voters: Voting shall be limited to eligible voters in accordance with Section 9.0.

7.5.9.4 Allowable Final Action Motions: The only allowable motions for Final Action are Approval as Submitted (AS), Approval as Modified by the committee (AM) or by one or more modifications published in the Public Comment Agenda (AMPC), and Disapproval (D).

7.5.9.5 Initial Motion: The code development committee action shall be the initial motion considered.

7.5.9.6 Motions for Modifications: Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second for a modification published in the Public Comment Agenda may be made (see Section 6.4.4). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all modifications.

7.5.9.7 Voting: After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If the motion fails to receive the majority required in Section 7.6, the Moderator shall ask for a new motion.

7.5.9.8 Subsequent Motion: If the initial motion is unsuccessful, a motion for either Approval as Submitted or Approval as Modified by one or more published modifications is in order. A motion for

Disapproval is not in order. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If a successful vote is not achieved, Section 7.5.9.9 shall apply.

7.5.9.9 Failure to Achieve Majority Vote at the Public Comment Hearing. In the event that a code change proposal does not receive any of the required majorities in Section 7.6, the results of the Public Comment Hearing for the code change proposal in question shall be Disapproval. The vote count that will be reported as the Public Comment Hearing result will be the vote count on the main motion in accordance with Section 7.5.9.7.

7.5.9.10 Public Comment Hearing Results: The result and vote count on each code change proposal considered at the Public Comment Hearing shall be announced at the hearing. In the event the electronic voting system is not utilized and a hand/standing count is taken in accordance with Sections 7.5.9.7 and 7.5.9.8, the vote count will not be announced if an individual standing vote count is not taken. The results shall be posted and included in the Online Governmental Consensus Ballot (see Section 8.2).

7.6 Majorities for Final Action: The required voting majority for code change proposals individually considered shall be based on the number of votes cast of eligible voters at the Public Comment Hearing shall be in accordance with the following table:

Committee Action	Desired Final Action		
	AS	AM/AMPC	D
AS	Simple Majority	2/3 Majority	Simple Majority
AM	2/3 Majority	Simple Majority to sustain the Committee Action or; 2/3 Majority on each additional modification and 2/3 Majority on entire code change proposal for AMPC	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

8.0 Online Governmental Consensus Vote

8.1 Public Comment Hearing Results: The results from the Individual Consideration Agenda at the Public Comment Hearing (see Sections 7.5.6 and 7.5.9.10) shall be the basis for the Online Governmental Consensus Vote. The ballot shall include the voting options in accordance with the following table:

Committee Action	Public Comment Hearing result and Voting Majority	Online Governmental Consensus Ballot and Voting Majority	
AS	AS: Simple Majority	AS: Simple Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AS: Simple Majority	D: Simple Majority

AM	AS: 2/3 Majority	AS: 2/3 Majority	D: Simple Majority
	AM: Simple Majority	AM: Simple Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AM: Simple Majority	D: Simple Majority
D	AS: 2/3 Majority	AS: 2/3 Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AS: 2/3 Majority	D: Simple Majority

8.2 Online Governmental Consensus Ballot: The ballot for each code change proposal considered at the Public Comment Hearing will include:

1. The Public Comment Hearing result and vote count.
2. The allowable Online Governmental Consensus Vote actions in accordance with Section 8.1.
3. Where the Public Comment Hearing result is As Submitted (AS) or Disapproval (D), the original code change proposal will be presented.
4. Where the Public Comment Hearing result is As Modified by the committee (AM) or As Modified by one or more Public Comments (AMPC), the original code change and approved modification(s) will be presented.
5. The committee action taken at the Committee Action Hearing.
6. ICC staff identification of correlation issues.
7. For those who voted at the Public Comment Hearing, the ballot will indicate how they voted, unless an electronic vote count is not taken in accordance with Section 7.5.9.10.
8. An optional comment box to provide comments.
9. Access to the Public Comment Agenda which includes: the original code change, the report of the committee action and the submitted public comments.
10. Access to the audio and video of the Committee Action and Public Comment Hearing proceedings.
11. Identification of the ballot period for which the online balloting will be open.

8.3 Voting process: Voting shall be limited to eligible voters in accordance with Section 9.0. Eligible voters are authorized to vote during the Public Comment Hearing and during the Online Governmental Consensus Vote; however, only the last vote cast will be included in the final vote tabulation. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

8.3.1 Participation requirement: A minimum number of participants to conduct the Online Governmental Consensus Vote shall not be required unless the code change proposal(s) were not voted upon utilizing the electronic voting devices at the Public Comment Hearing and the resulting vote was not assigned to each eligible voting member in accordance with Sections 7.5.9.7 and 7.5.9.8 . If this occurs, a minimum number of participants shall be required for those code change proposal(s) based on an assessment of the minimum number of votes cast during the entire Public Comment Hearing and the Online Governmental Consensus Vote shall determine the final on action on the code change proposal(s) in accordance with Section 10.1.

9.0 Eligible Final Action Voters

9.1 Eligible Final Action Voters: Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated annually. Eligible Final Action voters in attendance at the Public Comment Hearing and those

participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.

- 9.2 Applications:** Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

10.0 Tabulation, certification and posting of results

- 10.1 Tabulation and Validation:** Following the closing of the online ballot period, the votes received will be combined with the vote tally at the Public Comment Hearing to determine the final vote on the code change proposal. If a hand/standing count is utilized per Subsection 7.5.9.7 or 7.5.9.8, those votes of the Public Comment Hearing will not be combined with the online ballot. ICC shall retain a record of the votes cast and the results shall be certified by a validation committee appointed by the ICC Board. The validation committee shall report the results to the ICC Board, either confirming a valid voting process and result or citing irregularities in accordance with Section 10.2.

- 10.2 Voting Irregularities:** Where voting irregularities or other concerns with the Online Governmental Consensus Voting process which are material to the outcome or the disposition of a code change proposal(s) are identified by the validation committee, such irregularities or concerns shall be immediately brought to the attention of the ICC Board. The ICC Board shall take whatever action necessary to ensure a fair and impartial Final Action vote on all code change proposals, including but not limited to:

1. Set aside the results of the Online Governmental Consensus Vote and have the vote taken again.
2. Set aside the results of the Online Governmental Consensus Vote and declare the Final Action on all code change proposals to be in accordance with the results of the Public Comment Hearing.
3. Other actions as determined by the ICC Board.

- 10.3 Failure to Achieve Majority Vote:** In the event a code change proposal does not receive any of the required majorities for Final Action in Section 8.0, Final Action on the code change proposal in question shall be Disapproval.

- 10.4 Final Action Results:** The Final Action on all code change proposals shall be published as soon as practicable after certification of the results. The results shall include the Final Action taken, including the vote tallies from both the Public Comment Hearing and Online Governmental Consensus Vote, as well the required majority in accordance with Section 8.0. ICC shall maintain a record of individual votes for auditing purposes, however, the record shall not be made public. The exact wording of any resulting text modifications shall be made available to any interested party.

11.0 Code Publication

11.1 Next Edition of the Codes: The Final Action results on code change proposals shall be the basis for the subsequent edition of the respective Code.

11.2 Code Correlation: The Code Correlation Committee is authorized to resolve technical or editorial inconsistencies resulting from actions taken during the code development process by making appropriate changes to the text of the affected code. The process to resolve technical or editorial inconsistencies shall be conducted in accordance with CP#44 Code Correlation Committee.

12.0 Appeals

12.1 Right to Appeal: Any person may appeal an action or inaction in accordance with Council Policy 1 Appeals. Any appeal made regarding voter eligibility, voter fraud, voter misrepresentation or breach of ethical conduct must be supported by credible evidence and must be material to the outcome of the final disposition of a code change proposal(s).

The following actions are not appealable:

1. Variations of the results of the Public Comment Hearing compared to the Final Action result in accordance with Section 10.4.
2. Denied requests to extend the voter balloting period in accordance with Sections 5.7.4 or 8.3.
3. Lack of access to the internet based online collaboration and voting platform to submit a code change proposal, to submit a public comment or to vote.
4. Code Correlation Committee changes made in accordance with Section 11.2.

13.0 Violations

13.1 ICC Board Action on Violations: Violations of the policies and procedures contained in this Council Policy shall be brought to the immediate attention of the ICC Board for response and resolution. Additionally, the ICC Board may take any actions it deems necessary to maintain the integrity of the code development process.

2018 ICC CODE DEVELOPMENT CYCLE CROSS INDEX OF PROPOSED CODE CHANGES

Some of the proposed code changes include sections that are outside of the scope of the chapters or the code listed in the table of 2018-2019 Staff Secretaries on page xi. This is done in order to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this cross index are proposed code changes that include sections of codes or codes other than those listed on page ix. For example, IBC Section 402.4.2.2 is proposed for revision in code change FS18-18, which is found in the IBC-Fire Safety section of the code change proposal book. This section of the IBC is typically the responsibility of the IBC-General Committee as listed in the table of 2018-2019 Staff Secretaries. It is therefore identified in this cross index. Another example is Section 606.4.1 of the International Mechanical Code. The International Mechanical Code is maintained by the IMC Committee, but Section 606.4.1 will be considered for revision in proposed code change F143 which will be on the IFC Committee agenda. In some instances, there are other subsections that are revised by an identified code change that is not included in the cross index.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect Chapter 4 of the IBC, review the proposed code changes in the portion of the monograph for the IBC-General Code Development Committee (listed with a G prefix) then review this cross reference for Chapter 4 of the IBC for proposed code changes published in other code change groups. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

PREFIX	PROPOSED CHANGE GROUP (see monograph table of contents for location)
E	International Building Code - Means of Egress
EB	International Existing Building Code
FG	International Fuel Gas Code
FS	International Building Code - Fire Safety
G	International Building Code – General
M	International Mechanical Code
P	International Plumbing Code
PSD	International Private Sewage Disposal Code
PM	International Property Maintenance Code
RM	International Residential Code - Mechanical
RP	International Residential Code - Plumbing
S	International Building Code – Structural
SP	International Swimming Pool and Spa Code

2018 GROUP A COMMITTEE ACTION HEARING SCHEDULE

April 15 – 23, 2018

Greater Columbus Convention Center: Columbus, OH

The hearings will start at 1:00 pm on Sunday, April 15th. Prior to the hearings on Sunday morning, the Membership Councils and Major Jurisdictions Committee will be holding meetings. Following these meetings and prior to the hearings, a Members' Forum is scheduled. See [schedule](#).

Unless noted by "Start no earlier than X am/pm," each Code Committee will begin immediately upon completion of the hearings for the prior Committee. This includes moving a Committee forward or back from the day indicated based on hearing progress. The actual start times for the various Committees are not stipulated because of uncertainties in hearing progress. The schedule anticipates that the hearings will finish on the date noted as "Finish" for each track. This may require going beyond the scheduled finish time.

	Sunday April 15	Monday April 16	Tuesday April 17	Wednesday April 18	Thursday April 19
TRACK 1	Start 1 pm IPMC/IZC IBC - G End 7 pm	Start 8 am IBC - G End 7 pm	Start 8 am IBC - G IBC - FS (Start no earlier than 10 am) End 7 pm	Start 8 am IBC - FS End 7 pm	Start 8 am IBC - FS End 7 pm
TRACK 2	Start 1 pm ISPSC IFGC End 7 pm	Start 8 am IFGC IMC (Start no earlier than 8 am) End 7 pm	Start 8 am IMC IRC - M IRC - P End 7 pm	Start 8 am IRC - P IPC/IPSDC (Start no earlier than 10 am) End 7 pm	Start 8 am IPC End 7 pm

	Friday April 20	Saturday April 21	Sunday April 22	Monday April 23
TRACK 1	Start 8 am IBC - FS IBC - E (Start no earlier than 8 am) End 7 pm	Start 8 am IBC - E End 7 pm	Start 10 am IBC - E Finish 3 pm (See above)	
TRACK 2	Start 8 am IPC IFC/IWUIC (Start no earlier than 8 am) End 7 pm	Start 8 am IFC End 7 pm	Start 10 am IFC End 7 pm	Start 8 am IFC Finish 7 pm (See above)

SEE NEXT PAGE FOR SCHEDULE NOTES AND CODE COMMITTEE DESIGNATIONS

Notes:

- Code change agenda to be posted February 28th.
- Hearing times may be modified at the discretion of the Chairman based on hearing progress.
- Morning and afternoon breaks will be announced. A lunch break is planned for each track. A dinner break is not planned. The hearings are scheduled to adjourn for dinner and resume the next day, unless otherwise necessary to complete the agenda.
- Because of uncertainties in hearing progress, the start time indicated as “start no earlier than xx” is conservatively estimated and is not intended to be a hearing progress target.
- Consult the hearing order in the posted code change agenda for:
 - Code changes to be heard by a Committee other than the Committee under which the code change is designated.
 - Code changes comprised of multiple parts where each part is heard by a different Committee.
 - Code changes to the definitions to determine the applicable Committee who will hear the change to the definition for the respective code.
- There are no code change proposals submitted to the ICC Performance Code or the International Zoning Code.

Code Committees/Codes:

- IBC-E: International Building Code (IBC) Egress provisions. Chapters 10 and 11
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33
- IFC/IWUIC: International Fire and Wildland-Urban Interface Codes
- IFGC: International Fuel Gas Code
- IMC: International Mechanical Code
- IPC/IPSDC: International Plumbing Code and Private Sewage Disposal Codes
- IPMC/IZC: International Property Maintenance and Zoning Codes
- IRC-M: International Residential Code (IRC) Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP code committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC - MP code committee)
- ISPSC: International Swimming Pool and Spa Code

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE – EGRESS

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some E code change proposals may not be included on this list, as they are being heard by another committee.

IBC: 1003.4, 1003.5, 1003.8 (New), (IFC[BE] 1003.4, 1003.5, 1003.8 (New))

Proponent: Jake Pauls, Jake Pauls Consulting Services, representing Jake Pauls Consulting Services (bldguse@aol.com)

2018 International Building Code

Revise as follows:

1003.4 Slip-resistant surface. Circulation paths of the *means of egress* shall have a slip-resistant surface and be securely attached.

Exception: Walking surfaces of showers and bathtubs not required to be accessible are not required to be slip-resistant where grab bars or stanchions complying with Section 1003.8 are provided.

1003.5 Elevation change. Where changes in elevation of less than 12 inches (305 mm) exist in the *means of egress*, sloped surfaces shall be used. Where the slope is greater than one unit vertical in 20 units horizontal (5-percent slope), *ramps* complying with Section 1012 shall be used. Where the difference in elevation is 6 inches (152 mm) or less, the *ramp* shall be equipped with either *handrails* or floor finish materials that contrast with adjacent floor finish materials.

Exceptions:

1. A single step with a maximum riser height of 7 inches (178 mm) is permitted for buildings with occupancies in Groups F, H, R-2, R-3, S and U at exterior doors not required to be *accessible* by Chapter 11.
2. A *stair* with a single riser or with two risers and a tread is permitted at locations not required to be *accessible* by Chapter 11 where the risers and treads comply with Section 1011.5, the minimum depth of the tread is 13 inches (330 mm) and not less than one *handrail* complying with Section 1014 is provided within 30 inches (762 mm) of the centerline of the normal path of egress travel on the *stair*.
3. A step is permitted in *aisles* serving seating that has a difference in elevation less than 12 inches (305 mm) at locations not required to be *accessible* by Chapter 11, provided that the risers and treads comply with Section 1029.14 and the *aisle* is provided with a *handrail* complying with Section 1029.16.
4. Bathtubs required to be accessible and bathtubs with grab bars or stanchions complying with Section 1003.8 are permitted to have step-over bathtub walls.
5. Showers, not required to be accessible are permitted to have curbs 6 inches (152 mm) high maximum where grab bars or stanchions complying with Section 1003.8 are provided.

Throughout a story in a Group I-2 occupancy, any change in elevation in portions of the *means of egress* that serve nonambulatory persons shall be by means of a *ramp* or sloped walkway.

Add new text as follows:

1003.8 Stanchions or Grab bars for Bathtubs, Bathtub-Shower Combinations and Showers.

1003.8.1 General. Bathtubs and bathtub-shower combinations not required to be accessible shall provide at least one stanchion complying with 1003.8.2 and one grab bar complying with Section 1003.8.3. Showers not required to be accessible shall provide at least one stanchion or grab bar complying with Section 1003.4. All stanchions and grab bars shall comply with Sections 1003.8.5 through 1003.8.7.

1003.8.2. Stanchion or Grab Bar. A vertical stanchion or grab bar complying with Sections 1003.8.2.1 through 1003.8.2.3 shall be provided.

1003.8.2.1 Approach. The stanchion or grab bar shall be located so that it is usable without any obstruction. An unobstructed clear floor space of 21 inches (535 mm) wide minimum and 21 inches (535 mm) deep minimum, measured from the tub wall shall be provided. The clear floor space shall be located outside the tub and be within 12 inches (305 mm) of the centerline of the stanchion or grab bar measured horizontally.

1003.8.2.2 Length. The stanchion or grab bar shall be 36 inches (914 mm) long minimum and shall extend to a height of 60 inches minimum above the finished floor or bathtub floor, as applicable.

1003.8.2.3 Position. The stanchion or grab bar shall be positioned in accordance with at least one of the following two options:

1. Stanchion or grab bar located inside the bathtub or combination bathtub-shower compartment. The space, measured horizontally from the centerline of the stanchion or grab bar shall be 12 inches (305 mm) maximum to the exterior wall of the bathtub and 6 inches (152 mm) minimum to a shower curtain rod.
2. Stanchion or grab bar located outside the bathtub or combination bathtub-shower compartment. The stanchion or grab bar shall be 6 inches (152 mm) maximum from the outer side of the bathtub wall, measured horizontally.

1003.8.3. Grab Bar. A 24-inch (610 mm) long minimum grab bar shall be provided on the non-entry (long) side of bathtubs and bathtub-shower combinations and shall be positioned in accordance with Sections 1003.8.3.1 or 1003.8.3.2.

1003.8.3.1 Horizontal Position. A grab bar shall be installed in a horizontal position and shall be centered, plus or minus two inches (51 mm), along the length of the bathtub. The grab bar shall be located 8 inches (205 mm) minimum and 10 inches (255 mm) maximum above the bathtub rim measured to the centerline of the grab bar.

1003.8.3.2 Diagonal Position. A grab bar shall be installed in a diagonal position with its higher end 25 inches (635 mm) high minimum and 27 inches (685 mm) high maximum above the bathtub rim. The higher end shall be located no more than 12 inches (305 mm) from the control wall measured horizontally. The lower end shall be 8 inches (203 mm) high minimum and 10 inches high (255 mm) maximum above the bathtub rim.

1003.8.4 Showers. A stanchion or grab bar shall be provided, located either interior to or outside of the shower compartment, within 3 inches (76 mm) of the adjacent face of the opening. The stanchion or grab bar shall be 24 inches (610 mm) long minimum with its lower end 39 inches (991 mm) maximum above the finished floor.

1003.8.5 Other Details. Grab bars and stanchions shall comply with Section 1003.8.5.

1003.8.5.1 Cross Section. Grab bars and stanchions shall be circular in cross section having an outside diameter of 1-1/4 inches (32 mm) minimum and 2 inches (51 mm) maximum.

1003.8.5.2. Spacing. The space between the stanchion or grab bar and adjacent surfaces, including controls or other fixtures, shall be 1-1/2 inches (38 mm) wide minimum.

1003.8.5.3. Surface Hazards. Stanchions, grab bars, and adjacent surfaces shall be free of sharp or abrasive elements. Edges shall be rounded with a minimum radius of 0.25 inch (6 mm).

1003.8.6. Structural Characteristics. Allowable stresses shall not be exceeded for materials used when a vertical or horizontal force of 250 pounds (1112 N) is applied at any point on the grab bar, stanchion, fastener, mounting device, or supporting structure. Grab bars and stanchions shall not rotate within their fittings.

1003.8.7. Design and Installation for Water. Grab bars, stanchions, fasteners, mounting devices, and supporting structure shall be composed of materials and installed to withstand damaging effects of water, including corrosion and other deterioration through their service life.

Reason:

Reason Statement (Justification) for Grab Bars

for Bathtubs, Bathtub-Shower Combinations and Showers (Proposal ID: 1066)

Complying with New Requirements in IBC Section 1003

Proposed by Jake Pauls, BArch, CPE, HonDSc

Introduction

Points of Control. Grab bars, handrails and stanchions are important building components providing—in combination with our hands and our feet—what are called (in ergonomics) “points of control” to maintain balance and aid in ambulation and other movement activities that are crucial to utilizing means of egress for safety generally (in both normal and emergency conditions) and which pose dangers of injurious falls, the leading source of injuries in most countries, including the USA.

A brief digression to explain “stanchions.” You see them routinely on transportation vehicles such as subway trains and city buses. They are the vertical assemblies of graspable tubing that are fixed between ceilings, horizontal handrails just above head height, seats, floors, etc. usually located between seating and passageways or aisles. The term, stanchions is used in ADA requirements for transportation vehicles and for this context Wikipedia has the following description: “On board most buses and trams/subways, vertical supports to provide stability when passengers are standing. They are located throughout most city buses and are connected to seats, floor, roof, etc.” This term is used in contexts similar to those for the “poles” referred to in NFPA’s recent adoption of new requirements for grab bars or poles for new bathtubs, bathtub-shower combinations and showers.

Examples of Points of Control in Specific Contexts. The starred, central cell of Table 1. shows the equity, with points of control— shown in bold italics—achieved with now-proposed grab bars, handrails and stanchions being required, in Section 1003, in the same way that handrails are required for stairs in the rest of the IBC.

Table 1.

Minimum Number of Points of Control Provided with New (★) or Currently Imposed Rules or Practices

Number of Points of Control Via Hands or Feet	≤1	1	2	3	3-4
Standard walker for older adult with altered gait.					✓
Occupational settings with risk of worker falls from heights. Also, stairs where users can use two handrails simultaneously, one on each side.				✓	
Stairs where users have only a single handrail. <i>Grab bar(s) usable for bathtub/shower entry/egress.</i>			✓ ★		
Bathtubs/showers with slip resistant underfoot surfaces when wet.		✓			
Bathtubs/showers without slip resistant underfoot surfaces when wet, the common condition currently.	✓				

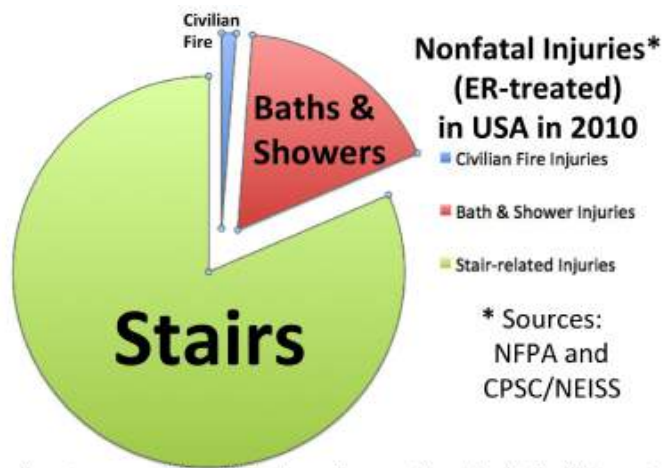

The Problems To Be Solved with A New Requirement for Grab Bars and Stanchions. The central and most important point of this code change proposal is to respond to the relatively high risk of injurious falls when entering and exiting bathing/showering facilities, in all new settings where they occur. Such risks exceed those for stairs on an exposure-adjusted basis. That is, the time during which one is stepping into or out of a bathtub or shower is more risky than a similar stepping behavior on a stair. The former result in about 25 percent of the injuries as do falls on stairs. This is based on about 300,000 US hospital emergency room visits per year for bathtubs and showers versus about 1.2 million US hospital emergency room visits per year for stairs, using comparably serious injury data for 2010 (discussed by Lawrence, et al., 2015 in the journal Injury Prevention). The societal cost of these injuries, plus about two and a half times additional, medically treated injuries, was (for 2010) about 20 billion dollars for US bathtubs and showers and about 93 billion dollars for US stairs with the greatest risk for both being in homes, where bathing/showering is a near daily activity for most people in the US (Lawrence, et al, 2015). (See also the annex to this justification for details of injuries documented by the US Consumer Product Safety Commission, CPSC.)

Table 1 depicts the current inequity as well as the increased equity that will be achieved when bathtubs and showers are subject to the same principle about availability of points of control (usable by ones hands or feet) that are crucial to our stability in utilizing those portions of the means of egress that entail elevation differences, changes of slope, and changes in slip resistance. The current—at best—one point of control provided with typical bathtubs and showers (i.e., one foot in a stable placement on a slip-resistant surface) would be augmented by one point of control available reliably to one hand. This achieves equity of safety with stairs where we can count on one foot planted on a tread and one hand on a handrail. For some situations, involving bathtubs used for immersion bathing (with occupants seated or lying on the bottom of the tub) two points of control, utilizing grab bars, or stanchions—one for each hand—are needed for this equity and, more practically, to accomplish the relatively difficult stand-to-sit and sit-to-stand transfers within the tub.

Size of the Problem with Bathtubs and Showers Compared to Other Large Problems. Figure 1, a pie chart, shows the approximate scales of the nonfatal injury problem for three dangers to building occupants. In the US, the traditional danger of fire-related injuries is far smaller than that from bathing/showering and even smaller in relation to stair-related injuries. Right now, in the I-Codes, the segment for bathing/showering is not addressed while many, many pages of the I-Codes deal with fire-related injury prevention. Again, the proposal for grab bars and other points of control to be provided equitably, will provide a major improvement to injury prevention that, heretofore, has been largely ignored in code development and in practice except in some hotel properties where no more than half of the grab bars or stanchions to be required under the new proposal are provided for bathtubs.

Figure 1.

Comparing three dangers resulting in injuries in buildings

There is an inverse relationship between these epidemiological insights and the extent of coverage of the great dangers of stairs and baths/showers in building codes and housing codes plus leading healthy homes literature.

International Codes, Scientific/Technical/Policy/Managerial Perspectives Precedent Set by NFPA Codes. The foregoing is the philosophical and epidemiological foundation for the proposed addition of requirements for grab bars, and stanchions in Section 1003 of the IBC and, in future or elsewhere, in the I-Codes generally. There is also the precedent taken in NFPA 101 and NFPA 5000 in their 2018 editions where grab bars (alternatively poles which are given the more-technical name “stanchions” in this IBC proposal) were proposed and almost completely adopted (with the exception of health care, discussed below) for new bathtubs and showers in buildings regulated by these codes. The new requirements were mostly noncontroversial and it is hoped that the same will be true with the proposals now submitted to the I-Codes.

The justification for the new requirements far outweigh the opposition to them as the ergonomic, biomechanics, epidemiological, etiological and economic aspects have been carefully considered and addressed to the satisfaction of many people who know building codes and safety standards well and whose votes on the many committees considering the issue attest to the multiple justifications for this new feature of building codes and safety standards.

Parallel Code Development Activity in Canada. A proposal, comparable to what NFPA has adopted, is being addressed by a Grab Bar Task Group for the National Building Code of Canada and, when its next cycle commences, will also be proposed for action by the ICC A117 Committee for a new section, on mainstreamed grab bar and stanchion features for the A117.1 standard. Leaders in the standards and codes field, conversant with the value of grab bars and stanchions have been discussing such mainstreaming since early 2016, at an international meeting of experts on bathing/showering safety held in Toronto and partly available for study in a free streaming video that is available with several other streaming videos addressing points of control, grab bars, cost-benefit issues, etc., that are all listed in the Bibliography provided with this proposal. So a lot of the groundwork has been laid and different perspectives have been elicited and discussed.

Survey of Existing Facilities. Centered on hotels, health care facilities**, airport airline club shower facilities*, and homes, the proponent for this code change has been conducting a personal, opportunity-based survey of bathing/showering facilities worldwide, including the following countries where his work on building use and safety has taken him in recent years or his work is followed by other professionals, including public health authorities.

- Canada**
- USA* **
- UK*
- Sweden**
- Finland
- Netherlands
- Italy
- Singapore*
- Australia**
- New Zealand
- Japan

The survey is documented in many hours of video and thousands of photographs plus many measurements of three-

four-, five-piece bathrooms ranging in size from a few square meters (20 square feet) to spaces big enough to park an automobile, occasionally with tubs and showers almost that big. Generally, the more compact the bathroom, the easier it is to provide the needed points of control—and with very substantial cost savings.

Detailed Justifications for Specific New Sections in IBC 1003.

1003.4 Slip Resistant Surface. Showers and bathtubs are part of the means of egress for a building as they form part of the “occupied portion of a building.” However, recognizing reality, due to the presence of water on standing and walking surfaces in and around showers and bathtubs, it is almost certain that those surfaces are not slip-resistant and thus an exception is needed to cover them. Therefore countermeasures, in the form of grab bars or stanchions are needed to mitigate these serious slip-and-fall risks. Thus, via a new exception, this is one of two scoping requirements triggering the mandatory provision of grab bars or stanchions found in a new section, 1003.8.

1003.5 Elevation Change. Bathtubs and most showers have elevation changes with various step-over and step-on surfaces, often exceeding 5 percent in slope, that greatly heighten the risk of missteps (such as tripping as well as slipping) and loss of balance that can result in injurious falls that are exacerbated by the typically hard, often projecting surfaces that are especially unforgiving if fall-related impacts occur. Grab bars and other points of control, like stanchions, have both prevention and mitigation roles, for such missteps and falls, that parallel what handrails do for stairs to prevent and mitigate missteps and falls. Thus, via a new exception, this is the second of two scoping requirements triggering the mandatory provision of grab bars found in a new section, 1003.8 as is demonstrated in Figure 2.

Figure 2.

Demonstration set up of both conventional grab bars (nominally meeting the length and location criteria of proposed IBC Section 1008) and heavy duty tubing, both horizontal and vertical—that latter being a stanchion (completely meeting the length, location and structural strength requirements of proposed IBC Section 1008)

1003.8.1 General. This sets out the scoping for the new section. In Figure 2, the photograph shows a demonstration bathtub-shower combination with a redundant set of both conventional (vertical and diagonal) grab bars and a vertical, floor-to-ceiling pole—technically termed a stanchion, the latter easily meeting the 250-pound structural load criterion. So does the full-length horizontal bar (a tube) at the back of the bathtub.

Section 1003.8.1 sets up a structure for the requirements; first addressed in 1003.8.2 for bathtubs and bathtub-shower combinations which require a vertical point of control for ambulatory entry to and egress from the bathtub that typically involves stepping over the bathtub wall and dealing with different, perhaps wet surfaces inside the tub and on the floor outside the tub. For some tubs there will also be an elevation difference between the tub bottom and the floor outside the tub that can be an additional danger. These are important ergonomic or biomechanics considerations for

reasonably safe bathing and showering that will significantly reduce the large toll of falls and other injury events involving bathtubs and showers (as described for a few hundred cases in the Annexes accompanying this Reason statement).

Addressed second in 1003.8.1 is the need for a horizontal or diagonal point of control on the non-egress side of a bathtub that is covered by 1003.8.3. This addresses the need for a point of control that assists people who want to sit or lie down in the tub and have an immersion bath. This involves stand-to-sit and sit-to-stand transfers that will be facilitated with the bilateral support provided, on one side, by the vertical grab bar or stanchion required by 1003.8.2, on the other side, used in conjunction with the horizontal or diagonal grab bar required by 1003.8.3.

Addressed third in 1003.8.1 is ambulatory access into and egress from a stand-alone shower (not combined with a bathtub) addressed in 1003.8.4. While step-over heights are smaller than for bathtubs, there are still dangers in smaller heights of curbs needed for water control as well as in different elevations of the shower pan and the floor outside the shower. Again, a vertical point of control assists with such transfers.

The final scoping feature in 1003.8.1 is its reference to several details of the grab bars or stanchions dealing with their graspability, surroundings, structural characteristics, and long-term serviceability in the wet environment typical for baths and, more so, for showers.

1003.8.2. Stanchion or Grab Bar. This introduces the provision, approach, length, and position requirements for the required vertical point of control, a stanchion or a conventional, wall-mounted grab bar for bathtubs. Vertical grab bars were found to be especially useful in studies performed over the last two decades in Canada. (Bibliography: Items # 5, 23, 24, 29, 30 plus two reports, from 2017, by Novak & King and King & Novak.)

1003.8.2.1 Approach. The unobstructed clear floor space of 21 inches (535 mm) wide minimum and 21 inches (535 mm) deep minimum, measured from the tub wall, is based on the current space requirements of Section R307, including Figure R307, in the International Residential Code. Along with the 12-inch (305 mm) maximum horizontal distance between the point of control and the edge of the clear floor space, this provides reachability to the grab bar or stanchion for a user approaching, or stepping from a bathtub in a bathroom where there are other fixtures such as a water closet or lavatory.

1003.8.2.2 Length. The minimum length of 36 inches (914 mm) for the vertical grab bar or stanchion and minimum height of 60 inches serves ambulatory transfers by adults and children and provides a vertical point of control that extends low enough to serve bathers (children as well as adults) sitting or crouching in the bathtub.

1003.8.2.3 Position. The two options cover vertical, conventional, wall-mounted grab bars as well as stanchions (secured in place between, for example, the ceiling and the floor or the rim (top) of the tub wall) that can be located anywhere as they are not fastened to a wall, which for this requirement usually means one of the two end walls (control end wall and had end wall) for many bathtubs. (See Figure 2 above.) Note that, for option 1, a grab bar on an end wall, there is an important requirement to keep the grab bar at least 6 inches (horizontally) from shower curtain attachments so that there is no interference, from a grab bar, to the sealing of a shower curtain against a wall to prevent water from a shower getting on the floor outside the bathtub. Note that option 2 permits placing a stanchion outside the bathtub, within six inches of the outside bathtub wall; such a stanchion can serve stand-to-sit and sit-to-stand transfer functions for users of a water closet adjacent to the bathtub (as shown in Figure 2). This is a bonus benefit of such stanchions which, in this proposal, are already sufficiently justified for the bathing and showering functions alone. Such a benefit (for many users) will be gained several times a day, as opposed to once per day for a shower or bath and the value of such secondary benefits—to usability and safety. This dual use benefit should be considered in doing a cost impact analysis. The benefit is especially important for older users who are the most impacted, in terms of serious injuries requiring hospital admission, and for whom toileting is essential, unlike showering or bathing which can be avoided more often.

1003.8.3. Grab Bar. This addresses the need for a point of control, on the non-egress, long side side of the bathtub where there is usually a wall (except in the case of a free-standing tub. This assists people, after they have stepped into the tub and who want to sit or lie down in the tub for an immersion bath. Note that while useful for stand-to-sit and sit-to-stand transfers, this horizontal or diagonal point of control will not be very useful for ambulatory transfers to and from a bathtub as a person has to lean precariously, threatening balance, over the width of the tub to reach the point of control on the non-egress side. Such transfers rely on the vertical point of control required by 1003.8.2.

1003.8.3.1. This does not limit compliance to a conventional wall-mounted grab bar. See Figure 2 for a nonconventional point of control, in effect a stanchion, in a horizontal orientation, secured by end walls, and extending the full length of the bathtub thus providing extra usability to bathers (as well as serving as a longer rack for towels, laundry, etc.). For free-standing tubs, with no adjacent walls, the requirements permit other solutions for the horizontal grab bar, for example, a conventional grab bar mounted on a surround often provided for most new stand-alone tubs.

1003.8.3.2 Diagonal Position. The stated dimensions for this diagonal grab bar will result in an approximate 45-degree inclination of this point of control that combines versatility with height as well as horizontal reach. Of all of the point-of-control positioning options, this one will almost invariably require a backing wall and this one places the

greatest demand on structural backing—in terms of its size in the wall—for the fastening, typically with screws, of conventional grab bars. Keep in mind that the diagonal grab bar is an option and there are less-costly ways of complying with 1003.8.3.

1003.8.4 Showers. The requirement is intended to serve entering and egressing users regardless of whether the point of control is located inside or outside the shower enclosure or compartment. For example, fixing a point of control inside a shower is often problematic due to the nature of shower enclosures/compartment and of shower pans, both of which are subject to important waterproofing requirements. Here a stanchion, fastened to the room floor and ceiling and located just outside the entrance to a shower can be a good solution. This is especially true for increasingly used fixed, sliding or pivoting glass screens, for water control (in place of a shower curtain) on the open side of showers. The floor and ceiling take the usage loads on the stanchion whereas a conventional grab bar relies on a wall or wall-like feature.

1003.8.5 Other Details. Related mostly to effective and safe graspability with one or both hands, these are largely based on requirements of ICC A117.1.

1003.8.5.1 Cross Section. Unlike ICC A117.1 only circular is addressed. This reflects the overwhelming provision of circular-section grab bars and stanchions in practice. Anyone wanting more flexibility with cross section could introduce, via an amendment to the proposal, a separate provision for noncircular sections also complying with ICC A117.1. The rationale for not including noncircular sections here is the overwhelming advantage of circular sections for hand approach from any direction, an important aspect of the more varied uses of points of control for bathing and showering facilities than is the case for handrails for stairs. Also, even for stairs, a large proportion of the railings installed—of decorative rather than reasonably functional, circular cross section—do not function sufficiently well for even the more-limited biomechanics of stair handrail use.

1003.8.5.2. Spacing. The 1.5 inches (38 mm) wide minimum space might not be adequate with some plumbing controls (e.g., water temperature), but it is a good starting point for adequate clearance.

1003.8.5.3. Surface Hazards. Impact against surfaces, including controls and spouts, in bathing and showering facilities is a major source injuries and the requirement are justified.

1003.8.6. Structural Characteristics. The minimum vertical or horizontal force of 250 pounds (1112 N)—applied at any point on the grab bar, stanchion, fastener, mounting device, or supporting structure—is commonly used in the US. There is a need for this to be maintained and confirmed through the life of the grab bars. (Canada has a somewhat higher load requirement, 290 pounds). The requirement that points of control will not rotate within their fittings is reasonable as it increases the effectiveness of a user’s grasp and the users’ stability generally.

1003.8.7. Design and Installation for Water. This is a relatively new requirement but it is very much needed, based on the proponent’s checking of fixing quality of many grab bars in hotels around the world. Many grab bars are not designed, installed and maintained for water! Water might not only corrode the critical attachment screws of conventional, wall-mounted grab bars; water also causes deterioration of the backing materials for some badly installed and maintained grab bars. This one, relatively new requirement warrants extra explanation—which follows here.

Problems Found in the Field with Conventional Grab Bars

During the course of his opportunity-based survey of grab bars provided for bathrooms in hotel guest rooms, the proponent of this code change has found two problems with many installations.

The first, affecting over 50 percent of the surveyed bathtub-shower combinations in hotels, comes from placement of vertical grab bars underneath—and within a few inches horizontally of the end bracket for shower curtains. This makes sealing the shower curtain against the end wall of the bathtub-shower combination very difficult so that the danger of water getting outside the bathtub, on the adjacent floor is heightened unreasonably and needlessly. The proposed section 1003.8.2.1 addresses this problem in its last sentence, “Such grab bar shall be located a maximum of 12 inches (305 mm), measured horizontally, inside of the exterior approach side of the bathtub or bathtub-shower combination and no closer than 6 inches (150 mm), measured horizontally, to the end fixing of any shower curtain rod.”

A much more worrying problem is found with a smaller percentage of conventional, wall-mounted grab bar installations, specifically grab bars which have cover plates over the screw plate onto which the tube of the grab bar is welded. There is invariably a space between the hole in the cover plate through which the tubing (grasped) portion of the grab bar passes and the tubing itself. Water can easily enter here and get trapped by the cover plate thus creating a pool of water and debris (hair, shampoo residue, etc.) from the showering process. Figure 3 provides an example photographed on the wall of a bathtub-shower combination in a hotel guest bathroom.

Figure 3. Corrosion behind grab bar cover plate

Aside from the hygiene problem here, there is a greatly heightened risk of two structural problems. One is water intrusion into the wall, around the fixing screws—typically two or three for each end of the grab bar, causing deterioration of the backing material so the screws become loose enough to be extractable with ones fingers. The second problem is equally worrisome, especially as the quality of the steel used in (off-shore) grab bars is relatively poor in terms of corrosion of the screws and, less often, the mounting plates. The worst case seen recently had the heads of all the screws holding a grab bar so corroded that their heads were completely deteriorated and the grab bar could be pulled away from the walls with little force by one hand—clearly far, far less than the stipulated load of 250 pounds that codes in the US stipulate for structural strength. The proponent has many photographs of these problems as well as a few videos showing how loose the grab bars have become due to corrosion as well as backing deterioration from water. One such photograph is provided in Figure 3; it is not the worst situation seen in the field.

Clearly such examples need to be addressed in several ways including stronger inspection by authorities and improved management of facilities. Improved design and manufacture of conventional grab bars would help too but, until that occurs, this proposal offers the pole options as well as mounting locations that keep the important “points of control” in relatively dry locations—for example at the exterior of a shower enclosure or outside of a shower curtain for tubs and showers—but still near enough to the entrance to be usable from both outside and inside the space where water sprays, deflects and flows freely.

Annexes

Annex 1: Representative sample of narratives of actual bathtub/shower-related injuries that led to US hospital emergency room (ER) visits and, for about one in ten of such visits, also led to hospital admission covered by **Annex 2**, (plus an additional 30 percent who went directly to hospital admission without an ER visit) in 2010. These are collected and published by the US Consumer Product Safety Commission (CPSC) National Electronic Injury Surveillance System (NEISS) and many more can be downloaded from the CPSC/NEISS Web site, <https://www.cpsc.gov/Research--Statistics/NEISS-Injury-Data>. Accessed January 8, 2018.

Annex 1: US CPSC NEISS: First 112 Sample Narratives (of 6,946 cases) for Product Code 0611 Injuries in 2010 - ER released w/wo treatment (Product Code 611 covers bathtubs or showers including fixtures or accessories; excluding enclosures, faucets, spigots and towel racks)

41 YOM FRACTURED A RIB BY SLIPPING IN THE BATHTUB & FALLING AGAINST THE TOILET AT HOME.

53 YOF SUSTAINED A CONTUSION OF A SHIN BY BUMPING IT WHILE SHOWERING AT HOME.

18 YOF SPRAINED HER LOWER BACK BY FALLING IN THE SHOWER AT SCHOOL.

02 YOF SUSTAINED A LACERATION OF THE CHIN BY FALLING IN THE BATHTUB AT HOME.

18 YOF SUSTAINED A HEAD INJURY BY FALLING IN A SHOWER AT HOME.

80 YOM DISLOCATED A HIP BY LIFTING LEG IN SHOWER.

86 YOF SUSTAINED A LACERATION OF THE SCALP BY TRIPPING ON A RUG IN THE SHOWER AT HOME.

71 YOF SUSTAINED A HEAD INJURY BY FALLING FROM TOILET AGAINST THE BATHTUB AT HOME.

68 YOF SPRAINED AN ANKLE BY FALLING IN A SHOWER.

47 YOF FRACTURED A KNEE BY FALLING IN THE SHOWER AT HOME.

30 YOM SLIPPED AND FELL INTO TUB DX: CONTUSION TO BACK

51 YOF SLIPPED IN TUB AND HIT HEAD DX/ SCALP LAC

60 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO COCCYX

44 YOM FELL AND HIT ABDOMEN ON BATHTUB AT HOME. DX/ ABDOMINAL CONTUSION

04 YOM WITH CUT TO FACE FELL IN TUB DX: LACERATION TO FACE

51 YOF AT HOME FELL AT 5PM WHEN LOST BALANCE AND HIT L SIDE OF RIBS ON BATHTUB.

33 YOF SLIPPED AND FELL IN TUB DX: HEAD LACERATION

23 MOM FELL IN BATHTUB AT HOME AND HIT CHIN CAUSING LACERATION.

62 YOM WITH BACK PAIN FELL INTO TUB DX; CONTUSION TO LOWER BACK

63 YOF FELL INTO BATHTUB / NO INJURIES OR COMPLAINTS

54 YOM SLIPPED AND FELL IN TUB DX: RIB FRACTURE

02 YOM SLIPPED IN TUB AT HOME AND INJURED FACE DX/ CHIN LAC

25 YOF WITH CHEST PAIN AFTER FALL INTO TUB DX: CONTUSION TO CHEST

84 YOM FELL OUT OF SHOWER ON TO THE FLOOR AT HOME HIT HEAD DX/ HEAD INJURY

85 YOF SLIPPED AND FELL IN TUB AND HIT HEAD AT HOME DX/ HEAD INJURY

06 YOM AT HM WAS TAKING A BATH & SWIMMING IN TUB WHEN HE STRUCK HIS HEAD AGAINST FAUCET CAUSING HEAD LACERATION.

28 YOM AT HOME FELL IN SHOWER. WAS RESPONSIVE PER EMS.

26 YOF SLIPPED / FELL IN THE SHOWER DX: R EAR LAC. / HEAD & R SHOULDER CONTUSION

36 YOF THIS AM SLIPPED WHILE TRYING TO GET OUT OF BATHTUB AND LANDED ON BUTTOCKS.

28 YOF RIPPED FINGER NAIL OFF WHEN SLIPPED IN THE SHOWER AND THE NAIL BENT BACKWARDS.

26 YOF INJURED KNEE STEPPING OUT OF SHOWER DX/ RIGHT KNEE SPRAIN

50 YOM FELL IN BATHTUB AND HIT CHEST DX/ RIB FX

83 YOM CUT SCROTUM FELL IN TUB DX: LACERATION TO SCROTUM

71 YOF FELL OUT OF BATHTUB AT HOME AND HIT HEAD ON THE FLOOR DX/ HEAD INJURY

89 YOF FELL IN TUB HITTING HEAD DX: CLOSED HEAD INJURY
69 YOF WAS IN SHOWER AND FELL BACKWARDS STRIKING HER BACK.
08 YOF AT HOME LACERATED FACE ABOVE R ORBITAL. HIT HER HEAD ON SOAP DISH WHILE SHOWERING. NO LOC.
40 YOM SLIPPED AND FELL IN SHOWER AND INJURED CHEST. DX/ RIB FX
17 YOF FELL IN TUB HURT NECK DX: NECK STRAIN
23 YOM INJURED LOWER BACK BENDING OVER IN SHOWER AT HOME DX/ LUMBAR STRAIN
83 YOF FELL IN THE TUB AT ASSISTED LIVING AND INJURED SHOULDER DX/ RT SHOULDER CONTUSION
02 YOM HIT FACE ON BATHTUB AT HOME DX/ FACIAL LAC
74 YOM FELL AND HIT HEAD IN TUB DX: CONTUSION TO HEAD
85 YOF SLIPPED AND FELL GETTING OUT OF TUB DX: CONTUSION TO HIP
58 YOF SLIPPED AND FELL INTO TUB HIT HEAD DX: CLOSED HEAD INJURY
13 MOM AT HOME FELL IN BATHTUB AND HIT FOREHEAD AND MOUTH.
06 YOM SLIPPED IN BATHTUB AND HIT HEAD DX/ HEAD CONTUSION
78 YOM SLIPPED AND FELL IN TUB DX: LACERATION TO HEAD
08 YOM SLIPPED IN TUB TWISTED ANKLE DX: ANKLE STRAIN
51 YOF HIT HEAD ON SOAP DISH IN SHOWER 2 TIMES THIS WEEK HAS HEADACHE DX/ CONCUSSION
51 YOF SLIPPED IN SHOWER AND INJURED KNEE AT HOME DX/ RIGHT KNEE CONTUSION
83 YOM SLIPPED AND FELL IN THE SHOWER LAST NIGHT AND INJURED BACK DX/ BACK PAIN
31 YOM HIT EYE WITH TOWEL WHILE GETTING OUT OF THE SHOWER AT HOME DX/ RIGHT EYE CORNEAL ABRASION
24 YOF FELL GETTING OUT OF SHOWER HIT HEAD DX/ SCALP LAC
48 YOF SLIPPED IN SHOWER HIT HEAD + LOC DX/ HEAD INJURY
11 YOM SLIPPED IN SHOWER AND INJURED LEG. DX/ LEFT LEG CONTUSION
30 YOF SLIPPED AND FELL INTO TUB DX: CONTUSION TO HIP
18 MOM FELL IN TUB DX: LACERATION TO FACE
46 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO LOWER BACK
30 YOM CUT HAND ON BROKEN SOAP DISH AT HOME. DX// RIGHT HAND LAC
70 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO CHEST
31 YOM CUT THUMB ON SHOWER DRAIN THIS AM.
62 YOF SLIPPED IN THE SHOWER AND FELL ON THE FLOOR AT HOME DX/ LEFT WRIST SPRAIN
67 YOM FELL GETTING OUT OF SHOWER HIT HEAD ON TUB AT HOME DX/ SCALP CONTUSION
45 YOF PASSED OUT IN SHOWER AT GROUP HOME HIT HEAD. DX/ HEAD INJURY
04 YOF FELL IN BATHTUB AND HIT MOUTH DX/ LIP LAC
43 YOM SLIPPED IN BATHTUB AND INJURED KNEE DX/ LEFT KNEE CONTUSION
15 YOM TAKING SHOWER AND SHOWER DOOR SHATTERED AND PT FEET WERE CUT WITH THE GLASS AT HOME DX/ BILAT
FOOT LAC
73 YOF AT 9AM TODAY WAS GETTING OUT OF TUB AND SLIPPED AND BUMPED L RIBS ON THE TUB. C/O RIB PAIN.
87 YOF BENT DOWN TO PUT SCALE AWAY FELL AND HIT INTO TUB AT HOME DX/ LEFT HIP CONTUSION22 YOM FELL IN TUB
AT HOME AND INJURED CHEST DX/ RIB FX
40 YOF SLIPPED GETTING OUT OF BATHTUB AND INJURED LOWER BACK DX/ LOW BACK PAIN
34 YOM FELL AND HIT TUB DX: SHOULDER STRAIN
70 YOF SLIPPED FELL HIT CHEST ON SIDE OF TUB DX: CONTUSION TO CHEST
89 YOF SLIPPED AND FELL IN THE SHOWER LAST NIGHT AT NURSING HOME INJURED CHEST DX/ CHEST CONTUSION
44 YOM FELL IN TUB AND HIT CHEST DX.CHEST CONTUSION
36 YOF SLIPPED AND FELL IN TUB DX: LACERATION TO FACE
56 YOM CUT WRIST ON BROKEN SHOWER KNOB AT HOME DX/ LEFT WRIST LAC

88 YOF FELL AT HOME IN SHOWER AND HIT HEAD ON TUB DX/ SCALP CONTUSION
51 YOM SLIPPED AND FELL IN TUB DX: NECK STRAIN
23 YOM FELL IN BATH TUB AND INJURED CHEST DX/ CHEST CONTUSION
59 YOM FELL IN SHOWER AND INJURED SHOULDER DX/ LEFT SHOULDER FX
46 YOM HAD FALL HIT TUB DX: CONTUSION TO FACE
78 YOF FELL AT HOME AND HIT FACE ON BATHTUB DX/ FACIAL CONTUSION
29YOF WITH BACK PAIN AFTER FALL IN TUB DX: LOW BACK STRAIN
31 YOF FELL GETTING OUT OF TUB AT HOME INJURED FLANK DX/ FLANK CONTUSION
72 YOF AT HOME FELL WHEN SLIPPED ON URINE IN BATHROOM AND HIT HEAD ON SIDE OF BATH TUB.
19 YOF SLIPPED AND FELL INTO TUB DX: CONTUSION TO LOWER BACK
08 YOM FELL IN THE SHOWER AT HOME AND HIT EAR DX/ LEFT EAR LAC
62 YOM SLIPPED / FELL IN THE SHOWER. DX: RIB CONTUSION
09 YOF FELL IN TUB AND HIT LIP. DX/ LIP LAC
56 YOF WITH SHOULDER PAIN AFTER USING BATHBRUSH IN SHOWER DX: SHOULDER STRAIN
75 YOF AT HOME FELL OFF HASSOCK APPROX 30 MIN AGO HITTING HEAD AND L ARM ON BATHTUB. DENIES LOC.
62 YOF SLIPPED IN TUB HITTING FOOT DX: CONTUSION TO FOOT
04 YOM SLIPPED IN THE BATHTUB AND HIT CHIN DX/ CHIN LAC
34 YOM FELL IN THE SHOWER AT HOME INJURED BACK DX/ BACK SPRAIN
25 YOF + ETOH BAL 313 FELL IN SHOWER AND HIT HEAD DX/ HEAD CONTUSION

Annex 2: US CPSC NEISS: First 48 Sample Narratives (of 630 cases) for Product Code 0611 Injuries in 2010 - ER treated & Then Admitted to Hospital (Product Code 611 covers bathtubs or showers including fixtures or accessories; excluding enclosures, faucets, spigots and towel racks)

89 YOF GETTING OUT OF THE SHOWER THE NEXT THING SHE KNEW SHE WAS ON THE FLOOR WITH HEAD AND SHOULDER INJURY; SHOULDER AND HEAD CONTUSION
69 YOM WAS WASHING HIMSELF IN SHOWER, FELL ONTO BLUNT PART OF BATHTUB, IMMEDIATELY HAD PAIN & TROUBLE BREATHING. DX - MULTIPLE RIB FXS
56 YOF SLIPPED IN THE SHOWER AND FELL FORWARD HITTING HER FACE & INJURING HER RT ARM- DX- MECHANICAL FALL W/ FRACTURE RT SHOULDER
78 YOF FAMILY FOUND HER ON THE FLOOR BETWEEN TOILET AND BATHTUB, SHE STATED SHE PASSED OUT WHEN SHE WAS IN SHOWER; SHOULDER INJURY
47 YOM HAD A WET SHEETROCK FALL ON HEAD WHILE IN SHOWER, +LOC, WAS CONFUSED. DX - BLUNT HEAD TRAUMA W/BRIEF LOC
62 YOM HAD A SYNCOPAL TODAY AT HOME IN THE SHOWER INJURING EYE AREA- DX- LACERATION TO FACE(EYE)
78 YOF PRESENT TO ER FROM HOME WHEN SHE WAS TAKING A BATH AND COLLAPSED - DX- CARDIAC ARREST, RESUSCITAED
43 YOM PRESENT TO ER AFTER HE WAS IN THE BATHTUB AND SLIP AND FELL GETTING OUT HITTING HEAD ON FLOOR- DX- BLUNT HEAD TRAUMA
81 YOM PRESENT TO ER AFTER A FALL IN THE SHOWER AT HOME TODAY INJURING THE HEAD AREA- DX- BLUNT HEAD TRAUMA
41 YOM FELL OUT OF SHOWER AT ASSISTED LIVING HOME YESTERDAY ONTO RT SIDE C/O RT HIP & RT LEG PAIN. DX - RT HIP FRACTURE
80 YOF TRYING TO GET OUT OF BATHTUB ACCIDENTLY FELL INJURED LOWER BACK; BACK CONTUSION AND AMBULATORY DYSFUNCTION
92 YOM PRESENT TO ER AFTER A FALL IN BATHTUB THIS MORNING INJURING RT HIP-DX- FRACTURE RT LOWER TRUNK (HIP)
88 YOF PRESENT TO ER AFTER A FAL IN BATH TUB AT SNF INJURING LT HIP- DX - FRACTURE LT LOWER TRUNK (HIP)
88 YOF WAS GETTING OUT OF SHOWER, FELT DIZZY & FELL STRIKING BACK OF HEAD ON FLOOR INJURING LT ARM. DX - SKIN TEAR LACERATION

88 YOF GETTING OUT OF BATHTUB THIS MORNING FELL TRIED TO BRACE HERSELF INJURED SHOULDER; SHOULDER FRACTURE

71 YOF WAS FOUND DOWN BY SON IN BATHTUB AT HOME, HAS INJURY TO LT EYE & FOREHEAD, IS REPETITIVE. DX - BLUNT HEAD TRAUMA, +ETOH

86 YOF LOST BALANCE WHEN SHE TURNED AROUND & FELL INTO BATHTUB C/O LOW BACK PAIN. DX - LOW BACK PAIN, POSS FX VS CONTUSION

80 YOF HUSBAND DID NOT WANT HER SMOKING IN HOUSE, WENT TO BATHROOM STOOD ON THE TOILET, OPENED WINDOW, SLIPPED BETWN TOILET/TUB; PELVIC FX

44 YOF FELL IN SHOWER TODAY SUSTAINING HEAD INJURY. DX - SCALP LACERATION

37 YOF SUSTAINED A MECHANICAL FALL IN SHOWER ONTO RT UPPER EXTREMITY, C/O RT SHOULDER PAIN. DX - RT DISTAL CLAVICLE FX

37 YOM HAD A GROUND LEVEL FALL IN BATHROOM STRIKING LOWER BACK ON BATHTUB. DX - SPINAL CONTUSION

84 YOF HAD SYNCOPAL EPISODE IN SHOWER AND FELL. DX: L 10TH RIB FX, INABILITY TO AMBULATE.

87 YOF FELL IN SHOWER. DX: RHABDOMYOLYSIS.

93 YOF FELL IN SHOWER AT ASSISTED LIVING. DX: L DISTAL HUMERUS FX.

79 YOM FELL IN SHOWER. DX: A FIB W/RAPID VENTRICULAR RESP, SYNCOPE, SDH, SAH, ELEVATED INR.

84 YOF FELL WHILE GETTING OUT OF BATHTUB SUSTAINING A FRACTURE TO HER LUMBAR SPINE

90 YOF SLIPPED IN BATHTUB AND GRAZED HEAD ON SHELF AT ASSISTED LIVING. DX: R KNEE STRAIN W/POSS INTERNAL DERANGEMENT, CLOSED HEAD INJURY.

82 YOF WITH NO INJ FROM FALL IN TUB

85 YOM WITH NO IN, FELL IN BATHTUB, ADMITTED FOR OTHER REASONS

52 YOM W/ALS FELL AND BECAME STUCK BETWEEN TOILET AND TUB. DX: RHABDOMYOLYSIS STATUS POST FALL, NASAL FX.

95 YOF FELL IN SHOWER SUSTAINING CHEST CONTUSION

71 YOF SLIPPED AND FELL IN SHOWER. DX: SYNCOPE, LARGE HEAD LAC, COAGULOPATHY, HYPOKALEMIA, LONT QT, ALCO

79 YOF FELL IN SHOWER SUSTAINING A FRACTURED KNEE

87 YOF WITH RIB FRACTURE FROM FALL IN TUB

79 YOM WITH LOWER BACK STRAIN FROM FALL IN SHOWER

81 YOF TURNED IN SHOWER AND FELL SUSTAINING A FRACTURED HIP

97 YOF FELL IN THE SHOWER AT NURSING HOME. DX: TRAUMATIC SDH, AGGITATION.

70 YOF FELL IN SHOWER AT HOME AND WAS UNABLE TO GET UP, SUSTAINED CHI, BACK CONTUSIONS

88 YOF FELL AGAINST BATHTUB AND WALL AT ASSISTED LIVING. DX: BACK/SHOUL PX, SYNCOPE, STAGE I THORACIC DECUBITUS ULCER, MULT OLD THORACIC FX'S.

88 YOF SLIPPED ON WET FLOOR GETTING OUT OF SHOWER AT NURSING HOME. DX: BACK CONT, PNEUMONIA, HYPOXEMIA, PLEURAL EFFUSION.

41YOF WITH NO INJURIES FROM FALL IN SHOWER, WAS ADMITTED

83 YOM FELL IN THE SHOWER. DX: TRAUMATIC ICH, FACIAL LAC, CONCUSSION W/O LOC, RENAL FAILURE.

94 YOM FELL GETTING OUT OF THE SHOWER AND HIT HEAD SUSTAINING A LACERATION

79 YOM FELL ON SIDE OF BATHTUB. DX: SYNCOPE, CHEST WALL CONT.

55 YOM SLIPPED AND FELL IN BATHTUB. DX: R HEMOTHORAX/PNEUMOTHORAX, MULT R RIB FX'S.

86 YOF FELL BACKWARDS INTO BATHTUB & HIT HEAD AT HOME DX: LACERATION TO SCALP/ ACUTE DEHYDRATED

95 YOF TRIPPED OVER THROW RUG WHILE GETTING INTO SHOWER AT HOME DX; AVULSION TO FACE/ MALIGNANT HYPERTENSION

53 YOF SLIPPED IN SHOWER AND FELL HITTING HIP ON TOILET AT HOME DX: STRA

Bibliography:

Bibliography for Jake Pauls Proposal for IBC Section 1003 on Grab Bars for Bathtubs, Bathtub-Shower Combinations and Showers

Approximately 50 internationally-produced scientific and technical references, on bathing/showering safety, were compiled by the proponent, in 2016, for an American Public Health Association (APHA) draft policy highlighting, especially two Canadian research studies that also are addressed in video presentations by Principal Investigators (Dr. Nancy Edwards, Dr. Alison Novak) for the research and posted, for free streaming viewing at, <https://vimeo.com/164239941> Accessed January 8, 2018. Additional videos covering technical aspects of bathing and showering safety (including cost impact and benefit issues*) are found at the following links (all of which are available, with descriptions, at www.bldguse.com, the proponent's Professional Practice Website, Accessed January 8, 2018.).

The Evaluation of Vertical Pole Configuration and Location on Assisting the Sit-to-Stand Movement in Older Adults with Mobility Limitations. *Assistive Technology* 27, 4, 2015, Available at <http://www.tandfonline.com/doi/full/10.1080/10400435.2015.1030514>. Accessed January 8, 2018. (In referring to sit-to-stand transfers, as from a toilet, this article uses the term, “transfer poles,” to describe the configuration and location of “poles” referred to in the code change proposal.)

Cost Impact

The code change proposal will increase the cost of construction .

The code change proposal will increase the cost of construction, but that increased cost pales in comparison to the benefits of enhanced usability and reduction of fall injuries.

The additional material in the form of conventional grab bars or poles plus their fixings is about 50 dollars per grab bar or pole (using retail prices for the components confirmed as recently as 2017) and with a conventional three-fixture bathroom with a bathtub there would be a need for two such grab bars or poles or one of each. Labor to install these would be about one hour for each. Thus an overall, installed cost is on the order of \$200 per bathroom. The service life would be on the order of two or more decades.

Against this added cost of an installed single grab bar or two per bathroom there are the ongoing benefits of enhanced normal (non-injury) uses which, for a typical US household for a 20-year period, for example, number about 7,000 per person or on the order of 20,000 per household. Those enhanced uses, with grab bars, have an economic value that is larger than the benefit of averted injuries from falls.

Currently without grab bars, our bathtubs and showers are the site of injuries serious enough to require professional medical attention at a rate, annually (using 2010 data) of about 1 million per 110 billion uses or about one in 110,000 uses. Every one of those non-injury uses has a value. By comparison, for stairs this ratio is about one professionally treated fall injury for every million flight uses in home settings and one such injury for every ten million flight uses in public settings where, under the IBC and more-detailed inspection procedures, stairs are nearly one order of magnitude safer than those nominally constructed under the IRC. See the video presentation by Jake Pauls to the April 2017 meeting, “The Impact of Building Codes and Standards in Public Health and Safety,” held in Melbourne, Australia, in connection with the 15th World Congress on Public Health. The streaming video containing this presentation, which includes the “Injury Pyramids” used for the above stair safety calculation, is available freely at <https://vimeo.com/239276202> (as listed in the first part of the Bibliography accompanying this proposal) accessed Jan 8, 2018.

The injuries-averted benefit, over twenty years, has a value, in 2010 dollars, about 6.5 times greater than the installation cost, based on the very reasonable assumption that half the falls are averted with the specified grab bars or poles. For the vertical poles that also enhance and make safer the use of toilets that, being adjacent to a bathtub, can serve stand-to-sit and sit-to-stand transfers for toileting, this benefit increases by about 35 percent to nearly 9 times greater than the installation cost. These projections are based on the injury economic data provided by the 2015 paper in the respected journal, *Injury Prevention*, by Lawrence, Spicer and Miller (see Bibliography for details).

The bottom line is that the benefits of both enhanced normal uses, in the tens of thousands per household over a 20-year period, combined with the benefit of averted injuries, is on the order of at least 20 or more times the cost of providing the grab bars, especially if they take the form of vertical poles serving bathtub-shower combination users as well as toilet users in a three-piece bathroom provision that is very common in homes and hotels, for example. For hotels, while the lavatory sink(s) may be in a separate space, the toilet and bathtub-shower combination are usually close together so that a single pole can serve transfers for both. Thus the cost impact of grab bar or pole installations is very small in relation to the benefits and that cost of installation is very small in relation to the overall price of a dwelling unit or hotel guest room for example.

Finally, the choice of residential settings for the foregoing benefit-cost analyses, reflects the greater attention such occupancies often receive in code change deliberations. Healthcare occupancies could also have been chosen for analyses as estimates of fall-related injuries to patients are that about “one-third of reportable falls with injuries in hospitalized older adults are linked to bathroom use” (quoted from reference identified as number 47 in the Bibliography for this proposal). Notably, in the recent NFPA deliberations on installation of grab bars, only healthcare occupancies were not included due to healthcare industry and healthcare fire protection engineering consultants’ opposition based on the claim that patients in healthcare were not permitted to use bathrooms without supervision.

The personal, post-fall (with closed-head injuries) experience recently by the proponent of this code change in three hospitals in Sweden, Australia and the USA, seriously questions this industry claim as well as the implicit assumption that bathrooms in healthcare provide reasonable safety from falls suffered in the course of toileting as well as bathing. Too often, the wheeled stand (with the vertical pole holding fluid being administered intravenously) is the most reliable “point of control” such patients have between their beds and toileting/bathing facilities either in the patient bedrooms or “down the hall.”

US

A326.3-18:

Test Method for Measuring Dynamic Coefficient of Friction for Hard Surface Floor Materials

Reason:

Currently, Section 1003.4 requires that circulation path surfaces of the means of egress be “slip-resistant” with no method of measurement, quantitative threshold, or general principles to help the specifier, end-user and code official. Given the Code’s lack of criteria for “slip-resistant,” materials are sometimes being inappropriately specified, and accidents occur in areas of the means of egress. This can be especially dangerous for emergency responders who are entering a building for the first time, potentially under conditions with water and limited visibility (smoke).

The purpose of this revision is to provide slip resistance criteria for hard surface flooring used in interior circulation paths. The proposed reference standard, ANSI A326.3, sets forth a quantitative minimum threshold, means of measurement, and general principles regarding slip resistance for hard surface flooring and is widely specified for ceramic tile, polished concrete, terrazzo, and natural stone. This would provide clarity, safety, and transparency with no increased cost of construction.

This proposal is being submitted by Tile Council of North America (TCNA), Natural Stone Institute, American Society of Concrete Contractors (ASCC), Concrete Polishing Council (CPC), and National Terrazzo and Mosaic Association (NTMA), with the support of many other organizations.

Previously, slip resistance for ceramic tile was standardized solely by ANSI A137.1 American National Standard Specifications for Ceramic Tile. In 2012, a proposal (S222-12) was approved which removed ANSI A137.1 from Section 2103 of the Code (previously, Section 2103.6) in an effort to consolidate masonry-based specification references. An unintended consequence of this change was that the Code was subsequently left with no slip resistance criteria for ceramic tile, much less stone, terrazzo, or concrete.

In 2015, a proposal (E3-15) was made to reintroduce the slip resistance provisions of ANSI A137.1 into the Code. Given that these provisions were being widely adopted and specified for flooring types beyond just ceramic tile, the scope of the proposal included other hard surface flooring types with the support of each respective industry. The proposal was met with positive feedback from the Means of Egress Committee, but was ultimately disapproved since the proposed reference standard was limited to ceramic tile. At the time, the Committee encouraged the proponents to collaborate on a stand-alone slip resistance specification which covered all hard surface flooring types and return in 2018 with a proposal.

Today, this work has been done for all hard surface flooring and is standardized in ANSI A326.3, including in the standard test sample size and testing in as-is conditions or under cleaned conditions. This standard is widely understood for hard surface flooring and specified throughout the architectural community with hard surface

manufacturers/suppliers/installers regularly providing the information needed by code officials as part of standard product submittals and information. Revising Section 1003.4 to reference ANSI A326.3 for hard surface flooring would clear-up ambiguity around the requirement for “slip-resistant” circulation path surfaces, facilitate increased safety and ease-of-specification, and codify the slip resistance standard which is most predominately used today for hard surface flooring.

ANSI ASC A108, the committee which developed ANSI A326.3, represents a broad range of stakeholders, including the Construction Specifications Institute (CSI), Natural Stone Institute, National Association of Homebuilders (NAHB), Underwriter Laboratories (UL), National Tile Contractors Association (NTCA), Tile Council of North America (TCNA), and 58 additional stakeholders (for a total of 64).

A copy of ANSI A326.3 has been attached to this proposal and is also easily accessible for free online via www.TCNAtile.com.

2018 International Building Code

1003.4 Slip-resistant surface. Circulation paths of the *means of egress* shall have a slip-resistant surface and be securely attached.

Add new text as follows:

1003.4.1 Resilient flooring. Resilient flooring shall be slip-resistant in accordance with UL 410.

Add new standard(s) follows:

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096
US

410-2006:

Standard for Slip Resistance of Floor Surface Materials

Reason:

This proposal is being submitted by Tile Council of North America (TCNA) with the support of the Resilient Floor Covering Institute (RFCI). It clarifies that UL 410 is the intended slip resistance standard for resilient flooring. This is a clear distinction from ANSI A326.3 which is used for hard surface flooring as proposed in a separate Code Change Proposal.

Currently, Section 1003.4 requires that circulation path surfaces of the means of egress be “slip-resistant” with no method of measurement, quantitative threshold, or general principles to help the specifier, end-user and code official. Given the Code’s lack of criteria for “slip-resistant,” materials are sometimes being inappropriately specified, and accidents occur in areas of the means of egress.

The purpose of this revision is to provide slip resistance criteria for resilient flooring used in interior circulation paths. The proposed reference standard, UL 410, sets forth a quantitative minimum threshold, means of measurement, and general principles regarding slip resistance for resilient flooring and is widely used throughout the resilient flooring industry. This revision would provide clarity, safety, and transparency with no increased cost of construction.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Resilient flooring that meets or exceeds the criteria of the UL 410 standard is not different in price from resilient flooring that is below the threshold criteria.

Analysis: A review of the standard proposed for inclusion in the code, UL 410-2006, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

2018 International Building Code

Revise as follows:

1003.5 Elevation change. Where changes in elevation of less than 12 inches (305 mm) exist in the *means of egress*, sloped surfaces shall be used. Where the slope is greater than one unit vertical in 20 units horizontal (5-percent slope), *ramps* complying with Section 1012 shall be used. Where the difference in elevation is 6 inches (152 mm) or less, the *ramp* shall be equipped with either *handrails* or floor finish materials that contrast with adjacent floor finish materials.

Exceptions:

- ~~1. A single step with a maximum riser height of 7 inches (178 mm) is permitted for buildings with occupancies in Groups F, H, R-2, R-3, S and U at exterior doors not required to be accessible by Chapter 11. At exterior doors in accordance with Section 1010.1.5.~~
- A *stair* with a single riser or with two risers and a tread is permitted at locations not required to be accessible by Chapter 11 where the risers and treads comply with Section 1011.5, the minimum depth of the tread is 13 inches (330 mm) and not less than one *handrail* complying with Section 1014 is provided within 30 inches (762 mm) of the centerline of the normal path of egress travel on the *stair*.

Throughout a story in a Group I-2 occupancy, any change in elevation in portions of the *means of egress* that serve nonambulatory persons shall be by means of a *ramp* or sloped walkway.

1010.1.5 Floor elevation. There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope).

Exceptions:

- ~~Doors At doors serving individual *dwelling units* or *sleeping units* in Groups R-2 and R-3 where the following apply:~~
 - ~~1.1. A door is permitted to open at the top step of an interior *flight* of stairs, provided that the door does not swing over the top step.~~
 - ~~1.2. Screen doors and storm doors are permitted to swing over *stairs* or landings.~~
- ~~Exterior doors as provided for in Section 1003.5, Exception 1, and Section 1022.2, which are not on an accessible route.~~
- At exterior doors serving Groups F, H, R-2 and S and where such doors are not part of an accessible route, the landing at an exterior door shall not be more than 7 inches (178 mm) below the landing on the egress side of the door, provided the door, other than an exterior storm or screen door, does not swing over the landing.
- ~~In Group R-3 occupancies At exterior doors serving Group U and individual *dwelling units* and *sleeping units* in Group R-2 and R-3, and where such units are not required to be *Accessible units*, *Type A units* or *Type B units*, the landing at an exterior doorway shall be not more than 7³/₄ inches (197 mm) below the landing on the top egress side of the threshold, provided the door, other than an exterior door. Such doors, including storm or screen door, does not shall be permitted to swing over the either landing.~~
- Variations in elevation due to differences in finish materials, but not more than 1/2 inch (12.7 mm).
- Exterior decks, patios or balconies that are part of Type B *dwelling units* or *sleeping units*, that have impervious surfaces and that are not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the *dwelling unit* or *sleeping unit*.
- Doors serving equipment spaces not required to be accessible in accordance with Section 1103.2.9 and serving an *occupant load* of five or less shall be permitted to have a landing on one side to be not more than 7 inches (178 mm) above or below the landing on the egress side of the door.

Reason:

Exterior doors typically occur with some change of elevation at the door. The amount of the elevation change is sometimes dependent on the occupancy. This proposal coordinates and clarifies code language for this typical condition. The intent and limitations of the code with respect to this subject is currently spread over several sections. This proposal clarifies the code intent as stated in the commentary.

Section 1003.5

Section 1003.5 is a general condition for elevation changes. Exception 1 currently addresses a special condition—elevation change at doors. The proposal moves this section to the doors section 1010.1.5. This change is editorial.

Section 1010.1.5

Exception 1: The proposed modification to 1010.1.5 removes and relocates exception 1.1 and 1.2 into exception 1 and exception 3. This simplification is primarily editorial.

Exception 2: The proposed modification contains the code language previously stated in Section 1003.5. The proposal now prohibits the outward swing of a door over a step in these occupancies. Steps at doors can create a trip hazard for the occupants.

Exception 3: The proposed modification allows individual dwelling and sleeping units and U occupancies to be governed by the same change in elevation as Group R-3. This is consistent with stairway rise/run provisions where Group R-3 and individual units in R-2 are governed by the same rules.

The additional language regarding the direction of swing is necessary because such statement is not made in any other code section. The building code commentary clarifies the direction of swing and the reasoning behind it, as follows--"Exception 1 allows up to a 7-inch step at exterior doors to avoid blocking the outward swing of the door by a build-up of snow or ice in locations that are not used by the public on a regular basis" the commentary goes on to say "the door may swing in either direction for this exception and may actually be required to swing out." Given the clear intent in the commentary, the proposed change to the code will clear up any doubt about the swing of the door.

The current code language allows doors in group F, R-3, R-2, S, and U occupancies to swing outward over a step to avoid the blocking of the outward swing from snow or ice. The revised proposal will limit outward swinging doors at a step to the Groups in exception 3, where transient type occupants will be familiar with the doorway conditions where the occupant load is low, and the trip hazard is unlikely.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change is primarily editorial. Certain provisions have been relocated, and interpretive language from the code commentary has been included in the text of the code .

Internal ID: 1784

E5-18

IBC: 1004.4, (IFC[BE] 1004.4)

Proponent: Jeffrey Tubbs, Arup, representing Arup (jeff.tubbs@arup.com)

2018 International Building Code

Revise as follows:

~~1004.4~~**1003.8 Multiple occupancies.** Where a building contains two or more occupancies, the *means of egress* requirements shall apply to each portion of the building based on the occupancy of that space. Where two or more occupancies utilize portions of the same *means of egress* system, those egress components shall meet the more stringent requirements of all occupancies that are served. Where buildings contain accessory occupancies in accordance with Section 508.2, the means of egress requirements shall separately apply to each portion of the building and shall be based on the occupancy of each space.

Reason:

The original code section provides requirements for egress components. However, the requirement was located within the occupant load section. Given the location, it was unclear how this requirement applied to egress components. The code change moves the requirement to the general section to clarify that application. The code change further provides a reasonable allowance for small Accessory occupancies where the risk lower due to low occupant load, or the risk is mitigated through fire separation.

Cost Impact

The code change proposal will decrease the cost of construction .

The code change includes an allowance for accessory occupancies. Therefore, in theory the code change should reduce the cost of construction for some buildings.

Internal ID: 1289

E6-18

IBC: TABLE 1004.5, (IFC[BE] TABLE 1004.5)

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

**TABLE 1004.5
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR ^a
Accessory storage areas, mechanical equipment room	300 gross
Agricultural building	300 gross
Aircraft hangars	500 gross
Airport terminal	20 gross
Baggage claim	300 gross
Baggage handling	100 gross
Concourse Waiting areas	15 gross
Assembly	
Gaming floors (keno, slots, etc.)	11 gross
Exhibit gallery and museum	30 net
<u>Billiard table/game table area</u>	<u>50 gross</u>
Assembly with fixed seats	See Section 1004.6
Assembly without fixed seats	7 net
Concentrated	5 net
(chairs only—not fixed)	15 net
Standing space	
Unconcentrated (tables and chairs)	
Bowling centers, allow 5 persons for each lane including 15 feet of runway, and for additional areas	7 net
Business areas	150 gross
Concentrated business use areas	See Section 1004.8
Courtrooms—other than fixed seating areas	40 net
Day care	35 net
Dormitories	50 gross
Educational	20 net
Classroom area	50 net
Shops and other vocational room areas	
Exercise rooms	50 gross
Group H-5 fabrication and manufacturing areas	200 gross
Industrial areas	100 gross
Institutional areas	240 gross
Inpatient treatment areas	100 gross
Outpatient areas	120 gross
Sleeping areas	
Kitchens, commercial	200 gross
Library	50 net

Mercantile	60 gross
Storage, stock, shipping areas	300 gross
Parking garages	200 gross
Residential	200 gross
Skating rinks, swimming pools	50 gross
Rink and pool	15 gross
Decks	
Stages and platforms	15 net
Warehouses	500 gross

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. Floor area in square feet per occupant.

Reason:

Many occupancies contain uses not classified in Table 1004.5. This proposed change clarifies the design occupant load for an occupancy use commonly seen in proposed projects. Billiards and gaming table rooms, since the tables take up

a large portion of the floor area, it makes sense to use an occupant load factor of 50 gross, similar to exercise rooms instead of the occupant load of 11 gross for gaming floors. Billiards tables, or similar, are used for the game of pool as indicated by the definition.

Definition of Billiard Table:

a table having a slate bed covered with billiard cloth and surrounded by cushioned rails on which billiards is played; also : any similar table provided with six pockets for the playing of pool or English billiards.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The net effect of this change will be to reduce the design occupant load, which will lead to a need for fewer required exits and plumbing facilities. See example below:

3000-SF-Room-(example)¶ Assuming A-2 Occupancy¶	Occ.-Load-1:11-GSF¶	Occ.-Load-1:50-GSF- (proposed)¶
Occupants¶	272¶	60¶
Exits-required¶	2R¶	2R¶
WC's-required¶	4M+-4F¶	2M+-2F¶
Lav's-required¶	2M+-2F¶	1M+-1F¶

Warehouses	500 gross

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. Floor area in square feet per occupant.

Reason:

This code change proposes to add a new addition to Table 1004.5 for business areas to address collaboration rooms/spaces which are now commonly being located in open office space environments in office buildings. Businesses currently operating in predominantly open office environments tend to need more collaboration rooms/spaces for private meetings between staff, both for small personnel meetings and team meetings, etc. Based on our experience, many questions have arisen concerning these types of designs in open office space environments in our Federal buildings regarding how the design team should calculate the occupant loads for these types of proposed space uses. Concerns have also been raised regarding the appropriateness of using the current occupant load factors in the IBC, for these types of rooms/spaces. In addition, there have been different interpretations among A/E firms, fire protection engineer consultants, and AHJs regarding how these specific rooms and spaces identified on drawings are to be utilized by building occupants. The terminology used for these types of rooms and spaces identified on design drawings also has been an issue since this terminology is not referenced or described in any national code or standard. For example, rooms and spaces have been identified on design drawings as huddle rooms, quiet rooms, focus rooms, etc.

Therefore, it is our opinion that Table 1004.5 currently does not adequately address these types of rooms/spaces in open office space environments. To address the concerns and questions, we have proposed alternative occupant load factors for collaboration rooms/spaces. The proposed revision is based on a small field evaluation study of several collaboration rooms having posted occupant loads based on an analysis of the efficiency of use of the space when occupied. That is, having a space with ample room so occupants do not feel cramped and elbow to elbow. It was determined that the occupant load factors for a specific room size corresponding to the posted occupant loads ranged between 28 ft²/person to 32 ft²/person. Therefore, a mean average occupant load factor of 30 ft²/person for collaboration rooms/spaces seemed reasonable and was chosen. In addition, since these collaboration rooms/spaces are used primarily for private meetings between staff, both for small personnel meetings and team meetings, etc. it was felt that the size of these rooms should be limited to address concerns these rooms/spaces will be used as conference rooms. Therefore, based on a review of a number of proposed space layouts having collaboration rooms/spaces, it seemed reasonable to limit the size of these rooms/spaces to less than or equal to 450 ft² in area when using an occupant load factor of 30 ft²/person.

Please remember, these specific rooms/spaces are primarily used by employees to transition temporarily from their regular work-station area in order to obtain privacy and/or to avoid disturbing other employees located in the open office environment. These rooms are not designated as conference rooms and typically are not used for conference rooms and therefore should not be compelled to comply with the more conservative occupant load factors associated with Assembly Use areas. However, currently the IBC does not specifically address an occupant load factor for these types of rooms/spaces. Therefore, some AHJs have classified these rooms/space, regardless of size, as Assembly Use areas and have interpreted that the occupant load factors currently in the IBC require that these rooms/spaces are compelled to use the occupant load factor of 15ft²/person.

Based on our personal experience reviewing space layouts that have incorporated various sized collaboration rooms/spaces and the fact that these rooms/spaces are primarily only used by employees to transition temporarily from their regular work-station area in order to obtain privacy and/or to avoid disturbing other employees located in the open office environment, we believe these rooms/spaces should not be compelled to comply with the more conservative occupant load factors associated with Assembly Use areas since these rooms/spaces are not used as conference rooms.

In summary, we believe the proposed new occupant load factor for business areas collaborative rooms/spaces will not negatively impact the overall safety for building occupants as it relates to the use of the building's means of egress systems during an emergency. In addition, the acknowledgement of collaborative rooms/spaces should also improve design consistency in calculating the occupant loads for these types of work environments as well as providing nationwide consistency among AHJs in the interpretation/enforcement of the appropriate occupant load factor to use for these types of rooms/spaces.

Lastly, please note that the National Fire Protection Association 101, Life Safety Code (2018 edition), has similar requirements to address business use collaboration rooms/spaces.

Bibliography:

National Fire Protection Association (NFPA), 101, Life Safety Code, 2018

Cost Impact

The code change proposal will decrease the cost of construction .

The code change proposed may decrease the cost of construction since collaboration rooms/spaces are primarily only used by employees to transition temporarily from their regular work-station area in order to obtain privacy and/or to avoid disturbing other employees located in the open office environment. Therefore, if these rooms/spaces are compelled to comply with the more conservative occupant load factors associated with Assembly Use areas, the total calculated number of occupants on a floor of the building would increase and may necessitate extra wider exit stairs or additional exit stairs.

E8-18

IBC: 1004.8, (IFC[BE] 1004.8)

Proponent: David Renn, City and County of Denver, representing Code Change Committee of Colorado Chapter of the ICC (david.renn@denvergov.org)

2018 International Building Code

Revise as follows:

1004.8 Concentrated business use areas. The occupant load factor for concentrated business use shall be applied to telephone call centers, trading floors, electronic data processing centers and similar business use areas with a higher density of occupants than would normally be expected in a typical business occupancy environment. ~~Where approved by the building official, the~~ The occupant load for concentrated business use areas shall be the actual ~~occupant load, where approved by the building official,~~ but not less than one occupant per 50 square feet (4.65 m²) of gross occupiable floor space.

Reason:

As currently written, the first sentence states that the occupant load factor for concentrated business use shall be applied to certain uses, and the second sentence defines what this occupant load factor is to be, including a requirement that it be approved by the building official. If the building official doesn't approve the occupant load factor, it is unclear how occupant loads would be calculated since the first sentence requires the use of this occupant load factor and there is no alternative.

This proposal moves "where approved by the building official" so this phrase applies to the actual occupant load, but not also to the minimum occupant load based on one occupant per 50 SF of gross area. This is appropriate since the actual occupant load is subjective and should be approved by the building official, and the minimum occupant load is a calculated minimum that does not need approval by the building official.

Note that this proposal changes the wording back to what was originally proposed for this new 2018 code section (proposal E 9-15). The "where approved by the building official" phrase was moved by the committee, but no reason statement was given for this move. This committee action, as shown in the 2015 Report of Committee Action Hearing, is shown below for reference:

E 9-15

Committee Action:

Approved as Modified

1004.6 Concentrated business use areas. The occupant load factor for concentrated business use shall be applied to telephone call centers, trading floors, electronic data processing centers and similar business use areas with a higher density of occupants than would normally be expected in a typical business occupancy environment. ~~The~~ Where approved by the code official, the occupant load for concentrated business use areas shall be the actual occupant load, ~~where approved by the code official,~~ but not less than one occupant per ~~100~~ 50 square foot gross of occupiable floor space.

Committee Reason: The modification from 100 sq.ft. per occupant to 50 sq.ft. per occupant as a maximum for concentrated business areas is appropriate. The documentation shows that a worst case scenario of 50 sq.ft. per person occurred in these high density spaces.

The supporting data substantiates an increase for the typical office spaces. There were concerns raised about areas where high costs of space would result in a higher density in an office as well as maintain the occupant load during the life of a building as different tenants change.

Assembly Action :

None

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change clarifies the intent of the code.

Internal ID: 1233

E9-18

IBC: 1004.9 (New), (IFC[BE] 1004.9 (New))

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC
(sthomas@coloradocode.net)

2018 International Building Code

Add new text as follows:

1004.9 Occupant load based on capacity. The occupant load of any room, area, space or story is permitted to be established as the number of occupants for which the existing means of egress is adequate, provided that measures are established to prevent occupancy greater than the number and capacity of the means of egress components.

Revise as follows:

~~1004.9~~**1004.10 Posting of occupant load.** Every room or space that is an assembly occupancy shall have the *occupant load* of the room or space posted in a conspicuous place, near the main *exit* or *exit access doorway* from the room or space, for the intended configurations. Posted signs shall be of an approved legible permanent design and shall be maintained by the owner or the owner's authorized agent.

Reason:

There are many times that the calculated occupant load for a room, area, space or story in an existing building exceeds the total number or capacity of the means of egress. This proposal permits the occupant load to be based on the existing design of the means of egress. For example, a story could not have more than 340 occupants if two doors providing 34 inches of clear width each were provided. Some means of controlling the occupant load would need to be determined. The building official could require that the maximum occupant load be posted as an example. A companion change in the IEBC will be submitted if necessary.

Cost Impact

The code change proposal will decrease the cost of construction .

The cost of adding an additional exit will not be needed for some buildings.

Internal ID: 1070

E10-18

IBC: 1005.7.1, (IFC[BE] 1005.7.1)

Proponent: Keith Flanders, Cosentini Associates, representing self (kflanders@cosentini.com)

2018 International Building Code

Revise as follows:

1005.7.1 Doors. Doors, when fully opened, shall not reduce the required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half.

Exceptions:

1. Surface-mounted latch release hardware shall be exempt from inclusion in the 7-inch maximum (178 mm) encroachment where both of the following conditions exist:
 - 1.1. The hardware is mounted to the side of the door facing away from the adjacent wall where the door is in the open position.
 - 1.2. The hardware is mounted not less than 34 inches (865 mm) nor more than 48 inches (1219 mm) above the finished floor.
2. Self- or automatic-closing doors shall be exempt from inclusion in the 7-inch maximum (178 mm) encroachment.
3. The restrictions on door swing shall not apply to doors within individual *dwelling units* and *sleeping units* of Group R-2 occupancies and *dwelling units* of Group R-3 occupancies.

Reason:

Door encroachment when the door is fully open is not an issue when the door is provided with an automatic closer or other self closing mechanism since the door will be closing. Accordingly such doors provided with self closing devices will be closed and should not be required to comply with the 7-inch encroachment provisions for when the door is fully open.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a design option to provide an automatic closing door versus fully complying with the encroachment provisions. Accordingly it does not change the cost of construction.

Internal ID: 1024

E11-18

IBC: 1006.2.1, (IFC[BE] 1006.2.1)

Proponent: Lee Kranz, representing City of Bellevue, WA (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1006.2.1 Egress based on occupant load and common path of egress travel distance. Two *exits* or *exit access doorways* from any space shall be provided where the design *occupant load* or the *common path of egress* travel distance exceeds the values *listed* in Table 1006.2.1. The cumulative *occupant load* from adjacent rooms, areas or spaces shall be determined in accordance with Section 1004.2.

1. The number of *exits* from foyers, lobbies, vestibules or similar spaces need not be based on cumulative *occupant loads* for areas discharging through such spaces, but the capacity of the *exits* from such spaces shall be based on applicable cumulative *occupant loads*.
2. *Care suites* in Group I-2 occupancies complying with Section 407.4.
3. Unoccupied mechanical rooms and penthouses are not required to comply with the common path of egress travel distance measurement.

Reason:

Mechanical rooms and penthouses are typically only occupied during routine maintenance or replacement of equipment. There are designs, particularly in existing buildings, where additional exits (including stairways or ramps) are being required due to the length of the common path of travel from these rooms or spaces which is expensive and unnecessary. This code change reduces the effective length of the common path for specific areas rarely used and when it is used the occupant load is minimal.

Cost Impact

The code change proposal will decrease the cost of construction .

If approved this code change will reduce construction costs because the need to construct additional exits will no longer be required for designs where mechanical rooms or penthouses add to the length of the common path of travel.

Internal ID: 91

E12-18

IBC: 1006.2.1, (IFC[BE] 1006.2.1)

Proponent: Todd Snider, West Coast Code Consultants (WC3), representing Self (Todd@KimballEng.com)

2018 International Building Code

Revise as follows:

1006.2.1 Egress based on occupant load and common path of egress travel distance. Two *exits* or *exit access doorways* from any space shall be provided where the design *occupant load* or the *common path of egress* travel distance exceeds the values *listed* in Table 1006.2.1. The cumulative *occupant load* from adjacent rooms, areas or spaces shall be determined in accordance with Section 1004.2.

Exceptions:

1. The number of *exits* from foyers, lobbies, vestibules or similar spaces need not be based on cumulative *occupant loads* for areas discharging through such spaces, but the capacity of the *exits* from such spaces shall be based on applicable cumulative *occupant loads*.
2. *Care suites* in Group I-2 occupancies complying with Section 407.4.
3. One exit or exit access doorway from any space shall be permitted for spaces located on a story permitted a single exit or access to a single exit in accordance with Section 1006.3.3.

Reason:

Proposed revision to add an exception to this Section to provide clarity between the conflicting requirements of IBC Table 1006.2.1 and Tables 1006.3.3(1) and 1006.3.3(2). There are times when IBC 1006.3.3 would allow a single Exit from a story or building but IBC 1006.2.1 would require access to two exits be provided.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost affect. This is clarifying an existing exception.

Internal ID: 1283

E13-18

IBC: 1006.2.2, (IFC[BE] 1006.2.2)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1006.2.2 Egress based on use. The numbers, types and locations of *exits* or access to *exits* shall be provided in the uses described in Sections 1006.2.2.1 through 1006.2.2.6.

Reason:

The subsections of 1006.2.2 includes not only the number of exits and exit access doorways, but also requirements regarding the exit and exit access doors, types of exit access, and their locations. This provides clarity in the scoping of this section.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is a clarification reminder of the scope of requirements included in the identified sections.

Internal ID: 447

E14-18

IBC: 1006.2.2.1, (IFC[BE] 1006.2.2.1)

Proponent: Lawrence Lincoln, Salt Lake City Corporation, representing Self (larry.lincoln@slcgov.com)

2018 International Building Code

Revise as follows:

1006.2.2.1 Boiler, incinerator and furnace rooms. ~~Two exit access doorways are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46 m²) and any that contain fuel-fired equipment exceeds~~ exceeding 400,000 British thermal units (Btu) (422 000 KJ) input capacity. Where two exit access doorways are required provided, one is permitted to be a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one-half the length of the maximum overall diagonal dimension of the room.

Exception:A single exit access doorway shall be allowed where the boiler, incinerator and furnace rooms are less than 500 square feet (46 m²) and a minimum 48 inch (1219 mm) clear aisle width is provided around the perimeter of the fuel-fired equipment.

Reason:

The elimination of the over 500 square foot requirement in the general statement and placing it into the exception really doesn't change the basic meaning of the section so far as the square footage requirement is concerned. The exception provides for an additional requirement when a single exit access door is utilized in a 500 square foot or less size room. Since IBC section 1020.2 already requires a minimum width of 24 inches 'to access and utilize mechanical,... systems or equipment', the doubling of the 24 inch required access width (to 48 inches) and reducing the exit access doorway requirement to one, seems reasonable. The logic behind doubling the required equipment access width comes from (NFPA 70) NEC article 110.26 (C) (2) (b). This section of the NEC allows for a single exit from an electrical room when the depth of the working space is doubled.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code proposal will not increase or decrease the cost of construction since the exception added is a trade-off.

Internal ID: 1995

E15-18 Part I

PART 1 - IBC: 1006.2.2.2; (IFC[BE] 1006.2.2)

PART 2 - IMC: 1105.10 [BE] (New)

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

THIS IS A TWO PART CODE CHANGE. PART I WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER OF THESE COMMITTEES.

2018 International Building Code

Revise as follows:

1006.2.2.2 Refrigeration machinery rooms. Machinery rooms larger than 1,000 square feet (93 m²) shall have not less than two *exits* or *exit access doorways*. Where two *exit access doorways* are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. *Exit access doorways* shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an *exit* or *exit access doorway*. An increase in *exit access* travel distance is permitted in accordance with Section 1017.1.

Exit and *exit access doorways* shall swing in the direction of egress travel and shall be equipped with panic hardware, regardless of the *occupant load* served. *Exit* and *exit access doorways* shall be tight fitting and self-closing.

Internal ID: 2151

E15-18 Part II

IMC: 1105.10 [BE] (New)

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Mechanical Code

Add new text as follows:

1105.10 [BE] Means of egress. Machinery rooms larger than 1,000 square feet (93 m²) shall have not less than two exits or exit access doorways. Where two exit access doorways are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room. All portions of machinery rooms shall be within 150 feet (45 720 mm) of an exit or exit access doorway. An increase in exit access travel distance is permitted in accordance with Section 1017.1. Exit and exit access doorways shall swing in the direction of egress travel and shall be equipped with panic hardware, regardless of the occupant load served. Exit and exit access doorways shall be tight fitting and self-closing.

Reason:

It is appropriate for refrigeration machinery rooms to have panic hardware on means of egress doors to protect occupants because of the risk of a rapid release of hazardous or asphyxiant gases. The need for rapid escape from refrigeration machinery rooms is not unlike what is needed for Group H Occupancies, which are required by Section 1010.1.10 to have panic hardware on all swinging doors. Likewise, IAR 2 includes this requirement for ammonia refrigeration machinery rooms.

It is also recommended that this section be duplicated in the IMC to ensure that the requirements are not overlooked by machinery room designers. The requirement in the IBC is not readily found as a refrigeration machinery room requirement since it is isolated in the means of egress chapter.

Cost Impact

The code change proposal will increase the cost of construction .

For machinery rooms that would not already have been provided with panic hardware on means of egress doors, the requirement to have panic hardware will constitute an increased cost.

Internal ID: 3396

E16-18

IBC: 1006.2.2.4, (IFC[BE] 1006.2.2.4)

Proponent: Lee Kranz, representing City of Bellevue, WA (lkranz@bellevuewa.gov)

2018 International Building Code

Delete without substitution:

~~**1006.2.2.4 Group I-4 means of egress.** Group I-4 facilities, rooms or spaces where care is provided for more than 10 children that are 2¹/₂ years of age or less, shall have access to not less than two exits or exit access doorways.~~

**TABLE 1006.2.1
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY**

OCCUPANCY	MAXIMUM OCCUPANT LOAD OF SPACE	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)		
		Without Sprinkler System (feet)		With Sprinkler System (feet)
		Occupant Load		
		OL ≤ 30	OL > 30	
A ^c , E, M	49	75	75	75 ^a
B	49	100	75	100 ^a
F	49	75	75	100 ^a
H-1, H-2, H-3	3	NP	NP	25 ^b
H-4, H-5	10	NP	NP	75 ^b
I-1, I-2 ^d , I-4	10	NP	NP	75 ^a
I-3	10	NP	NP	100 ^a
R-1	10	NP	NP	75 ^a
R-2	20	NP	NP	125 ^a
R-3 ^e	20	NP	NP	125 ^{a, g}
R-4 ^e	20	NP	NP	125 ^{a, g}
S ^f	29	100	75	100 ^a
U	49	100	75	75 ^a

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

- Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.2.
- Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.
- For a room or space used for assembly purposes having fixed seating, see Section 1029.8.
- For the travel distance limitations in Group I-2, see Section 407.4.
- The common path of egress travel distance shall only apply in a Group R-3 occupancy located in a mixed occupancy building.
- The length of common path of egress travel distance in a Group S-2 open parking garage shall be not more than 100 feet.
- For the travel distance limitations in Groups R-3 and R-4 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.3, see Section 1006.2.2.6.

Reason:

Section 1006.2.2.4 is redundant with Table 1006.2.1 and should be deleted. The maximum occupant load for a space with one exit or exit access doorway for an I-4 in the table is 10 and covers all I-4 uses so there is no need to keep Section 1006.2.2.4.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change deletes a section of the code already covered by Table 1006.2.1 and will not have a financial impact on the cost of construction.

Internal ID: 148

E17-18

IBC: 1006.2.2.4 (New), (IFC[BE] 1006.2.2.4 (New))

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new text as follows:

1006.2.2.4 Electrical rooms. The location and number of exit or exit access doorways shall be provided for electrical rooms in accordance with Section 110.26 of NFPA 70 for electrical equipment rated 1000V or less, and Section 110.33 of NFPA 70 for electrical equipment rated over 1000V. Panic hardware shall be provided where required in accordance with Section 1010.1.10.1.

Reason:

Section 1006.2.2 provides the specific requirements for the numbers, types, and locations of exits or access to exits for specific uses. Requirements are already provided in Section 1006.2.2.1 for boiler, incinerator and furnace rooms, which is based on the ASME Boiler and Pressure Vessel Code, and Section 1006.2.2.2 for refrigeration machinery rooms, which is based on ASHRAE 15.

The requirements for egress for electrical rooms are not currently addressed in this code, except for where panic or fire exit hardware is used in Section 1010.1.10, which does not provide direction on how many or where the exits or exit access doorways are to be located.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Chapter 27 of the IBC already requires electrical installations to comply with the provisions of NFPA 70. This proposal specifically directs the code user to the applicable requirements for electrical rooms in NFPA 70.

Internal ID: 448

E18-18

IBC: SECTION 1006.3, 1006.3.1, 1019.3 (IFC[BE] 1006.3, 1006.3.1, 1019.3)

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

SECTION 1006 NUMBER OF EXITS AND EXIT ACCESS DOORWAYS

1006.1 General. The number of *exits* or *exit access doorways* required within the *means of egress* system shall comply with the provisions of Section 1006.2 for spaces, including *mezzanines*, and Section 1006.3 for *stories* or occupied roofs.

Revise as follows:

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. ~~Where *stairways* serve more than one *story*, only the *occupant load* of each *story* considered individually shall be used in calculating the required number of *exits* or access to *exits* serving that *story*.~~

Add new text as follows:

1006.3.1 Occupant load. Where stairways serve more than one story, or more than one story and an occupied roof, only the occupant load of each story or occupied roof, considered individually, shall be used in when calculating the required number of exits or access to exits serving that story.

Revise as follows:

~~1006.3.1~~ ~~1006.3.2~~ **Adjacent story. Path of egress travel.** The path of egress travel to an *exit* shall not pass through more than one adjacent *story*.

Exception: The path of egress travel to an *exit* shall be permitted to pass through more than one adjacent *story* in any of the following:

1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and *ramps* connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.
2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.
3. Exit access stairways and ramps within an atrium comply with the provisions of Section 404.
- ~~4.~~ Exit access stairways and *ramps* in open parking garages that serve only the parking garage.
- ~~5.~~ Exit access stairways and *ramps* serving *open-air assembly seating* complying with the exit access travel distance requirements of Section 1029.7.
- ~~6.~~ Exit access stairways and *ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.
7. Exterior exit access stairways and ramps between occupied roofs.

~~1006.3.2~~ **1006.3.3 Egress based on occupant load.** Each *story* and occupied roof shall have the minimum number of separate and distinct *exits*, or access to *exits*, as specified in Table 1006.3.2. A single *exit* or access to a single *exit* shall be permitted in accordance with Section 1006.3.3. The required number of *exits*, or *exit access stairways* or *ramps* providing access to *exits*, from any *story* or occupied roof shall be maintained until arrival at the *exit discharge* or a *public way*.

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions *listed* in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. *Exit access stairways and ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit access stairways and ramps* connecting four stories or less serving and contained within an individual *dwelling unit* or *sleeping unit* or *live/work unit*.
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways and ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway* or *ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways and ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways and ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways and ramps* serving *smoke-protected* or *open-air assembly seating* complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways and ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.
9. Exterior exit access stairways or ramps between occupied roofs.

Reason:

The title of this section includes stories and occupied roof, but the section gives no guidance regarding the occupied roof. This change will clarify the application of the provisions to an occupied roof and another story. As has been the practice, the occupant load of each story or with this change, the occupant load of the roof (which isn't a story) will be used to determine the required occupant load for the stair serving it.

In addition, the two exceptions will recognize an exit access stairway located in an atrium and an exit access stairway serving an occupied roof to pass through more than one story. This change will make it clear that a stair in an atrium that is NOT part of the means of egress is always acceptable and not limited to the one adjacent story criteria.

Cost Impact

The code change proposal will decrease the cost of construction .

This change will simplify design decisions, review and approval of projects, reducing the cost of construction.

Internal ID: 1700

E19-18

IBC: 404.9.3, 1006.3.1, 1017.3, 1023.2, (IFC[BE] 1006.3.1, 1017.3, 1023.2)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

404.9 Exit access travel distance. *Exit access* travel distance for areas open to an *atrium* shall comply with the requirements of this section.

404.9.1 Egress not through the atrium. Where required access to the *exits* is not through the *atrium*, *exit access* travel distance shall comply with Section 1017.

404.9.2 Exit access travel distance at the level of exit discharge. Where the path of egress travel is through an *atrium* space, *exit access* travel distance at the *level of exit discharge* shall be determined in accordance with Section 1017.

Revise as follows:

404.9.3 Exit access travel distance at other than the level of exit discharge. Where the path of egress travel is not at the *level of exit discharge* from the *atrium*, that portion of the total permitted *exit access* travel distance that occurs within the *atrium* shall be not greater than 200 feet (60 960 mm). Exit access travel distance shall be measured in accordance with Sections 1006.3.1 and 1017.3.

404.10 Interior exit stairways. Not greater than 50 percent of *interior exit stairways* are permitted to egress through an atrium on the *level of exit discharge* in accordance with Section 1028.

CHAPTER 10 MEANS OF EGRESS

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. Where *stairways* serve more than one *story*, only the *occupant load* of each *story* considered individually shall be used in calculating the required number of *exits* or access to *exits* serving that *story*.

1006.3.1 Adjacent story. The path of egress travel to an *exit* shall not pass through more than one adjacent *story*.

Exception: The path of egress travel to an *exit* shall be permitted to pass through more than one adjacent *story* in any of the following:

1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and *ramps* connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.
2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.
3. Exit access stairways and ramps within an atrium complying with the provisions of Section 404.
4. Exit access stairways and *ramps* in open parking garages that serve only the parking garage.
- 5.4 Exit access stairways and *ramps* serving *open-air assembly seating* complying with the exit access travel distance requirements of Section 1029.7.
- 6.5 Exit access stairways and *ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.

1017.3 Measurement. *Exit access* travel distance shall be measured from the most remote point of each room, area or space along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit.

Exceptions:

1. Within atriums, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.
2. In open parking garages, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.

1017.3.1 Exit access stairways and ramps. Travel distance on *exit access stairways* or *ramps* shall be included in the *exit access* travel distance measurement. The measurement along *stairways* shall be made on a plane parallel and tangent to the *stair tread nosings* in the center of the *stair* and landings. The measurement along *ramps* shall be made on the walking surface in the center of the *ramp* and landings.

1023.2 Construction. Enclosures for interior *exit stairways* and *ramps* shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. *Interior exit stairway* and *ramp* enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior *exit stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. *Interior exit stairways* and *ramps* shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions:

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. ~~*Interior exit stairways* within an atrium enclosed in accordance with Section 404.6.~~

Reason:

The membership approved E139-12 (AS) which added the allowance for a stairway within an atrium to be considered an exit stairway into Section 1023.2. There is confusion where an atrium is called an exit stairway – how to measure travel distance, what could be in the atrium, if you could travel through an atrium to get to an exit stairway. Section 1019.3 states that open stairways in atriums is an ‘exit access stairway’, so the same stairway is currently called two different things in the code.

The intent of this proposal is to call the open stairway in the atrium an exit access stairway to be consistent with the terminology in Section 1019.3, Item 3.

The revision to Section 404.8.3 is a pointer for where exit access travel distance within an atrium includes travel down an exit access stairway. The revision to Sections 1006.3.1 and 1017.3 are to measure exit access travel distance in a manner that would be consistent with the using the open stairway as a required means of egress off a story consistent with if this stairway was an exit off the floor. The smoke protection provisions for atrium in Section 404 would have to be in place to be able to use this allowance as a required means of egress.

The BCAC also has a proposal to reformat the atrium requirements. If both changes pass, there will be no conflicts. The references to the location of requirements can be correlated.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is effectively codifying the intent to allow the use of open stairways within an atrium “as if” they are in an exit enclosure due to the enhanced safety that exists within an atrium that complies with all the requirements of IBC Section 404, without applying all the other limitations that exist for an exit enclosure elsewhere in the code.

Internal ID: 452

E20-18

IBC: 1006.3.1, (IFC[BE] 1006.3.1)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. Where *stairways* serve more than one *story*, only the *occupant load* of each *story* considered individually shall be used in calculating the required number of *exits* or access to *exits* serving that *story*.

Delete without substitution:

~~**1006.3.1 Adjacent story.** The path of egress travel to an *exit* shall not pass through more than one adjacent *story*.~~

~~**Exception:** The path of egress travel to an *exit* shall be permitted to pass through more than one adjacent *story* in any of the following:~~

- ~~1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and *ramps* connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.~~
- ~~2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.~~
- ~~3. Exit access stairways and *ramps* in open parking garages that serve only the parking garage.~~
- ~~4. Exit access stairways and *ramps* serving open air assembly seating complying with the exit access travel distance requirements of Section 1029.7.~~
- ~~5. Exit access stairways and *ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.~~

Reason:

The current list of exceptions allows for exit access stairways within 5 of the 8 options to use travel distance without a story limitation (individual dwelling units(#2), Group R-3 and R-4 congregate residences(#3), open parking garages(#6), open air seating(#7) and balconies(#8)). The 3 options currently limited to one story are the 2 story configuration (#1), water curtains around stairways opening (#4) and atriums (#5). These exceptions were added to the code by E27-15.

Travel distance, rather than stories should be the controlling factor. There would be no impact on two story configurations. Deletion of the requirement would allow for exit access travel distance to be measured down the open exit access stairway, regardless of the number of stories. This would now include open exit access stairways that use water curtains around stairways opening (#4) and atriums with smoke protection (#5). With the removal of the limitation for one story, none of the exceptions are needed.

This would be consistent with the BCAC proposal to revise measurement for travel distance along open exit access stairways in atriums.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will decrease the cost of construction .

This will reduce the cost in those situations where an enclosure would have been required for the stairway in buildings with more than two stories.

Internal ID: 526

E21-18

IBC: 1006.3.1, (IFC[BE] 1006.3.1)

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com); Douglas Evans, representing DHE FPE LLC (dhefpe@gmail.com)

2018 International Building Code

Delete and substitute as follows:

~~**1006.3.1 Adjacent story.** The path of egress travel to an exit shall not pass through more than one adjacent story.~~

~~**Exception:** The path of egress travel to an exit shall be permitted to pass through more than one adjacent story in any of the following:~~

- ~~1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.~~
- ~~2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.~~
- ~~3. Exit access stairways and ramps in open parking garages that serve only the parking garage.~~
- ~~4. Exit access stairways and ramps serving open air assembly seating complying with the exit access travel distance requirements of Section 1029.7.~~
- ~~5. Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.~~

1006.3.1 Access to exits at other levels. In other than Group I-2 and I-3 occupancies, access to exits at other building levels utilizing unenclosed exit access stairways and ramps shall be permitted. Such exit access stairways and ramps shall comply with one or more of the conditions listed in Section 1019.3. Regardless of the number of stories permitted to be served by the unenclosed exit access stairway or ramp, the exit access travel distance to the entrance to an exit shall not exceed the limitations set forth in Section 1017.2.

Reason:

This was the original intent of the ICC Code Technology Committee proposal E5-09/10 that was approved for the 2015 edition of the IBC. The logic was to allow the long established vertical opening exceptions to stand on their own merit.

If these specific conditions have been deemed to provide acceptable fire migration limits, it stands to reason that exit access travel distance may occur within those tenable environments.

However, a separate proposal overlaid the E5 provisions in Section 1006.3 by limiting path of egress travel to an exit only from an adjacent level. This effectively rendered the CTC methodology as moot.

Realizing that the single adjacent story provision was overly restrictive and did not recognize former exit access provisions, five exceptions to the adjacent story requirement were created for the 2018 edition based on the conditions contained in Section 1019.3. Inexplicably, only five of the eight conditions were referenced.

This proposal completes the correction by eliminating the base restriction and the five accompanying exceptions. In doing so, it returns to the original CTC methodology and recognizes all empirical Section 1019.3 fire migration scenarios that have been contained in the IBC and legacy codes for decades. Additionally, it describes the procedure for determining how to access exits at other stories by way of exit access stairways or ramps. Approval of this proposal will allow for the more flexible design of the exit access portion of the means of egress system and achieve more consistent interpretations of the provision.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal will allow for access to exits by unenclosed exit access stairways in atriums and buildings with specifically protected vertical openings

Staff Note: Section 1006.3.1 was added to the 2018 IBC by code proposal E27-15.

E22-18

IBC: SECTION TABLE 1006.3.2, TABLE 1006.3.3(1), TABLE 1006.3.3(2), (IFC[BE] TABLE 1006.3.2, TABLE 1006.3.3(1), TABLE 1006.3.3(2))

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

SECTION 1006 NUMBER OF EXITS AND EXIT ACCESS DOORWAYS

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. Where *stairways* serve more than one *story*, only the *occupant load* of each *story* considered individually shall be used in calculating the required number of *exits* or access to *exits* serving that *story*.

1006.3.2 Egress based on occupant load. Each *story* and occupied roof shall have the minimum number of separate and distinct *exits*, or access to *exits*, as specified in Table 1006.3.2. A single *exit* or access to a single *exit* shall be permitted in accordance with Section 1006.3.3. The required number of *exits*, or *exit access stairways* or *ramps* providing access to *exits*, from any *story* or occupied roof shall be maintained until arrival at the *exit discharge* or a *public way*.

**TABLE 1006.3.2
MINIMUM NUMBER OF EXITS OR ACCESS TO EXITS PER STORY OR OCCUPIED ROOF**

OCCUPIED LOAD PER STORY	MINIMUM NUMBER OF EXITS OR ACCESS TO EXITS FROM PER STORY OR OCCUPIED ROOF
1-500	2
501-1,000	3
More than 1,000	4

1006.3.3 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or occupied roof where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and common path of egress travel distance do not exceed the values in Table 1006.3.3(1) or 1006.3.3(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
 - 5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
 - 5.2. Either the *exit* from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved independent exits*.

**TABLE 1006.3.3(1)
STORIES AND OCCUPIED ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES**

<u>STORY AND OCCUPIED ROOF</u>	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane	R-2 ^{a, b}	4 dwelling units	125 feet
<u>Occupied roof over the first, second or third story above grade plane</u>	R-2 ^{a, b}	NA	<u>125 feet</u>
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 3048 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. This table is used for R-2 occupancies consisting of *dwelling units*. For R-2 occupancies consisting of *sleeping units*, use Table 1006.3.3(2).

TABLE 1006.3.3(2)
STORIES AND OCCUPIED ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

<u>STORY AND OCCUPIED ROOF</u>	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIED ROOF	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)
First story above or below grade plane and <u>occupied roofs over the first story above grade plane</u>	A, B ^b , E F ^b , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2 ^{a, c}	10	75
	S ^{b, d}	29	75
Second story above grade plane and <u>occupied roof over the second story above grade plane</u>	B, F, M, S ^d	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or on the roof of such buildings shall have a maximum *exit access* travel distance of 100 feet.
- c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.3(1).
- d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

Reason:

This is part of a series of 3 proposals dealing with occupied roofs. See BCAC proposals to the definition of penthouse and Section 1009.

The change to the title and heading in Table 1006.3.2 is for consistency with the text.

The proposed modifications to Section 1006 includes adding 'occupied roofs' to Table 1006.3.3(1) to clarify the conditions in which one exit or access to one exit is allowed for Group R-2 occupancies. The tables are modified to clarify that the occupied roofs are allowed 'over the allowable stories.'

Similarly this proposal adds 'occupied roofs' to Table 1006.3.3(2) to clarify the conditions in which one exit or access to one exit is allowed for the other occupancies. The table was also modified to clarify that the occupied roofs are allowed 'over the allowable stories.' A proposed modification to footnote b of the table clarifies that the allowable increase in exit access travel distance from 75 feet to 100 feet for properly sprinklered Group B, F and S occupancies also includes the roof area for these uses.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal provides clarification to a subject that was not previously addressed. The changes to the single occupant tables could allow for one exit stairway from an occupied roof instead of two.

Internal ID: 520

E23-18

IBC: 1006.3.3, (IFC[BE] 1006.3.3)

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

1006.3.3 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or occupied roof where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and common path of egress travel distance within the portion of the building served by the single exit do not exceed the values in Table 1006.3.3(1) or 1006.3.3(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
 - 5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
 - 5.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved independent exits*.

Reason:

This change allows single exits to serve multiple and separate, egress-independent portions of the same building, as long as the single exit conditions per Table 1006.3.3(1) or 1006.3.3(2) are met within that portion.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal allows for more flexibility in the configuration of the exits and exit access within the building, and will not increase the cost of construction.

Internal ID: 1688

IBC: 1006.3.3, TABLE 1006.3.3(1), TABLE 1006.3.3(2), (IFC[BE] 1006.3.3, TABLE 1006.3.3(1), TABLE 1006.3.3(2))

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1006.3.3 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or occupied roof where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and ~~common path of egress~~ exit access travel distance do not exceed the values in Table 1006.3.3(1) or 1006.3.3(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
 - 5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
 - 5.2. Either the *exit* from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved independent exits*.

**TABLE 1006.3.3(1)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES**

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM COMMON PATH OF EGRESS <u>EXIT ACCESS</u> TRAVEL DISTANCE
Basement, first, second or third story above grade plane	R-2 ^{a, b}	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 3048 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. This table is used for R-2 occupancies consisting of *dwelling units*. For R-2 occupancies consisting of *sleeping units*, use Table 1006.3.3(2).

**TABLE 1006.3.3(2)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES**

STORY	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY	MAXIMUM COMMON PATH OF EGRESS EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane	A, B ^b , E F ^b , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2 ^{a, c}	10	75
	S ^{b, d}	29	75
Second story above grade plane	B, F, M, S ^d	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall have a maximum *exit access* travel distance of 100 feet.
- c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.3(1).
- d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

Reason:

There is a conflict in terminology used for single exit criteria for stories/buildings in the IBC Section/Tables 1006.3.3 and IEBC Section/Tables 805.3.1.1. The intent of this proposal is a clarification, without technical revisions.

Below is the definition for common path of egress travel and exit access and a graphic from the IBC commentary illustrating the terms. Single exit stories/buildings cannot have a common path of egress travel since two exits are not required. The correct term is "exit access travel distance". This would match the terminology in the column headings for single exit tables with the footnotes for the single exit tables in the IBC and the table heading and footnotes in the IEBC.

If you look at the history for the single exit tables, until the reorganization that combined single exit spaces and stories, the term used was 'exit access travel distance.'

With the text incorrectly used in IBC Section 1006.3.3, it could be interpreted that the travel distance has to be to a place where there are two exits - which is on the ground floor - regardless if the stairway is an exit access or exit stairway. Exit access travel distance should stop at the door to the exit stairway.

COMMON PATH OF EGRESS TRAVEL. That portion of the exit access travel distance measured from the most remote point within a story to that point where the occupants have separate access to two exits or exit access doorways.

EXIT ACCESS. That portion of a means of egress system that leads from any occupied portion of a building or structure to an exit.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions

thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

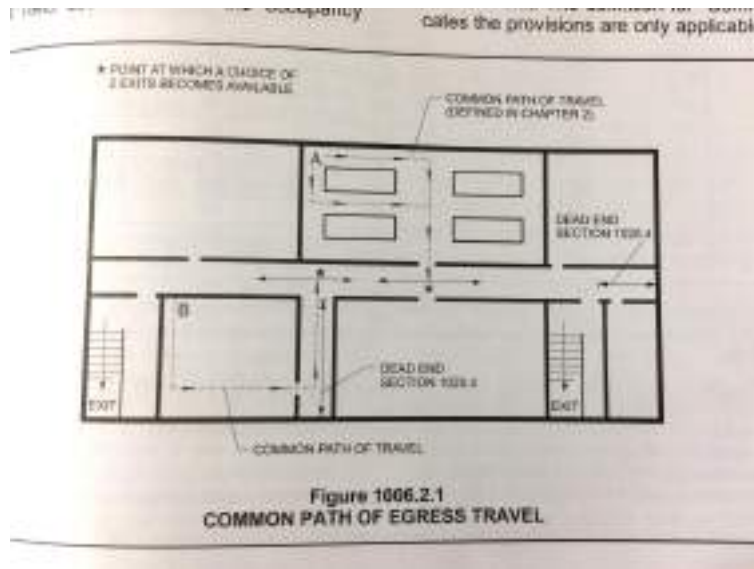

Figure 1006.2.1 from IBC Commentary

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

As the proposal essentially provides clarification to a subject that has created confusion.

Internal ID: 453

E25-18

IBC: 708.1, 708.4.1, 1007.1.1 (IFC[BE] 1007.1.1)

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1007.1.1 Two exits or exit access doorways. Where two *exits, exit access doorways, exit access stairways or ramps*, or any combination thereof, are required from any portion of the *exit access*, they shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between them. Interlocking or *scissor stairways* shall be counted as one *exit stairway*.

Exceptions:

1. Where interior *exit stairways* or *ramps* are interconnected by a 1-hour fire-resistance-rated *corridor* conforming to the requirements of Section 1020, the required exit separation shall be measured along the shortest direct line of travel within the corridor.
2. Where a building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance shall be not less than one-third of the length of the maximum overall diagonal dimension of the area served.
3. Group B tenant spaces required to have two means of egress are not required to comply with the dispersion requirements for those means of egress where all of the following are met:
 - 3.1. Interior The tenant space is separated into two areas by fire partitions complying with Section 708 with a minimum fire-resistance-rating of 1/2 hour.
 - 3.2. Each such separated area shall comply with Section 1006.2.1 as a space with one means of egress.
 - 3.2. Each such separated area shall have means of egress independent of any adjoining separated area.

708.1 General. The following wall assemblies shall comply with this section.

1. Separation walls as required by Section 420.2 for Group I-1 and Group R occupancies.
2. Walls separating tenant spaces in *covered and open mall buildings* as required by Section 404.4.2.1.
3. Corridor walls as required by Section 1020.1.
4. Enclosed elevator lobby separation as required by Section 3006.2.
5. Egress balconies as required by Section 1021.2.
6. Walls separating Group B tenant spaces as required by Section 1007.1.1.

708.4.1 Supporting construction. The supporting construction for a *fire partition* shall have a *fire-resistance rating* that is equal to or greater than the required fire-resistance rating of the supported *fire partition*.

Exception: In buildings of Types IIB, IIIB and VB construction, the supporting construction requirement shall not apply to fire partitions separating tenant spaces in covered and open mall buildings, fire partitions separating Group B tenant spaces, fire partitions separating dwelling units, fire partitions separating sleeping units and fire partitions serving as corridor walls.

Reason:

When an office space is located near the end of a corridor in an existing building and two means of egress are required from the tenant space, exit separation within the tenant space may be difficult or impossible to achieve. To mitigate this situation this proposal provides an exception to effectively separate one office tenant space into two (or more) thereby eliminating the need for separation between the two required exits or exit accesses. Some building officials may accept a solution like this using an alternative materials, design and methods of construction process but wouldn't it be better to have it in the code so there is a consistent application? This scenerio occurs on a regular basis in my jurisdiction so a policy was developed consistent with this proposal. We have been using this solution for many

years and it has saved many hours of debate as to how this problem should be solved.

Cost Impact

The code change proposal will decrease the cost of construction .

The cost of construction will be reduced because the need to install a new exit when the existing exit spread is too narrow will be reduced. There may be some additional costs associated with installation of a new fire partition that may not have been planned for in the design.

Internal ID: 149

E26-18

IBC: 1008.2, (IFC[BE] 1008.2)

Proponent: Lee Kranz, representing City of Bellevue, WA (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1008.2 Illumination required. The *means of egress* serving a room or space shall ~~be~~ have the capability of being illuminated at all times that the room or space is occupied.

Exceptions:

1. Occupancies in Group U.
2. *Aisle accessways* in Group A.
3. *Dwelling units* and *sleeping units* in Groups R-1, R-2 and R-3.
4. *Sleeping units* of Group I occupancies.

Reason:

The building code is premised on the concept that all of its provisions are enforceable but Section 1008.2 is not. There are times (like after hours or on the weekend) when there may be someone in the building but they don't want the lights on. Another example is processes that require that the lights are off such as film processing in a darkroom. Technically it's a code violation to be in a room or space with the lights off. The proposed language more accurately reflects the role of the code to require the option for occupants to illuminate the MOE.

Cost Impact

The code change proposal will decrease the cost of construction .

This code change will have minimal affect on the cost of construction but it may actually reduce costs after the building is completed. It simply changes the requirement to have the lights on at all times the building is occupied to say that occupants must have the option to turn on the lights. Maybe the electric bill will go down as a result.

Internal ID: 173

E27-18

IBC: 1008.2.1, (IFC[BE] 1008.2.1)

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Building Code

Revise as follows:

1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along exit access stairways, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles at the walking surface when the stairway is in use.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

Reason:

The Illuminating Engineering Society (IES) provide recommendations for the foot candle levels to ensure adequate illumination and safety for occupants in common areas to assist in achieving appropriate light levels with the greatest energy efficiency dependent on the occupancy and the level of detailed work. The recommended range for general circulation for average maintained foot candles is 10-30 foot candles. The intent of this provision is to provide the minimum recommended lighting on stairways so that the walking surface is visible. Persons with low vision, or those who are elderly may benefit from higher levels, but that is left for a best design practice. By saying "when the stairway is in use", the intent is to allow for light switches at each floor level landing or motion sensors. It is not intended for the stairway to be illuminated to this level at all times the building is occupied. By saying "exit access and exit stairways" this is not intended to apply to steps in the exit discharge. By placing the requirement here, the intent is to continue to allow the exception for theaters during performances.

Cost Impact

The code change proposal will increase the cost of construction .

Costs, however, will be minimal. NFPA 1 and 101 already require new stairs to have 10 foot-candles min. of illumination on the walking surface when the stairs are in use. Chapter 10 already requires exit access stairways, exit stairways, and their landings to provide 1 foot candle. Energy costs are minimal because the lighting need only be active when the space is in use and automatic dimmers are permitted allowing daylighting to supplement artificial lighting.

Internal ID: 539

E28-18

IBC: 412.7.3, 1008.3.1, 1008.3.2, 1010.1.4.5 (IFC[BE] 1008.3.1, 1008.3.2, 1010.1.4.5)

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com)

2018 International Building Code

412.7.3 Means of egress. The *means of egress* from *heliports* and *helistops* shall comply with the provisions of Chapter 10. Landing areas located on buildings or structures shall have two or more ~~*means of egress, exits or access to exits.*~~ For landing areas less than 60 feet (18 288 mm) in length or less than 2,000 square feet (186 m²) in area, the second *means of egress* is permitted to be a fire escape, *alternating tread device* or ladder leading to the floor below.

Revise as follows:

1008.3.1 General. In the event of power supply failure in rooms and spaces that require two or more ~~*means of egress, exits or access to exits,*~~ an emergency electrical system shall automatically illuminate all of the following areas:

1. *Aisles.*
2. *Corridors.*
3. *Exit access stairways and ramps.*

1008.3.2 Buildings. In the event of power supply failure in buildings that require two or more ~~*means of egress, exits or access to exits,*~~ an emergency electrical system shall automatically illuminate all of the following areas:

1. *Interior exit access stairways and ramps.*
2. *Interior and exterior exit stairways and ramps.*
3. *Exit passageways.*
4. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.1.
5. Exterior landings as required by Section 1010.1.6 for *exit doorways* that lead directly to the *exit discharge*.

1010.1.4.5 Security grilles. In Groups B, F, M and S, horizontal sliding or vertical security grilles are permitted at the main exit and shall be openable from the inside without the use of a key or special knowledge or effort during periods that the space is occupied. The grilles shall remain secured in the full-open position during the period of occupancy by the general public. Where two or more ~~*means of egress, exits or access to exits*~~ are required, not more than one-half of the *exits* or *exit access doorways* shall be equipped with horizontal sliding or vertical security grilles.

Reason:

The International Building Code does not require multiple means of egress. Occasionally, a given building may be served by two or more means of egress systems, but that is the building designer's option, not a code requirement.

This is residual legacy language that has been updated in most Chapter 10 provisions. Emergency electrical system means of egress illumination should be required when two or more exits or access to exits is required. This proposal should be regarded as editorial.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is editorial in nature.

Internal ID: 1611

E29-18

IBC: 1009.2.1, (IFC[BE] 1009.2.1)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1009.2.1 Elevators required. In buildings where a required *accessible* floor is four or more stories above or below a *level of exit discharge*, not less than one required *accessible means of egress* shall be an elevator complying with Section 1009.4. For purposes of determining where an elevator is required for accessible means of egress, in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, an occupied roof shall not be considered a story.

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *ramp* conforming to the provisions of Section 1012.

Reason:

This is part of a series of 3 proposals dealing with occupied roofs. See BCAC proposals to the definition of penthouse and Section 1006.

This is NOT for when an accessible route is required to an occupied roof. That is already addressed in Section 1104.4. This is ONLY for when an elevator would be required to serve as part of an accessible means of egress, and thus add a requirement for standby power. This allowance would only be applicable where there was an occupied roof on a 4 story building. If there is an occupied roof on any taller buildings, unless those buildings meet one of the other exceptions for ramps or horizontal exits, standby power would be required to all floors, including the occupied roof. The roof is required to be open to the outside, so there is not the accumulation for smoke that would be found on a typical interior floor – so that offers extra passive protection of occupants on the roof. Therefore, there did not seem to be any justification to require standby power for this limited situation. The stairways would still be required to comply with Section 1009 for accessible means of egress from the roof.

This proposal reinforces the concept that an occupied roof is not a story for the purpose of determining that an elevator is required as an accessible means of egress in properly sprinklered buildings.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This clarifies that standby power is not required for an elevator serving an occupied roof on a 4 story building. Without this clarification, if standby power was required, that would be a significant cost increase.

Internal ID: 522

E30-18

IBC: 1009.2.1, (IFC[BE] 1009.2.1)

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

1009.2.1 Elevators required. In buildings where a required *accessible* floor or occupied roof is four or more stories above or below a *level of exit discharge*, not less than one required *accessible means of egress* shall be an elevator complying with Section 1009.4.

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *ramp* conforming to the provisions of Section 1012.

Reason:

The code recognizes that there are practical limits to complete reliance on assisted evacuation of building occupants by fire personnel because of the limited availability of trained personnel or special devices. As a result, current ICC language requires an elevator be part of the accessible means of egress starting with the 4th story above the level of exit discharge (See 1009.2.1). Occupied roofs at the same level do not currently have this same requirement. The vertical travel distance encountered by a fire fighter performing an assisted rescue is the same whether the occupants are on an occupied roof on the 4th floor above the level of exit discharge or whether they are on the floor of the 4th story above the level of exit discharge within the building. As occupied roofs become more popular this becomes more of an issue for building departments around the country.

Occupied roofs at four or more stories above the level of exit discharge should be treated like occupied floors at the same level in the building. The occupant loads and hazards are similar between occupied roofs and occupied floors, the benefits to occupants and fire personnel from an elevator with emergency back-up power are similar, and a similar approach has been taken in other sections of the building code (see IBC Chapter 10 1006.3, 1006.3.2, and 1006.3.3). The 2018 IBC 1104.4 also requires at least one accessible route to each accessible story, mezzanine and occupied roof in multilevel buildings and facilities. If the requirements for an accessible route to the accessible level treat the occupied roof and accessible floor in the same manner, it is logical to conclude that the same level of protection for the accessible means of egress from an occupied roof should be required.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies the current intent of the accessible means of egress provisions of IBC 1009.2.1. The added language clarifies that an area of refuge and emergency power/legally required standby power must be provided per IBC 1009.4 for an occupied roof that is four or more stories above the level of exit discharge.

No fiscal impact.

Internal ID: 1690

E31-18

IBC: 1009.2.2 (New), (IFC[BE] 1009.2.2 (New))

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Building Code

Add new text as follows:

1009.2.2 Separation of means of egress. Where more than one accessible means of egress is required, the entrance to at least two of the exits, stairways or elevators serving as part of the accessible means of egress shall be separated by a distance not less than 30 feet (9144 mm).

Reason:

Because the elevator can serve as a component of the accessible means of egress, a standard core design with stairways at the opposite sides of the core and elevators in the middle will not allow a traditional remoteness application for the accessible means of egress. However, some separation should be required so that the possibility of a single event preventing egress is limited. The language is similar to that in Section 403.5.1 for remoteness of interior exit stairways in high rise buildings. In the case where multiple accessible means of egress are provided, the separation would apply to at least two of them.

Cost Impact

The code change proposal will increase the cost of construction .

The possibility exists that some building configurations will need to be revised to accomodate this remoteness. In reality, it is unlikely that any measureable increase will exist for most buildings.

Internal ID: 1228

E32-18

IBC: 1009.4, 1009.4.3 (New), (IFC[BE] 1009.4, 1009.4.3)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Building Code

Revise as follows:

1009.4 Elevators. In order to be considered part of an *accessible means of egress*, an elevator shall comply with Sections 1009.4.1 and ~~1009.4.2 through 1009.4.3.~~

Add new text as follows:

1009.4.3 Location. Where multiple elevators serve as more than one of the accessible means of egress, the elevators serving as different accessible means of egress must be provided with separate operating systems in accordance with Section 3003 and be located in separate elevator banks.

Reason:

The provisions for elevators as accessible means of egress were written assuming only one group of elevators in a building. The second means of egress would always be a stairway. Literally, there is no limitation of how many elevators can be used to fulfil the requirement in Section 1009.1 for multiple accessible means of egress. It is reasonable to require some separation between elevators if the option selected is to use elevators for all the accessible means of egress. These elevators should not be in the same bank of elevators, but somewhere else in the building. This is a viable option in large building with banks of elevator spaced throughout the building.

Cost Impact

The code change proposal will increase the cost of construction .

In the rare situation where multiple elevators are used, the increased cost would be that for the separation between hoistways.

Internal ID: 1235

E33-18

IBC:1009.6.2, (IFC[BE] 1009.6.2)

Proponent: Eirene Knott, BRR Architecture, representing Metropolitan Kansas City Chapter of the ICC (Eirene.Knott@brrarch.com)

2018 International Building Code

Revise as follows:

1009.6.2 Stairway or elevator access. Every required *area of refuge* shall have direct access to a *stairway* complying with Sections 1009.3 and 1023 or an elevator complying with Section 1009.4.

Exception:An interior area of refuge at the level of exit discharge that provides direct access to an exterior exit door.

Reason:

While the code provides clear direction that areas of refuge in a multi story building must have direct access to an elevator or stairway, it is not clear on what qualifies as an interior area of refuge in a single story building. The purpose of this code change is to provide clear direction in the code that an interior area of refuge is permitted in a single story building, or in a multi-story building on the level of exit discharge, without a stairway or elevator which provides immediate access to the exterior of the building.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

If the code will now allow for an interior area of refuge in a single story building or on the level of exit discharge in a multi-story building, rather than require an exterior area of refuge in either situation, this may actually reduce the cost of construction as the exterior wall would no longer need to have a fire resistance rating.

Internal ID: 115

E34-18

IBC: 1009.6.3 (IFC[BE] 1009.6.3), 1109.2.1.6, 3008.6.4, Chapter 35

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Building Code

Revise as follows:

1009.6.3 Size. Each *area of refuge* shall be sized to accommodate one *wheelchair space* of 30 inches by ~~48~~52 inches (762 mm by ~~1219~~1320 mm) for each 200 occupants or portion thereof, based on the *occupant load* of the *area of refuge* and areas served by the *area of refuge*. Such *wheelchair spaces* shall not reduce the *means of egress* minimum width or required capacity. Access to any of the required *wheelchair spaces* in an *area of refuge* shall not be obstructed by more than one adjoining *wheelchair space*.

Delete without substitution:

~~**1109.2.1.6 Clear floor space.** Where doors swing into a family or assisted use toilet or bathing room, a clear floor space not less than 30 inches by 48 inches (762 mm by 1219 mm) shall be provided, within the room, beyond the area of the door swing.~~

Revise as follows:

3008.6.4 Lobby size. Each occupant evacuation elevator lobby shall have minimum floor area as follows:

1. The occupant evacuation elevator lobby floor area shall accommodate, at 3 square feet (0.28 m²) per person, not less than 25 percent of the *occupant load* of the floor area served by the lobby.
2. The occupant evacuation elevator lobby floor area shall accommodate one *wheelchair space* of 30 inches by ~~48~~52 inches (760 mm by ~~1220~~1320 mm) for each 50 persons, or portion thereof, of the *occupant load* of the floor area served by the lobby.

Exception: The size of lobbies serving multiple banks of elevators shall have the minimum floor area *approved* on an individual basis and shall be consistent with the building's fire safety and evacuation plan.

Update standard(s) as follows:

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001

US

ICC A117.1-092017:

Accessible and Usable Buildings and Facilities

Reason:

The 2017 ICC A117.1 has revised the clear floor space from 30" by 48" to 30" by 52" for new construction. This new clear floor space size is based on a new study on anthropometrics which includes persons using wheelchairs, motorized wheelchairs and scooters. This proposal includes an increase in size for areas of refuge (including areas of refuge on stairway landings), exterior areas of assisted rescue, and lobbies in occupant evacuation elevators. Section 1109.2.1.6 for family assisted use bathrooms is proposed to be deleted as this requirement is addressed in Section 603 of ICC A117.1.

Cost Impact

The code change proposal will increase the cost of construction .

This is a general statement and may not be true for all cases. Standard details for an area of refuge, occupant evacuation elevator lobby or bus shelter may need to be modified to meet these new requirements, unless they have more floor space than required for the current (smaller) wheelchair spaces. With nearly unlimited possibilities of design options, the exact cost of this change are very difficult to calculate.

Analysis: The 2009 edition of the ICC A117.1 standard is referenced in Chapter 35.

Internal ID: 535

E35-18

IBC: 1009.8.1, (IFC[BE] 1009.8.1)

Proponent: Michael Tomaselli, Anne Arundel County, representing Anne Arundel County (iptoma88@aacounty.org)

2018 International Building Code

Revise as follows:

1009.8.1 System requirements. The two-way communication system shall be designed and installed as an area of rescue assistance emergency communication system in accordance with NFPA 72. Two-way communication systems shall provide communication between each required location and the *fire command center* or a central control point location *approved* by the fire department. Where the central control point is not a *constantly attended location*, a two-way communication system shall have a timed automatic telephone dial-out capability to a monitoring location or 9-1-1. The two-way communication system shall include both audible and visible signals.

Reason:

The IBC (2015 Ed.) - Paragraph 1009.8 requires that a two-way communication be installed at the landing serving each elevator or bank of elevators on an accessible floor that is one or more stories above or below the level of exit discharge. This system is vital for the accessible occupants of a building to communicate their need to be rescued in an emergency situation to the appropriate personnel. Currently, as the IBC states this system is not required to be monitored for integrity or maintain a level of fire resistance. There is no way to ensure that this system is operational if, and when, it is needed unless the system is used at a non-required point in time and found to be in nonworking condition. Also, without a level of fire resistive protection provided the cabling used to maintain working operation is susceptible to fire damage on a given floor.

By requiring this system be designed and installed as an area of rescue assistance emergency communication system in accordance with the 2016 Edition of NFPA 72 the system's pathways will be monitored for integrity and the necessary level of fire protection would be required accordingly. With an open fault on the pathway this system would now be provided either a redundant path or, the trouble would be annunciated at the fire alarm control unit. The system would also be provided with a two-hour fire-rated method of protection where the building it was installed within consisted of two-hour fire-rated construction. Both of these features work to ensure the system is operational when needed. It is not only important to provide a two-communication system for the accessible occupants within a building but it is equally as crucial to ensure that this system provide the service it is was intended for during an emergency event.

Bibliography:

[International Building Code] [2015 Edition] [International Code Council] [2014] [259-260]
[<https://codes.iccsafe.org/public/document/toc/542/>]

[National Fire Alarm and Signaling Code] [NFPA 72, 2016 Edition] [National Fire Protection Association] [2015]
[<http://www.nfpa.org/codes-and-standards/all-codes-and-standards/list-of-codes-and-standards/detail?code=72>]

Cost Impact

The code change proposal will increase the cost of construction .

This code change will increase the cost of construction in buildings with accessible elevators on floors one or more stories above or below the level of exit discharge. In buildings with two-hour fire-rated construction the wiring for the two-way communication system will be required to possess a two-hour fire-rated method of protection; whether it be the cabling itself, a two-hour fire-rated enclosure, two-hour fire-rated cabling system, or an approved alternative. Regardless of the building construction this system will also be required to be monitored for integrity. This monitoring could consist of a redundant pathway, which is additional wiring, or would be required to have any open fault annunciated at the fire alarm control unit as a trouble condition.

Internal ID: 82

E36-18

IBC: 1009.8.1, (IFC[BE] 1009.8.1)

Proponent: Ronald Clements Jr, representing Chesterfield County Building Inspection Department (clementsro@chesterfield.gov)

2018 International Building Code

Revise as follows:

1009.8.1 System requirements. Two-way communication systems shall provide communication between each required location and the *fire command center* or a central control point location *approved* by the fire department. Where the central control point is not a *constantly attended location*, ~~a~~the two-way communication system shall have a timed automatic telephone dial-out capability ~~to a monitoring location that provides two way communication with an approved supervising station~~ or 9-1-1. The two-way communication system shall include both audible and visible signals.

Reason:

There are varied interpretations about what "shall have timed automatic telephone dial-out capability to a monitoring location or 911" means. This text was added by the Egress committee as a modification to code change E37-07/08 to "provide clearer direction on how the phone system was expected to perform". Prior code editions required "controlled access to a public telephone system." Some are interpreting the current text to simply require a one-way signal be sent "to a monitoring service or 911" with no two way communication off-site. The intent was to provide two way communication either to the central control point; or, off-site via a telephone if no one was available at the central control point. The revise text clarifies the intent. The other issue addressed is what is a "monitoring location"? "Monitoring location" is not defined so what is required to approve a monitoring location? All of the other code provisions that address monitoring refer to "approved supervising station". "Supervising station" is defined in IBC chapter 2 and is the alternative to a "constantly attended location" in other code provisions that require monitoring. This code change provides that consistent and IBC defined terminology.

Cost Impact

The code change proposal will increase the cost of construction .

Whether or not this code change increases the cost of construction depends on the local interpretation of the current text. If the local interpretation is that the current text does not require two-way communication off-site then this code change will increase the cost of construction. If the interpretation of current text is that two-way communication must be maintained off-site then this will not increase the cost of construction.

Internal ID: 683

~~1010.3.4~~**1010.5.4 Additional door.** (No change to text)

Reason:

This is a reorganization of the door section to group like items together. There is not intended to be any technical changes.

Start in 1010.1 by recognizing that this section covers doors, gates and turnstiles. Clean up the reference to Section 1022.2 to be more specific.

List all door requirements – 1010.1.1 through 1010.1.7

Separate out door hardware requirements from the doors themselves – new section 1010.2

Relocate unlatching as generic requirement to beginning of hardware section – relocate to 1010.2.1

Group hardware requirements – height, monitoring, locks, bolt locks, sensor release, door hardware release

Group requirements for special safety concerns – closets, stairways, locking in schools, panic hardware. (The school criteria is currently under specials doors – this is definitely a locking criteria. With the new location, Item 2 is not needed).

Moved all the electrical locking arrangements (other than I-3 correctional facilities) to be next to each other, and ordered from most common to least common. Put the monitored or recorded egress section prior to these 4 electrical locking sections because monitored or recorded egress would almost exclusively be used with one of the electrical locking arrangements.

Group Special doors: revolving, power operated, horizontal sliding security grills – new section 1010.3

Renumber gates and turnstiles.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the

BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal reorganizes Section 1010 to provide clarity for the code user for the requirements for doors and door hardware. There are no technical changes to Section 1010.

IBC: 1010.1, 1020.1 (New), 1024.1, 1026.1, 1027.1, 1028.4, 1028.4.1, 1028.4.2, 1029(New), (IFC[BE] 1010.1, 1020.1 (New), 1024.1, 1026.1, 1027.1, 1028.4, 1028.4.1, 1028.4.2, 1029(New))

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com)

2018 International Building Code

Revise as follows:

1010.1 Doors General. ~~Means of egress doors shall meet the requirements of this section.~~ Doors, gates and turnstiles serving a *means of egress* system shall meet the applicable requirements of this section and Section 1022.2. Doors provided for egress purposes in numbers greater than required by this code shall meet the requirements of this section.

Means of egress doors shall be readily distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Mirrors or similar reflecting materials shall not be used on *means of egress* doors. *Means of egress* doors shall not be concealed by curtains, drapes, decorations or similar materials.

Add new text as follows:

1020.1 General. Corridors serving as an exit access component in a means of egress system shall comply with the requirements of this section.

Revise as follows:

1024.1 Exit passageways General. Exit passageways serving as an exit component in a *means of egress* system shall comply with the requirements of this section. An *exit passageway* shall not be used for any purpose other than as a *means of egress* and a *circulation path*.

1026.1 Horizontal exits General. Horizontal *exits* serving as an exit in a *means of egress* system shall comply with the requirements of this section. A *horizontal exit* shall not serve as the only exit from a portion of a building, and where two or more *exits* are required, not more than one-half of the total number of *exits* or total exit minimum width or required capacity shall be horizontal *exits*.

Exceptions:

1. Horizontal *exits* are permitted to comprise two-thirds of the required *exits* from any building or floor area for occupancies in Group I-2.
2. Horizontal *exits* are permitted to comprise 100 percent of the *exits* required for occupancies in Group I-3. Not less than 6 square feet (0.6 m²) of *accessible* space per occupant shall be provided on each side of the *horizontal exit* for the total number of people in adjoining compartments.

1027.1 Exterior exit stairways and ramps General. Exterior *exit stairways* and *ramps* serving as an element of exit component in a ~~required~~ *means of egress system* shall comply with the requirements of this section.

Add new text as follows:

1029 EGRESS COURTS

Revise as follows:

~~1028.4~~ **1029.1 Egress courts General.** ~~Egress courts serving as a portion of the~~ *an exit discharge component* in the *means of egress* system shall comply with the requirements of Sections 1028.4.1 and 1028.4.2 in this section.

~~1028.4.1~~ **1029.2 Width or capacity.** The required capacity of *egress courts* shall be determined as specified in Section 1005.1, but the minimum width shall be not less than 44 inches (1118 mm), except as specified herein. *Egress courts* serving Group R-3 and U occupancies shall be not less than 36 inches (914 mm) in width. The required capacity and width of *egress courts* shall be unobstructed to a height of 7 feet (2134 mm). The width of the *egress court* shall be not less than the required capacity.

Exception: Encroachments complying with Section 1005.7.

1028.4-21029.3 Construction and openings. Where an *egress court* serving a building or portion thereof is less than 10 feet (3048 mm) in width, the *egress court* walls shall have not less than 1-hour *fire-resistance-rated* construction for a distance of 10 feet (3048 mm) above the floor of the *egress court*. Openings within such walls shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.

Exceptions:

1. *Egress courts* serving an *occupant load* of less than 10.
2. *Egress courts* serving Group R-3.

Reason:

This is a series of editorial revisions intended to formalize the charging language of several sections within Chapter 10. The International Building Code is a so-called model code. Once adopted by a given political subdivision it becomes law. Having proper enabling or charging provisions for various technical requirements is legally necessary.

Presently, Section 1020 for corridors contains no charging language. A general section has been created using the same format as is currently used in Section 1018 for aisles and Section 1019 for exit access stairways and ramps.

Section 1010.1 has been improved by adding the "General" section title to be consistent with other means of egress component sections. Additionally, the first and second sentences of Section 1010.1 are redundant. The first sentence has been deleted. The second sentence now clarifies that the section is applicable to gates and turnstiles consistent with the Section 1010 heading.

The titles of Sections 1024.1, 1026.1 and 1027.1 have been changed to "General" to be consistent with other means of egress component sections.

Lastly, egress courts are a means of egress component. In the Chapter 10 format, individual means of egress components have their own section. Currently, egress court provisions are located in Section 1028.4 within the exit discharge section. This proposal simply relocates the egress court technical provisions to a new Section 1029 so as to be consistent with other Chapter 10 provisions.

This proposal establishes the proper legal charging language for lacking sections. In doing so, it provides consistency within the various Chapter 10 means of egress component sections. Some practitioners are given to assigning an importance factor between different terms and formats. Approval of this proposal will clarify these important means of egress provisions.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is essentially editorial.

E39-18

IBC: 1010.1.1, (IFC[BE] 1010.1.1)

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear opening width of 32 inches (813 mm). The clear opening width of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear opening width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a minimum clear opening width of 32 inches (813 mm). In Group I-2, doors serving as *means of egress* doors where used for the movement of beds shall provide a minimum clear opening width of 41¹/₂ inches (1054 mm). The ~~maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal.~~ The minimum clear opening height of doors shall be not less than 80 inches (2032 mm).

Exceptions:

1. In Group R-2 and R-3 *dwelling and sleeping units* that are not required to be an Accessible unit, Type A unit or Type B unit, the minimum ~~and maximum~~ width shall not apply to door openings that are not part of the required *means of egress*.
2. In Group I-3, door openings to resident *sleeping units* that are not required to be an *Accessible unit* shall have a minimum clear opening width of 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m²) in area shall not be limited by the minimum clear opening width.
4. The maximum width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.
5. The maximum width of door leaves in *power-operated doors* that comply with Section 1010.1.4.2 shall not be limited.
6. Door openings within a *dwelling unit* or *sleeping unit* shall have a minimum clear opening height of 78 inches (1981 mm).
7. In *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, exterior door openings other than the required *exit* door shall have a minimum clear opening height of 76 inches (1930 mm).
8. In Groups I-1, R-2, R-3 and R-4, in *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, the minimum clear opening widths shall not apply to interior egress doors.
9. Door openings required to be *accessible* within *Type B units* intended for user passage shall have a minimum clear opening width of 31.75 inches (806 mm).
10. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m²) in area shall have a maximum width of 60 inches (1524 mm) nominal.
11. The minimum clear opening width shall not apply to doors for nonaccessible shower or sauna compartments.
12. The minimum clear opening width shall not apply to the doors for nonaccessible toilet stalls.

Reason:

This proposal deletes the 48" maximum width requirements for swinging doors.

From the IBC Commentary: The maximum width for a means of egress door leaf in a swinging door is 48 inches (1219 mm) because larger doors are difficult to handle and are of sizes that typically are not fire tested.

We somewhat agree with this statement in the IBC Commentary. However, it is the width plus the height and the construction of the door (i.e. weight) which results in a door which may be difficult to open and / or close. Our perspective is the performance requirements in IBC Section 1010.1.3 Door Opening Force and the Chapter 11 Accessibility requirements effectively result in the design and installation of appropriately-sized doors. Regarding fire tested doors (i.e. fire-rated doors) - the solution is simple - install fire-rated doors which meet the existing door

opening force requirements of the IBC.

The revision in the 1st exception correlates with the proposed deleted text in the charging paragraph.

The revision in the 4th exception clarifies the exception.

From a different perspective, NFPA 101 has not had a requirement for maximum swinging door leaf width since the 1997 edition, stating there is insufficient reason to limit the maximum width of a door leaf provided the door is maintained in good working order. In addition, there is a trend in health-care occupancies for wider doorways to accommodate patient and equipment movement needs.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

We see no cost implications for the vast majority of buildings. However, this proposal may allow the use of a single door - that meets all IBC operational force requirements - where today the 48" width limit results in two doors in an opening. In these rare situations, the cost of construction may be reduced.

Internal ID: 2299

E40-18

IBC: 1010.1.1 (IFC[BE] 1010.1.1)

Proponent: Eirene Knott, BRR Architecture, representing Metropolitan Kansas City Chapter of the ICC (Eirene.Knott@brrarch.com)

2018 International Building Code

Revise as follows:

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear opening width of 32 inches (813 mm). The clear opening width of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear opening width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a minimum clear opening width of 32 inches (813 mm). In Group I-2, doors serving as *means of egress* doors where used for the movement of beds shall provide a minimum clear opening width of 41¹/₂ inches (1054 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. The minimum clear opening height of doors shall be not less than 80 inches (2032 mm).

Exceptions:

1. In Group R-2 and R-3 *dwelling and sleeping units* that are not required to be an Accessible unit, Type A unit or Type B unit, the minimum and maximum width shall not apply to door openings that are not part of the required *means of egress*.
2. In Group I-3, door openings to resident *sleeping units* that are not required to be an Accessible unit shall have a minimum clear opening width of 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m²) in area shall not be limited by the minimum clear opening width.
4. The width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.
5. The maximum width of door leaves in *power-operated doors* that comply with Section 1010.1.4.2 shall not be limited.
6. Door openings within a *dwelling unit* or *sleeping unit* shall have a minimum clear opening height of 78 inches (1981 mm).
7. In *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, exterior door openings other than the required *exit* door shall have a minimum clear opening height of 76 inches (1930 mm).
8. In Groups I-1, R-2, R-3 and R-4, in *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, the minimum clear opening widths shall not apply to interior egress doors.
9. Door openings required to be *accessible* within *Type B units* intended for user passage shall have a minimum clear opening width of 31.75 inches (806 mm).
10. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m²) in area shall have a maximum width of 60 inches (1524 mm) nominal.
11. The minimum clear opening width shall not apply to doors for nonaccessible shower or sauna compartments.
12. The minimum clear opening width shall not apply to the doors for nonaccessible toilet stalls.
13. The minimum clear opening width shall not apply to the doors for nonaccessible dressing, fitting or changing rooms.

Reason:

In the 2015/2016/2017 code development cycle, two changes, E47 and F243, were approved which added language in this section to allow for doors serving non-accessible saunas, shower compartments and toilet stalls to be less than 32 inches. The doors serving dressing/fitting/changing rooms serve the same purpose as these doors, which is to provide for access into and out of the room. If accessible dressing/fitting/changing rooms are provided per IBC 1109.12.1, the remaining dressing/fitting/changing rooms would meet the same requirements as those non-accessible sauna, shower compartment and toilet stall doors.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal may decrease the cost of construction if a smaller door is permitted as less materials will be required.

Internal ID: 114

E41-18

IBC: 1010.1.1.1, (IFC[BE] 1010.1.1.1)

Proponent: John Woestman, representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1010.1.1.1 Projections into clear ~~width-opening~~. There shall not be projections into the required clear opening width lower than 34 inches (864 mm) above the floor or ground. Projections into the clear opening width between 34 inches (864 mm) and 80 inches (2032 mm) above the floor or ground shall not exceed 4 inches (102 mm).

Exception: Door closers, overhead door stops, power door operators, and electromagnetic door ~~stops-locks~~ shall be permitted to be 78 inches (1980 mm) minimum above the floor.

Reason:

Clarifying the "door stops" in the exception are overhead door stops. Also, proposing to include in the exception door operational hardware which is commonly installed and may project into the opening at the top of the doorway. And, it seems appropriate to revise the title of Section 1010.1.1.1.

Below are several pictures which illustrate these hardware items.

Overhead door stop.
Photo courtesy ASSA ABLOY

Power door operator.
Photo courtesy domakaha

Power door operators (left doors), door closer (right door).
Photo courtesy Hager Companies

Electromagnetic door lock (top-left corner of doorway) and door closer.
Photo courtesy Allegion

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No cost implications identified with this proposal. This allows additional door operation with no increase in code requirements.

Internal ID: 2305

E42-18

IBC: 1010.1.2, 1010.1.2.1, (IFC[BE] 1010.1.2, 1010.1.2.1)

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1010.1.2 ~~Door swing.~~Egress door types. Egress doors shall be of the ~~pivoted or side-hinged swinging type door, pivoted door, or balanced door types.~~

Exceptions:

1. Private garages, office areas, factory and storage areas with an *occupant load* of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single *dwelling unit* in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1010.1.4.1.
6. In other than Group H occupancies, special purpose horizontal sliding, accordion or folding door assemblies complying with Section 1010.1.4.3.
7. Power-operated doors in accordance with Section 1010.1.4.2.
8. Doors serving a bathroom within an individual *sleeping unit* in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a *means of egress* from spaces with an *occupant load* of 10 or less.

1010.1.2.1 Direction of swing. ~~Pivot or side~~Side-hinged swinging doors, pivoted doors, and balanced doors shall swing in the direction of egress travel where serving a room or area containing an *occupant load* of 50 or more persons or a Group H occupancy.

Reason:

Updating 1010.1.2 to add balanced doors to the other common types of swinging doors allowed and used in the means of egress. Also revising the title of the section. Requirements for panic hardware on balanced doors is addressed in 1010.1.10.2 (text pasted below) - thus it can be assumed the intent of the code is that balanced doors are OK for doors in the means of egress.

Also, revising 1010.1.2.1 for consistency.

2018 IBC 1010.1.10.2 Balanced doors. If balanced doors are used and panic hardware is required, the panic hardware shall be the push-pad type and the pad shall not extend more than one-half the width of the door measured from the latch side

Several pictures below illustrate these types of doors.

Side-hinged door.
Photo courtesy Allegion

Pivoted door
Photo courtesy Allegion

Balanced door.
Photo courtesy C. R. Laurence

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal updates code technically to more closely match types of doors being installed in the means of egress.

Internal ID: 2315

E43-18

IBC: 1010.1.2, 1010.1.4.6(New), (IFC[BE] 1010.1.2, 1010.1.4.6(New))

Proponent: Joseph Hetzel, Thomas Associates, Inc., representing Door & Access Systems Manufacturers Association (jhetzel@thomasamc.com)

2018 International Building Code

Revise as follows:

1010.1.2 Door swing. Egress doors shall be of the pivoted or side-hinged swinging type.

Exceptions:

1. Private garages, office areas, factory and storage areas with an *occupant load* of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single *dwelling unit* in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1010.1.4.1.
6. In other than Group H occupancies, special purpose horizontal sliding, accordion or folding door assemblies complying with Section 1010.1.4.3.
7. Power-operated doors in accordance with Section 1010.1.4.2.
8. Doors serving a bathroom within an individual *sleeping unit* in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a *means of egress* from spaces with an *occupant load* of 10 or less.
10. In other than Groups A, E and H occupancies, high speed doors complying with Section 1010.1.4.6.

Add new text as follows:

1010.1.4.6 High speed doors. High speed doors shall include interior non-rated rolling, folding and sliding powered door assemblies, with a minimum opening speed of 32 inches per second, a minimum closing speed of 24 inches per second, and provide a means to automatically close the door. High speed doors shall comply with one of the following:

1. The door shall be operable by a simple method from either side of the opening without special knowledge or effort. The force required to operate the door shall not exceed 30 pounds (133 N) to set the door in motion and 15 pounds (67 N) to open the door to the minimum required height or width.
2. The door assembly shall have an integrated standby power supply, shall be electrically supervised, shall open to a minimum height of 80 inches (2.03 m) or a minimum width of 32 inches (813 mm) within 10 seconds after activation of the operating device, and shall stay open until full power is resumed.
3. The door panels shall be capable of being broken out manually in the event of power failure by a simple method from either side without special knowledge or effort. The force required to break out the door panels shall not exceed 30 pounds (133 N), and the force required to open the door panels to the minimum height and width shall not exceed 15 pounds (67 N).

Reason:

1. Brings codification to use in locations already occurring. High speed doors are often used in interior locations where such doors are the only means of exiting a space typically used for environmental/climate control, and where pivoted or side-hinged swinging doors cannot be used because of the need for such control. Therefore, provisions are needed in order for egress oriented high speed doors to be found compliant with the IBC other than using the Alternative Methods provisions because of the increasing frequency of use of such doors.
2. Belongs in a standalone code section under "special doors". Because they are non-swinging (neither pivoted nor side-hinged swinging) doors, high speed doors should be included as a new Exception in Section 1010.1.2.
3. Different fire related application calls for standalone provisions. Because they are not fire-rated products, high speed door requirements should be separate from those involving special purpose horizontal sliding, accordion or

folding doors.

4. Group exclusions have code precedence. The exclusion from Groups A, E and H is consistent with the limitation currently applied to using delayed egress locking systems.

5. "High speed door" description has code precedence. The description proposed for the term "high speed door" is similar in description of action to the definition of the term as contained in the International Energy Conservation Code.

6. Requirements have code precedence. Language involving maximum forces, making consideration to avoid special knowledge or effort, integrated standby power supply, and electrically supervised power supply is similar to that used for special purpose horizontal sliding, accordion or folding doors.

7. Each compliance option is an effective standalone option. Although high speed door manufacturers can integrate more than one option into their door designs, each option alone can provide needed egress.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code proposal is based on the premise that a high speed door is the only alternative for the door opening. With respect to other types of doors acceptable in other places as a component of a means of egress, a lower construction cost may be realized by using doors with one option without compromising safety.

IBC: 1010.1.3, (IFC[BE] 1010.1.3)

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Delete and substitute as follows:

~~**1010.1.3 Door opening force.** The force for pushing or pulling open interior swinging egress doors, other than fire doors, shall not exceed 5 pounds (22 N). These forces do not apply to the force required to retract latch bolts or disengage other devices that hold the door in a closed position. For other swinging doors, as well as sliding and folding doors, the door latch shall release when subjected to a 15-pound (67 N) force. The door shall be set in motion when subjected to a 30-pound (133 N) force. The door shall swing to a full-open position when subjected to a 15-pound (67 N) force.~~

1010.1.3 Forces to unlatch and open doors. The forces to unlatch and to open doors shall comply with the following:

1. Where door hardware operates by push or pull, the operational force to unlatch the door shall not exceed 15 pounds (66.7N). Where door hardware operates by rotation, the operational force to unlatch the door shall not exceed 28 inch-pounds (315 N-cm).
2. For manual interior swinging egress doors other than doors required to be fire rated, the force for pushing or pulling open the door shall not exceed 5 pounds (22 N).
3. For other swinging, sliding, or folding doors, and doors required to be fire-resistance-rated, the door shall require not more than a 30-pound (133 N) force to be set in motion and shall move to a full-open position when subjected to not more than a 15-pound (67 N) force.

Reason:

Updating and clarifying the maximum forces allowed to unlatch and open doors and correlating requirements with A117.1.

Item 1: The current IBC requirements in 1010.1.3 for maximum unlatching forces could be considered somewhat ambiguous. The proposed requirements in Item 1 are consistent with the requirements in the latest edition of A117.1, Section 404.2.6 and consistent with other ANSI standards for door hardware operational forces.

Items 2 and 3: The revisions in Items 2 and 3 are intended to clarify existing requirements in 1010.1.3.

Item 2 is based on the first sentence of 1010.1.3. Item 3 is based on the last two sentences of 1010.1.3.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies this section of the code, and correlates the code requirements to current accessibility requirements and to current requirements in several ANSI standards for door hardware

E45-18

IBC: 1010.1.3.2 (New), (IFC[BE] 1010.1.3.2 (New))

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new text as follows:

1010.1.3.2 Manual horizontal sliding doors. Where a manual horizontal sliding door is required to latch, the latch or other mechanism shall prevent the door from rebounding into a partially open position when the door is closed.

Reason:

In the event that horizontal doors are installed under these conditions the proposed language clarifies performance when a door is forcefully closed.

For Group I-2 and ambulatory care facilities this clarification of language is required in order to conform to Federal Standards and Centers for Medicaid and Medicare Services enforcement rules (K224).

This proposal is submitted by the ICC Committee on Healthcare (CHC) and the ICC Building Code Action Committee (BCAC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will increase the cost of construction .

If a horizontal sliding door is chosen where a door is required to latch, this requirement would add some performance requirements to stop the door from rebounding.

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1010.1.4.1 Revolving doors. Revolving doors shall comply with the following:

1. Revolving doors shall comply with BHMA A156.27 and shall be installed in accordance with the manufacturer's instructions.
2. Each revolving door shall be capable of *breakout* in accordance with BHMA A156.27 and shall provide an aggregate width of not less than 36 inches (914 mm).
3. A revolving door shall not be located within 10 feet (3048 mm) of the foot or top of *stairways* or escalators. A dispersal area shall be provided between the *stairways* or escalators and the revolving doors.
4. The revolutions per minute (rpm) for a revolving door shall not exceed the maximum rpm as specified in BHMA A156.27. Manual revolving doors shall comply with Table 1010.1.4.1(1). Automatic or *power-operated* revolving doors shall comply with Table 1010.1.4.1(2).
5. An emergency stop switch shall be provided near each entry point of power or automatic operated revolving doors within 48 inches (1220 mm) of the door and between ~~24-34 inches (610-864 mm)~~ and 48 inches (1220 mm) above the floor. The activation area of the emergency stop switch button shall be not less than 1 inch (25 mm) in diameter and shall be red.
6. Each revolving door shall have a side-hinged swinging door that complies with Section 1010.1 in the same wall and within 10 feet (3048 mm) of the revolving door.
7. Revolving doors shall not be part of an *accessible route* required by Section 1009 and Chapter 11.

Reason:

Revise vertical range requirements for mounting of the emergency stop switch to be consistent with accessibility requirements for reach ranges and to be consistent with the latest edition of ANSI/BHMA A156.27.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal is consistent with current accessibility requirements for reach ranges, and consistent with the latest edition of ANSI/BHMA A156.27 (which revolving doors are required to comply with).

Internal ID: 2312

E47-18

IBC: 1010.1.4.3, (IFC[BE] 1010.1.4.3)

Proponent: William Koffel, representing WonDoor (wkoffel@koffel.com)

2018 International Building Code

1010.1.4.3 Special purpose horizontal sliding, accordion or folding doors. In other than Group H occupancies, special purpose horizontal sliding, accordion or folding door assemblies permitted to be a component of a *means of egress* in accordance with Exception 6 to Section 1010.1.2 shall comply with all of the following criteria:

1. The doors shall be power operated and shall be capable of being operated manually in the event of power failure.
2. The doors shall be openable by a simple method ~~from both sides~~ without special knowledge or effort ~~or effort from the egress side or sides.~~
3. The force required to operate the door shall not exceed 30 pounds (133 N) to set the door in motion and 15 pounds (67 N) to close the door or open it to the minimum required width.
4. The door shall be openable with a force not to exceed 15 pounds (67 N) when a force of 250 pounds (1100 N) is applied perpendicular to the door adjacent to the operating device.
5. The door assembly shall comply with the applicable *fire protection rating* and, where rated, shall be self-closing or automatic closing by smoke detection in accordance with Section 716.2.6.6, shall be installed in accordance with NFPA 80 and shall comply with Section 716.
6. The door assembly shall have an integrated standby power supply.
7. The door assembly power supply shall be electrically supervised.
8. The door shall open to the minimum required width within 10 seconds after activation of the operating device.

Reason:

In many instances these doors are used in locations that require egress from both sides. However, there may be applications in which the direction of exit access travel is from only one side. Furthermore, the doors are now being used in security applications and as such, may not be manually operable from one side. This application should be permitted provided the egress requirements for the "secure" area can be met without requiring an occupant to pass through the door.

For example, one might want to secure the lobby area of an office building with a special purpose horizontal sliding, accordion style door to prevent access to other parts of the building by unauthorized personnel. As long as the means of egress requirements can be met for the lobby area, the door would not need to be manually operable from the lobby side.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal offers a design alternative to meet security needs of a particular building. It is one way to meet those needs and as such, the cost of construction is not impacted by the change.

Internal ID: 1345

E48-18

IBC: 1010.1.4.4, 1010.1.4.4.1, (IFC[BE] 1010.1.4.4, 1010.1.4.4.1); IFC: 1031.2.2

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1010.1.4.4 Locking arrangements in educational occupancies. In Group E ~~and occupancies~~, Group B educational occupancies and Group I-4 occupancies, egress doors from classrooms, offices and other occupied rooms ~~shall be permitted to be provided with locking arrangements designed to keep intruders from entering the room where shall comply with all of the following conditions are met:~~

1. The door shall be capable of being unlocked from outside the room with a key or other *approved* means.
2. The door shall be openable from within the room in accordance with Section 1010.1.9.
3. Modifications shall not be made to listed *panic hardware*, fire door hardware or door closers.
4. Modifications to fire door assemblies shall be in accordance with NFPA 80.

Remote locking or unlocking of doors from an approved location shall be permitted in addition to the unlocking operation in Item 1.

Delete without substitution:

~~**1010.1.4.4.1 Remote operation of locks.** Remote operation of locks complying with Section 1010.1.4.4 shall be permitted.~~

2018 International Fire Code

Revise as follows:

[BE] 1031.2.2 Locking arrangements in educational occupancies. In Group E occupancies, Group B educational occupancies and Group I-4 occupancies, egress doors ~~from classrooms, offices and other occupied rooms shall be permitted to be provided with locking arrangements designed to keep intruders from entering the room shall comply with Section 1010.1.4.4. where all of the following conditions are met:~~

1. ~~The door shall be capable of being unlocked from outside the room with a key or other approved means.~~
2. ~~The door shall be openable from within the room in accordance with Section 1010.1.9.~~
3. ~~Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.~~
4. ~~Modifications to fire door assemblies shall be in accordance with NFPA 80.~~

Reason:

During the last code development cycle several proposals were accepted to address various locking arrangements being proposed for educational occupancies. During the Group A and Group B cycles, there were additions made to the various proposals, which results in current code language that is not entirely correlated. This proposal attempts to correlate the codes so requirements are consistent throughout.

IFC includes allowances for Group I-4, which are not listed in the IBC. Lock-down plans for day care facilities are as important as for schools. The further language for Group I-4 "child day care" is not needed to describe the occupancy.

The reason statement for the public comment said that the committee did not want to make these locks mandatory, but by using "shall be permitted", lock-down systems could be provided that did not comply with these requirements. With the proposed language, a school could choose to add locks to keep out intruders, but those locks would have to comply with these important safety features.

Subsection 1010.1.4.4.1 is confusing. The allowance for remote unlocking from the outside could easily be included in

Section 1010.1.4.4. This was not included in IFC.

There will be a correlative change submitted to IEBC as part of Group B proposals since this is an important modification being done by schools across the country.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and Fire Code Action Committee (FCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac/>.

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

. This is a correlation between the IFC and IBC with no technical change.

Internal ID: 515

E49-18

IBC: 202 (New), 1010.1.4.6 (New), (IFC[BE] 202 (New), 1010.1.4.6(New))

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2018 International Building Code

Add new definition as follows:

CONTROL VESTIBULE. A space with door locking arrangements of interlocked doors in series such that while one door of the control vestibule is open, the other door in series is temporarily locked.

Add new text as follows:

1010.1.4.6 Control vestibule. Where doors in the means of egress are configured as a control vestibule, the door locking system shall provide for emergency egress and shall be subject to approval by the building official. A control vestibule in the means of egress shall comply with all of the following.

1. An approved override shall be provided on the egress side of each door of a control vestibule.
2. An approved override shall be provided on the ingress side of the outer door of a control vestibule.
3. Upon activation of the automatic sprinkler system or automatic fire detection system, the interlock function of the door locking system shall deactivate.
4. Upon loss of power to the interlock function of the doors, the interlock function of the door locking system shall deactivate.
5. The egress path from any point shall not pass through more than one control vestibule unless approved by the code official.
6. The door locking system units shall be listed in accordance with UL 294.

Reason:

We are proposing a definition for “control vestibule” and proposing detailed requirements for control vestibules.

The significant difference between doors in series in the means of egress (i.e. one after the other) and doors in the means of egress configured as a control vestibule is the doors of a control vestibule are interlocked such that when one door of a control vestibule is open, the other door in series in the control vestibule is temporarily locked; and conversely, in the means of egress when all doors of a control vestibule are closed, any door may be opened.

Control vestibules are most commonly configured as a space with two doors in series. But, some control vestibules are configured with more than one inner door and / or more than one outer door. For example, where a control vestibule is required to help keep clean rooms clean, there may be inner doors from three different clean rooms opening into the control vestibule, and one outer door for leaving the control vestibule in the direction of egress.

The proposed requirements for control vestibules are for these reasons:

Item 1: A requirement to address the potential situation where one of the doors on the control vestibule is held open (example: a person faints in the outer doorway), other occupants may need to be able to egress through the control vestibule, especially in emergency situations. It is common the activation of an override would set off an alarm, and / or the activation of an override without a valid reason results in disciplinary action (i.e. employee gets fired).

Item 2: In the event the inner door of a control vestibule is held open (example: a person faints at the inner door), an override allows access into the control vestibule. The required override on the ingress side of the outer door allows for emergency access into the control vestibule, if needed. This override commonly requires a higher level of authorization for use and / or is provided for responding emergency crews.

Items 3 and 4: Requires the interlock function to be disabled in the event of fire, actuation of the fire detection system, or power loss to the interlock system rendering the control vestibule equivalent to two doors in the means of egress allowing unobstructed egress.

Item 5: Requires that egressing through the control vestibule involves no more than two doors, unless approved by the code official. While not common, there are situations where more than one control vestibule may be needed in the means of egress.

Item 6: Requires the units of the control vestibule locking system to be listed in accordance with UL 294, the same standard required for units for other electrical locking system units.

Together, the definition and proposed requirements provide for egress and emergency egress where control vestibules are installed.

Note: a control vestibule is different than a sallyport, which is defined in the IBC and permitted in Group I-3 occupancies. Group I-3 includes correction centers, detention centers, jails, prisons, and similar uses. A sallyport is a security vestibule which prevents unobstructed passage. A control vestibule is intended to allow unobstructed passage, but prevents more than one door of doors in series to be open at the same time.

Cost Impact

The code change proposal will decrease the cost of construction .

Control vestibules are currently not addressed in the code. Where control vestibules are constructed, these requirements may include some locking requirements and interconnectedness currently not incorporated into some control vestibules.

Internal ID: 2326

E50-18

IBC: 1010.1.8 (New), (IFC[BE] 1010.1.8(New))

Proponent: Matthew Rowley, Frederick County Government, representing Frederick County Government
(matt@frederickcountymd.gov)

2018 International Building Code

Add new text as follows:

1010.1.8 Doors in infant care areas. All swinging doors serving rooms used for the care of children 2 1/2 years or less of age shall be equipped with door sweeps or a continuous rubber gasket running the entire underside of the door.

Reason:

An acquaintance opened a door when he returned home, not knowing his infant son was crawling on the floor on the other side of the door. His son's fingers were severed when they were caught underneath the swinging door.

I'm concerned for the safety of crawling children in similar situations.

Cost Impact

The code change proposal will increase the cost of construction .

The increased cost will be minimal. Door sweeps can be purchased for less than \$10.00 apiece.

Internal ID: 1450

E51-18

IBC: 1010.1.9 (New), (IFC[BE] 1010.1.9 (New))

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new text as follows:

1010.1.9 Vestibules. Where required by a compliance path of the International Energy Conservation Code, building entrances shall be provided with vestibules.

Reason:

The IECC requires vestibules to be provided at building entrances in all climate zones other than 1 and 2. In the design of buildings this can be a significant feature of entrances. The requirement can be overlooked by designers if they focus on the IBC during initial design and then are perhaps surprised by the requirement when adding the IECC to their construction documents. This proposal provides a direct reference to the compliance paths in the IECC for vestibules.

The proposal puts the reference for vestibules in Chapter 10 after the section for door arrangements (Section 1010.1.8). Since Section 1010.1.8 addresses doors in a series, this is the most logical place for designers to understand that a vestibule may be required by the IECC.

The BCAC developed this proposal with the SEHPCAC. This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This requirement already exists in the IECC. Inclusions in the IBC doesn't result in any construction not already anticipated.

Internal ID: 527

E52-18

IBC: 1010.1.9.4, (IFC[BE] 1010.1.9.4)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

1010.1.9.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In Group I-1 Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by clinical staff at all times or clinical staff have the codes or other means necessary to operate the locks at all times.
- ~~3.2.~~ In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
 - ~~3.1. 2.1.~~The locking device is readily distinguishable as locked.
 - ~~3.2. 2.2.~~A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
 - ~~3.3. 2.3.~~The use of the key-operated locking device is revocable by the *building official* for due cause.
- ~~4.~~ ~~3.~~Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
- ~~5.~~ ~~4.~~Doors from individual *dwelling* or *sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are operable from the inside without the use of a key or tool.
- ~~6.~~ ~~5.~~*Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
- ~~7.~~ ~~6.~~Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the building from the roof.

Reason:

This manual locking provision recognizes what is currently permitted under the Federal Standards and Centers for Medicaid and Medicare Services enforcement rules where the restraint of patients is allowed for the safety of the patient and/or the public (K222). This may be needed as part of the progression of treatment for patients.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

As a permitted condition the cost impact only occurs if the option is exercised.

IBC: 1010.1.9.4, 1010.1.10, (IFC[BE] 1010.1.9.4, 1010.1.10); IFC 1031.8

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1010.1.9.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
 - 2.1. The locking device is readily distinguishable as locked.
 - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
 - 2.3. The use of the key-operated locking device is revocable by the *building official* for due cause.
3. Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
4. Doors from individual *dwelling* or *sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
6. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the building from the roof.
7. Other than egress courts, where occupants must egress from an exterior space through the building for means of egress, exit access doors shall be permitted to be equipped with an approved locking device where installed and operated in accordance with all of the following:
 - 7.1. The maximum occupant load shall be posted where required by Section 1004.9. Such sign shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the exit access doorways.
 - 7.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required exit access door on the exterior side.
 - 7.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.
 - 7.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m²) sq. ft. in area, shall be provided at each exit access door to determine if there are occupants using the outdoor area.
 - 7.5. A readily visible durable sign shall be posted on the interior side on or adjacent to each locked required exit access door serving the exterior area stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED. The letters on the sign shall be not less than 1" high on a contrasting background.
8. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual dwelling or sleeping units.
9. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet or less, serving a private office space.

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Section 1010.1.9.4, Item 2.
2. Doors provided with *panic hardware* or *fire exit hardware* and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Section 1010.1.9.9 or 1010.1.9.10.
3. Exit access doors serving occupied exterior areas shall be permitted to be locked in accordance with Section 1010.1.9.4, Item 7.

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or *exit access* doors, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

2018 International Fire Code

Revise as follows:

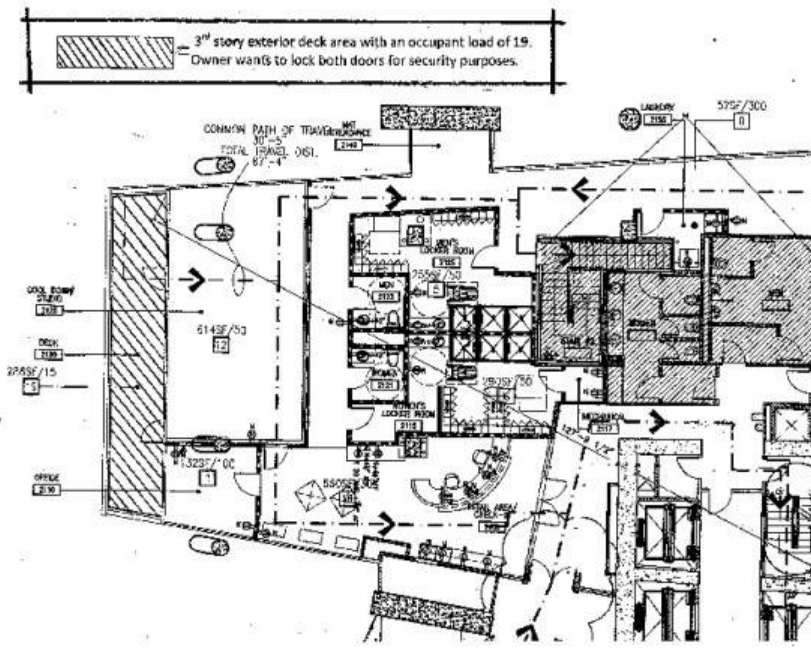

1031.8 Inspection, testing and maintenance. Two-way communication systems ~~for areas of refuge~~ shall be inspected and tested on a yearly basis to verify that all components are operational. Where required, the tests shall be conducted in the presence of the *fire code official*. Records of inspection, testing and maintenance shall be maintained.

Reason:

IBC Section 1004.7 requires an unobstructed path of egress from outdoor areas where single or multiple paths of egress travel are required to pass back through the building. Currently egress doors serving outdoor areas are not permitted to have locks. For security purposes, building owners and tenants install locks on required egress doors from these areas in violation of the code. Many building officials and fire officials allow locks and latches on doors serving the outdoor areas using the modification provisions of Sections 104.10 & 104.11. Since installation of locks on egress doors occurs on a regular basis it makes sense to provide a safe, reasonable and consistent standard to follow for the safety of people occupying outdoor areas who must re-enter the building for egress.

Additional safety is provided by requiring a two-way communication system, allowing occupants to call for help if the egress door is accidentally locked. Two-way communication system requirements are currently found in IBC Section 1009.8.1 & 1009.8.2.

The sketch below illustrates an occupied exterior deck where occupants must egress through the building to reach the exit discharge. The deck shown is on the 3rd story of the building where the installation of an exterior stairway is not practical. The owner has requested to install security locks on the exit access doors but IBC Section 1004.5 clearly requires that occupants be able to egress from the deck at all times. This proposal would allow the doors to be locked if the specified safety measures are met.

IFC Section 1030.8 - If this proposal passes, the two-way communication system needs to be tested and maintained. The IFC language is currently only for systems in areas of refuge.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

It is hard to say if this code change will increase or decrease the cost of construction. Compliance with the proposed conditions of approval (2-way communication device, vision glass, signage, etc) would increase costs but many of these improvements are being required as a result of alternate means and methods of construction requirements that occur when violations are discovered by Fire Prevention Officers after the C of O is issued. In those cases the cost to make these improvements will be higher then if they had been made during the initial construction of the building.

E54-18

IBC: 1010.1.9.6, Chapter 35, (IFC[BE] 1010.1.9.6, Chapter 80)

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1010.1.9.6 Unlatching. The unlatching of any door or leaf for egress shall require not require more than one ~~operation~~ motion in a single linear or rotational direction to release all latching and all locking devices. Latching or locking devices shall comply with ANSI/BHMA A156.41.

Exceptions:

1. Places of detention or restraint.
2. Where manually operated bolt locks are permitted by Section 1010.1.9.5.
3. Doors with automatic flush bolts as permitted by Section 1010.1.9.4, Item 3.
4. Doors from individual *dwelling units* and *sleeping units* of Group R occupancies as permitted by Section 1010.1.9.4, Item 4.

Add new standard(s) follows:

BHMA

Builders Hardware Manufacturers'
Association
355 Lexington Avenue, 15th Floor
New York NY 10017-6603
US

A156.41-2013:

Door Controls-Closers

Reason:

Code officials, specifiers, building owners, and security professions have been asking questions regarding what is required and what is permitted by the current language of 1010.1.9.6. This proposal is an attempt to address these questions, and provide more specifics as to what is meant by “not more than one operation” currently required by the code.

Also, this proposal introduces ANSI/BHMA A156.41 Door Hardware Single Motion to Egress into the IBC, as a requirement for door hardware used on doors in the means of egress, and performance requirements for manufacturers of door hardware.

Cost Impact

The code change proposal will increase the cost of construction .

Manufacturers will need to demonstrate compliance to A156.41, which may entail minimal cost to do so. On the other hand, these modifications should reduce ambiguity and questions during the design, construction, and code inspection process.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/BMHA A156.41-2013, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 2320

E55-18

IBC: 1010.1.9.7, (IFC[BE] 1010.1.9.7)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

1010.1.9.7 Controlled egress doors in Groups I-1 and I-2. Electric locking systems, including electro-mechanical locking systems and electromagnetic locking systems, shall be permitted to be locked in the *means of egress* in Group I-1 or I-2 occupancies where the clinical needs of persons receiving care require their containment. Controlled egress doors shall be permitted in such occupancies where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approved automatic smoke or heat-detection system* installed in accordance with Section 907, provided that the doors are installed and operate in accordance with all of the following:

1. The door locks shall unlock on actuation of the *automatic sprinkler system* or *automatic fire-smoke detection system*.
2. The door locks shall unlock on loss of power controlling the lock or lock mechanism.
3. The door locking system shall be installed to have the capability of being unlocked by a switch located at the *fire command center*, a nursing station or other *approved* location. The switch shall directly break power to the lock.
4. A building occupant shall not be required to pass through more than one door equipped with a controlled egress locking system before entering an exit.
5. The procedures for unlocking the doors shall be described and *approved* as part of the emergency planning and preparedness required by Chapter 4 of the International Fire Code.
6. All clinical staff shall have the keys, codes or other means necessary to operate the locking systems.
7. Emergency lighting shall be provided at the door.
8. The door locking system units shall be *listed* in accordance with UL 294.

Exceptions:

1. Items 1 through 4 shall not apply to doors to areas occupied by persons who, because of clinical needs, require restraint or containment as part of the function of a psychiatric treatment area.
2. Items 1 through 4 shall not apply to doors to areas where a *listed* egress control system is utilized to reduce the risk of child abduction from nursery and obstetric areas of a Group I-2 hospital.

Reason:

This clarification of language is required in order to conform with Federal Standards and Centers for Medicaid and Medicare Services enforcement rules (K221). The two control features are automatic fire suppression and smoke detection; this provision aligns with recognized federal standards. Where ambient conditions affect the performance of smoke detection Section 907.4.3 provides the opportunity for heat detection.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Detection device installation is already prescribed.

IBC: 1010.1.9.7, 1010.1.9.8.1, 1010.1.9.9, Chapter 35, (IFC[BE] 1010.1.9.7, 1010.1.9.8.1, 1010.1.9.9, Chapter 80)

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Building Code

Revise as follows:

1010.1.9.7 Controlled egress doors in Groups I-1 and I-2. Electric locking systems, including electro-mechanical locking systems and electromagnetic locking systems, shall be permitted to be locked in the *means of egress* in Group I-1 or I-2 occupancies where the clinical needs of persons receiving care require their containment. Controlled egress doors shall be permitted in such occupancies where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approved automatic smoke or heat detection system* installed in accordance with Section 907, provided that the doors are installed and operate in accordance with all of the following:

1. The door locks shall unlock on actuation of the *automatic sprinkler system* or *automatic fire detection system*.
2. The door locks shall unlock on loss of power controlling the lock or lock mechanism.
3. The door locking system shall be installed to have the capability of being unlocked by a switch located at the *fire command center*, a nursing station or other *approved* location. The switch shall directly break power to the lock.
4. A building occupant shall not be required to pass through more than one door equipped with a controlled egress locking system before entering an exit.
5. The procedures for unlocking the doors shall be described and *approved* as part of the emergency planning and preparedness required by Chapter 4 of the International Fire Code.
6. All clinical staff shall have the keys, codes or other means necessary to operate the locking systems.
7. Emergency lighting shall be provided at the door.
8. The electric egress door locking system units shall be listed in accordance with UL 294. Electric locks or electronic locking mechanisms shall be listed in accordance with UL1034.

Exceptions:

1. Items 1 through 4 shall not apply to doors to areas occupied by persons who, because of clinical needs, require restraint or containment as part of the function of a psychiatric treatment area.
2. Items 1 through 4 shall not apply to doors to areas where a *listed* egress control system is utilized to reduce the risk of child abduction from nursery and obstetric areas of a Group I-2 hospital.

1010.1.9.8.1 Delayed egress locking system. The delayed egress locking system shall be installed and operated in accordance with all of the following:

1. The delay electronics of the delayed egress locking system shall deactivate upon actuation of the *automatic sprinkler system* or *automatic fire detection system*, allowing immediate free egress.
2. The delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.
3. The delayed egress locking system shall have the capability of being deactivated at the *fire command center* and other *approved* locations.
4. An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.

Exception: Where *approved*, a delay of not more than 30 seconds is permitted on a delayed egress door.

5. The egress path from any point shall not pass through more than one delayed egress locking system.

Exceptions:

1. In Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds.
 2. In Group I-1 or I-4 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds and the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:
 - 6.1. For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
 - 6.2. For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
 - 6.3. The sign shall comply with the visual character requirements in ICC A117.1.

Exception: Where *approved*, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.
 7. Emergency lighting shall be provided on the egress side of the door.
 8. The delayed egress locking system units shall be *listed* in accordance with UL 294. Where door locking systems are also required to comply with Section 1010.1.10, the door locking system shall be listed in accordance with UL 294 and UL 305.

1010.1.9.9 Sensor release of electrically locked egress doors. Sensor release of electric locking systems shall be permitted on doors located in the *means of egress* in any occupancy except Group H where installed and operated in accordance with all of the following criteria:

1. The sensor shall be installed on the egress side, arranged to detect an occupant approaching the doors, and shall cause the electric locking system to unlock.
2. The electric locks shall be arranged to unlock by a signal from or loss of power to the sensor.
3. Loss of power to the lock or locking system shall automatically unlock the electric locks.
4. The doors shall be arranged to unlock from a manual unlocking device located 40 inches to 48 inches (1016 mm to 1219 mm) vertically above the floor and within 5 feet (1524 mm) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads "PUSH TO EXIT". When operated, the manual unlocking device shall result in direct interruption of power to the electric lock-independent of other electronics-and the electric lock shall remain unlocked for not less than 30 seconds.
5. Activation of the building *fire alarm system*, where provided, shall automatically unlock the electric lock, and the electric lock shall remain unlocked until the *fire alarm system* has been reset.
6. Activation of the building *automatic sprinkler system* or fire detection system, where provided, shall automatically unlock the electric lock. The electric lock shall remain unlocked until the *fire alarm system* has been reset.
7. The door locking system units shall be *listed* in accordance with UL 294. Where door locking systems are also required to comply with Section 1010.1.10, the door locking system shall be listed in accordance with UL 294 and UL 305.

Add new standard(s) follows:

1034-11:

Standard for Burglary-Resistant Electric Locking Mechanisms - with revisions through 2015

Reason:

There has been confusion about UL 294 being used to list all portions of the electric door locking systems covered by this section. This proposal clarifies that the system units be listed to UL 294, and that the electric locking mechanisms (mag locks) be listed to UL 1034.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is editorial only and provides clarification to existing requirements for hardware listing.

Analysis: A review of the standard proposed for inclusion in the code, UL 1034-11, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 231

E57-18

IBC: 1010.1.9.7, (IFC[BE] 1010.1.9.7)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

1010.1.9.7 Controlled egress doors in Groups I-1 and I-2. Electric locking systems, including electro-mechanical locking systems and electromagnetic locking systems, shall be permitted to be locked in the *means of egress* in Group I-1 or I-2 occupancies where the clinical needs of persons receiving care require their containment. Controlled egress doors shall be permitted in such occupancies where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approved automatic smoke or heat detection system* installed in accordance with Section 907, provided that the doors are installed and operate in accordance with all of the following:

1. The door locks shall unlock on actuation of the *automatic sprinkler system* or *automatic fire detection system*.
2. The door locks shall unlock on loss of power controlling the lock or lock mechanism.
3. The door locking system shall be installed to have the capability of being unlocked by a switch located at the *fire command center*, a nursing station or other *approved* location. The switch shall directly break power to the lock.
4. A building occupant shall not be required to pass through more than one door equipped with a controlled egress locking system before entering an exit.
5. The procedures for unlocking the doors shall be described and *approved* as part of the emergency planning and preparedness required by Chapter 4 of the International Fire Code.
6. All clinical staff shall have the keys, codes or other means necessary to operate the locking systems.
7. Emergency lighting shall be provided at the door.
8. The door locking system units shall be *listed* in accordance with UL 294.

Exceptions:

1. Items 1 through 4 shall not apply to doors to areas occupied by persons who, because of clinical needs, require restraint or containment as part of the function of a psychiatric or cognitive treatment area.
2. Items 1 through 4 shall not apply to doors to areas where a *listed* egress control system is utilized to reduce the risk of child abduction from nursery and obstetric areas of a Group I-2 hospital.

Reason:

The addition of 'cognitive' is so this option is available for Alzheimer and dementia wards where there are clinical needs. This locking arrangement is only for areas where the staff controls the locking arrangements.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This takes away requirements if the clinical needs justify same.

Internal ID: 585

E58-18

IBC: 1010.1.9.8, 1010.1.10, (IFC[BE] 1010.1.9.8, 1010.1.10)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1010.1.9.8 Delayed egress. Delayed egress locking systems shall be permitted to be installed on doors serving the following occupancies in buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approved automatic smoke or heat detection system* installed in accordance with Section 907.

1. Group B, F, I, M, R, S and U occupancies.
2. Group E classrooms with an *occupant load* of less than 50.

~~**Exception:** Delayed~~

3. In a courthouse, delayed egress locking systems shall be permitted to be installed on exit or *exit access* doors, other than the main exit or *exit access* door, serving a Group A-3 courtroom in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Section 1010.1.9.4, Item 2.
2. Doors provided with *panic hardware* or *fire exit hardware* and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Section 1010.1.9.9 or 1010.1.9.10.
3. Courtrooms shall be permitted to be locked in accordance with Section 1010.1.9.8, Item 3.

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or *exit access* doors, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

Reason:

This is only a format issue resulting from the multiple changes last cycle to the delayed egress locks - E66-15 AMPC1, E68-15 AM/AMPC1, E69-15 AS. The allowance for courtrooms, while logical, is out of place as an exception to Items 1 and 2 in Section 1010.1.9.8.

Correlation with Section 1010.1.9.8 in Section 1010.1.10 is needed because this is Group A where panic hardware is otherwise required.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a format revision with no change to technical criteria.

Internal ID: 514

E59-18

IBC: 1010.1.9.8.1, (IFC[BE] 1010.1.9.8.1)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

1010.1.9.8.1 Delayed egress locking system. The delayed egress locking system shall be installed and operated in accordance with all of the following:

1. The delay electronics of the delayed egress locking system shall deactivate upon actuation of the *automatic sprinkler system* or *automatic fire detection system*, allowing immediate free egress.
2. The delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.
3. The delayed egress locking system shall have the capability of being deactivated at the *fire command center* and other *approved* locations.
4. An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.

Exception: Where *approved*, a delay of not more than 30 seconds is permitted on a delayed egress door.

5. The egress path from any point shall not pass through more than one delayed egress locking system.

Exceptions:

1. In Group I-1, Condition 2, Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds.
2. In Group I-1, Condition 1 or I-4 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds and the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:

- 6.1. For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
- 6.2. For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
- 6.3. The sign shall comply with the visual character requirements in ICC A117.1.

Exception: Where *approved*, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.

7. Emergency lighting shall be provided on the egress side of the door.
8. The delayed egress locking system units shall be *listed* in accordance with UL 294.

Reason:

Group I-1 Condition 2 is already required to be protected with an NFPA13 automatic fire suppression system, so it should be grouped with Group I-2 and I-3. The second exception recognizes occupancy Group I-1 Condition 1 and I-4 is based on the inclusion of an automatic fire suppression sprinkler system NFPA13 system, which is above the

allowances for NFPA13R for Group I-1, Condition 1 and no sprinklers for some Group I-4.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification, not a new requirement.

Internal ID: 586

E60-18

IBC: 1010.1.9.8.1, Chapter 35, (IFC[BE] 1010.1.9.8.1, Chapter 80)

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1010.1.9.8.1 Delayed egress locking system. The delayed egress locking system shall be installed and operated in accordance with all of the following:

1. The delay electronics of the delayed egress locking system shall deactivate upon actuation of the *automatic sprinkler system* or *automatic fire detection system*, allowing immediate free egress.
2. The delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.
3. The delayed egress locking system shall have the capability of being deactivated at the *fire command center* and other *approved* locations.
4. An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.

Exception: Where *approved*, a delay of not more than 30 seconds is permitted on a delayed egress door.

5. The egress path from any point shall not pass through more than one delayed egress locking system.

Exceptions:

1. In Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds.
2. In Group I-1 or I-4 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds and the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:

- 6.1. For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
- 6.2. For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
- 6.3. The sign shall comply with the visual character requirements in ICC A117.1.

Exception: Where *approved*, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.

7. Emergency lighting shall be provided on the egress side of the door.
8. The delayed egress locking system units shall be *listed* in accordance with UL 294.
9. The delayed egress locking system shall comply with ANSI/BHMA A156.24.

Add new standard(s) follows:

ANSI/BHMA A156.24-2018:

Delayed Egress Locking Systems

Reason:

Delayed egress locking systems are a device, or a combination of devices, arranged to be locked in the direction of egress travel, and are intended to temporarily delay the egress of occupants.

Over the last two cycles of the IBC, delayed egress locking systems have been permitted in new occupancy groups and in some instances more than one delayed egress locking system is permitted in the egress path. These provisions were allowed in light of the increased need for security in E and I occupancies, as well as courtroom buildings.

In addition to the increase in allowed application of delayed egress, since 2012 the Code has evolved to recognize use of a 'delayed egress locking system' which is comprised of not just mechanical but electro-mechanical and electro-magnetic locking systems.

In light of the increased occupancy group allowance and application of more than one delayed egress locking system in the path of egress, requiring compliance to BHMA A156.24 Delayed Egress Locking Systems helps assure these locking systems will function reliably and as intended by the Code.

Cost Impact

The code change proposal will increase the cost of construction .

Requiring delayed egress door locking hardware to comply with ANSI/BHMA A156.24 could be expected to increase the cost of the door hardware. But, recall that delayed egress locking systems are entirely optional (shall be permitted) and are not required by the IBC. Thus, the cost of construction may increase only where delayed egress locking systems are desired.

Also, many delayed egress door locking products are currently on the market today. Currently, the UL online certification directory for "Special Locking Arrangements" contains 23 unique files (23 manufacturers) in category code FWAX - Special Locking Arrangements - with over 100 product models listed for these applications. UL category FWAX includes many products for delayed egress door locking applications.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/BMHA A156.24-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

IBC: 1010.1.9.9, (IFC[BE] 1010.1.9.9)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Ed Kullik, representing ICC Building Code Action Committee (BCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

1010.1.9.9 Sensor release of electrically locked egress doors. Sensor release of electric locking systems shall be permitted on doors located in the *means of egress* in any occupancy except Group H where installed and operated in accordance with all of the following criteria:

1. The sensor shall be installed on the egress side, arranged to detect an occupant approaching the doors, and shall cause the electric locking system to unlock.
2. The electric locks shall be arranged to unlock by a signal from or loss of power to the sensor.
3. Loss of power to the lock or locking system shall automatically unlock the electric locks.
4. The doors shall be arranged to unlock from a manual unlocking device located 40 inches to 48 inches (1016 mm to 1219 mm) vertically above the floor and within 5 feet (1524 mm) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads "PUSH TO EXIT." When operated, the manual unlocking device shall result in direct interruption of power to the electric lock-independent of other electronics and the electric lock shall remain unlocked for not less than 30 seconds.
5. Activation of the building *fire alarm system*, where provided, shall automatically unlock the electric lock, and the electric lock shall remain unlocked until the *fire alarm system* has been reset.
6. Activation of the building *automatic sprinkler system* or fire detection system, where provided, shall automatically unlock the electric lock. The electric lock shall remain unlocked until the *fire alarm system* has been reset.
7. Emergency lighting shall be provided on the egress side of the door.
8. The door locking system units shall be *listed* in accordance with UL 294.

Reason:

The requirement for egress side emergency lighting provides all occupants with minimum egress illumination levels at the door for operation and to read the sign. This proposed requirement is aligned with current delayed egress and controlled egress locking conditions.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

If the locking system is installed, added cost may be incurred where emergency lighting is not currently in place.

Internal ID: 588

E62-18

IBC: 1010.1.9.12, (IFC[BE] 1010.1.9.12)

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1010.1.9.12 Stairway doors. Interior *stairway means of egress* doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. *Stairway* discharge doors shall be openable from the egress side and shall only be locked from the opposite side.
2. This section shall not apply to doors arranged in accordance with Section 403.5.3.
3. *Stairway* exit doors are permitted to be locked from the side opposite the egress side, provided that they are openable from the egress side and capable of being unlocked simultaneously without unlatching upon a signal from the *fire command center*, if present, or a signal by emergency personnel from a single location inside the main entrance to the building. The door locking system units shall be listed in accordance with UL 294.
4. *Stairway exit* doors shall be openable from the egress side and shall only be locked from the opposite side in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single *exit stairway* where permitted in Section 1006.3.3.
5. *Stairway exit* doors shall be openable from the egress side and shall only be locked from the opposite side in Group R-2 occupancies where the only interior access to the *dwelling unit* is from a single *exit stairway* where permitted in Section 1006.3.3.

Reason:

Locks which are capable of being unlocked upon a signal from the fire command center (if present) or by a signal by emergency personnel from a single location inside the main entrance to the building would have to be electrified locks controlled by an electrical locking system. Consistent with other electrical locks and locking systems in the means of egress in Sections 1010.1.9.7 through 1010.1.9.10 (controlled egress doors, delayed egress doors, and electrically locked egress doors), it is appropriate to require these locking system units installed on stairway doors to be listed in accordance with UL 294.

Cost Impact

The code change proposal will increase the cost of construction .

Explanation: The same locking devices available and used for the locks in Sections 1010.1.9.7 through 1010.1.9.10 (controlled egress doors, delayed egress doors, and electrically locked egress doors) would likely be used for stairway doors. These locks and locking systems are currently required by the code to be listed in accordance with UL 294 which does add to the cost of the product. However, Exception 3, where the new requirement is proposed is a "shall be permitted" provision, and only where this exception is voluntarily implemented would the potential cost increase be realized.

Internal ID: 2318

E63-18

IBC: 1010.1.10, (IFC[BE] 1010.1.10)

Proponent: Scott Clough, University of Virginia, representing self (sc9xc@virginia.edu)

2018 International Building Code

Revise as follows:

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Section 1010.1.9.4, Item 2.
2. Doors provided with *panic hardware* or *fire exit hardware* and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Section 1010.1.9.9 or 1010.1.9.10.

Electrical rooms with equipment rated 1,200 amperes or more ~~and over 6 feet (1829 mm) wide, and~~ that contain overcurrent devices, switching devices or control devices ~~with and have~~ exit or exit access doors, less than 25 feet (7 620 mm) from the nearest edge of the working space in front of the equipment as defined by NFPA 70 shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

Reason:

This code section was originally intended to correlate with section 110.26(C)(3) of the 2012 edition of the NEC. This section has since been revised and the condition for equipment over 6ft wide has been removed. Additional language was added regarding the distance of the exit door from the working space of the equipment. The IBC should be updated to reflect these changes.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Per the current IBC, panic hardware is required when two conditions are met. The proposal revises one of those conditions to align with the NEC. While the NEC may be more restrictive in a small percentage of cases, those rooms would have required panic hardware regardless, in order to comply with the electrical code. Therefore, there is no impact to the cost of construction.

E64-18

IBC: 1010.1.10, 1010.1.10.1 (New), (IFC[BE] 1010.1.10, 1010.1.10.1 (New))

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Section 1010.1.9.4, Item 2.
2. Doors provided with *panic hardware* or *fire exit hardware* and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Section 1010.1.9.9 or 1010.1.9.10.

~~Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or exit access doors, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.~~

Add new text as follows:

1010.1.10.1 Rooms with electrical equipment. Exit or exit access doors serving transformer vaults, rooms designated for batteries or energy storage systems, or modular data centers shall be equipped with *panic hardware* or *fire exit hardware*. Where rooms contain electrical rooms with equipment rated 800 amperes or more that contain overcurrent devices, switching devices or control devices, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

Reason:

The current requirements in the International Building Code are not in alignment with the requirements in NFPA 70, the National Electrical Code. Section 110.26(C)(3) requires where there are exit or exit access doors serving a room with electrical equipment rated 800 amperes or more those doors shall be equipped with listed panic hardware. Equipment rated 1200 amperes or more is used to determine the number and locations of exits or exit access doorways, which is addressed in Section 1006.2.2. Also, NFPA 70 for transformer vaults (in Sections

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Chapter 27 of the IBC already requires electrical installations to comply with the provisions of NFPA 70. This proposal aligns the requirements in the IBC with NFPA 70.

Internal ID: 449

IBC: 1010.1.10.1, Chapter 35, (IFC[BE] 1010.1.10.1, Chapter 80)

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1010.1.10.1 Installation. Where panic or *fire exit hardware* is installed, it shall comply with the following:

1. *Panic hardware* shall be *listed* in accordance with UL 305 and shall comply with ANSI/BHMA A156.3.
2. *Fire exit hardware* shall be *listed* in accordance with UL 10C and UL 305 and shall comply with ANSI/BHMA A156.3.
3. The actuating portion of the releasing device shall extend not less than one-half of the door leaf width.
4. The maximum unlatching force shall not exceed 15 pounds (67 N).

Add new standard(s) follows:

BHMA

Builders Hardware Manufacturers'
Association
355 Lexington Avenue, 15th Floor
New York NY 10017-6603

ANSI/BHMA A156.3-2014:

Exit Devices

Reason:

ANSI/BHMA A156.3 Exit Devices includes all the requirements of UL 305; and additional requirements to help ensure exit devices will perform their intended functions, especially in emergency egress situations. ANSI/BHMA A156.3 has been the voluntary industry performance standard for panic hardware and for fire exit hardware since 1994. A156.3 requires testing which includes additional operational cycles to ensure reliable egress after extended usage; abuse tests, and requirements for outside trim. This proposal updates the IBC to be consistent with requirements in NFPA 101 effective with the 2012 edition.

Cost Impact

The code change proposal will increase the cost of construction .

From an IBC perspective, this proposal adds the requirement for panic hardware and fire exit hardware to also comply with ANSI/BHMA A156.3, which could be expected to increase the cost of construction. But, from a practical perspective, there's very limited panic hardware / fire exit hardware on the market which does not currently comply with ANSI/BHMA A156.3 along with UL 305 (and UL 10C, where required).

Analysis: A review of the standard proposed for inclusion in the code, ANSI/BMHA A156.3-2014, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

IBC: 1011.5.2, (IFC[BE] 1011.5.2)

Proponent: Todd Snider, West Coast Code Consultants (WC3), representing Self (Todd@KimballEng.com)

2018 International Building Code

Revise as follows:

1011.5.2 Riser height and tread depth. *Stair* riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. The riser height shall be measured vertically between the *nosings* of adjacent treads or between the stairway landing and the adjacent tread. Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's nosing. *Winder* treads shall have a minimum tread depth of 11 inches (279 mm) between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair.

Exceptions:

1. *Spiral stairways* in accordance with Section 1011.10.
2. *Stairways* connecting stepped *aisles* to cross *aisles* or concourses shall be permitted to use the riser/tread dimension in Section 1029.14.2.
3. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; the maximum riser height shall be 7³/₄ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum *winder* tread depth at the walkline shall be 10 inches (254 mm); and the minimum *winder* tread depth shall be 6 inches (152 mm). A *nosing* projection not less than ³/₄ inch (19.1 mm) but not more than 1¹/₄ inches (32 mm) shall be provided on *stairways* with solid risers where the tread depth is less than 11 inches (279 mm).
4. See Section 503.1 of the International Existing Building Code for the replacement of existing stairways.
5. In Group I-3 facilities, *stairways* providing access to *guard* towers, observation stations and control rooms, not more than 250 square feet (23 m²) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).

Reason:

Proposed revision to clarify that a riser is between adjacent treads as well as treads and landings.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change will not affect cost. The purpose is to clarify an existing requirement.

Internal ID: 1287

E67-18

IBC: 1011.5.5, (IFC[BE] 1011.5.5)

Proponent: David Cooper, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)

2018 International Building Code

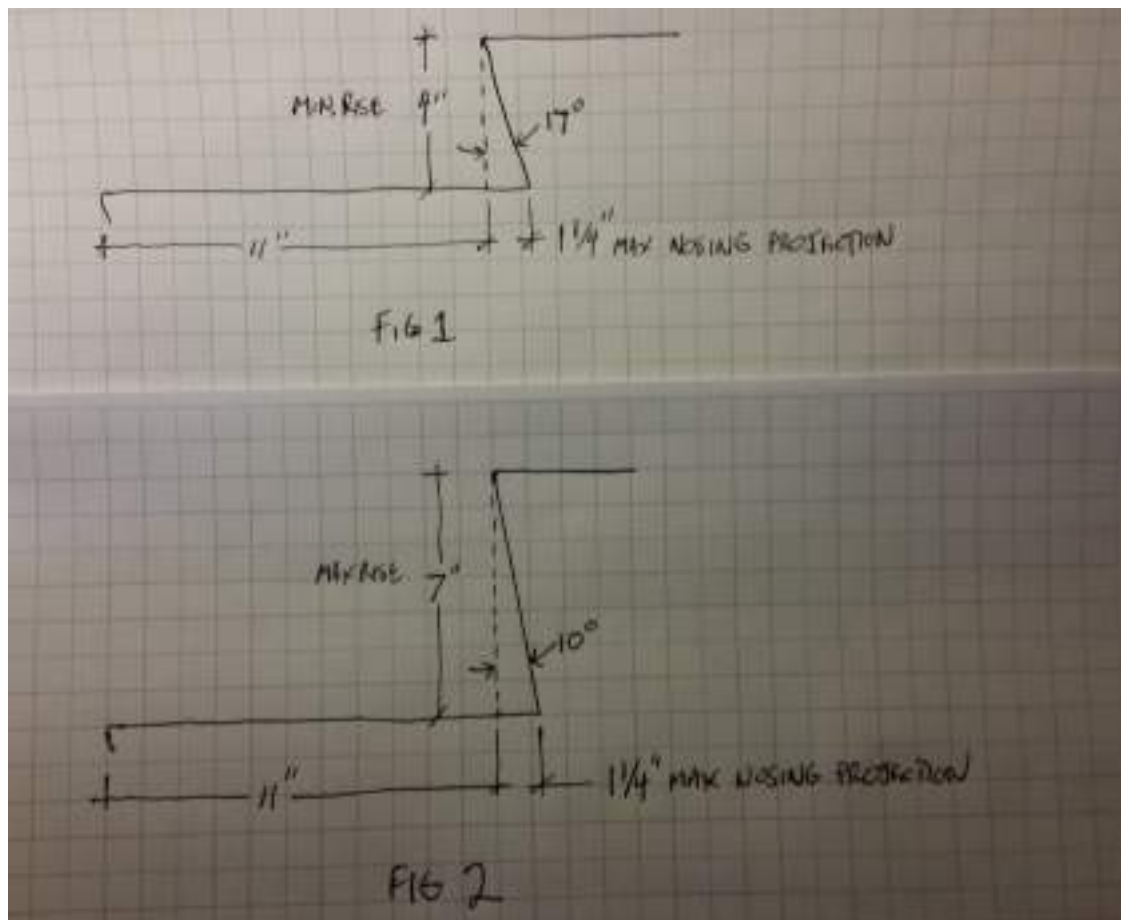

Revise as follows:

1011.5.5 Nosing and riser profile. *Nosings* shall have a curvature or bevel of not less than $\frac{1}{16}$ inch (1.6 mm) but not more than $\frac{9}{16}$ inch (14.3 mm) from the foremost projection of the tread. Risers shall be solid and vertical or sloped under the tread above from the underside of the *nosing* above ~~at an angle not more than 30 degrees (0.52 rad) from the vertical, provided the nosing projection is in accordance with Section 1011.5.5.1.~~

1011.5.5.1 Nosing projection size. The leading edge (nosings) of treads shall project not more than $\frac{1}{4}$ inches (32 mm) beyond the tread below.

Reason:

Figure 1 illustrates the sloped riser angle at the minimum riser height and maximum nosing projection. Figure 2 illustrates the sloped riser angle at the maximum riser height and maximum nosing projection. The current language is confusing because it is impossible to slope the riser anywhere close to 30 degrees without greatly exceeding the maximum nosing projection. The proposed change correlates an appropriate limit and clarifies widely misunderstood code language.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only clarifies the intent of the code and does not change materials or methods.

Internal ID: 1038

E68-18

IBC: 1011.6, (IFC[BE] 1011.6)

Proponent: John Terry, self, representing self (John.Terry@dca.nj.gov)

2018 International Building Code

Revise as follows:

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where wheelchair spaces are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

Exception: Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.

Reason:

The degree to which a door may impinge into a corridor and a stairway landing is the same, however, the language in both sections is not. The purpose of this proposed change is to clarify that the limitation on the door projection is into the REQUIRED width, not the provided width. As you can see in the attached plan, technically, the door swings more than 7 inches into the landing, however, it does not impinge on the required width. This will clarify what I believe is the intent of this provision.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change merely clarifies the intent of the current text and therefore has no impact on cost.

Internal ID: 272

E69-18

IBC: 1011.6, (IFC[BE] 1011.6)

Proponent: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)

2018 International Building Code

Revise as follows:

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. Where wheelchair spaces are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

Exception-Exceptions:

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.
2. At intermediate landings of curved stairways the landing depth shall be measured along the walkline radius between the nosings of the flights adjoining the landing .

Reason:

Similar to a straight run stairway with a landing separating two flights aligned in a straight line the paths of travel on the stairway shown in figure 1 is a continuum. This new exception provides needed specification of where to regulate the landing depth. Due to the tapered shape of the landing similar to the treads of the adjoining flights it makes sense to regulate the depth like the treads at the walklines of the flights. This proposal will provide for consistent interpretation and enforcement.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Although the size of these landings are currently open to wide interpretation we feel that this change will not change the cost of construction.

Internal ID: 1040

E70-18

IBC: 1011.6, (IFC[BE] 1011.6)

Proponent: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)

2018 International Building Code

Revise as follows:

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. Where wheelchair spaces are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

~~Exception~~ Exceptions:

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.
2. The landing at stairway turns of 90 degrees (1.57 rad) or more shall not be required to provide a minimum depth in accordance with this section where the corner of the landing on the outside of the turn in plan has been truncated and the area of the landing provided is not less than that described by an arc with a radius equal to the width of the flight served.

Reason:

This proposal simply reiterates the interpretation found in the IBC commentary for more than a decade that has aptly provided guidance to the fact that landings of stairways need not be rectilinear in shape. Truncating the outside corner by rounding or beveling in plan without reduction of the effective width in the path of travel can actually improve compliant use of handrails when continuous handrails are optionally provided at landings by eliminating the need to unnaturally stray from the travel path into the corner to maintain a continuous grip on the handrail.

A proposal with similar intent failed in the last cycle because the text was interpreted to allow a wall niche to be added to a landing to meet the minimum area requirement. This proposal clearly describes the condition under which the corner of a landing may be truncated in plan. In this proposal the turn is described as a turn in the “stairway”. By definition landings and flights of stairs compose stairways and thus the term “stairway turns” is appropriate.

Example of 90 degree stairway turn with minimum landing size.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies the code text to comply with the the most common interpretation and will not increase construction costs.

E71-18

IBC: 1011.11, (IFC[BE] 1011.11)

Proponent: Don Birdsall, LIFT-U Division of Hogan Mfg., Inc., representing LIFT-U Division of Hogan Mfg., Inc. (donbirdsall@hoganmfg.com)

2018 International Building Code

Revise as follows:

1011.11 Handrails. *Flights of stairways* shall have *handrails* on each side and shall comply with Section 1014. Where glass is used to provide the *handrail*, the *handrail* shall comply with Section 2407.

Exceptions:

1. *Flights of stairways* within *dwelling units* and *flights of spiral stairways* are permitted to have a *handrail* on one side only.
2. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require *handrails*.
3. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require *handrails*.
4. Changes in room elevations of three or fewer risers within *dwelling units* and *sleeping units* in Group R-2 and R-3 do not require handrails.
5. Where a platform lift in the park position is accessed by a stairway with two or fewer risers, handrails are not required where handholds are provided that comply with the following:
 - 5.1 Handholds are provided on each side of the top landing.
 - 5.2 Handholds are provided vertically or horizontally with gripping surfaces 34 inches (864mm) high minimum and 42 inches (1066 mm) high maximum above the bottom landing.
 - 5.3 Handholds shall comply with the graspability provisions for handrails and have a length of not less than 4.5 inches (144 mm).

Reason:

The primary intent of this new exception is to provide a safe alternative for a limited situation at platform lifts used to access small raised areas. Because of the movement of the lift, standard set handrails will not work. However, typically these lifts are surrounded by short walls that can serve as handholds for someone to grab to stop a possible fall. This condition frequently exists when a wheelchair lift is installed in a courtroom to provide access to the witness stand and judges' bench. The lift platform is the floor of the Witness Stand. The platform at the entrance to the Witness Stand is commonly parked at a height requiring a step to enter. The Witness Stand is surrounded by millwork low walls. A similar condition can exist in government meeting rooms, churches, and academic buildings.

Section 1011.11 requires two handrails starting at a one riser stairway. The addition of handrails interferes with the vertical travel of the platform lift. The judges' bench and often the witness stand are required to be elevated for safety and court function. A platform lift is required to make these areas accessible by both the ADA and the IBC.

This additional exception provides and describes handholds for this limited situation that assist the person walking up and down the steps and do not interfere with the platform lift operation for persons with mobility issues.

Video of situation: <https://hoganmfg.sharefile.com/d-s7519e8a5a7148c48>

Bibliography:

International Building Code 2015

ASME A18.1 Safety Standard for Platform Lifts and Stairway Chairlifts, 2014 Edition

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This revision will have minimal to no impact on the cost of the project and will allow access to the Justice System for all users - motion impaired and ambulatory. A barrier removal facilitation change.

1013.3 Illumination. Exit signs shall be internally or externally illuminated.

Exception: Tactile signs required by Section 1013.4 need not be provided with illumination.

Revise as follows:

1013.4 Raised character and braille exit signs. ~~A sign stating EXIT in visual characters, raised characters and braille and complying with ICC A117.1 shall be provided adjacent to each door to~~ Where exit signs are provided at an area of refuge, providing direct access to a stairway, an exterior area for assisted rescue, an exit stairway or ramp, an exit passageway and the exit discharge, a sign stating EXIT in visual characters, raised characters and braille and complying with ICC A117.1 shall be provided.

1023.8 Discharge identification. An interior exit stairway and ramp shall not continue below its *level of exit discharge* unless an *approved* barrier is provided at the *level of exit discharge* to prevent persons from unintentionally continuing into levels below. Directional exit signs shall be provided as specified in Section 1013.

1023.9 Stairway identification signs. A sign shall be provided at each floor landing in an *interior exit stairway* and *ramp* connecting more than three stories designating the floor level, the terminus of the top and bottom of the *interior exit stairway* and *ramp* and the identification of the *stairway* or *ramp*. The signage shall state the story of and direction to the *exit discharge*, and the availability of roof access from the *interior exit stairway* and *ramp* for the fire department. The bottom of the sign shall be located 5 feet (1524 mm) minimum above the floor landing in a position that is readily visible when the doors are in the open and closed positions. ~~In addition to the stairway identification sign, a floor-level sign in visual characters, raised characters and braille complying with ICC A117.1 shall be located at each floor-level landing adjacent to the door leading from the interior exit stairway and ramp into the corridor to identify the floor level.~~

1023.9.1 Signage requirements. *Stairway* identification signs shall comply with all of the following requirements:

1. The signs shall be a minimum size of 18 inches (457 mm) by 12 inches (305 mm).
2. The letters designating the identification of the interior exit stairway and *ramp* shall be not less than 1¹/₂ inches (38 mm) in height.
3. The number designating the floor level shall be not less than 5 inches (127 mm) in height and located in the center of the sign.
4. Other lettering and numbers shall be not less than 1 inch (25 mm) in height.
5. Characters and their background shall have a nonglare finish. Characters shall contrast with their background, with either light characters on a dark background or dark characters on a light background.
6. Where signs required by Section 1023.9 are installed in the interior exit *stairways* and *ramps* of buildings subject to Section 1025, the signs shall be made of the same materials as required by Section 1025.4.

1023.10 Elevator lobby identification signs. At landings in interior exit *stairways* where two or more doors lead to the floor level, any door with direct access to an enclosed elevator lobby shall be identified by signage located on the door or directly adjacent to the door stating "Elevator Lobby." Signage shall be in accordance with Section 1023.9.1, Items 4, 5 and 6.

Add new text as follows:

1023.11 Tactile floor-level signs. Where floor level signs are provided in interior exit stairways and ramps, a floor-level sign in visual characters, raised characters and braille complying with ICC A117.1 shall be located at each floor-level landing adjacent to the door leading from the interior exit stairway and ramp into the corridor to identify the floor level.

Reason:

There is a small adjustment to 1013.4 so that it is clear that tactile signage is only required in situations where exit signage is required. The current language could be read to require tactile exit signage at exit doors where exit signage is not required, such as in single exit buildings.

The stairway and lobby identification signs are mostly for fire department personnel so they have information on where they are in the building. The signage requirements in 1023.9.1 result in a large sign (18"x12"). So that everyone in the stairway can see the sign as they evacuate, and the fire department can see the sign when they move into the stairway while occupants are still evacuating, it needs to be clarified that it is the bottom of the sign that needs to be above 5 feet. Current language does not indicate which point of the sign is at 5' and at the same time limit the options for location too much.

For the stairway identification sign to be visible when the doors are in the open and closed position (Section 1023.9) might make the best placement on a wall across from the door, not next the door. This proposal moves the requirement for visual, raised and braille signage at the doorway to a new section so it is more easily understood that this is a separate sign and the information needed. The intent of this tactile sign adjacent to the door provides for information/wayfinding for persons with vision impairments on what floor someone is on as they move to exit the building. The sign at exit discharge in Section 1013.4 would let someone know which door to leave the building (in addition to the barrier in Section 1023.8).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These signs are already required by code, this is a clarification of the requirements only.

E73-18

IBC: 1013.4, (IFC[BE] 1013.4)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Building Code

Revise as follows:

1013.4 Raised character and braille exit signs. A sign stating EXIT in visual characters, raised characters and braille and complying with ICC A117.1 shall be provided adjacent to each door to an area of refuge, providing direct access to a stairway, an exterior area for assisted rescue, an *exit stairway* or ramp, an *exit passageway*, a *horizontal exit* and the *exit discharge*.

Reason:

"Horizontal exit" is added to complete the types of locations where tactile exit signs should be provided. A greatly enlarged area of refuge is essentially a horizontal exit. Tactile signage should be placed at all such locations where passage through the opening results in a greater level of safety.

Cost Impact

The code change proposal will increase the cost of construction .

In those cases where a horizontal exit is provided, an additional sign would be required which technically would be an increase in cost.

Internal ID: 931

E74-18

IBC: 1013.6.1, (IFC[BE] 1013.6.1)

Proponent: Daniel E Nichols, MTA Metro-North Railroad, representing MTA Metro-North Railroad (dnichols@mnr.org)

2018 International Building Code

Revise as follows:

1013.6.1 Graphics. Every exit sign and directional exit sign shall have plainly legible letters not less than 6 inches (152 mm) high with the principal strokes of the letters not less than $\frac{3}{4}$ inch (19.1 mm) wide. The word "EXIT" shall have letters having a width not less than 2 inches (51 mm) wide, except the letter "I", and the minimum spacing between letters shall be not less than $\frac{3}{8}$ inch (9.5 mm). Signs larger than the minimum established in this section shall have letter widths, strokes and spacing in proportion to their height.

The word "EXIT" shall be in high contrast with the background and shall be clearly discernible when the means of exit sign illumination is or is not energized. If a chevron directional indicator is provided as part of the exit sign, the construction shall be such that the direction of the chevron directional indicator cannot be readily changed.

Exception: Where approved by the fire code official, alternative font case and dimensions of the word "EXIT" are permitted where based on the use of standardized signage criteria throughout a facility.

Reason:

In locations that utilize signage for both way-finding and emergency egress information, the consistency of lettering increases the readability of the sign. In transit systems, the use of upper- and lower-case is utilized for all information pertaining to exit points, safety information, location description, and other customer communication needs.

In the transportation discipline, the change to upper- and lower-case is being integrated into new roadway guide signs along highways. The recent release of the Manual on Uniform Traffic Control Devices issued by the Federal Highway Administration has incorporated this change to upper- and lower-case for signs that are providing information, like direction to locations. Whereas it not seem a setback to align the EXIT lettering with the remainder of adjacent signage, locations like transit systems utilize more information on a sign than just EXIT to describe how to get to an exit and what the exit actually is.

To prevent inappropriate use of this exception, there are two "gates" that must be satisfied. The first is the approval of the fire code official and the second is the development of a graphic standards design that is consistent throughout the premises.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This will not change the cost of construction as this does not change the need for exit signs.

IBC: 1014.4, (IFC[BE] 1014.4)

Proponent: Anthony Barnes, representing self (tbarnes@trexcommercial.com)

2018 International Building Code

Revise as follows:

1014.4 Continuity. *Handrail* gripping surfaces shall be continuous, without interruption by newel posts or other obstructions.

Exceptions:

1. *Handrails* within *dwelling units* are permitted to be interrupted by a newel post at a turn or landing.
2. Within a *dwelling unit*, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.
3. Handrail brackets or balusters attached to the bottom surface of the *handrail* that do not project horizontally beyond the sides of the *handrail* within 1½ inches (38 mm) of the bottom of the *handrail* shall not be considered obstructions. For each ½ inch (12.7 mm) of additional *handrail* perimeter dimension above 4 inches (102 mm), the vertical clearance dimension of 1½ inches (38 mm) shall be permitted to be reduced by ⅛ inch (3.2 mm).
4. Where *handrails* are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the *handrail* gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper *guards*.
5. *Handrails* serving stepped *aisles* or ramped *aisles* are permitted to be discontinuous in accordance with Section 1029.16.1.
6. Handrails that are part of demountable guards are permitted gaps of 1 inch (25 mm) maximum in the continuous gripping surface.

Reason:

Demountable or portable equipment is typically built out of 8' maximum length pieces. In order for a ramp or seating riser handrail to be demountable, the handrail needs to be removed easily and quickly. This is best accomplished if it's part of the guard. IBC 1014.4 requires "handrail gripping surfaces to be continuous." This is difficult to achieve without bolting on a continuous handrail to a portable guard. By making the handrail broken at locations typically associated with breaks in guards or platforms/risers, the guard and handrail can be constructed together, ensuring a swifter installation for the end user.

Cost Impact

The code change proposal will decrease the cost of construction .

This change will make for less costly railing system without sacrificing safety.

Internal ID: 2357

E76-18

IBC: 1014.1, 1014.9(New), (IFC[BE] 1014.1, 1014.9(New))

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1014.1 Where required. *Handrails* serving *flights of stairways*, ramps, stepped *aisles* and ramped *aisles* shall be adequate in strength and attachment in accordance with Section 1607.8. *Handrails* required for flights of *stairways* by Section 1011.11 shall comply with Sections 1014.2 through ~~1014.9~~ 1014.10. *Handrails* required for *ramps* by Section 1012.8 shall comply with Sections 1014.2 through 1014.8. *Handrails* for stepped *aisles* and ramped *aisles* required by Section 1029.16 shall comply with Sections 1014.2 through 1014.8.

Add new text as follows:

1014.9 Reach range. *Handrails* on the side of stairways shall be located not more than 12 inches (305 mm) laterally outward from the edge of stairway treads.

Revise as follows:

~~**1014.9**~~ **1014.10 Intermediate handrails.** *Stairways* shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a handrail. On monumental stairs, *handrails* shall be located along the most direct path of egress travel.

Reason:

Recently I reviewed a stairway design that included a bicycle runnel. Runnels are typically a 15" to 20" wide sloped track that allows a rider to push a bicycle along the side of the stairway while traversing up or down. Currently the code does not limit the maximum distance that a handrail may be located from the edge of the stair treads. The 12" limitation was chosen to allow enough room for runnels while maintaining a comfortable distance for pedestrians to reach the handrail.

SDR - BIKE RUNNEL AND HANDRAIL EXHIBIT
GGLO, 02/23/2017

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change will not affect the cost of construction one way or the other because no additional materials or labor are needed to make the installation.

Internal ID: 90

E77-18

IBC: 1015.2, (IFC[BE] 1015.2)

Proponent: Daniel E Nichols, MTA Metro-North Railroad- New York, NY, representing MTA Metro-North Railroad (dnichols@mnr.org)

2018 International Building Code

Revise as follows:

1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, including *mezzanines*, equipment *platforms*, *aisles*, *stairs*, *ramps* and landings that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.8.

Exception: *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of *stages* and raised *platforms*, including *stairs* leading up to the *stage* and raised *platforms*.
3. On raised *stage* and platform floor areas, such as runways, *ramps* and side *stages* used for entertainment or presentations.
4. At vertical openings in the performance area of *stages* and *platforms*.
5. At elevated walking surfaces appurtenant to *stages* and *platforms* for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not *accessible* to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1029.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.

Reason:

This proposal adds an exception that is commonly recognized in the train stations; the absence of a guard on train station platforms where passenger loading occurs. The use of qualifier "on the loading side" is consistent with that of exception #1. The terms "fixed guideway transit systems" and "passenger rail systems" are consistent with the definitions of transportation systems found in NFPA 130.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This does not change the cost of construction since this is a clarification of how platforms are treated when applying the guard requirements.

Internal ID: 947

E78-18

IBC: 1015.4, (IFC[BE] 1015.4)

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net)

2018 International Building Code

Revise as follows:

1015.4 Opening limitations. Required *guards* shall not have openings that allow passage of a sphere 4 inches (102 mm) in diameter from the walking surface to the required *guard* height.

Exceptions:

1. ~~From a height of 36 inches (914 mm) to 42 inches (1067 mm), *guards* shall not have openings that allow passage of a sphere 4³/₈ inches (111 mm) in diameter.~~
2. The triangular openings at the open sides of a stair, formed by the riser, tread and bottom rail shall not allow passage of a sphere 6 inches (152 mm) in diameter.
3. At elevated walking surfaces for access to and use of electrical, mechanical or plumbing systems or equipment, *guards* shall not have openings that allow passage of a sphere 21 inches (533 mm) in diameter.
4. In areas that are not open to the public within occupancies in Group I-3, F, H or S, and for *alternating tread devices* and ships ladders, *guards* shall not have openings that allow passage of a sphere 21 inches (533 mm) in diameter.
5. In assembly seating areas, *guards* required at the end of *aisles* in accordance with Section 1029.17.4 shall not have openings that allow passage of a sphere 4 inches (102 mm) in diameter up to a height of 26 inches (660 mm). From a height of 26 inches (660 mm) to 42 inches (1067 mm) above the adjacent walking surfaces, *guards* shall not have openings that allow passage of a sphere 8 inches (203 mm) in diameter.

Reason:

This exception is useless. It was changed from 6 inches to 4 3/8 inch just so we didn't need to go to 4 inches. There is no practical purpose to go to 4 3/8 inch at the top of the guard. This exception is never used.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No one uses this exception. So, it won't affect the cost of construction either way.

Internal ID: 1068

E79-18

IBC: 1015.4, (IFC[BE] 1015.4)

Proponent: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)

2018 International Building Code

Revise as follows:

1015.4 Opening limitations. Required *guards* shall not have openings that allow passage of a sphere 4 inches (102 mm) in diameter from the walking surface to the required *guard* height.

Exceptions:

1. From a height of 36 inches (914 mm) to 42 inches (1067 mm), *guards* shall not have openings that allow passage of a sphere $4\frac{3}{8}$ inches (111 mm) in diameter.
2. The triangular openings at the open sides of a stair, formed by the riser, tread and bottom rail shall not allow passage of a sphere 6 inches (152 mm) in diameter.
3. At elevated walking surfaces for access to and use of electrical, mechanical or plumbing systems or equipment, *guards* shall not have openings that allow passage of a sphere 21 inches (533 mm) in diameter.
4. In areas that are not open to the public within occupancies in Group I-3, F, H or S, and for *alternating tread devices* and ships ladders, *guards* shall not have openings that allow passage of a sphere 21 inches (533 mm) in diameter.
5. In assembly seating areas, *guards* required at the end of *aisles* in accordance with Section 1029.17.4 shall not have openings that allow passage of a sphere 4 inches (102 mm) in diameter up to a height of 26 inches (660 mm). From a height of 26 inches (660 mm) to 42 inches (1067 mm) above the adjacent walking surfaces, *guards* shall not have openings that allow passage of a sphere 8 inches (203 mm) in diameter.
6. ~~Within individual dwelling units and sleeping units in Group R-2 and R-3 occupancies, guards~~ Guards on the open sides of *stairs* shall not have openings that allow passage of a sphere $4\frac{3}{8}$ (111 mm) inches in diameter.

Reason:

The $4\frac{3}{8}$ inch sphere rule for guards on stairs has been working well without issue and has proven to be effective in both IBC residential applications and IRC applications, where the susceptible, very- young-children, are far more prevalent than in commercial and public places. A 4" sphere rule requirement for stair guards is an unnecessary and excessive regulation. This change will increase the sphere rule limitation to $4\frac{3}{8}$ inches for all stair guards but will not affect other required guards.

Cost Impact

The code change proposal will decrease the cost of construction .

Fewer balusters or less in-fill material will reduce both material and fabrication costs.

Internal ID: 1041

E80-18

IBC: 1015.8, (IFC[BE] 1015.8)

Proponent: Timothy Pate, Colorado Chapter Code Change Committee, representing Colorado Chapter Code Change Committee (tpate@broomfield.org)

2018 International Building Code

Revise as follows:

1015.8 Window openings. Windows in Group R-2 and R-3 buildings including *dwelling units*, where the ~~top of the sill~~ bottom of an operable window opening is located less than 36 inches above the finished floor and more than 72 inches (1829 mm) above the finished grade or other surface below on the exterior of the building, shall comply with one of the following:

1. Operable windows where the top of the sill of the opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below and that are provided with window fall prevention devices that comply with ASTM F2006.
2. Operable windows where the openings will not allow a 4-inch-diameter (102 mm) sphere to pass through the opening when the window is in its largest opened position.
3. Operable windows where the openings are provided with window fall prevention devices that comply with ASTM F2090.
4. Operable windows that are provided with window opening control devices that comply with Section 1015.8.1.

Reason:

This proposal will change the language on how to measure above the floor for when you need to provide child fall protection. The current language says to measure to the sill and there is not a definition of sill. The sill is typically lower than the bottom of the window opening. This change will modify language to have the measurement to the bottom of the actual opening of the window and will also get language to match what is in section 1030.3 for how to measure for maximum height of egress windows above floor.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There will not be any cost impact since the change is just to clarify how to measure height above floor.

Internal ID: 1037

IBC: 1015.8, (IFC[BE] 1015.8)

Proponent: Jim Tidwell, Tidwell Code Consulting, representing Self (jimtiddwell@tccfire.com); Jim Graham, Self, representing National Association for Child Window Safety (jgraham@childwindowsafety.org)

2018 International Building Code

Revise as follows:

1015.8 Window openings. Windows in Group R-2 and R-3 buildings including *dwelling units*, where the top of the sill of an operable window opening is located ~~less than 36 inches above the finished floor and~~ more than 72 inches (1829 mm) above the finished grade or other surface below on the exterior of the building, shall comply with one of the following:

1. Operable windows where the top of the sill of the opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below and that are provided with window fall prevention devices that comply with ASTM F2006.
2. Operable windows where the openings will not allow a 4-inch-diameter (102 mm) sphere to pass through the opening when the window is in its largest opened position.
3. Operable windows where the openings are provided with window fall prevention devices that comply with ASTM F2090.
4. Operable windows that are provided with window opening control devices that comply with Section 1015.8.1.

Exception: Windows over counters, plumbing fixtures or doors.

Reason:

This code change is intended to address the ongoing problem of children climbing onto and falling from windows. According to a report published in the *Journal Pediatrics®*, Official Journal of the American Academy of Pediatrics, "From 1990 through 2008, an estimated 98,415 children (95% CI: 82 416– 114 414 children) were treated in US hospital EDs for injuries attributable to a fall from a window, with an average of 5,180 patients (95% CI: 4828 –5531 patients) per year." This report is the most recent, comprehensive study to date on the problem.

There is a viable, inexpensive solution to this problem that has proven effective in the largest city in the United States, New York City. In the mid 1970's, New York City implemented a program they called "Children Can't Fly" in an effort to reduce injuries resulting from window falls. A center piece of that effort was a Local Law requiring window guards in every building with three or more apartments where children under 10 resided. Since then, injuries and deaths from window falls have been dramatically reduced. According to Barbara Barlow, MD, Chief of Pediatric Surgery, Harlem Hospital Center, "The 96% decrease in accidental falls from windows since 1979 demonstrates that the "Children Can't Fly" program in New York City has almost eliminated accidental falls from windows in our hospital population" [quote from report titled "Ten years of experience with falls from a height in children, Barlow B, Niemirska M, Gandhi R, Leblanc W (1983)].

Note that the New York City statute does not stipulate a minimum sill height, as they recognized the fact that children climb on windows; furniture placed near a window can provide a means to climb to the window; and children are inherently curious and will explore areas, such as windows, that have proven dangerous when not properly protected by child window fall protection devices. Using a sill height as a threshold to require fall protection is fallacious because the fall protection is necessary for climbing, exploring children, not just a child who happens to trip and fall near a window.

Also, New York City did not accept limiting devices as a solution. There is another proposal to address this issue separately.

This proposal is simple and straightforward. It removes the reference to a minimum sill height measured inside the room. The current 36" threshold isn't high enough to prevent many children from accidentally falling from a window even if the child is at floor level. For children climbing on the window or adjacent furniture (a significant portion of the problem), any sill height is simply a way around solving the problem, and will not have the desired effect.

Approving this code change will undoubtedly save thousands of children from serious injuries or death at a very low cost.

Cost Impact

The code change proposal will increase the cost of construction .

Increased cost include the addition fall protection for windows not currently required to be equipped with such protection.

Internal ID: 587

E82-18

IBC: 1015.8, 1015.8.1, (IFC[BE] 1015.8, 1015.8.1)

Proponent: Jim Tidwell, Tidwell Code Consulting, representing Self (jimtiddwell@tccfire.com); Jim Graham, Self, representing National Association for Child Window Safety (jgraham@childwindowsafety.org)

2018 International Building Code

Revise as follows:

1015.8 Window openings. Windows in Group R-2 and R-3 buildings including *dwelling units*, where the top of the sill of an operable window opening is located less than 36 inches above the finished floor and more than 72 inches (1829 mm) above the finished grade or other surface below on the exterior of the building, shall comply with one of the following:

- ~~1. Operable windows where the top of the sill of the opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below and that are provided with window fall prevention devices that comply with ASTM F2006.~~
- ~~2.1.~~ Operable windows where the openings will not allow a 4-inch-diameter (102 mm) sphere to pass through the opening when the window is in its largest opened position.
- ~~3.~~ Operable windows where the openings are provided with window fall prevention devices that comply with ASTM F2090.
- ~~4.~~ Operable windows that are provided with window opening control devices that comply with Section ~~1015.8.1.~~
2. Operable windows equipped with corrosion resistant screen capable of withstanding a minimum force of 60 pounds (27 kg) as a concentrated load applied to the center of the screen.
3. Operable windows equipped with barriers with openings that do not allow the passage of a sphere 4 inches (102 mm) in diameter and are capable of withstanding a minimum force of 60 pounds (27 kg) as a concentrated load applied at an location on the barrier.

Delete and substitute as follows:

~~**1015.8.1 Window opening control devices.** Window opening control devices shall comply with ASTM F2090. The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Section 1030.2.~~

1015.8.1 Operation during emergencies. Windows provided for emergency escape and rescue shall comply with Section 1015.8 and Section 1030.2 for operation during emergencies.

Reason:

This code change is intended to address the ongoing problem of children climbing onto and falling from windows. According to a report published in the Journal Pediatrics®, Official Journal of the American Academy of Pediatrics, "From 1990 through 2008, an estimated 98,415 children (95% CI: 82 416- 114 414 children) were treated in US hospital EDs for injuries attributable to a fall from a window, with an average of 5,180 patients (95% CI: 4828 -5531 patients) per year." This report is the most recent, comprehensive study to date on the problem.

There is a viable, inexpensive solution to this problem that has proven effective in the largest city in the United States, New York City. In the mid 1970's, New York City implemented a program they called "Children Can't Fly" in an effort to reduce injuries resulting from window falls. A center piece of that effort was a Local Law requiring window guards in every building with three or more apartments where children under 10 resided. Since then, injuries and deaths from window falls have been dramatically reduced. According to Barbara Barlow, MD, Chief of Pediatric Surgery, Harlem Hospital Center, "The 96% decrease in accidental falls from windows since 1979 demonstrates that the "Children Can't Fly" program in New York City has almost eliminated accidental falls from windows in our hospital population" [quote from report titled "Ten years of experience with falls from a height in children, Barlow B, Niemirska M, Gandhi R, Leblanc W (1983)].

Note that the New York City statute does not stipulate a minimum sill height, as they recognized the fact that children climb on windows; furniture placed near a window can provide a means to climb to the window; and children are inherently curious and will explore areas, such as windows, that have proven dangerous when not properly protected by child window fall protection devices. Using a sill height as a threshold to require fall protection is fallacious because the fall protection is necessary for climbing, exploring children, not just a child who happens to trip and fall near a window.

Also, New York City did not accept limiting devices as a solution. While those devices meet the criteria of ASTM standards, it is widely recognized that the devices are easily and regularly defeated by occupants in need of ventilation, especially during warm weather. When engaged, the limiting devices only allow the window to be opened four inches; however, they are intentionally constructed to allow an adult to easily override the safety feature to fully open the window, thus exposing the child to the fall risk they're intended to address. There is no available data to indicate these devices are having the intended effect, thus the need for a passive physical barrier that allows the window to open to provide necessary ventilation in a space. Allowing these devices in lieu of a physical barrier as described in this proposal places those with the greatest need – the lower socioeconomic strata of our society who depend upon natural ventilation for comfort in warm weather – at the greatest risk.

This proposal is simple and straightforward. It will require all operable windows in residential occupancies to have passive barriers – either window screens or window guards – that meet the ASTM standards for fall protection (60 lbs. concentrated load). It does not recognize limiting devices, as these have shown to be easily overridden, and of limited value.

There is another proposal that addresses the sill height.

Approving this code change will undoubtedly save thousands of children from serious injuries or death at a very low cost.

Cost Impact

The code change proposal will increase the cost of construction .

Potential increase in cost due to the difference in the cost of guards or screens in lieu of vent stops.

IBC: 1015.6, 1015.7 (IFC[BE] 1015.6, 1015.7; IMC[BE]304.11), 3302.4(New)

Proponent: Lauren Bauerschmidt, American Society of Safety Engineers, representing American Society of Safety Engineers (LBauerschmidt@asse.org)

2018 International Building Code

Revise as follows:

1015.6 Mechanical equipment, systems and devices. *Guards* shall be provided where various components that require service are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The *guard* shall extend not less than 30 inches (762 mm) beyond each end of such components. The *guard* shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter.

Exception: Guards are not required where personal permanent anchorage connectors used in fall arrest anchorage connector devices and restraint systems that comply with ANSI/ASSE Z359.1 are installed. The anchorage connectors shall be inspected and maintained in accordance with ANSI/ASSE Z359.1.

1015.7 Roof access. *Guards* shall be provided where the roof hatch opening is located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The *guard* shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter.

Exception: *Guards* are not required where personal permanent anchorage connectors used in fall arrest anchorage connector devices and restraint systems that comply with ANSI/ASSE Z359.1 are installed. The anchorage connectors shall be inspected and maintained in accordance with ANSI/ASSE Z359.1.

Add new text as follows:

3302.4 Fall protection and fall arrest. Fall protection and fall arrest systems shall comply with applicable requirements of this code and shall comply with ANSI/ASSE Z359.1.

2018 International Mechanical Code

Revise as follows:

[BE] 304.11 Guards. Guards shall be provided where various components that require service and roof hatch openings are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof, or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of components that require service. The top of the guard shall be located not less than 42 inches (1067 mm) above the elevated surface adjacent to the guard. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the International Building Code.

Exception: Guards are not required where permanent anchorage connectors used in fall arrest and restraint anchorage connector devices systems that comply with ANSI/ASSE Z359.1 are installed. The anchorage connectors shall be inspected and maintained in accordance with ANSI/ASSE Z359.1.

Reason:

Year over year, falls from heights are the leading cause of death and injury on work sites. In building construction within the scope of the IBC ("construction, alteration, relocation, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal and demolition of every building or structure"), workers are exposed to falls

from heights. The Code must include requirements to either eliminate fall hazards, guard against falls or install fall arrest/restraint systems to prevent injuries and fatalities. The code change proposal incorporates fall protection and fall arrest requirements because the current Code is inadequate.

In response to suggestions ASSE has received, ANSI/ASSE Z359.1-2016 The Fall Protection Code is a comprehensive reference document. The Z359.1-2016 standard states: "The Fall Protection Code encompasses standards for personal fall protection systems that incorporate a full body harness, intended to protect the user against falls from a height either by preventing or arresting free falls. In general, systems that prevent or restrain a fall are preferable to systems that arrest a free fall." By referencing the ANSI/ASSE Z359.1-2016 standard, greater clarification is provided for safe work practices to avoid falls from height causing potential injury or fatality.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

OSHA 1926.501(a) Safety and Health Regulations for Construction already requires construction to have fall protection. Referencing the ANSI/ASSE Z359.1-2016 standard provides direction to comply with that requirement. Therefore, this code change does not impact the cost of construction.

Internal ID: 1388

E84-18

IBC: 1015.7 (IFC[BE] 1015.7, IMC[BE] 304.11)

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gcmcmann@jeffco.us)

2018 International Building Code

Revise as follows:

1015.7 Roof access. *Guards* shall be provided where the roof hatch opening is located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall extend 30 inches (762mm) beyond each end of the hatch parallel to the roof edge. *The guard* shall be constructed so as to prevent the passage of a sphere 21 inches (533 mm) in diameter.

Exception: *Guards* are not required where personal fall arrest anchorage connector devices that comply with ANSI/ASSE Z 359.1 are installed.

2018 International Mechanical Code

[BE] 304.11 Guards. Guards shall be provided where various components that require service and roof hatch openings are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof, or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of components that require ~~service.~~ service and each end of the hatch parallel to the roof edge. The top of the guard shall be located not less than 42 inches (1067 mm) above the elevated surface adjacent to the guard. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the International Building Code.

Exception: Guards are not required where fall arrest/restraint anchorage connector devices that comply with ANSI/ASSE Z 359.1 are installed.

Reason:

The guard needs to be extended beyond the ends of the hatch that is parallel to the roof edge in order to eliminate the tripping hazard that is common when using the hatch. Tools, cords, equipment and other things can easily trip someone up. It's common to use the perimeter wall to fasten a ladder on and position the hatch at the edge of the roof which could seriously injure or kill someone. As can be seen in the photo, it would be easy to trip and fall off the roof even if there is a guard there for the width of the hatch only. This is a true example of life safety.

Cost Impact

The code change proposal will increase the cost of construction .

The cost may increase to provide the added safety feature.

Internal ID: 110

E85-18

IBC: 1016.2, (IFC[BE] 1016.2)

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows:

1016.2 Egress through intervening spaces. Egress through intervening spaces shall comply with this section.

1. *Exit access* through an enclosed elevator lobby is permitted. ~~Access to~~ Where access to two or more exits or exit access doorways is required in Section 1006.2.1, access to not less than one of the required *exits* shall be provided without travel through the enclosed elevator lobbies required by Section 3006. Where the path of *exit access* travel passes through an enclosed elevator lobby, the level of protection required for the enclosed elevator lobby is not required to be extended to the exit unless direct access to an exit is required by other sections of this code.
2. Egress from a room or space shall not pass through adjoining or intervening rooms or areas, except where such adjoining rooms or areas and the area served are accessory to one or the other, are not a Group H occupancy and provide a discernible path of egress travel to an exit.
Exception: *Means of egress* are not prohibited through adjoining or intervening rooms or spaces in a Group H, S or F occupancy where the adjoining or intervening rooms or spaces are the same or a lesser hazard occupancy group.
3. An *exit access* shall not pass through a room that can be locked to prevent egress.
4. *Means of egress* from *dwelling units* or sleeping areas shall not lead through other sleeping areas, toilet rooms or bathrooms.
5. Egress shall not pass through kitchens, storage rooms, closets or spaces used for similar purposes.

Exceptions:

1. *Means of egress* are not prohibited through a kitchen area serving adjoining rooms constituting part of the same *dwelling unit* or *sleeping unit*.
2. *Means of egress* are not prohibited through stockrooms in Group M occupancies where all of the following are met:
 - 2.1. The stock is of the same hazard classification as that found in the main retail area.
 - 2.2. Not more than 50 percent of the *exit access* is through the stockroom.
 - 2.3. The stockroom is not subject to locking from the egress side.
 - 2.4. There is a demarcated, minimum 44-inch-wide (1118 mm) *aisle* defined by full- or partial-height fixed walls or similar construction that will maintain the required width and lead directly from the retail area to the exit without obstructions.

Reason:

This proposal is clarifying that when access to two or more exits are required, one access can go through elevator lobby. Where only one access, due to low occupant load, is required then that access can go through elevator lobby.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification for single exit spaces and will not change construction requirements.

Internal ID: 1520

E86-18

IBC: 1017.3, (IFC[BE] 1017.3)

Proponent: John Terry, self, representing self (John.Terry@dca.nj.gov)

2018 International Building Code

Revise as follows:

SECTION 1017 EXIT ACCESS TRAVEL DISTANCE

1017.3 Measurement. *Exit access* travel distance shall be measured from the most remote point of each room, area or space along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit. Where more than one means of egress is required, exit access travel distance shall be measured to the nearest exit.

Exception: In open parking garages, *exit access* travel distance is permitted to be measured to the closest riser of an *exit access stairway* or the closest slope of an *exit access ramp*.

Reason:

The text of this section is too subtle where it is stated that travel distance is measured to “an” exit. The added language makes clear the intent of the requirement.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change merely clarifies the intent of the current text and therefore has no impact on cost.

Internal ID: 271

E87-18

IBC: 1019.2, 1019.3, 1019.4, (IFC[BE] 1019.2, 1019.3, 1019.4)

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com)

2018 International Building Code

Add new text as follows:

1019.2 Construction. Where exit access stairways and ramps are required to be enclosed by other provisions of this section, they shall be constructed in accordance with the provisions of Section 1023.2. Stairway openings, penetrations and ventilation shall be in accordance with the provisions of Sections 1023.4, 1023.5 and 1023.6, respectively.

Revise as follows:

~~1019.2~~**1019.3 All occupancies.** *Exit access stairways and ramps* that serve floor levels within a single story are not required to be enclosed.

~~1019.3~~**1019.4 Occupancies other than Groups I-2 and I-3.** In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways or ramps* that do not comply with one of the conditions *listed* in this section shall be enclosed ~~with a shaft enclosure constructed in accordance with Section 713.~~

1. *Exit access stairways and ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit access stairways and ramps* connecting four stories or less serving and contained within an individual *dwelling unit or sleeping unit or live/work unit*.
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways and ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway or ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways and ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways and ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairwaysrampssmoke-protected or open-air assembly seatingexit access* travel distance requirements of Section 1029.7.
8. *Exit access stairwaysramps* gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.

~~1019.4~~**1019.5 Group I-2 and I-3 occupancies.** In Group I-2 and I-3 occupancies, floor openings between stories containing *exit access stairways or ramps* are required to be enclosed ~~with a shaft enclosure constructed in accordance with Section 713.~~

Exception: In Group I-3 occupancies, *exit access stairways or ramps* constructed in accordance with Section 408 are not required to be enclosed.

Reason:

Currently, where exit access stairways and ramps are required to be enclosed by Sections 1019.3 or 1019.4, those sections state that they should be enclosed with a shaft enclosure in accordance with Section 713. This proposal deletes those references and replaces them with a new construction provision in Section 1019.2 that requires that enclosed exit access stairways comply with Section 1023 construction, opening protection, penetration protection and ventilation requirements as for interior exit stairways.

The current shaft enclosure construction requirement has legacy origins for convenience stairways. Exit access stairways, however, are formal means of egress components and their construction should be consistent with occupant safety needs. The apparent upgrade is less impactful than might be thought. The construction requirements for shaft

enclosures and interior exit stairways are virtually identical. The primary difference occurs with opening and penetration protection requirements. Obviously, interior exit stairway opening and penetration provisions are better suited to protect occupants in the means of egress as opposed to present utility protection concerns.

The original purpose of the exit access stairway concept was to allow for unenclosed, non-rated interior stairways within building spaces so as to allow for occupant circulation and access to exits at other building levels. Where Section 1019.3 conditions are exceeded, such exit access stairways must be enclosed. As occupants enter an enclosed stairway, they have an expectation that those stairways will provide a relatively tenable environment during egress. To meet occupant expectations and increase fire and life safety, shaft enclosure construction requirements are proposed to be replaced by interior exit stairway construction requirements. Approval of this proposal will increase occupant safety based on current means of egress philosophy.

Cost Impact

The code change proposal will decrease the cost of construction .

Shaft enclosure and interior exit stairway construction requirements are virtually identical. Interior exit stairway opening, penetration and ventilation requirements, however, are much more restrictive. Due to the limited types and numbers of such breeches, construction costs should decrease. Practically speaking, these are the types of protections that would logically be used in an enclosed stairway; and therefore, would likely not impact the cost of construction.

Internal ID: 1568

E88-18

IBC: 1019.3, (IFC[BE]1019.3)

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* ~~that do not comply with one of the conditions listed in this section~~ shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

Exceptions:

1. *Exit access stairways* and *ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit access stairways* and *ramps* connecting four stories or less serving and contained within an individual *dwelling unit* or *sleeping unit* or *live/work unit*.
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways* and *ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway* or *ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways* and *ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways* and *ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways* and *ramps* serving *smoke-protected* or *open-air assembly seating* complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways* and *ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.

Reason:

The charging language in this section is difficult to interpret. The eight items listed are essentially exceptions to the requirement for the stair or ramp to be in an enclosed shaft so why not say it that way?

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarrification only. This change will not impact the cost of construction.

Internal ID: 305

E89-18

IBC: 1019.3, (IFC[BE] 1019.3)

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing exit access stairways or ramps that do not comply with one of the conditions listed in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. Exit access stairways and ramps that serve or atmospherically communicate between only two adjacent stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit or sleeping unit or live/work unit.
3. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. Exit access stairways and ramps in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the stairway or ramp and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. Exit access stairways and ramps within an atrium complying with the provisions of Section 404.
6. Exit access stairways and ramps in open parking garages that serve only the parking garage.
7. Exit access stairways and ramps serving smoke-protected or open-air assembly seating complying with the exit access travel distance requirements of Section 1029.7.
8. Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.

Reason:

Under the current code it is possible to "skip" a story with the stair shaft which could create a path for smoke migration from, for example, the 1st story to the 3rd or 4th story. This change would require that the stories be adjacent to each other in order for the stairway to be open.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarrification only; no cost impact.

Internal ID: 94

E90-18

IBC: TABLE 1020.2, (IFC[BE] TABLE 1020.2)

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows:

**TABLE 1020.2
MINIMUM CORRIDOR WIDTH**

OCCUPANCY	MINIMUM WIDTH (inches)
Any facility not <i>listed</i> in this table	44
Access to and utilization of mechanical, plumbing or electrical systems or equipment	24 36
With an <i>occupant load</i> of less than 50	36
Within a <i>dwelling unit</i>	36
In Group E with a <i>corridor</i> having an <i>occupant load</i> of 100 or more	72
In corridors and areas serving stretcher traffic in ambulatory care facilities	72
Group I-2 in areas where required for bed movement	96

For SI: 1 inch = 25.4 mm.

Reason:

In order to be consistent with Section 306.2 of IMC and Section 1010.1.1 of IBC, this change is warranted.

Cost Impact

The code change proposal will increase the cost of construction .

The change of corridor and door widths will increase the cost of construction.

Internal ID: 1523

E91-18

IBC: 1020.4, (IFC[BE] 1020.4)

Proponent: John Mengedoht, representing NBBJ (jmengedoht@nbbj.com)

2018 International Building Code

Revise as follows:

1020.4 Dead ends. Where more than one exit or *exit access doorway* is required, the *exit access* shall be arranged such that dead-end *corridors* do not exceed 20 feet (6096 mm) in length.

Exceptions:

1. In in Group I-3, Condition 2, 3 or 4, occupancies, the dead end in a *corridor* shall not exceed 50 feet (15 240 mm).
2. In occupancies in Groups B, E, F, I-1, M, R-1, R-2, S and U, where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the length of the dead-end *corridors* shall not exceed 50 feet (15 240 mm).
3. A dead-end *corridor* shall not be limited in length where the length of the dead-end *corridor* is less than 2.5 times the least width of the dead-end corridor.
4. In Group I-2, Condition 2 occupancies, the length of dead end corridors that do not serve patient rooms or patient treatment spaces shall not exceed 30 feet (9144 mm).

Reason:

The 20 foot dead end corridor limit makes sense in hospitals where patients might not be easily or rapidly moved. However, 20 feet does not appear to make sense for for non-patient areas such as staff areas or small waiting areas for visitors which are functionally similar to Group B spaces. Hospitals receiving Medicare or Medicaid payments (nearly all) are subject to the federal Centers for Medicare and Medicaid Services (CMS), which requires compliance with the 2012 NFPA 101. The NFPA 101 requires a maximum of 30 foot dead end corridors in "health care" occupancies (hospitals) so this proposal will align with NFPA 101 in this regard.

At the same time, the NFPA 101 requires a 2 hour separation between health care (hospital) occupancies and other occupancies. Therefore, designating areas of a hospital as Group B in order to achieve longer dead end corridors is not cost-effective due to the added cost of the 2 hour rated occupancy separation.

Bibliography:

2012 NFPA 101, Chapter 18 New Health Care Occupancies, Section 18.2.5.2: Dead-end corridors shall not exceed 30 ft (9.1 m).

2012 NFPA 101, Chapter 19 Existing Health Care Occupancies, Section 19.2.5.2: Existing dead-end corridors not exceeding 30 ft (9.1 m) shall be permitted.

2012 NFPA 101, Chapter 18 New Health Care Occupancies, Section 18.1.3.3: Sections of health care facilities shall be permitted to be classified as other occupancies, provided that... they are separated from areas of health care occupancies by construction having a minimum 2 hour fire resistance rating in accordance with Chapter 8.

2012 NFPA 101, Chapter 18 Existing Health Care Occupancies, Section 19.1.3.3: Sections of health care facilities shall be permitted to be classified as other occupancies, provided that... they are separated from areas of health care occupancies by construction having a minimum 2 hour fire resistance rating in accordance with Chapter 8.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Extending dead end corridors to a maximum of 30 feet will not impact the cost of construction but it will provide greater flexibility in the design of hospitals.

Internal ID: 1310

E92-18

IBC: 1020.5 (IFC[BE] 1020.5)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

1020.5 Air movement in corridors. Corridors shall not serve as supply, return, exhaust, relief or ventilation air ducts.

Exceptions:

1. Use of a *corridor* as a source of makeup air for exhaust systems in rooms that open directly onto such corridors, including toilet rooms, bathrooms, dressing rooms, smoking lounges and janitor closets, shall be permitted, provided that each such *corridor* is directly supplied with outdoor air at a rate greater than the rate of makeup air taken from the corridor.
2. Where located within a *dwelling unit*, the use of *corridors* for conveying return air shall not be prohibited.
3. Where located within tenant spaces of 1,000 square feet (93 m²) or less in area, utilization of *corridors* for conveying return air is permitted.
4. ~~Incidental air movement from pressurized rooms within health care facilities, provided that the corridor is not the primary source of supply or return to the room.~~ Transfer air movement required to maintain pressurization difference within health care facilities in accordance with Section 407.1 of the International Mechanical Code.

Reason:

This is a clarification for when the corridor can be used for air movement. ASHREA 170 was added in IMC which clarifies which rooms are pressurized. This makes that connection in the codes. This is intended to cover transfer air for both positive and negative charged rooms. We thought 'transfer' was a more descriptive word for the air movement.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

ASHREA 170 is already required in the IMC for pressurized rooms, so there are no changes to construction requirements.

Internal ID: 708

E93-18

IBC: 1021.4, (IFC[BE] 1021.4)

Proponent: Lawrence Cousin, representing Self (larrycivic@hotmail.com)

2018 International Building Code

Revise as follows:

1021.4 Location. Exterior egress balconies shall have a minimum *fire separation distance* of 10 feet (3048 mm) measured at right angles from the exterior edge of the egress balcony to the following:

1. Adjacent *lot lines*.
2. Other portions of the building.
3. Other buildings and equipment yards on the same lot unless the adjacent building *exterior walls* and openings are protected in accordance with Section 705 based on fire separation distance.

For the purposes of this section, other portions of the building shall be treated as separate buildings.

Reason:

This is necessary to address the ambiguity of the required minimum separation distance (clearance) between a building and equipment yard on the same lot. Equipment yard is not a building but the slab on which the equipment stands is a structure. Case in point is trying to establish the minimum required distance between a school building and equipment yard/chiller. Just need clarity in the code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The cost will not change because this proposal addresses separation distance from structure to structure. Elsewhere in the code describes construction based on separation distance.

Internal ID: 1380

E94-18

IBC: 1023.2, (IFC[BE] 1023.2)

Proponent: Stephen Thomas, representing Colorado Chapter ICC (sthomas@coloradocode.net)

2018 International Building Code

Revise as follows:

1023.2 Construction. Enclosures for interior exit *stairways* and *ramps* shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. *Interior exit stairway* and *ramp* enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit *stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. Enclosures for ~~interior-interior~~ exit stairways and ramps shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions:

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. *Interior exit stairways* within an *atrium* enclosed in accordance with Section 404.6.

Reason:

This change is editorial in nature. We are only trying to make the last sentence consistent with the first sentence. The enclosure is what is required to be fire-resistant rated, not the stairway itself.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change is editorial in nature.

Internal ID: 237

E95-18

IBC: 1023.2, (IFC[BE] 1023.2)

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows:

1023.2 Construction. Enclosures for interior exit *stairways* and *ramps* shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. *Interior exit stairway* and *ramp* enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit *stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. *Interior exit stairways* and *ramps enclosures* shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions:

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. *Interior exit stairways* within an *atrium* enclosed in accordance with Section 404.6.

Reason:

This is merely a clarification to the section.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an editorial correction with not changes for construction requirements.

E96-18

IBC: 1023.2, (IFC[BE] 1023.2)

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com); Douglas Evans, representing DHE FPE LLC (dhefpe@gmail.com)

2018 International Building Code

Revise as follows:

1023.2 Construction. Enclosures for interior exit *stairways* and *ramps* shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. *Interior exit stairway* and *ramp* enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit *stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. *Interior exit stairways* and *ramps* shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions-Exception:

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. ~~*Interior exit stairways* within an atrium enclosed in accordance with Section 404.6.~~

Reason:

Exception 2 to interior exit stairway enclosure construction within an atrium space was introduced in the 2015 Edition of the IBC. The proponent's published reason statement contended that the inherent one-hour atrium enclosure protection and required smoke control was equivalent to a one-hour interior exit stairway enclosure. Although equivalency to a one-hour enclosure can be debated, exit stairways serving four or more stories are required to be of 2-hour fire resistance-rated construction. The atrium enclosure protection is also exempted on three levels (404.6 Exception 3), which allows these stairs open to those levels.

This provision is also philosophically flawed on many levels. Interior exit stairway enclosures are to be used for no purpose other than as a means of egress. Opening and penetration protection requirements are intended to limit exposure of the enclosure.

The plural in Exception 2 (stairways) allows all required exits to be through the atrium. The current exception allows occupants unlimited egress travel distance down unenclosed stairways even if the stairs are within the smoke plume. Furthermore, compliance with Section 909 is typically reliant on fans, dampers, secondary power supplies and the ever changing fuel loading on the atrium floor. In high-rise buildings, such stairways are required to be within smokeproof enclosures.

Allowing unlimited travel distance on an unenclosed stairway is technically and philosophically inconsistent with the exit access travel distance limitations stated at Section 404.9. Those provisions allow for a maximum of 200 feet of travel at other than the level of exit discharge. The IBC Code and Commentary, Volume I states, "Since smoke is being drawn into the atrium, the time allotted to reach an exit through the atrium is limited." It would seem logical that that same thinking would apply to an unenclosed interior exit stairway.

Additionally, Section 905.4 requires a standpipe hose connection for each story in every required interior exit stairway since these enclosures provide a protected space for fire department operations. Obviously, there is no passive standpipe hose connection protection in an unenclosed interior exit stairway.

Traditionally, exit access stairways within atrium spaces have been allowed to be unenclosed (Section 1019.3, Condition 5). However, exit access travel distance limitations in Section 1017.2 apply. In fact, Table 1017.2 Footnote a, references Section 404.9 travel distance limitations through an atrium space. This minimally creates confusion, if not a contradiction.

This proposal restores the original ICC Code Technology Committee philosophy that interior exit stairways always be enclosed with no exceptions. Removal of the current exception ensures a protected path of means of egress travel for building occupants between the exit access and exit discharge portions of the means of egress system.

Cost Impact

The code change proposal will increase the cost of construction .

Approval of this proposal will increase the cost of construction only in buildings having an atrium where an unenclosed interior exit stairway is desired. If the building otherwise has the required number of exits, such a stairway would be

regarded as an exit access stairway and there would be no cost impact.

Internal ID: 1479

E97-18

IBC: 1023.4, (IFC[BE] 1023.4)

Proponent: Keith Flanders, Cosentini Associates, representing self (kflanders@cosentini.com)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows:

1023.4 Openings. *Interior exit stairway and ramp* opening protectives shall be in accordance with the requirements of Section 716.

Openings in *interior exit stairways* and *ramps* other than unprotected exterior openings shall be limited to those required for *exit access* to the enclosure from normally occupied spaces and for egress from the enclosure.

Elevators shall not open into *interior exit stairways* and ramps.

Exception:Openings are permitted from a normally unoccupied space where the interior exit stairway or ramp is pressurized as a smokeproof enclosure in accordance with Section 909.20.6.

Reason:

A pressurized smokeproof enclosure requires a smoke detector be provided at the entrance to the interior exit stairway or ramp. As such, the concern of a fire developing unnoticed is mitigated by the presence of a smoke detector which is connected to building fire alarm system. This allows for early notification of building occupants, quick response by the fire department, and activation of the pressurization system to protect the stair from smoke infiltration.

Often times, a mechanical penthouse or fire pump room is directly accessed from a stair. However, these are considered normally unoccupied spaces and therefore a vestibule must be provide between the stair and the mechanical space to alleviate these door opening provisions from such a space. However, when the stair is pressurized, the additional requirements alleviate the concerns of openings from a normally unoccupied space. Accordingly it is reasonable to have the normally unoccupied space open into the stair without requiring a vestibule to separate the two spaces.

Cost Impact

The code change proposal will decrease the cost of construction .

This may decrease the cost of construction where a vestibule would no longer be required. It will not substantially change the overall cost.

Internal ID: 1020

E98-18

IBC: 1023.5, (IFC[BE] 1023.5)

Proponent: Lee Kranz, City of Bellevue, WA, representing City of Bellevue, WA (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1023.5 Penetrations. Penetrations into or through interior exit *stairways* and *ramps* are prohibited except for the following:

1. Equipment and ductwork necessary for independent ventilation or pressurization.
2. *Fire protection systems.*
3. Security systems.
4. Two-way communication systems.
5. Electrical raceway for fire department communication systems.
6. Electrical raceway serving the *interior exit stairway* and *ramp* and terminating at a steel box not exceeding 16 square inches (0.010 m²).
7. Structural elements supporting the interior exit stairway or ramp or enclosure, such as beams or joists.

Such penetrations shall be protected in accordance with Section 714. There shall not be penetrations or communication openings, whether protected or not, between adjacent interior exit *stairways* and ramps.

Exception: Membrane penetrations shall be permitted on the outside of the *interior exit stairway* and ramp. Such penetrations shall be protected in accordance with Section 714.4.2.

Reason:

It is common for structural elements such as beams and joists to penetrate interior exit stair and ramp shaft enclosures as part of the floor framing. This is commonly known as platform framing. Section 713.1 specifically excludes interior exit stairways from the shaft requirements and there isn't any direction provided in 1023 for structural elements penetrating into a stair shaft. Lacking code guidance in 1023 most building officials are using Section 713.8 provisions for structural elements. The proposed language to be inserted in Section 1023.5 is needed for interior exit stairways and ramps and is verbatim to that found in Section 713.8 for shaft enclosures.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

This code change is for clarification only and will not impact the cost of construction.

Internal ID: 100

E99-18

IBC: 1023.8, (IFC[BE] 1023.8)

Proponent: Todd Snider, West Coast Code Consultants (WC3), representing Self (Todd@KimballEng.com)

2018 International Building Code

Revise as follows:

1023.8 Discharge identification.Barriers at level of exit discharge. An interior exit stairway and *ramp* shall not continue below its *level of exit discharge* unless an *approved* barrier is provided at the *level of exit discharge* to prevent persons from unintentionally continuing into levels below. Such barrier shall not obstruct the stairway landing required by Section 1011.6 or reduce the egress width required by Section 1005. Directional exit signs shall be provided as specified in Section 1013.

Reason:

Proposed revision to rename this Section as the title is confusing and misleading.

Proposed revision to require that approved barriers provided in egress stair not obstruct the required landing or reduce required egress widths.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The added requirement will not affect cost because this requirement is already implied and followed by most.

Internal ID: 1293

E100-18

IBC: 1023.9, 1023.10 (New), (IFC[BE] 1023.9, 1023.10 (New))

Proponent: Todd Snider, West Coast Code Consultants (WC3), representing Self (Todd@KimballEng.com)

2018 International Building Code

Revise as follows:

1023.9 Stairway identification signs. A sign shall be provided at each floor landing in an *interior exit stairway* and *ramp* connecting more than three stories designating the floor level, the terminus of the top and bottom of the *interior exit stairway* and *ramp* and the identification of the *stairway* or *ramp*. The signage shall state the story of and direction to the *exit discharge*, and the availability of roof access from the *interior exit stairway* and *ramp* for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing, measured to the bottom of the sign, in a position that is readily visible when the doors are in the open and closed positions. ~~In addition to the *stairway* identification sign, a floor-level sign in visual characters, raised characters and braille complying with ICC A117.1 shall be located at each floor-level landing adjacent to the door leading from the *interior exit stairway* and *ramp* into the *corridor* to identify the floor level.~~

Add new text as follows:

1023.10 Floor-Level sign. Where stairway identification signs are required by Section 1023.9 a separate floor-level sign shall be provided. The floor-level sign shall be in visible characters, raised characters, and braille complying with ICC A117.1 and shall be located at each floor level landing adjacent to the door leading from the interior exit stairway and ramp to identify the floor level.

Reason:

Proposed revision to clarify that the stairway identification sign and the floor-level sign are two separate signs. Floor level sign should be moved to its own section.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Will not have cost affect. This is only clarifying existing requirements.

Internal ID: 1297

E101-18

IBC: 1024.6, (IFC[BE] 1024.6)

Proponent: David Renn, City and County of Denver, representing Code Change Committee of Colorado Chapter of the ICC (david.renn@denvergov.org)

2018 International Building Code

Revise as follows:

1024.6 Penetrations. Penetrations into or through an *exit passageway* are prohibited except for the following:

1. Equipment and ductwork necessary for independent ventilation or pressurization.
2. Fire protection systems.
3. Security systems.
4. Two-way communication systems.
5. Electrical raceway for fire department communication.
6. Electrical raceway serving the *exit passageway* and terminating at a steel box not exceeding 16 square inches (0.010 m²).

Such penetrations shall be protected in accordance with Section 714. There shall not be penetrations or communicating openings, whether protected or not, between adjacent exit passageways.

Exception: Membrane penetrations shall be permitted on the outside of the exit passageway. Such penetrations shall be protected in accordance with Section 714.4.2.

Reason:

Section 1024.7 includes requirements for "equipment and ductwork for exit passageway ventilation as permitted in Section 1024.6..."; however, Section 1024.6 currently allows equipment and ductwork for pressurization, but not for for ventilation. This proposal adds ventilation into Section 1024.6 to be consistent with Section 1024.7. This is also consistent with the allowed penetrations for interior exit stairways and ramps given in Section 1023.5.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change clarifies the intent of the code.

Internal ID: 1214

E102-18

IBC: 707.4, 1024.8 (New), (IFC[BE] 1024.8)

Proponent: David Renn, City and County of Denver, representing Code Change Committee of Colorado Chapter of the ICC (david.renn@denvergov.org)

2018 International Building Code

Revise as follows:

707.4 Exterior walls. Where exterior walls serve as a part of a required fire-resistance-rated shaft or ~~stairway separation or ramp enclosure~~ for a stairway, ramp or separation exit passageway, such walls shall comply with the requirements of Section 705 for exterior walls and the fire-resistance-rated enclosure or separation requirements shall not apply.

Exception: Exterior walls required to be *fire-resistance rated* in accordance with Section 1021 for exterior egress balconies, Section 1023.7 for interior exit stairways and ramps, Section 1024.8 for exit passageways and Section 1027.6 for exterior exit stairways and ramp.

Add new text as follows:

1024.8 Exit passageway exterior walls. Exterior walls of the exit passageway shall comply with Section 705. Where nonrated walls or unprotected openings enclose the exterior of the exit passageway and the walls or openings are exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor of the exit passageway, or to the roof line, whichever is lower.

Reason:

The code currently has specific requirements for exterior walls of interior exit stairways and ramps, but has no specific requirements for exit passageways. This proposed change adds exterior wall requirements for exit passageways that are the same as Section 1023.7 requirements for interior exit stairways and ramps. Since exit passageways and interior exit stairways and ramps are all exit components, the current provisions for interior exit stairways and ramps should apply to exit passageways as well. This new section is proposed to be 1024.8 to be in the same general location as for interior exit stairways (i.e. after the Ventilation section).

Cost Impact

The code change proposal will decrease the cost of construction .

This change will lower cost where the fire-resistance rating of exterior walls of exit passageways can be reduced.

Internal ID: 1231

E103-18

IBC: 1025.1, (IFC[BE] 1025.1)

Proponent: Keith Flanders, Cosentini Associates, representing self (kflanders@cosentini.com)

2018 International Building Code

Revise as follows:

1025.1 General. *Approved* luminous egress path markings delineating the exit path shall be provided ~~in high-rise buildings of where serving spaces with~~ Group A, B, E, I-1, M or R-1 occupancies located more than 75 feet above the lowest level of fire department access in accordance with this section.

Exception: Luminous egress path markings shall not be required on the *level of exit discharge* in lobbies that serve as part of the exit path in accordance with Section 1028.1, Exception 1.

Reason:

Luminous egress path markings should only be required once the occupancy is located more than 75 feet above the lowest level of fire department access. Requiring luminous egress path markings for these occupancies in any portion of a high-rise building is overly restrictive. Where located below this level, the occupancy is similar to any other building less than 75 feet above the lowest level of fire department access and therefore would not require luminous egress path markings.

Additionally, the luminous egress path markings are only required for exits serving the specified occupancies. High-rise buildings often have three or more exit stairs, if a stair does not serve one of the specified occupancies, it should not be required to have luminous egress path markings. This is the reason for further defining the scope of this section.

Cost Impact

The code change proposal will decrease the cost of construction .

Based on the language of the code, luminous egress path markings are often required in locations that they are not deemed necessary. This clarifies the intent which may limit the areas that luminous egress path markings are provided.

Internal ID: 1022

E104-18

IBC: 1017.3, 1029.6.2, 1029.6.2.3, 1029.6.3.1 (New), (IFC[BE] 1017.3, 1029.6.2, 1029.6.2.3, 1029.6.3.1 (New))

Proponent: Gene Boecker, Code Consultants, Inc., representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Building Code

Revise as follows:

1017.3 Measurement. *Exit access* travel distance shall be measured from the most remote point of each room, area or space along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit.

Exception ~~Exceptions:~~

1. In open parking garages, *exit access* travel distance is permitted to be measured to the closest riser of an *exit access stairway* or the closest slope of an *exit access ramp*.
2. In smoke protected seating and open air assembly seating, exit access travel distance shall be measured in accordance with Section 1029.7.

1029.6 Capacity of aisle for assembly. The required capacity of *aisles* shall be not less than that determined in accordance with Section 1029.6.1 where *smoke-protected assembly seating* is not provided, Section 1029.6.2 where *smoke-protected assembly seating* is provided and Section 1029.6.3 where *open-air assembly seating* is provided.

1029.6.2 Smoke-protected assembly seating. The required capacity in inches (mm) of the aisle for *smoke-protected assembly seating* shall be not less than the *occupant load* served by the egress element multiplied by the appropriate factor in Table 1029.6.2. The total number of seats specified shall be those within the space exposed to the same smoke-protected environment. Interpolation is permitted between the specific values shown. A life safety evaluation, complying with NFPA 101, shall be done for a facility utilizing the reduced width requirements of Table 1029.6.2 for *smoke-protected assembly seating*.

~~**Exception:** For open air assembly seating with an occupant load not greater than 18,000, the required capacity in inches (mm) shall be determined using the factors in Section 1029.6.3.~~

**TABLE 1029.6.2
CAPACITY FOR AISLES FOR SMOKE-PROTECTED ASSEMBLY**

TOTAL NUMBER OF SEATS IN THE SMOKE-PROTECTED ASSEMBLY SEATING	INCHES OF CAPACITY PER SEAT SERVED			
	Stepped aisles with handrails within 30 inches	Stepped aisles without handrails within 30 inches	Level aisles or ramped aisles not steeper than 1 in 10 in slope	Ramped aisles steeper than 1 in 10 in slope
Equal to or less than 5,000	0.200	0.250	0.150	0.165
10,000	0.130	0.163	0.100	0.110
15,000	0.096	0.120	0.070	0.077
20,000	0.076	0.095	0.056	0.062
Equal to or greater than 25,000	0.060	0.075	0.044	0.048

For SI: 1 inch = 25.4 mm.

1029.6.2.3 Automatic sprinklers. Enclosed areas with walls and ceilings in buildings or structures containing *smoke-protected assembly seating* shall be protected with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1.

Exceptions:

1. The floor area used for contests, performances or entertainment provided that the roof construction is more than 50 feet (15 240 mm) above the floor level and the use is restricted to low fire hazard uses.
2. Press boxes and storage facilities less than 1,000 square feet (93 m²) in area.
- ~~3. Outdoor seating facilities where seating and the means of egress in the seating area are essentially open to the outside.~~

1029.6.3 Open-air assembly seating. In *open-air assembly seating*, the required capacity in inches (mm) of *aisles* shall be not less than the total *occupant load* served by the egress element multiplied by 0.08 (2.0 mm) where egress is by stepped *aisle* and multiplied by 0.06 (1.52 mm) where egress is by level *aisles* and ramped *aisles*.

Exception: The required capacity in inches (mm) of *aisles* shall be permitted to comply with Section 1029.6.2 for the number of seats in the *open-air assembly seating* where Section 1029.6.2 permits less capacity.

1029.6.3.1 Automatic sprinklers. Enclosed areas with walls and ceilings in buildings or structures containing open-air assembly seating shall be protected with an approved automatic sprinkler system in accordance with Section 903.3.1.1.

Exceptions:

1. The floor area used for contests, performances or entertainment provided the roof construction is more than 50 feet (15 240 mm) above the floor level and the use is restricted to low fire hazard uses.
2. Press boxes and storage facilities less than 1,000 square feet (93 m²) in area.
3. Open-air assembly seating facilities where seating and the means of egress in the seating area are essentially open to the outside.

Reason:

The intent of this proposal is consistency with E132-15, proposed by BCAC last cycle. This proposal split smoke protected seating and open air seating with the following definitions:

OPEN-AIR ASSEMBLY SEATING. Seating served by means of egress that is not subject to smoke accumulation within or under a structure and is open to the atmosphere.

SMOKE-PROTECTED ASSEMBLY SEATING. Seating served by means of egress that is not subject to smoke accumulation within or under a structure for a specified design time by means of passive design or by mechanical ventilation.

The change of phrase from outdoor smoke protected to open air assembly seating that was done with E132-15 was missed in the exception to 1029.6.2. However, With the split, the exception in 1029.6.2 is no longer needed as a pointer. The exception in 1029.6.3 lets open air assembly seating use the lesser numbers in Table 1029.6.2 which is applicable for seating of 20,000 or more. This also answers the question about what numbers to use for open-air seating for venues from 18,000 to 20,000. For example: Current text would allow aisle capacity to use 0.08 for <=18,000 seats; 0.096 for 18,000 to 20,000 and then 0.076 for >=20,000. There is no technical justification for this.

Again, with the straight reference to 1029.6.3 for open air seating, there is a total miss for sprinklers in Section 1029.6.2.3. This would be inconsistent with IFC Section 903.2.1.5. The exception for 1029.6.2.3 should be deleted, and the appropriate information added for open air assembly seating in Section 1029.6.3.1.

[F] 903.2.1.4 Group A-4. An automatic sprinkler system shall be provided throughout stories containing Group A-4 occupancies and throughout all stories from the Group A-4 occupancy to and including the levels of exit discharge serving that occupancy where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m²).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.

[F] 903.2.1.5 Group A-5. An automatic sprinkler system shall be provided for all enclosed Group A-5 accessory use areas in excess of 1,000 square feet (93 m²).

[F] 903.2.1.5.1 Spaces under grandstands or bleachers. Enclosed spaces under grandstands or bleachers shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 where either of the following exist:

1. The enclosed area is 1,000 square feet (93 m²) or less and is not constructed in accordance with Section 1029.1.1.1.
2. The enclosed area exceeds 1,000 square feet (93 m²).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a correlation of requirements within Section 1029 and across codes, not new requirements.

E105-18

IBC: TABLE 1029.13.2.1, (IFC[BE] TABLE 1029.13.2.1)

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Building Code

Revise as follows:

**TABLE 1029.13.2.1
SMOKE-PROTECTED OR OPEN-AIR ASSEMBLY AISLE ACCESSWAYS**

TOTAL NUMBER OF SEATS IN THE SMOKE-PROTECTED OR OPEN-AIR ASSEMBLY SEATING	MAXIMUM NUMBER OF SEATS PER ROW PERMITTED TO HAVE A MINIMUM 12-INCH CLEAR WIDTH AISLE ACCESSWAY			
	Aisle or doorway at both ends of row		Aisle or doorway at one end of row only	
	Seats with backrests	Seats without backrests	Seats with backrests	Seats without backrests
Less than 4,000	14	21	7	10
4,000 to 6,999	15	22	7	10
7,000 to 9,999	16	23	8	11
10,000 to 12,999	17	24	8	11
13,000 to 15,999	18	25	9	12
16,000 to 18,999	19	26	9	12
19,000 to 21,999	20	27	10	13
22,000 and greater	21	28	11	14

For SI: 1 inch = 25.4 mm.

Reason:

This proposal is editorial and only for clarification.

The first entry in the table is clear that it applies to less than 4,000. But the following entries only indicate a single value, with no indication of whether the number of seats must be exactly that number or not. Based on the heading for the first column which states "Total Number of Seats...", you could apply both "Less than 4,000" and "4,000" to a facility with 3,500 seats. This obviously was not the intent.

This proposal fills in the gaps and leaves no question as to how to apply the values in the table.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

This is editorial and does not change the application of the code requirements.

Internal ID: 2029

E106-18

IBC: 1029.16, 1029.16.1, (IFC[BE] 1029.16. 1029.16.1)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1029.16 Handrails. Ramped *aisles* having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and stepped *aisles* shall be provided with *handrails* in compliance with Section 1014 located either at one or both sides of the *aisle* or within the *aisle* width. Where stepped aisle have seating on one side and the aisle width is 74 inches (1880 mm) or greater, two handrails are required. Where two handrails are required, one of the handrails shall be within 30 inches horizontally of the end of the aisle accessways.

Exceptions:

1. *Handrails* are not required for ramped *aisles* with seating on both sides.
2. *Handrails* are not required where, at the side of the *aisle*, there is a *guard* with a top surface that complies with the graspability requirements of *handrails* in accordance with Section 1014.3.
3. *Handrail* extensions are not required at the top and bottom of stepped *aisles* and ramped *aisles* to permit crossovers within the *aisles*.

1029.16.1 Discontinuous handrails. Where there is seating on both sides of the *aisle*, the mid-*aisle handrails* shall be ~~discontinuous with~~ discontinuous. Where the stepped aisle is required to have two handrails, handrails not located on a guard or wall shall be discontinuous. The gaps or breaks at intervals shall not exceeding five rows to facilitate access to seating and to permit crossing from one side of the *aisle* to the other. These gaps or breaks shall have a clear width of not less than 22 inches (559 mm) and not greater than 36 inches (914 mm), measured horizontally, and the mid-*aisle handrail* shall have rounded terminations or bends.

1029.16.2 Handrail termination. *Handrails* located on the side of stepped *aisles* shall return to a wall, *guard* or the walking surface or shall be continuous to the *handrail* of an adjacent stepped *aisle flight*.

1029.16.3 Mid-aisle termination. Mid-*aisle handrails* shall not extend beyond the lowest riser and shall terminate within 18 inches (381 mm), measured horizontally, from the lowest riser. *Handrail* extensions are not required.

Exception: Mid-*aisle handrails* shall be permitted to extend beyond the lowest riser where the *handrail* extensions do not obstruct the width of the cross *aisle*.

Reason:

The social stairway is a new style being used in common areas of schools and multi-assembly buildings. It appears to fall somewhere between stairways and assembly seating. If this is considered a stairway next to platforms, the general requirement for handrails on both sides of the stairway prevents access to the platforms (Example 4). Considering this configuration as assembly seating would require one handrail with current text.

This proposal considers this arrangement as a type of assembly seating. The width would have to be determined using both the general circulation number from the upper/lower floor and the seating in accordance with Section 1029.6.1, which requires extra width if a handrail is not with 30". By considering this assembly seating, accessible wheelchairs spaces would already be addressed. Drop offs along the top would have to meet guard provisions.

To address occupant safety, this proposal will require a mid-*aisle handrail* on wide stepped *aisles* in addition to the handrail on the wall. The reasoning for 74" was that we did not want either side of the handrails to create a width that was not readily useable (30" + 44" = 74"). The second handrail being within 30" of the edge of the platform allows flexibility in handrail placement, but still keeps the handrail within reach of persons moving off the platforms. Where there is not a cross *aisle*, the handrail would still have to have handrail extensions at the top and bottom, as well as meet all the other handrail provisions in Section 1014 and 1029.6. This 2nd handrails would typically not show up in stadium seating where *aisles* are typically less wide than specified here.

As you can see in the examples provided: Example 1 has two handrails, but with one on the far side of the platform. Example 4 a 2nd handrail blocks access to the platforms, so people either climb up the platforms, or go under the handrail. In example 2 and 3 a handrail is only provided on one side of the stairway, regardless of width. None of these configuration would address stairway safety and access to the platforms. Example 3 has an example handrail drawn in red of what these requirements would add.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board

of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Figure 1

Figure 2

Figure 3

Figure 4

Cost Impact

The code change proposal will increase the cost of construction .

In some situations, this could require a 2nd handrail for occupant safe egress on the stairways.

E107-18

IBC: SECTION 1030.1, (IFC[BE] 1030.1)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

SECTION 1030 EMERGENCY ESCAPE AND RESCUE

Revise as follows:

1030.1 General. ~~Where required.~~ In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one *exit* or *access* to only one *exit* as permitted by Tables 1006.3.3(1) and 1006.3.3(2).
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth story above *grade plane* shall have not fewer than one ~~exterior~~ *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, ~~an~~ *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an exit door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior ~~exit~~ *egress* balcony that opens to a *public way*.
3. *Basements* ~~without habitable spaces~~ *used only to house mechanical equipment* and having not more than 200 square feet (18.6 m²) in floor area shall not be required to have *emergency escape and rescue openings*.
4. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:
 - 4.1. One *means of egress* and one *emergency escape and rescue opening*.
 - 4.2. Two *means of egress*.

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

IBC

The definition includes 'exterior', so it does not need to be repeated in the text.

It was decided not to add the IRC defined 'habitable attic'. If added to the IBC, would the IBC also have to pick up the definition and the number of stories below the habitable attic space? (the IRC definition says this is not a story).

IBC Exception 2 - change to correct term for 'exterior egress balcony'

IBC Exception 3 - coordination with IRC, limit is just size without additional criteria for habitable.

Add storm shelter exception to IBC. Reference ICC 500 so that the escape openings provided are what is specified for storm shelters.

There will be a similar proposal for the IRC in Group B.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any

interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a coordination item for exceptions for EEROs already permitted between the codes.

Internal ID: 458

E108-18

IBC: 1030.1.1, (IFC[BE] 1030.1.1)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1030.1.1 Operational constraints and opening control devices. *Emergency escape and rescue openings shall be operational from inside the room without the use of keys or tools. Window-opening control devices ~~complying with ASTM F2090 shall be permitted for use on windows serving as a required emergency escape and rescue opening~~ shall comply with ASTM F2090.*

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

IBC - Last sentence reworded as a requirement to be consistent with IRC

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a coordination item for requirements for EEROs already permitted between the codes.

IBC: 1030.2, 1030.2.1, 1030.3, (IFC[BE] 1030.2, 1030.2.1, 1030.3)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new text as follows:

1030.2 Emergency escape and rescue openings. Emergency escape and rescue openings shall have minimum dimensions in accordance with Section 1030.2.1 through 1030.2.3.

Revise as follows:

~~1030.2~~**1030.2.1 Minimum size.** *Emergency escape and rescue openings* shall have a minimum net clear opening of 5.7 square feet (0.53 m²).

Exception: The minimum net clear opening for *grade-floor emergency escape and rescue openings* shall be 5 square feet (0.46 m²).

~~1030.2~~**1030.2.2 Minimum dimensions.** The minimum net clear opening height dimension shall be 24 inches (610 mm). The minimum net clear opening width dimension shall be 20 inches (508 mm). The net clear opening dimensions shall be the result of normal operation of the opening.

~~1030.3~~**1030.2.3 Maximum height from floor.** ~~Emergency~~ *Where a window is provided as the emergency escape and rescue openings, such window* shall have the bottom of the clear opening not greater than 44 inches (1118 mm) measured from the floor.

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

This proposal deals with Minimum size, dimensions and height.

IBC 310.3 – revise to coordinate language and organization with the IRC.

There will be a similar proposal to Group B for IRC:

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. E110-18

IBC: 1030.3 (New), (IFC[BE] 1030.3 (New))

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new text as follows:

1030.3 Emergency escape and rescue doors. Where a door is provided as the required emergency escape and rescue opening, it shall be a swinging door or a sliding door.

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

This proposal deals with doors used as emergency escape and rescue openings. IBC and IRC have different phrases for types of doors. Rather than totally separate requirements for doors and windows, the intent of this proposal is to use the same criteria as much as possible. That is literally what the current IRC text does, but with a lot of duplication.

There will be a coordination change for IRC as part of Group B.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a coordination item for requirements for EEROs already permitted between the codes.

IBC: 1030.4, 1030.4.1, 1030.4.2, 1030.4.2.1 (New), 1030.4.3 (New), 1030.5, (IFC[BE] 1030.4, 1030.4.1, 1030.4.2, 1030.4.2.1 (New), 1030.4.3 (New), 1030.5)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1030.4 Window Area wells. ~~An emergency escape and rescue opening with a finished sill height the bottom of the clear opening below the adjacent ground level grade shall be provided with a window an area well in accordance with Sections 1030.4.1 and 1030.4.2 through 1030.4.4.~~

1030.4.1 Minimum size. The minimum horizontal area of the ~~window area well~~ shall be 9 square feet (0.84 m²), with a ~~minimum dimension of horizontal projection and width of not less than 36 inches (914 mm).~~ The area ~~of the window well~~ shall allow the *emergency escape and rescue opening* to be fully opened.

Exception: The ladder or steps required by Section 1030.4.2.1 shall be permitted to encroach not more than 6 inches (152 mm) into the required dimensions of the area well.

1030.4.2 Ladders or steps. ~~Window Area wells with a vertical depth of more than 44 inches (1118 mm) shall be equipped with an approved permanently affixed ladder or steps. Ladders or rungs shall have an inside width of not less than 12 inches (305 mm), shall project not less than 3 inches (76 mm) from the wall and shall be spaced not more than 18 inches (457 mm) on center (o.c.) vertically for the full height of the window well. The ladder or steps shall not encroach into the required dimensions of the window well by more than 6 inches (152 mm). The ladder or steps shall not be obstructed by the emergency escape and rescue opening when the window or door is in the open position. Ladders or steps required by this section are exempt from the stairway requirements of shall not be required to comply with Section 1011.~~

Add new text as follows:

1030.4.2.1 Ladders. Ladders or rungs shall have an inside width of at least 12 inches (305 mm), shall project at least 3 inches (76 mm) from the wall and shall be spaced not more than 18 inches (457 mm) on center (o.c.) vertically for the full height of the area well.

1030.4.3 Drainage. Area wells shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section 1805.

Exception: A drainage system for area wells is not required where the foundation is on well-drained soil or sand-gravel mixture soils in accordance with the United Soil Classification System, Group I Soils, in accordance with Section 1803.5.1.

Revise as follows:

~~1030.5~~**1030.4.4 Bars, grilles, covers and screens.** ~~Where bars, grilles, covers, screens or similar devices are permitted to be placed over emergency escape and rescue openings, bulkhead enclosures or window area wells that serve such openings, provided that the minimum net clear opening size complies shall comply with Sections 1030.1.1 through 1030.4.2 1030.2.2 and such 1030.4. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the emergency escape and rescue opening. Where such bars, grilles, covers, screens or similar devices are installed in existing buildings, they shall not reduce the net clear opening of the emergency escape and rescue opening and smoke alarms shall be installed in accordance with Section 907.2.10 regardless of the valuation of the alteration.~~

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

This proposal deals with area wells. There will be a coordinated change for IRC in Group B.

IBC 1030.4 - The same point of measurement should be used for both the maximum height above floor (section above) and the window well. Should not mix 'grade' and 'ground level'.

IBC 1030.4.1 - “horizontal projection and width” is more specific. IBC exception for ladder encroachment moved up from 1030.4.2.

IBC 1030.4.2 - IBC encroachment of ladder into well moved up to 1030.4.1. IRC. The sentence about the window not obstructing the ladder has been clarified. Added ‘doors’. Requirements for ladders moved into separate section.

IBC 1030.4.3 - No change to requirements. Just pulled out to separate section.

IBC 1030.4.4 - Revisions for coordination. Reference to emergency and escape opening size and minimum window well size. IBC existing building sentence should be in IEBC. “Special knowledge is revised to be consistent with IBC - the term allows for too broad of an interpretation.

There will be a coordination change for IRC as part of Group B.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a coordination item for requirements for EEROs already permitted between the codes.

Internal ID: 462

E112-18

IBC: 1030.4.2.2 (New), (IFC[BE] 1030.4.2.2(New))

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new text as follows:

1030.4.2.2 Steps. Steps shall have an inside width of not less than 12 inches (305 mm), shall have treads greater than 5 inches (127 mm) in depth and a riser height not greater than 18 inches (457 mm) for the full height of the area well.

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

The current provisions says ladders and steps don't have to comply with the standard stairway provisions, however, while specific provisions are provided for ladders, no limits are provided for steps. The option here it the same width and distance between steps are permitted for ladders. The tread depth is the minimum width from alternating tread devices and ships ladders.

Following are examples of stepped configurations that are used today. The proposed language would allow for the use of Figures 1 and 3, but not 2 and 4.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Figure 1

Figure 2

Figure 3

Figure 4

Cost Impact

The code change proposal will increase the cost of construction .

There would be an increase for costs at EEROs where a home owner wanted to have the option of a stepped area well. This could possibly add extra steps, but there is not an increase in size requirements.

Internal ID: 463

E113-18

IBC: 1030.6 (New), (IFC[BE] 1013.6 (New))

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Add new text as follows:

1030.6 Drainage. Window wells shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section 1805.4.2 or by an approved alternative method.

Reason:

This new section will align the IBC for the drainage of window wells with a similar requirement already found in IRC R310.2.3.2 Drainage. This new code requirement would be easily implemented during the general plan review process. The purpose of the section is to prevent the flooding of emergency escape and rescue openings.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The connection of window well drainage to the required foundation drainage system will have an initial cost increase for the materials and labor for the required connection. This initial cost could be offset over the life of the structure by mitigating possible damages caused by the potential moisture intrusion from water accumulation in the bottom of the window well.

Internal ID: 1691

E114-18

IBC: 1104.4

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1104.4 Multistory buildings and facilities. At least one *accessible route* shall connect each *accessible story, facilities*

Exceptions:

1. An *accessible route* is not required to *stories*, of not more than 3,000 square feet (278.7 m²) and are located above and below *accessible* levels. This exception shall not apply to:
 - 1.1. Multiple tenant facilities of Group M occupancies containing five or more tenant spaces used for the sales or rental of goods and where at least one such tenant space is located on a floor level above or below the *accessible* levels.
 - 1.2. *Stories* or *mezzanines* containing offices of health care providers (Group B or I).
 - 1.3. Passenger transportation facilities and airports (Group A-3 or B).
 - 1.4. Government buildings.
 - 1.5. Structures with 4 or more dwelling units.
2. *Stories/mezzanines* contain *accessible* elements or other spaces as determined by Section 1107 or 1108 are not required to be served by an *accessible route* from an *accessible* level.
3. In air traffic control towers, an *accessible route* is not required to serve the cab and the floor immediately below the cab.
4. Where a two-story building or facility has one *story* or *mezzanine* with an *occupant load* of five or fewer persons that does not contain *public use space*, that *story* or *mezzanine* shall not be required to be connected by an *accessible route* to the *story* above or below.

Reason:

The intent of this proposal is a correlation items so that the efficiency units do not conflict with the Type B requirements in the codes.

The best way to explain the need for this is to use the example of a two story building with apartments over another use, such as parking or mercantile. Section 1107.7.1.1 would require Type B units on that 2nd floor. With typical apartments, it would be very unlikely for 4 apartments and the corridor to have an area of less than 3,000 sq. ft. Therefore, they would not be able to use Section 1104.4 Exception 1 - which is correlated with Fair Housing requirements. However, with efficiency units (IBC Section 1207.4 and IPC Section 404.6) , there could be 4 or more efficiency units with a total area of less than 3,000 sq.ft. The addition of Item 1.5 would clarify that Section 1104.4 Exception 1 should not be used for dwelling units. Other apartment building arrangements would continue to use Section 1104.4 Exception 2.

This is important because the market is trending toward smaller living areas in multi-family R-2 structures particularly in urban areas. US Census statistics show that in 2000, app. 46,000 rental units built were less than 1,000 sq.ft. In 2015, 114,000 units and in 2016, 99,000 units were less than 1,000 sq.ft. The Urban Land Institute reported in 2013 that major Municipalities including New York City, San Francisco, Boston, Dallas and Philadelphia are allowing smaller apartments with Seattle and Portland (OR) having no minimum sizes.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will increase the cost of construction .

This provision would require a elevator in buildings with four or more efficiency units on the 2nd floor over other

occupancies where the 2nd floor area was less than 3,000 sq.ft. However, this is already a requirement under the Fair Housing Accessibility Guidelines, so you are helping developers/architects/municipalities reduce the chance of being sited and retrofitting to add an elevator at a later date. This would not have any effect on larger buildings or buildings with apartments on the 1st floor.

Internal ID: 3400

E115-18

IBC: 1105.1, 1105.1.1 (New), TABLE 1105.1.1 (New)

Proponent: Joseph Hetzel, Thomas Associates, Inc., representing American Association of Automatic Door Manufacturers (Jhetzel@thomasamc.com)

2018 International Building Code

Revise as follows:

1105.1 Public entrances. In addition to *accessible* entrances required by Sections ~~1105.1-1105.1.2~~ through ~~1105.1.7-1105.1.8~~, at least 60 percent of all *public entrances* shall be *accessible*.

Exceptions:

1. An *accessible* entrance is not required to areas not required to be *accessible*.
2. Loading and *service entrances* that are not the only entrance to a tenant space.

Add new text as follows:

1105.1.1 Automatic doors. In facilities with the occupancies and building occupant loads indicated in Table 1105.1.1, at least one accessible exterior public entrance shall be either a full power-operated door or a low-energy power-operated door.

**TABLE 1105.1.1
PUBLIC ENTRANCE WITH POWER-OPERATED DOOR**

<u>OCCUPANCY</u>	<u>BUILDING OCCUPANT LOAD GREATER THAN</u>
<u>A-1, A-2, A-3, A-4</u>	<u>300</u>
<u>B, M, R-1</u>	<u>500</u>

Reason:

1. Enhances accessibility. It is widely accepted that automatic doors in general enhance overall accessibility, by accommodating a wide array of conditions people have that qualify them to need accessibility at facility entrances. This accommodates a wide variety of accessibility needs that manual doors being installed today cannot encompass.
2. Considers "transient" use. The Table directly addresses people who infrequently use public entrances so that they would need no special knowledge, skill or tool to enter a facility. All occupancies included in the Table experience such "transient" use.
3. Addresses a public need. The occupancies cited are associated with a serious existing need for automatic doors. The safety of both use and moving people in and out of buildings in those occupancies by using only manually operated doors is a major concern particularly in emergency situations.
4. Focuses on public entrances. The Table applies where the public is most likely to access facilities. Regarding which public entrance to choose for an automatic door if multiple entrances are accessible, this is left to the building designer on which would be best but the requirement of "at least one" door allows the designer to consider all entrances if feasible.
5. Occupancies involved are those most applicable to the public. The population requiring accessibility commonly needs accommodations to enter assembly, business, mercantile, and hotel/motel facilities as part of their everyday life. No code requirement for automatic doors means an increased safety risk and a decreased accessibility convenience.
6. Brings completion to accessible entrance provisions. The Table is needed in Section 1105, where accessible entrances are governed.
7. No disproportional economic burden. The thresholds have been chosen so as not to be a requirement for smaller occupancies such as small assembly facilities or strip mall businesses.
8. Addresses statistical need for accessibility. The thresholds also assume that a minimum of 2% of the population will be in need of accessibility at any given time for the specified occupancies. For an occupant load of 300, this means that at least six people will have the need that an automatic door will provide. The anticipated accessibility need should exceed this estimate a large enough percentage of time to constitute a critical mass of facilities needing

power-operated doors when meeting the established thresholds.

9. Enhances public safety. Automatic doors are regulated by ANSI/BHMA safety standards intended to prevent people from coming in contact with moving doors. Facilities employing automatic doors are required to abide by these requirements, which affords protection to anyone - including children, the elderly, and/or those with accessibility needs - in the vicinity of moving doors while minimizing or preventing operational problems. Automatic doors are thus far safer in the marketplace than manually operated doors.

10. Favorably increases facility usage. Those with accessibility needs are less likely to choose to use a facility without an automatic door, therefore resulting in reduced institutional, social, and economic benefits to entities operating within a facility.

11. Occupant load thresholds have related code precedence. The justification of minimum occupant load uses Risk Category and minimum number of exits as starting points, since these are the only locations in the Code with occupancy thresholds to consider. Risk Category and minimum number of exits share a common concern with automatic doors because the threshold numbers represent a critical mass of people above which a unique set of code requirements need to apply. Following is an explanation of how the threshold numbers have been arrived at for each occupancy in the Table.

o Group A: Also from Table 1604.5, Risk Category III. The scope of public assemblies is an occupant load greater than 300.

o Groups B, M and R-1: From Table 1006.3.1, minimum number of exits or access to exits per story. Table 1006.3.1 states that three exits or exit access doorways shall be provided from any space with an occupant load of 501 to 1000, and four shall be provided with an occupant load greater than 1000. The proposed Table would set a threshold of three exits or exit access doorways, in a given story with a public entrance, to require an automatic door at that public entrance. R-1 is the applicable Group R occupancy because hotels and motels should be encompassed by the Table where the threshold occupant load would be appropriate for those structures.

12. Alleviates concerns about maximum manual force required to operate an entrance door. Although the IBC regulates this maximum force, any type of force needed to operate a manual door is a concern for the accessibility community. Automatic doors would require no force to operate.

13. Alleviates concerns about manual force variations. Wind pressures, internal building stack pressures, and/or increasing hardware friction are common concerns and affect manual operation of entrance doors all throughout the country. This concern is removed since automatic doors require no force to operate.

14. More than a "best practice" requirement. The requirement is a need, as opposed to a "best practice", because automatic doors encourage people to use facilities, are safer, and more efficiently move people in and out of buildings. It is widely known that people - particularly children, the elderly, and/or those with accessibility needs - have great difficulty, or find it impossible, to open entrance doors because of stack pressures, door configurations, door friction, wind, or door weight.

Cost Impact

The code change proposal will increase the cost of construction .

The increased construction cost will be outweighed by the benefits provided to the public as outlined in our reasoning statement.

Internal ID: 361

E116-18

IBC: 1106.2, 1111.1

Proponent: Jim Safranek, representing Safranek Group LLC

2018 International Building Code

Revise as follows:

1106.2 Groups I-1, R-1, R-2, R-3 and R-4. *Accessible* parking spaces shall be provided in Group I-1, R-1, R-2, R-3 and R-4 occupancies in accordance with Items 1 through 4 as applicable.

1. In Group R-2, R-3 and R-4 occupancies that are required to have *Accessible, Type A* or *Type B dwelling units* or *sleeping units*, at least 2 percent, but not less than one of the parking serving the residents, of each type of parking space provided shall be *accessible*. Where guest parking is provided that serve the residents, at least 2 percent, but not less than one of the parking spaces provided for guests shall be accessible.
2. In Group I-1 and R-1 occupancies, *accessible* parking shall be provided in accordance with Table 1106.1.
3. Where at least one parking space is provided for each *dwelling unit* or *sleeping unit*, at least one *accessible* parking space shall be provided for each *Accessible* and *Type A unit*.
4. Where parking is provided within or beneath a building, *accessible* parking spaces shall be provided within or beneath the building.

1111.1 Signs. Required *accessible* elements shall be identified by the International Symbol of Accessibility at the following locations.

1. *Accessible* parking spaces required by ~~Section~~ Sections 1106.1, 1106.3 or 1106.4.
Exception: Where the total number of parking spaces provided is four or less, identification of *accessible* parking spaces is not required.
2. *Accessible* parking spaces required by Section 1106.2. Where accessible parking spaces are required for guests of residents, such spaces shall also be designated at guest parking.
Exception: In Group I-1, R-2, R-3 and R-4 facilities, where parking spaces are assigned to specific *dwelling units* or *sleeping units*, identification of *accessible* parking spaces is not required.
3. *Accessible* passenger loading zones.
4. *Accessible* rooms where multiple single-user toilet or bathing rooms are clustered at a single location.
5. *Accessible* entrances where not all entrances are *accessible*.
6. *Accessible* check-out aisles where not all aisles are *accessible*. The sign, where provided, shall be above the check-out aisle in the same location as the checkout aisle number or type of check-out identification.
7. Family or assisted-use toilet and bathing rooms.
8. *Accessible* dressing, fitting and locker rooms where not all such rooms are *accessible*.
9. *Accessible* areas of refuge in accordance with Section 1009.9.
10. Exterior areas for assisted rescue in accordance with Section 1009.9.
11. In recreational facilities, lockers that are required to be *accessible* in accordance with Section 1109.9.

Reason:

Purpose: To clarify the accessible parking requirements for resident guest/visitor parking associated with Group R-2, R-3, and R-4.

Reason and Substantiation: As currently written, item 1 for section 1106.2 requires a minimum of 2%, but not less than 1 accessible parking space for each "type" of parking space provided. The International Building Code does not identify what represents a "type" of parking space. For Group R-2 projects, some of the potential "types" of parking spaces

include the following:

- Parking garage
- Open parking lot
- Carports
- Individual stand-alone garages
- Tuck under building garages
- Secured parking
- Unsecured parking

Normally, the "types" of parking associated with Item 1 for section 1106.2 represent either a different type of physical structure for the parking or possibly a different condition for the parking (such as secured/unsecured). Additionally, the "types" of parking associated with Item 1 for section 1106.2 do not normally represent a distinct user group such as resident or resident guest/visitor. Because of that, it appears to be unclear in the International Building Code as to the requirements for accessible parking spaces, where resident guest/visitor parking is provided for Groups R-2, R-3, and R-4 occupancies. This is often the case for Group R-2 apartment projects where there are distinct parking spaces identified solely for use by resident guests/visitors. The proponent is aware of some jurisdictions that have interpreted that Table 1106.1 be used for Group R-2 resident guest/visitor parking and other jurisdictions that have interpreted that item 1 of section 1106.2 is applicable. As section 1106.2 is currently written, a jurisdiction could interpret that for a Group R-2 apartment project, item 1 for section 1106.2 would be applicable for the Group R-2 parking, inclusive of resident and resident guests/visitors. At that point, it appears that section 1106.2 does not provide guidance for allotting the minimum required accessible parking spaces for the R-2 occupancy between the residents and resident guests/visitors, unless they are classified as a "type" of parking based on different user groups.

For reference, the Fair Housing Act (FHA) Guidelines, require that a "sufficient" number of accessible parking spaces be provided where resident guest/visitor parking is provided. This FHA requirement for resident guest/visitor accessible parking is distinct and separate from the FHA requirement for accessible parking associated with units.

The item proposed to be added to section 1106.2 seeks to clarify the accessible parking requirements for resident guest/visitor parking for Group R-2 occupancies and align it with FHA requirements for resident guest/visitor parking that classify it as a distinct and separate type of parking that requires its own accessible parking spaces. If the Committee believes that section 1106.2 currently encompasses resident guest/visitor parking, the proponent requests that language be added to section 1106.2 clarifying this intent and ensuring that accessible parking will be provided at locations where resident guest/visitor parking is provided. If the Committee believes that Table 1106.1 is applicable for resident guest/visitor parking, the proponent requests that language found in the proponents proposed code addition in item 5 for section 1106.2 be revised to reflect this.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The construction cost impact for the proposed code change will depend upon how jurisdictions currently determine accessible parking, where parking solely for resident guests/visitors is provided.

Where jurisdictions currently use Table 1106.1, the proposed code change language will result in a reduction in construction costs. This comes about from a reduction in accessible parking spaces (as much as 1/2) and their associated construction (including accessible routes) for parking areas (solely for resident guests/visitors) with less than 301 vehicles.

Where jurisdictions currently use Item 1 in section 1106.2 and require 2% of the combined resident and resident guest/visitor parking to be accessible, the proposed code change language will result in an increase in construction costs. This comes about from an increase in the number of accessible parking spaces and their associated construction (including accessible routes) for parking areas (solely for resident guests/visitors).

Internal ID: 1601

E117-18

IBC: 1106.2

Proponent: Jim Safranek, representing Safranek Group LLC

2018 International Building Code

Revise as follows:

1106.2 Groups I-1, R-1, R-2, R-3 and R-4. Accessible parking spaces shall be provided in Group I-1, R-1, R-2, R-3 and R-4 occupancies in accordance with Items 1 through 4 as applicable.

1. In Group R-2, R-3 and R-4 occupancies that are required to have *Accessible, Type A or Type B dwelling units or sleeping units*, at least 2 percent, but not less than one, of each type of parking space provided shall be *accessible*.
2. In Group I-1 and R-1 occupancies, *accessible* parking shall be provided in accordance with Table 1106.1.
3. Where at least one parking space is provided for each *dwelling unit or sleeping unit*, in addition to the accessible parking in Items 1 and 2, and at least one *accessible* parking space shall be provided for each *Accessible and Type A unit*.
4. Where parking is provided within or beneath a building, *accessible* parking spaces shall be provided within or beneath the building.

Reason:

Purpose: To clarify whether the number of parking space required by item 3 of section 1106.2 are in addition to the minimum required number of accessible parking spaces or are included as part of the minimum required number of accessible parking spaces.

Reason and Substantiation: For groups I-1, R-1, R-2, R-3 and R-4 the required minimum number of accessible parking spaces is either 2% (Group R-2, R-3 and R-4) or per Table 1106.1 (Group I-1 and R-1). Additionally, item 3 in section 1106.2 states, "Where a parking space is provided for each dwelling unit or sleeping unit, at least one accessible parking space shall be provided for each Accessible and Type 'A' unit.". Item 3 does not appear to clarify whether the required parking spaces for Accessible and Type 'A' units are included among the required minimum number of accessible spaces (either 2% of provided parking spaces or per Table 1106.1), or, are in addition to the required minimum number of accessible spaces.

For example, given a Group R-2 apartment project with 250 parking stalls for 250 units (1 parking stall per unit), where 5 of the units are Type 'A' units and the remaining units are Type 'B' units and there are 5 accessible parking spaces provided. Do the requirements of Section 1106.2, item 3 mean the following:

1. that a minimum of 5 accessible parking spaces will be required ($250 \times 2\% = 5$, per section 1106.2, item 1) and this also corresponds to the minimum number of required and provided Type 'A' units (1106.2, item 3)?
2. or, that in addition to the minimum required accessible parking spaces (5) (section 1106.2, item 1), 5 additional parking spaces will be required for each of the provided Type 'A' units (per section 1106.2, item 3), resulting in a total of 10 accessible parking spaces?

The proposed additional language to item 3 of section 1106.2 seeks to clarify its intent.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Whether or not the code change proposal will increase or decrease the cost of construction depends upon how jurisdictions have been interpreting item 3 of section 1106.2.

If jurisdictions have been interpreting that accessible parking spaces required by item 1 of section 1106.2 do not include the accessible parking spaces required by item 3 of section 1106.2 (which must be also be additionally provided), this will not increase construction costs. The reason for this is that the jurisdiction's interpretation of items 1 and 3 of section 1106.2 is consistent with the code change proposal, that reflects the intent of the code.

If jurisdictions have been interpreting that accessible parking spaces required by item 1 of section 1106.2 include the accessible parking spaces required by item 3 of section 1106.2, this will increase construction costs. The reason for this is that the jurisdiction's interpretation of items 1 and 3 of section 1106.2 is not consistent with the code change proposal and additional accessible parking spaces and their accompanying accessible access aisles and accessible routes will be required.

E118-18

IBC: 1106.5

Proponent: Jim Safranek, representing Safranek Group LLC (info@safranekgroup.com)

2018 International Building Code

Revise as follows:

1106.5 Van spaces. For every six or fraction of six *accessible* parking spaces, at least one shall be a van-accessible parking space.

Van-accessible spaces shall be determined and dispersed in accordance with the following:

Where accessible parking spaces on the site are determined in accordance with only one of Sections 1106.1, 1106.2, 1106.3 or 1106.4, the number of van-accessible parking spaces shall be determined by counting all the accessible parking spaces on the site. Where accessible parking spaces are provided in more than one location, van-accessible parking spaces shall be distributed.

Where accessible parking spaces on the site are determined in accordance with any combination of Sections 1106.1, 1106.2, 1106.3 and 1106.4, the number of van-accessible spaces shall be determined by counting the accessible spaces on the site required to comply with each section. Where accessible parking spaces are provided in more than one location, van-accessible parking spaces shall be distributed within the parking associated with the requirements for each section.

Exception-Exceptions:

1. Van-accessible parking spaces are not required to be distributed by type of parking in accordance with Section 1106.2.
2. In Group U private garages that serve Group R-2 and R-3 occupancies, van-accessible spaces shall be permitted to have vehicular routes, entrances, parking spaces and access aisles with a minimum vertical clearance of 7 feet (2134 mm).

Reason:

Purpose: Parking areas for many projects consist of multiple parking facilities, multiple types of parking, and multiple occupancies served by the parking facilities. For these circumstances, section 1106.5 does not currently provide clear provisions for determining the minimum number of required accessible parking spaces for vans and their distribution. Interpretations for determining the minimum number of accessible parking spaces for vans and their distribution vary among jurisdictions. The proposed code language seeks to bring consistency by:

1. identifying the methodology for determining the minimum number of required accessible parking spaces for vans where multiple parking facilities occur
2. identifying the distribution of the required accessible parking spaces for vans where there are:
 - a.) multiple parking facilities on one site subject to both section 1106.1 and section 1106.2 item 1
 - b.) multiple types of parking spaces associated with Group R-2, R-3, and R-4 occupancies on one site
3. aligning with the requirements found in the 2010 ADA Standards for Accessible Design and those found in the Fair Housing Act Guidelines
4. ensuring the availability of accessible van parking spaces for multiple, varying occupancies (each, possibly having their own separate parking facilities) on one site

Reason: The current language in section 1106.5 does not address how the number of accessible parking spaces for vans spaces are determined when there are multiple parking facilities on one site. Here is an example:

Example: Given a privately funded apartment project on one site with common-use areas that are not available for use by the general public. This apartment project (Group R-2) contains resident parking that consists of the following; 150 car open surface parking lot, 20 carports, and 20 garages beneath the building. The leasing office for the apartment project (on the site with the apartments) was constructed as a stand-alone building and has a separate visitor and employee parking lot for 10 cars. For the Group R-2 parking, per section 1106.2, item 1, 2%, but not less than 1, of each "type" of parking is required to be accessible. This yields a total of 5 accessible parking spaces; 3 accessible parking spaces for the open surface parking, 1 accessible parking space for the carport, and 1 accessible parking space for the garages beneath the building. For the visitor and employee parking lot, per section 1106.1 and table 1106.1, a minimum of 1 accessible parking space is required.

When it comes to determining the minimum number of required accessible parking spaces for vans, there are two

commonly used methods by jurisdictions:

Method 1. Combine the number of required or provided accessible parking spaces from both the Group R-2 and leasing office parking facilities and then divide this number by six to determine the required, minimum number of accessible parking spaces for vans.

5 accessible parking spaces (R-2) + 1 accessible parking space (leasing office) = 6 accessible parking spaces / 6 = minimum of 1, accessible parking space for vans, required.

At this point, the language in section 1106.5 does not identify where the single accessible parking space for the van would be located. It could be located either in the leasing office parking space or the R-2 parking areas. If the accessible parking space for the van is located only at the Group R-2 area, the parking at the leasing office area would be non-compliant with the provisions found in the 2010 ADA Standards for Accessible Design.

Method 2. Use the individual number of required or provided accessible parking spaces for each parking "facility" and divide this individual number by six to determine the required minimum number of accessible parking spaces for vans for each parking facility.

5 accessible parking spaces (R-2) / 6 = .833 = 1 accessible parking space for vans, required (R-2 parking facility)

1 accessible parking space (leasing office) / 6 = .167 = 1 accessible parking space for vans, required (leasing office parking facility)

The code language found in proposed section 1106.5.1, item 1, seeks to ensure that at a minimum, in situations where there are separate parking facilities serving multiple, varying occupancies (notably I-1, R-2, R-3, and R-4), an accessible van space will be provided where accessible parking is required that utilizes section 1106.1. This is aligned with the requirements found in the 2010 ADA Standards for Accessible Design. It should be noted that the proposed language exceeds the requirements found in the Fair Housing Act Guidelines because The Guidelines do not require that accessible van parking be provided at resident parking areas. However, in circumstances where the Group R-2, R-3, or R-4 occupancy are also subject to the Federal accessibility statutes, such as the ADA, the proposed language ensures that where multiple parking facilities serving multiple occupancies occur on one site, an accessible parking space for a van will be provided, aligning with the requirements found in the ADA.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Whether the language of the code change proposal will increase or decrease the cost of construction depends upon how jurisdictions currently determine the minimum required number of accessible parking spaces for vans and their distribution. As the documentation for the code change proposal illustrates, currently there are two methods by which the minimum number of required accessible parking spaces for vans can be determined.

Where there are parking facilities for I-1, R-1, R-2, R-3, and R-4 occupancies combined with parking for other occupancies, the code change proposal may not necessarily increase or decrease the cost of construction as compliance with ADA requirements may potentially necessitate multiple locations for accessible parking spaces for vans.

IBC: 1106.7 (New), Chapter 35

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Building Code

Add new text as follows:

1106.7 Parking meters and pay stations. Where parking meters and pay stations serve accessible parking spaces, such parking meters and pay stations shall be accessible.

Update standard(s) as follows:

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001

US

ICC A117.1-092017:

Accessible and Usable Buildings and Facilities

Reason:

The 2017 ICC A117.1 will have requirements for accessibility to parking meters and pay stations. This scoping will clarify where those provisions should apply where parking meters and pay stations are provided in parking lots or parking garages on a site. To combat fraud and abuse of disabled parking privileges and to increase revenue, many jurisdictions such as Arlington, VA and Bethany Beach, DE are moving toward requiring people eligible to park in accessible spaces to pay for parking. See "Metered Parking Spaces" at <https://www.townofbethanybeach.com/399/Public-Parking---Pay-to-Park>. Information about accessible pay stations in the City of Raleigh, NC is at <https://www.raleighnc.gov/business/content/PWksParkingMgmt/Articles/UsingNewParkingMeters.html>.

Cost Impact

The code change proposal will increase the cost of construction .

The cost will be labor. Installers will need to take care to site parking meters and pay stations on accessible routes and to locate operable parts of equipment adjacent to clear floor space. Most parking meters on the market today are accessible when installed close to curb ramps, on an accessible route, and at a height (48" max.) allowing wheelchair users to approach and reach the controls. The revenue from the previously free parking spaces could mitigate the cost.

Analysis: The 2009 edition of the ICC A117.1 standard is referenced in Chapter 35.

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

ELECTRIC VEHICLE CHARGING STATION. One or more vehicle spaces served by an electric vehicle charging system.

Revise as follows:

406.2.7 Electric vehicle charging ~~stations~~systems. Where provided, electric vehicle charging ~~stations~~systems shall be installed in accordance with NFPA 70. Electric vehicle charging system equipment shall be listed and labeled in accordance with UL 2202. Electric vehicle supply equipment shall be listed and labeled in accordance with UL 2594. Accessibility to electric vehicle charging stations shall be provided in accordance with Chapter 11.

SECTION 1106 PARKING AND PASSENGER LOADING FACILITIES

Add new text as follows:

1106.1 General. Parking shall comply with Section 1106.2 through 1106.7. Passenger loading zones shall comply with Section 1106.8.

1107 MOTOR VEHICLE RELATED FACILITIES

1107.1 General. Electrical vehicle charging stations shall comply with Section 1107.2. Fuel-dispensing systems shall comply with Section 1107.3.

1107.2 Electrical vehicle charging stations. . Electrical vehicle charging stations shall comply with Sections 1107.2.1 and 1107.2.2.

Exception: Electrical vehicle charging stations provided to serve Groups R-2, R-3 and R-4 occupancies are not required to comply with this section.

1107.2.1 Number of accessible vehicle spaces. At least five percent (5%) of vehicle spaces on the site served by electrical vehicle charging systems but, not fewer than one for each type of electric vehicle charging system shall be accessible.

1107.2.2 Vehicle space size. . Accessible vehicle spaces shall comply with the requirements for a van accessible parking space that is 132 inches (3350 mm) minimum in width with an adjoining access aisle that is 60 inches (1525 mm) minimum in width.

Revise as follows:

~~1109.14~~**1107.3 Fuel-dispensing systems.** Fuel-dispensing systems shall be *accessible*.

Update standard(s) as follows:

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001

US

ICC A117.1-~~09~~2017:

Accessible and Usable Buildings and Facilities

Reason:

IBC Section 406.7 requires that "Accessibility to electric vehicle charging stations (EVCS) shall be provided in accordance with Chapter 11". However, Chapter 11 does not contain specific scoping to address these EVCS. This proposal seeks to provide some detail in Chapter 11 to address that shortfall.

Section 1106.1 provides a charging statement for parking and passenger loading zones, which was missing in the current code.

This proposal creates a new Section 1107 to deal with motor vehicle related facilities. This will provide new requirements for electrical vehicle charging stations and retains the current requirements for fuel-dispensing systems.

Section 1107.2 is a general scoping statement for EVCS.

The exception refers to R-2 occupancies. This is due to the way these function. If a person gets an EV and elects to install an EVCS at their designated parking space, that should not trigger the requirement since it is occupant specific.

Section 1107.2.1 addresses the number of space. It does not mandate EVCS. It acknowledges that where EVCS are provided a portion must be accessible. A factor of five percent (5%) was used based on similar thresholds for other types of amenities like lockers, dressing rooms, bowling lanes, sinks, etc. It is also important to note that this is based on the number of EVCS provided on the site. This is a minimal requirement. Rather than address it by cluster of EVCS, such as could happen on a campus, this begins at a very low requirement. If it proves insufficient, it can be adjusted at a later date. It also requires at least one accessible EVCS for each type of charger. There are currently two common types of charging equipment. If one space can be served by both types, that would comply. But, it makes sure that they will both be accessible.

Section 1107.2.2 prescribes the requirements for the charging space. By making a reference to the van accessible parking space and designating the size, the other aspects of the space such as slope, marking, etc. as found in ICC A117.1 (Section 502) will be included.

The 2017 edition of the ICC A117.1 Standard does not contain any scoping and does not include any specific requirements for the space where charging will happen. The provisions in the A117.1 (Section 502.11) address operable parts, an accessible route from the access aisle to the charging equipment, and criteria on what to do with potential obstructions.

Cost Impact

The code change proposal will increase the cost of construction .

EVCS are not required. However, IBC Section 406.7 currently requires them to be accessible, but fails to provide technical specifications. If provided, this may require additional width at a small percentage of the spaces at those charging stations.

Analysis: The 2009 edition of the ICC A117.1 standard is referenced in Chapter 35.

Internal ID: 538

E122-18

IBC: 1107.5.1.1

Proponent: Gregory Nicholls, The PREVIEW Group, Inc., representing The American Institute of Architects (gnicholls@preview-group.com)

2018 International Building Code

Revise as follows:

1107.5.1.1 Accessible units. In Group I-1, Condition 1, at least 4 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*. In Group I-1, Condition 2, at least 10 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*. Accessible dwelling units and sleeping units shall be dispersed among the various classes of units.

Reason:

This proposal seeks to make all classes of sleeping and dwelling units in Group I-1 occupancies available to the disable community. The proposed text being added matches the dispersal language in Section 1107.6.1.1 for Group R-1 and Section 1107.6.2.2.1 2018 IBC. The designs for Group I-1 facilities often have varying numbers of bedrooms and/or communicating units to facilitate the situations for those couples or families that have varying care requirements but want to remain close. Modifications are limited in these facilities, as the patients and clients are renting the space, similar to Group R-1's. Also, the difference in the degree of accessibility is more drastic between the Accessible units required for Group I-1 and the remaining Type B units than it is for Type A units and Type B units in Group R-2.

The Advisory to Section 223.1 of the 2010 Standards for Construction for Long-Term Care Facilities addresses this as well by noting, "While dispersion is not required, the flexibility it provides can be a critical factor in ensuring cost effective compliance with applicable civil rights laws, including Titles II and III of the ADA and Section 504 of the Rehabilitation Act of 1973, as amended. Additionally, all types of features and amenities should be dispersed among accessible sleeping rooms to ensure equal access to and a variety of choices for all patients and residents."

This proposal takes in what is already a part of the IBC for Groups R-1 and R-2 for dispersal of the Accessible and Type A units and the advisory text in the 2010 ADA Standards for Construction and provides an appropriate and necessary capacity for those with disabled persons in their families and/or relationships to have choices for in they choose to live as do those without physical disabilities.

Bibliography:

2010 ADA Standards for Accessible Design, Dept of Justice

Cost Impact

The code change proposal will increase the cost of construction .

The cost increase will be very minimal, as this proposal does not increase the number of Accessible units, only their variety. The only increase then, would be if this meant the designer had to provide larger units that are Accessible.

E123-18

IBC: 1107.5, 1107.5.1, 1107.5.1.1, 1107.5.1.2 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

1107.5 Group I. *Accessible units* and *Type B units* shall be provided in Group I occupancies in accordance with Sections 1107.5.1 through 1107.5.5.

Revise as follows:

1107.5.1 Group I-1. *Accessible units* and *Type B units* shall be provided in Group I-1 occupancies in accordance with Sections 1107.5.1.1 and ~~1107.5.1.2~~ through 1107.5.1.3.

1107.5.1.1 Accessible units—units in Group I-1, Condition 1. In Group I-1, Condition 1, at least 4 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*. ~~In Group I-1, Condition 2, at least 10 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*.~~

Exceptions:

1. In not more than 50 percent of the Accessible units, water closets shall not be required to comply with ICC A117.1 where such water closets comply with Section 1109.2.2.
2. In not more than 50 percent of the Accessible units, roll-in-type showers shall not be required to comply with ICC A117.1 where roll-in-type showers comply with Section 1109.2.3.

Add new text as follows:

1107.5.1.2 Accessible units in Group I-1, Condition 2. In Group I-1, Condition 2, at least 10 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*.

Exceptions:

1. In not more than 50 percent of the Accessible units, water closets shall not be required to comply with ICC A117.1 where such water closets comply with Section 1109.2.2.
2. In not more than 50 percent of the Accessible units, roll-in-type showers shall not be required to comply with ICC A117.1 where roll-in-type showers comply with Section 1109.2.3.

Revise as follows:

~~1107.5.1.2~~**1107.5.1.3 Type B units.** In structures with four or more *dwelling units* or *sleeping units intended to be occupied as a residence*, every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

Reason:

This is a part of a series of proposals for both scoping and technical criteria to allow for assisted toileting and bathing in some types of care facilities.

Group I-1 facilities are the first step for housing for persons who need assistance including custodial care. The code should recognize that older adults have limited upper body strength. Allowing for half of the Accessible units to use the assisted toileting and bathing, allows for options within the facility.

It should be noted that the assisted toileting arrangement would be permitted for the Type B units with current A117.1 text. This option would exceed requirements for the Fair Housing Act Guideline.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

If someone chooses this option, there would be an increase in bathroom size for the water closet and a situation where someone did a roll-in instead of a transfer shower.

Internal ID: 702

E124-18

IBC: 1107.5.2, 1107.5.2.1, 1107.5.2.2

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

1107.5.2 Group I-2 nursing homes. *Accessible units* and *Type B units* shall be provided in nursing homes of Group I-2, Condition 1 occupancies in accordance with Sections 1107.5.2.1 and 1107.5.2.2.

1107.5.2.1 Accessible units. At least 50 percent but not less than one of each type of the *dwelling units* and *sleeping units* shall be *Accessible units*.

Exceptions:

1. In not more than 90 percent of the Accessible units, water closets shall not be required to comply with ICC A117.1 where such water closets comply with Section 1109.2.2.
2. In not more than 90 percent of the Accessible units, roll-in-type showers shall not be required to comply with ICC A117.1 where roll-in-type showers comply with Section 1109.2.3.

1107.5.2.2 Type B units. In structures with four or more *dwelling units* or *sleeping units* intended to be occupied as a residence, every *dwelling unit* and *sleeping unit* intended to be occupied as a residence shall be a *Type B unit*.

Exception: The number of *Type B units* is permitted to be reduced in accordance with Section 1107.7.

Reason:

This is a part of a series of proposals for both scoping and technical criteria to allow for assisted toileting and bathing in some types of care facilities.

Group I-2 nursing home facilities are the second step for housing for persons who need assistance including medical care. The code should recognize that older adults have limited upper body strength. Allowing for 90 of the Accessible units to use the assisted toileting and bathing, allows for options within the facility.

It should be noted that the assisted toileting arrangement would be permitted for the Type B units with current A117.1 text. This option would exceed requirements for the Fair Housing Act Guideline.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

If someone chooses this option, here would be an increase in bathroom size for the water closet and a situation where someone did a roll-in instead of a transfer shower.

E125-18

IBC: 1107.5.4

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

1107.5.4 Group I-2 rehabilitation facilities. In hospitals and rehabilitation facilities of Group I-2 occupancies that specialize in treating conditions that affect mobility, or units within either that specialize in treating conditions that affect mobility, 100 percent of the *dwelling units* and *sleeping units* shall be *Accessible units*.

Exceptions:

1. In not more than 50 percent of the Accessible units, water closets shall not be required to comply with ICC A 117.1 where such water closets comply with Section 1109.2.2.
2. In not more than 50 percent of the Accessible units, roll-in-type showers shall not be required to comply with ICC A117.1 where roll-in-type showers comply with Section 1109.2.3.

Reason:

This is a part of a series of proposals for both scoping and technical criteria to allow for assisted toileting and bathing in some types of care facilities.

Group I-2 rehabilitation hospital facilities are housing for persons who need assistance including medical care. The code should recognize that older adults have limited upper body strength. Allowing for 50 of the Accessible units to use the assisted toileting and bathing, allows for options within the facility.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Cost Impact

The code change proposal will increase the cost of construction .

If someone chooses this option, here would be an increase in bathroom size for the water closet and a situation where someone did a roll-in instead of a transfer shower.

Internal ID: 704

E126-18

IBC: 1107.7.2

Proponent: Jim Safranek, representing Safranek Group LLC

2018 International Building Code

Revise as follows:

1107.7.2 Multistory units. *A multistory dwelling unit or sleeping unit that is not provided with elevator service is not required to be a Type A unit or a Type B unit. Where a *multistory unit* is provided with external elevator service to only one floor, the floor provided with elevator service shall be the primary entry to the unit, shall comply with the requirements for a Type A units or Type B unit, where applicable and, where provided within the unit, a living area, a kitchen and a toilet facility shall be provided on that floor.*

Reason:

Purpose: One type of Group R-2 multi-family residential project seen in several areas of the United States are apartment buildings consisting solely of multiple, stacked, two-level multistory dwelling units (upper units placed above lower units) using a common-use building stair to access the upper units, instead of using a common-use elevator.

For this type of building, per section 1107.7.2 of the 2018 IBC, the individual multistory dwelling units are not required to be Type 'B' units. Therefore, an apartment project consisting solely of a building (or buildings) containing these type of units would not have any Type 'B' units and initially would appear to be exempt from any accessibility requirements. However, section 1107.6.2.2.1 of the 2018 IBC would require that a Type 'A' unit be provided, regardless of the fact that the project did not contain any Type 'B' units. The result of this is a project that did not contain any Type 'B' units and initially appeared to be exempt from any accessibility requirements would be required to provide Type 'A' units and all common-use areas that were initially exempt from accessibility requirements would now be required to comply with applicable accessibility requirements. The purpose of this proposal is to clarify the requirements for Type 'A' units for Group R-2 projects consisting solely of multistory dwelling units without elevator service.

Reason and Substantiation: Where Exception 1 of section 1107.6.2.2.1 permits the number of Type 'A' units to be reduced per section 1107.7, subsection 1107.7.1 (Structures without elevator service), does not address the possibility of multi-level dwelling units in a structure without elevator service. The result of this is that the requirements found in section 1107.7.1 and its subsections, 1107.7.1.1 and 1107.7.1.2 yield units that are classified as Type 'B' units. Additionally, section 1107.7.2 (Multistory units) does identify that a multistory dwelling or sleeping unit not provided with elevator service is not required to be a Type 'B' unit, which mirrors the requirements found in the Fair Housing Act. Section 1107.7.2 also states that a multistory unit with an external elevator service to one floor is required to have the floor of that unit meet Type 'B' requirements. Unfortunately, section 1107.7.2 does not have language such as that found in section 1107.7.1 ("The number of Type 'A' units shall be determined in accordance with Section 1107.6.2.2.1.") stating how the number of Type 'A' units are determined where multi-level dwelling units occur. Given the lack of any specific requirement clarifying how Type 'A' units are determined for multistory units, the general requirement found in section 1107.6.2.2.1 is then applicable and all multistory units, regardless of whether they have a floor required to comply with Type 'B' requirements, or not (in the case of multistory units without elevator service) are utilized when determining the number of Type 'A' units for a project. This will result in all projects with multistory units being required to have Type 'A' units.

For any Group R-2 project (except those with certain grade conditions and those with nonelevator buildings where certain design flood elevation conditions exist) Type 'B' units will always occur and Type 'A' units will always be required. Given this, it appears overly restrictive that the International Building Code (IBC) require that Type 'A' units and their corresponding accessible common-use areas be provided where Type 'B' units and accessible common-use areas are not required, as is the case for R-2 projects that consist solely of stacked multistory dwelling units without any type of elevator service. Additionally, this requirement for Type 'A' units where Type 'B' units are not provided, greatly exceeds the accessibility requirements found in the Fair Housing Act (FHA). For a project consisting solely of multistory dwelling units without elevator service, the multistory dwelling units as well as their accompanying common-use areas would not be required to comply with the accessibility requirements found in the FHA. While some accessibility requirements found in the IBC and its accompanying accessibility standard ICC A117.1 exceed the requirements found in the FHA, in this circumstance, the IBC would greatly exceed the FHA requirements.

The proposed addition to section 1107.7.2 attempts to address this issue by eliminating the requirement for Type 'A' units at Group R-2 projects where only multistory dwelling units without any type of elevator service are provided.

Cost Impact

The code change proposal will decrease the cost of construction .

For multi-family residential projects that consist solely of multistory dwelling units, there will be a reduction in costs

where Type 'A' units and accessible common-use areas are not required.

Internal ID: 1584

E127-18

IBC: 1107.7.5

Proponent: Gregory Wilson, representing Federal Emergency Management Agency (gregory.wilson2@fema.dhs.gov); David Collins, The American Institute of Architects, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

Revise as follows:

1107.7.5 ~~Design flood elevation.~~Flood hazard areas. ~~The required number of Type A units and Type B units shall not apply to a site where the~~ shall not be required for buildings without elevator service that are located in flood hazard areas as established in Section 1612.3, where the minimum required elevation of the lowest floor or the lowest horizontal structural building members of nonelevator buildings are at or above the *design flood elevation* resulting supporting horizontal structural member, as applicable, results in all of the following:

1. A difference in elevation between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15 240 mm) exceeding 30 inches (762 mm).
2. A slope exceeding 10 percent between the minimum required floor elevation at the primary entrances and vehicular and pedestrian arrival points within 50 feet (15 240 mm).

Where such arrival points are not within 50 feet (15 240 mm) of the primary entrances, the closest arrival points shall be used.

Reason:

This proposal makes the provision easier to read and also makes it consistent with terms used in this code and reference standard ASCE 24-14, Flood Resistant Design and Construction. The purpose of this section is that if, based on the required floor elevation, the listed criteria are met, then an accessible route to the units is deemed not feasible. The original language of this section is from a legacy code (likely BOCA).

This proposal changes the elevation reference point from the design flood elevation to the minimum required lowest floor elevation of the building, which is specified in Sec. 1612, by reference to ASCE 24-14. For Flood Design Class 2 buildings, which includes multi-family buildings, the minimum required lowest floor elevation is the base flood elevation plus one foot. Therefore, the required lowest floor elevation should be used to apply the test specified in the number items.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No additional cost. This proposal does not increase construction requirements or costs.

Internal ID: 1141

E128-18

IBC: 1109.2, 1109.2.2 (New), 1109.2.2.1 (New), 1109.2.2.2 (New), 1109.2.2.2.1 (New), 1109.2.2.2.2 (New), 1109.2.2.2.3 (New), 1109.2.2.3 (New), 1109.2.2.4 (New), 1109.2.2.5 (New), 1109.2.2.6 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

1109.2 Toilet and bathing facilities. Each toilet room and bathing room shall be *accessible*. Where a floor level is not required to be connected by an *accessible route*, the only toilet rooms or bathing rooms provided within the facility shall not be located on the inaccessible floor. Except as provided for in Sections ~~1109.2.2-1109.2.3~~ and ~~1109.2.3-1109.2.4~~, at least one of each type of fixture, element, control or dispenser in each accessible toilet room and bathing room shall be *accessible*.

Exceptions:

1. Toilet rooms or bathing rooms accessed only through a private office, not for *common* or *public use* and intended for use by a single occupant, shall be permitted to comply with the specific exceptions in ICC A117.1.
2. This section is not applicable to toilet and bathing rooms that serve *dwelling units* or *sleeping units* that are not required to be *accessible* by Section 1107.
3. Where multiple single-user toilet rooms or bathing rooms are clustered at a single location, at least 50 percent but not less than one room for each use at each cluster shall be *accessible*.
4. Where no more than one urinal is provided in a toilet room or bathing room, the urinal is not required to be *accessible*.
5. Toilet rooms or bathing rooms that are part of critical care or intensive care patient sleeping rooms serving *Accessible units* are not required to be *accessible*.
6. Toilet rooms or bathing rooms designed for bariatrics patients are not required to comply with the toilet room and bathing room requirement in ICC A117.1. The *sleeping units* served by bariatrics toilet or bathing rooms shall not count toward the required number of *Accessible sleeping units*.
7. Where permitted in Section 1107, in toilet rooms or bathrooms serving Accessible units, water closets designed for assisted toileting shall comply with Sections 1109.2.2.
8. Where toilet facilities are primarily for children's use, required *accessible* water closets, toilet compartments and lavatories shall be permitted to comply with children's provision of ICC A117.1.

Add new text as follows:

1109.2.2 Water closets designed for assisted toileting. Water closets designed for assisted toileting shall comply with Section 1109.2.2.1 through 1109.2.2.6.

1109.2.2.1 Location. The centerline of the water closet shall be 24 inches (610 mm) minimum and 26 inches maximum (660 mm) from one side of the required clearance.

1109.2.2.2 Clearance. Clearance around the water closet shall comply with Section 1109.2.2.2.1 through 1109.2.2.2.3

1109.2.2.2.1 Clearance width. Clearance around a water closet shall be 66 inches (1675 mm) minimum in width, measured perpendicular from the side of the clearance that is 24 inches (610 mm) minimum and 26 inches (660 mm) maximum from the water closet centerline.

1109.2.2.2.2 Clearance depth. Clearance around the water closet shall be 78 inches (1980 mm) minimum in depth, measured perpendicular from the rear wall

1109.2.2.2.3 Clearance overlap. The required clearance around the water closet shall be permitted overlaps per ICC A117.1 Section 604.3.3

1109.2.2.3 Height. The height of the water closet seats shall comply with ICC A117.1 Section 604.4.

1109.2.2.4 Swing-up grab bars. The swing-up grab bars shall comply with ICC A117.1 Sections 609.2 and 609.8. Swing-up grab bars shall be provided on both sides of the water closet and shall comply with all of the following:

1. The centerline of the grab bar shall be 14 inches minimum to 16 inches (356 to 405 mm) maximum from the centerline of the water closet
2. The length of the grab bar is 36 inches (915 mm) minimum in length, measured from the rear wall to the end of the grab bar.
3. The top of the grab bar in the down position is 30 inches (760 mm) minimum and 34 inches (865 mm) maximum above the floor.

1109.2.2.5 Flush controls. Flush controls shall comply with ICC A117.1 Section 604.6.

1109.2.2.6 Dispensers. Toilet paper dispensers shall be mounted on at least one of the swing-up grab bars and the outlet of the dispenser shall be located at 24 inches (610 mm) minimum to 36 inches (915 mm) maximum from the rear wall.

Reason:

This is a part of a series of proposals for both scoping and technical criteria to allow for assisted toileting and bathing in some types of care facilities. We are asking for this technical criteria to be added into the IBC at this time due to the timing for the next edition of the ICC A117.1 - probably not referenced until the 2024 or 2027 code cycle. The format follows the ICC A117.1 for water closets for clarity and easy comparison of requirements.

In our educated opinion, these technical criteria will provide equivalent facilitation to the accessible toilet requirement in ICC A117.1 and the 2010 ADA Standard. These requirements are for toilets used by older adults or persons with limited upper body strength in care settings and where care-givers assist residents. It provides additional space between the toilet and any obstructions, such as a lavatory, cabinet or wall. Additional space is provided in front of a toilet to allow for additional approach options. Clear floor space for an unassisted side transfer is provided as well, consistent with 2010 ADA and A117.1. The provisions allow the use of fold-down grab bars in lieu of wall-mounted grab bars.

The code needs to recognize that older adults have limited upper body strength and while they do need assistance (grab bars) when transferring on/off the toilet the standard grab bar configuration does not work for them. Research has proven that the use of fold-down grab bars on both sides of the toilet is safer and easier for older adults who transfer independently. In addition, residents in care settings who need staff assistance to transfer on/off the toilet need more space between the toilet and the wall to enable a staff person (or two) to fully assist a person without risk of injury to the caregiver. In addition, the additional space at the toilet also allows for better access with a lifting device.

The Mayer-Rothschild Foundation has completed research that gives ideal dimensions for grab bars and toilet spacing. The research was completed too late to be considered for inclusion in the most recent ICC A117.1. Adding this into the IBC at this time is needed by the industry to provide adequate patient care and limit risks for this population and staff. The intent is to propose these technical provisions to the next A117.1 - the earliest of which could be the 2022, with a reference in the 2024 codes.

This information was presented to the U.S. Access Board in early 2017. They supported the idea, but at this time the U.S. Access Board cannot move forward with any new federal rules at this time due to federal budgetary limitation.

For additional information on the research see: <http://ideasinstitute.org/publications.asp>

ALTERNATE WATER CLOSET

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Bibliography:

Lee, S.J., Sanford, J., Calkins, M. Meglen, S., Endicott, S. & Phillips, A. (2017) Beyond ADA accessibility: Meeting seniors' needs for toilet transfers. HERD. DOI: 10.1177/1937586717730338

Cost Impact

The code change proposal will increase the cost of construction .

There cost for the two grab bars should be similar. There is some additional clear floor space around the toilet to allow for assistance by staff.

2018 International Building Code

Revise as follows:

1109.2 Toilet and bathing facilities. Each toilet room and bathing room shall be *accessible*. Where a floor level is not required to be connected by an *accessible route*, the only toilet rooms or bathing rooms provided within the facility shall not be located on the inaccessible floor. Except as provided for in Sections ~~1109.2.2-1109.2.4~~ and ~~1109.2.3-1109.2.5~~, at least one of each type of fixture, element, control or dispenser in each accessible toilet room and bathing room shall be *accessible*.

Exceptions:

1. Toilet rooms or bathing rooms accessed only through a private office, not for *common* or *public use* and intended for use by a single occupant, shall be permitted to comply with the specific exceptions in ICC A117.1.
2. This section is not applicable to toilet and bathing rooms that serve *dwelling units* or *sleeping units* that are not required to be *accessible* by Section 1107.
3. Where multiple single-user toilet rooms or bathing rooms are clustered at a single location, at least 50 percent but not less than one room for each use at each cluster shall be *accessible*.
4. Where no more than one urinal is provided in a toilet room or bathing room, the urinal is not required to be *accessible*.
5. Toilet rooms or bathing rooms that are part of critical care or intensive care patient sleeping rooms serving *Accessible units* are not required to be *accessible*.
6. Toilet rooms or bathing rooms designed for bariatrics patients are not required to comply with the toilet room and bathing room requirement in ICC A117.1. The *sleeping units* served by bariatrics toilet or bathing rooms shall not count toward the required number of *Accessible sleeping units*.
7. Where permitted in Section 1107, in bathrooms serving Accessible units, showers designed for assisted toileting shall comply with Section 1109.2.3.
8. Where toilet facilities are primarily for children's use, required *accessible* water closets, toilet compartments and lavatories shall be permitted to comply with children's provision of ICC A117.1.

Add new text as follows:

1109.2.3 Standard roll-in-type shower compartment designed for assisted bathing. Standard roll-in-type shower compartments designed for assisted bathing shall comply with Section 1109.2.3.1 through 1109.2.3.8.

1109.2.3.1 Size. Standard roll-in-type shower compartments shall have a clear inside dimension of 60 inches (1525 mm) minimum in width and 30 inches (760 mm) minimum in depth, measured at the center point of opposing sides. An entry 60 inches (1525 mm) minimum in width shall be provided.

1109.2.3.2 Clearance. A clearance of 60 inches (1525 mm) minimum in length adjacent to the 60-inch (1525 mm) width of the open face of the shower compartment, and 30 inches (760 mm) minimum in depth, shall be provided.

Exceptions:

1. A lavatory complying with Section 606 shall be permitted at one end of the clearance.
2. Where the shower compartment exceeds minimum sizes, the clear floor space shall be placed adjacent to the grab bars and 30 inches minimum from the back wall.

1109.2.3.3 Grab bars. Grab bars shall comply with ICC Section 609 and shall be provided in accordance with Section 1109.2.3.3.1 and 1109.2.3.3.2. In standard roll-in type shower compartments, grab bars shall be provided on three walls. Where multiple grab bars are used, required horizontal grab bars shall be installed at the same height above the floor.

Grab bars can be separate bars or one continuous bar.

1109.2.3.3.1 Back-wall grab bar. The back-wall grab bar shall extend the length of the back wall and extend within 6 inches (150 mm) maximum from the two adjacent side walls.

Exception:The back wall grab bar shall not be required to exceed 48 inches (1220 mm) in length. The rear grab bar shall be located with one end within 6 inches maximum of a side wall with a grab bar complying with Section 1109.2.3.3.2.

1109.2.3.3.2 Side-wall grab bars. The side wall grab bars shall extend the length of the wall and extend within 6 inches (150 mm) maximum from the adjacent back wall.

Exceptions:

1. The side-wall grab bar shall not be required to exceed 30 inches (760 mm) in length. The side grab bar shall be located with one end within 6 inches maximum of the back wall with a grab bar complying with Section 1109.2.3.3.1.
2. Where the side walls are located 72 inches (1830 mm) or greater apart, a grab bar is not required on one of the side-walls.

1109.2.3.4 Seats. Wall-mounted folding seats shall not be installed.

1109.2.3.5 Controls and hand showers. In standard roll-in-type showers, the controls and hand shower shall be located 38 inches (965 mm) minimum and 48 inches (1220 mm) maximum above the shower floor. Controls shall be located to facilitate caregiver access.

1109.2.3.6 Hand showers. Hand showers shall comply with ICC A117.1 Section 608.5.

1109.2.3.7 Thresholds. Thresholds shall comply with ICC A117.1 Section 608.6.

1109.2.3.8 Shower enclosures. Shower compartment enclosures for shower compartments shall comply with ICC A117.1 Section 608.7.

1109.2.3.9 Water temperature. Water temperature shall comply with ICC A117.1 Section 608.8.

Reason:

This is a part of a series of proposals for both scoping and technical criteria to allow for assisted toileting and bathing in some types of care facilities. We are asking for this technical criteria to be added into the IBC at this time due to the timing for the next edition of the ICC A117.1 - probably not referenced until the 2024 or 2027 code cycle. The format follows the ICC A117.1 for roll-in showers for clarity and easy comparison of requirements.

In our educated opinion, these technical criteria will provide equivalent facilitation to the accessible bathing requirement in ICC A117.1 and the 2010 ADA Standard. These requirements are for showers used by older adults or persons with limited upper body strength in care settings and where care-givers assist residents.

The key part of this change is to remove the requirement for permanently installed folding or fixed seats. These wall-mounted seats do not work well when residents are being assisted with showering. The wall mounted seats make it challenging for care-givers to access the back and one side of the resident they are bathing. Most often, if residents cannot stand for bathing, a portable, rolling chair is used and the folding seat stays folded up (but takes up space). This allows the care-giver greater access to all sides of the resident. In addition, the rolling chair is often easier to transfer to for older adults, than a wall mounted seat.

This proposal also recognizes alternate shower configurations that provide equal, if not better accessibility. For example, many nursing homes provide a "European" shower where two sides are open to the bathroom. This provides greater access for both resident with mobility issues as well as the care-giver. Water can be managed with shower curtains, either on a curtain track or an "L-shaped" curtain rod, however usually the entire room is designed to be a "wet room".

This information was presented to the U.S. Access Board in early 2017. They supported the idea, but at this time the U.S. Access Board cannot move forward with any new federal rules at this time due to federal budgetary limitation.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate

duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

For additional information on the research please go to: <http://ideasinstitute.org/publications.asp>

ASSISTED BATHING ROLL-IN SHOWER - MINIMUM SIZE

ASSISTED BATHING ROLL-IN SHOWER - USING EXCEPTIONS EXAMPLE 1

ASSISTED BATHING ROLL-IN SHOWER - USING EXCEPTIONS EXAMPLE 2

Bibliography:

Lee, S.J., Sanford, J., Calkins, M. Meglen, S., Endicott, S. & Phillips, A. (2017) Beyond ADA accessibility: Meeting seniors' needs for toilet transfers. HERD. DOI: 10.1177/1937586717730338

Cost Impact

The code change proposal will increase the cost of construction .

Costs will be minimal. It is will likely be equal when replacing the folding seat with a grab bar. Both require blocking in the wall. If a designer chooses the minimum size shower, the size requirements will be the same as currently required. This allows for additional design options.

Internal ID: 701

E130-18

2018 International Building Code

Update standard(s) as follows:

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001
US

ICC A117.1-092017:

Accessible and Usable Buildings and Facilities

Add new text as follows:

1109.6 Bottle filling stations. Where bottle filling stations are provided, they shall be accessible.

Exception: Bottle filling stations over drinking fountains for standing persons are not required to be accessible provided bottle filling stations are also located over the drinking fountains for persons using wheelchairs.

Reason:

In the interest of reducing the usage of disposable bottles for water, many schools are providing bottle filling stations. Due to security limitations, bottle filling stations are also being provided in airports. All operable parts intended for use by occupants must be accessible. The requirements for standing drinking fountains potentially will not allow for complaint reach over an obstruction. When the bottle filling stations are provided over the wheelchair drinking fountains, having them also over the standing drinking fountains would be providing redundant facilities.

□

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a requirement for filling station location and height. It does not change any technical criteria for such stations.

Analysis: The 2009 edition of the ICC A117.1 standard is referenced in Chapter 35.

Internal ID: 543

E131-18

IBC: 1109.13

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Building Code

Revise as follows:

~~1109.12~~**1109.13 Dressing, fitting and locker rooms.** Where dressing rooms, fitting rooms or locker rooms are provided, at least 5 percent, but not less than one, of each type of use in each cluster provided shall be *accessible*.

Reason:

The requirement needs to be its own section. As it is presently located, the provision is subordinate to the charging section which only addresses "service facilities." Employee locker rooms, locker rooms in residential buildings and locker rooms at the public pool would not be addressed since they are not service facilities. This is not consistent with the federal ADA or FHA. By moving the requirement to it's own section, it will be able to apply to all types of locker rooms and dressing rooms, consistent with the intent for equal access.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is simply clarifying the intent.

Internal ID: 930

E132-18

IBC: 1109.12.3, Chapter 35

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Building Code

Revise as follows:

1109.12.3 ~~Point of sale~~ Sales and service counters, counters and windows. Where counters or windows are provided for ~~sales~~ sale or distribution of goods or services, at least one of each type of counter and window provided shall be *accessible*. Where such counters or windows are dispersed throughout the building or facility, *accessible* counters or windows shall also be dispersed.

Update standard(s) as follows:

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001

US

ICC A117.1-~~09~~2017:

Accessible and Usable Buildings and Facilities

Reason:

The 2017 A117.1 has significantly improved technical criteria for service counters and windows, including provisions for a line of sight between the customers and employees and provisions for security glazing. The scoping requirements need to be coordinated to include service windows without counters. The title is simplified. A117.1 exempts drive-up only counters and windows, so a similar exception is not needed here. The proposal adds “windows” as a service element to clarify that these types of interactive elements must be accessible just like a counter. Service windows have been interpreted to be a type of service counter.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change has the effect to clarify the intent and remove ambiguity.

Analysis: The 2009 edition of the ICC A117.1 standard is referenced in Chapter 35.

Internal ID: 544

E133-18

IBC: 1109.13, Chapter 35

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Building Code

Revise as follows:

1109.13 Controls, operating mechanisms and hardware. Controls, operating mechanisms and hardware intended for operation by the occupant, including switches that control lighting and ventilation and electrical convenience outlets, in *accessible* spaces, along *accessible routes* or as parts of *accessible* elements shall be *accessible*.

Exceptions:

1. Operable parts that are intended for use only by service or maintenance personnel shall not be required to be *accessible*.
- ~~2. Electrical or communication receptacles serving a dedicated use shall not be required to be *accessible*.~~
- ~~3. Where two or more outlets are provided in a kitchen above a length of counter top that is uninterrupted by a sink or appliance, one outlet shall not be required to be *accessible*.~~
- ~~4. Floor electrical receptacles shall not be required to be *accessible*.~~
- ~~5. HVAC diffusers shall not be required to be *accessible*.~~
- ~~6. Except for light switches, where redundant controls are provided for a single element, one control in each space shall not be required to be *accessible*.~~
- ~~27. Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to comply with Section 1010.1.9.2.~~
3. Operable parts exempted in accordance with ICC A117.1 are not required to be *accessible*.

Update standard(s) as follows:

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001
US

ICC A117.1-092017:

Accessible and Usable Buildings and Facilities

Reason:

The purpose of this proposal is coordination with the 2017 ICC A117.1 exceptions for operable parts in Section 309.1. All current exceptions proposed to be deleted are listed in ICC A117.1 Section 309.1, plus an additional 5 new exceptions. Since the code requirements and override allowances in a standard, the new exception will allow for exceptions listed in ICC A117.1. This will maintain coordination of this item over time.

Below is the language from the 2017 ICC A117.1 for reference. The applicable exceptions are underlined.

309.1 General. Operable parts shall comply with Section 309.

Exceptions:

1. Receptacle outlets serving a dedicated use.
2. Where two or more receptacle outlets are provided in a kitchen above a length of countertop that is uninterrupted by a sink or appliance, one receptacle outlet shall not be required to comply with this section.
3. In a kitchen, where a clear floor space for a parallel approach cannot be located at a countertop in a corner between appliances, receptacle outlets over the countertop shall not be required to comply with this section provided that the countertop area does not exceed 9 square feet (0.835 m²) maximum.

4. Floor receptacle outlets.
5. HVAC diffusers.
6. Controls mounted on ceiling fans.
7. Where redundant controls other than light switches are provided for a single element, one control in each space shall not be required to comply with this section.
8. Reset buttons and shut-offs serving appliances, piping and plumbing fixtures.
9. Electrical panelboards shall not be required to comply with Section 309.4.
10. Emergency aid devices, such as fire department hose connections, valve controls, gauges, police call boxes and annunciator panels shall not be required to comply with this section provided that they are used only for emergencies by emergency personnel acting in their official capacity.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal points to exceptions to the operable parts requirements in A117.1 which might otherwise be missed. The change is only correlative and contains, in itself, no substantive changes.

Analysis: The 2009 edition of the ICC A117.1 standard is referenced in Chapter 35.

Internal ID: 549

E134-18

IBC: 1110.4.14

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Building Code

Revise as follows:

1110.4.14 Swimming pools, wading pools, cold baths, hot tubs and spas. Swimming pools, wading pools, cold baths, hot tubs and spas shall be *accessible* and be on an *accessible route*.

Exceptions:

1. Catch pools or a designated section of a pool used as a terminus for a water slide flume shall not be required to provide an *accessible* means of entry, provided that a portion of the catch pool edge is on an *accessible route*.
2. Where spas, cold baths or hot tubs are provided in a cluster, at least 5 percent, but not less than one of each type spa, cold baths or hot tub in each cluster, shall be *accessible* and be on an *accessible route*.
3. Swimming pools, wading pools, spas, cold baths and hot tubs that are required to be *accessible* by Sections 1110.2.2 and 1110.2.3 are not required to provide *accessible* means of entry into the water.

Reason:

The proposal includes two changes: clarification that the intent is to have access to at least one of each type of aquatic element and the addition of cold baths.

As written, it could be interpreted that if a cluster included a hot tub and a spa as a cluster, access would only be required to one of those although they are different types of elements - with bubbles and without. The change makes the language consistent with the intent of the federal ADA.

The second is a change to include cold baths as another type. This is a different thermal experience and should be included, consistent with the intent of the ADA for equal access.

Cost Impact

The code change proposal will increase the cost of construction .

With the addition of "cold baths" to the list, access to some elements which did not necessarily require access before would increase construction cost. The otehr change woudl not affect cost since it is in keeping with the original intent.

Internal ID: 929

E135-18

IBC: 1110.4.15, Chapter 35

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Building Code

Revise as follows:

1110.4.15 Shooting facilities with firing positions. Where shooting facilities with firing positions are designed and constructed at a site, at least 5 percent, but not less than one, of each type of firing position shall be *accessible* and be on an *accessible route*.

Exception: Shooting facilities with firing positions on free-standing platforms that are elevated above grade 12 feet (3660 mm) minimum provided that the aggregate area of elevated firing positions is 500 square feet (46 m²) maximum are not required to be accessible

Update standard(s) as follows:

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001

US

ICC A117.1-~~09~~2017:

Accessible and Usable Buildings and Facilities

Reason:

The 2017 ICC A117.1 exempts elevated shooting stations and is consistent with the 2010 ADA Standards. These stations are elevated so that hunters can practice shooting from an elevated location, such as a tree stand. The size limitations are similar to those specified for press boxes. Where facilities are required to be accessible is a scoping issue, so this exception should be based in the building code. The other exceptions in ICC A117.1 Section 1001.2.1 are all found in the IBC in the applicable sections in Section 1110.

A117.1 2017

1001.2.1 General Exceptions. The following shall not be required comply with this standard or to be on an accessible route:

1. Raised structures used solely for refereeing, judging, or scoring a sport. (IBC 1110.4.6)
2. Water Slides. (IBC 1110.4.13.2)
3. Animal containment areas that are not for public use. (IBC 1110.4.8)
4. Raised boxing or wrestling rings.(IBC 1110.4.5)
5. Raised diving boards and diving platforms. (IBC 1110.4.13.2)
6. Bowling lanes that are not required to provide wheelchair spaces. (IBC 1110.4.3)
7. Mobile or portable amusement rides. (IBC 1110.4.8)
8. Amusement rides that are controlled or operated by the rider. (IBC 1110.4.8.3 Exp. 1)
9. Amusement rides designed primarily for children, where children are assisted on and off the ride by an adult. (IBC 1110.4.8.3 Exp. 2)
10. Amusement rides that do not provide amusement ride seats. (IBC 1110.4.8.3 Exp. 3)
11. Shooting facilities with firing positions on free-standing platforms that are elevated above grade 12 feet (3660 mm) minimum provided that the aggregate area of elevated firing positions is 500 square feet (46 m²) maximum.

Cost Impact

The code change proposal will decrease the cost of construction .

Exceptions always decrease costs - that's why we love them.

Analysis: The 2009 edition of the ICC A117.1 standard is referenced in Chapter 35.

Internal ID: 545

E136-18

IBC: 1111.1, 1111.2 (New)

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Building Code

Revise as follows:

1111.1 Signs. Required *accessible* elements shall be identified by the International Symbol of Accessibility at the following locations.

1. *Accessible* parking spaces required by Section 1106.1.
Exception: Where the total number of parking spaces provided is four or less, identification of *accessible* parking spaces is not required.
2. *Accessible* parking spaces required by Section 1106.2.
Exception: In Group I-1, R-2, R-3 and R-4 facilities, where parking spaces are assigned to specific *dwelling units* or *sleeping units*, identification of *accessible* parking spaces is not required.
3. *Accessible* passenger loading zones.
4. *Accessible* toilet or bathing rooms where ~~multiple single user~~ not all toilet or bathing rooms are clustered at a single location accessible.
5. *Accessible* entrances where not all entrances are *accessible*.
6. *Accessible* check-out aisles where not all aisles are *accessible*. The sign, where provided, shall be above the check-out aisle in the same location as the checkout aisle number or type of check-out identification.
- ~~7. Family or assisted use toilet and bathing rooms.~~
- ~~8-7.~~ *Accessible* dressing, fitting and locker rooms where not all such rooms are *accessible*.
- ~~9-8.~~ *Accessible* areas of refuge in accordance with Section 1009.9.
- ~~10-9.~~ Exterior areas for assisted rescue in accordance with Section 1009.9.
- ~~11-10.~~ In recreational facilities, lockers that are required to be *accessible* in accordance with Section 1109.9.

Add new text as follows:

1111.2 Signs identifying toilet or bathing rooms. Signs required in Section 403.4 of the International Plumbing Code identifying toilet rooms and bathing rooms shall be visual characters, raised characters and braille complying with ICC A117.1. Where pictograms are provided as designations for toilet rooms and bathing rooms, the pictograms shall have visual characters, raised characters and braille complying with ICC A117.1.

Reason:

The intent of this proposal is to provide a missing piece of signage information in Section 1111 for toilet and bathing rooms. IPC Section 403.4 references back to IBC Section 1111 for requirements for accessible signage.

While Appendix E, Section E107.2 in the IBC addresses room signage that is not required in the codes, signs are required at toilet and bathing rooms by IPC Section 403.1.2, 403.2.1 and 403.4. Similar to exit signs (required in IBC Sections 1013.1 and 1013.4) and stairway signage (required in IBC Sections 1023.9), where signs are required, the same information must be available to persons with vision impairments. Some information on toilet and bathing room signage is stated in IBC Section 1111.1 (International Symbol for Accessibility) and 1111.2 (directional signage), but not any information on room designation.

It is suggested to reorder the signage requirements in 1111.1 to group like subjects together.

Section 1111.1 current Exception 4 is revised to clarify that the International Symbol for Accessibility is required at

accessible toilet and bathrooms rooms where not all toilet and bathing rooms in the building are accessible. This is consistent with the general intent for signage - the accessibility symbol is not required if all like elements are accessible. The current language in Exception 4 would only be applicable to clustered single occupant bathrooms that take advantage of the 50% allowance in Section 1109.2 Exception 3. Buildings being altered or with additions may not have all bathrooms accessible. A more generic reference would allow the same consideration for family or assisted use toilet facilities or bathing rooms, so current Exception 7 is not needed.

A new section 1111.2 would add specific criteria for toilet and bathing room signage other than the International Symbol for Accessibility (Section 1111.1). The language is consistent with the terminology for permanent rooms and spaces specified in E107.2 for permanent room designation.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The sign is already required by the 2010 ADA Standard to be accessible. This clarification could reduce where the International Symbol of Accessibility was required on a sign.

Internal ID: 555

E137-18

IBC: E104.2.2

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Building Code

Revise as follows:

E104.2.2 Group I-3. In Group I-3 occupancies at least 2 percent, but no fewer than one of the total number of general holding cells and general housing cells equipped with ~~audible emergency alarm systems~~ notification devices and permanently installed telephones within the cell, ~~shall comply~~ both complying with Section E104.2.4.

Reason:

The type of alarm referenced in this section is not considered an emergency alarm system, as defined in Section 202 and regulated by Section 908. Instead, the intent of the section appears to be triggering the requirements in Section E104.2.4. If the intent of the current text is to require that visual notification devices AND a permanently installed telephone be provided in 2% of cells, then the section requires addition revision for clarity. This proposal suggests such a revision to open the question to discussion, and provides a clarifying text to be used if there is agreement on how the section should be applied.

Elimination of the "emergency alarm systems" text is necessary to correlate with revisions to emergency alarm provisions done last cycle by F75-16 because the system required by this section is not in the scope of the code's emergency alarm system requirements.

Cost Impact

The code change proposal will decrease the cost of construction .

Removes the implication that an alarm system is required vs. simply emergency alarm devices that are correlated to this section in Section E104.2.4.

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL PROPERTY MAINTENANCE CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some FS code change proposals may not be included on this list, as they are being heard by another committee.

FS1-18

IBC: 703.2, 703.4

Proponent: Jeffrey Shapiro, representing Tyco Fire Products (jeff.shapiro@intlcodeconsultants.com)

2018 International Building Code

Revise as follows:

703.2 Fire-resistance ratings. The *fire-resistance rating* of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263, without the use of automatic sprinklers or any other fire suppression system being incorporated as part of the test, or in accordance with Section 703.3. The *fire-resistance rating* of penetrations and *fire-resistant joint systems* shall be determined in accordance Sections 714 and 715, respectively.

703.3 Methods for determining fire resistance. The application of any of the methods listed in this section shall be based on the fire exposure and acceptance criteria specified in ASTM E119 or UL 263. The required *fire resistance* of a building element, component or assembly shall be permitted to be established by any of the following methods or procedures:

1. *Fire-resistance* designs documented in approved sources.
2. Prescriptive designs of fire-resistance-rated building elements, components or assemblies as prescribed in Section 721.
3. Calculations in accordance with Section 722.
4. Engineering analysis based on a comparison of building element, component or assemblies designs having *fire-resistance ratings* as determined by the test procedures set forth in ASTM E119 or UL 263.
5. Alternative protection methods as allowed by Section 104.11.
6. *Fire-resistance* designs certified by an approved agency.

Delete without substitution:

~~**703.4 Automatic sprinklers.** Under the prescriptive fire resistance requirements of this code, the *fire resistance rating* of a building element, component or assembly shall be established without the use of *automatic sprinklers* or any other fire suppression system being incorporated as part of the assembly tested in accordance with the fire exposure, procedures and acceptance criteria specified in ASTM E119 or UL 263. However, this section shall not prohibit or limit the duties and powers of the *building official* allowed by Sections 104.10 and 104.11.~~

Reason:

This proposal captures discussion points from previous cycles and provides a simpler approach to dealing with limiting the E119 test protocol to not include fire suppression systems. Although E119 doesn't allow this, it is understood that some interest groups have wanted the point emphasized in the IBC. In this proposal, the technical restrictions in 703.4 have been relocated to Section 703.2, since this is where compliance with E119 is established in the IBC. It's a more suitable place for the fire-suppression system limitation to reside. Alternatives to E119, including the reference to alternative methods per Section 104.11, will once again be consolidated in 703.3 without having to rely on a separate section (703.4) that is redundant with respect to performance-based alternatives. If you compare the text of this proposal with the current text in 703.4, you will see that it is closely aligned so as to maintain the intent of current provisions while eliminating confusion and concern associated with Section 703.4. Note that existing subsections of Section 703.2 are to be retained without change and are shown for clarity to see how the provisions fit together.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is a clarification of how the code applies.

Internal ID: 2374

FS2-18

IBC: 703.5, 703.5.1, 703.5.2

Proponent: Tim Earl, GBH International, representing self (tearl@gbhinternational.com)

2018 International Building Code

Revise as follows:

703.5 Noncombustibility tests. The tests indicated in ~~Sections~~ Section 703.5.1 and ~~703.5.2~~ shall serve as criteria for acceptance of building materials as set forth in Sections 602.2, 602.3 and 602.4 in Types I, II, III and IV construction. The term “noncombustible” does not apply to the flame spread characteristics of *interior finish* or *trim* materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or flame spread beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

703.5.1 Elementary-Non-combustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with this section with a surfacing of not more than 0.125 inch (3.18 mm) thick that has a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as non-combustible.

Delete without substitution:

~~**703.5.2 Composite materials.** Materials having a structural base of noncombustible material as determined in accordance with Section 703.5.1 with a surfacing not more than 0.125 inch (3.18 mm) thick that has a *flame spread index* not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible materials.~~

Reason:

This current language is technically incorrect. The intent of the section title of Section 703.5.1 is to describe materials which are not layered and have a uniform structure throughout. This is complicated by the fact that the title is not reflected in the text of the section, so there is a disconnect. With Section 703.5.2, the problem is similar. While the title 'composite materials' isn't specifically used in the text, the text does describe a 'composite' of materials. In our efforts to correct the titles and have the titles clearly reflected in the text, we realized that a big part of the problem was the organization of these 3 sections. We believe our proposed solution results in clearer code and simpler code. This proposal does not result in any technical change to the code requirements.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal cleans up incorrect language and will have no impact on construction costs. It is essentially editorial.

Internal ID: 505

FS3-18

IBC: 703.5.1, Chapter 35

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing North American Insulation Manufacturers Association (NAIMA)

2018 International Building Code

Revise as follows:

703.5.1 Elementary materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136, or ASTM E2652, using the acceptance criteria prescribed by ASTM E136.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959

E2652-16:

Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone-shaped Airflow Stabilizer at 750oC

Reason:

Several of the I-Codes have varying definitions of the term “non-combustible material”, each based upon the way in which the concept of “non-combustible” is used within that Code. Throughout the ICC code system, the concept of “noncombustible material” is based on the idea that the material should not ignite or burn when subjected to fire or heat. Our intent is to require the same pass/fail criteria as currently exists in ASTM E136, using all fo the thermocouples required by ASTM E136, but using the ASTM E2652 apparatus. When ASTM E2652 is used, the pass/fail criteria and methodology are those required by ASTM E136.

The concept of “noncombustible materials” and “noncombustibility” in terms of types of construction is widely used throughout the International Codes. The IBC, IFC, IEBC and IFGC do not contain a separate definition of “noncombustible”, even though they use the terminology “non-combustible materials”.

In common usage, the term “noncombustible” is used to denote materials which do not ignite or are not capable of sustaining combustion. The common Dictionary definitions for “noncombustible” are typically as follows:

Noncombustible, adj - incapable of being burned

(Merriam -Webster’s International Dictionary of the English Language, Unabridged, 2013)

In the traditional use of the terminology and concept of “non-combustible” in the Codes has been based on acceptable performance when tested in accordance with ASTM E136, Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C. Materials passing the test are permitted limited flaming and other indications of combustion. However, these have traditionally been acceptable. Understandably, ASTM E136 does not replicate the full spectrum of actual building fire exposure conditions. However, this test method does provide an assessment indicating those materials which do not act to aid combustion or add appreciable heat to an ambient fire.

ASTM has published another standard ASTM E2652-16, entitled Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C. This test method is similar to ASTM E136, but based on the international standard for Noncombustibility. The key difference between the two standards is in the equipment. The apparatuses in this test method and in Test Method E 136 is that the furnace tube in this test method has a conical air-flow stabilizer section attached at its bottom. Both test methods use cylindrical furnace tubes. Like ASTM E136, the test Standard does not include mandatory pass/fail criterion. It allows those criteria to be determined by the Codes or other users. Appendix X3 also contains a comparison of results obtained from this apparatus versus ASTM E136. ASTM E136 has already been revised to include ASTM E2652 as an alternate methodology.

Bibliography:

ASTM E2652-16 - Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone- shaped Airflow Stabilizer, at 750°C.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an additional option only.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2562-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1091

FS4-18

IBC: 703.5.2

Proponent: Andy Williams, representing Metal Construction Association (afwilliams@Connect2amc.com)

2018 International Building Code

Revise as follows:

703.5.2 Composite materials. Materials having a structural base of noncombustible material as determined in accordance with Section 703.5.1 with a surfacing not more than 0.125 inch (3.18 mm) thick that has a *flame spread index* not greater than 50 for each component of the composite or laminate material when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible materials.

Reason:

Section 703.5.2 was added into the code long ago to allow gypsum wallboard to be recognized as a noncombustible material. While no adhesive material is typically used in gypsum, there are a number of exterior wall cladding materials that are currently using this section to allow recognition as a noncombustible element. These products typically consist of a noncombustible core (aluminum), in either a honeycomb or corrugated format with a relatively thin layer of aluminum attached to both faces. The adhesives used to make this attachment are combustible however Section 703.5.2 is being used as a reason to not be concerned with the introduction of this combustible element.

With the recent high rise building fires worldwide recently, the concern is rapid flame spread on the exterior of the building that could take place using the adhesive as a transfer method.

Making this proposed change would remove laminates and composites using combustible adhesives from the noncombustible product category and make these products be compliant with NFPA 285 Standard Fire Test Method for Evaluation of **Fire Propagation** Characteristics of Exterior Non-Load-Bearing Wall Assemblies Containing **Combustible Components** when required in the Exterior Wall Section 1402.5.

While the combustible WRB alone may be acceptable and not trigger the need for NFPA 285 Compliance (1402.5 Exception 1), The addition of two layers of combustible adhesive (front and back) of the laminate or composite material would definitely add combustible material and most likely make the wall assembly non-compliant with the exceptions to Section 1402.5.

Corrugated Core (End View)

Upper Section - Cut away view of honeycomb core, combustible adhesive, with exterior aluminum skin

Lower Section - Same panel with exterior aluminum skin removed.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cost of NFPA 285 testing would be added to the overall cost of this product. Similar cost addition as other combustible wall assemblies.

Internal ID: 1263

FS5-18

IBC: 703.8 (New)

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new text as follows:

703.8 Determination of noncombustible protection time contribution. The time, in minutes, contributed to the fire resistance rating by the noncombustible protection of mass timber building elements, components, or assemblies, shall be established through a comparison of assemblies tested using procedures set forth in ASTM E 119 or UL 263. The test assemblies shall be identical in construction, loading, and materials, other than the noncombustible protection. The two test assemblies shall be tested to the same criteria of structural failure.

1. Test Assembly 1 shall be without protection.
2. Test Assembly 2 shall include the representative noncombustible protection. The protection shall be fully defined in terms of configuration details, attachment details, joint sealing details, accessories and all other relevant details.

The noncombustible protection time contribution shall be determined by subtracting the fire resistance time, in minutes, of Test Assembly 1 from the fire resistance time, in minutes, of Test Assembly 2.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB determined that the fire resistance rating of mass timber structural elements, embodied in a series of proposals including this one, shall consist of the inherent fire resistance rating of the mass timber and the additional fire resistance rating of the Noncombustible Protection described in new definitions proposals. The TWB determined that at least 2/3 of the required fire resistance rating should come from the Noncombustible Protection. The TWB decided to provide both a performance path, as embodied in this proposal, and a prescriptive path, embodied in another proposal for Section 722.7.

This proposal constitutes the performance path for determining the contribution of noncombustible protection for mass timber elements. The proposal outlines a protocol to accomplish this. This proposal should be considered as a companion proposal to the proposals creating new types of mass timber construction in Section 602.4 and the code proposal in Section 722.7. The proposed new Section 602.4 requires the use of noncombustible protection on most mass timber elements in most of the proposed new types of construction.

This proposal, new section 703.8, is created to provide the method by which any material not contained in the prescriptive Table in Section 722.7 may be tested to show the time, in minutes, which it contributes as noncombustible protection. This procedure is representative of the procedure used in the past to determine the protection times for various membranes in Section 722.6 Component Additive Method for wood construction. It is neither new nor ambiguous in its use. Recent testing by AWC confirms the values derived from historic testing. A report is available at the following link: <http://bit.ly/WFC-firetestofGWBonCLT> . This link was confirmed active on 12/27/17.

This procedure should not be confused with “membrane protection” which is based on temperature rise on the unexposed side of a membrane attached to construction elements. Noncombustible construction is, instead, noncombustible material meeting the requirements of Section 703.5. Its contribution to the fire resistance rating of any building element is determined by this proposed new section. Simply put, it is determined by measuring the fire resistance time, in minutes and determined by structural failure, of a mass timber building element and then conducting a second test measuring the fire resistance time, in minutes and determined by structural failure, of the identical mass timber element with identical load, construction and condition, but with the proposed noncombustible protection applied to it. The difference in time between the two samples is the contribution, in minutes, of the noncombustible protection.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood

buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Internal ID: 942

FS6-18

IBC: 703.9 (New), Chapter 35

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new text as follows:

703.9 Sealing of adjacent mass timber elements. In buildings of Type IVA, IVB, and IVC construction, sealant or adhesive shall be provided to resist the passage of air in the following locations:

1. At abutting edges and intersections of mass timber building elements required to be fire resistance-rated
2. At abutting intersections of mass timber building elements and building elements of other materials where both are required to be fire resistance-rated.

Sealants shall meet the requirements of ASTM C920. Adhesives shall meet the requirements of ASTM D3498.

Exception:Where sealant or adhesive is not a required component of a fire resistance-rated assembly.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

D3498-03(2011):

Standard Specification for Adhesives for Field-Gluing Plywood to Lumber Framing for Floor Systems

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

Mass timber has inherent properties of fire resistance, serving both to provide structural fire resistance and to safeguard against the spread of fire and smoke within a building or the spread of fire between structures.

When mass timber panels are connected together, fire tests have demonstrated that it is important for the abutting edges and intersections in the plane of and between the different planes of panels that form a separation to be sealed. The structures tested as part of the fire tests supporting this submittal were constructed with this sealing.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit:
<http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17.

The US CLT manual recommends a bead of construction adhesive. Construction adhesive or other sealant can be used to prevent air flow. When a wall or horizontal assembly serves as the separation between two atmospheres, a fire creates differential pressure where heated gasses raise the pressure and work to drive fire and hot gasses through the structure. Voids that are not properly sealed can serve as a conduit for air movement during a fire, so abutting edges and intersections are recommended to be sealed.

Periodic special inspections during construction are required to make sure it is clear that the appropriate sealant or adhesive is used and to establish inspections to verify for ongoing quality control. However, Chapter 17 is a Group B

topic. It will be taken up then. It is shown below for clarity and to emphasize the importance the TWB places on proper application of sealants and adhesives in mass timber construction.

1705.19 Sealing of Mass Timber. Periodic special inspections of sealants or adhesives shall be conducted where sealant or adhesive required by Section 703.9 is applied to mass timber building elements as designated in the approved construction documents.

Some panels are manufactured under proprietary processes to ensure there are no voids at these intersections. Where this proprietary process is incorporated and tested, there is no requirement for sealant or adhesive and an exception is provided for this instance. Where the sealant is not required and is not specifically excluded it is still considered to be a good practice covered by this section.

This code change proposal does not apply to “joints” as defined in Section 202 of the IBC as joints have their own requirements for the placement and inspection of fire resistant joint systems in IBC Section 715. Joints are defined as having an opening that is designed to accommodate building tolerances or to allow independent movement. Panels and members that are connected together as covered by this code change proposal do not meet the definition of a joint since they are rigidly connected and do not have an opening.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D3498-03(2011), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 943

FS7-18

IBC: 704.3 (New)

Proponent: Terry Maiers, BSB Design, Inc., representing BSB Design, Inc. (tmaiers@bsbdesign.com)

2018 International Building Code

Add new text as follows:

704.3 Protection of primary structural frame other than columns. Members of the primary structural frame other than columns that are required to have protection to achieve a fire-resistive rating and support more than two floors or one floor and roof or support a load-bearing wall or a non-load bearing wall more than two stories high, shall be provided individual encasement protection by protecting them on all side for the full length, including connections to other structural members, with materials having the required fire-resistive rating.

Exceptions:

1. Individual encasement protection on all sides shall be permitted on all exposed sides provided the extent of the protection is in accordance with the required fire-resistive rating, as determined in Section 703.
2. Where primary structural members are enclosed within a continuous horizontal membrane of fire-resistive rated construction that is equal to or greater that required by other sections of this code, shall not be required to be individually encased on any side of the primary structural member, including connections

Reason:

The reason for the requested change to the language of the section in question is that if the membrane enclosure is constructed to the established tested assembly then any structural member, whether primary or secondary would be protected by that tested assembly. It seems redundant to have a horizontal membrane from a tested assembly and to then include an additional level of protection that would exceed the required rating for the structural members contained within the tested horizontal membrane assembly.

As an example of an actual construction project, the floor/ceiling assembly of an A-3 occupancy and an R-2 occupancy is constructed of a primary steel frame system with horizontal beams connected to the steel columns. Either with a top bearing hanger framing system or a bottom chord bearing system, are placed wood trusses that support the floor sheathing with a finish topping of concrete along with a ceiling assembly of resilient channels and appropriate gypsum board ceiling. This is a very common floor/ceiling assembly type that has been tested by many agencies.

The issue of requiring a separate encasement of the individual primary structural members in these situations is illogical.

The reason for that statement is the fact the with or without the separate encasement protection as required by the current code, the wood framing members that are supporting the floor surface that the occupants would be walking on would be destroyed by the fire that has penetrated the one-hour rated assembly before the primary framing system has failed.

Cost Impact

The code change proposal will decrease the cost of construction .

The relative impact of the cost of construction in these cases would be appreciable to the client and the contractor. For example if you consider a situation where you are creating a 1-hour rated horizontal membrane cavity that supports a floor that is constructed of a mixed material f wood and steel that is supporting 3 - 4 floors above that level, you not only have to create the horizontal membrane that meets the tested assembly but you also have to completely encase the individual primary members as well. If this suggested change is approved then the need for the additional encasement eliminated and so is the cost.

Internal ID: 1792

FS8-18

IBC: 704.6.1 (New)

Proponent: Crystal Sujeski, representing Crystal Sujeski (crystal.sujeski@fire.ca.gov)

2018 International Building Code

704.6 Attachments to structural members. The edges of lugs, brackets, rivets and bolt heads attached to structural members shall be permitted to extend to within 1 inch (25 mm) of the surface of the fire protection.

Add new text as follows:

704.6.1 Secondary (non-structural) attachments to structural members. Where primary and secondary structural steel members require fire protection, secondary (non-structural) tubular steel attachments to those structural members shall be protected with the same fire resistive rating as required for the structural member. The protection shall extend from the structural member a distance of not less than 12 inches. An open tubular attachment shall be filled with an equivalent fire protection method for a distance of 12-inch length from the structural member, or the entire length of the open tube, whichever is less.

Reason:

Primary structural frame members shall comply with Table 601 for fire resistance rating. Secondary (non-structural) steel tubes provide support for a building's exterior curtain wall and are thereby considered to be unrated members that do not require any fire protection. The connection of non-structural tubes to primary structural members has potentially adverse thermal effects on the required fire resistance rating of the primary steel frame members.

Building attachments for miscellaneous non-structural items (hangers, braces, framing tracks, erection lifting lugs, wall supports, etc.) are typically not required to be individually fire protected. In addition, fire resistance rated assemblies are tested without attachments, and with a homogeneous and continuous protection system or material. Thus, rated assemblies are explicitly limited to only the tested or approved components given in the published listing, which does not include bare steel attachments or discontinuous member protection. If such secondary steel attachments are connected to a fire resistance rated steel assembly, they may jeopardize the assembly's rating and protection system by the introduction of "thermal shorts", which can cause unexpected and excessive heat conduction, convection, or radiation through the attachment or its connection to the primary assembly.

The proposal to require a 12-inch extension of fireproofing on all non-structural attachments is based on a general industry practice as described in ANSI/UL 263 BXUV (exhibit C). Attached in the documentation is exhibit A, a letter from Steve Unser, a chief building official from the City of Creve Coeur, MO stating a policy to address the "12- inch rule" of fireproofing structural attachments to fireproofed beams and columns.

Moreover, in cases where an open tubular steel connection is utilized it is vital that the interior surfaces of the tube walls are fireproofed and the bottom ends of the tubes are closed. Without this protection, this condition results in bare (unprotected) steel areas at the attachment that could be directly exposed to radiant and convective heat from a fire source.

Attached (exhibit B1 and B2) is a modeling analysis of a high-rise project in Stockton, CA prepared by Jensen Hughes Senior Engineers Nestor Iwankiw and Thomas Forsythe. Their analysis further supports the proposed code change that would require fire proofing of secondary non-structural attachments.

Under the current code, fire-proofing requirements for non-structural attachments and their connections remain ambiguous. This lack of clarity makes fire protection enforcement difficult due to increased construction costs for contractors, builders and owners. Furthermore, special inspectors, fire and building officials are not taught to look for these deficiencies, resulting in numerous buildings with unprotected steel that can potentially have serious implications on public safety and welfare.

The proposal establishes a legal basis for requiring the additional fire protection as described herein.

The 'attached' documentation can be viewed at this link established 2/21/18

https://www.dropbox.com/sh/t0hlmrxf63gejfh/AABEvqgYih_QPK928kuUwazKa?dl=0

Cost Impact

The code change proposal will increase the cost of construction .

This code change will increase the cost of construction; however, without additional fire protection the structural integrity of the building may be compromised.

Internal ID: 1476

FS9-18

IBC: TABLE 601, 704.11

Proponent: Jonathan Siu, City of Seattle Department of Construction and Inspections, representing Washington Association of Building Officials Technical Code Development Committee (Jon.Siu@seattle.gov)

2018 International Building Code

Revise as follows:

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary structural frame ^f (see Section 202)	3 ^{a, b}	2 ^{a, b}	1 ^b	0	1 ^b	0	HT	1 ^b	0
Bearing walls and elements supporting primary or secondary structural frame members Exterior ^{e, f} Interior	3 3 ^a	2 2 ^a	1 1	0 0	2 1	2 0	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.

704.11 Bottom flange protection-Lintels, shelf angles, and plates. ~~Fire protection is not required at the bottom flange of lintels, shelf angles and plates, spanning not more than 6 feet 4 inches (1931 mm) whether part of the primary structural frame or not, and from the bottom flange of lintels, shelf angles and plates not part of the structural frame, regardless of span.~~

Fire protection shall be provided at the bottom flange of lintels, shelf angles and plates, where they span more than 6 feet 4 inches (1931 mm), and are an element of the structural frame.

Reason:

The first portion of this proposal is intended to clarify the requirements for fire protection of members supporting bearing walls. The second portion is partially editorial in nature, restating a requirement in the positive, rather than stating what is not required, but is also intended to be consistent with the first part of the proposal.

Table 601 regarding supporting members in bearing walls:

As currently written, the code does not address fire protection of members supporting bearing walls, whether that be bearing walls in their entirety or portions of bearing walls. This then leaves an open question for interpretation--are beams supporting bearing walls or lintels supporting portions of bearing walls considered part of the bearing wall with the associated protection, or are they primary or secondary structural frame, and protected accordingly?

The latter interpretation would be inconsistent with the code philosophy that members supporting important elements be protected to the same degree as those elements (for example, fire barriers and horizontal assemblies). On the other hand, from a structural standpoint, the former interpretation is problematic, as these members are **not** bearing walls, and therefore some would argue that the protection requirements for bearing walls do not apply.

This proposal addresses both issues. It recognizes that these structural members are going to be either primary or secondary structural frame, but requires them to be protected to the same degree as the bearing wall, consistent with code philosophy and structural understanding. The phrasing of the requirement is similar to what is used for secondary members in floor and roof construction in the same table. Locating the requirement in the text of the table as opposed to a footnote is consistent with code formatting principles of not putting significant requirements in footnotes.

Section 704.11 regarding lintels, shelf angles, and plates:

While the online Merriam-Webster dictionary broadly defines a lintel as "a horizontal architectural member spanning and usually carrying the load above an opening," our experience is the terms "lintels, shelf angles, or plates" as used in this section are generally intended to be used in the context of supporting concrete or masonry materials above.

As written, this section presumes fire protection is required for the bottom flange of lintels, shelf angles, and plates if they are part of the primary or secondary structural frame. It then goes on to say if the span is less than 6'-4", or if the element is not part of the structural frame, then protection is not required. Lintels above openings in masonry bearing walls generally are not supported on columns, and would therefore be secondary frame by definition. In accordance with this section, they are then required to be protected if they span more than 6'-4". However, Table 601 currently does not address secondary members that are supporting elements in bearing walls, as stated above.

This proposed rewrite turns the current language around to clearly state that protection is required if the span exceeds 6'-4" **and** is part of the structural frame. "Structural frame" would encompass both primary and secondary frame members. Consistent with the proposed change to Table 601, this proposal would require these lintels, shelf angles, and plates to be protected to the same degree as the wall they are supporting.

Related code change proposal:

A separate but related code change proposal has been submitted to clarify requirements for supporting fire walls and fire barriers. If this proposal and the fire wall/fire barrier proposals both pass, the combined Section 704.11 can appear as follows:

704.11 Lintels, shelf angles, and plates. Fire protection shall be provided at the bottom flange of lintels, shelf angles and plates, where they span more than 6 feet 4 inches (1931 mm) and meet at least one of the following conditions:

1. They are an element of the structural frame, or
2. They support fire wall or fire barrier construction.

Cost Impact

The code change proposal will increase the cost of construction .

Because this is a mostly a clarification of the current code language, the impact on cost of construction will depend on how a local jurisdiction is interpreting the current code provisions. If the jurisdiction is requiring fireproofing consistent with structural frame items in Table 601, this proposal could result in increased cost for providing fireproofing for beams or lintels, or for increased fireproofing materials in some cases where primary or secondary structural frame has a lower required fire-resistance rating than bearing wall rating (see Types III and IV construction). However, if the local jurisdiction already requires lintels and beams supporting bearing walls to have the same fire-resistance rating as the bearing wall they are supporting, then there will be no change in the cost of construction.

Internal ID: 581

FS10-18

IBC: SECTION 202, 202, 704.14 (New), 603.1, 722.5.2.2, 722.5.2.3

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BF] INTUMESCENT FIRE-RESISTANT COATINGS- MATERIALS. Thin film liquid mixture applied to substrates ~~by brush, roller, spray or trowel which~~, intumescent fire-resistive material expands into a protective ~~foamed~~ layer to provide fire-resistant protection of the substrates when exposed to flame or intense heat.

Add new text as follows:

704.14 Intumescent fire-resistant materials (IFRM). Intumescent fire-resistant materials (IFRM) shall be consistent with the fire-resistance rating, the listing and manufacturers installation instructions. The instructions shall include, but are not limited to, substrate condition, application temperatures, surface conditions and IFRM handling, storage, mixing, conveyance, method of application, curing and ventilation. The finished condition of IFRM applied to structural members or horizontal assemblies shall not, upon complete drying or curing, exhibit delamination.

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

 1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.

11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated* wood, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant ~~coatings materials~~, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

722.5.2.2 Sprayed fire-resistant materials. The provisions in this section apply to structural steel beams and girders protected with sprayed fire-resistant materials. Larger or smaller beam and girder shapes shall be permitted to be substituted for beams specified in *approved* unrestrained or restrained fire-resistance-rated assemblies, provided that the thickness of the fire-resistant material is adjusted in accordance with the following expression:

$$h_2 = h_1 [(W_1 / D_1) + 0.60] / [(W_2 / D_2) + 0.60]$$

(Equation 7-17)

where:

h = Thickness of sprayed fire-resistant material in inches.

W = Weight of the structural steel beam or girder in pounds per linear foot.

D = Heated perimeter of the structural steel beam in inches.

Subscript 1 refers to the beam and fire-resistant material thickness in the *approved* assembly. Subscript 2 refers to the substitute beam or girder and the required thickness of fire-resistant material. The *fire resistance* of structural steel beams and girders protected with intumescent or mastic fire-resistant ~~coatings materials~~ shall be determined on the basis of fire-resistance tests in accordance with Section 703.2.

722.5.2.3 Structural steel trusses. The *fire resistance* of structural steel trusses protected with fire-resistant materials sprayed to each of the individual truss elements shall be permitted to be determined in accordance with this section. The thickness of the fire-resistant material shall be determined in accordance with Section 722.5.1.3. The weight-to-heated-perimeter ratio (W/D) of truss elements that can be simultaneously exposed to fire on all sides shall be determined on the same basis as columns, as specified in Section 722.5.1.1. The weight-to-heated-perimeter ratio (W/D) of truss elements that directly support floor or roof assembly shall be determined on the same basis as beams and girders, as specified in Section 722.5.2.1. The *fire resistance* of structural steel trusses protected with intumescent or mastic fire-resistant ~~coatings materials~~ shall be determined on the basis of *fire resistance* tests in accordance with Section 703.2.

Reason:

There has been a section in the IBC that refers to Sprayed Fire-Resistant Materials (SFRM) for many years. Currently is no section in the IBC for a different type of material that produces the same result, Intumescent Fire-Resistant Materials (IFRM). The requirements for IFRM are as important as those for SFRM. Therefore, this section should be added to the code. The language is taken from the SFRM section and modified to fit IFRM's.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Adding this section to the code brings another option for fire-resistance in buildings.

Internal ID: 1989

FS11-18

IBC: SECTION 202, 202 (New), 705, 705.1, 705.2, TABLE 705.2, 705.2.1, 705.2.2, 705.2.3, 705.2.3.1, 705.8.1

Proponent: Lee Kranz, City of Bellevue, representing City of Bellevue, WA (lkranz@bellevuewa.gov)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

OPENING EXTERIOR. Fenestration, doors, hatches, vents, intake or exhaust grilles and similar elements installed in an exterior wall or roof assembly. Portions of the building perimeter covered by roofs or stories extending beyond an exterior wall below and not provided with a physical barrier commonly considered to be an exterior wall.

Revise as follows:

705 EXTERIOR WALLS AND PROJECTIONS

705.1 General. *Exterior walls and projections* shall comply with this section.

705.2 Projections. Cornices, eave overhangs, exterior balconies, elevated floors, roof assemblies and similar projections extending beyond the exterior wall shall conform to the requirements of this section and Section 1405. Exterior egress balconies and exterior exit stairways and ramps shall comply with Sections 1021 and 1027, respectively. Projections shall not extend any closer to the line used to determine the *fire separation distance* than shown in Table 705.2.

~~Exception~~ **Exceptions:**

1. Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section for projections between the buildings.
2. Elevated floors and roof assemblies extending beyond the exterior wall shall not be considered to be projections if of Type I or Type II construction.

**TABLE 705.2
MINIMUM DISTANCE OF PROJECTION**

FIRE SEPARATION DISTANCE-FSD (feet)	MINIMUM DISTANCE FROM LINE USED TO DETERMINE FSD
0 to less than 2	Projections not permitted
3 to less than 5	24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof
5 or greater	40 inches

For SI: 1 foot = 304.8 mm; 1 inch = 25.4 mm.

705.2.1 Types I and II construction. Projections ~~from extending beyond exterior walls~~ of Type I or II construction shall be of noncombustible materials or combustible materials as allowed by Sections 705.2.3.1 and 705.2.4.

705.2.2 Type III, IV or V construction. Projections ~~from extending beyond exterior walls~~ of Type III, IV or V construction shall be of any *approved* material.

705.2.3 Combustible projections. Combustible projections, including elevated roof and floor assemblies projecting beyond the exterior wall and extending to within 5 feet (1524 mm) of the line used to determine the fire separation distance shall be of not less than 1-hour *fire-resistance-rated* construction, heavy timber construction, complying with Section 2304.11, *fire-retardant-treated wood* or as permitted by Section 705.2.3.1.

Exception: Type VB construction shall be allowed for combustible projections in Group R-3 and U occupancies with a *fire separation distance* greater than or equal to 5 feet (1524 mm).

705.2.3.1 Balconies and similar projections. Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of heavy timber construction in accordance with Section 2304.11. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:

1. On buildings of Types I and II construction, three stories or less above grade plane, fire-retardant-treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood and plastic composites that comply with ASTM D7032 and Section 2612 are permitted for pickets, rails and similar guard components that are limited to 42 inches (1067 mm) in height.
3. Balconies and similar ~~projections elements projecting from exterior walls~~ on buildings of Types III, IV and V construction shall ~~be permitted to be of Type V construction and shall not be required to have a fire-resistance rating where sprinkler protection is extended to these areas.~~
4. ~~Where sprinkler protection is extended to the balcony areas, the~~ and the aggregate length of the balcony on each floor shall not be limited where sprinkler protection is extended to these areas.

705.8.1 Allowable area of openings. The maximum area of unprotected and protected openings permitted in an *exterior wall* in any story of a building shall not exceed the percentages specified in Table 705.8 based on the *fire separation distance* of each individual story.

Exceptions:

1. In other than Group H occupancies, unlimited unprotected openings are permitted in the first story above grade plane where the wall faces one of the following:
 - 1.1. A street and has a *fire separation distance* of more than 15 feet (4572 mm).
 - 1.2. An unoccupied space. The unoccupied space shall be on the same lot or dedicated for public use, shall be not less than 30 feet (9144 mm) in width and shall have access from a street by a posted fire lane in accordance with the International Fire Code.
2. Buildings whose exterior bearing walls, exterior nonbearing walls and exterior primary structural frame are not required to be fire-resistance rated shall be permitted to have unlimited unprotected openings.

Reason:

FS17-15 was approved for the 2018 IBC. It makes it clear that fire separation distance must be measured from the property line to the physical exterior wall, even if it is located a significant distance back under a story or roof projecting beyond the exterior wall (visualize an upside down wedding cake). This brought to light a basic flaw in the code related to building designs where an elevated floor or roof extends beyond the exterior wall toward the property

line. For example, under the current provisions, in a type V-B combustibile building, an upper story or roof projecting beyond the exterior wall is not limited in terms of how close it may come to the property line. Since 705.2 is intended to only address elements projecting "from an exterior wall" and not "floors or roofs extending beyond an exterior wall" the open side created by these designs is not regulated thereby creating a high potential for conflagration fires. Consistency in application of this basic code concept is critical to prevent fires from spreading from one building to another. In a recent survey of ICC plan check engineers, it was clear that the current code language does not provide clear direction on how to protect buildings when elevated floors or roofs extend beyond the exterior wall. If this proposal is approved it will provide the needed direction and create consistency in application.

FS17-15

705.8.1

Proposed Change as Submitted

Proponent : Stephen Thomas, representing Colorado Chapter (sthomas@coloradocode.net)

2015 International Building Code

Revise as follows:

705.8.1 Allowable area of openings. The maximum area of unprotected and protected openings permitted in an exterior wall in any story of a building shall not exceed the percentages specified in Table 705.8 based on the fire separation distance of each individual story.

Exceptions:

1. In other than Group H occupancies, unlimited unprotected openings are permitted in the first story above grade plane either:
 - 1.1. Where the wall faces a street and has a fire separation distance of more than 15 feet (4572 mm); or
 - 1.2. Where the wall faces an unoccupied space. The unoccupied space shall be on the same lot or dedicated for public use, shall be not less than 30 feet (9144 mm) in width and shall have access from a street by a posted fire lane in accordance with the International Fire Code.
2. Buildings whose exterior bearing walls, exterior nonbearing walls and exterior primary structural frame are not required to be fire-resistance rated shall be permitted to have unlimited unprotected openings.

Reason: The intent of this change is to clarify that the limitation of openings in exterior walls is based on the fire separation distance of each individual story. There appears to be confusion on how to evaluate openings in exterior walls when an upper floor extends out over a lower floor. We believe that the opening protection is determined at the exterior wall of the story, not the wall plane of the story above. Just the opposite would be true if the building was a pyramid style building where the upper floors step back from the floor below. The opening protection would depend on the distance to the lot line at each story, not the first story. Please see attached diagrams.

Cost Impact: Will not increase the cost of construction
 The change clarifies the intent of the code. There is no effect on the construction cost.

FS17-15 | 705.8.1-
 73026/6448

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The committee agreed that this proposal clarifies that the limitation of openings in exterior walls is based on the fire separation distance of each individual story, rather than only based on the FSD of the first story.

Individual Consideration Agenda**Public Comment 1:**

Proponent : Ali Fattah, City of San Diego Development Services, representing City of San Diego (afattah@sandiego.gov) requests Disapprove.

Commenter's Reason: We urge disapproval of this code change. The proposed code change was approved by the committee in lieu of PS 16 even though they addressed two different issues. PS 17 addresses the method of measurement. PS 18 address the hazards of usable space under a story of a building that is larger than the story below.

The definition of fire separation distance in Section 202 is a measurement from the building face and is a method of measurement to a reference point whether a lot line or an imaginary line. It stands to reason that if the code intent is for a lot line or imaginary line to be vertical that there should be one line used for measurement purposes. When the term is used the code intends it to be used as a measurement to the same reference so the code change is not necessary. The code change however has a negative consequence and reduces fire protection without technical justification. Additionally the definition add in PS 11 may lead to the portion of the upper story projecting beyond the lower smaller story a projection.

Additionally Section 705.5 and 705.8.1 makes clear that the area measurement for openings is per story based on the fire separation distance (which is to the building face). Evaluation of the inverted wedding cake scenario should be evaluated on a case by case basis and this code change does not allow for that. PS 18 was addressing an issue that Section 705.5 and Table 602 never require an exterior wall but tell when an exterior wall needs to be fire resistance rated based on occupancy, type of construction and fire separation distance. An exterior wall should be required to protect a neighboring property from the hazards of an occupancy and its fire loading. PS 17 would allow a upper story located 6 inches from a lot line with no exterior wall openings to have a story below with no exterior wall with occupants able to touch the neighboring property's fence or event the exterior wall.

Public Comment 2:

Proponent : Lee Kranz, City of Bellevue, WA , representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov) requests Disapprove.

Commenter's Reason: The image below, which was provided in the proponent's original reason statement, shows a multi-story building with upper levels extending closer to the property line than the lower levels. In many cases, areas located below the upper levels would count as floor area based on the definition of Building area. The text in this definition states that "Areas of the building not provided with surrounding walls shall be included in the building area if such areas are included within the horizontal projection of the roof or floor above". There have been many case studies of configuration fires due to radiant heat transferring from one building to the projecting horizontal surfaces of another building if that building is located too close to the property line and has not been provided with rated exterior walls and protected openings at the outboard edge of the overhang. This code change also does not address exterior wall and opening protection for

structures with no exterior walls such as carports (see carport illustrations below). Does constructing a wall below the edge of a carport roof on the side opposite to the property line setback change the way fire would spread from one parcel improvement to the other? Based on this code change, constructing such a wall would allow the open side of the carport to extend all the way to the property line because the setback to the exterior wall would be on the side opposite of the open carport roof edge. This code change has potentially dangerous consequences and should not be approved.

Canopy with no exterior walls. Under the current code the setback is measured to edge of wall based on definition of "Building Area" and "Fire Separation Distance".

Canopy with exterior wall. The proposed code change would allow the setback to be measured to the exterior wall instead of the opposite side of the canopy. This could result in the roof edge having a zero setback without a (rated exterior) wall or opening protective adjacent to the property line.

PS17-15

Cost Impact

The code change proposal will increase the cost of construction .

There may be cases where additional fire protection assemblies will be required on the open sides of buildings having overhanging floors or roofs that extend beyond the exterior wall of a floor below.

Internal ID: 92

FS12-18

IBC: 705, 705.1, 705.2, 705.2.4 (New)

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

SECTION 705 EXTERIOR WALLS AND PROJECTIONS

705.1 General. Exterior walls and projections shall comply with this section.

705.2 Projections. Cornices, roof and eave overhangs, projecting floors above, exterior balconies and similar projections extending beyond the exterior wall shall conform to the requirements of this section and Section 1405. Exterior egress balconies and exterior exit stairways and ramps shall comply with Sections 1021 and 1027, respectively. Projections shall not extend any closer to the line used to determine the *fire separation distance* than shown in Table 705.2.

Exception-Exceptions:

1. Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section for projections between the buildings.
2. Projecting floors complying with Section 705.2.4 are not required to comply with the projection limitations of Table 705.2.

Add new text as follows:

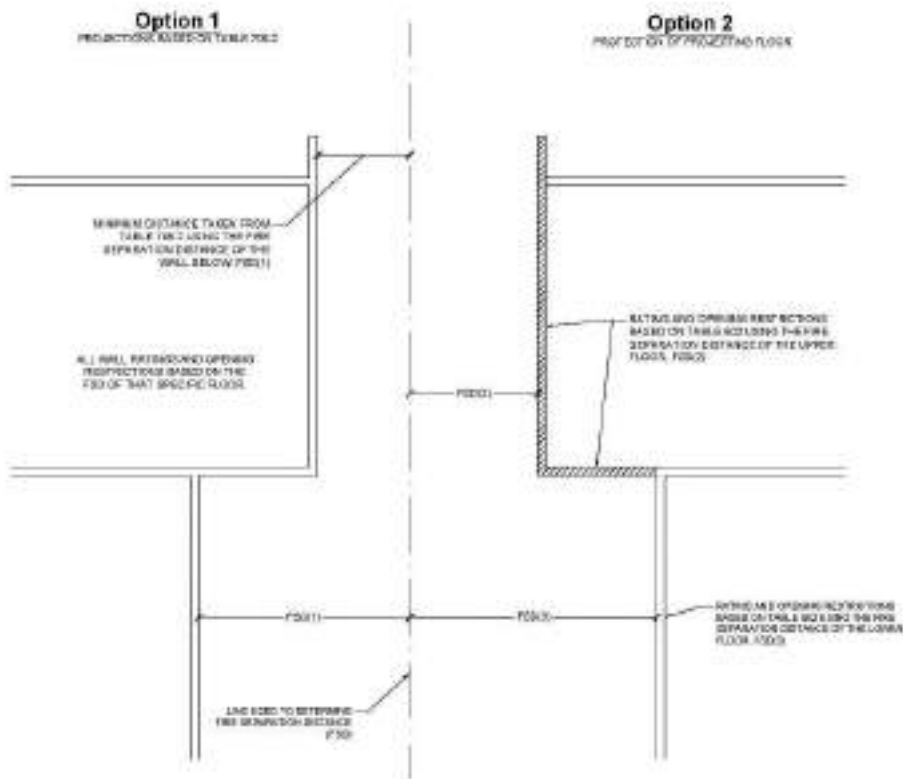

705.2.4 Projecting floors. Where the fire separation distance on a lower floor is greater than the fire separation distance on the floor immediately above, the projecting floor shall have the same fire-resistance rating as the exterior wall above based on Table 602. The fire-resistant rating of the horizontal portion shall be continuous to the lower vertical wall.

Exception:Buildings of Type I or Type II construction

Reason:

The current code does not account for a scenario where an upper floor extends closer to a lot line than the floor below. There is direction that indicates that fire separation distance will be measured to the face of the exterior wall on each floor level separately. This could create an unsafe condition where a lower floor has less stringent requirements than a floor/ceiling assembly and wall above, and fire may be able to propagate through roll out from the lower floor.

This situation is similar to the flame spread conditions of projections. Including projecting floors as projections will help limit the dangers by making the floor above meet the projection requirements. The exception allows for the projections table to not apply where the horizontal surface is given the same fire-resistant rating as the more hazardous wall above.

Cost Impact

The code change proposal will increase the cost of construction .

There will be no change in the cost of construction for Type I and II buildings. For other types the cost to install fire resistance rated soffit materials for projecting floors will increase the cost of construction.

Internal ID: 416

FS13-18

IBC: 705.1, 705.2

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Himself (sthomas@coloradocode.net)

2018 International Building Code

Revise as follows:

705.1 General. *Exterior walls* shall comply with this section and Section 1405.

705.2 Projections. Cornices, eave overhangs, exterior balconies and similar projections extending beyond the exterior wall shall conform to the requirements of this section. ~~and Section 1405~~. Exterior egress balconies and exterior exit stairways and ramps shall comply with Sections 1021 and 1027, respectively. Projections shall not extend any closer to the line used to determine the *fire separation distance* than shown in Table 705.2.

Exception: Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section for projections between the buildings.

Reason:

Section 1405 is titled "Combustible materials on the exterior side of exterior walls". There is no language in that section that discusses projections. Therefore, the cross reference in Section 705.2 which relates to projections is not in the correct place. So, I relocated the cross reference to the General Section 705.1. It could be argued that Section 1405 should be relocated to Section 705 since it has to do with the fire characteristics of exterior walls. I will let the committee decide whether that is appropriate. This change is just to make sure the reference is in the correct location.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change is a clarification and does not change any technical requirements.

Internal ID: 1857

FS14-18

IBC: TABLE 705.2

Proponent: Todd Snider, West Coast Code Consultants (WC3), representing Self (Todd@KimballEng.com)

2018 International Building Code

Revise as follows:

TABLE 705.2
MINIMUM DISTANCE OF PROJECTION

FIRE SEPARATION DISTANCE-FSD (feet)	MINIMUM DISTANCE FROM LINE USED TO DETERMINE FSD
0 to less than 2	Projections not permitted
2 to less than 3	24 inches
3 to less than 5	24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof <u>$\frac{2}{3}$ the FSD</u>
5 or greater	40 inches

For SI: 1 foot = 304.8 mm; 1 inch = 25.4 mm.

Reason:

Proposed revision to change the step function for determining distance from line used to determine FSD. From 0 to 3 feet the code requires a lengthy equation which states that a 24 inch separation plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof. This equation is complicated and is not very helpful when the line used for determining FSD is not parallel to the exterior wall. For example take a wall where the FSD increases from 3 feet at one end of the wall to 5 feet at the far end of the wall. At three feet the separation requires is 24 inches which allows a 12 inch projects. As the FSD increases to say 3'-1", this would require a separation of 24 inches plus 8 inches which is 32 inches of separation which reduces the projection to 5 inches. The FSD has increased but the size of the projection has decreased. A 12 inch projection is not allowed again until the FSD reaches 3'-8". Then the projection will increase to 16 inches at a FSD of 4 feet. As the FSD continues to increase at 4'-1" the allowed projection will reduce to 9 inches (49"-24"-2*8" = 40" separation), which is again not only less than what was permitted at 4 feet FSD but also less than what was allowed with only a 3 foot FSD. A 16 inch projection will not be allowed again until 4'-8" FSD. At which time separation is set at 40 inches and the size of the projection increases at the same rate as the FSD increases. The solution is to provide a linear equation to determine the separation distance. $\frac{2}{3}$ of the FSD.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change has no cost affect. It will just simplify the determination for distance of projections to FSD.

Internal ID: 1275

FS15-18

IBC: SECTION 202, 202 (New), 705.2, TABLE 705.2, 705.2.1, 705.2.2, 705.2.3, 705.2.3.1, 705.3

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Himself (sthomas@coloradocode.net)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

BUILDING PROJECTION. An unenclosed floor, roof or appendage extending beyond the exterior wall of a building such as, but not limited to cornices, eave overhangs, exterior decks or balconies, porte cocheres and similar protrusions.

Revise as follows:

~~705.2 Projections.~~Building projections. ~~Cornices, eave overhangs, exterior balconies and similar projections extending beyond the exterior wall~~Building projections shall conform to the requirements of this section and Section 1405. Exterior egress balconies and exterior exit stairways and ramps shall comply with Sections 1021 and 1027, respectively. ~~Projections~~Building projections shall not extend any closer to the line used to determine the *fire separation distance* than shown in Table 705.2.

Exception: Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section for projections between the buildings.

TABLE 705.2
MINIMUM DISTANCE OF BUILDING PROJECTION

FIRE SEPARATION DISTANCE-FSD (feet)	MINIMUM DISTANCE FROM LINE USED TO DETERMINE FSD
0 to less than 2	Projections not permitted
2 to less than 3	24 inches
3 to less than 5	24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof
5 or greater	40 inches

For SI: 1 foot = 304.8 mm; 1 inch = 25.4 mm.

705.2.1 Types I and II construction. ~~Projections~~ Building projections from walls of Type I or II construction shall be of noncombustible materials or combustible materials as allowed by Sections 705.2.3.1 and 705.2.4.

705.2.2 Type III, IV or V construction. ~~Projections~~ Building projections from walls of Type III, IV or V construction shall be of any *approved* material.

705.2.3 Combustible building projections. Combustible building projections extending to within 5 feet (1524 mm) of the line used to determine the *fire separation distance* shall be of not less than 1-hour *fire-resistance-rated* construction, heavy timber construction, complying with Section 2304.11, *fire-retardant-treated wood* or as permitted by Section 705.2.3.1.

Exception: Type VB construction shall be allowed for combustible projections in Group R-3 and U occupancies with a *fire separation distance* greater than or equal to 5 feet (1524 mm).

705.2.3.1 Balconies and similar projections. Balconies, decks and similar building projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of heavy timber construction in accordance with Section 2304.11. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:

1. On buildings of Types I and II construction, three stories or less above grade plane, fire-retardant-treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood and plastic composites that comply with ASTM D7032 and Section 2612 are permitted for pickets, rails and similar guard components that are limited to 42 inches (1067 mm) in height.
3. Balconies, decks and similar projections on buildings of Types III, IV and V construction shall be permitted to be of Type V construction and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony or deck areas, the aggregate length of the balcony on each floor shall not be limited.

705.3 Buildings on the same lot. For the purposes of determining the required wall and opening protection, building projections and roof-covering requirements, buildings on the same lot shall be assumed to have an imaginary line between them.

Where a new building is to be erected on the same lot as an existing building, the location of the assumed imaginary line with relation to the existing building shall be such that the *exterior wall* and opening protection of the existing building meet the criteria as set forth in Sections 705.5 and 705.8.

Exceptions:

1. Two or more buildings on the same lot shall be either regulated as separate buildings or shall be considered as portions of one building if the aggregate area of such buildings is within the limits specified in Chapter 5 for a single building. Where the buildings contain different occupancy groups or are of different types of construction, the area shall be that allowed for the most restrictive occupancy or construction.
2. Where an S-2 parking garage of Construction Type I or IIA is erected on the same lot as a Group R-2 building, and there is no *fire separation distance* between these buildings, then the adjoining *exterior walls* between the buildings are permitted to have occupant use openings in accordance with Section 706.8. However, opening protectives in such openings shall only be required in the exterior wall of the S-2 parking garage, not in the exterior wall openings in the R-2 building, and these opening protectives in the exterior wall of the S-2 parking garage shall be not less than 1¹/₂-hour *fire protection rating*.

Reason:

The committee felt that a definition for building projections would be helpful in the administering of the code. We submitted a public comment and received opposition to the revised language. We have taken the comments from the committee hearing and the public comment hearing and created this proposal. There is quite a bit of confusion as to

what a projection is. We have provided guidance and examples of what we feel are projections. The term unenclosed floors is intended to keep from having an upper story that is enclosed from being called a projection. Decks and balconies would be examples of unenclosed floors.

We have also changed the term 'Projection' to 'Building Projection' to differentiate this definition from other sections of the code that use similar language. For example, projection rooms and projections into ramps. It is not our intent to apply this definition to those sections of the code. The rest of the change involves coordinating the existing language with the new definition.

The fire characteristics are different for projections than they are for horizontal assemblies within a building. First, there is no enclosed space above the projection. The second is that the heat and smoke from a fire under a projection will go up and then out to the atmosphere. The heat and smoke is not trapped within a room like it is within a building. That is why I believe projections are handled differently in the code.

The photo below is the porte cochere entry at the City Center project in Clark County, Nevada. The question is what is this structure. Is it a projection that is regulated by Section 705.2 or is a building element regulated by Table 601. That is the question I am trying to clarify in the code. This change would clarify that this structure would be a projection and would need to comply with Section 705.2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification of the current code.

Internal ID: 1468

FS16-18

IBC: 705.2.3

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Himself (sthomas@coloradocode.net)

2018 International Building Code

Delete and substitute as follows:

~~**705.2.3 Combustible projections.** Combustible projections extending to within 5 feet (1524 mm) of the line used to determine the *fire separation distance* shall be of not less than 1-hour *fire resistance rated* construction, heavy timber construction, complying with Section 2304.11, *fire-retardant treated wood* or as permitted by Section 705.2.3.1.~~

~~**Exception:** Type VB construction shall be allowed for combustible projections in Group R-3 and U occupancies with a *fire separation distance* greater than or equal to 5 feet (1524 mm).~~

705.2.3 Projection Protection. Projections extending to within 5 feet (1524 mm) of the line used to determine the fire separation distance shall be one of the following:

1. Noncombustible materials.
2. Combustible materials of not less than 1-hour fire resistance rated construction.
3. Heavy timber construction complying with Section 2304.11.
4. Fire-retardant treated wood.
5. As permitted by Section 705.2.3.1.

Exception: Type VB construction shall be allowed for combustible projections in Group R-3 and U occupancies with a *fire separation distance* greater than or equal to 5 feet (1524 mm).

Reason:

The current language in this section is limited to combustible projections. There is no language in the code that tells the user what to do if they are using noncombustible materials in a Type I or II building. The current language would apparently allow that noncombustible projection to go right up to the lot line. So, I have deleted the word combustible in the section so that it would apply to all types of projections regardless of the materials used. I have also added noncombustible materials to the items permitted to go into the 5-foot limitation. The previous language would not permit noncombustible projections into the five-foot limitation because it wasn't listed. So, this change will address that issue as well. This change also puts the requirements into a list which we have found makes the code easier to use. This change does not change the overall requirement. I believe it clarifies the code and gives better direction to the user of the code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

This is intended to be a clarification of the code, not a change to the technical requirements.

Internal ID: 1683

FS17-18

IBC: 705.2.5 (New)

Proponent: Matthew Dobson, representing Suburban Exterior Fire Work Group; Richard Swan, International Association of Fire Fighters, representing International Association of Fire Fighters (rswan@iaff.org)

2018 International Building Code

Add new text as follows:

705.2.5 Protected soffit. In Group R buildings of Type V construction a protected soffit or fireblocking shall be provided above doorways in exterior walls. It shall extend horizontally 5 feet in both directions measured from the outside edge of the door frame. A protected soffit shall not be required where noncombustible wall cladding is installed from grade to not less than 10 feet above grade.

Soffit protection shall be applied to the horizontal underside of the roof framing members or fireblocking shall be provided in accordance with Section 718.2.1. Soffit protection shall consist of not less than one of the following materials:

1. 5/8 inch exterior grade gypsum board.
2. 1/4 inch Fiber-cement board.
3. 23/32 inch plywood.
4. 23/32 inch OSB.
5. 7/16 inch OSB Fire retardant treated wood.

Enclosed soffits shall be constructed as ventilated spaces in accordance with Section 1202.2 or unvented assemblies in accordance with Section 1202.3. Soffit panels shall be vinyl, wood structural panel, aluminum, fiber cement, or other approved soffit materials.

Reason:

Over the past code cycles there has been concern over smoker habits, combustible mulch, and the potential hazard they pose with combustion of exterior walls. The Suburban Exterior Fire Work Group, a group of fire service members, UL fire fighter safety institute, and other material stakeholders has been focused on this issue over the past 18 months.

The problem identified is the spread of fire from the exterior into to the unprotected attic space and then spreading quickly to other parts of the building.

The group has taken a 3 prong approach to address the issue:

Regulate the human risk by prohibiting smoking near exterior doors.

Remove combustible material/mulch from near the outside of combustible wall assemblies.

Create a block to slow down any fires that occur in the above described setting.

The proposed protected soffit approach will require a form of blocking outside of exterior doorways and garage doors. These proposed material have been required in North Carolina for over 5 years and are accepted to provide some form of blocking that will slow down the movement of fire from the outside to the attic space, effectively helping to address the issue and allow fire service more time put out the fire. Testing on these protected soffits are currently underway to show the effectiveness of these assemblies both vented and unvented.

Over the decade, fire departments in the Washington, DC region have been confronted with structure fires which have demonstrated a consistent pattern of starting on the outside. These fires have the potential for rapid loss of structural integrity and catastrophic collapse before occupants are alerted. As attention has grown locally, it is apparent that this type of fire is becoming common on a national basis.

These fires tend to follow a distinct pattern. These fires start at a low point on the exterior and spread vertically along the exterior wall producing flammable gases, which are readily admitted into the attic area through ventilation soffits. If not cooled, these heated gases accumulate and combust, creating rapidly spreading fire conditions in the attic area, often without occupant awareness. The unchecked fire often results in full roof involvement, creating a dangerous and difficult situation for occupants and fire fighters.

The group examined a number of structure fires which have exhibited the pattern described above. There is agreement over 3 common aspects. First, these fires often result from careless smoking habits. Second, when the smoking materials are not properly disposed of, they often come into contact with combustible materials adjacent to a building and, very commonly, this is mulch. And, last, the combustible exterior wall is a factor in the the growth of these fires into the attic space.

The careless smoker is an impediment to effective fire prevention efforts. The fire service has consistently provided data that shows smoking is the leading cause of fatal fires in the United States. Public fire and life safety efforts have been reasonably effective at communicating the message to not smoke in bed, and various medical organizations have demonstrated the health risk associated with “second hand” smoke. We now see that people are routinely smoking outside, at or near the entrance to a building, which increases the possibility of an accidental ignition of outside combustibles. If one were to chronicle the actions of today’s smoker, it would likely show the last action they take when exiting a building is to “light up.” When returning inside, they often drop the cigarette near the entrance. Many smokers seem to believe that dropping a match or cigarette onto the ground or into a flower pot is an effective method of extinguishment, however, this behavior often places the smoking material directly into the mulch, initiating the low fire described earlier.

Mulch has become a common exterior decorative material which aids in suppressing weed growth while enhancing a building’s curb appeal. However, most mulch is a dead organic material, comprised of chipped wood, tree bark or pine needles. Mulch is most effective when it is maintained in a moist state, however it can dry out very quickly and become a readily ignitable fuel source. Because of its relatively small mass in comparison to its surface area, when ignited, it will progress and sustain open flame.

The group discussed a method in which to proceed, the interest being to address, in the quickest manner, industrial and social changes which could reduce the possibility of a fire on the outside of a building. Each aspect presents unique challenges for fire prevention efforts:

1. Changing the behavior of the smoker is an ongoing and difficult challenge, especially as social pressures have resulted in regulatory changes to require people to smoke outside of a building. Further development of the “fire safe” cigarette, by way of testing using mulch, could be deemed too costly for the industry, and would have no effect on improper disposal of matches. Thus, the quickest and most practical strategy for this aspect of the problem is to expand public fire and life safety education to focus on the hazards of improper disposal of smoking materials, coupled with enforcement of applicable requirements for regulation of smoking and disposal of products. However, in this age of “information overflow” it is questionable if this would result in widespread behavioral changes for smokers;
2. Regulating the use and placement of mulch, that the study group believes could have the quickest and most significant impact toward reducing the exterior fire problem, while additional strategies to address the other problems noted are pursued.

The use of wood and wood related mulch for building decoration is purely optional. It is not a required construction component under current building codes. Therefore, regulations to curtail its use or require that it be separated from a building’s combustible exterior are reasonable and could be codified on a national basis. On a large scale, the mere action of creating separation of combustible materials has been a wildland fire tactic for years. Several states and local jurisdictions have already employed this theory by either recommending or requiring that wood-based mulch be separated from exterior combustible walls:

1. The Virginia Department of Forestry recommends to “provide a minimum of an 18 inch clearance between landscaping mulch beds and combustible building materials” and to “ensure proper clearance to electric devices, such as decorative lights, by following the manufacturer’s instructions;”
2. In Raleigh, NC, following a disastrous fire in a multi-family building, the city passed a pine straw mulch ordinance that bans the use of pine straw as ground cover within 10 feet of multi-family dwellings. The ordinance exempts 1 and 2-family dwellings, however, the city strongly encourages these homeowners to comply with the pine straw restrictions;
3. The Commonwealth of Massachusetts prohibits the new application of mulch within 18 inches around combustible exteriors of buildings, such as wood or vinyl but not brick or concrete. Residential buildings with six units or less are exempted from this regulation, but it is recommended that all homeowners adopt these safety practices. The regulation applies to all other buildings including commercial properties.
4. Ventura County, CA prohibits mulch and wood chips within the required “defensible space” zone (which ranges from 0’ to 30’ from the exterior of a building).

This small sampling of jurisdictions has produced enough evidence to lead the study group to suggest the possible introduction of a code proposal to require separation, or non-application, of wood-based mulch in proximity to combustible exterior walls.

The proposed protected soffit approach will require a form of blocking outside of exterior doorways and garage doors. These proposed material have been required in North Carolina for over 5 years and are accepted to provide some form of blocking that will slow down the movement of fire from the outside to the attic space, effectively helping to address the issue and allow fire service more time put out the fire.

We think this approach is effective, efficient, and cost effective.

Cost Impact

The code change proposal will increase the cost of construction .

This change will add some cost to construction. However the change is designed to use potentially scrap material on site to act as blocking so cost should not be very much. There will be some labor to install the protected soffit or blocking.

(sthomas@coloradocode.net)

2018 International Building Code

Revise as follows:

705.5 Fire-resistance ratings. *Exterior walls* shall be fire-resistance rated in accordance with Tables 601 and 602 and this section based on the Type of Construction and Table 705.5 and this section based on the Fire Separation Distance. The required *fire-resistance rating* of *exterior walls* with a *fire separation distance* of greater than 10 feet (3048 mm) shall be rated for exposure to fire from the inside. The required *fire-resistance rating* of *exterior walls* with a *fire separation distance* of less than or equal to 10 feet (3048 mm) shall be rated for exposure to fire from both sides.

TABLE 602.705.5**FIRE-RESISTANCE RATING REQUIREMENTS FOR EXTERIOR WALLS BASED ON FIRE SEPARATION DISTANCE^a,
d, g**

FIRE SEPARATION DISTANCE =X (feet)	TYPE OF CONSTRUCTION	OCCUPANCY GROUP H^e	OCCUPANCY GROUP F-1, M, S-1^f	OCCUPANCY GROUP A, B, E, F-2, I, Rⁱ, S-2, U^h
X < 5 ^b	All	3	2	1
5 ≤ X < 10	IA	3	2	1
	Others	2	1	1
10 ≤ X < 30	IA, IB	2	1	1 ^c
	IIB, VB	1	0	0
	Others	1	1	1 ^c
X ≥ 30	All	0	0	0

For SI: 1 foot = 304.8 mm.

- a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 601.
- b. See Section 706.1.1 for party walls.
- c. Open parking garages complying with Section 406 shall not be required to have a fire-resistance rating.
- d. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the story in which the wall is located.
- e. For special requirements for Group H occupancies, see Section 415.6.
- f. For special requirements for Group S aircraft hangars, see Section 412.3.1.
- g. Where Table 705.8 permits nonbearing exterior walls with unlimited area of unprotected openings, the required fire-resistance rating for the exterior walls is 0 hours.
- h. For a building containing only a Group U occupancy private garage or carport, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.
- i. For a Group R-3 building of Type II-B or Type V-B construction, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.

602.1 General. Buildings and structures erected or to be erected, altered or extended in height or area shall be classified in one of the five construction types defined in Sections 602.2 through 602.5. The building elements shall have a *fire-resistance rating* not less than that specified in Table 601 and exterior walls shall have a *fire-resistance rating* not less than that specified in Table ~~602-705.5~~. Where required to have a *fire-resistance rating* by Table 601, building elements shall comply with the applicable provisions of Section 703.2. The protection of openings, ducts and air transfer openings in building elements shall not be required unless required by other provisions of this code.

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary structural frame ^f (see Section 202)	3 ^{a, b}	2 ^{a, b}	1 ^b	0	1 ^b	0	HT	1 ^b	0
Bearing walls Exterior ^{e, f} Interior	3 3 ^a	2 2 ^a	1 1	0 0	2 1	2 0	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 705.5								
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table ~~602~~705.5).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.

705.6 Structural stability. *Exterior walls* shall extend to the height required by Section 705.11. Interior structural elements that brace the exterior wall but that are not located within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Table 601 for that structural element. Structural elements that brace the exterior wall but are located outside of the exterior wall or within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Tables 601 and ~~602~~ 705.5 for the exterior wall.

402.4.2.2 Anchor building separation. An *anchor building* shall be separated from the *covered or open mall building* by *fire walls* complying with Section 706.

Exceptions:

1. *Anchor buildings* of not more than three stories *above grade plane* that have an occupancy classification the same as that permitted for tenants of the *mall building* shall be separated by 2-hour fire-resistance-rated *fire barriers* complying with Section 707.
2. The exterior walls of *anchor buildings* separated from an *open mall building* by an *open mall* shall comply with Table ~~602~~705.5.

402.4.2.3 Parking garages. An attached garage for the storage of passenger vehicles having a capacity of not more than nine persons and *open parking garages* shall be considered as a separate building where it is separated from the *covered or open mall building* or anchor building by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.

Parking garages, which are separated from *covered mall buildings*, *open mall buildings* or *anchor buildings*, shall comply with the provisions of Table ~~602~~705.5.

Pedestrian walkways and tunnels that connect garages to *mall buildings* or *anchor buildings* shall be constructed in accordance with Section 3104.

406.5.6 Fire separation distance. *Exterior walls* and openings in *exterior walls* shall comply with Tables 601 and ~~602~~705.5. The distance to an adjacent *lot line* shall be determined in accordance with Table ~~602~~705.5 and Section 705.

704.10 Exterior structural members. Load-bearing structural members located within the *exterior walls* or on the outside of a building or structure shall be provided with the highest *fire-resistance rating* as determined in accordance with the following:

1. As required by Table 601 for the type of building element based on the type of construction of the building.
2. As required by Table 601 for exterior bearing walls based on the type of construction.
3. As required by Table ~~602~~705.5 for *exterior walls* based on the *fire separation distance*.

705.11 Parapets. Parapets shall be provided on *exterior walls* of buildings.

Exceptions: A parapet need not be provided on an *exterior wall* where any of the following conditions exist:

1. The wall is not required to be *fire-resistance rated* in accordance with Table ~~602~~705.5 because of *fire separation distance*.
2. The building has an area of not more than 1,000 square feet (93 m²) on any floor.

3. Walls that terminate at roofs of not less than 2-hour fire-resistance-rated construction or where the roof, including the deck or slab and supporting construction, is constructed entirely of noncombustible materials.
4. One-hour fire-resistance-rated *exterior walls* that terminate at the underside of the roof sheathing, deck or slab, provided that:
 - 4.1. Where the roof/ceiling framing elements are parallel to the walls, such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction for a width of 4 feet (1220 mm) for Groups R and U and 10 feet (3048 mm) for other occupancies, measured from the interior side of the wall.
 - 4.2. Where roof/ceiling framing elements are not parallel to the wall, the entire span of such framing and elements supporting such framing shall not be of less than 1-hour fire-resistance-rated construction.
 - 4.3. Openings in the roof shall not be located within 5 feet (1524 mm) of the 1-hour fire-resistance-rated *exterior wall* for Groups R and U and 10 feet (3048 mm) for other occupancies, measured from the interior side of the wall.
 - 4.4. The entire building shall be provided with not less than a Class B roof covering.
5. In Groups R-2 and R-3 where the entire building is provided with a Class C roof covering, the *exterior wall* shall be permitted to terminate at the underside of the roof sheathing or deck in Types III, IV and V construction, provided that one or both of the following criteria is met:
 - 5.1. The roof sheathing or deck is constructed of *approved* noncombustible materials or of *fire-retardant-treated wood* for a distance of 4 feet (1220 mm).
 - 5.2. The roof is protected with 0.625-inch (16 mm) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by not less than nominal 2-inch (51 mm) ledgers attached to the sides of the roof framing members for a minimum distance of 4 feet (1220 mm).

[BG] 1510.2.4 Type of construction. Penthouses shall be constructed with walls, floors and roofs as required for the type of construction of the building on which such penthouses are built.

Exceptions:

1. On buildings of Type I construction, the exterior walls and roofs of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating. The exterior walls and roofs of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall not be required to have a fire-resistance rating.
2. On buildings of Type I construction two stories or less in height above grade plane or of Type II construction, the exterior walls and roofs of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating or a lesser fire-resistance rating as required by Table ~~602.7.05.5~~ 602.705.5 and be constructed of *fire-retardant-treated wood*. The exterior walls and roofs of penthouses with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be constructed of fire-retardant-treated wood and shall not be required to have a fire-resistance rating. Interior framing and walls shall be permitted to be constructed of *fire-retardant-treated wood*.
3. On buildings of Type III, IV or V construction, the exterior walls of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating or a lesser fire-resistance rating as required by Table ~~602.7.05.5~~ 602.705.5. On buildings of Type III, IV or VA construction, the exterior walls of penthouses with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be of heavy timber construction complying with Sections 602.4 and 2304.11 or noncombustible construction or *fire-retardant-treated wood* and shall not be required to have a fire-resistance rating.

1020.1 Construction. Corridors shall be fire-resistance rated in accordance with Table 1020.1. The *corridor walls* required to be fire-resistance rated shall comply with Section 708 for *fire partitions*.

Exceptions:

1. A *fire-resistance rating* is not required for *corridors* in an occupancy in Group E where each room that is used for instruction has not less than one door opening directly to the exterior and rooms for assembly purposes have not less than one-half of the required *means of egress* doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.
2. A *fire-resistance rating* is not required for *corridors* contained within a *dwelling unit* or *sleeping unit* in an occupancy in Groups I-1 and R.
3. A *fire-resistance rating* is not required for *corridors* in open parking garages.
4. A *fire-resistance rating* is not required for *corridors* in an occupancy in Group B that is a space requiring only a single *means of egress* complying with Section 1006.2.
5. Corridors adjacent to the *exterior walls* of buildings shall be permitted to have unprotected openings on unrated *exterior walls* where unrated walls are permitted by Table ~~602-705.5~~ and unprotected openings are permitted by Table 705.8.

2103.1 Masonry units. Concrete masonry units, clay or shale masonry units, stone masonry units, glass unit masonry and AAC masonry units shall comply with Article 2.3 of TMS 602. Architectural cast stone shall conform to ASTM C1364 and TMS 504. Adhered manufactured stone masonry veneer units shall conform to ASTM C1670.

Exception: Structural clay tile for nonstructural use in fireproofing of structural members and in wall furring shall not be required to meet the compressive strength specifications. The fire-resistance rating shall be determined in accordance with ASTM E119 or UL 263 and shall comply with the requirements of Table ~~602-705.5~~.

3103.3 Location. Temporary structures shall be located in accordance with the requirements of Table ~~602-705.5~~ based on the *fire-resistance rating* of the *exterior walls* for the proposed type of construction.

Reason:

When someone looks in the Table of Contents or Index of the code for exterior walls, they are sent to Section 705. However, the requirements for the fire-resistance rating of the exterior walls are hidden back in the Type of Construction Chapter 6. Type of construction deals with the materials and fire-resistance rating of building elements based on the size of the building. Exterior wall fire-resistance ratings are based on Fire Separation Distance. These are two separate issues. Therefore, we are proposing to move Table 602 back to the appropriate Section 705 where it belongs. There is no technical change in this proposal. It is just moving the table to the proper section of the code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code requirements will not change with this proposal.

Internal ID: 368

FS19-18

IBC: 705.6 (New), 705.7

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net)

2018 International Building Code

Add new text as follows:

705.6 Continuity. The fire-resistance rating of exterior walls shall extend from the top of the foundation or floor/ceiling assembly below to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. The underside of a floor/ceiling or roof/ceiling assembly having a fire-resistance rating that is not less than the fire-resistance rating of the exterior wall.

Parapets shall be provided as required by Section 705.11.

Revise as follows:

~~**705.6**~~**705.7 Structural stability.** ~~Exterior walls shall extend to the height required by Section 705.11.~~ Interior structural elements that brace the exterior wall but that are not located within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Table 601 for that structural element. Structural elements that brace the exterior wall but are located outside of the exterior wall or within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Tables 601 and 602 for the exterior wall.

Reason:

The current code language provides continuity language for other fire-resistant rated wall assemblies, but not exterior walls. Therefore, there is confusion in the design and construction community on how to build the exterior walls. The proposal provides such language and clarifies the intent of the code for exterior walls. The language is similar to that of a fire partition.

Current Section 705.6 includes language regarding parapets that really doesn't belong in a structural requirement. Therefore, we have relocated language regarding parapets to the new Section for Continuity. It is better located there.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal will reduce the cost because the confusion will be eliminated and people will not be making things up.

FS20-18

IBC: 202 (New), 705.6.1 (New), 707.5.2 (New)

Proponent: Paul Coats, American Wood Council, representing American Wood Council (pcoats@awc.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

PLATFORM CONSTRUCTION. A system of construction where the floor structure is supported by the bearing exterior and interior walls below, and supports the exterior walls and interior partitions above it.

SECTION 705 EXTERIOR WALLS

Add new text as follows:

705.6.1 Platform framing. Where floors connect to exterior walls in platform construction, the structural framing shall be protected at the intersection to maintain the continuity of the fire-resistance rating required of the wall, as required by Section 704.1. The fire-resistance rating shall be maintained through the use of materials permitted by the type of construction, but not limited to, one or more of the following: the ceiling membrane, solid blocking, solid wood elements, the rim board, protection by noncombustible materials, or other features or protection deemed to achieve the required fire-resistance rating. The requirements of Section 703.2.5 and 705.7 shall apply. The material requirements for the portion of the floor in the plane of the exterior wall shall be as for floor construction in accordance with the type of construction.

SECTION 707 FIRE BARRIERS

707.5.2 Platform framing. Where floors or roofs connect to fire barriers in platform construction, the structural framing shall be protected at the intersection to maintain the continuity of the required fire resistance rating for the fire barrier, and the support of the fire barrier in accordance with Section 704.1. The fire-resistance rating shall be maintained through the use of materials permitted by the type of construction, including but not limited to, one or more of the following: solid blocking, solid wood elements, the rim board, protection by noncombustible materials, or other features or protection deemed to achieve the required fire-resistance rating.

Reason:

This code change provides improved continuity of protection when exterior walls and fire barriers intersect with floors in buildings using platform construction.

Ratings required for exterior walls by either Table 602 or Table 601 may be greater than the rating required for the floors. As a result, questions arise about the protection of the wall/floor intersection in platform construction where differently rated elements come together. The protection of the intersection should be in accordance with the underlying principles of continuity and support for the rated wall construction. There are many practical solutions being used currently that would comply with this proposed code change. They involve the use of solid wood blocking or other protection to provide the continuity in fire resistance rating for the construction supporting the wall. AWC has developed details that may be approved by the code official for the exterior wall/floor intersection which can be found in the AWC Design for Code Acceptance (DCA) No. 3, Fire Rated Wood Wall and Floor Assemblies. They can be viewed and downloaded here: <http://awc.org/codes-standards/publications/dca3>. Link established 2.21.18.

The same questions arise for platform-framed fire barriers protecting shafts and interior stair enclosures, which often are required to be two-hour rated while the supporting floor construction is one-hour, therefore similar provisions were added to 707.5 for fire barriers.

Fire retardant treated wood (FRTW) is permitted for exterior walls of Type III and IV construction. Some code officials have required the floor construction in the plane of the exterior wall (the end of the floor in platform construction) to be FRTW, which is costly and burdensome and provides very little safety advantage since the intersection is already protected by FRTW or noncombustible cladding on the exterior. The proposal clarifies that for exterior wall intersections, the elements of the floor construction (joists, rim board, floor sheathing, and blocking if used) can be in accordance with the materials requirements for floors. The cladding component of the wall would need to be fire retardant treated or noncombustible as for the exterior wall framing itself.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There are a variety of current interpretations and applications for fire resistance in platform construction involving exterior walls and fire barriers. This proposed change may slightly reduce or slightly increase construction costs, depending on the current approach of individual jurisdictions.

Internal ID: 437

FS21-18

IBC: 705.10 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Add new text as follows:

705.10 Penetrations. Penetrations of exterior walls required by this section to have a fire-resistance rating shall comply with Section 714.

Exception: Penetrations in exterior walls that are permitted to have unprotected openings.

Reason:

Protection of penetrations through fire-resistance-rated assemblies is a fundamental feature of compartmentation and the need to prevent fire and smoke spread. The IBC requires penetrations to be protected in fire walls (706.9), fire barriers (707.7), fire partitions (708.7), smoke barriers (709.6), smoke partitions (710.6), and vertical openings (712.1.4). The IBC distinguishes between openings and penetrations. In the context of IBC section 705.8, openings are not penetrations. So in the IBC, exterior wall penetrations (e.g. for pipes, ducts, and other services) do not require opening protectives. They are separate and distinct. Consequently, the IBC does not require protection of through-penetrations through exterior walls, even when they are fire-resistance-rated, and regardless of the limiting distance. Conversely, joints in exterior walls are already required to be protected in Section 705.9, and ducts & air transfer openings are required to be protected in Section 705.10.

The IBC does not currently limit the size, type, or number of unprotected penetrations in exterior walls. Tables 601 and 602 require exterior walls to have a fire-resistance rating under some circumstances. Further, Chapter 7 also requires fire rated opening protectives, rated joints, and ducts and transfer openings to be protected depending upon the limiting distance. This proposal would treat penetrations through rated exterior walls in the same manner as fire-resistant joints in exterior walls. It would require penetrations in exterior walls to be firestopped only when protected openings are required based on Chapter 6 and Chapter 7 limiting distance requirements.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

Where unprotected openings are not permitted, penetrations which could previously be left unprotected will now require protection in accordance with Section 714.

Internal ID: 318

FS22-18

IBC: 706.1.1

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Building Code

Revise as follows:

706.1.1 Party walls. Any wall located on a *lot line* between adjacent buildings, which is used or adapted for joint service between the two buildings, shall be constructed as a *fire wall* in accordance with Section 706. Party walls shall be constructed without openings and shall create separate buildings.

Exceptions:

1. Openings in a party wall separating an *anchor building* and a mall shall be in accordance with Section 402.4.2.2.1.
2. ~~Fire-Party walls and fire walls~~ are not required on lot lines dividing a building for ownership purposes where the aggregate height and area of the portions of the building located on both sides of the lot line do not exceed the maximum height and area requirements of this code. For the code official's review and approval, he or she shall be provided with copies of dedicated access easements and contractual agreements that permit the owners of portions of the building located on either side of the lot line access to the other side for purposes of maintaining fire and life safety systems necessary for the operation of the building.

Reason:

This section mixes use of the terms fire wall and party wall, and both should be mentioned in Exception 2 to make it clear that walls constructed in accordance with Exception 2 are allowed to have penetrations in accordance with the restrictions stated in the exception.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Intended as a clarification of existing provisions.

IBC: 706.5, 706.5.1 (New), 706.5.2 (New), 706.5.1

Proponent: Ronald Clements Jr, representing Chesterfield County Building Inspection Department (clementsro@chesterfield.gov)

2018 International Building Code

Revise as follows:

706.5 Horizontal continuity. *Fire walls shall be continuous from exterior wall to exterior wall and shall terminate in accordance with this section extend not less than 18 inches (457 mm) beyond the exterior surface of exterior walls.*

Exceptions:

- ~~1. Fire walls shall be permitted to terminate at the interior surface of combustible exterior sheathing or siding provided that the exterior wall has a fire-resistance rating of not less than 1 hour for a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.~~
- ~~2. Fire walls shall be permitted to terminate at the interior surface of noncombustible exterior sheathing, exterior siding or other noncombustible exterior finishes provided that the sheathing, siding or other exterior noncombustible finish extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall.~~
- ~~3. Fire walls shall be permitted to terminate at the interior surface of noncombustible exterior sheathing where the building on each side of the fire wall is protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

Add new text as follows:

706.5.1 Termination at 180 degree or greater exterior wall angle. Where the angle between the exterior walls on either side of the fire wall is equal to or greater than 180 degrees (3.14 rad), the fire wall termination shall comply with one of the following:

1. The fire wall shall terminate at the interior surface of any exterior sheathing or siding permitted by this code provided that the exterior wall has a fire-resistance rating of not less than 1 hour for a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.
2. The fire wall shall terminate at the interior surface of noncombustible exterior sheathing with non-combustible exterior siding or other noncombustible exterior finishes provided that the non-combustible sheathing and siding or other exterior noncombustible finish extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.
3. The fire wall shall terminate at the interior surface of noncombustible exterior sheathing with any siding or exterior finish materials permitted by this code provided that the non-combustible sheathing extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall and the buildings on each side of the fire wall are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.
4. The fire wall shall terminate at the interior surface of masonry or concrete exterior walls where the masonry or concrete exterior walls extend a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.
5. The fire wall shall terminate at the interior surface of any exterior sheathing or siding permitted by this code provided the buildings on each side of the fire wall are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1.

6. The fire wall shall extend not less than 18 inches (457 mm) beyond the exterior surface of the exterior wall.

706.5.2 Termination at less than 180 degree exterior wall angle. Where the angle between the exterior walls on either side of the fire wall, within 4 feet (1220 mm) of the fire wall, is less than 180 degrees (3.14 rad), the fire wall termination shall extend to the plane of the exterior sheathing or surface of one of the exterior walls on either side of the fire wall. An imaginary line shall be established extending out from the fire wall termination point between the exterior walls on both sides of the fire wall for the purpose of establishing the fire separation distance for the exterior walls. The fire-resistance rating and opening protection requirements for the exterior walls shall meet Sections 705.5 and 705.8 based on the fire separation distance established by the imaginary line.

Delete without substitution:

~~**706.5.1 Exterior walls.** Where the fire wall intersects exterior walls, the fire-resistance rating and opening protection of the exterior walls shall comply with one of the following:~~

- ~~1. The exterior walls on both sides of the fire wall shall have a 1-hour fire-resistance rating with $3/4$ -hour protection where opening protection is required by Section 705.8. The fire-resistance rating of the exterior wall shall extend not less than 4 feet (1220 mm) on each side of the intersection of the fire wall to exterior wall. Exterior wall intersections at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad) do not need exterior wall protection.~~
- ~~2. Buildings or spaces on both sides of the intersecting fire wall shall assume to have an imaginary lot line at the fire wall and extending beyond the exterior of the fire wall. The location of the assumed line in relation to the exterior walls and the fire wall shall be such that the exterior wall and opening protection meet the requirements set forth in Sections 705.5 and 705.8. Such protection is not required for exterior walls terminating at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad).~~

Reason:

The fire wall horizontal termination provisions are set up with section 706.5 providing the termination methods for firewall terminations where the exterior walls on either side are at an angle of 180 degrees or greater and section 706.5.1 providing the termination methods for fire wall termination where the exterior walls on either side are at an angle less than 180. 706.5.1 is an additional requirement, when the angle is less than 180, to the base requirement in 706.5. This does not work in practice. If a fire wall terminates at the vertex of a 90 degree angle between the two exterior walls on either side the fire wall cannot extend 18 inches beyond the surface of the exterior wall nor can the fire wall extend to the surface of the exterior sheathing so the sections cannot build on one another. Section 706.5.1 refers to conditions when a fire wall intersects the exterior wall. Geometrically an intersection is a point common to two lines so the condition detailed in 706.5 for a 180 termination is an intersection of the exterior wall by the fire wall so one could argue that the last sentence of 706.5.1 items 1 and 2 override the requirements of 706.5 when the exterior walls are at 180 to each other. That is not the intent. This code change fixes the problem by separating out the termination requirements based on the angle between the exterior walls. The 706.5.1 method applies when the angle between exterior walls is 180 degrees or greater and the 706.5.2 method applies when the angle between exterior walls is less than 180 degrees.

Additionally the base requirement for the 18" extension is the exception, not the rule, so the exceptions have been re-organized into options and the 18 inch exception is now another option. The termination methods that allow termination at sheathing have opening protection requirements added since the code is currently silent on this fact. Current code would allow the entire 4 foot to be open. New option 4 was added to allow termination of the fire wall at an exterior masonry or concrete wall, this is currently not addressed. New option 5 was added to allow for a full NFPA 13 sprinkler to count as equivalent to 4 feet on non-combustible siding.

Section 706.5.2 addresses the firewall termination where the exterior walls on either side are at an angle less than 180 degrees. The first exception was removed because it makes no sense to allow this method when it would not be allowed if the buildings were separated by an inch. If two adjacent buildings are separated and joined by a fire wall and they have exterior walls that are exposed to each other at angles less than 180 degrees they should be treated as separate buildings for exposure purposes just as any two separate buildings would be treated. Current exception 1 gives you a less restrictive method when the building are touching; that makes no sense. The imaginary line exception is now a single requirement. The section was also cleaned up so it is clear how to apply the imaginary line. The current text literally states that the wall itself will assume to have an imaginary line. Walls cannot assume things. The current text also does not clearly state that the imaginary line is to be used to establish fire separation distances. Since that is not provided based on current text there is no protection requirement because section 705.5 and 705.8 are based on fire separation distance defined in chapter 2.

Example of less than 180 termination

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarifying code change.

Internal ID: 845

FS24-18

IBC: 706.6.1

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

706.6.1 Stepped buildings. Where a *fire wall* also serves as an *exterior wall* for a building and separates buildings having different roof levels, such wall shall terminate at a point not less than 30 inches (762 mm) above the lower roof level, ~~provided the exterior wall for a height of 15 feet (4572 mm) level.~~ Exterior walls above the fire wall extending more than 30 inches (762 mm) above the lower roof shall be of not less than 1-hour fire-resistance-rated construction from both sides with openings protected by fire assemblies having a *fire protection rating* of not less than $\frac{3}{4}$ hour. Portions of the exterior walls greater than 15 feet (4572 mm) above the lower roof shall be of non-fire-resistance rated construction unless otherwise rated construction is required by other provisions of this code.

Exception: ~~Where the A fire wall terminates serving as part of an exterior wall for a building that separates buildings having different roof levels shall be permitted to terminate at the underside of the roof sheathing, deck or slab of the lower roof, provided that all of the following requirements are met:~~

1. The lower roof assembly within 10 feet (3048 mm) of the fire wall has not less than a 1-hour *fire-resistance rating*, and the
2. The entire length and span of supporting elements for the rated roof assembly ~~has~~ shall have a fire-resistance rating of not less than 1-hour.
- ~~2-3.~~ Openings in the lower roof shall not be located within 10 feet (3048 mm) of the *fire wall*.
4. 1-hour fire- resistance rated exterior wall protection above the lower roof, as specified in this section, is not required unless fire resistance rated construction is required by other provisions of this

Reason:

Section 706.6.1 is confusing as currently written. It is intended to regulate the design of fire walls and exterior walls above and in-line with the fire walls for buildings having stepped roof levels. The intent of this section is to maintain adequate separation between the two portions of the same building so that one side will not be damaged for the time required by Section 706.4. This is done by extending the fire wall to at least 30" above the lower roof and rating the exterior wall above and in-line to not less than 1-hour up to 15' above the lower roof. The second option is to provide a 1-hour rated roof assembly extending not less than 10' over from the fire wall with no openings permitted within the 10' portion of the roof adjacent to the fire wall.

This proposal does not change the requirements of the section. Rather, the text has been re-written to clarify the expectations for the exterior wall located above the lower roof and sets clear expectations in the exception for horizontal protection by itemizing these requirements.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change is being made in an attempt to clarify the code. It will not change the cost of construction of fire walls.

Internal ID: 88

FS25-18

IBC: 706.8 (New), 704.11

Proponent: Jonathan Siu, City of Seattle Department of Construction and Inspections, representing Washington Association of Building Officials Technical Code Development Committee (Jon.Siu@seattle.gov)

2018 International Building Code

Add new text as follows:

706.8 Supporting construction. The supporting construction for a fire wall shall be protected to afford the required fire resistance rating of the fire wall supported. Hollow vertical spaces within a fire wall shall be fireblocked in accordance with Section 718.2 at every floor level.

Revise as follows:

704.11 Bottom flange protection. Fire protection is not required at the bottom flange of lintels, shelf angles and plates, spanning not more than 6 feet 4 inches (1931 mm) whether part of the primary structural frame or not, and from the bottom flange of lintels, shelf angles and plates not part of the structural frame, regardless of span. Fire protection shall be provided at the bottom flange of lintels, shelf angles and plates, spanning more than 6 feet 4 inches, where they support fire wall or fire barrier construction.

Reason:

This proposal is intended to clarify the requirements for structural members, including lintels and similar members, supporting fire walls.

New Section 706.8 regarding supporting construction for fire walls:

As currently written, the code does not specify what level of fire resistance rating is required for structural members supporting fire walls. There are requirements for supporting construction for fire barriers and horizontal assemblies in Sections 707.5.1 and 711.2.3, but none for fire walls. This leaves the code requirement open to interpretation--is supporting construction part of the fire wall and protected accordingly, or is it part of the structural frame, or can it be unprotected because the code doesn't specifically require protection?

The last two interpretations can result in unprotected construction supporting a fire wall above. Particularly regarding primary or secondary structural frame, a beam supporting a fire wall above an opening may not be "structural frame" if the fire wall is not a bearing wall. This seems to be inconsistent with the requirements for structural stability of the fire wall in Section 706.2, as well as the requirements to protect supporting construction for fire barriers and horizontal assemblies. Note that the lack of the requirement in fire walls versus the specific requirement in fire barriers and horizontal assemblies is used as an argument that the code writers deliberately omitted the requirement for fire walls.

The assumption may be that a fire wall is continuous from foundation to roof, but the code allows large openings up to 156 square feet in fire walls (Section 706.8). A beam supporting fire wall construction above a 12-foot high opening could have an unprotected 13-foot span. Some jurisdictions may be able to get protection for that beam by calling it part of the fire wall, but that is arguable.

This proposed code change addresses the issue by inserting a new section into Section 706 to clarify construction must have the same fire resistance rating as the fire wall it structurally supports. The proposed text is identical to the language currently used for fire barriers in Section 707.5.1, including the requirement for fireblocking at floors. We evaluated the exceptions in Sections 707.5.1 and 711.2.3 (parallel requirement for horizontal assemblies), and determined that none were applicable to fire walls, as they relate to providing separations between occupancies or incidental uses, or to other wall types.

Section 704.11 regarding lintels, shelf angles, and plates:

While the online Merriam-Webster dictionary broadly defines a lintel as "a horizontal architectural member spanning and usually carrying the load above an opening," our experience is the terms "lintels, shelf angles, or plates" as used in this section are generally intended to be used in the context of supporting concrete or masonry materials above.

As written, this section requires protection for the bottom flange of these members if they span more than 6'-4" and are part of the primary or secondary structural frame. However, if a concrete or masonry fire wall or fire barrier is not also a bearing wall, it is questionable whether this section applies, since these members can be interpreted as being neither primary nor secondary structural frame. This then leaves it open to interpretation whether fire protection is required for a lintel supporting concrete or masonry in a non-bearing fire wall or fire barrier.

This proposal clarifies lintels, shelf angles, or plates spanning more than 6'-4" must be protected if they support fire wall or fire barrier construction.

Related code change proposal:

A separate but related code change proposal has been submitted to clarify requirements for supporting bearing walls. If this proposal and the bearing wall proposal both pass, the combined Section 704.11 can appear as follows:

704.11 Lintels, shelf angles, and plates. Fire protection shall be provided at the bottom flange of lintels, shelf angles and plates, where they span more than 6 feet 4 inches (1931 mm) and meet at least one of the following conditions:

1. They are an element of the structural frame, or
2. They support fire wall or fire barrier construction.

Cost Impact

The code change proposal will increase the cost of construction .

Because this is a clarification of the current code language, the impact on cost of construction will depend on how a local jurisdiction is interpreting the current code provisions. If the jurisdiction is requiring fire resistance ratings consistent with the fire resistance rating of fire walls, there will be no change in the cost of construction. However, if the jurisdiction is applying the code literally, this proposal could result in increased cost for fireproofing of beams or some lintels providing structural support for non-bearing fire walls or fire barriers.

	0.5	¹ / ₃	OH-20 or W-30
Party wall	All	NP	Not Applicable

NP = Not Permitted.

- a. Not permitted except fire-resistance-rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 716.1.2.3.
- b. XXX = The fire rating duration period in minutes, which shall be equal to the fire-resistance rating required for the wall assembly.
- c. Fire-protection-rated glazing is not permitted for fire barriers required by Section 1206 of the International Fire Code to enclose energy storage systems. Fire-resistance-rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 716.1.2.3 shall be permitted.

716.2.5.4 Fire door frames with transom lights and sidelights. Fire-protection-rated glazing shall be permitted in door frames with transom lights, sidelights or both, where a 3/4-hour *fire protection rating* or less is required and in 2-hour fire-resistance-rated exterior walls in accordance with Table 716.1(2). *Fire door* frames with transom lights, sidelights, or both, installed with fire-resistance-rated glazing tested as an assembly in accordance with ASTM E119 or UL 263 shall be permitted where a *fire protection rating* exceeding 3/4 hour is required in accordance with Table 716.1(2).

Add new text as follows:

716.2.5.4.1 Energy storage system separation. Fire-protection-rated glazing shall not be permitted in fire door frames with transom lights and sidelights in fire barriers required by Section 1206 of the International Fire Code to enclose energy storage systems.

716.3.2.1 Interior fire window assemblies. Fire-protection-rated glazing used in fire window assemblies located in fire partitions and fire barriers shall be limited to use in assemblies with a maximum fire-resistance rating of 1 hour in accordance with this section.

716.3.2.1.1 Where 3/4-hour-fire-protection window assemblies permitted. Fire-protection-rated glazing requiring 45-minute opening protection in accordance with Table 716.1(3) shall be limited to fire partitions designed in accordance with Section 708 and fire barriers utilized in the applications set forth in Sections 707.3.6, 707.3.7 and 707.3.9 where the fire-resistance rating does not exceed 1 hour. Fire-resistance-rated glazing assemblies tested in accordance with ASTM E119 or UL 263 shall not be subject to the limitations of this section.

716.3.2.1.1.1 Energy storage system separation. Fire-protection-rated glazing is not permitted for use in fire window assemblies in fire barriers required by Section 1206 of the International Fire Code to enclose energy storage systems.

Reason:

Battery storage systems, now referred to as Energy Storage Systems, have historically been separated from other portions of an occupancy by one or two hour fire-resistance-rated construction as an Incidental Use. The enclosure protects the general occupancy areas from an event involving the Incidental Use.

One of the hazards of an energy storage system is thermal runaway leading to a fire event. These fire events can be significant and last several hours. The systems are required to be designed to prevent thermal runaway internally, however, thermal runaway can be induced in some case by an exterior event such as a damaging impact or from a fire exposure. Though the code now requires fire suppression of the space occupied by the energy storage system, the remainder of the occupancy may not be protected and the current code language allows the use of fire-protection-rated glazing material in door and window openings.

Fire-protection-rated glazing is intended to stop spread of flame and smoke, but not radiant heat. The radiant heat flow through the glazing is significant, enough to cause a fire on the other side of the fire-resistance-rated separation assembly, and, specific to this issue, induce thermal runaway of the energy storage system. (See the included Intertek test report and heat transmittal through ceramic fire-protection-rated glazing with a revision date of May 13, 2016.)

https://www.dropbox.com/sh/n8h65nht5dcruq5/AAAZxIS4ioKu_eTXz1GqjwQ3a?dl=0

A large part of the new requirements in the International Fire Code targeting energy storage systems and in the currently in cycle NFPA 855 Energy Storage Systems Standard is protecting the energy storage system from exposure hazards to the system. This proposal builds on that part of the protection to the systems by prohibiting the use of fire-protection-rated glazing in one hour assemblies that are used to enclose energy storage systems.

Cost Impact

The code change proposal will increase the cost of construction .

The increase in cost of construction is specific to energy storage system and is negligible compared to the overall cost of compliance when installing energy storage systems.

Internal ID: 1872

FS27-18

IBC: 707.5

Proponent: David Renn, City and County of Denver, representing Code Change Committee of Colorado Chapter of the ICC (david.renn@denvergov.org)

2018 International Building Code

Revise as follows:

707.5 Continuity. *Fire barriers* shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above and shall be securely attached thereto. Such *fire barriers* shall be continuous through concealed space, such as the space above a suspended ceiling. Joints and voids at intersections shall comply with Sections 707.8 and 707.9

Exceptions:

1. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 713.12.
2. *Interior exit stairway* and *ramp* enclosures required by Section 1023 and *exit access stairway* and *ramp* enclosures required by Section 1019 shall be permitted to terminate at a top enclosure complying with Section 713.12.
3. An exit passageway enclosure required by Section 1024.3 that does not extend to the underside of the roof sheathing, slab or deck above shall be enclosed at the top with construction of the same fire-resistance rating as required for the exit passageway.

Reason:

Exception 2 currently allows interior exit stairway and ramp enclosures to terminate at a top enclosure meeting the requirements for a top enclosure of a shaft. This proposed change extends this same allowance to exit passageways. Since exit passageways and interior exit stairways and ramps are all exit components, the current allowance for a top enclosure should apply to all of these components. Since an exit passageway does not penetrate a floor as shaft does, this proposal includes this allowance as a new exception, rather than referring to top enclosure requirements for shafts.

The use of a fire-resistance rated top enclosure for an exit passageway is commonly used as a means to allow mechanical, electrical and plumbing work to route above an exit enclosure. This proposal would specifically allow what is currently allowed by many jurisdictions through the modifications provisions in IBC 104.10.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no change to construction cost since this new exception is not required to be used. If used, there is a cost trade off between extending fire barriers to the roof, sheathing, slab or deck and providing the top enclosure. Savings in mechanical, electrical or plumbing systems may be realized by routing over an exit passageway instead of around an exit passageway.

FS28-18

IBC: 707.5.1

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows:

707.5.1 Supporting construction. The supporting construction for a *fire barrier* shall be protected to afford the required *fire-resistance rating* of the *fire barrier* supported. Hollow vertical spaces within a *fire barrier* shall be fireblocked in accordance with Section 718.2 at every floor level.

Exceptions:

1. The maximum required *fire-resistance rating* for assemblies supporting *fire barriers* separating tank storage as provided for in Section 415.9.1.2 shall be 2 hours, but not less than required by Table 601 for the building construction type.
2. Supporting construction for 1-hour *fire barriers* required by Table 509 in buildings of Types IIB, IIIB and VB construction is not required to be *fire-resistance rated* unless required by other sections of this code.
3. Supporting construction for 2-hour interior exit stairways and ramps shaft enclosure of Section 1023.2, is not required to exceed the ratings given in Table 601 unless required by other sections of this code.

Reason:

One hour buildings and 2-hour shafts. Shaft walls are officially fire barriers. Therefore, some jurisdictions require that elevator and stairs shafts in Type IIA, IIIA and VA four story buildings need to have their shafts supported by a structural system that complies with 2-hour fire resistance. This is questionable logic. This means that the code allows the building to completely fall down after a 1 hour fire but the code wants the shaft to remain standing among the rubble? I have always thought of this as odd, and not very practical to design or construct, and not very defensible from a logical point of view.

Cost Impact

The code change proposal will decrease the cost of construction .

This code change will decrease the cost of construction.

If this proposal is approved, the required fire rating of the supporting structure could be reduced and as the result cost of construction can be decreased.

Internal ID: 1524

FS29-18

IBC: 707.8, 707.9

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

~~**707.8 Joints, joints and voids.** Joints made in or between fire barriers, and joints made at the intersection of fire barriers with underside of a fire resistance rated floor or roof sheathing, slab or deck above, and the exterior vertical wall intersection shall comply with Section 715~~

The following joints and voids shall be protected in accordance with Section 715.

1. Joints in or between fire barriers.
2. Joints between fire barriers and fire-resistance-rated wall assemblies.
3. Joints between fire barriers and the underside of fire-resistance-rated floors or floor/ceiling assemblies
4. Joints between fire barriers and the underside of fire-resistance rated roofs or roof/ceiling assemblies.
5. Voids at the intersection of fire barriers and nonfire-resistance-rated exterior curtain wall assemblies.
6. Voids between fire barriers and the underside of nonfire-resistance-rated roofs or roof/ceiling assemblies.
7. Voids between fire barriers and the underside of nonfire-resistance-rated floors or floor/ceiling assemblies.

Delete without substitution:

~~**707.9 Voids at intersections.** The voids created at the intersection of a *fire barrier* and a nonfire resistance rated roof assembly or a nonfire resistance rated exterior wall assembly shall be filled. An approved material or system shall be used to fill the void, and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.~~

Reason:

Other FCAC proposals reorganize and make changes to Section 715, including adding protection requirements for voids, so Section 707.9 is no longer needed. This proposal simplifies the references to Section 715 and includes all of the joints and voids that require protection. Depending on the action on the other proposals Item (7) may need to be deleted from this proposal.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The changes are editorial and do not add new construction requirements.

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

CONTINUITY HEAD-OF-WALL JOINT SYSTEM An assemblage of specific materials or products that are designed to resist the passage of fire through voids created at the intersection of fire barriers and the underside of nonfire-resistance-rated roofs and floors for a prescribed period of time.

Revise as follows:

[BF] F RATING. The time period that the through-penetration firestop system or continuity head-of-wall joint system limits the spread of fire through the penetration when tested in accordance with ASTM E814 or UL 1479 or void.

[BF] T RATING. The time period that the penetration firestop system, including the penetrating item, or the continuity head-of-wall joint system limits the maximum temperature rise to 325°F (163°C/180°C) above its initial temperature through the penetration or void on the nonfire side when tested in accordance with ASTM E814 or UL 1479 side.

707.9 Voids at intersections. The voids created at the intersection of a *fire barrier* and a nonfire-resistance-rated roof or floor assembly or a nonfire-resistance-rated exterior wall assembly shall be filled. An approved material or system shall be used to fill the void, and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases protected with a material or system which complies with Section 715.

Add new text as follows:

715.5 Voids at intersection of fire barriers and underside of nonfire-resistance-rated roofs and floors. The voids created at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof or floor sheathing, slab or deck above shall be protected by an approved continuity head-of-wall joint system installed as tested in accordance with ASTM E2837 to provide an F rating/T rating for a time period not less than the required fire-resistance rating of the wall assembly in which it is installed or with an approved material or system. Such materials or systems shall be securely installed in accordance with the manufacturer's installation instructions in or on the void for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases. Continuity head-of-wall joint systems shall also be installed in accordance with the listing criteria.

Add new standard(s) follows:

E2837-17:

Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies

Reason:

Section 707.9 of the 2012 and later editions of the International Building Code have a provision whereby the voids created at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof sheathing, slab or deck above shall be filled with an approved material or system. This proposal is intended to introduce similar requirements for the void created at the intersection of a fire barrier and the underside of a nonfire-resistance-rated floor sheathing, slab or deck. The language proposed gives an option to fill the void with an approved material, or to protect it with a continuity head-of-wall joint system tested to a new Standard ASTM E2837, entitled "Standard Test

Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies". Since there are a limited number of published systems at this time, the use of a tested system is being proposed as an option to the allowance of an approved material or system. At some later date, when more tested systems are available, the code language can be revised once again to mandate tested systems in much the same way systems tested to ASTM E1966 or UL 2079 are mandated for rated-to-rated construction.

This proposal also parallels another proposal which introduces the new ASTM standard for use with the void at the intersection of a fire barrier and a nonfire-resistance-rated roof assembly. This proposal incorporates the required changes relating to both the roof and the floor intersections. If both proposals are approved as submitted, the language of this proposal prevails as it incorporates the required changes for voids beneath both roofs and floors.

The proposal also compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

If approved this proposal will mandate protection of voids which do not require protection by the 2018 IBC.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2837-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

E2837-17:

Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies

Reason:

This proposal clarifies language for protecting voids at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof assembly as follows:

- Section 707.9 was revised to follow the format of Section 707.8, and the protection requirements were moved to Section 715.
- A new Section 715.5 includes the protection requirements previously in Section 707.9 for voids at intersections of

fire barriers and the underside of nonfire-resistance-rated roofs. In addition, Section 715.5 includes an option for protecting this void with a continuity head-of-wall joint system.

- A definition of continuity head-of-wall joint system was provided.
- The definitions of F rating and T rating were revised to reference continuity head-of-wall joint systems. In addition, reference to the two firestop test standards was removed from the definitions.
- The definition of T rating was revised to correct an error in the metric conversion of the temperature rise criteria. When converting a **temperature rise**, the equation is $^{\circ}\text{C} = 5/9(^{\circ}\text{F})$. The 32°F portion of the equation for converting actual temperatures falls out of the equation.
- ASTM E2837 was added as new referenced standard.
- There are currently approximately 20 continuity head-of-wall joint system tested and certified by UL meeting an F rating/T rating.
- This proposal to include ASTM E2837 test aligns with the requirements added in the 2018 edition of NFPA 101.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply provides another option for demonstrating code compliance.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2837-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 326

FS32-18

IBC: 708.1

Proponent: Sarah Rice, representing Myself (srice@preview-group.com)

2018 International Building Code

Revise as follows:

708.1 General. The following wall assemblies shall comply with this section.

1. Separation walls as required by Section 420.2 for Group I-1 and Group R occupancies.
2. Walls separating tenant spaces in *covered and open mall buildings* as required by Section 402.4.2.1.
3. Corridor walls as required by Section 1020.1.
4. Enclosed elevator lobby separation as required by Section 3006.2.
5. Egress balconies as required by Section 1021.2
6. Walls separating ambulatory care facilities from adjacent spaces, corridors or tenants as required by Section 422.2

Reason:

Section 708.1 provides a list of the locations where fire partitions are required in the IBC. Missing from the list is the requirement found in Section 422.2 to separate ambulatory care facilities from adjacent spaces. This code change simply brings that requirement into the list.

IBC Section 422.2 reads:

422.2 Separation. Ambulatory care facilities where the potential for four or more care recipients are to be incapable of self-preservation at any time shall be separated from adjacent spaces, corridors or tenants with a fire partition installed in accordance with Section 708.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change is simply a correlation.

Internal ID: 2373

FS33-18

IBC: 708.1

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

708.1 General. The following wall assemblies shall comply with this section.

1. Separation walls as required by Section 420.2 for Group I-1 and Group R occupancies.
2. Walls separating tenant spaces in *covered and open mall buildings* as required by Section 402.4.2.1.
3. Corridor walls as required by Section 1020.1.
4. Enclosed elevator lobby separation as required by Section ~~3006.2~~3006.3.
5. Egress balconies as required by Section 1021.2
6. Walls separating ambulatory care facilities from adjacent spaces, corridors or tenants as required by Section 422.2.
7. Walls separating individual sleeping units and contiguous attic and crawl spaces to those units are separated from each other and public or common areas as required by Sections 907.2.8.1, 907.2.9.1 and 907.2.10.1.
8. Walls separating vestibules from a level of exit discharge as required by Section 1028.1.

Reason:

Section 708.1 describes the application of fire partitions as required by other sections of the code. This list has become outdated over time. This proposal updates this list by adding the additional sections which require walls to be constructed as fire partitions.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. 2018 International Building Code

Revise as follows:

708.3 Fire-resistance rating. Except as provided in Section 708.3.1 Fire partitions shall have a fire-resistance rating of not less than 1 hour.

Add new text as follows:

708.3.1 Group I-1, R-1 and R-2 buildings. For Group I-1, R-1 and R-2 occupancies in buildings of Type III, IV and V construction that are more than two stories in height or that have dwelling or sleeping units located on a floor level that is more than 25-feet above the grade plane, the separation walls required by Section 420.2 shall be fire barriers that comply with Section 707 and shall have a 2-hour fire resistance rating. In addition, any load bearing walls shall meet the requirements of Section 1604 without sheathing.

Exceptions:

1. Corridor walls permitted to have a 1/2-hour fire-resistance rating by Table 1020.1.
2. Dwelling unit and sleeping unit separations in buildings of Types IIB, IIIB and VB construction shall have fire-resistance ratings of not less than ~~1/2~~ 1-hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Revise as follows:

708.4.1 Supporting construction. The supporting construction for a *fire partition* shall have a *fire-resistance rating* that is equal to or greater than the required fire-resistance rating of the supported *fire partition*.

Exception: In buildings of Types IIB, IIIB and VB construction, the supporting construction requirement shall not apply to 1-hour fire partitions separating tenant spaces in covered and open mall buildings, *fire partitions* separating dwelling units, *fire partitions* separating sleeping units and *fire partitions* serving as corridor walls.

711.2.3 Supporting construction. The supporting construction shall be protected to afford the required *fire-resistance rating* of the *horizontal assembly* supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the *horizontal assembly* is not required to be fire-resistance rated at the following:

1. *Horizontal assemblies* at the separations of incidental uses as specified by Table 509 provided that the required *fire-resistance rating* does not exceed 1 hour.
2. ~~Horizontal~~ One-hour fire resistance rated horizontal assemblies at the separations of *dwelling units* and *sleeping units* as required by Section 420.3.

711.2.4 Fire-resistance rating. The *fire-resistance rating* of *horizontal assemblies* shall comply with Sections 711.2.4.1 through 711.2.4.6 but shall be not less than that required by the building type of construction.

711.2.4.1 Separating mixed occupancies. Except as provided in Section 711.2.4.1.1, Where the *horizontal assembly* separates mixed occupancies, the assembly shall have a *fire-resistance rating* of not less than that required by Section 508.4 based on the occupancies being separated.

Add new text as follows:

711.2.4.1.1 Group I-1, R-1 and R-2 buildings. For Group I-1, R-1 and R-2 occupancies in buildings of Type III, IV and V construction that are more than two stories in height or that have dwelling or sleeping units located on a floor level that is more than 25-feet above grade plane, the horizontal assemblies providing the separations of dwelling and sleeping units as required by Section 420.3 shall have a 2-hour fire resistance rating. In addition, any load bearing walls supporting the horizontal assembly shall comply with the requirements of Section 1604 without the use of sheathing.

711.2.4.3 Dwelling units and sleeping units. Except as provided in Section 711.2.4.3.1, *Horizontal assemblies* serving as dwelling or sleeping unit separations in accordance with Section 420.3 shall be not less than 1-hour *fire-resistance-rated* construction.

711.2.4.3.1 Group I-1, R-1 and R-2 buildings. For Group I-1, R-1 and R-2 occupancies in buildings of Type III, IV and V construction that are more than two stories in height or that have dwelling or sleeping units located on a floor level that is more than 25-feet above grade plane, the horizontal assemblies at the separation of dwelling and sleeping units as required by Section 420.3 shall have a 2-hour fire resistance rating. In addition, any load bearing walls supporting the horizontal assemblies shall meet the requirements of Section 1604 without the use of sheathing.

Exception: Horizontal assemblies separating dwelling units and sleeping units shall be not less than 1 -hour fire-resistance-rated construction in a building of Types IIB, IIIB and VB construction, where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Reason:

The changing construction methods and the noticeable shift to light weight materials for Group I-1, R-1 and R-2 occupancy buildings; and the continued national trend in reducing fire department staffing numbers, this proposed code language provides for two distinct safety provisions. The first is the increased compartmentalization of the building to reduce fire spread and damage using passive fire protection methods. The second safety provision is the ability of the structure to be constructed in such a way that it retains its structural integrity after being subject to a fire. The provisions of **Section 101.3 Intent**, state:

“The purpose of this code is to establish the minimum requirements to safeguard the public health, safety and general welfare through structural strength, means of egress facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations.”

Currently many of these load bearing walls are constructed in such a way that the wall sheathing is a critical part of the structural integrity of the wall. The sheathing is used for localized member stability, global stability, and in many cases the lateral load resisting system for the entire building. During an adverse event, such as a fire this sheathing can be compromised by fire damage, mechanical damage, and water damage compromising the overall structural integrity of the building. Where the current standard test used for fire resistance is the ASTM E119, Standard Test Methods for Fire Tests of Building Construction and Materials, in practice this test does not account for the reduction in strength and stiffness that results from fire and water damage. It is not practical to think that every assembly would be tested at designed load levels and the resulting strength and stiffness data used in design, as a result the proposed provisions would provide for the structure to rely on the sheathing only as a fire resistive element and would allow the structure to maintain its design strength after the sheathing was compromised or removed for any reason.

The proposed story level and floor height is based on the ability for a fire department to make a rescue from the exterior of the structure using the equipment commonly found on an NFPA 1901 equipped motorized fire engine, this using the most common extension ladder size, being a 24 foot long extension ladder which can easily reach a second floor window. In addition, for structures three stories or greater in height, the level of vertical load and potential lateral load on these walls increases and as a result an additional level of safety is needed.

The success of NFPA 13 & 13R sprinkler systems to manage and control fire is acknowledged however, the provisions of this code change are designed to assist those active fire protection systems in effectively doing their job and to provide structural stability and strength that is dictated under the provisions of Section 101.3.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Based on an independent third-party study of rectangular 4-story Type V multi-family dwellings if constructed in three different cities, this code change proposal may or may not increase the cost of construction, depending on location and material costs at the time of the construction.

A multi-family residential structure must be schematically designed to meet all of the requirements of the 2015 International Building Code to accurately evaluate the relative construction cost. Once designed, the cost comparison buildings were reviewed for code compliance, and cost estimates prepared. The study was prepared Walter G. M. Schneider III, Ph.D., P.E., MCP, CBO, CFO and Ryan L. Solnosky, Ph.D., P.E.

The building model chosen for the project was a 4 story multi-family residential structure encompassing approximately 25,000 gross square feet of building area per floor. The cost comparisons are based on the proposed target building assembled using a mixed bedroom scheme for residential occupancies.

The following construction types were included in the evaluation:

Conventional wood framing with floor system (Type VA construction)

Light gauge steel framing with concrete slab floor on steel deck (Type IIB construction)

Load bearing concrete masonry with precast concrete floor (Type IIB construction)

Load-bearing precast concrete walls and precast concrete floor (Type IIB construction)

Load-bearing insulated concrete form (ICF) walls* and precast concrete floor (Type IIB construction)

Load-bearing insulated concrete form (ICF) walls* and ICF concrete floor (Type IIB construction)

* For the ICF systems walls separating dwelling units were specified as concrete masonry.

The cost estimate for each building model included the complete fit out of each building with the exception of movable appliances and furniture.

From the cost estimates for the 3-city study, the report concluded that the compartmentalized construction method utilizing concrete based construction materials was cost competitive with light weight conventional wood frame construction.

Copies of the study are available on request.

2018 International Building Code

Revise as follows:

708.3 Fire-resistance rating. *Fire partitions used to separate dwelling units and sleeping units shall have fire-resistive ratings of not less than 2 hours. Other fire partitions shall have a fire-resistance rating of not less than 1 hour.*

Exceptions:

1. Corridor walls permitted to have a $1\frac{1}{2}$ -hour fire-resistance rating by Table 1020.1.
2. *Dwelling unit and sleeping unit separations in buildings of Types ~~II~~, ~~III~~ and ~~VB~~ construction shall have fire-resistance ratings of not less than ~~1~~/~~2~~-~~1~~ hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.*

711.2.4.3 Dwelling units and sleeping units. *Horizontal assemblies serving as dwelling or sleeping unit separations in accordance with Section 420.3 shall be not less than ~~1~~/~~2~~-hour fire-resistance-rated construction.*

Exception: *Horizontal assemblies separating dwelling units and sleeping units shall be not less than $1\frac{1}{2}$ -hour fire-resistance-rated construction in a building of Types ~~II~~, ~~III~~, ~~IV~~ and ~~V~~ construction, where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.*

Reason:

Reductions in passive fire protection, especially between dwelling units has long been a concern of our members and allies. Our fears are unfortunately coming true as the U.S. is beginning to see occupied structures with sprinkler protection experiencing substantial or complete burn out as well as deaths and injuries. Westchester, PA 4 seniors killed, Chesapeake, VA 3 killed, Evans, GA 1 killed. Survivors are forced to re-locate and start over. See attachment for complete list.

This proposal returns the requirement for a 2- hour fire rating between dwelling and sleeping units while still recognizing the increased reliability of NFPA 13 systems. We feel this is a good compromise to return a level of redundancy into the code for our citizens who depend on this code for not only life safety but also for property protection within their space they call home. The requirements in this proposals can easily be met by any of the material industries. Note that this requirement is applicable to all construction types except for Type I horizontal assemblies. Type I requires a 2 hour floor rating regardless. Because of that, including Type I in the 711.2.4.3 would result in a reduction of hourly rating and reduction in safety.

In a perfect world we could all rely on active fire suppression systems and that proper maintenance and monitoring would occur, the system will always suppress the fire regardless of added obstructions. That simply is not the case. We live in a world where many times Murphy's Law presides and if the chance exists it can and will happen. Providing a 2 hour or 1 hour in the case of NFPA 13, will enhance the structures ability to withstand fire and provide more time for residents to recognize the emergency and escape and fire service personnel to perform recovery operations.

Cost Impact

The code change proposal will increase the cost of construction .

The added cost will typically be limited to providing an additional layer of type x gypsum to each side of the wall assembly or ceiling assembly serving as the dwelling unit separation.

IBC: 708.4

Proponent: Paul Battaglia, STC Sound Control, representing STC Sound Control, President
(paul@stcsoundcontrol.com)

2018 International Building Code

Revise as follows:

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below and be securely attached to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. The underside of a floor/ceiling or roof/ceiling assembly having a fire-resistance rating that is not less than the fire-resistance rating of the fire partition.

Exceptions:

1. Fire partitions shall not be required to extend into a crawl space below where the floor above the crawl space has a minimum 1-hour fire-resistance rating.
2. Fire partitions serving as a corridor wall shall not be required to extend above the lower membrane of a corridor ceiling provided that the corridor ceiling membrane is equivalent to corridor wall membrane, and either of the following conditions is met:
 - 2.1. The room-side membrane of the corridor wall extends to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above.
 - 2.2. The building is equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, including automatic sprinklers installed in the space between the top of the fire partition and underside of the floor or roof sheathing, deck or slab above.
3. Fire partitions serving as a corridor wall shall be permitted to terminate at the upper membrane of the corridor ceiling assembly where the corridor ceiling is constructed as required for the corridor wall.
4. Fire partitions separating tenant spaces in a covered or open mall building complying with Section 402.4.2.1 shall not be required to extend above the underside of a ceiling. Such ceiling shall not be required to be part of a fire-resistance-rated assembly, and the attic or space above the ceiling at tenant separation walls shall not be required to be subdivided by fire partitions.
5. Fire partitions shall be permitted to extend from the top of a floor underlayment system that is not a component of the floor/ceiling assembly where the building is equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason:

This proposal is intended to allow continuous installation of floor underlayment systems, such as those required for impact noise isolation, without compromise to fire safety in buildings. Continuous installation will save 13% of system cost and speed construction. It will also provide isolation of structure-borne sound not possible with discontinuous underlayment installation.

Acoustical underlayment systems are required by IBC 1207.3 to attain high Impact Isolation Classification (IIC) ratings for floors in facilities with dwelling units and sleeping rooms. Continuous installation of underlayment is currently an integral part of many fire-rated floor/ceiling systems that include gypsum cement poured over acoustical mats, recycled newspaper mats, and plywood panels installed over rubber pads (ex: UL Design L563).

Fire partitions may be placed directly on top of these fire-rated floor/ceiling systems under the current IBC 708.4 since they are part of the fire-resistance rated floor/ceiling assemble. There is no difference in construction details or fire behavior between adjacent rooms when fire partitions are placed on top of the underlayment systems whether the underlayment system is integral to the floor/ceiling system or it isn't.

We propose that fire partitions should be allowed to be placed directly on these underlayment systems where they are not a part of the fire-rated system, especially where automatic sprinkler systems are installed. Furthermore, an underlayment system that performs as a component of a fire-rated floor/ceiling assembly will provide additional fire

safety when added to an otherwise complete assembly.

Continuous installation of underlayment provides the additional benefit of structure-borne sound isolation between floors by creating a discontinuous path for sound and vibration between the underlayment and the subfloor.

Cost Impact

The code change proposal will decrease the cost of construction .

Under current Code requirements a fire-rated partition must be installed on the top of the floor/ceiling assembly prior to placing the additional underlayment. The proposal will allow installation of underlayment systems over an entire building floor system prior to construction of any partitions, thus eliminating additional cutting and fitting around in-place partitions that add 13% to the system cost. It will also eliminate interruptions in the installation process and the related and unnecessary costs of remobilization.

	Fire Partitions in Place	Continuous Installation
Total Floor Area of Underlayment	11,240	11,586
Perimeter Length	1,943	564
Full Panels @ 4x8	352	363
Pads in Field @ 10 per panel	3,520	3,630
Pads at Perimeter @ 2	972	282
Total Pads	4,492	3,912

Internal ID: 130

FS37-18

IBC: 708.4.1

Proponent: Sarah Rice, representing Myself (srice@preview-group.com)

2018 International Building Code

Revise as follows:

708.4.1 Supporting construction. The supporting construction for a *fire partition* shall have a *fire-resistance rating* that is equal to or greater than the required fire-resistance rating of the supported *fire partition*.

Exception: In buildings of Types IIB, IIIB and VB construction, the supporting construction requirement shall not apply to *fire partitions* separating tenant spaces in covered and open mall buildings, *fire partitions* separating dwelling units, *fire partitions* separating sleeping units, *fire partitions separating ambulatory care facilities from adjacent spaces or corridors,* and *fire partitions* serving as corridor walls.

Reason:

When the CTC Working Group on ambulatory care put together what is now Section 422, the correlative changes appropriate for fire partitions were not made. This code change brings in those changes.

Currently the IBC literally requires the supporting construction for fire partitions in Type IIB, IIIB and VB construction used to separate ambulatory care facilities to be fire rated the same as the wall.

Cost Impact

The code change proposal will decrease the cost of construction .

Currently there is no exception for the supporting construction of fire partitions separating ambulatory care facilities from other areas, thus it is literally required to be fire rated. Providing the exception reduces cost through fewer materials in the supporting construction.

Internal ID: 2375

FS38-18

IBC: SECTION 202, 202, 709.4.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BG] SMOKE COMPARTMENT. ~~A space within a building enclosed by smoke barriers on all sides, including the top and bottom, separated from other interior areas of the building by smoke barriers, including interior walls and horizontal assemblies.~~

709.4.1 Smoke-barrier walls-assemblies separating smoke compartments. ~~Smoke-barrier walls-assemblies used to separate smoke compartments shall form an effective membrane enclosure that is continuous from outside wall or smoke barrier wall to outside wall or another smoke barrier wall and horizontal assemblies.~~

Reason:

Modification of the definition is better describing the intent and means of defining the smoke compartment. It further clarifies that the separation is to occur between interior areas of the building and not require a roof or exterior wall to meet the requirements of a smoke barrier.

Proposed modifications to Section 709.4.1 reflect that smoke barriers used for creating smoke compartments and separating them from other interior areas of the building, is not accomplished by just walls, but horizontal assemblies may also be required. The use of vertical and horizontal components is clearly noted in Sections 709.1 and 711.2.4.4. Changing that smoke barrier walls can “begin and end” at another smoke barrier wall, instead of just outside wall to outside wall provides an increase design flexibility in all types of care facilities. It also is comparable to the language for separation of areas of refuge and elevator lobbies in Section 709.4.2.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC), and ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will decrease the cost of construction .

Proposed changes will reduce the cost of construction as exterior walls and roofs will no longer need to perform as “smoke barrier assemblies” as the present language has been interpreted to require. It also eliminates the need for smoke barrier walls to be constructed through the building to an outside wall. Potentially increasing the size of the smoke compartment and creating an increase in the construction of mechanical systems that could have been outside of the space if the walls would have been permitted to terminate at another smoke barrier instead of an outside wall.

Internal ID: 605

FS39-18

IBC: 710.5, 710.5.3 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

710.5 Openings. Openings in smoke partitions shall comply with Sections 710.5.1 and ~~710.5.2~~ through 710.5.3

Add new text as follows:

710.5.3 Pass through openings in Group I-2 Condition 2. Where pass through openings are provided in smoke partitions in Group I-2, Condition 2 occupancies, such openings shall comply with the following:

1. Smoke compartment in which the pass through openings occur do not contain a patient care suite or sleeping room.
2. Pass through openings are installed in a door or vision panel that is not required to have a fire protection rating.
3. The top of the pass through opening is located a maximum of 48 inches above the floor.
4. The aggregate area of all such pass through openings within a single room shall not exceed 80 square inches (0.05m²).

Reason:

At Section 710.5.3, the addition of pass through openings is to recognize important operational functions in the context of the corridor wall. There are several examples of this operational practice. Hospital pneumatic tube delivery systems cannot handle some materials and others where the shaking of the material compromises its effectiveness. In particular, chemotherapy, gross lab materials (tissue biopsy, small organ, etc.) and cash / checks are restricted from being delivered via pneumatic tube system, which is why walk-up pickup and delivery is still an important operational feature of some areas.

First, in a hospital pharmacy, air pressure relationships are established to keep a safe environment. From an operational standpoint, there are frequent pickups by patient care staff from an in-house pharmacy that require direct hand-off and signing of forms. In addition, there are basic security requirements from DEA and state pharmacy boards that require the pharmacy material to be secured, whether it is narcotics, opioids or chemotherapy materials. Opening and closing the door compromises the air relationships prescribed by the IMC Section 407.1, as well as security.

In a laboratory setting, air pressure relationships are critical, and many samples get delivered by hand through a pass-through. Cashier areas are set like a secured bank windows, due to the co-payment cash being delivered by staff, or a patient with a financial issue to be discussed.

This concept has existed in hospitals for a long time, because it has been allowed by the federal standard (K364). This code changes seeks to establish the same criteria to respond to the operational need of the corridor, while maintaining its integrity.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

Costs will increase with this change because it allows extra features to be added to an opening. However, it does not add cost to the healthcare industry because we already follow these requirements in the context of the federal standard.

FS40-18

IBC: 713.4

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

2018 International Building Code

Revise as follows:

713.4 Fire-resistance rating. Shaft enclosures shall have a *fire-resistance rating* of not less than 2 hours where connecting four *stories* or more, and not less than 1 hour where connecting less than four *stories*. The number of *stories* connected by the shaft enclosure shall include any basements but not any *mezzanines*. Shaft enclosures shall have a *fire-resistance rating* not less than the floor assembly penetrated, but need not exceed 2 hours. Shaft enclosures shall meet the requirements of Section 703.2.1.

Exception: For buildings with automatic sprinkler systems in accordance with 903.3.1.1, not greater than 420 feet (128 m) in building height, the required fire-resistance rating of the fire barriers enclosing vertical shafts, other than interior exit stairways and elevator hoistways, shall not be less than 1 hour where automatic sprinklers are installed within the shafts at the top and alternate floors. Each floor throughout the building shall be equipped with sprinkler control valves equipped with supervisory initiating and water-flow initiating devices.

Reason:

The text of the new exception to IBC Section 713.4, comes from IBC Section 403.2.1.2. Section 403.2.1.2 allows shafts in high-rises (over 75 ft in height) up to 420 feet in height to have a 1-hour rating where the building is fully sprinklered, with sprinklers at the top of the shaft and alternating floor levels. Each floor has a supervised floor control valves and water flow switches. This proposals extends the same requirement to all shafts (except stairs and elevators) of any building. This exception would only apply to NFPA 13 sprinklered buildings, with the addition of supervised floor control valves, water flow switches and sprinklers at the top of the shaft and at each alternate level. NFPA 13 does not require low-rise buildings to be equipped with floor control valves on each floor (NFPA 13, 8.2.4) and shafts with noncombustible or limited-combustible (gypsum board) surfaces are not required to have sprinklers (NFPA 13 8.15.2).

The high-rise shaft reduction language can be traced back to the 1990 BOCA code. There are no records of adverse or failures of the active or passive measures when this reduction is used. It can be reasoned that a 76 ft building (a high-rise) can have sprinklered 1-hr shafts whereas a 75 ft building (not a high-rise) would be required to have 2-hr shafts without the codified option or exception to allow a reduction for sprinklers.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal correlates the requirement for high-rise shaft rating reduction to all shafts. To obtain the reduction for buildings under 75 ft, an automatic sprinkler system per NFPA 13 is required, as well as supervised floor control valves, water flow switches and sprinklers at the top of the shaft and at each alternating level. A low-rise building (2-4 stories) can be sprinklered without supervised floor control valves, water-flow for each floor. This text provides an option to a building designer and owner where the additional expense warrants a reduction in shaft rating.

Internal ID: 1230

FS41-18

IBC: 713.12

Proponent: Kellie Saylor, OZ Architecture, representing Code Change Committee of Colorado Chapter of the International Code Council (ksaylor@ozarch.com)

2018 International Building Code

Revise as follows:

713.12 Enclosure at top. ~~A shaft enclosure that does not~~ The top of shaft enclosures shall comply with one of the following:

1. They shall extend to the underside of the roof sheathing, deck or slab of the building and the roof assembly shall comply with the requirements for the type of construction as specified in Table 601.
2. They shall terminate below the roof assembly and be enclosed at the top with construction of the same fire-resistance rating as the topmost floor penetrated by the shaft, but not less than the fire-resistance rating required for the shaft enclosure.
3. They shall extend past the roof assembly and comply with the requirements of Section 1510.

Reason:

The current phrasing in this section can be confusing and it does not address one of the most common conditions at the top of a shaft enclosure. The previous section, 713.11 Enclosure at bottom, identifies the most common conditions at the bottom of a shaft enclosure and clearly lists the requirements for each condition. This proposed change to the Enclosure at top section aims to provide the same level of detail and organization as the Enclosure at bottom section. This proposal does not result in a technical change to the code requirements, but it does attempt to make those requirements more clear.

Three different conditions are identified for the top of a shaft enclosure in this proposal - the shaft enclosure can 1) extend to the underside of the sheathing, 2) terminate below the roof assembly or 3) extend past the roof assembly. The requirements for conditions one and two can be inferred from the current code language. However, the requirements for the third condition are not currently identified in this section. When a shaft enclosure extends past the roof assembly, it would then meet the definition of a Penthouse and need to meet the requirements of section 1510 Rooftop Structures. It is a common condition for elevator shafts to extend past the roof and it deserves mention in section 713.12 Enclosure at top. The proposal adds this third condition and includes a reference to section 1510 Rooftop Structures. Additionally, the first condition (where a shaft enclosure extends to the underside of the sheathing) has been expanded to note that the roof must meet the requirements for the type of construction specified.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction. This code change proposal does not result in a technical change to the code requirements but does make some of those requirements more clear. Since these requirements are already part of the code, it is not likely that there will be an increase or decrease in the cost of construction.

Internal ID: 312

FS42-18

IBC: 713.12.1 (New)

Proponent: David Collins, The American Institute of Architects, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

713.12 Enclosure at top. A shaft enclosure that does not extend to the underside of the roof sheathing, deck or slab of the building shall be enclosed at the top with construction of the same *fire-resistance rating* as the topmost floor penetrated by the shaft, but not less than the *fire-resistance rating* required for the shaft enclosure.

Add new text as follows:

713.12.1 Penthouse mechanical rooms. A fire/smoke damper shall not be required at the penetration of the rooftop structure where shaft enclosures extend up through the roof assembly into a rooftop structure conforming to Section 1510. All ductwork in the shaft shall be connected directly to HVAC equipment.

Reason:

The code includes provisions for termination of a shaft at the bottom and a shaft that terminates short of the roof assembly, but provides no guidance for a shaft that penetrates a roof structure. This change will clearly allow a shaft to terminate above the roof and ducts to connect the shaft to the HVAC equipment without any additional protection at the penetration of the roof when it is inside a rooftop structure permitted by Section 1510.

Cost Impact

The code change proposal will decrease the cost of construction .

By clarifying how shafts are terminated at the top should reduce the cost of construction, confusion and unnecessary installation of dampers. Criteria for shutdown of systems by detectors and dampers are found in the IMC and would suffice where the ductwork in the shaft connect to that equipment.

Internal ID: 1753

FS43-18

IBC: 713.13, 713.13.1

Proponent: Lawrence Lincoln, Salt Lake City Corporation, representing self (larry.lincoln@slcgov.com)

2018 International Building Code

Revise as follows:

713.13 Waste and linen chutes and incinerator rooms. Waste and linen chutes shall comply with the provisions of NFPA 82, Chapter 6 and shall meet the requirements of Sections 712 and 713.13.1 through 713.13.6. Incinerator rooms shall meet the provisions of Sections 713.13.4 through 713.13.5.

Exception-Exceptions:

1. Chutes serving and contained within a single dwelling unit.
2. Doors between the chute discharge and the discharge room shall not be required.

713.13.1 Waste and linen. A shaft enclosure containing a recycling, or waste or linen chute shall not be used for any other purpose and shall be enclosed in accordance with Section 713.4. A shaft enclosure shall be permitted to contain recycling and waste chutes. Openings into the shaft, from access rooms ~~and discharge rooms~~, shall be protected in accordance with this section and Section 716. Openings into chutes shall not be located in *corridors*. Doors into chutes shall be self-closing. ~~Discharge doors shall be self or automatic closing upon the actuation of a smoke detector in accordance with Section 716.2.6.6, except that heat activated closing devices shall be permitted between the shaft and the discharge room.~~

Reason:

Why is the IBC requiring waste and linen chute discharge doors to be fire-rated when the chute itself is not required to be fire-rated? As it is written, IBC code section 713.13 is trying to protect a building component (the chute) which is not a fundamental building element of construction. (See illustration). The addition of exception #2 eliminates the requirement of the chute discharge doors in its entirety along with the fire-rating as required by NFPA 82, Chapter 6. It is not the intention of this exception to eliminate NFPA 82, Chapter 6 in its entirety but only that portion of NFPA 82, Chapter 6 that requires the chute discharge doors and its fire rating. (See IBC section 102.4.1 concerning 'Conflicts' between referenced codes and standards, and the code. It indicates that the provisions of the code shall apply).

The strikeout of the words 'and discharge rooms' in section 713.13.1 eliminates the requirement for any type of fire-rated door at the bottom of the shaft where the shaft connects to the discharge room. IBC section 713.13.4 already requires that the waste and linen discharge room have the same fire-rating as the shaft enclosure that contains the chute. If the shaft enclosure and the discharge room are required to have the same fire rating, where is the need for a fire-rated door at that location? There is no need, nor is there a need for a waste and linen chute discharge door, let alone a fire-rated waste and linen chute discharge door.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposed code changes eliminates a requirement therefore it would decrease the cost of construction.

Internal ID: 1998

FS44-18

IBC: 713.13, 713.13.1, 713.13.3, 713.13.4

Proponent: Sarah Rice, The Preview Group, representing Myself (srice@preview-group.com)

2018 International Building Code

Revise as follows:

713.13 Waste, recycle and linen chutes and incinerator rooms. Waste, recycle and linen chutes shall comply with the provisions of NFPA 82, Chapter 6 and shall meet the requirements of Sections 712 and 713.13.1 through 713.13.6. Incinerator rooms shall meet the provisions of Sections 713.13.4 through 713.13.5.

Exception: Chutes serving and contained within a single dwelling unit.

713.13.1 Waste, recycle and ~~linen~~-linen chute enclosures. A shaft enclosure containing a recycling, or waste or linen chute shall not be used for any other purpose and shall be enclosed in accordance with Section 713.4. A shaft enclosure shall be permitted to contain recycling and waste chutes. Openings into the shaft, from access rooms and discharge rooms, shall be protected in accordance with this section and Section 716. Openings into chutes shall not be located in *corridors*. Doors into chutes shall be self-closing. Discharge doors shall be self- or automatic-closing upon the actuation of a smoke detector in accordance with Section 716.2.6.6, except that heat-activated closing devices shall be permitted between the shaft and the discharge room.

713.13.3 Chute access rooms. Access openings for waste, recycling or linen chutes shall be located in rooms or compartments enclosed by not less than 1-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. Openings into the access rooms shall be protected by opening protectives having a *fire protection rating* of not less than $3/4$ hour. Doors shall be self- or automatic-closing upon the detection of smoke in accordance with Section 716.2.6.6. The room or compartment shall be configured to allow the access door to the room or compartment to close and latch with the access panel to the ~~refuse or laundry~~ chute in any position.

713.13.4 Chute discharge room. Waste, recycling or linen chutes shall discharge into an enclosed room separated by *fire barriers* with a *fire-resistance rating* not less than the required fire rating of the shaft enclosure and constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. Openings into the discharge room from the remainder of the building shall be protected by opening protectives having a *fire protection rating* equal to the protection required for the shaft enclosure. Doors shall be self- or automatic-closing upon the detection of smoke in accordance with Section 716.2.6.6. Waste chutes shall not terminate in an incinerator room. Waste and linen rooms that are not provided with chutes need only comply with Table 509.

Reason:

Previous code changes introduced "recycling chutes" to Section 713.13.1, but not the parent section, Section 713.1, or the sections for chute access or chute discharge rooms.

With the desire to be more environmentally conscious, building owners are incorporating more "built-in" mechanisms to promote the recycling of materials, such as dedicated chutes for the ready disposal of recyclable materials.

This proposal is somewhat editorial in nature as it only seeks to add consistency between the section on chute design in 713.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

As the 2018 IBC specifically regulates the overall construction of recycling chutes in the same manner as waste or linen chutes, there should not be any increase in cost.

Internal ID: 2369

FS45-18

IBC: 713.13.1, 713.13.4

Proponent: Todd Snider, West Coast Code Consultants (WC3), representing Self (Todd@KimballEng.com)

2018 International Building Code

Revise as follows:

713.13.1 Waste and linen. A shaft enclosure containing a recycling, or waste or linen chute shall not be used for any other purpose and shall be enclosed in accordance with Section 713.4. A shaft enclosure shall be permitted to contain recycling and waste chutes. Openings into the shaft, from access rooms ~~and discharge rooms~~, shall be protected in accordance with this section and Section 716. Openings into the shaft from the discharge room shall be protected in accordance with NFPA 82, Chapter 6. Openings into chutes shall not be located in *corridors*. Doors into chutes shall be self-closing. Discharge doors shall be self-or automatic-closing upon the actuation of a smoke detector in accordance with Section 716.2.6.6, except that heat-activated closing devices shall be permitted between the shaft and the discharge room.

713.13.4 Chute discharge room. Waste or linen chutes shall discharge into an enclosed room separated by *fire barriers* with a *fire-resistance rating* not less than the required fire rating of the shaft enclosure and constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. Openings into the discharge room from the remainder of the building and from the shaft shall be protected by opening protectives having a *fire protection rating* equal to the protection required for the shaft enclosure. Doors shall be self-or automatic-closing upon the detection of smoke in accordance with Section 716.2.6.6. Waste chutes shall not terminate in an incinerator room. Waste and linen rooms that are not provided with chutes need only comply with Table 509.

Reason:

Proposed revision to clarify the requirements for opening protection between the shaft and the chute discharge room and to revise to match the requirements of the NFPA 82 standard referenced in Section IBC 713.13. The code currently requires that openings between the shaft and the discharge room to be protected per IBC 716, this requirement is not clear in the language of the code in this section, additionally, the requirements of IBC 716 do not match the requirements of Section 6.3.2.1 of NFPA 82. IBC 716 requires a fire rated door which has a closer and latch that is fire tested. Section 6.3.2.1 of NFPA 82 requires an approved automatic closing or self-closing door or fire damper of construction that is equivalent to the opening fire protection rating for the chute. The factory listed chute doors at the discharge cannot meet the latch requirements for the tested assemblies per IBC 716.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change simply clarifies a requirement that is already existing.

Internal ID: 1276

FS46-18

IBC: SECTION 202, 202 (New), 714.2.1 (New)

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

FIRESTOP IDENTIFICATION DEVICE A label or placard, of any type, that identifies the firestop system.

Add new text as follows:

714.2.1 Firestop identification devices. Penetration firestop systems shall be permanently identified with a device, label or other method. The device shall be handwritten with permanent ink, or pre-printed, legible tag or label, or format readable by an electronic device. The device shall be located on both sides of the fire barrier, smoke barrier or fire wall. The device shall at a minimum have the following information:

1. Listing system number or engineering judgement number.
2. Date of Installation
3. Installing company name, contact information.
4. Manufacturer name of the firestop system.
5. "Warning, Penetration Firestop System - Do Not Remove or Tamper.

Adhesive or mechanically attached Identification devices shall be located within 6 inches (150 mm), of the penetration firestop system edge, on top of the horizontal assembly, 6 inches (150 mm) below or beside the firestop system. For multiple penetrations of the same listing number arranged within 6 inches (150 mm) of each other, the device shall be located centered under or within 6 inches (150 mm) to either side of the grouping. Hanging tags shall be attached to the penetrating item with permanent wire, string or plastic tie, within 6 inches (150 mm) of the assembly.

Reason:

Installing penetration firestop systems looks as easy as applying red caulk to an assembly. Firestop systems are not easy to install. Firestop systems are very complex, detailed listed systems that take understanding of the tolerances so they work when called upon by fire.

This proposal adds a requirement to identify the firestop system used to maintain fire-resistance at the assembly. This is a way for the special inspection agency inspector, during construction, and building owner and manager, during the life of the building, to understand quickly what listing has been used. The listing has the information needed to evaluate the installation and maintain compliance during construction and through the building life cycle. It's not read caulk that's been installed. It's an assemblage of materials designed to keep fire from spreading outside the room of origin. The identification device makes the verification process much more efficient and effective.

Cost Impact

The code change proposal will increase the cost of construction .

The cost of an identification device will add a very small amount to the cost of construction, but will decrease the cost of inspection and maintenance. The identification device cost per penetration firestop system is approximately \$0.10US per penetration.

Internal ID: 2330

FS47-18

IBC: 714.2.1 (NEW), 715.2.1(NEW)

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2018 International Building Code

Add new text as follows:

714.2 Installation. A listed *penetration firestop* system shall be installed in accordance with the manufacturer's installation instructions and the listing criteria.

714.2.1 Contractor qualifications. In buildings that are 420 feet. (128 m) or greater in building height, penetration firestop systems shall be installed by contractors qualified by Underwriters Laboratories (UL), Factory Mutual (FM), or an approved agency.

Exceptions:

1. Where the work is of a minor nature as approved by the building official.
2. Where the work is a repair or Alteration Level 1 as defined by the International Existing Building Code.

715.2 Installation. A *fire-resistant joint system* shall be securely installed in accordance with the manufacturer's installation instructions and the listing criteria in or on the joint for its entire length so as not to impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases.

715.2.1 Contractor qualifications. In buildings that are 420 feet (128 m) or greater in building height, fire-resistant joint systems shall be installed by contractors qualified by Underwriters Laboratories (UL), Factory Mutual (FM) or an approved agency.

Exceptions:

1. Where the work is of a minor nature as approved by the building official.
2. Where the work is a repair or Alteration Level 1 as defined by the International Existing Building Code.

Reason:

There currently is a big risk with penetration firestop systems not installed to the listing or manufacturer's installation instructions. Building survey findings have shown installation deficiencies demonstrating a lack of knowledge regarding penetration firestop systems, lack of knowledge of the complex listings, and lack of knowledge regarding manufacturer's instructions. Also, a risk exists with fire-resistive joint systems not installed to the listing or the manufacturers installation instructions. Building survey findings identify installation deficiencies showing a lack of listing knowledge for these complex assemblies.

Requirements that penetration firestop systems and fire-resistive joint systems be installed by a FM 4991 Approved or UL Qualified Firestop Contractor means 3rd party exam and audit proven knowledge and processes exist to follow listings and manufacturers instructions. The FM 4991, Standard for the Approval of Firestop Contractors and UL Qualified Firestop Contractor Programs are similar to fabricator approval process in 1704.2.5.1 and manufacturers ISO 9000 quality management systems programs, but customized for the construction environment. The programs are administered by FM Approvals and UL, both independent of the Firestop Contractors International Association (FCIA) or firestop manufacturers, and the Contractors being audited. The programs verify that procedures for worker training, installation, review of installation, documentation or inventory of systems, and more, comply with program requirements and the contractor's quality management system procedures. A designated responsible individual implements the program at the firestop contractor company.

The initial cost to become FM 4991 Approved or UL Qualified ranges from \$7000 to \$12,000. An annual audit is required by the UL and FM programs which costs about \$3,500. The contractor company spreads these costs amongst all their projects, meaning a small cost of doing business. Efficiencies gained from quality processes help offset the costs.

The current FM 4991 or UL Qualified Contractor list mirrors where these tall buildings are located. The contractors travel a region increasing availability providing competitive bidding to building owners and managers. Whereas it will be several years before this requirement would be in effect, there is plenty of time for other contractors to participate in the FM or UL programs.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The firestop contractor that understands systems selection, analysis, the listings and manufacturers installation instructions gets the penetration firestop systems installed correctly the first time. The firestop contractor that does not know the industry protocol and installs 'fire caulk' and not systems is not providing the work result demanded by the code and will be non compliant. There are enough FM 4991 Approved and UL Qualified Firestop Contractors to provide a competitive environment for the general contractor and building owner and manager, and, should this be mandated, many more will appear.

Internal ID: 2243

FS48-18

IBC: 714.4.2

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows:

714.4.2 Membrane penetrations. *Membrane penetrations* shall comply with Section 714.4.1. Where walls or partitions are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced.

Exceptions:

1. *Membrane penetrations* of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 16 square inches (0.0103 m²) in area, provided that the aggregate area of the openings through the membrane does not exceed 100 square inches (0.0645 m²) in any 100 square feet (9.29 m²) of wall area. The *annular space* between the wall membrane and the box shall not exceed 1/8 inch (3.2 mm). Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
 - 1.1. By a horizontal distance of not less than 24 inches (610 mm) where the wall or partition is constructed with individual noncommunicating stud cavities.
 - 1.2. By a horizontal distance of not less than the depth of the wall cavity where the wall cavity is filled with cellulose loose-fill, rockwool or slag *mineral wool* insulation.
 - 1.3. By solid *fireblocking* in accordance with Section 718.2.1.
 - 1.4. By protecting both outlet boxes with *listed* putty pads.
 - 1.5. By other *listed* materials and methods.
2. *Membrane penetrations* by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the wall membrane and the box shall not exceed 1/8 inch (3.2 mm) unless *listed* otherwise. Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
 - 2.1. By the horizontal distance specified in the listing of the electrical boxes.
 - 2.2. By solid *fireblocking* in accordance with Section 718.2.1.
 - 2.3. By protecting both boxes with *listed* putty pads.
 - 2.4. By other *listed* materials and methods.
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of a wall opening protective material system for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by boxes other than electrical boxes, provided that such penetrating items and the *annular space* between the wall membrane and the box, are protected by an *approved membrane penetration firestop system* installed as tested in accordance with ASTM E814 or UL 1479, with a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water, and shall have an F and T rating of not less than the required *fire-resistance rating* of the wall penetrated and be installed in accordance with their listing.
5. The *annular space* created by the penetration of an automatic sprinkler, provided that it is covered by a metal escutcheon plate.
6. *Membrane penetrations* of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that exceed 16 square inches (0.0103 m²) in area, or steel electrical boxes of any size having an aggregate area through the membrane exceeding 100 square inches (0.0645 m²) in any 100 square feet (9.29 m²) of wall area, provided that such penetrating items are protected by *listed* putty pads or other *listed* materials and methods, and installed in accordance with the listing.
7. The wall membrane of 1- or 2-hour fire-resistance-rated wall assemblies is permitted to be interrupted with a double wood end stud at the intersection of light frame wood wall assemblies provided: the intersecting wall has a membrane of 5/8 inch Type X gypsum, all penetrating items

through the double wood stud are protected in accordance with Section 714.4.1.1 or 714.4.1.2, and the interrupted membrane is tight to the double wood stud. The cavity of the 1- or 2- hour fire-resistance-rated wall assembly shall be blocked solid with material suitable as a fire block in Section 718.2 if the wall membrane is interrupted on both sides of the wall within a single stud space.

Reason:

This proposal provides an exception for wall assemblies similar to exception 7 currently in Section 714.5.2 for membrane penetrations of a horizontal assembly. Additional material suitable as a fire block is added to the wall cavity if a similar condition occurs on both sides of the 1- or 2- hour rated wall into the same stud cavity. Double studs at the intersection have an intrinsic fire resistance rating greater than the layer of 5/8" gypsum board and is suitable in this wall application similar to the horizontal assembly found in section 714.5.2.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal is merely guiding the user as to how to treat the intersection of two fire rated walls. In the absence of any current guidelines, this could potentially increase the cost of construction

Internal ID: 2095

FS49-18

IBC: 714.4.3, 714.5.3

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

714.4.3 Dissimilar materials. Noncombustible penetrating items shall not connect to combustible items beyond the point of firestopping unless it can be demonstrated that the *fire-resistance* integrity of the wall is maintained.

Exceptions:

1. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is combustible, the combustible material shall extend not less than 6 inches past both sides of the approved penetration firestop system before transitioning to non-combustible materials. The 6 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.
2. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is non-combustible, the non-combustible material shall extend not less than 36 inches past both sides of the approved penetration firestop system before transitioning to combustible materials. The 36 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.

714.5.3 Dissimilar materials. Noncombustible penetrating items shall not connect to combustible materials beyond the point of firestopping unless it can be demonstrated that the *fire-resistance* integrity of the *horizontal assembly* is maintained.

Exceptions:

1. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is combustible, the combustible material shall extend not less than 6 inches past both sides of the approved penetration firestop system before transitioning to non-combustible materials. The 6 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.
2. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is non-combustible, the non-combustible material shall extend not less than 36 inches past both sides of the approved penetration firestop system before transitioning to combustible materials. The 36 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.

Reason:

Many plumbing system installations involve the combined use of combustible and noncombustible piping, drains, waste and vents. For example, cast iron (noncombustible) drains may be used for sound control but plastic (combustible) vents are combined on each story for cost savings. The reason for these designs is understandable but the integrity of fire-resistive rated construction may be compromised as a result of mixing these materials. The 6" and 36" dimensions are drawn from Section 8.3.5.5 of the 2015 edition of NFPA 101, which provides a method that maintains the integrity of the fire-resistive rated assembly as reflected in this proposal. This code change will also reduce delays and the cost of construction by eliminating the need for testing.

8.3.5.5 Transitions.

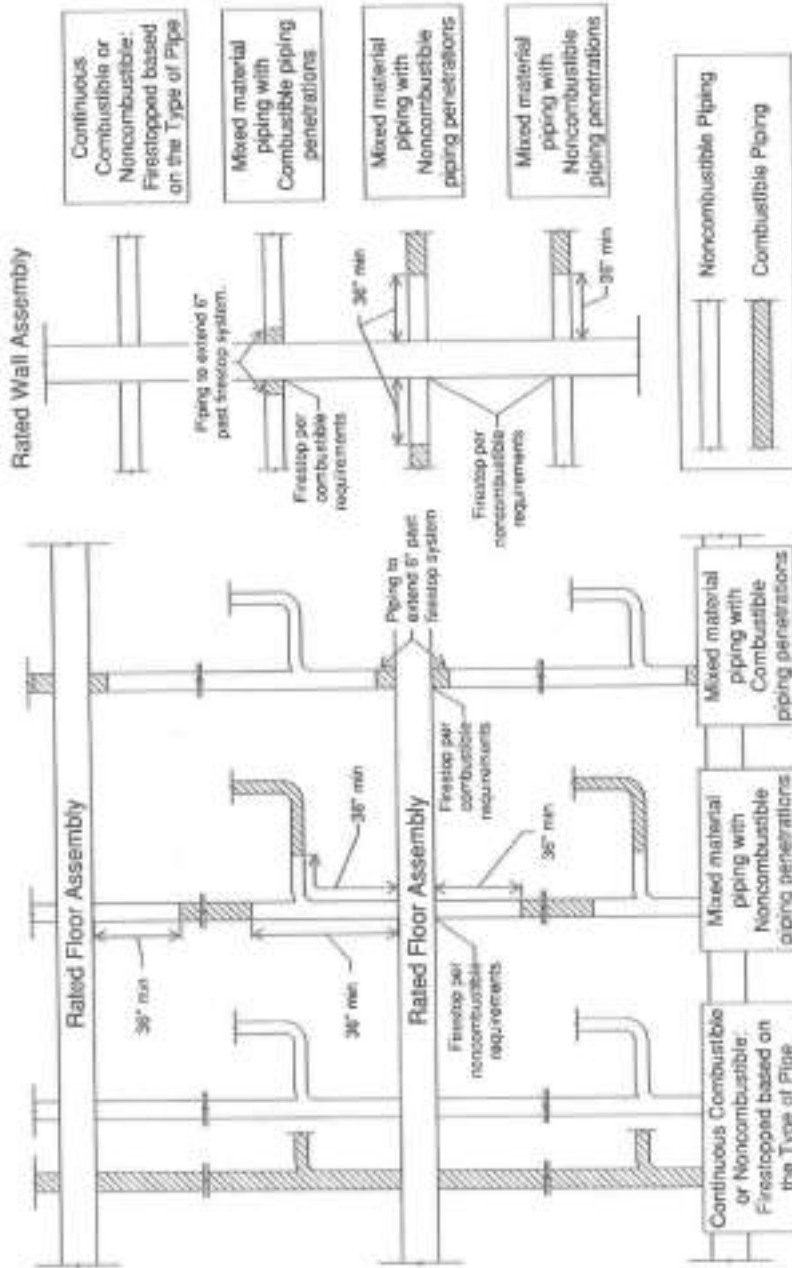

8.3.5.5.1

Where piping penetrates a fire resistance-rated wall or floor assembly, combustible piping shall not connect to noncombustible piping within 36 in. (915 mm) of the firestop system or device without demonstration that the transition will not reduce the fire resistance rating, except in the case of previously approved installations.

8.3.5.5.2

Unshielded couplings shall not be used to connect noncombustible piping to combustible piping unless it can be demonstrated that the transition complies with the fire-resistive requirements of 8.3.5.1.

Dissimilar Materials Penetrating a Rated Assembly
IBC 714.3.3 & 714.4.3 and NFPA 101 8.3.5.5

Bibliography:

2015 Edition of NFPA 101, Section 8.3.5.1 and 8.3.5.2.

Cost Impact

The code change proposal will decrease the cost of construction .

This code change will reduce the cost of construction by eliminating the need for testing.

Internal ID: 97

FS50-18

IBC: 714.5.2

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

714.5.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.5.1.1 or 714.5.1.2. Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced.

Exceptions:

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or masonry items where the *annular space* is protected either in accordance with Section 714.5.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm²) in any 100 square feet (9.3 m²) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm²) in area, provided that the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm²) in any 100 square feet (9.29 m²) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed 1/8 inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed 1/8 inch (3.2 mm) unless *listed* otherwise.
5. The *annular space* created by the penetration of a fire sprinkler, provided that it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of ~~1- and a~~ maximum 2-hour fire-resistance-rated *horizontal assemblies* is permitted to be interrupted with the double wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard, provided that all penetrating items through the double top plates are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates.
8. Ceiling membrane penetrations by listed luminaires (light fixtures) or by luminaires protected with listed materials, which have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.

Reason:

Section 714.5.2, Exception 7, relates to the double wood top plate exception, and the language currently applies only to 1- and 2- hour fire-resistance-rated horizontal assemblies. However, there are cases where the fire-resistance rating of the horizontal assembly may be 90 minutes, 45 minutes or 30 minutes.

This proposal clarifies the exception, but does not change the intent of the original IBC requirement.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply clarifies the original intent of the exception. It does not add new construction requirements.

Internal ID: 319

FS51-18

IBC: 712.1.5.2, 715.1 (New), 715.3, , 715.3.1, 715.5, 715.6, 715.7, 715.8

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

712.1.5.2 Joints in or between nonfire-resistance-rated floor assemblies. Joints in or between floor assemblies without a required *fire-resistance rating* shall be permitted where they comply with one of the following:

1. The joint shall be concealed within the cavity of a wall.
2. The joint shall be located above a ceiling.
3. The joint shall be sealed, treated or covered with an *approved* material or system to resist the free passage of flame and the products of combustion.

Exception: Joints meeting one of the exceptions listed in Section ~~715.1~~715.3.

Add new text as follows:

715.1 General. The provision of this section shall govern the materials and methods of construction used to protect joints and voids in or between horizontal and vertical assemblies.

Revise as follows:

~~715.1-715.3 General.~~ **Fire-resistance-rated assembly intersections.** Joints installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved *fire-resistant joint* system designed to resist the passage of fire for a time period not less than the required *fire-resistance rating* of the wall, floor or roof in or between which the system is installed. ~~Fire-resistant joint systems shall be tested in accordance with Section 715.3.~~

Exception: *Fire-resistant joint systems* shall not be required for joints in all of the following locations:

1. Floors within a single *dwelling unit*.
2. Floors where the joint is protected by a shaft enclosure in accordance with Section 713.
3. Floors within atriums where the space adjacent to the atrium is included in the volume of the atrium for smoke control purposes.
4. Floors within malls.
5. Floors and ramps within parking garages or structures constructed in accordance with Sections 406.5 and 406.6.
6. Mezzanine floors.
7. Walls that are permitted to have unprotected openings.
8. Roofs where openings are permitted.
9. Control joints not exceeding a maximum width of 0.625 inch (15.9 mm) and tested in accordance with ASTM E119 or UL 263.
10. The intersection of exterior curtain wall assemblies and the roof slab or roof deck.

Delete without substitution:

~~715.1.1 Curtain wall assembly.~~ The void created at the intersection of a floor/ceiling assembly and an exterior curtain wall assembly shall be protected in accordance with Section 715.4.

Revise as follows:

~~715.3-715.3.1~~ **Fire test criteria.** *Fire-resistant joint systems* shall be tested in accordance with the requirements of either ASTM E1966 or UL 2079. Nonsymmetrical wall joint systems shall be tested with both faces exposed to the furnace, and the assigned *fire-resistance rating* shall be the shortest duration obtained from the two tests. Where

evidence is furnished to show that the wall was tested with the least fire-resistant side exposed to the furnace, subject to acceptance of the *building official*, the wall need not be subjected to tests from the opposite side.

Exception: For *exterior walls* with a horizontal *fire separation distance* greater than 10 feet (3048 mm), the joint system shall be required to be tested for interior fire exposure only.

715.4.1-715.5 Exterior curtain wall/nonfire-resistance-rated floor assembly intersections. Voids created at the intersection of exterior curtain wall assemblies and nonfire-resistance-rated floor or floor/ceiling assemblies shall be sealed with an *approved* material or system to retard the interior spread of fire and hot gases between *stories*.

715.4.2-715.6 Exterior curtain wall/vertical fire barrier intersections. Voids created at the intersection of nonfire-resistance-rated exterior curtain wall assemblies and *fire barriers* shall be filled. An approved material or system shall be used to fill the void and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.

715.5-715.7 Spandrel wall. Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section 705.8.5. Where Section 705.8.5 does not require a fire-resistance-rated spandrel wall, the requirements of Section 715.4 shall still apply to the intersection between the spandrel wall and the floor.

715.6-715.8 Fire-resistant joint systems in smoke barriers. *Fire-resistant joint systems* in *smoke barriers*, and joints at the intersection of a horizontal *smoke barrier* and an exterior curtain wall, shall be tested in accordance with the requirements of UL 2079 for air leakage. The L rating of the joint system shall not exceed 5 cfm per linear foot (0.00775 m³/s m) of joint at 0.30 inch (7.47 Pa) of water for both the ambient temperature and elevated temperature tests.

Reason:

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: [https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/Section 715](https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/Section%20715) is not organized in the best fashion, which has created problems in properly applying its requirements.

This proposal, developed by the FCAC Chapter 7 work group, clarifies the requirements without making any substantive changes. Clarification was provided primarily by rearranging requirements in a more logical order, revising titles of sections so they are more descriptive of the subject matter, and correcting cross references to the new section numbers. Additional revisions include:

- A new Section 715.1 was added with charging language similar to Section 714.1.
- The cross reference in new 715.3 was removed since the referenced section immediately follows at 715.3.1.
- The cross reference in former 715.1.1 was not needed and has been deleted.

This proposal will be accompanied by a series of technical proposals. The technical proposals will introduce new and revised terminology, new and revised definitions, and new and revised requirements which complement the new organization proposed here. Assuming this proposal and the series of technical proposals are all Approved as Submitted, the updated language would appear as follows in the 2021 IBC:

SECTION 202

DEFINITIONS

CONTINUITY HEAD-OF-WALL JOINT SYSTEM. An assemblage of specific materials or products that are designed to resist the passage of fire through voids created at the intersection of fire barriers and the underside of nonfire-resistance-rated roofs and floors for a prescribed period of time.

F RATING. The time period that the through-penetration firestop system, perimeter fire barrier or continuity head-of-wall joint system limits the spread of fire through the penetration or void.

T RATING. The time period that the penetration firestop system, including the penetrating item, or the continuity head-

of-wall joint system limits the maximum temperature rise to 325°F (180°C) above its initial temperature through the penetration or void on the nonfire side.

PERIMETER FIRE BARRIER. An assemblage of specific materials or products that are designed to resist for a prescribed period of time the passage of fire through voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor or floor/ceiling assemblies.

SECTION 707 FIRE BARRIERS

707.8 Joints and voids. The following joints and voids shall be protected in accordance with Section 715:

1. Joints in or between fire barriers.
2. Joints between fire barriers and fire-resistance-rated wall assemblies.
3. Joints between fire barriers and the underside of fire-resistance-rated floor or floor/ceiling assemblies.
4. Joints between fire barriers and the underside of fire-resistance-rated roofs or roof/ceiling assemblies.
5. Voids at the intersection of fire barriers and nonfire-resistance-rated exterior curtain wall assemblies.
6. Voids between fire barriers and the underside of nonfire-resistance-rated roofs or roof/ceiling assemblies.
7. Voids between fire barriers and the underside of nonfire-resistance-rated floors or floor/ceiling assemblies.

Delete current Section 707.9.

SECTION 712 VERTICAL OPENINGS

712.1.5.2 Joints in or between nonfire-resistance-rated floor assemblies. Joints in or between floor assemblies without a required fire-resistance rating shall be permitted where they comply with one of the following:

1. The joint shall be concealed within the cavity of a wall.
2. The joint shall be located above a ceiling.
3. The joint shall be sealed, treated or covered with an approved material or system to resist the free passage of flame and the products of combustion.

Exception: Joints meeting one of the exceptions listed in Section 715.3.

SECTION 715 JOINTS AND VOIDS

715.1 General. The provision of this section shall govern the materials and methods of construction used to protect joints and voids in or between horizontal and vertical assemblies.

715.2 Installation. Systems or materials protecting joints and voids shall be securely installed in accordance with the manufacturer's installation instructions in or on the joint or void for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases. Fire-resistant joint systems, perimeter fire barriers and continuity head-of-wall joint systems shall also be installed in accordance with the listing criteria.

715.3 Fire-resistance-rated assembly intersections. Joints installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved fire-resistant joint system designed to resist the passage of fire for a time period not less than the required fire-resistance rating of the wall, floor or roof in or between which the system is installed.

Exception: Fire-resistant joint systems shall not be required for joints in all of the following locations:

1. Floors within a single dwelling unit.
2. Floors where the joint is protected by a shaft enclosure in accordance with Section 713.
3. Floors within atriums where the space adjacent to the atrium is included in the volume of the atrium for smoke control purposes.
4. Floors within malls.
5. Floors and ramps within parking garages or structures constructed in accordance with Sections 406.5 and 406.6.
6. Mezzanine floors.
7. Walls that are permitted to have unprotected openings.

8. Roofs where openings are permitted.

9. Control joints not exceeding a maximum width of 0.625 inch (15.9 mm) and tested in accordance with ASTM E 119 or UL 263.

10. The intersection of exterior curtain wall assemblies and the roof slab or roof deck.

715.3.1 Fire test criteria. Fire-resistant joint systems shall be tested in accordance with the requirements of either ASTM E1966 or UL 2079. Nonsymmetrical wall joint systems shall be tested with both faces exposed to the furnace, and the assigned fire-resistance rating shall be the shortest duration obtained from the two tests. Where evidence is furnished to show that the wall was tested with the least fire-resistant side exposed to the furnace, subject to acceptance of the building official, the wall need not be subjected to tests from the opposite side.

Exception: For exterior walls with a horizontal fire separation distance greater than 10 feet (3048 mm), the joint system shall be required to be tested for interior fire exposure only.

715.4 Exterior curtain wall/fire-resistance-rated floor intersections. Voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor or floor/ceiling assemblies shall be protected with an approved perimeter fire barrier to prevent the interior spread of fire. Such systems shall provide an F rating for a time period not less than the fire-resistance rating of the floor or floor/ceiling assembly.

715.4.1 Fire test criteria. Perimeter fire barriers shall be tested in accordance with the requirements of ASTM E2307.

Exception: Voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be protected with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the fire-resistance rating of the floor assembly.

715.5 Exterior curtain wall/nonfire-resistance-rated floor assembly intersections. Voids created at the intersection of exterior curtain wall assemblies and nonfire-resistance-rated floor or floor/ceiling assemblies shall be filled with an approved material or system to retard the interior spread of fire and hot gases between stories.

715.6 Exterior curtain wall/vertical fire barrier intersections. Voids created at the intersection of nonfire-resistance-rated exterior curtain wall assemblies and vertical fire barriers shall be filled with an approved material or system to retard the interior spread of fire and hot gases.

715.7 Voids at intersections of fire barriers and underside of nonfire-resistance-rated roofs and floors. The voids created at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof or floor sheathing, slab or deck above shall be protected by an approved continuity head-of-wall joint system installed as tested in accordance with ASTM E2837 to provide an F rating/T rating for a time period not less than the required fire-resistance rating of the wall assembly in which it is installed or be filled with an approved material or system. Such materials or systems shall be securely installed in accordance with the manufacturer's installation instructions in or on the void for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases. Continuity head-of-wall joint systems shall also be installed in accordance with the listing criteria.

715.8 Curtain wall spandrels. Height and fire-resistance requirements for curtain wall spandrels shall comply with Section 705.8.5. Where Section 705.8.5 does not require a fire-resistance-rated spandrel wall, the requirements of Sections 715.4 and 715.5 shall still apply to the intersection between the spandrel wall and the floor.

715.9 Joints and voids in smoke barriers. Fire-resistant joint systems protecting joints in smoke barriers, and perimeter fire barriers protecting voids at the intersection of a horizontal smoke barrier and an exterior curtain wall, shall be tested in accordance with the requirements of UL 2079 for air leakage. The L rating of the joint system shall not exceed 5 cfm per linear foot (0.00775 m³/s m) of joint at 0.30 inch (74.7 Pa) of water for both the ambient temperature and elevated temperature tests.

CHAPTER 35

REFERENCED STANDARDS

ASTM E2837-17 Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply reorganizes the current requirements for protecting joints and voids.

FS52-18

IBC: 715.2, 715.4.2

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

715.2 Installation. ~~A fire-resistant joint system~~ Systems or materials protecting joints and voids shall be securely installed in accordance with the manufacturer's installation instructions and the listing criteria in or on the joint or void for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases. Fire-resistant joint systems or systems used to protect voids at exterior curtain walls and fire-resistance-rated floor intersections shall also be installed in accordance with the listing criteria.

715.4.2 Exterior curtain wall/vertical fire barrier intersections. Voids created at the intersection of nonfire-resistance-rated exterior curtain wall assemblies and vertical fire barriers shall be filled. ~~An filled with an approved material or system shall be used to fill the void and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage interior spread of fire and hot gases.~~

Reason:

Section 715.2 of the 2018 IBC covering installation is incomplete as written. It currently covers only fire-resistant joint systems. The installation requirements relating to the protection of the other types of and voids covered in Section 715 are inconsistently covered where the protection method is described. This proposal clarifies the installation requirements for all types of protection for joints and voids. Where the protection method is required to be tested to a specific test standard, the language proposed follows what is currently specified in the 2018 IBC for this situation. Where the code only requires the void to be filled, there are no listing requirements to describe the installation of a material or system.

The revisions to Section 715.4.2 serve three purposes as follows:

- Remove the installation details which are now contained in the revised Section 715.2.
- Add the word vertical in the body to be consistent with the title.
- Add the path of fire propagation covered by this provision in a similar manner to the way the path is described for the other types of voids.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

All changes are editorial in nature and as such will not change construction practices.

IBC: 202 (New), 202, 715.4, 715.4.1 (New), 715.5, 715.6, 715.7, 715.8, 1705.17

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

PERIMETER FIRE CONTAINMENT SYSTEM. An assemblage of specific materials or products that are designed to resist for a prescribed period of time the passage of fire through voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor or floor/ceiling assemblies.

Revise as follows:

[BF] F RATING. The time period that the through-penetration firestop system or perimeter fire containment system limits the spread of fire through the penetration when tested in accordance with ASTM E814 or UL 1479 or void.

715.4 Exterior curtain wall/fire-resistance-rated floor intersection/intersections. ~~Where fire-resistance-rated floor or floor/ceiling assemblies are required, voids~~ Voids created at the intersection of the exterior curtain wall assemblies and ~~such floor fire-resistance-rated floor or floor/ceiling assemblies shall be sealed~~ protected with an ~~approved~~ perimeter fire containment system to prevent the interior spread of fire. Such systems shall ~~be securely installed and tested in accordance with ASTM E2307 to provide an F rating for a time period not less than the fire-resistance rating of the floor or floor/ceiling assembly.~~ Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section ~~705.8.5.~~ **Exception:** ~~Voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be sealed with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the fire-resistance rating of the floor assembly.~~ 705.8.5.

Add new text as follows:

715.4.1 Fire test criteria. Perimeter fire barriers shall be tested in accordance with the requirements of ASTM E2307.

Exception: Voids created at the intersection of the exterior curtain wall assemblies and floor assemblies where the vision glass extends to the finished floor level shall be permitted to be protected with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the fire-resistance rating of the floor assembly.

Revise as follows:

715.4.1-715.5 Exterior curtain wall/nonfire-resistance-rated floor assembly intersections. Voids created at the intersection of exterior curtain wall assemblies and nonfire-resistance-rated floor or floor/ceiling assemblies shall be ~~sealed~~ filled with an *approved* material or system to retard the interior spread of fire and hot gases between *stories*.

715.4.2-715.6 Exterior curtain wall/vertical fire barrier intersections. Voids created at the intersection of nonfire-resistance-rated exterior curtain wall assemblies and vertical fire barriers shall be filled. An approved material or system shall be used to fill the void and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.

715.5-715.7 Spandrel wall. Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section 705.8.5. Where Section 705.8.5 does not require a fire-resistance-rated spandrel wall, the requirements of Section 715.4 shall still apply to the intersection between the spandrel wall and the floor.

715.6-715.8 Fire-resistant joint systems-joints and voids in smoke barriers. *Fire-resistant joint systems protecting joints* in *smoke barriers*, and ~~joints-perimeter fire containment systems protecting voids~~ at the intersection of a horizontal *smoke barrier* and an exterior curtain wall, shall be tested in accordance with the requirements of UL 2079 for air leakage. The L rating of the joint system shall not exceed 5 cfm per linear foot (0.00775 m³/s m) of joint at 0.30 inch (~~7.47-74.7~~ Pa) of water for both the ambient temperature and elevated temperature tests.

[BF] 1705.17 Fire-resistant penetrations and joints. In high-rise buildings or in buildings assigned to *Risk Category III* or *IV*, *special inspections* for *through-penetrations*, membrane penetration firestops, *fire-resistant joint systems* and perimeter fire ~~barrier-containment~~ systems that are tested and *listed* in accordance with Sections 714.4.1.2, 714.5.1.2, 715.3 and 715.4 shall be in accordance with Section 1705.17.1 or 1705.17.2.

Reason:

The primary intent of this proposal is to introduce the phrase “Perimeter Fire Containment Systemr” to describe the method of protecting the void at the intersection of an exterior curtain wall assembly and a fire-resistance-rated floor or floor/ceiling assembly. Having such a phrase simplifies the code language by having a short and concise phrase to describe such intersections. This proposal also creates consistency with other provisions of Section 715 which states voids which are not required to be tested to any particular fire test standards are to be “filled”, and joints and voids which are required to be tested to a specific standard are to be “protected”. The revisions to Section 715.8 are intended to update the section heading to include both types of joints and voids referenced in the body of the Section and include the new language perimeter fire barrier.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

All changes are editorial in nature and as such will not change construction practices.

Internal ID: 325

FS54-18

IBC: 715.4, 715.5

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

715.4 Exterior curtain wall/floor intersection. Where fire-resistance-rated floor or floor/ceiling assemblies are required, voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies shall be sealed with an *approved* system to prevent the interior spread of fire. Such systems shall be securely installed and tested in accordance with ASTM E2307 to provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor assembly. ~~Height and fire-resistance requirements for curtain wall spandrels shall comply with Section 705.8.5.~~

Exception: Voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be sealed with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the *fire-resistance rating* of the floor assembly.

715.5 Spandrel wall. ~~Curtain wall spandrels.~~ Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section 705.8.5. Where Section 705.8.5 does not require a fire-resistance-rated spandrel wall, the requirements of ~~Section~~ Sections 715.4 and 715.4.1 shall still apply to the intersection between the spandrel wall and the floor.

Reason:

This proposal accomplishes several goals. First, it deletes a redundant reference to Section 705.8.5 from Section 715.4. The same reference is also in Section 715.5 covering curtain wall spandrels. Second, it cleans up inconsistent references to the curtain wall spandrels between the title and the body of Section 715.5. Third, it clarifies that this requirement applies to both the void at the intersection of a fire-resistance-rated floor and the curtain wall, covered in Section 715.4, and the void at the intersection of a nonfire-resistance-rated floor and the curtain wall, covered in Section 715.4.1.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

All changes are editorial in nature and as such will not change construction practices.

Internal ID: 329

FS55-18

IBC: 715.6

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

715.6 Fire-resistant joint systems joints and voids in smoke barriers. *Fire-resistant joint systems protecting joints in smoke barriers, and joints-systems protecting voids at the intersection of a horizontal smoke barrier and an exterior curtain wall, shall be tested in accordance with the requirements of UL 2079 for air leakage. The L rating of the joint system shall not exceed 5 cfm per linear foot (0.00775 m³/s m) of joint at 0.30 inch (~~7.47~~74.7 Pa) of water for both the ambient temperature and elevated temperature tests.*

Reason:

The title of Section 715.6 as currently written only references the protection of one of the two types of joints and voids covered in the text of the Section. As such, this proposal expands on the title of the section to incorporate both types of joints and voids covered by the Section. In addition, the proposal 1) clarifies that it is the system protecting the joints and voids, not the joint or void itself which is being tested for an L rating, and 2) corrects the conversion from inches of water to Pa.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. 	1	¾	Maximum size tested	D-H-45	¾			D-H-45
					Fire protection			
Smoke barriers	1	1/3	Maximum size tested	D-20	¾			D-H-OH-45

For SI: 1 square inch = 645.2 mm.

- a. Two doors, each with a fire protection rating of 1½ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.
- b. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.
- c. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.
- d. See Section 716.2.5.1.2.1.
- e. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.
- f. Two doors installed on opposite sides of the same opening in a fire partition shall both comply with the requirements in Table 716.1(2).

Reason:

Two doors installed on opposite sides of the same opening in a fire partition are common in adjoining hotel rooms. Currently the code is silent on the requirements for this type of "communicating" door. NFPA 101 states that only one door must be rated at a guest-to-guest room opening and some AHJ's rely on this as an interpretation since the IBC is silent. However, if only one door were rated and it was open when a fire started then the fire partition separating the rooms would be compromised. This code change proposal adds a footnote to Table 716.1(2) to indicate that both doors must be rated when installed on opposite sides of the same opening. This footnote is applied in the table under the Type of Assembly column at the row for "Other fire partitions".

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction. This code change proposal is only making a requirement more clear for a specific application. It is reasonable to assume that this is how the code is typically enforced for this application anyways so there will likely not be an increase or decrease in the cost of construction. .

For SI: 1 square inch = 645.2 mm.

- a. Two doors, each with a fire protection rating of 1½ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.
- b. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.
- c. Under the column heading "Fire-rated glazing marking door vision panel" W refers to the fire-resistance rating of the glazing, not the frame.
- d. See Section 716.2.5.1.2.1.
- e. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.

716.2.5.1.2.2 Fire walls and fire barriers. Fire-protection-rated glazing shall be permitted in fire doors in fire walls and fire barriers having a 1½-hour required fire protection-resistance rating intended for installation in fire barriers greater than 1 hour, where limited to 100 square inches (0.065 m²).

Reason:

Currently, the code's treatment of 100 sq. in. view panels in fire doors is inconsistent. In that regard, the code generally prohibits 100 sq. in. view panels in fire doors that are used in 3- and 4-hour fire walls or fire barriers while it specifically permits their use in fire doors in 3- and 4-hour horizontal exits in fire walls. (See, Table 716.1(2) footnote. d.) This proposal would provide for the consistent treatment of 100 sq. in. view panels in fire doors used in all 3- and 4-hour fire walls and fire barriers.

View panels in fire doors are an important feature of safely moving the general public out of a burning building. While first responders are trained in how to determine whether there is a fire on the other side of a door that you can't see through, the general public does not have that training. Unwittingly opening a door with a fire burning on the other side could seriously compromise the safety of all those attempting to exit the building.

Approving this proposal will improve the safety of exits and make the treatment of view panels in fire doors consistent throughout the code. Additionally, it will make the code consistent with NFPA 80 which permits 100 sq. in. view panels in 3-hour fire doors. (See, NFPA 80-2016, Sections 4.4.4, 4.4.5 and Table 4.4.5).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not mandate any change in fire doors. Rather, it would, simply, make the treatment of view panels in fire doors consistent throughout the code and with NFPA 80. Since they are already permitted by NFPA 80 and the code already permits them in horizontal exits in fire walls, 3-hour fire doors with view panels are readily available throughout the marketplace.

Internal ID: 400

FS58-18

IBC: 716.2.2.3.1, TABLE 716.1(2)

Proponent: Tom Zaremba, Roetzel & Andress, representing Glazing Industry Code Committee and Alliance of Primary Fire Rated Glazing Manufacturers (tzaremba@ralaw.com)

2018 International Building Code

Revise as follows:

716.2.2.3.1 Glazing in doors. Fire-protection-rated glazing ~~in excess of less than or equal to~~ 100 square inches (0.065 m²) ~~is not permitted. Fire resistance-rated glazing shall be permitted in fire doors. Any fire-rated glazing shall be permitted in excess of 100 square inches (0.065 m²) shall be permitted in fire doors. Listed fire resistance-rated glazing in a fire door shall have if it is listed and labeled as having~~ a maximum transmitted temperature rise in accordance with Section 716.2.2.3 when the *fire door* is tested in accordance with NFPA 252, UL 10B or UL 10C.

	1	¾	Maximum size tested	D-H-45	¾		D-H-45	
					Fire protection			
Smoke barriers	1	¾	Maximum size tested	D-20	¾		D-H-OH-45	

For SI: 1 square inch = 645.2 mm.

- a. Two doors, each with a fire protection rating of 1½ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.
- b. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.
- c. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.
- d. See Section 716.2.5.1.2.1.
- e. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.

Reason:

Section 716.2.2.3 of the IBC mandates that certain fire doors limit the temperature rise on their non-fire exposed side during the first 30-minutes of the fire test ("Temperature Rise Doors"). In Section 716.2.2.3.1, the use of fire-protection rated glazing in such Temperature Rise Doors is limited to 100 sq. in. Fire-resistance rated glazing is permitted in sizes larger than 100 sq. in. if it is listed and labeled as meeting the maximum transmitted temperature rise permitted by Section 716.2.2.3.

Since the adoption of Section 716.2.2.3, a new class of fire-protection rated glazing was developed and is now available in the marketplace. This new type of fire-protection rated glass is specifically designed to limit temperature rise across its surface. Temperature Rise Doors tested using this new class of fire-protection rated glass in sizes greater than 100 sq. in. are now being listed by UL as fully compliant with the temperature rise limitations of Section 716.2.2.3.

The changes to Section 716.2.2.3.1 and Table 716.1(2) proposed here are intended to permit the use of this new class of fire-protection rated glass in Temperature Rise Doors in sizes larger than 100 sq. in. if, and only if, they are listed and labeled as having a maximum transmitted temperature rise in accordance with Section 716.2.2.3.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Approving this code change proposal will not increase or decrease the cost of construction since it does not mandate the use of any product. Instead, it will, simply, increase the number of products that specifiers will have to chose from when Temperature Rise Doors are required.

- e. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.

Reason:

This code change is intended to provide requirements for opening protection in individual walls which are part of a double fire wall constructed in accordance with NFPA 221.

According to IBC Section 706.2, "fire walls designed and constructed in accordance with NFPA 221 shall be deemed to comply with this section." In NFPA 221, 2018 edition, requirements for a specific type of fire wall called a Double Fire Wall are detailed. A Double Fire Wall consists of two walls, parallel to each other which have no connections between them and are independently supported by structural elements on either side. According to NFPA 221 Section 4.6 and Table 4.6, when each wall of a double fire wall assembly is supported by structural elements which have a fire-resistance rating less than that required for the single wall, the fire-resistance rating of each wall may be reduced by one hour. Whether a single wall or a double wall assembly, the walls are still fire walls.

In NFPA 221 Table 4.6, a 4-hour fire wall is allowed to be constructed of two 3-hour fire walls, a 3-hour fire wall is allowed to be constructed of two 2-hour fire walls, and a 2-hour fire wall is allowed to be constructed of two 1-hour walls. In NFPA 221 Table 4.9.2 and IBC Table 716.6(2) one can find requirements for opening protection assemblies for 3-hour fire walls, and 2-hour fire walls, however, there are no requirements for 1-hour walls.

During the 2015-2017 code development cycle, FS 84-15 attempted to provide requirements by creating a single line addition to the table for "Fire walls having a required fire-resistance rating of 1 hour". The committee liked the idea, however, they did not like reference to a 1-hour fire wall. During the Public Comment Hearings, a public comment was submitted which added a foot note that made reference to individual walls as part of a double fire wall assembly. The public comment was not heard because there was still confusion over the concept of a 1-hour fire wall and attempts to overturn the committee decision were unsuccessful.

There are many conditions when construction of two independent walls is a more desirable option than a single fire wall. Openings between the "separate" buildings are common. In NFPA 221, openings in each wall of the double fire wall shall be protected, however there is no direction for fire-resistance ratings for the individual walls. The designer can easily find requirements for the 3-hour and 2-hour fire walls, however, there is no direction for the 1-hour wall. The code official must determine the appropriate rating and their decision is subjective. It is possible that code officials from different jurisdictions will not be consistent.

This code change is more inclusive and clarifies opening protection assemblies for the individual walls which make up the double fire wall. Also, for the 1-hour, individual wall, it is clear that this only exists as a part of a fire wall with a 2-hour fire-resistance rating.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change will not increase the cost of construction because this change clarifies opening protection assemblies in the individual walls are based on the fire-resistance rating of the individual walls which is less than that which would be required for the single wall.

Analysis: The referenced standard,NFPA 221, is currently referenced in other 2018 I-codes.

Internal ID: 2269

FS60-18

IBC: SECTION 202, 202 (New), 716.2.2.1.1

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

TERMINATED STOPS. Factory feature of a door frame where the stops of the door frame are terminated not more than 6 inches from the bottom of the door frame. Terminated stops are also known as "hospital stops" or "sanitary stops".

Revise as follows:

716.2.2.1.1 Smoke and draft control. The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot ($0.01524 \text{ m}^3/\text{s} \times \text{m}^2$) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited. Terminated stops shall be prohibited on doors required by Section 405.4.3 to comply with Section 716.2.2.1 and prohibited on doors required by Section 3006.3 Item 3, 3007.6.3, or 3008.6.3 to comply with Section 716.2.2.1.1.

Reason:

The code today is silent regarding door frames with terminated stops. Interior door frames in many buildings have terminated stops, especially – but not only in – health care facilities. Some interior door frames in business occupancies, and other occupancies, may also have terminated stops.

Unfortunately, the IBC currently does not include an important requirement that door assemblies required to meet the testing requirements of UL1784 when tested without an artificial bottom seal, as required in IBC Sections 405.4.3, 3006.3(3), 3007.6.3, and 3008.6.3, should be prohibited from using door frames with terminated stops. This proposal addresses this oversight.

For other smoke and draft control door assemblies required to be tested to UL1784, this proposal is consistent with the testing requirements of UL 1784.

Terminated stops are a factory feature of a door frame, where the stops are terminated above the floor. The bottom of the stop is closed at a 45-degree or 90-degree angle. The purpose of terminated stops is to make it easier to clean that area of the floor without the extra corners to catch debris or pathogens, and to avoid getting moveable items caught on the stop. Terminated stops are also known as "hospital stops" or "sanitary stops."

Door frame with terminated stop.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal addresses what is currently allowed and prohibited in the code, but not explicitly "spelled out".

Internal ID: 2329

FS61-18

IBC: 716.2.2.3.1, TABLE 716.1(2)

Proponent: Kurt Roeper, ASSA ABLOY, representing ASSA ABLOY (kurt.roeper@assaabloy.com)

2018 International Building Code

Revise as follows:

716.2.2.3.1 Glazing in doors. ~~Fire protection rated glazing in excess of 100 square inches (0.065 m²) is not permitted.~~ Fire protection rated glazing in excess of 100 square inches (0.065 m²) shall be permitted in fire doors where buildings are equipped with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2. Where buildings are not equipped with an automatic sprinkler system and the area of glazing in a fire door is greater than 100 square inches (0.65 m²), fire-resistance-rated glazing is required. ~~fire doors.~~ Listed fire-resistance-rated glazing in a ~~fire door~~ shall have a maximum transmitted temperature rise in accordance with Section 716.2.2.3 when the ~~fire door~~ is tested in accordance with NFPA 252, UL 10B or UL 10C.

Other fire barriers	1	¾	Maximum size tested	D-H	¾		D-H	
Fire partitions; Corridor walls	1 0.5	½b 1½b	Maximum size tested Maximum size tested	D-20 D-20	¾b ½		D-H-OH-45 D-H-OH-20	
Other fire partitions	1 0.5	¾ 1½	Maximum size tested Maximum size tested	D-H-45 D-H-20	¾ 1/3		D-H-45 D-H-20	
Exterior walls	3	1½	100 sq. in. ^b	≤ 100 sq. in. = D-H-90 > 100 sq. in. = D-H-W-90	Not Permitted	3	Not Permitted	W-180
	2	1½	Maximum size tested	D-H-90 or D-H-W-90	1½	2	D-H-OH-90	W-120
	1	¾	Maximum size tested	D-H-45	¾		D-H-45	
					Fire protection			
Smoke barriers	1	1/3	Maximum size tested	D-20	¾		D-H-OH-45	

For SI: 1 square inch = 645.2 mm.

- a. Two doors, each with a fire protection rating of 1½ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.
- b. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.
- c. Under the column heading "Fire-rated glazing marking door vision panel" W refers to the fire-resistance rating of the glazing, not the frame.
- d. See Section 716.2.5.1.2.1.
- e. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.
- f. Except where the building is equipped throughout with an automatic sprinkler system and the fire-rated glazing is in accordance with Section 716.2.2.3.1.

Reason:

Per the exception in 716.2.2.3, the maximum transmitted temperature rise is not required in buildings equipped throughout with an automatic sprinkler system. As written, section 716.2.2.3.1 does not provide the same exception for glazing in excess of 100 square inches in a door. This proposed change provides consistency of the performance requirements between the door and glazing when the exception is exercised.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal will decrease the cost of construction in cases where the exception of 716.2.2.3 has been exercised

FS62-18

IBC: 202, 717.2, 717.2.3 (New), 717.3.1; IMC 202, 607.2, 607.3.1

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BF] CEILING RADIATION DAMPER. A listed device installed in a ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly to limit automatically the radiative heat transfer through an air inlet/outlet opening. Ceiling radiation dampers include air terminal units, ceiling dampers and ceiling air diffusers. Ceiling radiation dampers are classified for use in either static systems that will automatically shut down in the event of a fire, or in dynamic systems that continue to operate during a fire. A dynamic ceiling radiation damper is tested and rated for closure under elevated temperature airflow.

717.2 Installation. Fire dampers, smoke dampers, combination fire/smoke dampers and ceiling radiation dampers located within air distribution and smoke control systems shall be installed in accordance with the ~~requirements of this section, the manufacturer's instructions and the dampers' listing,~~ listing and Sections 717.2.1 through 717.2.3.

Add new text as follows:

717.2.3 Static dampers. Fire dampers and ceiling radiation dampers that are listed for use in static systems shall only be installed in heating, ventilation and air-conditioning systems that are automatically shut down in the event of a fire.

Revise as follows:

717.3.1 Damper testing. *Dampers* shall be listed and labeled in accordance with the standards in this section.

1. *Fire dampers* shall comply with the requirements of UL 555. ~~Only fire dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air conditioning systems designed to operate with fans on during a fire.~~
2. *Smoke dampers* shall comply with the requirements of UL 555S.
3. *Combination fire/smoke dampers* shall comply with the requirements of both UL 555 and UL 555S.
4. *Ceiling radiation dampers* shall comply with the requirements of UL 555C or shall be tested as part of a fire-resistance-rated floor/ceiling or roof/ceiling assembly in accordance with ASTM E119 or UL 263. Only *ceiling radiation dampers* labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.
5. *Corridor dampers* shall comply with requirements of both UL 555 and UL 555S. *Corridor dampers* shall demonstrate acceptable closure performance when subjected to 150 feet per minute (0.76 mps) velocity across the face of the *damper* during the UL 555 fire exposure test.

Reason:

The reason for the definition change is that UL 555C now has requirements to test ceiling radiation dampers for either closure under dynamic or static conditions. This information is also included in the definition of "fire damper"

The last sentence in Items 1 and 4 regarding dynamic-type fire dampers and ceiling radiation dampers are installation requirements, not testing requirements. These requirements should be in Section 717.2. Static-type fire dampers and ceiling radiation dampers have been evaluated only for use where the air movement is effectively stopped at the start of a fire. Dynamic-type fire dampers and ceiling radiation dampers, as well as smoke dampers, combination fire/smoke dampers, and corridor dampers, have been evaluated been evaluated for use in HVAC systems where the airflow is operational at the time of a fire, such as in a smoke-control system, or from other situations in which the fan system is operational at the time of a fire. Also, Section 717.2, and the subsections, apply to the installation of dampers.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal relocates the existing installation requirements for ceiling radiation dampers to the appropriate code section.

FS63-18

IBC 717.3.1 (IMC 607.3.1)

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcman@jeffco.us)

2018 International Building Code

Revise as follows:

717.3.1 Damper testing. *Dampers* shall be listed and labeled in accordance with the standards in this section.

1. *Fire dampers* shall comply with the requirements of UL 555. Only fire *dampers* labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.
2. *Smoke dampers* shall comply with the requirements of UL 555S.
3. *Combination fire/smoke dampers* shall comply with the requirements of both UL 555 and UL 555S.
4. *Ceiling radiation dampers* shall comply with the requirements of UL 555C or shall be tested as part of a fire-resistance-rated floor/ceiling or roof/ceiling assembly in accordance with ASTM E119 or UL 263. Only *ceiling radiation dampers* labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.

Exception: Ceiling radiation dampers shall not be required to be dynamic rated in dwelling unit HVAC systems where the air handler is shut off upon detection of smoke by the smoke alarms installed in the dwelling unit.

5. *Corridor dampers* shall comply with requirements of both UL 555 and UL 555S. *Corridor dampers* shall demonstrate acceptable closure performance when subjected to 150 feet per minute (0.76 mps) velocity across the face of the *damper* during the UL 555 fire exposure test.

Reason:

At this point in time there are no manufacturers of ceiling radiation dampers (crd's) rated for use in dynamic systems. The code is calling for a requirement that is not available but these fire dampers are being installed in every R-2 being built today with little repercussions. The code says these dampers aren't permitted but gives no guidance as to what to do about it. Non-dynamic rated crd's will continue to be installed in dynamic systems regardless because there are no other options. R-2's will continue to be built. This proposal provides a solution to the dilemma and provides a safe alternative to the problem by tying the smoke detectors to the air handlers there by stopping the airflow which will permit the damper to release the way it was designed to do. The manufacturers have no plans to test their products as there is little motivation to do so .

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal in editorial in nature

FS64-18

IBC: 717.3.1 (IMC 607.3.1), 717.6.2.1.1 (New), 717.6.2.1.2 (New);

Proponent: Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (Eirene.Knott@brrarch.com)

2018 International Building Code

Revise as follows:

717.3.1 Damper testing. *Dampers* shall be listed and labeled in accordance with the standards in this section.

1. *Fire dampers* shall comply with the requirements of UL 555. Only fire *dampers* labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.
2. *Smoke dampers* shall comply with the requirements of UL 555S.
3. *Combination fire/smoke dampers* shall comply with the requirements of both UL 555 and UL 555S.
4. *Ceiling radiation dampers* shall comply with the requirements of UL 555C or shall be tested as part of a fire-resistance-rated floor/ceiling or roof/ceiling assembly in accordance with ASTM E119 or UL 263. ~~Only ceiling radiation dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.~~
5. *Corridor dampers* shall comply with requirements of both UL 555 and UL 555S. *Corridor dampers* shall demonstrate acceptable closure performance when subjected to 150 feet per minute (0.76 mps) velocity across the face of the *damper* during the UL 555 fire exposure test.

Add new text as follows:

717.6.2.1.1 Dynamic systems. Only ceiling radiation dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire.

717.6.2.1.2 Static systems. Static dampers shall be provided with systems which are not designed to operate during a fire.

Exceptions:

1. Where a static ceiling radiation damper is installed at the opening of a duct, a smoke detector shall be installed inside the duct or outside the duct with sampling tubes protruding into the duct. The detector or tubes within the duct shall be within 5 feet (1524 mm) of the damper. Air outlets and inlets shall not be located between the detector or tubes and the damper. The detector shall be listed for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate.
2. Where a static ceiling radiation damper is installed in a ceiling, the damper shall be permitted to be controlled by a smoke detection system installed within the same room as the ceiling radiation damper.
3. Where a static ceiling radiation damper is installed in an area served by the duct in which the damper will be located, the ceiling radiation damper shall be permitted to be controlled by the smoke detection system.
4. Where a ceiling radiation damper is installed within a room and an occupant sensor is provided within the room served by the damper, a static damper shall be permitted.

Reason:

The purpose behind this code change is to provide some direction on the use of dynamic versus static ceiling radiation dampers (CRD's). As of the writing of this proposed code change, there are no UL listed CRD's that are dynamic; I have confirmed this with UL.

Under the 2018 IBC/IMC, if a CRD is required in a floor/ceiling assembly, the only choice is to utilize a static damper since no dynamic dampers are available. Under a static system, there can be no air movement within the duct once the system is shut down. So, unless a system is designed to shut down with activation of a smoke detector or other detection device, a static damper cannot be used unless the entire system is designed to shut down upon activation of an initiation device. Exhaust systems and 100 percent outside air systems fall into the definition of static systems as

they do not shut down at the activation of an initiation device. As a result, these systems would then be required to provide dynamic dampers. Since CRD's do not exist in the dynamic form, there is no clear direction within the code as to how a static system could be designed to utilize static CRD's. This provides limitations to the designer on how to design an exhaust or outside air system within floor/ceiling or roof/ceiling assemblies.

If we use an R-1 occupancy as an example, some hotel brands utilize interstitial space within the floor/ceiling assembly to convey toilet room exhaust. Because there is no clear direction in the IBC or the IMC some hotel brands are providing a sensor of some sort on each exhaust fan serving the toilet room within each sleeping unit because the CRD is being required to stop the flow of air. One option that is being utilized to overcome this missing direction is to provide an occupant sensor within the toilet room that controls the activation of the exhaust fan. If the toilet room is vacant, the exhaust fan is not running and therefore the system is static. I believe this proposed code change would achieve the protection that is expected by the IBC/IMC as well as providing options for the design professional to have choices in their system layout/function.

Cost Impact

The code change proposal will increase the cost of construction .

While I cannot confirm the exact cost impact that this code change would provide, by giving the designer some options for using static dampers, this should potentially decrease the cost of construction.

Internal ID: 302

FS65-18

IBC: 717.3.3.1

Proponent: William Koffel, representing Air Movement and Control Association (wkoffel@koffel.com)

2018 International Building Code

Revise as follows:

717.3.3.1 Fire damper ~~actuation device~~ **actuation.** ~~The fire damper actuation device~~ Primary heat responsive devices used to actuate fire dampers shall meet one of the following requirements:

1. The operating temperature shall be approximately 50°F (10°C) above the normal temperature within the duct system, but not less than 160°F (71°C).
2. The operating temperature shall be not more than 350°F (177°C) where located in a smoke control system complying with Section 909.

Reason:

"Primary heat responsive device" is the terminology used in UL 555 and as such, should be the phrase used in the IBC. The change in the title is consistent with the title used for smoke damper actuation.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal will have no impact on the cost of construction. It is simply a change in terminology to be consistent with the UL test standard.

Internal ID: 1549

FS66-18

IBC: 717.4, 717.4.1 (New), 717.4.1.1 (New), 717.4.1.2 (New), 717.4.2 (New), 717.4.3 (New)

Proponent: William Koffel, representing Air Movement and Control Association (wkoffel@koffel.com)

2018 International Building Code

Revise as follows:

717.4 Access and identification and periodic inspection and testing. Access, identification and periodic inspection and testing of fire and smoke dampers shall comply with Sections 717.4.1 through 717.4.3.

Add new text as follows:

717.4.1 Access. Fire and smoke dampers shall be provided with an approved means of access that is large enough to permit inspection and maintenance of the damper and its operating parts.

717.4.1.1 Access openings. The access shall not affect the integrity of fire-resistance-rated assemblies. The access openings shall not reduce the fire-resistance rating of the assembly. Access doors in ducts shall be tight fitting and suitable for the required duct construction.

717.4.1.2 Restricted access . Where space constraints or physical barriers restrict access to a damper for periodic inspection and testing, the damper shall be a single- or multi-blade type damper and shall comply with the remote inspection requirements of NFPA 80 or NFPA 105

717.4.2 Identification. Access points shall be permanently identified on the exterior by a label having letters not less than 1/2 inch (12.7 mm) in height reading: FIRE/SMOKE DAMPER, SMOKE DAMPER or FIRE DAMPER.

717.4.3 Periodic inspection and testing. Periodic inspection and testing of fire dampers shall be in accordance with NFPA 80. Periodic inspection and testing of smoke dampers shall be in accordance with NFPA 105. Periodic inspection and testing of combination fire/smoke dampers shall be in accordance with NFPA 80 and NFPA 105.

Reason:

It is understood that periodic inspection and testing is typically within the scope of the IFC. However, it is not uncommon to alert interested parties to these requirements in the IBC (for example see Chapter 9). In this instance it is important for the design professional to be aware of the inspection and testing requirements since they impact the access requirements contained in the IBC. In addition, the proposal provides design professionals with an alternative of remote testing (as permitted by NFPA 80 and NFPA 105) in situations where adequate access for inspection and testing cannot be provided.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The alternative for remote testing does not impact the cost of construction because it is not required. However, recognizing that remote testing is an option may actually decrease the cost of construction in instances where providing adequate access is challenging.

Analysis. The proposal takes existing Section 717.4 and breaks it into subsections. Much of the text in the subsections is existing text redistributed from 717.4. The cdpACCESS system parameters result in showing new sections as having new text even where the text is not new but is being reorganized.

Internal ID: 1551

FS67-18

IBC: 717.5.2 (IMC 607.5.2)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

717.5.2 Fire barriers. Ducts and air transfer openings of *fire barriers* shall be protected with *listed fire dampers* installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for *interior exit stairways* and *ramps* and *exit passageways*, except as permitted by Sections 1023.5 and 1024.6, respectively.

Exception: *Fire dampers* are not required at penetrations of *fire barriers* where any of the following apply:

1. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an *approved* smoke control system in accordance with Section 909 and where the use of a *fire damper* would interfere with the operation of a smoke control system.
3. Such walls are penetrated by fully ducted HVAC systems, have a required *fire-resistance rating* of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a fully ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals. Flexible air connectors shall be permitted in the following locations:
 - 3.1. Non-metal flex connections shall be permitted at the duct connection to the air handling unit or equipment located within the mechanical room in accordance with Section 603.9 of the International Mechanical Code.
 - 3.2. Non-metal flex connections shall be permitted from an overhead metal duct to a ceiling diffuser within the same room in accordance with Section 603.6.2 of the International Mechanical Code.

Reason:

The intention of this code change is to more accurately reflect typical installations found in most buildings. As currently written, the code implies that any flex duct (or equipment flexible connections) negates the use of the exception for fire dampers in 1 hour walls in fully ducted, fully sprinklered buildings.

The code permits the omission of the fire damper for a metal duct system that terminates either at a wall (such as a sidewall grille) or continues on to a duct opening past the fire barrier and has openings in the duct ("continuous from the air-handling appliance or equipment to the air outlet and inlet terminals"). This section does not prohibit openings to be on both sides of the duct as long as the openings are in metal duct. However, as currently written, if flex duct is used to connect a metal duct to a ceiling diffuser (standard practice) this triggers the requirement for a fire damper.

The flex connection within the concealed space does not constitute a greater hazard than other conditions that would permit the omission of the fire dampers (see attached sketches below).

FULLY SPRINKLERED BUILDING
FULLY DUCTED HVAC

NO FIRE DAMPER REQUIRED

FULLY SPRINKLERED BUILDING
FULLY DUCTED HVAC

NO FIRE DAMPER REQUIRED

FULLY SPRINKLERED BUILDING
FULLY DUCTED HVAC

NO FIRE DAMPER REQUIRED

FULLY SPRINKLERED BUILDING
FULLY DUCTED HVAC

NO FIRE DAMPER REQUIRED

Likewise, a flex connection at the AHU within the mechanical space does not constitute a hazard that should trigger the fire damper within the system

As proposed, this section will coordinate with the requirements already established in the International Mechanical Code. IMC Section 606.6.3 limits the design air temperature for flexible air connectors to 250 degrees F (121 C). Under the vast majority of conditions where flexible air connectors will be used (installed above a ceiling, light or ordinary hazard occupancy, ordinary or intermediate temperature sprinklers, quick or standard response), the sprinkler response can be demonstrated by calculation to occur before the ceiling jet temperature from a fire reaches the limit of 606.6.3.

The intention is to maintain the allowance of flexible connectors at the terminal end of hard ductwork within the room of the air register. This public comment maintains the requirements of the IMC, including:

- Limiting the length of the flexible connector to 14 feet actual length.

- Requiring the flexible connector to be tested in accordance with UL 181.

- Requiring use only at the end of hard ductwork.

- Maintains the requirement for hard ductwork to pass through the barrier.

This allows constructability of a fully ducted system, and maintains the integrity of the system throughout the building.

It is not the intention of the code change to allow flexible ducts through any vertical barriers (as already prohibited by Section 717.7). The flexible ductwork is only to be allowed within a room, and above the ceiling. See the sketch below to better clarify the intention.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposed code change would result in a decrease in construction cost since this will eliminate fire dampers where the building/installation complies with the requirements of the proposed exception. Where a building does not meet the requirements of the proposed exception, there would be no change in construction cost (dampers would still be required as they are now).

Internal ID: 1286

FS68-18

IBC: 717.5.2 (IMC 607.5.2)

Proponent: Mark Jelinske, representing Self (mjelinske@rmhgroup.com)

2018 International Building Code

Revise as follows:

717.5.2 Fire barriers. Ducts and air transfer openings of *fire barriers* shall be protected with *listed fire dampers* installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for *interior exit stairways* and *ramps* and *exit passageways*, except as permitted by Sections 1023.5 and 1024.6, respectively.

Exception: *Fire dampers* are not required at penetrations of *fire barriers* where any of the following apply:

1. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an *approved* smoke control system in accordance with Section 909 and where the use of a *fire damper* would interfere with the operation of a smoke control system.
3. ~~Such walls are penetrated by ducted HVAC systems, have a required *fire resistance rating* of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air handling appliance or equipment to the air outlet and inlet terminals.~~

Reason:

There is no empirical evidence showing that the integrity of a Fire Barrier is not compromised by a ducted penetration simply because the building is protected by sprinklers.

It might be argued that since this exception can only be used in a fully sprinklered building, the challenge to the Fire Barrier is much less than the time/temperature curve of the ASTM/UL test. However, the extent and rating of Fire Barriers is already greatly reduced in a fully sprinklered building; so the counter argument is that the Fire Barriers in a fully sprinklered building are very important and constitute the "last stand" of the passive Life Safety features of a building. These should not rely on an active means of protection. The protection for no other penetration or opening is allowed to be eliminated simply due to sprinklers.

Where dampers are not desired, exception 1 already has the provision for an assembly tested in accordance with ASTM E119 or UL 263. Such an assembly has shown evidence of maintaining the integrity of fire resistive construction. This should be the standard for a "last stand" passive Life Safety feature.

Note that this proposal does not include eliminating the similar exception for Fire Dampers in Fire Partitions. Fire Partitions are already considered a lower level of protection, and therefore a lower standard for protection is appropriate.

Cost Impact

The code change proposal will increase the cost of construction .

Since an exception is being eliminated, some additional dampers will be required. But the extent of Fire Barriers in most occupancies is already reduced with sprinklers. Further, the ability to apply this exception is not that common for the remaining Fire Barriers in sprinklered buildings, since the common case of HVAC system using flexible duct, flexible equipment connections, or flexible seismic joints disqualify such systems from being considered "ducted".

Internal ID: 1113

FS69-18

IBC: 717.5.3

Proponent: Raymond Grill, Arup, representing Self (ray.grill@arup.com)

2018 International Building Code

Revise as follows:

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *listed* fire and *smoke dampers* installed in accordance with their listing.

Exceptions:

1. *Fire dampers* are not required at penetrations of shafts where any of the following criteria are met:
 - 1.1. Steel exhaust subducts are extended not less than 22 inches (559 mm) vertically in exhaust shafts, provided that there is a continuous airflow upward to the outside.
 - 1.2. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly.
 - 1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 and where the *fire damper* will interfere with the operation of the smoke control system.
 - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. ~~In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smoke dampers* are not required at penetrations of shafts where all of the following criteria are met:~~
 - ~~2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.0187 inch (0.4712 mm) (No. 26 gage).~~
 - ~~2.2. The subducts extend not less than 22 inches (559 mm) vertically.~~
 - ~~2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.~~
3. *Fire and smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smoke dampers* are not required in kitchen and clothes dryer exhaust systems where *dampers* are prohibited by the International Mechanical Code.

Reason:

The requirement for smoke dampers at penetrations in shafts was first included in the IBC during the comment phase of the development of the first edition of the International Building Code. This requirement did not exist in any of the model building codes (BOCA, UBC & SBC). A requirement for smoke dampers at penetrations of shafts has never been incorporated in the NFPA system of codes. The justification for smoke dampers in the original code change is that smoke can travel through a duct to locations in a building that are remote from the fire. While this statement is correct, smoke travel through ducted ventilation shafts has not been a contributing factor to firespread or fire deaths in buildings. Smoke detectors at HVAC equipment have been required to accomplish automatic shut off of HVAC equipment to minimize the potential of smoke spread through ventilation ducts. For example, the majority of fire deaths in upper stories of the MGM Grand fire of 1980 were due to smoke spread through stair shafts and seismic joints that were not protected. Fancoil units in guestrooms drew air from the corridors which also contributed to fatalities. While the HVAC system was cited as a potential source of smokespread, smoke detectors were not present

to provide automatic shutoff of equipment (NFPA Preliminary Report of the MGM Grand Hotel Fire). The MGM Grand was not sprinkler protected.

There was only one fatality in an upper story of the San Juan DuPont fire in 1986 which was not readily explained. The San Juan Dupont was not sprinkler protected. Smoke travel through ventilation shafts was not a contributing factor in the First Interstate fire in Los Angeles or the Meridian fire in Philadelphia. Sprinklers were not active on fire floors in either of those buildings. Even in the World Trade Center bombing of 1993, 6 fatalities were attributed to the explosion, but there were no fatalities due to the effects of smoke (Isner, Michael S. and Klem, Thomas J., "World Trade Center Explosion and Fire," National Fire Protection Association). While these fires were thoroughly investigated, and code changes promulgated to address fire safety issues, smoke dampers in duct penetrations of shafts were never adopted as changes to any of the model codes as a result of these fires.

The original code change in the IBC did not present any technical substantiation for the additional requirement for smoke dampers and there has never been an instance that I am aware of where the provision of smoke dampers in shafts would have made a difference in the fire performance of a fully sprinklered building.

This requirement has been massaged based on negotiation with manufacturers and building ownership groups over the past code cycles because it has always been difficult to implement. The requirement for smoke dampers at penetrations of shafts should be removed for fully sprinklered buildings.

There have been jurisdictions (District of Columbia and Commonwealth of Virginia) and federal agencies that have never adopted the smoke damper requirement for sprinklered buildings. There have not been any incidences reported to show a need for smoke dampers. Agencies include the General Services Administration, Department of Veteran Affairs, and Department of Defense. These agencies own and operate buildings that include all of the occupancy types addressed by the IBC. Smoke dampers are not required in shaft penetrations in their buildings.

Performance of Fully Sprinklered Buildings

It is important to note that the IBC requires sprinkler protection for most buildings of any significant size or occupant load. Therefore, the performance of sprinklered buildings is relevant. There has never been a multiple life loss fire in a fully sprinklered building of any occupancy type where the occupants have not been intimate with the fire or where an explosive or terrorist event has occurred.

Fire incidents in fully sprinklered buildings have never been identified to demonstrate the need for smoke dampers at shaft penetrations..

Maintaining Operability

Smoke dampers are operated by either a pneumatic actuator or electric motor. Smoke dampers require regular testing and maintenance to keep them operating. Even the most diligent building owners have a difficult time maintaining operability of smoke dampers.

Sustainability

There is a significant amount of resources that go into the implementation of smoke dampers at shaft penetrations. There has not been a demonstrated value to property protection or life safety in fully sprinklered buildings to justify their need.

Cost Impact

The code change proposal will decrease the cost of construction .

This code change will significantly reduce the cost of construction. A rough installed cost estimate for the smoke dampers and associated required equipment can range from \$2000-\$3000 per damper or even more for large dampers. This does not include the ongoing cost of testing the dampers and detectors that are required to operate the dampers. Regular testing is also required at regular frequencies. Testing costs per damper can vary depending on the number of dampers being tested and the accessibility and complexity of the system.

Internal ID: 2307

FS70-18

IBC: 717.5.3 (IMC [BF] 607.5.5) , 717.5.3.1 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

717.5.3 Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with *listed* fire and *smoke dampers* installed in accordance with their listing.

Exceptions:

1. *Fire dampers* are not required at penetrations of shafts where any of the following criteria are met:
 - 1.1. Steel exhaust subducts having a wall thickness of not less than 0.0187 inch (0.4712 mm) are extended not less than 22 inches (559 mm) vertically in exhaust shafts, ~~provided that there is a continuous airflow upward to the outside and an exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with Section 909.11, so as to maintain a continuous upward airflow to the outdoors.~~
 - 1.2. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly.
 - 1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 and where the *fire damper* will interfere with the operation of the smoke control system.
 - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, *smoke dampers* are not required at penetrations of shafts where all of the following criteria are met:
 - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a ~~minimum~~ wall thickness of not less than 0.0187-inch (0.4712 mm) (No. 26 gage).
 - 2.2. The subducts extend not less than 22 inches (559 mm) vertically.
 - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the ~~outside-outdoors.~~
3. *Smoke dampers* are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. *Smoke dampers* are not required at penetrations of shafts where ducts are used as part of an *approved* mechanical smoke control system designed in accordance with Section 909 and where the *smoke damper* will interfere with the operation of the smoke control system.
5. *Fire dampers* and *combination fire/smoke dampers* are not required in kitchen and clothes dryer exhaust systems where *dampers* are prohibited by the International Mechanical Code.

Add new text as follows:

717.5.3.1 Continuous upward airflow. Fire dampers and smoke dampers shall not be installed in shafts that are required to maintain a continuous upward airflow path where closure of the damper would result in the loss of the airflow.

Reason:

Exceptions 1.1 and 2 involve subducts used as a substitute for fire and smoke dampers, respectively. Subducts depend on continuous upward airflow in the shaft to function as intended. Fire dampers or smoke dampers installed in the airpath in a manner that would cutoff the upward airflow through the shaft to the exhaust fan at the top of the shaft when the damper closes would negate the effectiveness of the subducts. An example of where this situation might occur is with two offset shafts, one with an exhaust fan on one without, connected together with a horizontal duct.

Section 717.5.3 would require fire and smoke dampers where the interconnecting duct penetrates the walls of each shaft enclosure. But such use would cut off the continuous airflow through the shaft which does not contain the exhaust fan. This proposal resolves that issue by stating that fire and smoke dampers shall not be installed where such installation would result in a loss of this airflow path. From there, since the penetrations are not protected with a fire damper, Section 717.1.2 would require the penetrations to be protected with a through-penetration firestop system.

Additional changes are being proposed to create consistency between the requirements for the subducts in Exceptions 1 and 2 of Section 717.5.3.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Where ducts are used to create the continuous upwards airflow, penetrations of these ducts into and out of shaft will now be required to be protected with a through-penetration firestop system in lieu of a fire and smoke damper.

Internal ID: 301

FS71-18

IMC: 607.5.2, 607.5.3

Proponent: Mark Jelinske, representing Self (mjelinske@rmhgroup.com)

2018 International Building Code

Revise as follows:

717.5.2 Fire barriers. Ducts and air transfer openings of *fire barriers* shall be protected with *listed fire dampers* installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for *interior exit stairways* and *ramps* and *exit passageways*, except as permitted by Sections 1023.5 and 1024.6, respectively.

Exception: *Fire dampers* are not required at penetrations of *fire barriers* where any of the following apply:

1. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an *approved* smoke control system in accordance with Section 909 and where the use of a *fire damper* would interfere with the operation of a smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required *fire-resistance rating* of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the final branch connection to individual air outlet and inlet terminals. The final duct branches to the air inlets or outlets shall be accordance with Section 603 of the International Mechanical Code.

717.5.4 Fire partitions. Ducts and air transfer openings that penetrate *fire partitions* shall be protected with *listed fire dampers* installed in accordance with their listing.

Exceptions: In occupancies other than Group H, *fire dampers* are not required where any of the following apply:

1. Corridor walls in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and the duct is protected as a through penetration in accordance with Section 714.
2. Tenant partitions in *covered and open mall buildings* where the walls are not required by provisions elsewhere in the code to extend to the underside of the floor or roof sheathing, slab or deck above.
3. The duct system is constructed of *approved* materials in accordance with the International Mechanical Code and the duct penetrating the wall complies with all of the following requirements:
 - 3.1. The duct shall not exceed 100 square inches (0.06 m²).
 - 3.2. The duct shall be constructed of steel not less than 0.0217 inch (0.55 mm) in thickness.
 - 3.3. The duct shall not have openings that communicate the *corridor* with adjacent spaces or rooms.
 - 3.4. The duct shall be installed above a ceiling.
 - 3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.
 - 3.6. A minimum 12-inch-long (305 mm) by 0.060-inch-thick (1.52 mm) steel sleeve shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum 1¹/₂-inch by 1¹/₂-inch by 0.060-inch (38 mm by 38 mm by 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The *annular space* between the steel sleeve and the wall opening shall be filled with *mineral wool* batting on all sides.
4. Such walls are penetrated by ducted HVAC systems, have a required *fire-resistance rating* of 1 hour or less, and are in buildings equipped throughout with an automatic sprinkler system in

accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than No. 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the final branch connection to individual air outlet and inlet terminals. The final duct branches to the air inlets or outlets shall be accordance with Section 603 of the International Mechanical Code.

2018 International Mechanical Code

Revise as follows:

[BF] 607.5.2 Fire barriers. Ducts and air transfer openings that penetrate fire barriers shall be protected with *listed* fire dampers installed in accordance with their listing. Ducts and air transfer openings shall not penetrate enclosures for interior exit stairways and ramps and exit passageways except as permitted by Sections 1023.5 and 1024.6, respectively, of the International Building Code.

Exception: Fire dampers are not required at penetrations of fire barriers where any of the following apply:

1. Penetrations are tested in accordance with ASTM E119 or UL 263 as part of the fire-resistance-rated assembly.
2. Ducts are used as part of an *approved* smoke control system in accordance with Section 513 and where the fire damper would interfere with the operation of the smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, are in areas of other than Group H and are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the International Building Code. For the purposes of this exception, a ducted HVAC system shall be a duct system for the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than 26 gage [0.0217 inch (0.55 mm)] thickness and shall be continuous from the air-handling *appliance or equipment* to the final branch connection to individual air outlet and inlet terminals. The final duct branches to the air inlets or outlets shall be accordance with Section 603.

[BF] 607.5.3 Fire partitions. Ducts and air transfer openings that penetrate fire partitions shall be protected with *listed* fire dampers installed in accordance with their listing.

Exception: In occupancies other than Group H, fire dampers are not required where any of the following apply:

1. Corridor walls in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the International Building Code and the duct is protected as a through penetration in accordance with Section 714 of the International Building Code.
2. The partitions are tenant partitions in covered and open mall buildings where the walls are not required by provisions elsewhere in the International Building Code to extend to the underside of the floor or roof sheathing, slab or deck above.
3. The duct system is constructed of *approved* materials in accordance with Section 603 and the duct penetrating the wall complies with all of the following requirements:
 - 3.1. The duct shall not exceed 100 square inches (0.06 m²).
 - 3.2. The duct shall be constructed of steel not less than 0.0217 inch (0.55 mm) in thickness.
 - 3.3. The duct shall not have openings that communicate the corridor with adjacent spaces or rooms.
 - 3.4. The duct shall be installed above a ceiling.
 - 3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.
 - 3.6. A minimum 12-inch-long (305 mm) by 0.060-inch-thick (1.52 mm) steel sleeve shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum 1¹/₂-inch by 1¹/₂-inch by 0.060-inch (38 mm by 38 mm by 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The annular space between the steel sleeve and the wall opening shall be filled with rock (mineral) wool batting on all sides.
4. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, and are in areas of other than Group H and are in buildings equipped throughout

with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the International Building Code. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than 26 gage in thickness and shall be continuous from the air-handling appliance or equipment to the final branch connection to individual air outlet and inlet terminals. The final duct branches to the air inlets or outlets shall be accordance with Section 603.

Reason:

The exception as it now stands makes no sense. A 26 ga duct system can have unlimited openings immediately on both sides of a fire barrier or fire partition and not require a fire damper, as long as it continues to the equipment. But as soon as one of those openings has a flexible duct runout to a diffuser, for some reason a damper is required. There is no evidence that connecting a flexible duct to a sheet metal duct opening decreases the fire resistance of a wall penetrated by that duct.

This proposal will eliminate a major source of confusion and varying interpretations. The IBC and IMC commentaries have different interpretations, and a completely different interpretation was received via a staff technical question. Additional different interpretations have been enforced by local jurisdictions. As long as it is acceptable for a sheet metal duct with unlimited openings to penetrate a Fire Barrier or a Fire Partition without a fire damper, there is no reason those openings should not have flex duct on them.

IBC 717.7 prohibits the flexible duct itself from penetrating fire resistive construction.

Cost Impact

The code change proposal will decrease the cost of construction .

Many HVAC systems have flexible duct as the final branch run-out to grilles and diffusers. Under the current code language, these systems are not fully ducted, and therefore require fire dampers. This proposal will reduce the amount of dampers required in such systems in fully sprinklered buildings.

Internal ID: 1768

FS72-18

IBC: 718.2.1

Proponent: Tony Crimi, representing North American Insulation Manufacturers Association (NAIMA) (tcrimi@sympatico.ca)

2018 International Building Code

Revise as follows:

718.2.1 Fireblocking materials. *Fireblocking* shall consist of the following materials:

1. Two-inch (51 mm) nominal lumber.
2. Two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints.
3. One thickness of 0.719-inch (18.3 mm) wood structural panels with joints backed by 0.719-inch (18.3 mm) wood structural panels.
4. One thickness of 0.75-inch (19.1 mm) particleboard with joints backed by 0.75-inch (19 mm) particleboard.
5. One-half-inch (12.7 mm) gypsum board.
6. One-fourth-inch (6.4 mm) cement-based millboard.
7. Batts or blankets of mineral wool, mineral fiber or other *approved* materials installed in such a manner as to be securely retained in place.
8. Cellulose insulation installed as tested in accordance with ASTM E119 or UL 263 for the specific application.

Reason:

This proposal harmonizes section 718.2.1 of the IBC with R302.11.1 of the IRC. In the 2018 cycle, this proposed language was added to the IRC, but not to the IBC.

The current Code language in the IBC not only lacks acceptance criteria, it also lacks a test method. Therefore, this proposal would ensure that testing of cellulose insulation for use as a fireblocking material is in accordance with ASTM E119 or UL 263. This proposal incorporates the test method identified by the proponents for evaluation of spray-applied cellulose insulation for use as fireblocking.

This clarifies the code requirement in a manner consistent with the language in IBC 718.2.1.3 and IRC R302.11.1.3, and prevents potentially unintended, or unsuitable, test methods from being used for these purposes. The proposal aims to provide more detail to the requirement to test cellulose insulation in accordance with the appropriate fire test standards. For the 2012 cycle, spray-applied cellulose was added to the list of acceptable fireblocking materials. The proponent's statement identified ASTM E119 as the test standard used by the Cellulose Insulation Manufacturers Association (CIMA) to conduct a variety of fireblocking fire tests. However, these Reports are not publicly available, so any modifications to the ASTM E119 procedure, or limitations identified in these reports, are not known.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

It modifies one option only, and is based on the original supporting information.

Internal ID: 1089

FS73-18

IBC: 718.2.1

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows:

718.2.1 Fireblocking materials. *Fireblocking* shall consist of the following materials:

1. Two-inch (51 mm) nominal lumber.
2. Two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints.
3. One thickness of 0.719-inch (18.3 mm) wood structural panels with joints backed by 0.719-inch (18.3 mm) wood structural panels.
4. One thickness of 0.75-inch (19.1 mm) particleboard with joints backed by 0.75-inch (19 mm) particleboard.
5. One-half-inch (12.7 mm) gypsum board.
6. One-fourth-inch (6.4 mm) cement-based millboard.
7. Batts or blankets of mineral wool, mineral fiber or other *approved* materials installed in such a manner as to be securely retained in place.
8. Cellulose insulation installed as tested for the specific application.
9. Mass timber complying with Section 2304.11.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The purpose of this code change proposal is to recognize that mass timber as a suitable fireblocking material. The current list of acceptable materials lists “nominal lumber”, therefore since mass timber (e.g. Sawn, glued-laminated, and cross laminated timbers) are of greater mass the correlation from single nominal lumber to mass timber was determined to be of equal or greater blocking resistance to reduce the ability of fire, smoke and gasses from moving to different part of the building through combustible concealed spaces.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
3308.4 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit <http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, please visit <http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Internal ID: 944

FS74-18

IBC: 718.2.6, 1402.5, 1408.10.4, 2603.5.5, Chapter 35

Proponent: JC Harrington, FM Global, representing FM Global (john.harrington@fmglobal.com)

2018 International Building Code

Revise as follows:

718.2.6 Exterior wall coverings. *Fireblocking* shall be installed within concealed spaces of exterior wall coverings and other exterior architectural elements where permitted to be of combustible construction as specified in Section 1405 or where erected with combustible frames. *Fireblocking* shall be installed at maximum intervals of 20 feet (6096 mm) in either dimension so that there will be no concealed space exceeding 100 square feet (9.3 m²) between *fireblocking*. Where wood furring strips are used, they shall be of *approved* wood of natural decay resistance or preservative-treated wood. If noncontinuous, such elements shall have closed ends, with not less than 4 inches (102 mm) of separation between sections.

Exceptions:

1. *Fireblocking* of cornices is not required in single-family dwellings. *Fireblocking* of cornices of a two-family dwelling is required only at the line of dwelling unit separation.
2. *Fireblocking* shall not be required where the exterior wall covering is installed on noncombustible framing and the face of the exterior wall covering exposed to the concealed space is covered by one of the following materials:
 - 2.1. Aluminum having a minimum thickness of 0.019 inch (0.5 mm).
 - 2.2. Corrosion-resistant steel having a base metal thickness not less than 0.016 inch (0.4 mm) at any point.
 - 2.3. Other *approved* noncombustible materials.
3. *Fireblocking* shall not be required where the exterior wall covering has been tested in accordance with, and complies with the acceptance criteria of, NFPA 285, or the 16 foot parallel panel test as described in ANSI/FM 4880. The exterior wall covering shall be installed as tested in accordance with NFPA 285, or the 16 foot parallel panel test per ANSI/FM 4880.

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285, or the 16 foot (4877 mm) parallel panel test as described in ANSI/FM 4880. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

1408.10.4 Full-scale tests. The HPL system shall be tested in accordance with, and comply with, the acceptance criteria of either NFPA 285 or the 16 foot parallel panel test as described in ANSI/FM 4880. Such testing shall be performed on the HPL system with the HPL in the minimum and maximum thicknesses intended for use.

2603.5.5 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of either NFPA 285 or the 16 foot parallel panel test as described in ANSI/FM 4880.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
 - 2.1. There is no airspace between the insulation and the concrete or masonry.
 - 2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

Update standard(s) as follows:

CHAPTER 35 REFERENCED STANDARDS

FM

FM Approvals
Headquarters Office 1151 Boston-
Providence Turnpike P.O. Box 9102
Norwood MA 02062

4880-2015~~2017~~:

Approval Standard for Class 1 Fire Rating of Building Panels or Interior Finish Materials

Reason:

ANSI/FM 4880 is a consensus fire test standard that can be used to test fire exposure to the interior side or exterior side of exterior walls. The 16 ft parallel panel test is described in ANSI/FM 4880. The 16 ft parallel panel test as an alternative to the NFPA 285 test will not result in a related cost increase.

Bibliography:

Agarwal, Gaurav, "Evaluation of the Fire Performance of Aluminum Composite Material (ACM) Assemblies using ANSI/FM 4880, FM Global Research Technical Report, December 20017.

Nam,Soonil and Bill, Robert G Jr. "A New Intermediate-scale Fire Test for Evaluating Building Material Flammability", SFPE Journal of Fire Protection Engineering, Feb 2009

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal offers another method to determine use of the exception. No affect on cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, FM 4880-2017, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018. The 2015 edition of the standard is currently referenced. This proposal increases the use of the standard as well as proposes to go to the 2017 edition.

Internal ID: 1868

FS75-18

IBC: TABLE 721.1(1), 722.2.3.1

Proponent: Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov)

2018 International Building Code

Revise as follows:

TABLE 721.1(1)

MINIMUM PROTECTION OF STRUCTURAL PARTS BASED ON TIME PERIODS FOR VARIOUS NONCOMBUSTIBLE INSULATING MATERIALS^m

Portions of table not shown remain unchanged.

STRUCTURAL PARTS TO BE PROTECTED	ITEM NUMBER	INSULATING MATERIAL USED	MINIMUM THICKNESS OF INSULATING MATERIAL FOR THE FOLLOWING FIRE-RESISTANCE PERIODS (inches)			
			4 hours	3 hours	2 hours	1 hour
4. Bonded or unbonded post-tensioned tendons in pre-stressed concrete ^e .	4-1.1	Carbonate, lightweight, sand-lightweight and siliceous ^f aggregate concrete Unrestrained members: Solid slabs ^h <u>See Section 722.2.3.3.1 as well as Table 722.2.3(2)</u> Beams and girders [†] 8" wide greater than 12" wide	—	2	1 ³ / ₂	—
	4-1.2	<u>See Section 722.2.3.3.1 as well as Table 722.2.3(2)</u> Carbonate, lightweight, sand-lightweight and siliceous aggregate Restrained members: ^k Solid slabs ^h Beams and girders [†] 8" wide greater than 12" wide	1 ³ / ₄	1	3 ³ / ₄	—
			2 ¹ / ₂	2	1 ³ / ₄	—
			2	1 ³ / ₄	1 ¹ / ₂	—

For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm², 1 cubic foot = 0.0283 m³, 1 pound per cubic foot = 16.02 kg/m³.

- a. Reentrant parts of protected members to be filled solidly.
- b. Two layers of equal thickness with a ³/₄-inch airspace between.
- c. For all of the construction with gypsum wallboard described in Table 721.1(1), gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided that attachment is identical to that specified for the wallboard and the joints on the face layer are reinforced, and the entire surface is covered with not less than ¹/₁₆-inch gypsum veneer plaster.
- d. An approved adhesive qualified under ASTM E119 or UL 263.
- e. Where lightweight or sand-lightweight concrete having an oven-dry weight of 110 pounds per cubic foot or less is used, the tabulated minimum cover shall be permitted to be reduced 25 percent, except that the reduced cover shall be not less than ³/₄ inch in slabs or 1¹/₂ inches in beams or girders.
- f. For solid slabs of siliceous aggregate concrete, increase tendon cover 20 percent.
- g. Adequate provisions against spalling shall be provided by U-shaped or hooped stirrups spaced not to exceed the depth of the member with a clear cover of 1 inch.
- h. Prestressed slabs shall have a thickness not less than that required in Table 721.1(3) for the respective fire-resistance time period.
- i. Fire coverage and end anchorages shall be as follows: Cover to the prestressing steel at the anchor shall be ¹/₂ inch greater than that required away from the anchor. Minimum cover to steel-bearing plate shall be 1 inch in beams and ³/₄ inch in slabs.
- j. For beam widths between 8 inches and 12 inches, cover thickness shall be permitted to be determined by interpolation.
- k. Interior spans of continuous slabs, beams and girders shall be permitted to be considered restrained.
- l. For use with concrete slabs having a comparable fire endurance where members are framed into the structure in such a manner as to provide equivalent performance to that of monolithic concrete construction.
- m. Generic fire-resistance ratings (those not designated as PROPRIETARY* in the listing) in GA 600 shall be accepted as if herein listed.
- n. Additional insulating material is not required on the exposed outside face of the column flange to achieve a 1-hour fire-resistance rating.

722.2.3.1 Slab cover. The minimum thickness of concrete cover to the positive moment reinforcement shall comply with Table 722.2.3(1) for reinforced concrete and Table 722.2.3(2) for prestressed concrete. These tables are applicable for solid or hollow-core one-way or two-way slabs with flat undersurfaces. These tables are applicable to slabs that are either cast in place or precast. For precast prestressed concrete not covered elsewhere, the procedures contained in PCI MNL 124 shall be acceptable. Interior spans of continuous slabs, beams, and girders shall be permitted to be considered restrained. The required positive reinforcing shall be provided along the full length of the continuous tendon.

Reason:

The proposed code change addresses a conflict in the IBC between the prescriptive fire resistance Tables for post tensioned concrete slabs in Table 721.1(1) and prescriptive tables in Section 722. Section 721 is intended to be prescriptive in nature where fire resistance is established based on reinforcing cover protecting post tensioned cables in slabs. Post tensioned cables are more temperature sensitive than mild solid reinforcing bars used in reinforced concrete slabs. Pre-stressed concrete is generally pre-cast concrete and is generally unrestrained. Various organizations such as the American Concrete Institute (ACI) and the Post-Tensioning Institute (PTI) consider cast in place post tensioned concrete to be pre-stressed concrete and as a result item #4 is labeled differently than my description.

Section 722 provides a calculated method for determining the fire resistance of various structural elements including PRESTRESSED CONCRETE FLOOR OR ROOF SLABS . A comparison of the reinforcing covers in Table 721.1(1) item # 4 with the required cover in Table 722.2.3(2) reveals that in many cases the second table is less restrictive and requires less reinforcing cover. Section 722.1 reference concrete standard ACI 216.1/TMS 0216 "Code Requirements for Determining Fire Resistance of Concrete and Masonry Construction Assemblies" and after researching the issue further

it became clear that Table 722.2.3(2) was adopted through transcription from Table 4.3.1.1 for pre-stressed slabs.

The differences in the tables occur with fire resistance ratings of 3 hours and higher for un-restrained and restrained slabs. Additionally, Table 4.3.1 of the ACI standard idealizes all cast in place slabs as restrained whereas footnote k in Table 721.1(1) states that " k. Interior spans of continuous slabs, beams and girders shall be permitted to be considered restrained." Section 722.2.3 is silent on restraint and Section 703.2.3 generically discuss restrained vs unrestrained and throws it on to the design professional to demonstrate a restrained condition.

The proposed code change seeks to modify item # 4-1.1 solid slabs to add a reference to Section 722.2.3.3.1 and Table 722.2.3.3(2) and strikes the covers required for solid slabs. Additionally, the proposed code change copies the text from Table 721.1(1) footnote K and adds the text to Section 722.2.3.1. Reinforcing tendons are continuous over several spans and as a result the required fire resistive cover bottom shall be required along the full length of the tendon.

Very few code users determine fire resistance in new buildings with post tensioned concrete slabs based on calculation and as a consequence this code change harmonizes the required covers for unrestrained pre-stressed or post tensioned concrete slabs.

The proposed code change can be considered editorial in nature.

FS76-18

IBC: TABLE 721.1(3)

Proponent: Tim Earl, representing The Gypsum Association (tearl@gbhinternational.com)

2018 International Building Code

Revise as follows:

TABLE 721.1(3)
MINIMUM PROTECTION FOR FLOOR AND ROOF SYSTEMS^{a, q}

Portions of table not shown remain unchanged.

FLOOR OR ROOF CONSTRUCTION	ITEM NUMBER	CEILING CONSTRUCTION	THICKNESS OF FLOOR OR ROOF SLAB (inches)				MINIMUM THICKNESS OF CEILING (inches)			
			4 hours	3 hours	2 hours	1 hour	4 hours	3 hours	2 hours	1 hour
5. Reinforced concrete	5-1.1	Slab with suspended ceiling of vermiculite gypsum plaster over metal lath attached to 3/4" cold-rolled channels spaced 12" on center. Ceiling located 6" minimum below joists.	3	2	—	—	1	3/4	—	—
	5-2.1	3/8" x 5/8" Type X gypsum wallboard ^c attached to 0.018 inch (No. 25 carbon sheet steel gage) by 7/8" deep by 2 5/8" hat-shaped galvanized steel channels with 1"-long No. 6 screws. The channels are spaced 24" on center, span 35" and are supported along their length at 35" intervals by 0.033" (No. 21 galvanized sheet gage) galvanized steel flat strap hangers having formed edges that engage the lips of the channel. The strap hangers are attached to the side of the concrete joists with 5/32" by 1 1/4" long power-driven fasteners. The wallboard is installed with the long dimension perpendicular to the channels. End joints occur on channels and supplementary channels are installed parallel to the main channels, 12" each side, at end joint occurrences. The finished ceiling is located approximately 12" below the soffit of the floor slab.	—	—	2 1/2	—	—	—	5/8	—

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m³,

1 pound per square inch = 6.895 kPa, 1 pound per linear foot = 1.4882 kg/m.

- a. Staples with equivalent holding power and penetration shall be permitted to be used as alternate fasteners to nails for attachment to wood framing.
- b. Where the slab is in an unrestrained condition, minimum reinforcement cover shall be not less than $1\frac{5}{8}$ inches for 4 hours (siliceous aggregate only); $1\frac{1}{4}$ inches for 4 and 3 hours; 1 inch for 2 hours (siliceous aggregate only); and $\frac{3}{4}$ inch for all other restrained and unrestrained conditions.
- c. For all of the construction with gypsum wallboard described in this table, gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided that attachment is identical to that specified for the wallboard, and the joints on the face layer are reinforced and the entire surface is covered with not less than $\frac{1}{16}$ -inch gypsum veneer plaster.
- d. Slab thickness over steel joists measured at the joists for metal lath form and at the top of the form for steel form units.
- e.
 - (a) The maximum allowable stress level for H-Series joists shall not exceed 22,000 psi.
 - (b) The allowable stress for K-Series joists shall not exceed 26,000 psi, the nominal depth of such joist shall be not less than 10 inches and the nominal joist weight shall be not less than 5 pounds per linear foot.
- f. Cement plaster with 15 pounds of hydrated lime and 3 pounds of approved additives or admixtures per bag of cement.
- g. Gypsum wallboard ceilings attached to steel framing shall be permitted to be suspended with $1\frac{1}{2}$ -inch cold-formed carrying channels spaced 48 inches on center, that are suspended with No. 8 SWG galvanized wire hangers spaced 48 inches on center. Cross-furring channels are tied to the carrying channels with No. 18 SWG galvanized wire hangers spaced 48 inches on center. Cross-furring channels are tied to the carrying channels with No. 18 SWG galvanized wire (double strand) and spaced as required for direct attachment to the framing. This alternative is applicable to those steel framing assemblies recognized under Note q.
- h. Six-inch hollow clay tile with 2-inch concrete slab above.
- i. Four-inch hollow clay tile with $1\frac{1}{2}$ -inch concrete slab above.
- j. Thickness measured to bottom of steel form units.
- k. Five-eighths inch of vermiculite gypsum plaster plus $\frac{1}{2}$ inch of approved vermiculite acoustical plastic.
- l. Furring channels spaced 12 inches on center.
- m. Double wood floor shall be permitted to be either of the following:
 - (a) Subfloor of 1-inch nominal boarding, a layer of asbestos paper weighing not less than 14 pounds per 100 square feet and a layer of 1-inch nominal tongue-and-groove finished flooring.
 - (b) Subfloor of 1-inch nominal tongue-and-groove boarding or $\frac{15}{32}$ -inch wood structural panels with exterior glue and a layer of 1-inch nominal tongue-and-groove finished flooring or $\frac{19}{32}$ -inch wood structural panel finish flooring or a layer of Type I Grade M-1 particleboard not less than $\frac{5}{8}$ -inch thick.
- n. The ceiling shall be permitted to be omitted over unusable space, and flooring shall be permitted to be omitted where unusable space occurs above.
- o. For properties of cooler or wallboard nails, see ASTM C514, ASTM C547 or ASTM F1667.
- p. Thickness measured on top of steel deck unit.
- q. Generic fire-resistance ratings (those not designated as PROPRIETARY* in the listing) in the GA 600 shall be accepted as if herein listed.

Reason:

This is a typo. $\frac{3}{8}$ " type X boards are not readily commercially available. Generic $\frac{5}{8}$ " type X boards are readily available in the market. This change simply fixes this.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change simply corrects a typo, which will not affect construction costs.

FS77-18

IBC: 722.1, 722.2.3.1, Chapter 35

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Stephen V. Skalko, P.E. & Associates, LLC (svskalko@svskalko-pe.com); Jason Krohn, representing Precast/Prestressed Concrete Institute (jkrohn@pci.org)

2018 International Building Code

Revise as follows:

722.1 General. The provisions of this section contain procedures by which the *fire resistance* of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this section and shall not be otherwise used. The calculated *fire resistance* of ~~concrete-specific materials or~~ combinations of materials shall be established by one of the following:

1. Concrete, concrete masonry and clay masonry assemblies shall be permitted in accordance with ACI 216.1/TMS 0216.
2. Precast and precast, prestressed concrete assemblies shall be permitted in accordance with PCI 124.
3. ~~The calculated fire resistance of~~ Steel assemblies shall be permitted in accordance with Chapter 5 of ASCE 29.
4. ~~The calculated fire resistance of~~ Exposed wood members and wood decking shall be permitted in accordance with Chapter 16 of ANSI/AWC National Design Specification for Wood Construction (NDS).

722.2.3.1 Slab cover. The minimum thickness of concrete cover to the positive moment reinforcement shall comply with Table 722.2.3(1) for reinforced concrete and Table 722.2.3(2) for prestressed concrete. These tables are applicable for solid or hollow-core one-way or two-way slabs with flat undersurfaces. These tables are applicable to slabs that are either cast in place or precast. For precast prestressed concrete not covered elsewhere, the procedures contained in PCI ~~MNL-124~~ shall be acceptable.

Update standard(s) as follows:

PCI

Precast Prestressed Concrete
Institute
200 West Adams Street, Suite 2100
Chicago IL 60606-6938
US

~~MNL-PCI 124-1118:~~

~~Design Specification for Fire Resistance of Precast Prestressed Concrete~~

Reason:

PCI MNL 124 was one of the first stand-alone technical documents developed for calculating the fire resistance of precast, prestressed concrete elements. The first edition was published in 1977 and was referenced in the legacy codes. The publication was updated in 1989 and again in 2011. It has been referenced in the International Building Code since the first edition of the IBC in 2000 with the 2011 edition referenced in the 2015 edition of the IBC. To make the document more useful to the design and code enforcement community, PCI has undertaken another revision to separate out code enforceable language from commentary and reformat the publication following ANSI-accredited standard development procedures.

PCI 124-18 is now a PCI consensus standard that provides a calculation method for determining the fire resistance of precast and precast, prestressed concrete elements and assemblies. In Section 722.2.3.1 PCI MNL 124 is presently referenced in the IBC for use in determining the cover to reinforcement in precast prestressed slabs. PCI 124-18 however also has provisions for determining the fire resistance for precast and precast, prestressed members and assemblies beyond just reinforcement cover for slabs.

This proposed code change adds PCI 124-18 to the list of acceptable calculation procedures in Section 722.1 for all precast and precast, prestressed concrete, not just slabs. The code change also formats the section to list individually all the acceptable calculation methods for concrete, masonry, steel and wood elements and assemblies.

Listing the methods in this manner will help the code user easily identify these methods the code allows to be used under Section 722.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

PCI 124 is the updated version of MNL 124, which is presently referenced in the IBC. But, PCI 124 is developed through an ANSI accredited consensus process, including using mandatory language for ease of enforcement. Code users who applied MNL 124 for determining fire resistance of precast and precast-prestressed concrete elements previously will be applying the same concepts to establish the fire resistances, thus the cost of construction should remain unchanged.

Analysis: A review of the standard proposed for inclusion in the code, PCI 124-18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018. Under a previous number, MNL 124, this standard is already referenced. This proposal expands the use of the standard by reference and updates the number.

Internal ID: 1539

FS78-18

IBC: 722.2.3

Proponent: Michael Hill, representing Self

2018 International Building Code

Revise as follows:

722.2.3 Concrete cover over reinforcement. The minimum thickness of concrete cover over reinforcement in concrete slabs, reinforced beams and prestressed beams shall comply with this section. The structural capacity of concrete slabs, reinforced beams and prestressed beams at elevated temperatures shall be determined by calculation.

Reason:

Many engineers, architects and building officials do not fully understand the difference between the tables in sections 721 and 722. The proposed addition of text to this section will reinforce the requirement for the design professional to determine the capacity of the concrete members at elevated temperatures by engineering calculations.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarification only

Internal ID: 1371

FS79-18

IBC: 722.2.2.1.4 (New)

Proponent: Amy Trygestad, Concrete Reinforcing Steel Institute, representing Concrete Reinforcing Steel Institute (atrygestad@crsi.org); William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Stephen Szoke, American Concrete Institute, representing American concrete Institute (steve.szoke@concrete.org)

2018 International Building Code

Add new text as follows:

722.2.2.1.4 Flat plate concrete slabs with uniformly spaced hollow voids. Table 722.2.2.1 shall be used to determine the fire-resistance of 1 hour and 2 hours for flat plate concrete slabs with uniformly spaced hollow voids. The equivalent thickness of the slab shall be determined by dividing the net concrete volume of the slab by the floor area. The net concrete volume of the slab shall be equal to the volume of concrete of a solid slab minus the average concrete volume displaced by the hollow voids.

Reason:

The proposed subsection is to include prescriptive fire-resistance rating for flat plate concrete slabs with uniformly spaced hollow voids based on equivalent thickness.

In general, the equivalent thickness of a flat plate concrete slab with uniformly spaced hollow voids is equal to the net volume of concrete divided by the floor area. IBC Table 722.2.2.1 provides minimum slab thickness of reinforced concrete floor and roof assemblies to achieve fire-resistance ratings based on aggregate type. Flat plate concrete slabs with uniformly spaced hollow voids are similar to slabs with ribbed or undulating soffits, so an equivalent slab thickness must be calculated for use in Table 722.2.2.1.

To verify the system fire-resistance rating, a voided slab assembly was tested in accordance with the requirements of ASTM E119 in June 2017. The test assembly consisted of an 8-in.-thick normalweight concrete slab with siliceous aggregate, a design compressive strength of 5,000psi, and a cover of 3/4 in. to the main flexural reinforcing bars. The equivalent thickness was 5.9 in, calculated using the net concrete volume of the slab divided by the slab area. The edge of the slab on all 4 sides were supported vertically by the test frame, no restraint was provided for thermal expansion or rotation. As such, the assembly was unrestrained during the duration of the fire test, which is conservative for cast-in-place concrete slab systems.

The ASTM E119 test was terminated when the assembly reached the heat transmission end point at 2 hours 51 minutes, corresponding to a 2-hour fire-resistance rating. Throughout the duration of the test, the assembly supported the applied loading with no signs of collapse. Thus, the fire-resistance rating based on equivalent thickness is essentially the same as that determined from the fire test. The test is documented in the Test Report FC-891_R1.

In addition, numerous fire tests have been performed on similar voided slab assemblies in accordance with the provisions in Fire Behavior of Building Materials and Building Components; Definitions, Requirements and Tests (DIN 4102-02). The time-temperature curve used to test assemblies in the DIN requirements is essentially the same as that prescribed in Fire-Resistance Test - Elements of Building Construction - Part 1: General Requirements (ISO 834). ISO834 and ASTM E119 time-temperature curves are also essentially the same, and it has been shown that the differences in severity between the two tests are negligible.

FS80-18

IBC: TABLE 722.6.2(5)

Proponent: Rick Roos, representing Rockwool (richard.roos@roxul.com)

2018 International Building Code

Revise as follows:

**TABLE 722.6.2(5)
TIME ASSIGNED FOR ADDITIONAL PROTECTION**

DESCRIPTION OF ADDITIONAL PROTECTION	FIRE RESISTANCE (minutes)
<p>Add to the fire-resistance rating of wood stud walls if the spaces between the studs are completely filled with glass fiber mineral wool batts weighing not less than 2 pounds per cubic foot (0.6 pound per square foot of wall surface) or rockwool or slag material wool batts weighing not less than 3.3 pounds per cubic foot (1 pound per square foot of wall surface), or cellulose insulation having a normal density not less than 2.5 pounds per cubic foot.</p>	<p align="center">15</p>
<p><u>Add to the fire-resistance rating of wood stud walls if the spaces between the studs are completely filled with mineral wool batts weighing not less than 0.86 pounds per cubic foot (0.25 pounds per square foot of wall surface).</u></p>	<p align="center">15</p>
<p><u>Add to the fire-resistance rating of wood stud walls if spaces between the studs are completely filled with glass fiber batts weighing not less than 0.42 pounds per cubic foot (0.12 pounds per square foot of wall surface).</u></p>	<p align="center">5</p>
<p><u>Add to the fire-resistance rating of wood stud walls if the spaces between the</u></p>	<p align="center">10</p>

studs are completely filled with cellulose insulation having a nominal density of not less than 3.12 pounds per cubic foot (0.91 pounds per square foot of wall surface.

For SI: 1 pound/cubic foot = 16.0185 kg/m³.

Reason:

This proposal aims to update Table 722.2.2(5) based on the most recent fire performance research data available. Research undertaken at the National Research Council of Canada involving over 20 new fire resistance tests of wall assemblies in accordance with the methodology of ASTM E119 and led the National Building Code of Canada (NBC) to differentiate between these three insulation materials. The calculation method for wood and steel light-frame construction, was introduced into the 1965 edition of the NBC and was based on fire test reports dated between 1932 and 1962. Like the US Building Codes, many of the original values were based on fire-resistance data generated over four decades ago on typical wall assemblies for that time. Subsequently, additional fire testing research was performed using construction materials, products and techniques that are currently in use. This provided many new insights into the fire resistance of current light-frame assemblies. Four major consortium projects on the fire resistance of wall (load and non-loadbearing) and floor/ceiling assemblies have been completed in recent years, as well as other smaller or related projects, providing data supporting the update and expansion of this Code. with new material and assemblies of materials, including new structural members. This also lead to revisions to the minimum density of insulation materials required to achieve these performance levels. This proposal is consistent with the current Canadian Building Code (NBC) as seen in the excerpt attached to this proposal.

Glass fiber, cellulose and mineral wool insulation materials have dramatically different high temperature performance. Glass fiber melts at 1050°F and mineral wool melts at a temperature of 2080°F, as shown in the image below. Cellulose fiber is made from wood fibers and is treated with flame retardants, and although combustible, it has more of an ability to stay in place than glass fiber insulation, which softens and melts, causing it to sag and create large voids between studs. This renders it ineffective as the fire exposure proceeds to higher temperatures.

Glass fiber insulation has been proven to have substantially less contribution to fire resistance than mineral wool and cellulose insulation. It contributes **only 5 minutes** toward the contribution to the overall fire resistance duration of wood stud wall assemblies. Cellulose has significantly more contribution than glass fiber insulation, providing **10 minutes** additional protection to wood stud wall systems.

In contrast, Mineral wool insulation contributes **15 minutes** toward the overall fire resistance of wood stud wall assemblies.

Excerpt from NBC Component Additive Method

Table D-2.3.4.-G
Time Assigned for Additional Protection

Description of Additional Protection	Time, min
Add to the fire-resistance rating of wood stud walls, sheathed with gypsum board or lath and plaster, if the spaces between the studs are filled with preformed insulation of rock or slag fibres conforming to CAN/ULC-S702, "Mineral Fibre Thermal Insulation for Buildings," and with a mass per unit area of not less than 1.22 kg/m ² of wall surface	15 ⁽¹⁾
Add to the fire-resistance rating of non-loadbearing wood stud walls, sheathed with gypsum board or lath and plaster, if the spaces between the studs are filled with preformed insulation of glass fibres conforming to CAN/ULC-S702, "Mineral Fibre Thermal Insulation for Buildings," and having a mass per unit area of not less than 0.6 kg/m ² of wall surface	5 ⁽²⁾
Add to the fire-resistance rating of loadbearing wood stud walls sheathed with gypsum board if the spaces between the studs are filled with insulation of cellulose fibres conforming to CAN/ULC-S703, "Cellulose Fibre Insulation for Buildings," and having a density of not less than 50 kg/m ³	10
Add to the fire-resistance rating of plaster on gypsum lath ceilings if 0.76 mm diam wire mesh with 25 mm by 25 mm openings or 1.57 mm diam diagonal wire reinforcing at 250 mm o.c. is placed between lath and plaster	30
Add to the fire-resistance rating of plaster on gypsum lath ceilings if 76 mm wide metal lath strips are placed over joints between lath and plaster	10
Add to the fire-resistance rating of plaster on 9.5 mm thick gypsum lath ceilings (Table D-2.3.4.-D) if supports for lath are 300 mm o.c.	10
Add to the fire-resistance rating of floor assemblies if the spaces between the structural members are filled with preformed insulation of rock or slag fibres conforming to CAN/ULC-S702, "Mineral Fibre Thermal Insulation for Buildings," and having a mass per unit area of not less than 1.22 kg/m ² of floor surface	5 ⁽²⁾
Add to the fire-resistance rating of floor assemblies if the spaces between the structural members are filled with wet-blown cellulose fibres conforming to CAN/ULC-S703, "Cellulose Fibre Insulation for Buildings," and having a density of not less than 50 kg/m ³	5 ⁽²⁾⁽³⁾
Add to the fire-resistance rating of floor assemblies where the floor topping on the unexposed side of the floor assemblies consists of concrete not less than 38 mm thick	5 ⁽²⁾

Notes to Table D-2.3.4.-G:

- (1) Applies to wood-framed walls only.
- (2) Applies to wood joists, wood trusses, wood I-joists and cold-formed-steel joists (C-shaped joists).
- (3) Applies to cellulose fibre:
 - (i) for wood joists, wood I-joist and wood trusses—that is spray-applied with a minimum density of 50 kg/m³, a minimum depth of 90 mm on the underside of the subfloor, and of 90 mm on the sides of the structural members;
 - (ii) for cold-formed-steel joists—that is spray-applied with a minimum density of 50 kg/m³ and a minimum thickness of 90 mm on the underside of the subfloor, of 90 mm on the sides of the structural members, and of 13 mm on the underside of the bottom flange other than at resilient metal channel locations.

Bibliography:

2015 National Building Code of Canada - Division B, D-15

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal updates the Code to provide several options. The cost impact will ultimately depend on the choice of materials and the fire resistance rated assembly components.

IBC: 722.7 (New), 722.7.1 (New), TABLE 722.7.1(1) (New), TABLE 722.7.1(2) (New), 722.7.2 (New), 722.7.2.1 (New), 722.7.2.2 (New)

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new text as follows:

722.7 Fire resistance rating of mass timber. The required fire resistance of mass timber elements in Section 602.4 shall be determined in accordance with Section 703.2 or Section 703.3. The fire resistance rating of building elements shall be as required in Tables 601 and 602 and as specified elsewhere in this code. The fire resistance rating of the mass timber elements shall consist of the fire resistance of the unprotected element added to the protection time of the noncombustible protection.

722.7.1 Minimum required protection. Where required by Sections 602.4.1 through 602.4.3, noncombustible protection shall be provided for mass timber building elements in accordance with Table 722.7.1(1). The rating, in minutes, contributed by the noncombustible protection of mass timber building elements, components, or assemblies, shall be established in accordance with Section 703.8. The protection contributions indicated in Table 722.7.1(2) shall be deemed to comply with this requirement when installed and fastened in accordance with Section 722.7.2.

TABLE 722.7.1(1)
PROTECTION REQUIRED FROM NONCOMBUSTIBLE COVERING MATERIAL

<u>Required Fire Resistance Rating of Building Element per Tables 601 and 602 (hours)</u>	<u>Minimum Protection Required from Noncombustible Protection (minutes)</u>
<u>1</u>	<u>40</u>
<u>2</u>	<u>80</u>
<u>3 or more</u>	<u>120</u>

**TABLE 722.7.1(2)
PROTECTION PROVIDED BY NONCOMBUSTIBLE COVERING MATERIAL**

Noncombustible Protection	Protection Contribution (minutes)
<u>1/2 inch Type X Gypsum Board</u>	<u>30</u>
<u>5/8 inch Type X Gypsum Board</u>	<u>40</u>

722.7.2 Installation of gypsum board noncombustible protection. Gypsum board complying with Table 722.7.1(2) shall be installed in accordance with this section.

722.7.2.1 Interior surfaces. Layers of Type X gypsum board serving as noncombustible protection for interior surfaces of wall and ceiling assemblies determined in accordance with Table 722.7.1(1) shall be installed in accordance with the following:

1. Each layer shall be attached with Type S drywall screws of sufficient length to penetrate the mass timber at least 1 inch when driven flush with the paper surface of the gypsum board.

Exception: The third layer, where determined necessary by Section 722.7, shall be permitted to be attached with 1 inch #6 Type S drywall screws to furring channels in accordance with ASTM C645.

2. Screws for attaching the base layer shall be 12 inches on center in both directions.
3. Screws for each layer after the base layer shall be 12 inches on center in both directions and offset from the screws of the previous layers by 4 inches in both directions.
4. All panel edges of any layer shall be offset 18 inches from those of the previous layer.
5. All panel edges shall be attached with screws sized and offset as in items 1 through 4 above and placed at least 1 inch but not more than 2 inches from the panel edge.
6. All panels installed at wall-to-ceiling intersections shall be installed such that ceiling panels are installed first and the wall panels are installed after the ceiling panel has been installed and is fitted tight to the ceiling panel. Where multiple layers are required, each layer shall repeat this process.
7. All panels installed at a wall-to-wall intersection shall be installed such that the panels covering an exterior wall or a wall with a greater fire resistance rating shall be installed first and the panels covering the other wall shall be fitted tight to the panel covering the first wall. Where multiple layers are required, each layer shall repeat this process.
8. Panel edges of the face layer shall be taped and finished with joint compound. Fastener heads shall be covered with joint compound.
9. Panel edges protecting mass timber elements adjacent to unprotected mass timber elements in accordance with Section 602.4.2.2 shall be covered with 1-1/4 inch metal corner bead and finished with joint compound.

722.7.2.2 Exterior surfaces. Layers of Type X gypsum board serving as noncombustible protection for the outside of the exterior heavy timber walls determined in accordance with Table 722.7.1(1) shall be fastened 12 inches on center each way and 6 inches on center at all joints or ends. All panel edges shall be attached with fasteners located at least 1 inch but not more than 2 inches from the panel edge. Fasteners shall comply with one of the following:

1. Galvanized nails of minimum 12 Gage with a 7/16 inch head of sufficient length to penetrate the mass timber a minimum of 1 inch.
2. Screws which comply with ASTM C1002 (Type S, Type W, or Type G) of sufficient length to penetrate the mass timber a minimum of 1 inch.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

Typically, mass timber elements will be large due to structural requirements. In addition, CLT panels typically are utilized in odd number laminations. This typically results in excess capacity which means better fire endurance. Thus, mass timber elements are conservative in their fire resistance rating. Furthermore, the TWB decided to provide both a prescriptive path, as embodied in this proposal, and a performance path, embodied in another proposal.

This proposal outlines a method to calculate the fire resistance rating of a protected wood element by adding the fire resistance rating of the unprotected wood member together with the protection time provided by the noncombustible protection applied to the exposed wood.

This proposal should be considered as a companion proposal to the proposals creating new types of mass timber construction in Section 602.4 and the code proposal for Section 703.8 outlining a testing protocol to determine the contribution of noncombustible protection. This code proposal allows the user to select a prescriptive solution utilizing Type X gypsum wall board, which is deemed to comply with the basic requirements of this section and those of the proposed Section 602.4. Since this is a prescriptive solution, conditions of use such as attachment, finishing and edge treatment when bordering exposed mass timber areas, are also included in this section.

A proposal in Section 703.8 both forms the performance path for this determination and is the basis by which the contribution of the Noncombustible Protection to the fire resistance rating is determined. Testing of beams, columns, walls and ceiling panels has been used to establish the values found in table 722.7.1(b) for 1/2-inch Type X and 5/8-inch Type X gypsum board as well. Recent testing by AWC confirms the values derived from historic testing. A report is available at the following link: <http://bit.ly/WFC-firetestofGWBonCLT>. This link was confirmed active on 12/27/17.

Tests proposed in Section 703.8 may be used in the future to justify additional materials added to this table and should not be confused with “membrane protection” which is based on temperature rise on the unexposed side of a membrane attached to construction elements. Noncombustible construction is, instead, noncombustible material meeting the requirements of Section 703.5. Its contribution to the fire resistance rating of any building element is determined by this proposed new section. Simply put, it is determined by measuring the fire resistance time in minutes to the point of structural failure of a mass timber building element and then conducting a second test measuring the fire resistance time in minutes taken to the same point of structural failure. Each test is to be conducted with identical mass timber element with identical load, construction and condition, but with the proposed noncombustible protection applied to the second assembly. The difference in time between the two samples is the contribution, in minutes, of the noncombustible protection.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Analysis: The referenced standards, ASTM C645 and ASTM C1002, are currently referenced in 2018 I-codes.

Internal ID: 945

FS82-18

IBC: 803.9, IFC 803.9

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Building Code

Revise as follows:

803.9 High-density polyethylene (HDPE) and polypropylene (PP)-Solid thermoplastics. Where solid thermoplastics that melt and drip when exposed to flame, including but not limited to, polypropylene (PP), high-density polyethylene or polypropylene is (HDPE), solid polycarbonate, solid polystyrene, and solid acrylic materials, are used as an interior finish, #they shall comply with Section 803.1.1.

2018 International Fire Code

Revise as follows:

[BF] 803.9 High-density polyethylene (HDPE) and polypropylene (PP)-Solid thermoplastics. Where solid thermoplastics that melt and drip when exposed to flame, including but not limited to, polypropylene (PP), high-density polyethylene or polypropylene is (HDPE), solid polycarbonate, solid polystyrene, and solid acrylic materials, are used as an interior finish, #they shall comply with Section 803.1.1.

Reason:

The same reason that HDPE and PP are not permitted to be used as interior finish simply based on testing to ASTM E84 also applies to some solid thermoplastics that melt and drip when exposed to flame. For proper fire safety they should be tested to NFPA 286.

Note that this applies purely to interior finish and that it does not cover foam plastics, which are already required to be tested to NFPA 286 if used as interior finish.

Cost Impact

The code change proposal will increase the cost of construction .

This will require more materials to be tested in accordance with a more rigorous (and more reliable) but more costly fire test.

Internal ID: 309

FS83-18

IBC: 803.9

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBENGINEER@aol.com)

2018 International Building Code

Revise as follows:

803.9 High-density polyethylene (HDPE) and polypropylene (PP). Where high-density polyethylene or polypropylene is used as an *interior finish*, it shall comply with Section 803.1.1. Where high-density polyethylene toilet and urinal partitions are used, they shall comply with Section 1209 and the interior finish requirements of Section 803.1.1 or 803.1.2.

Reason:

This proposal adds a requirement indicating that toilet and urinal partitions made of HDPE or PP are not regulated by this section. The interior finish requirements for toilet and urinal partitions would still apply, however, the Class of material in Table 803.3 would be the applicable requirements.

The interior finish requirements are concerned with the fire aspects of a building component. However, there is no history of a fire concern with HDPE water closet and urinal. A study was completed by NFPA Research entitled, "Non-Residential Structure Fires That Originated in Lavatories, Locker Rooms or Coat Check Rooms," dated November 2017, authored by Marty Ahrens. The report shows no fire issue with water closet or urinal partitions. There are no fire deaths reported from fires originating in a commercial toilet room. The results are not surprising.

HDPE partition manufacturers have a framing system that protects the edges of the HDPE material. As a result, the HDPE partitions cannot readily ignite. The typical cause of a fire origin in a toilet room is the waste basket or electrical appliance. There is no fire ignition source in the vicinity of a water closet or urinal partition.

What must be understood is that while fire-retardant chemicals can be added to HDPE used for water closet and urinal partitions, however, the chemicals change the exterior surface requirements of the partitions. The fire-retardant chemicals make the surface more porous. It also makes the surface less scratch resistant. As a result, the partitions would no longer have the same cleanliness and sanitation aspect required for a water closet or urinal partition. This would in effect eliminate the acceptance of HDPE partitions.

The NFPA study clearly establishes that a fire hazard with HDPE water closet or urinal partitions does not exist. It is more important to emphasize the sanitary and health issues as identified in Section 1209.

Cost Impact

The code change proposal will decrease the cost of construction .

The change will remove an unnecessary requirement for water closet and urinal partitions.

Internal ID: 1502

FS84-18

IBC: 803.10

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

803.10 Site-fabricated stretch systems. Where used as interior wall or interior ceiling finish materials, *site-fabricated stretch systems* containing all three components described in the definition in Chapter 2 shall be tested in the manner intended for use, and shall comply with the requirements of Section 803.1.1 ~~803.1.2~~ or with the requirements of Class A in accordance with Section 803.1.2. If the materials are tested in accordance with ASTM E84 or UL 723, specimen preparation and mounting shall be in accordance with ASTM E2573.

2018 International Fire Code

Revise as follows:

[BF] 803.10 Site-fabricated stretch systems. Where used as newly installed interior wall or interior ceiling finish materials, site-fabricated stretch systems containing all three components described in the definition in Chapter 2 shall be tested in the manner intended for use, and shall comply with the requirements of Section 803.1.1 or ~~803.1.2~~ with the requirements of Class A in accordance with Section 803.1.2. If the materials are tested in accordance with ASTM E84 or UL 723, specimen preparation and mounting shall be in accordance with ASTM E2573.

Reason:

This is clarification because interpretation is unclear but these systems were always intended to meet Class A in ASTM E84.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Since this is meant at a clarification of intent the cost should not increase. However, due to the confusion on interpretation it is possible that different flame spread ratings have been required and this could have some effect on cost.

Internal ID: 291

FS85-18

IBC: TABLE 803.13

Proponent: Gregory Nicholls, representing The American Institute of Architects (gnicholls@preview-group.com)

2018 International Building Code

Revise as follows:

**TABLE 803.13
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCYk**

GROUP	SPRINKLERED ¹			NONSPRINKLERED		
	Interior exit stairways and ramps and exit passageways ^{a,r}	<u>Enclosures for fire-resistive rated corridors, and enclosure for surfaces adjacent to exit access stairways and ramps, and unenclosed exit discharge elements</u> ^{a,n}	Rooms and enclosed spaces ^c	Interior exit stairways and ramps and exit passageways ^a	<u>Enclosures for fire-resistive rated corridors, and enclosure for surfaces adjacent to exit access stairways and ramps, and enclosed portions of exit discharge elements</u> ^{a,n}	Rooms and enclosed spaces ^c
A-1 & A-2	B	B	C	A	A ^d	B ^e
A-3 ^f , A-4, A-5	B	B	C	A	A ^d	C
B, E, M, R-1	B	C ^m	C	A	B	C
R-4	B	C	C	A	B	B
F	C	C	C	B	C	C
H	B	B	C ^g	A	A	B
I-1	B	C	C	A	B	B
I-2	B	B	B ^{h, i}	A	A	B
I-3	A	A ^j	C	A	A	B
I-4	B	B	B ^{h, i}	A	A	B
R-2	C	C	C	B	B	C
R-3	C	C	C	C	C	C
S	C	C	C	B	B	C
U	No restrictions			No restrictions		

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929 m².

a. Class C interior finish materials shall be permitted for wainscoting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.15.1.

- b. In other than Group I-3 occupancies in buildings less than three stories above grade plane, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.
- c. Requirements for rooms and enclosed spaces shall be based on spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered to be enclosing spaces and the rooms or spaces on both sides shall be considered to be one room or space. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.
- d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall be not less than Class B materials.
- e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.
- f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.
- g. Class B material is required where the building exceeds two stories.
- h. Class C interior finish materials shall be permitted in administrative spaces.
- i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.
- j. Class B materials shall be permitted as wainscoting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.
- k. Finish materials as provided for in other sections of this code.
- l. Applies when protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
- m. Corridors in ambulatory care facilities shall be provided with Class A or B materials.
- n. Unenclosed exit discharge elements include those providing the fire-resistive rated floors below

Reason:

The current table does not clearly or adequately address what should be done with exit discharge elements allowed by Section 1028.1 exception 1. The reference to "lobbies" appears to be an antiquated reference to the older versions of the legacy codes that used that term in the exit discharge description. But the problem is that the intermediate space (such as a lobby or vestibule) allowed by the exception does not have to be enclosed when certain conditions are met, and is not an interior exit stairway, ramp or passageway.

This proposal seeks to revise the table to provide clear direction on where these exit discharge elements belong, and provide those spaces with requirements less restrictive than enclosed exit elements but more restrictive than typical spaces. Experience seeing numerous office and hotel lobbies used as an exit discharge element would lead us to believe that this table has not been applied to the finishes in exit discharge spaces, so this change also attempts to remain in focus to actual construction.

With these areas such as corridors, exit access elements and discharges which are often open to the rest of the floor, where does the authority of this table stop and start? For corridors that are not required to be rated, what difference is there between the spaces they can and often are open to and the corridor itself? So the proposal delineates fire-resistive corridors from others that can be treated as rooms and spaces. For the unenclosed exit access stairs and ramps and the unenclosed exit discharge elements, the new text provides some clarity that the limits of the finish ratings would only apply to the walls and ceilings by the ramps, stairs, vestibules and lobby/exit discharge path. The addition of footnote n provides for the rated floor below these elements required by the conditions in the exception to Section 1028.1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The current code is not clear on what is required for finishes in exit discharge elements, so there is no comparative cost.

FS86-18

IBC: [F] 806.9 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Add new text as follows:

[F] 806.9 Combustible lockers. Where lockers constructed of combustible materials are used, the lockers shall be considered to be interior finish and shall comply with Section 803.

Exception: Lockers constructed entirely of wood and noncombustible materials shall be permitted to be used wherever interior finish materials are required to meet a Class C classification in accordance with Section 803.1.2.

Reason:

The requirements in this section are contained in the IFC Section 808.4, but they should equally be contained in the IBC, because lockers are often included in building plans (such as in schools) and they should be checked at the time of issuing the certificate of occupancy instead of waiting until after the building is in use.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is already in the IFC, so there is no technical change

Internal ID: 600

FS87-18

IBC: 909.20.5.1 (New)

Proponent: Douglas Evans, DHE FPE LLC, representing DHE FPE LLC (dhefpe@gmail.com)

2018 International Building Code

Add new text as follows:

909.20.5.1 Stair pressurization relief damper. A controlled relief vent capable of discharging a minimum of 2,500 cfm (1180 L/s) of air at the design pressure difference shall be located in the upper portion of the pressurized stair enclosure.

Reason:

The requirement for a dampered relief opening capable of discharging at least 2500 cfm allows a safety factor for stair pressurization to compensate for doors opening and closing. The dampered opening relieves excessive pressure when doors are opened and closed and reduces the potential for over pressurization. Further, if smoke does infiltrate the stair, the dampered relief allows smoke to vent to atmosphere.

This is an overpressure feature that only opens when the pressure in the stair sufficiently exceeds the required 0.10 inches of water pressure. This design constraint helps compensate for pressure differences created by stack effect by requiring fans to provide a slightly higher flow and pressure than needed. Depending on the height of the stair and design of the pressurization system, this option may even allow omission of pressure sensors and variable speed fans designed to compensate for stack effect conditions that vary through the year.

Cost Impact

The code change proposal will decrease the cost of construction .

This additional requirement is actually expected to decrease construction costs as described in the preceding justification statement.

Internal ID: 1630

FS88-18

IBC: 909.20, 909.20.4, 909.20.5, , 909.20.5.1, 909.20.5.2, 909.20.5.3, 909.20.6

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

1023.11 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2 or 412.2.2.1, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

Revise as follows:

909.20 Smokeproof enclosures. Where required by Section 1023.11, a smokeproof enclosure shall be constructed in accordance with this section. A smokeproof enclosure shall consist of an *interior exit stairway* or *ramp* that is enclosed in accordance with the applicable provisions of Section 1023 and an open exterior balcony ~~or ventilated vestibule~~ meeting the requirements of this section. Where access to the roof is required by the International Fire Code, such access shall be from the smokeproof enclosure where a smokeproof enclosure is required.

Delete without substitution:

~~**909.20.4 Mechanical ventilation alternative.** The provisions of Sections 909.20.4.1 through 909.20.4.4 shall apply to ventilation of smokeproof enclosures by mechanical means.~~

~~**909.20.4.1 Vestibule doors.** The door assembly from the building into the vestibule shall be a *fire door assembly* complying with Section 716.2.2.1. The door assembly from the vestibule to the *stairway* or *ramp* shall not have less than a 20-minute *fire protection rating* and shall meet the requirements for a smoke door assembly in accordance with Section 716.2.2.1. The door shall be installed in accordance with NFPA 105.~~

~~**909.20.4.2 Vestibule ventilation.** The vestibule shall be supplied with not less than one air change per minute and the exhaust shall be not less than 150 percent of supply. Supply air shall enter and exhaust air shall discharge from the vestibule through separate, tightly constructed ducts used only for that purpose. Supply air shall enter the vestibule within 6 inches (152 mm) of the floor level. The top of the exhaust register shall be located at the top of the smoke trap but not more than 6 inches (152 mm) down from the top of the trap, and shall be entirely within the smoke trap area. Doors in the open position shall not obstruct duct openings. Duct openings with controlling *dampers* are permitted where necessary to meet the design requirements, but *dampers* are not otherwise required.~~

~~**909.20.4.2.1 Engineered ventilation system.** Where a specially engineered system is used, the system shall exhaust a quantity of air equal to not less than 90 air changes per hour from any vestibule in the emergency operation mode and shall be sized to handle three vestibules simultaneously. Smoke detectors shall be located at the floor side entrance to each vestibule and shall activate the system for the affected vestibule. Smoke detectors shall be installed in accordance with Section 907.3.~~

~~**909.20.4.3 Smoke trap.** The vestibule ceiling shall be not less than 20 inches (508 mm) higher than the door opening into the vestibule to serve as a smoke and heat trap and to provide an upward moving air column. The height shall not be decreased unless *approved* and justified by design and test.~~

~~**909.20.4.4 Stairway or ramp shaft air movement system.** The *stairway* or *ramp* shaft shall be provided with a dampered relief opening and supplied with sufficient air to maintain a minimum positive pressure of 0.10 inch of water (25 Pa) in the shaft relative to the vestibule with all doors closed.~~

Revise as follows:

909.20.5 Stairway and ramp pressurization alternative. Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the vestibule is not required, provided that each interior *exit stairway* or *ramp* is pressurized to not less than 0.10 inch of water (25 Pa) and not more than 0.35 inches of water (87 Pa) in the shaft relative to the building measured with all *interior exit stairway* and *ramp* doors closed under maximum anticipated conditions of stack effect and wind effect. The activation of ventilating equipment required by this section shall be by smoke detectors installed at each floor level at an *approved* location at the entrance to the smokeproof enclosure. Smoke detectors shall be installed in accordance with Section 907.3.

Delete without substitution:

~~**909.20.6 Ventilating equipment.** The activation of ventilating equipment required by the alternatives in Sections 909.20.4 and 909.20.5 shall be by smoke detectors installed at each floor level at an *approved* location at the entrance to the smokeproof enclosure. When the closing device for the *stairway* and *ramp* shaft and vestibule doors is activated by smoke detection or power failure, the mechanical equipment shall activate and operate at the required performance levels. Smoke detectors shall be installed in accordance with Section 907.3.~~

Revise as follows:

~~**909.20.6-1909.20.5.1 Ventilation systems.** Smokeproof enclosure ventilation systems shall be independent of other building ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:~~

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or connected to the smokeproof enclosure by ductwork enclosed by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.
2. Equipment, control wiring, power wiring and ductwork shall be located within the smokeproof enclosure with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.
3. Equipment, control wiring, power wiring and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.

Exceptions:

1. Control wiring and power wiring located outside of a 2-hour fire barrier construction shall be protected using any one of the following methods:
 - 1.1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a fire-resistance rating of not less than 2 hours.
 - 1.2. Where encased with not less than 2 inches (51 mm) of concrete.
 - 1.3. Electrical circuit protective systems shall have a fire-resistance rating of not less than 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

~~**909.20.6-2909.20.5.2 Standby power.** Mechanical vestibule and *stairway* and *ramp* shaft ventilation systems and automatic fire detection systems shall be provided with standby power in accordance with Section ~~2702-2702.~~~~

~~**909.20.6-3909.20.5.3 Acceptance and testing.** Before the mechanical equipment is *approved*, the system shall be tested in the presence of the *building official* to confirm that the system is operating in compliance with these requirements.~~

Reason:

The mechanical ventilation alternative for interior exit stairways or ramps found in Section 909.20.4 is outdated. This option was a carry-over from the legacy codes and is rarely if ever used to reduce the risk of smoke contamination of a stair or ramp enclosure. When smokeproof enclosures are required by Section 1023.11 designers typically use pressurized stairways to prevent smoke from entering the stair or ramp enclosure thus vestibules are no longer required or used. It is unlikely that a smokeproof enclosure will be required in a nonsprinklered building, which is the only reason the mechanical ventilation alternative would ever be utilized. Also, with the current design requirements of 909.20.4, there is a potential risk associated with exhausting 150% of the makeup air from the vestibule thereby creating a negative pressure in the vestibule as it relates to adjacent spaces allowing smoke to enter the enclosure & the interior exit stairway or ramp.

This provision is rarely if ever used so why keep it in the code?

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

The mechanical ventilation alternative is not typically used so removing it from the code should have no financial impacts pro or con.

FS89-18

IBC: 909.20, 909.20.4, 909.20.6

Proponent: Douglas Evans, representing DHE FPE LLC (dhefpe@gmail.com)

2018 International Building Code

Revise as follows:

909.20 Smokeproof enclosures. Where required by Section 1023.11, a smokeproof enclosure shall be constructed in accordance with this section. A smokeproof enclosure shall consist of an *interior exit stairway* or *ramp* that is enclosed in accordance with the applicable provisions of Section 1023 and an open exterior balcony ~~or ventilated vestibule~~ meeting the requirements of this section. Where access to the roof is required by the International Fire Code, such access shall be from the smokeproof enclosure where a smokeproof enclosure is required.

Delete without substitution:

~~**909.20.4 Mechanical ventilation alternative.** The provisions of Sections 909.20.4.1 through 909.20.4.4 shall apply to ventilation of smokeproof enclosures by mechanical means.~~

~~**909.20.4.1 Vestibule doors.** The door assembly from the building into the vestibule shall be a *fire door assembly* complying with Section 716.2.2.1. The door assembly from the vestibule to the *stairway* or *ramp* shall not have less than a 20-minute *fire protection rating* and shall meet the requirements for a smoke door assembly in accordance with Section 716.2.2.1. The door shall be installed in accordance with NFPA 105.~~

~~**909.20.4.2 Vestibule ventilation.** The vestibule shall be supplied with not less than one air change per minute and the exhaust shall be not less than 150 percent of supply. Supply air shall enter and exhaust air shall discharge from the vestibule through separate, tightly constructed ducts used only for that purpose. Supply air shall enter the vestibule within 6 inches (152 mm) of the floor level. The top of the exhaust register shall be located at the top of the smoke trap but not more than 6 inches (152 mm) down from the top of the trap, and shall be entirely within the smoke trap area. Doors in the open position shall not obstruct duct openings. Duct openings with controlling *dampers* are permitted where necessary to meet the design requirements, but *dampers* are not otherwise required.~~

~~**909.20.4.2.1 Engineered ventilation system.** Where a specially engineered system is used, the system shall exhaust a quantity of air equal to not less than 90 air changes per hour from any vestibule in the emergency operation mode and shall be sized to handle three vestibules simultaneously. Smoke detectors shall be located at the floor side entrance to each vestibule and shall activate the system for the affected vestibule. Smoke detectors shall be installed in accordance with Section 907.3.~~

~~**909.20.4.3 Smoke trap.** The vestibule ceiling shall be not less than 20 inches (508 mm) higher than the door opening into the vestibule to serve as a smoke and heat trap and to provide an upward moving air column. The height shall not be decreased unless *approved* and justified by design and test.~~

~~**909.20.4.4 Stairway or ramp shaft air movement system.** The *stairway* or *ramp* shaft shall be provided with a dampered relief opening and supplied with sufficient air to maintain a minimum positive pressure of 0.10 inch of water (25 Pa) in the shaft relative to the vestibule with all doors closed.~~

Revise as follows:

909.20.6 Ventilating equipment. The activation of ventilating equipment required by the ~~alternatives~~ alternative in Sections 909.20.4 and Section 909.20.5 shall be by smoke detectors installed at each floor level at an *approved* location at the entrance to the smokeproof enclosure. When the closing device for the *stairway* and *ramp* shaft and vestibule doors is activated by smoke detection or power failure, the mechanical equipment shall activate and operate at the required performance levels. Smoke detectors shall be installed in accordance with Section 907.3.

Reason:

This proposal eliminates the mechanical ventilation alternative. Although the mechanical ventilation alternative has been in the IBC since inception, it seems unlikely this option is used very often, if at all. This is due to the complexity of the design and the additional equipment necessary to achieve the specified results.

There are two primary approaches to meet the mechanical ventilation option. One approach requires large supply and exhaust fans, as well as the associated ducts to serve all vestibules simultaneously. A second approach requires not

only the supply and exhaust ducts, but also one supply and one exhaust damper in each vestibule. With this approach, each damper in every vestibule will have to properly configure for the system to function.

Section 909.20.4.3 requires a minimum ceiling height of 20 inches above the door. With a minimum door opening height of 80 inches as required by Section 1010.1.1, these constraints dictate a minimum of 8 feet 4 inches from the top of one slab to the bottom of the slab above. Adding another 6 inches for a reasonable slab thickness gives almost 9 foot slab-to-slab height. Although this may not be a hardship for most multi-story buildings, this will impact some designs.

Cost Impact

The code change proposal will decrease the cost of construction .

Due to the complexity of this option, it is more expensive to design, construct, commission and maintain than other recognized approaches for smokeproof enclosures.

Internal ID: 1634

FS90-18

IBC: 909.20, 909.20.6 (New), 909.20.6.1 (New), 909.20.6.2 (New), 909.20.6.3 (New), 909.20.7

Proponent: Douglas Evans, representing DHE FPE LLC (dhefpe@gmail.com)

2018 International Building Code

Revise as follows:

909.20 Smokeproof enclosures. Where required by Section 1023.11, a smokeproof enclosure shall be constructed in accordance with this section. A smokeproof enclosure shall consist of an *interior exit stairway* or *ramp* that is enclosed in accordance with the applicable provisions of Section 1023 and an open exterior balcony or ventilated vestibule or pressurized stair and pressurized entrance vestibule meeting the requirements of this section. Where access to the roof is required by the International Fire Code, such access shall be from the smokeproof enclosure where a smokeproof enclosure is required.

Add new text as follows:

909.20.6 Pressurized stair and vestibule alternative. The provisions of Sections 909.20.6.1 through 909.20.6.3 shall apply to smokeproof enclosures using a pressurized stair and pressurized entrance vestibule.

909.20.6.1 Vestibule doors. The door assembly from the building into the vestibule shall be a fire door assembly complying with Section 716.2.2.1. The door assembly from the vestibule to the stairway shall not have less than a 20-minute fire protection rating and meet the requirements for a smoke door assembly in accordance with Section 716.2.2.1. The door shall be installed in accordance with NFPA 105.

909.20.6.2 Pressure difference. The stair enclosure shall be pressurized to a minimum of 0.05 inch of water gage (12.44 Pa) positive pressure relative to the vestibule with all stairway doors closed under the maximum anticipated stack pressures. The vestibule, with doors closed, shall have a minimum of 0.05 inch of water gage (12.44 Pa) positive pressure relative to the fire floor. The pressure difference across doors shall not exceed 30 lbs (133-N) maximum force to begin opening the door.

909.20.6.3 Dampered relief opening. A controlled relief vent capable of discharging a minimum of 2,500 cfm (1180 L/s) of air at the design pressure difference shall be located in the upper portion of the pressurized exit enclosure.

Revise as follows:

909.20.6-909.20.7 Ventilating equipment. The activation of ventilating equipment required by the alternatives in Sections 909.20.4, 909.20.5 and ~~909.20.5-909.20.6~~ shall be by smoke detectors installed at each floor level at an *approved* location at the entrance to the smokeproof enclosure. When the closing device for the *stairway* and *ramp* shaft and vestibule doors is activated by smoke detection or power failure, the mechanical equipment shall activate and operate at the required performance levels. Smoke detectors shall be installed in accordance with Section 907.3.

Reason:

This amendment will allow the use of a pressurized stair along with a pressurized entrance vestibule as one of the options for smokeproof enclosures. The pressurized stair and vestibule option has been used in Southern Nevada for over 20 years and has a proven track record. This proposal allows the existing options to remain, but also allows a pressurized stair and vestibule as another option. This proposal has been shown to work well for high-rise buildings where outdoor air temperatures cause stack effect conditions. Due to potentially excessive stack effect pressures, the stair pressurization alternative outlined in Section 909.20.5 can be difficult to implement. This proposal provides an option for designers when dealing with tall buildings.

This option essentially creates an "air lock" between the pressurized stair and normally occupied portion(s) of the building, which makes it easier to achieve the 0.10 between the stair and building without over pressurizing the stair. Leakage under/around the door separating the stair from the vestibule has been found to be sufficient to pressurize vestibules without additional ducts or fans. At times, an adjustable door sweep is used to regulate leakage and meet the associated pressure requirements.

This option is less expensive to design, construct, commission and maintain than the ventilated vestibule option. It can be a viable option for tall stairs and reduces the impact of stack effect. The stair pressurization (w/o vestibule) option is difficult to implement in tall buildings due to pressure differences created by stack effect.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal allows an additional option for smokeproof enclosures and can reduce overall cost during design, construction, commissioning and continued building maintenance.

Internal ID: 1637

FS91-18

IBC: 1402.2

Proponent: Theresa Weston, representing Air Barrier Association (theresa.a.weston@dupont.com)

2018 International Building Code

Revise as follows:

1402.2 Weather protection. *Exterior walls* shall provide the building with a weather-resistant *exterior wall envelope*. The *exterior wall envelope* shall include flashing, as described in Section 1404.4. The *exterior wall envelope* shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a *water-resistive barrier* behind the exterior veneer, as described in Section 1403.2, and a means for draining water that enters the assembly to the exterior. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1404.3 and Section C402.5 of the International Energy Conservation Code.

Exceptions:

1. A weather-resistant *exterior wall envelope* shall not be required over concrete or masonry walls designed in accordance with Chapters 19 and 21, respectively.
2. Compliance with the requirements for a means of drainage, and the requirements of Sections 1403.2 and 1404.4, shall not be required for an *exterior wall envelope* that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E331 under the following conditions:
 - 2.1. *Exterior wall envelope* test assemblies shall include not fewer than one opening, one control joint, one wall/eave interface and one wall sill. Tested openings and penetrations shall be representative of the intended end-use configuration.
 - 2.2. *Exterior wall envelope* test assemblies shall be not less than 4 feet by 8 feet (1219 mm by 2438 mm) in size.
 - 2.3. *Exterior wall envelope* assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m²).
 - 2.4. *Exterior wall envelope* assemblies shall be subjected to a minimum test exposure duration of 2 hours.The *exterior wall envelope* design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the *exterior wall envelope*, joints at the perimeter of openings or intersections of terminations with dissimilar materials.
3. *Exterior insulation and finish systems* (EIFS) complying with Section 1407.4.1.

Reason:

Air leakage control is currently dealt with in the I-codes based on energy efficiency considerations, but it is also critical to protection against moisture condensation. Air leakage can move 100x more moisture than vapor diffusion, and vapor retarders will not work properly without air leakage control. As stated in the Whole Building Design Guide:

“Moisture contributed by air leakage is a significant source and should be a serious concern in the design of the wall system. In fact, the design of the building envelope for minimizing air leakage is more critical than the design of the vapor barrier.

To illustrate this point, consider that the amount of moisture contributed to a building by the air that flows through a crack 1/16th inch thick by 1 foot long is just over 5 pints per day in a light breeze. In contrast, the amount of moisture contributed by vapor diffusion through a 10 foot by 50-foot painted block wall over the same period equals just under 1/3 of a pint (about 5 ounces).”

It is important to include air leakage control in Section 1402.2 as it will highlight its importance to moisture management and facilitate the inclusion of air leakage control in water management details.

Cost Impact

The code change proposal will increase the cost of construction .

For jurisdictions that adopt both the IBC and IECC, there will be no cost impact as this proposed provision is already in existing code provisions. For jurisdictions that do not adopt the IECC, there will be increased cost of incorporating air barriers into the construction, but that cost will be offset by reducing air infiltration related condensation moisture

issues and associated liability.

Internal ID: 2144

FS92-18

IBC: 1402.2

Proponent: Benjamin Meyer, representing self (2ben.meyer@gmail.com)

2018 International Building Code

Revise as follows:

1402.2 Weather protection. *Exterior walls* shall provide the building with a weather-resistant *exterior wall envelope*. The *exterior wall envelope* shall include flashing, as described in Section 1404.4. The *exterior wall envelope* shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a *water-resistive barrier* behind the exterior veneer, as described in Section 1403.2, and a means for draining water that enters the assembly to the exterior. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1404.3.

Exceptions:

1. ~~A weather resistant exterior wall envelope shall not be required over concrete or masonry walls designed in accordance with Chapters 19 and 21, respectively.~~
- 2.1. Compliance with the requirements for a means of drainage, and the requirements of Sections 1403.2 and 1404.4, shall not be required for an *exterior wall envelope* that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E331 under the following conditions:
 - 1.1. ~~2.1.~~ *Exterior wall envelope* test assemblies shall include not fewer than one opening, one control joint, one wall/eave interface and one wall sill. Tested openings and penetrations shall be representative of the intended end-use configuration.
 - 1.2. ~~2.2.~~ *Exterior wall envelope* test assemblies shall be not less than 4 feet by 8 feet (1219 mm by 2438 mm) in size.
 - 1.3. ~~2.3.~~ *Exterior wall envelope* assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m²).
 - 1.4. ~~2.4.~~ *Exterior wall envelope* assemblies shall be subjected to a minimum test exposure duration of 2 hours.

The *exterior wall envelope* design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the *exterior wall envelope*, joints at the perimeter of openings or intersections of terminations with dissimilar materials.
2. ~~3.~~ *Exterior insulation and finish systems* (EIFS) complying with Section 1407.4.1.

Reason:

Conformance with the material and structural requirements described in chapters 19 and 21 do not directly correspond with the water management (WRB) performance specified in 1402.2.

For example Chapter 21 contains structural requirements for Dry-Stack Masonry (2114). Compliance with these requirements in no way ensures complies with 1402.2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

proposal doesn't add requirements

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

2018 International Building Code

Add new definition as follows:

WIND-DRIVEN RAIN INDEX. A representation of the combined climate effects of wind and rain which affect the magnitude and frequency of rain deposition on building exterior surfaces.

Revise as follows:

1402.2 Weather protection. *Exterior walls* shall provide the building with a weather-resistant *exterior wall envelope*. The *exterior wall envelope* shall include flashing, as described in Section 1404.4. The *exterior wall envelope* shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a *water-resistive barrier* behind the exterior veneer, as described in Section 1403.2, and a means for draining water that enters the assembly to the exterior. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1404.3. Where required by Section 1404.5, additional provisions for weather protection shall be provided.

Exceptions:

1. A weather-resistant *exterior wall envelope* shall not be required over concrete or masonry walls designed in accordance with Chapters 19 and 21, respectively.
2. Compliance with the requirements for a means of drainage, and the requirements of Sections 1403.2 and 1404.4, shall not be required for an *exterior wall envelope* that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E331 under the following conditions:
 - 2.1. *Exterior wall envelope* test assemblies shall include not fewer than one opening, one control joint, one wall/eave interface and one wall sill. Tested openings and penetrations shall be representative of the intended end-use configuration.
 - 2.2. *Exterior wall envelope* test assemblies shall be not less than 4 feet by 8 feet (1219 mm by 2438 mm) in size.
 - 2.3. *Exterior wall envelope* assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m²).
 - 2.4. *Exterior wall envelope* assemblies shall be subjected to a minimum test exposure duration of 2 hours.

The *exterior wall envelope* design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the *exterior wall envelope*, joints at the perimeter of openings or intersections of terminations with dissimilar materials.

3. *Exterior insulation and finish systems* (EIFS) complying with Section 1407.4.1.

Add new text as follows:

1404.5 Additional provisions for weather protection. The provisions of Section 1404.5.1 and 1404.5.2 shall apply in the required wind-driven rain index and climate zones and, where not required, shall be permitted.

1404.5.1 Enhanced drainage. Where the wind-driven rain index of Figure 1404.5.1 is 4 or greater, the means of drainage required by Section 1402.2 shall be satisfied by one of the following:

1. A drained air space not less than nominal 3/16-inch deep behind the cladding.
2. An open drainage material, not less than nominal 1/4-inch thick and with a cross-section area that is not less than 80 percent open, installed between the cladding and backing,
3. Hollow-backed metal or vinyl siding installed in accordance with the manufacturer's instructions, or
4. An approved drainage design with drainage performance at least equivalent to Items 1, 2, or 3, or

not less than 90 percent drainage efficiency as measured in accordance with ASTM E 2273 or Annex A2 of ASTM E 2925.

Reprinted, with permission, from ASTM STP778 Masonry: Materials, Properties, and Performance, copyright ASTM International, 100 Barr Harbor Drive, West Conshohocken, PA 19428.

1404.5.1
WIND-DRIVEN RAIN INDEX

1404.5.2 Protection against inward vapor drive. Where claddings addressed in Sections 1404.10 and 1404.15 are used in Climate Zones 1A, 2A, or 3A in accordance with Chapter 3 of the International Energy Conservation Code and installed over wood-based or gypsum-based sheathing, a ventilated air space shall be provided in accordance with Exception 2 in Section 2510.6 and drainage shall be provided in accordance with Items 1, 2, or 4 of Section 1404.5.1.

Exceptions:

1. An approved drainage and ventilation design, including vent inlets and outlets, with ventilation performance at least equivalent to Items 1 or 2 of Section 1404.5.1 as measured in accordance with Annex A1 of ASTM E 2925.
2. An air space for ventilation shall not be required where foam plastic insulating sheathing complying with ASTM C 578 or ASTM C 1289 is located between the cladding and the wood-based or gypsum-based sheathing.

Add new standard(s) follows:

CHAPTER 35 REFERENCED STANDARDS

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959

E2925-17:

Standard Specification for Manufactured Polymeric Drainage and Ventilation Materials Used to Provide a Rainscreen Function

Reason:

Proposed new Section 1404.5 is needed to provide adequate moisture performance for exterior wall coverings and vulnerable wall materials in hazardous climate conditions that are prone to cause moisture problems. In these cases, the generic minimum weather protection practices in the code are unreliable and increase the risk of moisture durability problems including material degradation, rot, and mold. This proposal will serve to address this problem and provide risk-consistent solutions in coordination with climate hazards (e.g., wind-driven rain) as they vary across the U.S. In regions of low-to-moderate hazard, this proposal requires no change in practice but permits the enhanced provisions to be used.

First, the existing exceptions in Section 1402.2 are unchanged. Therefore, where these existing exceptions apply, the enhanced requirements of proposed Section 1404.5 would not apply because the charging language for use of Section 1404.5 is located in Section 1402.2.

Second, the provisions of proposed Section 1404.5 are required only in the more extreme climates of the U.S. with regard to moisture effects on exterior walls of buildings. However, the practices employed are beneficial in all climates; therefore, they are permitted to be used in other climate conditions.

Within Section 1404.5, proposed Section 1404.5.1 addresses drainage for exterior wall coverings in climates with significant wind-driven rain hazard. In these climates, the need for enhanced drainage is well understood from experience and research. For example, these provisions are modeled very closely after provisions found in the National Building Code of Canada (Section 9.27) as applied to climates with significant wind-driven rain. The NBC provisions were necessitated by wide-spread water intrusion problems and are based on research, field studies, and expert judgment. In the U.S. similar problems are occurring, particularly with conventional stucco installations on wood frame construction. These provisions will also help mitigate risk of water intrusion damage related to normal imperfections in exterior wall covering installation.

Also within Section 1404.5, proposed Section 1404.5.2 addresses inward vapor drives which present a well-known cause of moisture problems for walls clad with "reservoir claddings" such as adhered veneer (1404.10) and stucco (1404.15). These cladding types absorb water rainwater and then while drying (particularly with impinging energy from the sun) create significant inward vapor drives, forcing water vapor through underlying layer(s), such as the water resistive barrier, and into moisture sensitive materials within the wall assembly (such as wood-based and gypsum-based sheathings). Moisture sensitive materials such as wood-based and gypsum-based sheathings backing stucco and adhered veneers are particularly vulnerable if not adequately protected. Other reservoir claddings, like anchored masonry veneer (i.e., not adhered), already comply with Section 1404.5.2 due to the presence of a nominal 1-inch or greater vented air space behind the veneer.

The proposed provisions of Section 1404.5.2 coordinate with changes made last code cycle for Section 2510.6, exception 2. However, these requirements are broadly applicable and, thus, are best located in Chapter 14 and not hidden in an incomplete exception statement back in Chapter 25. More importantly, Section 1404.5.2 ensures the ventilated air space required in Exception 2 of Section 2510.6 also complies with the drainage requirements of Section 1404.5.1 and this serves to define a minimum size or effectiveness of the ventilated air space. Additionally, the charging language for Section 1404.5 permits these enhanced practices or options to be used in any climate zone, not just those limited conditions addressed in Exception 2 of Section 2510.6.

The exceptions in Section 1404.5.2 provide useful alternative means of addressing inward vapor drives from reservoir claddings. The first exception provides a means to justify use of alternative drainage and ventilation designs. The second exception provides a means to avoid use of a ventilated air space. It works by way of blocking the inward movement of water vapor from the reservoir cladding by use of lower permeance foam plastic insulating sheathing behind the cladding. This practice has been used successfully to prevent inward vapor drives from reservoir claddings and protect underlying moisture sensitive wall materials. It is also commonly used with 1-coat stucco systems. The drainage requirements of Section 1404.5.1 would still apply where applicable.

The provisions of Section 1404.5 are supported by various sources as documented in the research report ("Moisture Control Guide") referenced in the bibliography. The wind-driven rain map provided as new Figure 1404.5.1 is based on an ASTM paper as noted as the source for the figure. It is also very consistent with a more recent wind-driven rain climatology study by the University of Georgia.

From a resiliency perspective, it is no less appropriate to consider actions to address variation of building durability climate hazards across the U.S. as it is to consider variation in structural hazards such as wind, snow, and earthquake loads as they also vary across the U.S. In fact, durability problems related to climate-driven moisture effects and associated vulnerabilities of construction materials and methods often contribute to damages from structural hazards. Thus, this proposal will help ensure intended structural performance for the service life of a building.

Bibliography:

Model Moisture Control Guidelines for Light-Frame Walls: A Building Code Supplement for Builders, Designers, and Code Officials, ABTG Research Report No. 1701-01, 2017, Applied Building Technology Group LLC, <https://www.appliedbuildingtech.com/rr/1701-01>

Cost Impact

The code change proposal will increase the cost of construction .

cdpACCESS does not provide a option to declare "The code change proposal will increase and decrease cost of construction" (which is perhaps a more appropriate description of the cost impact of this proposal for reasons that follow).

For most of the U.S. these provisions do not apply and there is no cost impact. However, proposed Section 1404.5.1 will increase costs for cladding installation on some types of construction in the more hazardous wind-driven rain climates by requiring provision of adequate drainage behind claddings. However, there is no change or cost impact for claddings that already meet the requirements (e.g., anchored brick veneer) or which are already inherently drained (e.g., vinyl siding). There also is no change or cost impact for walls of concrete or masonry construction per Section 1402.2, Exception 1, or for claddings meeting the existing performance requirement of Section 1402.2, Exception 2 (e.g., barrier EIFS).

Proposed Section 1404.5.2 would appear to increase cost for stucco and adhered veneer installations that are in hot-humid climates and which do not already address inward driven moisture, but the drainage and ventilation requirements are already vaguely required (complete in concept but not in detail) in Exception 2 of Section 2510.6 of the code. Also, Exception 1 of Section 1402.2 prevents any cost impact to installations on concrete or masonry construction. Finally, proposed Section 1404.5.2 includes additional options for compliance (e.g., exceptions) that may actually reduce cost of compliance for some stucco and adhered veneer installations.

Without robust data on the variation in construction types and cladding types by regional climate conditions, it is difficult to determine the magnitude of cost impact and whether or not it is a net increase or decrease in cost for a population of buildings representative of those built using the IBC. But, it is clear in some specific cases there could be a cost increase. In these specific cases, one conventional solution that would satisfy both Sections 1404.5.1 and 1404.5.2 would be to provide furring behind the cladding (and this is not necessarily the low-cost solution). The total cost of furring including overhead and profit per the 2017 RS Means Open Shop Building Construction Costs manual ranges from about \$0.60/SF (\$1.17/LF 1x3 wood furring pneumatically nailed to wood framing at 24"oc) to \$2.22/SF (metal furring at 16"oc). Considering the many cases where there is no cost impact, this proposal will range in cost impact of \$0/SF to as much as \$2.22/SF depending on a number of factors. It is likely that the net impact is closer to \$0/SF than \$2.22/SF.

FS94-18

IBC: 1402.3 (New)

Proponent: David Collins, The American Institute of Architects, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

Add new text as follows:

1402.3 Fenestration. Vertical fenestration and skylights, including windows and doors, shall comply with the International Energy Conservation Code, as applicable.

Reason:

The IECC contains detailed requirements regarding doors, windows and skylights which apply to all buildings. Primarily fenestration is located in the exterior walls of the building. Obviously skylights are located in the roof. The IBC already addresses the quantity and fire resistance of openings in Chapter 7. Chapter 14 addresses the overall integrity of exterior walls. Providing energy efficient fenestration is part of the design consideration of exterior walls. The fenestration requirements are somewhat complex and should remain in the IECC, but the existence of the IECC provisions need to be referenced in the IBC to reduce the possibility of them being overlooked.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This requirement already exists in the IECC. Inclusions in the IBC doesn't result in any construction not already anticipated.

Internal ID: 1168

IBC: 1402.5 (New)

Proponent: Tim Earl, GBH International, representing self (tearl@gbhinternational.com)

2018 International Building Code

Add new text as follows:

1402.5 Exterior wall envelope. Exterior walls on buildings of Type I, II, III, or IV construction that are greater than 40 feet (12,192 mm) in height above grade plane where the exterior wall envelope contains a combustible material, the complete exterior wall envelope shall be tested as a system in accordance with and comply with the acceptance criteria of NFPA 285 unless compliance with NFPA 285 is specifically exempted elsewhere in this Chapter.

Exception: An exterior wall envelope where the only combustible component is a water-resistive barrier in compliance with section 1402.6.

Reason:

This code change proposal is a generic requirement that ensures that all exterior wall envelope systems containing combustible materials must be tested to NFPA 285 as a complete system (if they exceed 40 ft. in height) unless otherwise exempted by other provisions of Chapter 14.

This proposal is followed by a series of proposals addressing various issues associated with combustible materials in exterior walls. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope. Just as at present, no testing of completely non-combustible exterior walls would be required.

An alternate proposal addresses added requirements in the case of the presence of projections or interior corners.

The issue of wind effects has been raised but no standard test (or standardized variations of a standard test) exists that can address that.

The definition of “exterior wall envelope” in the IBC makes it clear that it is the “product” that needs to be tested because the fire performance of any system is affected by the fire performance of all its components. Therefore, if each component is fire tested individually and they all meet the requirements, there is no assurance that the entire system (meaning the exterior wall envelope) will perform adequately and meet the requirements.

This was always the intent for fire performance testing and minimum fire safety requirements of the chapter, but the section as currently written is not as clear as it should be. This is intended to address concerns with current language and requirements that could ultimately lead to tragic fires like the one in Grenfell Tower(London, England).

Note: The current definition for EXTERIOR WALL ENVELOPE in the IBC follows:

A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

Cost Impact

The code change proposal will increase the cost of construction .

While it was always the intent that systems be tested, if users were not testing the entire exterior wall system, they will now be required to do so.

2018 International Building Code

Add new text as follows:

1402.6 Flame spread of wall and attic protection. Where a building is not required to comply with NFPA 285, the exterior walls, or combination of exterior walls and eaves shall comply with Section 1402.6.20 when subject to fire testing in accordance with Sections 1402.6.2 through 1402.6.23.

Exceptions:

1. When there is or no observed flame spread above the lower 8 feet of the 16-foot test assembly, the wall assembly being tested is considered to have passed the test and is acceptable for use on the exterior of buildings.
2. Where eaves are located at a height greater than 8 feet above grade, the wall includes a gable vent or the building is designed with a parapet and low sloped roof, the exterior wall system above 8 feet from grade can be constructed using any alternative approved materials, provided the assembly of the lower 8 feet above grade of the wall assembly is permitted in accordance to Exception 1 to Section 1402.6.

1402.6.1 Wall sections deemed to comply. Wall assemblies listed below are deemed to comply with Section 1402.6 when the water-resistant barrier is the only combustible component and the water-resistive barrier has a peak heat release rate of less than 150 kW/m², a total peak heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

1. The following wall assemble is deemed to comply with Section 1402.6 and is acceptable for use on the exterior wall of buildings when the attic space, exterior wall with gable vents, or parapet with low sloped roofs are more than 16 feet above grade plane. The wall assembly is required on the lower portion of the wall to a height of 16-feet above grade plane.
 - 1.1. Vinyl siding over water-resistant barrier and 1/2 inch plywood.
2. The following wall assemblies are deemed to comply with the Exception to Section 1402.6 and are acceptable for use on all exterior walls. The wall assembly is required on the lower portion of the wall to a height of 8-feet above grade plane.
 - 2.1. Fiber cement siding over water-resistant barrier and 1-inch R-5 EPS.
 - 2.2. 3/8-inch base coat stucco over water-resistant barrier and 1/2-inch plywood.
 - 2.3. 3/8-inch base coat stucco over water-resistant barrier, 1-inch R-5 EPS and 1/2-inch plywood.
 - 2.4. EIFS with 3/16-inch base coat of fiberglass mesh w/acrylic finish over water-resistant barrier and 1/2-inch plywood.
 - 2.5. EIFS with 3/16-inch base coat of fiberglass mesh w/acrylic finish over water-resistant barrier 1.5-inches EPS and 1/2-inch plywood.
 - 2.6. Vinyl siding over water-resistant barrier, mineral wool boards and 1/2-inch OSB.

1402.6.2 Fire test. This fire-test-response procedure prescribes a method to assess the fire performance of a vertically oriented specimen, eave projection and roof that encloses an attic space, exposed to direct flame impingement in a simulated external fire. When tested in accordance with 1402.6, when present, the eave construction shall be uniform and continuous around the perimeter of the test specimen.

1402.6.3 Test assembly. The test assembly wall dimensions shall be 16 feet wide and 16 feet high and have a

supporting wall on each end that extends back 8 feet at a 90-degree angle to the 16-foot wall. The eave shall be constructed as an 18-inch projection, extending horizontally from the top of the 16-foot wall section. The roof and attic spaces shall be constructed such that the roof extends from the projection's fascia at an angle of 6:12. The roof shall be covered with 5/8-inch OSB roof sheathing and roofing materials. The roof members shall have an intermediate supporting vertical member extending from the top of the 16-foot wall as well as at the ends of the 8 foot walls.

1402.6.4 Joint detail. The test assembly shall incorporate joint detail(s) representative of actual installation.

1402.6.5 Wall detail. The wall assembly used as the test specimen shall include sheathing, weather barrier and cladding attached to the exterior surface of the structural support elements.

1402.6.6 Wall material. For wall assemblies composed of layered materials, such as sheathing, water-resistive barrier, continuous exterior insulation and siding (cladding), the installation of such layered materials shall be in accordance with the manufacturer's instructions, or in the absence of such instructions, applicable building code requirements. In the absence of manufacturer's specifications, the wall assembly shall include the following minimum components: nominal 2x4 studs spaced 16 in (410 mm) on center, and the desired exterior siding material. If sheathing is used, tests shall be run on typical 7/16 in. oriented strand board (OSB) of Exposure 1 rating. Where specified by the manufacturer, sheathing materials and installation shall be in accordance with the manufacturer's instructions. The type, thickness, and installation method of any sheathing method of any sheathing shall be included in the report.

1402.6.7 Accelerated aging/weathering and pre-test conditions of test material. When required by a regulatory or other agency a pre-test accelerated aging/weathering of the samples shall be completed. The manufacturer shall have the option to conduct such weathering. Weathering shall be conducted as specified by the regulatory agency or applicable methods as specified for the product. Details of the weathering method used, or reference to a standard test method, shall be included in the report.

1402.6.8 Test samples. Two hygroscopic samples of each materials from the same stock from which the test assembly was constructed shall be tacked to the test assembly during construction in such a manner that they are easily removed. These pieces shall be conditioned with the completed test specimen.

1402.6.9 Storage. The completed test assemblies and samples shall be stored indoors at temperatures not lower than 60°F (16°C) nor higher than 90°F (32°C) for the period of time necessary to cure the assembly components. Test assemblies are to be stored so that each will be surrounded by freely circulating air.

1402.6.10 Sample testing. Just prior to the assembly testing, the pieces of hygroscopic materials prepared in 705.2.5.2.1 shall be tested for moisture content.

1402.6.11 Moisture determination. Samples of like materials shall be reported as the average. For lumber and other wood-based materials, use Test Method ASTM D4442. Alternatively, the moisture content for lumber and other wood-based materials is permitted to be measured using a moisture meter. For other hygroscopic materials, use test methods appropriate for those materials.

1402.6.12 Lumber used in the construction of the supporting wall structure. The moisture content shall not be more than 12 percent. For wood sheathing, the moisture content shall not exceed 8%. For other hygroscopic materials, the moisture shall be within ranges specified by the manufacturer before the assembly is constructed. These specified ranges shall be typical for exposure.

1402.6.13 Burner details. The ignition source for the test shall be gas diffusion burner with a nominal 4 in. wide by 39 in. (100 mm wide by 1000 mm) long porous top surface of a refractory material. With the exception of top surface dimensions, the essential configuration of the burner is comparable to the burner design describe in Test Method E2257.

1402.6.14 Burner enclosure. The burner enclosure shall be positioned so that it is centered relative to the width of the 16-foot test wall. The distance from the bottom of the test assembly to the top surface of the burner shall be 12 plus or minus 2 inches. (300 plus or minus 50 mm). The bottom of the test assembly shall be protected from burner fire exposure by the placement of a 4 foot (1220 mm) wide thermal barrier.

1402.6.15 Procedure. The ambient temperature in the test room shall be above 60°F (15°C) and the relative humidity shall be less than 75 percent. The test room shall be draft-protected and equipped with an exhaust hood system for removal of products of combustion during the test.

1402.6.16 Horizontal air flow. The horizontal air flow, measured at a horizontal distance of 20 inches. (0.5m) from

the edge of the wall assembly, shall not exceed 1.64 feet per second (0.5 m/s).

1402.6.17 Test assembly position. Prior to testing position the test assembly under the exhaust hood and set the gas burner for the prescribed level of output.

1402.6.18 Burner output. Once the burner output is verified, position the specimen holder assembly at the desired test location under the collection hood.

1402.6.19 Burner ignition. Simultaneously ignite the gas burner and start the timer marking the beginning of the test. Control the burner to a constant 100 kw output. Control the hood duct flow to collect all products of combustion.

1402.6.20 Flame exposure. Continue the flame exposure for a period of 20 minutes, or until such time that observations of flames in the attic space have been made. The specimen will have passed the test if no flame intrusion was observed into the attic space.

1402.6.21 Documentation. Perform photographic or video documentation, or both, before, during and after each test.

1402.6.22 Report. The report shall include the following:

1. Name and address of the testing laboratory.
2. Name and address of test sponsor.
3. Description of the test assembly including construction details of the wall system, details of individual components and the manufacturer's installation details and limitations as applicable.
4. Number of specimens tested.
5. Conditioning of test assemblies.
6. Pre-test accelerated aging/weathering exposure, as applicable.
7. Moisture content of hygroscopic elements of the wall system construction at the time of testing.
8. Details of the calibration including heat supply rate.
9. Date of test, identification number and date of report.

1402.6.23 Test Results. The test results shall include:

1. A notation of the time and location of the breach of the flame into the attic space.
2. A determination of the presence of glow on the unexposed side of the assembly at the end of the 60-minute observation period.
3. Observations of the burning characteristics of the exposed surface of the test during and after the test exposure.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

D4442-16:

Standard Test method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter

E2257-17:

Standard Test Method for Room Fire Test of Wall and Ceiling Materials and Assemblies

Reason:

The proposed change establishes a material-neutral, engineering solution, that allows for a wide range of options and design solutions to address the issue of fire spreading across the exterior wall and breaching the attic space, from

fires that originate on the exterior of a building. The risks associated to exterior fires of this type have been rising dramatically due to changes in the energy code that require more wall insulation. The increased insulation can be accommodated by increasing the wall thickness and installing more insulation in the wall cavity or by adding continuous insulation to the exterior of the more typical 2x4 or 2x6 wall. The exterior insulation does not present a fire hazard if it is non-combustible or protected in a way to prevent the insulation from being involved in a fire originating near the exterior wall from fires in nearby buildings, landscaping and in some cases radiative heat from the windows of a nearby building. This code proposal incorporated into the IBC is a means to evaluate the spread of fire on the exterior of buildings that also includes testing to determine if the fire spreads into the attic. The provisions in the proposal are based on fire testing research performed at UL, Fire Service Summary Report: Study of Residential Attic Fire Mitigation Tactics and Exterior Fire Spread Hazards on Firefighter Safety, funded by the Department of Homeland Security, and UL fire test, Verification Services Project for Exterior Wall Mock-up Fire Demonstration with Comfortboard 80 Insulation Products. Work is now underway with UL/ANSI to develop a standard that can be referenced in future editions of the ICC Codes.

Section 1402.6.1 adding the list of wall configurations deemed to comply includes wall assemblies that were tested in the above referenced test by UL. Based on that testing the listed wall assemblies would comply with the test procedure proposed by this code change. The section is based on provisions in the IECC that lists materials and assemblies that are deemed to comply with the IECC requirements for air leakage.

A report from NFPA Research entitled, Residential Structure Fires Originating On Outer Walls, Spreading On Exterior Walls Or Trim, and Beginning On An Outer Wall with Plastic, January 2018, identifies the problem that now exists because of the increased use of unprotected combustible products used to meet the current energy code requirements. The report documents the number of residential fires where the item contributing most flame spread was exterior sidewall covering and surface finish. From 2005 to 2015, this type of fire occurs on average 7663 times per year, causing an annual average of 50 casualties, 345 injuries and \$539 million in property loss.

UL fire test, Verification Services Project for Exterior Wall Mock-up Fire Demonstrations with Comfortboard 80 Insulation Products has shown that a fire can reach the attic in a building through the soffit in 2-3 minutes in buildings with unprotected combustible products in the exterior wall. In buildings with light siding and non-combustible insulation, tested using the same procedure, the exterior of the building does not catch on fire and thus the issue of the fire getting into the attic never happens.

The methodology proposed for fire testing in this proposal, assess the flame spread of the exterior wall and the time it takes for a fire to breach the attic space. To have a complete solution to the spread of fire into the attic it is imperative that the exterior wall meet the criteria in Section 1405.1 concerning Combustible Materials on the Exterior Side of Exterior Walls. A companion change has been submitted to add Type V construction to the section.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The cost impact if any is minor. Some cost will be incurred by material manufacturers to determine compliance with the required test procedure. Material and installation cost are basically natural.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2257-17 and ASTM D4442-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

FS97-18

IBC: 1402.5 (New), 1402.5.1 (New)

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Building Code

Add new text as follows:

1402.5 Exterior wall envelope. Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane where the exterior wall envelope contains a combustible material, the complete exterior wall envelope shall be tested as a system in accordance with and comply with the acceptance criteria of NFPA 285 unless compliance with NFPA 285 is specifically exempted elsewhere in this Chapter.

Exception:An exterior wall envelope where the only combustible component is a water-resistive barrier in compliance with Section 1402.6

1402.5.1 Projections or inside corners. Where the exterior wall contains projections or inside corners, fire testing shall be conducted to demonstrate that the projections or inside corners will not negatively affect the fire safety of the exterior wall envelope. Such testing shall be related to the actual end-use configuration and be performed on the finished manufactured assembly in the maximum thickness intended for use. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

Reason:

This code change proposal is a generic requirement that ensures that all exterior wall envelope systems containing combustible materials must be tested to NFPA 285 as a complete system (if they exceed 40 ft. in height) unless otherwise exempted by other provisions of Chapter 14.

The reason fire testing of exterior wall envelopes is needed is because they can cause high fire losses (especially in terms of victims) and some examples are shown in the bibliography.

This proposal is followed by a series of proposals addressing various issues associated with combustible materials in exterior walls. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope. Just as at present, no testing of completely non-combustible exterior walls would be required.

An alternate proposal does not address any added requirements in the case of the presence of projections or interior corners. That provides a simpler approach, particularly in view of the fact that it is difficult to define exactly what level of projections or corners would trigger the requirement.

The issue of wind effects has been raised but no standard test (or standardized variations of a standard test) exists that can address that.

The definition of "exterior wall envelope" in the IBC makes it clear that it is the "product" that needs to be tested because the fire performance of any system is affected by the fire performance of all its components. Therefore, if each component is fire tested individually and they all meet the requirements, there is no assurance that the entire system (meaning the exterior wall envelope) will perform adequately and meet the requirements.

This was always the intent for fire performance testing and minimum fire safety requirements of the chapter, but the section as currently written is not as clear as it should be. This is intended to address concerns with current language and requirements that could ultimately lead to tragic fires like the one in Grenfell Tower (London, England) in 2017.

Note: The current definition for EXTERIOR WALL ENVELOPE in the IBC follows:

A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

Evidence exists that fires in exterior wall envelopes containing projections or inside corners may present additional fire hazard and, for that reason, a section requiring specialized testing is being proposed to be added. Standard tests can be modified or specific tests can be used to investigate the effects of such constructions on fire safety.

Cost Impact

The code change proposal will increase the cost of construction .

It is possible that some exterior wall envelopes are not being tested at present. In that case, the cost of construction would be increased.

Internal ID: 791

FS98-18

IBC: 1402.5 (New),

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Add new text as follows:

1402.5 Water-resistive barriers. Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible water-resistive barrier shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, fenestration products, flashing of fenestration products and water resistive barrier flashing and accessories at other locations, including through wall flashings, shall not be considered part of the water-resistive barrier.

Exceptions:

1. Walls in which the water-resistive barrier is the only combustible component and the exterior wall has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the water-resistive barrier is the only combustible component and the water-resistive barrier complies with the following:
 - 2.1. A peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg when tested, on specimens at the thickness intended for use, in accordance with ASTM E 1354, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².
 - 2.2. A flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723, with test specimen preparation and mounting in accordance with ASTM E 2404.

Delete without substitution:

~~**1402.5 Vertical and lateral flame propagation.** Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible water resistive barrier shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, fenestration products, flashing of fenestration products and water resistive barrier flashing and accessories at other locations, including through wall flashings, shall not be considered part of the water resistive barrier.~~

~~Exceptions:~~

- ~~1. Walls in which the water resistive barrier is the only combustible component and the exterior wall has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.~~
- ~~2. Walls in which the water resistive barrier is the only combustible component and the water resistive barrier has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².~~

Reason:

The water resistive barrier needs to meet two fire tests and they are somewhat garbled in this section and the proposed wording separates them out, placing the test to ASTM E1354 first and the test to ASTM E84 separately second. Also, when testing water resistive barriers in accordance with ASTM E84 the standard practice ASTM E2404 needs to be used, as made clear in the test method with the revisions developed by ASTM for ASTM E2404. This is consistent with the way that many other uses of ASTM E84 are indicated in chapter 8, for example.

This proposal is clarification of the language in the code because the scope of ASTM E2404 was expanded since the approval of the language in the 2018 code.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety

and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

2018 International Building Code

Revise as follows:

1402.5 Vertical and lateral fire testing of exterior walls for flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane ~~and contain a combustible water-resistive barrier shall be tested~~ that include combustible components shall be tested for flame propagation in accordance with and comply with the acceptance criteria of ~~NFPA 285, the test methods in Table 1402.5.~~ The complete exterior wall envelope shall be tested. For the purposes of this section, fenestration products, flashing of fenestration products and water-resistive-barrier flashing and accessories at other locations, including through wall flashings, shall not be considered part of the water-resistive ~~barrier.~~ barrier.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

Add new text as follows:

1402.5.1 Supplemental requirements for test method. Where compliance with this section is required by Table 1402.5, the following shall apply:

1. Where an exterior wall will include one or more horizontal projections, the wall assembly shall be tested in accordance with NFPA 285 using a test sample that incorporates a horizontal projection that extends 5 feet from the exterior wall surface and is located 36 inches above the window opening. The tested assembly shall be required to comply with the acceptance criteria of NFPA 285.
2. Where an exterior wall will include one or more interior corners, the wall assembly shall be tested in accordance with one of the following options:
 - 2.1 NFPA 285 using a test sample that incorporates a corner that is located at the left or right edge of the window opening and extends an exterior wall surface at a right angle to the plane of the window that creates a 5 foot deep interior corner. The tested assembly shall be required to comply with the acceptance criteria of NFPA 285.
 - 2.2 NFPA 285 using the standard wall assembly and an additional test using the 16 foot parallel panel test specified in FM 4880. The tested assembly shall be required to comply with the acceptance criteria of both NFPA 285 and FM 4880.
3. Where an exterior wall will include both horizontal projections and interior corners, the wall shall be tested in accordance with both Item 1 and Item 2.
4. Tests in Item 1 and Item 2.1 shall be conducted with wind applied at 60 second intervals, accomplished by cycling the fan or fans on and off for the duration of the test. Fans shall apply a uniformly distributed wind speed of 30 feet per second to the face of the test assembly when running at full speed.

Table 1402.5
REQUIRED EXTERIOR WALL FIRE TEST METHOD

Exterior Wall Construction ^a	Required Test Method
Flat wall surface	ASTM E119
Exterior finish or coating	See Section 1402.5.1

a. Where no projections or interior corners exceed 12 inches, measured perpendicular to the wall surface, the wall is considered to be a flat wall surface

Reason:

For the past year, I have been attempting to get the NFPA 285 committee to consider adjustments to the NFPA 285 test procedure to address the issues of building geometry and wind. My approach has been to fight attempts to expand the use of NFPA 285 to include any wall assembly until changes are made to the standard to address these concerns. The development process for NFPA 285 has been very contentious on this issue, with the committee completely reversing course from one meeting to the next, and ultimately, the NFPA Standards Council refused to issue the latest update and returned the entire document to the technical committee.

The fire service has very little voice in the NFPA 285 process compared to industry interests, and it has been very difficult to get the committee to give these concerns due consideration, and on this issue, I am representing the perspective of the fire service and a code official. Lacking the ability to get appropriate consideration from the NFPA 285 technical committee, I am seeking to get the IBC to establish parameters for exterior wall tests that would be dictated to anyone writing test protocols for IBC buildings with walls regulated by this section.

The fire service is well aware of the effects of wind driven fires and of building geometry when it comes to fire behavior, and we can ill afford the risk of catastrophic high-rise fires involving exterior walls. While it has been claimed that there have been no such documented losses involving NFPA 285 compliant panels on buildings, the lack of a bad fire does not equate to a conclusion that everything is fine. Instead, numerous catastrophic exterior fires that have occurred just happened to occur on buildings with non-compliant walls assemblies. What would have happened if NFPA 285 compliant panels were used? Nobody can say for certain.

The current NFPA 285 test method is scoped to ONLY include non-bearing geometrically flat curtain walls attached to buildings, and I have no issue with the current test method continuing for this application. However, the effectiveness of this test method for assemblies with overhangs and inside corners that can intensify the fire exposure needs to be known before these untested geometric variations should be permitted by NFPA 285 or the IBC. UL's mantra is "know by test." We haven't tested, therefore, we don't know.

The addition of a wind application to the proposed samples with overhangs and/or corners recognizes that wind turbulence is likely to further increase fire intensity. Inside corners will form a flame vortex, and overhangs are expected to concentrate heat beneath the overhang. Either could cause an assembly that might pass the basic NFPA 285 test to fail.

The suggested parameters for the depth of extensions and wind speed (which approximately equates to 20 mph) are my best estimate, as a fire protection engineer and former firefighter, at a reasonable test. I have asked a variety of individuals involved in this issue to offer suggestions or run sample tests and got nowhere.

The fire service would be unwise to accept the risk of catastrophic high-rise fires by knowingly standing by while the NFPA 285 test method is exploited. Without knowing the fire performance consequences of stretching the test method to allow assemblies that are not well represented in the test, we cannot reasonably assure public safety or firefighter safety. We must do a better job of making sure we get this issue right because Grenfell Tower was a wake up call with respect to the consequences of inadequate testing. Do we really want to allow buildings to be built with untested wall configurations only to later learn that we screwed up and created a large pool of dangerous existing buildings? The time to address these concerns is now, before NFPA 285 loses its current scoping constraints and before tall wood buildings gain access to a test method that wasn't designed for that application.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Currently, NFPA 285's scope is limited to not include all types of wall assemblies that are being addressed by this proposal. Compliance with additional tests being proposed may or may not have an impact on the cost of construction, depending on whether existing assemblies and materials are able to pass the proposed test protocols.

Proponent: William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Jason Thompson, representing Masonry Alliance for Codes and Standards (jthompson@ncma.org)

2018 International Building Code

Revise as follows:

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. The NFPA 285 test shall be conducted with an airflow velocity of 4.5 m/s (10 mph) applied perpendicular to the exterior face of the test specimen. The airflow velocity shall be measured at the exterior surface of the test specimen and one foot above the top of the test specimen window opening. For the purposes of this section, *fenestrationfenestrationwater-resistive-barrier* of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

Reason:

It is common knowledge that air movement can intensify fire effects and spread fire. Ask any Boy Scout how they help the fire grow when using a campground fire pit for cooking. Or watch the news regarding the spread of wildfires through communities. Airflow does accelerate fire. But the question is by how much? That question remains unanswered even though we rely on exterior fire testing to assure there is not fire spread up the side of the building possibly resulting in a conflagration. The requirement for NFPA 285 testing in the IBC currently begins at 40 ft. of building height. The test is performed by placing a burner inside the test apparatus compartment and another burner at a window opening in the test specimen to simulate a room fire. The combination of the burners helps form a fire plume beginning at the top of window opening. Distance of fire spread as well rate of fire spread up the exterior wall is recorded and determined whether it meets the pass-fail criteria. This proposal would require that the test also include an air velocity of 4.5 m/s (10 mph) measured on the exterior wall test specimen surface at one foot above the opening and perpendicular to the wall. This would enable the proponents of products used in exterior wall assemblies to determine if their product is negatively impacted from a wind perspective during the test.. If the assembly fails further development of the assembly would be required.

A prevailing wind at a height of 40 ft. is common in any area of the country and provides reasoning that these assemblies should be tested in an environment that more closely resembles the intended application. Until, and unless standard development organizations incorporate provisions such as this into editions of standards, providing a wind component in the building code assures proper consideration of wind effects to fire spread on exterior walls assemblies required to be tested to NFPA 285

Cost Impact

The code change proposal will increase the cost of construction .

To pin point the increased cost of construction this proposal is difficult due to the costs being very dependant on the material the user intends to use. Air velocity will not affect many materials but will affect some.

FS101-18

IBC: 1402.5

Proponent: Andy Williams, Metal Construction Association, representing Metal Construction Association (afwilliams@Connect2amc.com)

2018 International Building Code

Revise as follows:

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, ~~fenestration:~~

1. Laminate and composite panels that are manufactured using a combustible adhesive shall be considered as a combustible exterior wall element.
2. Fenestration products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

Reason:

This text is being proposed to recognize that laminate or composite panels utilizing a combustible adhesive are adding combustibles to the exterior wall cladding and should be regulated in accordance with NFPA 285 Standard Fire Test Method for Evaluation of **Fire Propagation** Characteristics of Exterior Non-Load-Bearing Wall Assemblies Containing **Combustible Components**. While not high in volume, the only material separating these combustible adhesives from a fire is the exterior metal skin which is often only a thin layer of aluminum. Once the metal skin is penetrated by fire, the concern is that flames will spread rapidly through this untested material. There is no test criteria for the flame spread performance of the combustible adhesive in 703.5.2.

This change is proposed for Chapter 14 because this is an issue specific to Exterior Walls. There is no intent to address composite and laminate materials used for other applications that are not typically limited based on performance in NFPA 285.

The motivation for this proposal is to eliminate the potential for additional high rise cladding fires for panel systems that have not been tested to NFPA 285.

The current code makes an exception for the combustibles contained in the WRB (1402.5 Exception 1 and Exception 2). This panel type adds to the level of combustibles in the wall assembly and should be tested to show that there is no additional hazard for flame spread through the exterior wall assembly.

Typical panels have a noncombustible core with a layer of metal held on by a combustible adhesive. Two examples are shown below.

Corrugated Core (End View)

Upper Section - Cut away view of honeycomb core, combustible adhesive, with exterior aluminum skin

Lower Section - Same panel with exterior aluminum skin removed.

While there are other types of panels with alternate noncombustible cores and attached facers, the performance question is regarding the ability of the combustible adhesive to spread flame in a fire situation. This can only be done through recognized testing - in this case NFPA 285.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cost of NFPA 285 testing would be added to the overall cost of this product. Similar cost addition as other combustible wall assemblies.

Internal ID: 1378

FS102-18

IBC: 1402.5

Proponent: Bob Zabcik, representing Metal Construction Association (bobz@ncilp.com)

2018 International Building Code

Revise as follows:

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a either a combustible water-resistive barrier or a combustible adhesive shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

Reason:

Composite or laminate panels, whether assembled in the field or factory, are often made out of primary materials which are considered to be non-combustible. However, when these materials are assembled with adhesives that may contribute to the flame spread and potential heat of the wall assembly, then testing such as NFPA 285 should be required. That is exactly the purpose of this passage in the context of Weather Resistive Barriers.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The certification and testing costs of the subject products may increase.

FS103-18

IBC: 1402.5

Proponent: Thomas Meyers, Building Intuition, LLC, representing Self (codeconsultant@gmail.com)

2018 International Building Code

Revise as follows:

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².
3. Walls in which the water-resistive barrier is applied over pressure-impregnated, fire-retardant-treated-wood complying with Section 2303.2 and the water-resistive barrier complies with Exception 1 or Exception 2.

Reason:

Recent building cladding fires, such as the Grenfell Tower fire in London, have prompted review of the application of the NFPA 285 test standard to identify potential existing conflicts and areas of needed improvement or clarification.

Section 1402.5 appears to create a conflict resulting in significant industry confusion regarding the use of fire-retardant-treated wood (FRTW) in Types I, II, III, & IV construction as allowed by Section 602 and 603. This section suggests that FRTW cannot be used with a NFPA 285 compliant water-resistive barrier beyond 40 feet in height. The code currently allows FRTW used in Type III construction to extend to 85 feet in height. As FRTW does not meet the definition of “noncombustible” per Section 703.5, Exceptions 1 and 2 cannot be applied. This change provides for the needed clarification to permit FRTW to be used as permitted in Section 602 and 603 in conjunction with a NFPA 285 compliant water-resistive barrier.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Potential construction savings where FRTW use was denied due to existence of a combustible water-resistive barrier.

IBC: 1402.5

Proponent: Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov)

2018 International Building Code

Revise as follows:

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².
3. Exterior walls on buildings of Type III construction in which the water-resistive barrier is installed directly on exterior gypsum sheathing and the exterior wall has a wall covering of adhered veneer or stucco applied directly to the water-resistive barrier.

Reason:

The IBC requires that exterior walls incorporating combustible water-resistive barriers in buildings higher than 40 ft and constructed of Type I, I, III or IV construction be tested to NFPA 285. Grade building paper has not been tested, Type V buildings can have a height that exceeds 40 ft and are not addressed. All the wall assemblies listed do not incorporate wood studs. The proposed code change ensures that the ignition of the water resistive barrier will not be caused by ignition of the combustible sheathing such as OSB or plywood. Section 703.5.2 conceptually addresses this issue similarly to that where a thin material is laminated on a non-combustible material can be considered non-combustible if it meets a flame spread rating. Exception 1 in Section 1402.5 also recognizes the benefit of the combustible water resistive barrier in a non-combustible wall. Similarly this code change recognize that the ignition potential for a combustible water resistive barrier sandwiched between two non-combustible sheathing materials or plaster without flue space is very limited. While there may be drainage planes between the stucco and the water resistive barrier the flue space is small enough to be negligible.

We have received several alternate methods and materials requests to utilize Grad D paper in lieu of listed proprietary water resistive barriers since the generic legacy material has not been tested ad all the listed wall assemblies are listed on metal framing. We have also reviewed fire analysis of heat release rates, time to ignition and various other parameters comparing the legacy material to the proprietary materials and they appear to have comparable properties and as a result chose to not include Type V buildings permitted to have a height in excess of 40 ft to this code change.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed code change provides an option that does not require the use of proprietary water resistive barriers.

Internal ID: 933

FS105-18

IBC: 1402.5

Proponent: Benjamin Meyer, representing self (2ben.meyer@gmail.com)

2018 International Building Code

Revise as follows:

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².
3. Water-resistive barriers complying with Section 703.5.2.

Reason:

The reference code section can be applied to a WRB material on certain substrates. This exception simplifies other exceptions in the WRB section, while still meeting the stringency and intent of non-combustibility.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Alternate compliance and testing method which already exists in the code.

FS106-18

IBC: 1403.2

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council

2018 International Building Code

Revise as follows:

1403.2 Water-resistive barrier. Not fewer than one layer of No.15 asphalt felt ,complying with ASTM D226 for Type 1 felt, or other *approved* materials, shall provide a continuous water-resistive barrier behind the exterior wall veneer. No.15 asphalt felt shall be attached to the studs or sheathing and applied horizontally with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where vertical joints occur, No.15 asphalt felt shall be lapped not less than 6 inches (152 mm). Other approved water-resistive barrier materials shall be installed in accordance with the water-resistive barrier manufacturer's installation instructions. The No.15 asphalt felt or other approved water-resistive barrier material shall be continuous to the top of walls and terminated at penetrations and building appendages with flashing as described in Section 1404.4, in such a manner as to provide a continuous-1404.4. The water-resistive barrier behind the exterior wall veneer installation shall comply with the requirements for weather protection of the exterior wall envelope as described in Section 1402.2.

Reason:

This proposal better correlates the IBC with language in the 2018 IRC (Section R703.2) that provides additional clarity of intent and requirements. In particular, IBC Section 1403.2 is missing basic minimum installation requirements for No.15 asphalt felt. In addition, the 2018 IRC recognizes that other approved materials must be installed in accordance with the manufacturer's installation instructions since they often or necessarily vary from the basic minimum installation requirements for No.15 asphalt felt. Finally, the last phrase of the existing paragraph has been incorporated in the first sentence because it relates to the overall objective of the paragraph and should not be an afterthought.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal clarifies the provision and correlates with similar language in the IRC with no change in requirements or cost.

Internal ID: 984

FS107-18

IBC: 1403.2

Proponent: John Woestman, Kellen Co., representing Extruded Polystyrene Foam Association (XPSA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1403.2 Water-resistive barrier. Not fewer than one layer of No.15 asphalt felt, complying with ASTM D226 for Type 1 felt or other *approved* materials, shall be attached to the studs or sheathing, with flashing as described in Section 1404.4, in such a manner as to provide a continuous *water-resistive barrier* behind the *exterior wall veneer*. Other approved water-resistive barrier materials shall be installed in accordance with the water-resistive barrier manufacturer's installation instructions.

Reason:

This proposal adds a sentence that was added to the 2018 IRC (Section R703.2) but was not coordinated with the 2018 IBC. The purpose is to ensure that, for alternative water-resistive barrier materials, the manufacturer's installation instructions are the basis for installation as they may necessarily vary from the typical minimum installation practice used for Type 1 felt.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is a clarification and does not add cost.

Internal ID: 986

FS108-18

IBC: 1403.2

Proponent: Joseph Lstiburek, representing Self (joe@buildingscience.com)

2018 International Building Code

Revise as follows:

1403.2 Water-resistive barrier. Not fewer than one layer of No.15 asphalt felt, complying with ASTM D226 for Type 1 felt or other *approved* materials with a water resistance complying with ASTM E2556, Type I, shall be attached to the studs or sheathing, with flashing as described in Section 1404.4, in such a manner as to provide a continuous *water-resistive barrier* behind the *exterior wall* veneer.

Reason:

The existing code language gives insufficient guidance for other approved materials. The added language addresses this issue and provides a specific performance requirement for water resistance and provides consistency with other sections of the code that relate specifically to water-resistive barriers.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change gives better guidance for water resistance.

Internal ID: 1319

2018 International Building Code

Revise as follows:

1403.8 ~~Plastics.~~ Plastic construction elements. ~~Plastic panel, apron or spandrel walls as defined in this code~~ construction elements of the exterior wall envelope, including aprons, panels and spandrels shall not be limited in thickness, provided that such plastics and their assemblies conform to the applicable requirements of Chapter 26 and are constructed of *approved* weather-resistant materials of adequate strength to resist the wind loads for cladding specified in Chapter 16. Plastic spandrel walls shall also comply with the applicable requirements of section 715.5. Light transmitting plastic wall panels shall comply with Section 2607.

Reason:

This code change proposal is intended to clarify the requirements for plastic construction elements in exterior walls. This section is confusing as currently written.

Section 1404.8 does not address plastics in general, but does contain some requirements for specific plastic construction elements on exterior walls. The following terms are not defined in the IBC code: plastic panels, plastic aprons and plastic spandrel walls. The only reference to spandrel walls (and not specifically to plastic spandrel walls) is in section 715.5. Plastic panels are not mentioned in the code, except for light transmitting plastic wall panels that are referenced in section 2607.

In view of the fact that the section as written is confusing, this proposal will serve to clarify the requirements for better understanding by designers and building code officials, without changing requirements.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

1. Grenfell fire, London England:

Buildings Across U.S. Are Wrapped in Same Panels That Fueled Deadly London Fire: <https://www.wsj.com/articles/built-to-burn-thousands-of-buildings-world-wide-are-wrapped-in-combustible-panels-1508858048>

3. Address Hotel Fire, Dubai https://en.wikipedia.org/wiki/The_Address_Downtown_Dubai January 8th, 2018

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply clarifies the section for better use and understanding.

Internal ID: 389

FS111-18

IBC: 1403.12

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

1403.12 Polypropylene siding. *Polypropylene siding* shall be certified and labeled as conforming to the requirements of ASTM D7254 and those of Section 1403.12.1 or 1403.12.2 by an approved quality control agency. *Polypropylene siding* shall be limited to buildings of Type VB construction and shall be installed in accordance with the requirements of Section 1404.18 and ~~in accordance with the~~ manufacturer's instructions. *Polypropylene siding* shall be secured to the building so as to provide weather protection for the *exterior walls* of the building.

Reason:

This proposal limits the use of Polypropylene siding to only buildings of Type VB construction and adds back language that was inadvertently removed during the last code cycle.

Polypropylene siding is permitted in the code by section 1403.12, which requires it to meet ASTM D7254. The fire test in ASTM D7254 is ASTM E84 and polypropylene siding typically materials melt and fall to the floor of the tunnel during the test before the flame reaches the test specimen, which means that the flame spread index determined is not a valid test result.

Polypropylene siding is a product with very poor fire performance, something that has been demonstrated time after time. For example, the heat release rate of the polypropylene material typically used for polypropylene siding is about twice as high as that of typical wood siding and over twice as high as that of vinyl siding. The heat released by a material used in the outside of a building is an indication of the radiated heat to a nearby building.

Siding tests using ASTM E1354 fire test:

Wood (cedar) siding: peak heat release rate 309 kW/m - effective heat of combustion: 13 MJ/kg

Polypropylene siding 1: peak heat release rate 546 kW/m - effective heat of combustion: 25 MJ/kg

Polypropylene siding 2: peak heat release rate 878 kW/m - effective heat of combustion: 32 MJ/kg

Material tests using ASTM E1354 fire test:

Vinyl (PVC): peak heat release rate 190 kW/m - effective heat of combustion: 9 MJ/kg

For that reason, the use of this material has been limited to Type VB construction since it was first allowed into the IBC. When polypropylene siding burns it releases much more heat than any other siding material permitted by the code.

The difference between Type VB construction and no limits on the Type of construction, allows construction with greater heights, more stories above grade plane and larger allowable areas as well as allowing in buildings of Types I through IV construction. The text proposed to be added by this proposal was deleted at the last cycle with the rationale that this section simply addresses wind speeds. However, the permission for using polypropylene siding in any type of construction applies to the entire chapter.

Note also that the fire separation distance for polypropylene siding is 10 feet (as opposed to 5 feet for other materials) due to its poorer fire performance.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

1. Grenfell fire, London England:

Buildings Across U.S. Are Wrapped in Same Panels That Fueled Deadly London Fire: <https://www.wsj.com/articles/built-to-burn-thousands-of-buildings-world-wide-are-wrapped-in-combustible-panels-1508858048>

2. Torch Tower Fire, Dubai

https://en.wikipedia.org/wiki/The_Marina_Torch January 8th, 2018

3. Address Hotel Fire, Dubai https://en.wikipedia.org/wiki/The_Address_Downtown_Dubai January 8th, 2018

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal corrects the removal of the limitation to Type VB buildings that was inadvertently removed from the code the last cycle.

Internal ID: 388

FS112-18

IBC: 1403.12, 1403.12.2

Proponent: Matthew Dobson, Vinyl Siding Institute, representing Vinyl Siding Institute (mdobson@vinylsiding.org)

2018 International Building Code

Revise as follows:

1403.12 Polypropylene siding. *Polypropylene siding* shall be certified and labeled as conforming to the requirements of ASTM D7254 ~~and those of Section 1403.12.1 or 1403.12.2~~ by an approved quality control agency. Polypropylene siding shall comply with Section 1403.12.1 or 1403.12.2. *Polypropylene siding* shall be installed in accordance with the requirements of Section 1404.18 and in accordance with the manufacturer's instructions. *Polypropylene siding* shall be secured to the building so as to provide weather protection for the *exterior walls* of the building.

1403.12.2 Fire separation distance. ~~The Polypropylene siding shall not be installed on walls with a fire separation distance between a building with polypropylene siding and the adjacent building shall be not of less than 10 5 feet (3048-1524 mm).~~

Reason:

This change does not change the intent of the code but improves then language in the following ways:

-Editorial in first paragraph.

-Makes the requirement more consistent in with the language currently in the IRC.

-Makes it consistent with how the I-codes fundamentally treat fire separation distance, as a measurement to property line and requirements for wall performance. The way the code's is written is confusing and not appropriate. The code does not necessarily measure fire separation distance between buildings except in specific situations. Buildings are definitely not measured with a fire separation distance, this measurement is for walls exclusively in the I-codes.

It's worth looking at the definition:

FIRE SEPARATION DISTANCE. The distance measured from the building face to one of the following:1. The closest interior lot line.2. To the centerline of a street, an alley or public way.3. To an imaginary line between two buildings on the lot.The distance shall be measured at right angles from the face of the wall.

In general this is not a change in requirements and limitations.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is a clarification of how fire separation is measured and will not have any cost impact.

Internal ID: 834

FS113-18

IBC: 1403.14 (New)

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council

2018 International Building Code

Add new text as follows:

1403.14 Attachments through Insulation. Exterior wall coverings attached to the building structure through foam plastic insulating sheathing shall comply with the attachment requirements of Section 2603.11, 2603.12, or 2603.13.

Reason:

In the last two code cycles, Chapter 26 was revised to address cladding attachment requirements for cases where the cladding attachments pass through a layer of foam plastic insulating sheathing. However, those revisions occurred during the structural committee hearings (Group B) and did not allow coordination with sections in Chapter 14 assigned to the fire safety committee (Group A). This proposal is a follow-up to ensure that provisions in Chapter 14 which deal with installation of wall coverings are linked to special attachment requirements in three sections of Chapter 26 for cases where cladding attachments must be integrated with use of foam plastic insulating sheathing on the exterior of buildings. The language is added to Section 1403.13 because the referenced requirements are related to use of foam plastic insulation materials and are generally applicable to many cladding types in Section 1404; therefore, this approach avoids redundant references that would otherwise need to occur for each cladding type.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal cross references and clarifies application of requirements already in the code.

Internal ID: 980

FS114-18

IBC: 202 (New), 1403.13 (New), Chapter 35

Proponent: Matthew Dobson, VSI, representing Vinyl Siding Institute (mdobson@vinylsiding.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

INSULATED VINYL SIDING. A cladding product, with manufacturer-installed foam plastic insulating material as an integral part of the cladding product, having a thermal resistance of not less than R-2.

Add new text as follows:

1403.13 Insulated vinyl siding. Insulated vinyl siding shall be certified and labeled as conforming to the requirements of ASTM D7793 by an approved quality control agency.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

D7793-17:

Standard Specification for Insulated Vinyl Siding.

Reason:

This proposal introduces a product category that has been in the market for over 20 years and was standardized over 5 years ago. During the last cycle insulated vinyl siding was not allowed in the IBC (even though it is recognized in the IRC and the Energy Code), and the main reason provided was that the product should be tested as one assembly for flame spread and smoke developed index.

Insulated vinyl siding should be treated the same as any other cladding and insulation products. According to the IBC, cladding does not require flame spread testing or smoke developed index testing, except in applications where the product might be considered an interior finish, e.g. breezeways of apartments. Of course, the foam plastic needs to meet the requirements of Chapter 26 of the IBC and the product standard requires this testing in accordance with the IBC and IRC.

The IBC has provisions in place for cladding when used in certain density settings and when used with non-combustible construction. The previous argument used is not valid because it places additional requirements on one type of cladding product when there are many other cladding systems that would not be required to be tested similarly. Additionally, when insulated vinyl siding needs to be tested as a whole assembly in high density settings, it can pass the E119 test.

Insulated vinyl siding has proven to be safe for the past twenty years, and with this proposal we submit examples of several products approved for use in higher density settings as part of an E119 1-hour rated assembly. Insulated vinyl siding has also been approved for use in urban wildland interface settings in California via the CA SFM 12-7A-1 test. Also submitted is code compliance report where it specifies insulated vinyl siding is allowed for use in the IBC, and has been for years. Information has been included as attachments.

By recognizing the product standard, developed through the ASTM standard making process in 2010-2012, the code is simply staying up-to-date with recognition of the proper standard – providing accurate information to building officials on a well-performing product that also contributes to energy efficiency.

Cost Impact

The code change proposal will decrease the cost of construction .

By adding this reference into the IBC it will help to reduce some of the additional regulatory costs associated with product standards not recognized by the building code.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D7793-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 830

FS115-18

IBC: TABLE 1404.2

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards (jthompson@ncma.org)

2018 International Building Code

Revise as follows:

**TABLE 1404.2
MINIMUM THICKNESS OF WEATHER COVERINGS**

COVERING TYPE	MINIMUM THICKNESS (inches)
Adhered masonry veneer	
Architectural cast stone	0.75
Other	0.25
Aluminum siding	0.019
Anchored masonry veneer	
Stone (natural)	2.0
Architectural cast stone	1.25 -2.5
Other	2.625
Asbestos-cement boards	0.125
Asbestos shingles	0.156
Cold-rolled copper ^d	0.0216 nominal
Copper shingles ^d	0.0162 nominal
Exterior plywood (with sheathing)	0.313
Exterior plywood (without sheathing)	See Section 2304.6
Fiber cement lap siding	0.25 ^c
Fiber cement panel siding	0.25 ^c
Fiberboard siding	0.5
Glass-fiber reinforced concrete panels	0.375
Hardboard siding ^c	0.25
High-yield copper ^d	0.0162 nominal
Lead-coated copper ^d	0.0216 nominal
Lead-coated high-yield copper	0.0162 nominal
Marble slabs	1
Particleboard (with sheathing)	See Section 2304.6
Particleboard (without sheathing)	See Section 2304.6
Porcelain tile	0.25
Steel (approved corrosion resistant)	0.0149
Structural glass	0.344
Stucco or exterior cement plaster	
Three-coat work over:	
Metal plaster base	0.875 ^b
Unit masonry	0.625 ^b
Cast-in-place or precast concrete	0.625 ^b
Two-coat work over:	
Unit masonry	0.5 ^b
Cast-in-place or precast concrete	0.375 ^b
Terra cotta (anchored)	1
Terra cotta (adhered)	0.25
Vinyl siding	0.035
Wood shingles	0.375
Wood siding (without sheathing) ^a	0.5

For SI: 1 inch = 25.4 mm, 1 ounce = 28.35 g, 1 square foot = 0.093 m².

- a. Wood siding of thicknesses less than 0.5 inch shall be placed over sheathing that conforms to Section 2304.6.
- b. Exclusive of texture.
- c. As measured at the bottom of decorative grooves.
- d. 16 ounces per square foot for cold-rolled copper and lead-coated copper, 12 ounces per square foot for copper shingles, high-yield copper and lead-coated high-yield copper.

Reason:

Industry standards and recommendations have set the minimum thickness of anchored cast stone veneer at 2.5 inches for decades. This minimum thickness is necessary to ensure there is sufficient engagement of the veneer anchor embedded in the mortar bed joint to provide later support of the veneer as well as provide the necessary cover depth for corrosion protection of the veneer anchor.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change will bring the IBC requirements in line with already established industry standards and practices being used.

Internal ID: 2016

FS116-18

IBC: TABLE 1404.2

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards (jthompson@ncma.org)

2018 International Building Code

Revise as follows:

**TABLE 1404.2
MINIMUM THICKNESS OF WEATHER COVERINGS**

COVERING TYPE	MINIMUM THICKNESS (inches)
Adhered masonry veneer	0.25
Architectural cast stone	0.75
Other	0.25
Aluminum siding	0.019
Anchored masonry veneer	2.0
Stone (natural)	1.25
Architectural cast stone	2.625
Other

Asbestos shingles	0.156
Cold-rolled copper ^d	0.0216 nominal
Copper shingles ^d	0.0162 nominal
Exterior plywood (with sheathing)	0.313
Exterior plywood (without sheathing)	See Section 2304.6
Fiber cement lap siding	0.25 ^c
Fiber cement panel siding	0.25 ^c
Fiberboard siding	0.5
Glass-fiber reinforced concrete panels	0.375
Hardboard siding ^c	0.25
High-yield copper ^d	0.0162 nominal
Lead-coated copper ^d	0.0216 nominal
Lead-coated high-yield copper	0.0162 nominal
Marble slabs	1
Particleboard (with sheathing)	See Section 2304.6
Particleboard (without sheathing)	See Section 2304.6
Porcelain tile	0.25
Steel (approved corrosion resistant)	0.0149
Structural glass	0.344
Stucco or exterior cement plaster	0.875 ^b
Three-coat work over:	0.625 ^b
Metal plaster base	0.625 ^b
Unit masonry	0.5 ^b
Cast-in-place or precast concrete	0.375 ^b
Two-coat work over:	
Unit masonry	
Cast-in-place or precast concrete	
Terra cotta (anchored)	1
Terra cotta (adhered)	0.25
Vinyl siding	0.035
Wood shingles	0.375
Wood siding (without sheathing) ^a	0.5

For SI: 1 inch = 25.4 mm, 1 ounce = 28.35 g, 1 square foot = 0.093 m².

- a. Wood siding of thicknesses less than 0.5 inch shall be placed over sheathing that conforms to Section 2304.6.
- b. Exclusive of texture.
- c. As measured at the bottom of decorative grooves.
- d. 16 ounces per square foot for cold-rolled copper and lead-coated copper, 12 ounces per square foot for copper shingles, high-yield copper and lead-coated high-yield copper.

Reason:

For several years efforts have been underway to standardize the minimum thickness requirements for adhered masonry veneers. While some adhered veneers are thicker than the 0.25 in. minimum for architectural, aesthetic, or manufacturing reasons, this change brings the requirements of Chapter 14 in line with industry practices.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change brings the requirements of Chapter 14 in line with current industry recommendations.

Internal ID: 2017

2018 International Building Code

Delete without substitution:

~~**1404.3 Vapor retarders.** Vapor retarders as described in Section 1404.3.3 shall be provided in accordance with Sections 1404.3.1 and 1404.3.2, or an approved design using accepted engineering practice for hygrothermal analysis.~~

Revise as follows:

1404.3 Vapor retarders. Vapor retarder materials shall be classified in accordance with Table 1404.3(1). A vapor retarder shall be provided on the interior side of frame walls in accordance with Table 1404.3(2) and Table 1404.3(3), or an approved design using accepted engineering practice for hygrothermal analysis. The appropriate climate zone shall be selected in accordance with Chapter 3 of the International Energy Conservation Code.

~~**1404.3.1 Class I and II vapor retarders.** Class I and II vapor retarders shall not be provided on the interior side of frame walls in Zones 1 and 2. Class I vapor retarders shall not be provided on the interior side of frame walls in Zones 3 and 4 other than Marine 4. Class I or II vapor retarders shall be provided on the interior side of frame walls in Zones 5, 6, 7, 8 and Marine 4. The appropriate zone shall be selected in accordance with Chapter 3 [CE] of the International Energy Conservation Code Commercial Provisions.~~

Exceptions:

1. Basement walls.
2. Below-grade portion of any wall.
3. Construction where moisture accumulation, condensation, or its freezing of moisture will not damage the materials.
4. ~~Conditions where Class III vapor retarders are required in Section 1404.3.2.~~

Add new text as follows:

1404.3(1)

VAPOR RETARDER MATERIALS AND CLASSES

<u>VAPOR RETARDER CLASS</u>	<u>ACCEPTABLE MATERIALS</u>
I	<u>Sheet polyethylene, nonperforated aluminum foil, or other approved materials with a perm rating of less than or equal to 0.1</u>
II	<u>Kraft-faced fiberglass batts, paint, or other approved materials with a perm rating greater than 0.1 and less than or equal to 1.0</u>
III	<u>Latex paint, enamel paint, or other approved materials with a perm rating of greater than 1.0 and less than or equal to 10</u>

TABLE 1404.3(2)
VAPOR RETARDER OPTIONS

CLIMATE ZONE	VAPOR RETARDER CLASS		
	I	II	III ^a
<u>1, 2</u>	<u>Not permitted</u>	<u>Not Permitted</u>	<u>Permitted</u>
<u>3, 4 (except Marine 4)</u>	<u>Not permitted</u>	<u>Permitted</u>	<u>Permitted</u>
<u>Marine 4, 5, 6, 7, 8</u>	<u>Permitted</u>	<u>Permitted</u>	<u>See Table 1404.3(3)</u>

a. Only Class III vapor retarders shall be used on the interior side of frame walls where foam plastic insulating sheathing with a perm rating of less than 1 is applied in accordance with Table 1404.3(3) on the exterior side of the frame wall.

Revise as follows:

**TABLE 1404.3.2 1404.3(3)
CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^{a,b}
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R2.5 over 2 x 4 wall Continuous insulation with <i>R</i> -value \geq R3.75 over 2 x 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R5 over 2 x 4 wall Continuous insulation with <i>R</i> -value \geq R7.5 over 2 x 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R7.5 over 2 x 4 wall Continuous insulation with <i>R</i> -value \geq R11.25 over 2 x 6 wall
7 and 8	Continuous insulation with <i>R</i> -value \geq R10 over 2 x 4 wall Continuous insulation with <i>R</i> -value \geq R15 over 2 x 6 wall

For SI: 1 pound per cubic foot = 16 kg/m³.

- a. Spray foam with a maximum permance of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation requirement where the spray foam R-value meets or exceeds the specified insulating sheathing R-value.
- b. Vented cladding shall include vinyl lap siding, polypropylene, or horizontal aluminum siding, brick veneer with clear airspace as specified in this code, and other approved vented claddings.

Delete without substitution:

~~**1404.3.2 Class III vapor retarders.** Class III vapor retarders shall be permitted where any one of the conditions in Table 1404.3.2 is met. Only Class III vapor retarders shall be used on the interior side of frame walls where foam plastic insulating sheathing with a perm rating of less than 1 is applied in accordance with Table 1404.3.2 on the exterior side of the frame wall.~~

~~**1404.3.3 Material vapor retarder class.** The vapor retarder class shall be based on the manufacturer's certified testing or a tested assembly.~~

~~The following shall be deemed to meet the class specified:~~

~~Class I: Sheet polyethylene, nonperforated aluminum foil with a perm rating of less than or equal to 0.1.~~

~~Class II: Kraft faced fiberglass batts or paint with a perm rating greater than 0.1 and less than or equal to 1.0.~~

~~Class III: Latex or enamel paint with a perm rating of greater than 1.0 and less than or equal to 10.0.~~

~~**1404.3.4 Minimum clear airspaces and vented openings for vented cladding.** For the purposes of this section, vented cladding shall include the following minimum clear airspaces:~~

1. ~~Vinyl, polypropylene or horizontal aluminum siding applied over a weather resistive barrier as specified in this chapter.~~
2. ~~Brick veneer with a clear airspace as specified in this code.~~
3. ~~Other approved vented claddings.~~

Reason:

This proposal is a non-technical change to reformat the vapor retarder provisions to make them more transparent and user-friendly. The proposal uses a "look-up" table format whereby the logic for selection of appropriate vapor retarders is more visually obvious and appropriate options are more readily selected for various climate conditions and vapor retarder classes. This proposal is intended to help bring focus on consideration of formatting and editorial improvements while technical changes are addressed in separate proposals.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is a nontechnical format change and therefore has no cost impacts except those that might be associated with improving compliance and enforcement.

Internal ID: 1010

FS118-18

IBC: 1404.3, 1404.3.1

Proponent: Theresa Weston, DuPont, representing Air Barrier Association (theresa.a.weston@dupont.com)

2018 International Building Code

1404.3 Vapor retarders. Vapor retarders as described in Section 1404.3.3 shall be provided in accordance with Sections 1404.3.1 and 1404.3.2, or an approved design using accepted engineering practice for hygrothermal analysis.

Revise as follows:

1404.3.1 Class I and II vapor retarders. Class I and II vapor retarders shall not be provided on the interior side of frame walls in Zones 1 and 2. Class I vapor retarders shall not be provided on the interior side of frame walls in Zones 3 and 4 other than Marine 4. Class I or II vapor retarders shall be provided on the interior side of frame walls in Zones 5, 6, 7, 8 and Marine 4. The appropriate zone shall be selected in accordance with Chapter 3 [CE] of the International Energy Conservation Code-Commercial Provisions.

Exceptions:

1. Basement walls.
2. Below-grade portion of any wall.
3. Construction where moisture or its freezing will not damage the materials.
4. Class I and II vapor retarders with vapor permeability greater than 1 perm when measured by ASTM E96 water method (Procedure B) shall be allowed on the interior side of any frame wall in all climate zones.
- 4-5. Conditions where Class III vapor retarders are required in Section 1404.3.2.

Reason:

This proposal recognizes that some vapor retarders (both traditional and new materials) do not fit neatly into categories that are defined by Procedure A (dessicant method) vapor permeability measurements alone. The prohibition against the use of specific vapor retarder classes in specific climate zones is based on providing assemblies with the ability to dry to the interior. However, if a vapor retarder has vapor permeability that increases with relative humidity (RH) to a class III level, it has been shown that it allows drying. Therefore, these materials should not be prohibited. A list of references which demonstrate the improved drying using these types of materials is shown below.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction because it does not add any new requirements or restrictions. It provides additional options to meet the code.

2018 International Building Code

Revise as follows:

1404.3 Vapor retarders. Vapor retarders as described in Section ~~1404.3.3~~1404.3.1 shall be provided in accordance with Sections ~~1404.3.1~~1404.3.2 and ~~1404.3.2~~1404.3.3, or an approved design using accepted engineering practice for hygrothermal analysis.

~~1404.3.3~~1404.3.1 **Material vapor retarder class.** The *vapor retarder class* shall be based on the manufacturer's certified testing or a tested assembly.

The following shall be deemed to meet the class specified:

Class I: Sheet polyethylene, nonperforated aluminum foil with a perm rating of less than or equal to 0.1.

Class II: Kraft-faced fiberglass batts or paint with a perm rating greater than 0.1 and less than or equal to 1.0.

Class III: Latex or enamel paint with a perm rating of greater than 1.0 and less than or equal to 10.0.

~~1404.3.1~~1404.3.2 **Class I and II vapor retarders.** Class I and II vapor retarders shall not be provided on the interior side of frame walls in Zones 1 and 2. Class I vapor retarders shall not be provided on the interior side of frame walls in Zones 3 and 4 other than Marine 4. Class I or II vapor retarders shall be provided on the interior side of frame walls in Zones 5, 6, 7, 8 and Marine 4. The appropriate zone shall be selected in accordance with Chapter 3 [CE] of the International Energy Conservation Code-Commercial Provisions.

Exceptions:

1. Basement walls.
2. Below-grade portion of any wall.
3. Construction where moisture or its freezing will not damage the materials.
4. Conditions where Class III vapor retarders are required in Section ~~1404.3.2~~1404.3.3.

~~1404.3.2~~1404.3.3 **Class III vapor retarders.** Class III vapor retarders shall be permitted where any one of the conditions in Table ~~1404.3.2~~1404.3.3 is met. Only Class III vapor retarders shall be used on the interior side of frame walls where foam plastic insulating sheathing with a perm rating of less than 1 is applied in accordance with Table ~~1404.3.2~~1404.3.3 on the exterior side of the frame wall.

**TABLE 1404.3-21404.3.3
CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^a
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R2.5 over 2 × 4 wall Continuous insulation with <i>R</i> -value \geq R3.75 over 2 × 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R5 over 2 × 4 wall Continuous insulation with <i>R</i> -value \geq R7.5 over 2 × 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R7.5 over 2 × 4 wall Continuous insulation with <i>R</i> -value \geq R11.25 over 2 × 6 wall
7 and 8	Continuous insulation with <i>R</i> -value \geq R10 over 2 × 4 wall Continuous insulation with <i>R</i> -value \geq R15 over 2 × 6 wall

For SI: 1 pound per cubic foot = 16 kg/m³.

- a. Spray foam with a maximum permanence of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation requirement where the spray foam *R*-value meets or exceeds the specified insulating sheathing *R*-value.

Reason:

This proposal is a non-technical change to reorder the original section 1404.3.3 Material vapor retarder class, which describes the three different vapor retarder classes before the original sections 1404.3.1 Class I and II vapor retarders and 1404.3.2 Class III vapor retarders. The proposal is intended to help bring clarity by introducing the three vapor retarder classes before outlining the restrictions in vapor retarder usage for the different climate zones as provided in the original sections 1404.3.1 and 1404.3.2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change proposal is editorial with no technical change in content.

Internal ID: 1709

IBC: 1404.3.1, TABLE 1404.3.1 (New), 1404.3.2

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz); Vladimir Kochkin, representing Home Innovation Research Labs (vkochkin@homeinnovation.com)

2018 International Building Code

Revise as follows:

1404.3.1 Class I and II vapor retarders. Class I and II vapor retarders shall not be provided on the interior side of frame walls in Zones 1 and 2. Class I vapor retarders shall not be provided on the interior side of frame walls in Zones 3 and 4 other than Marine 4. Class I or II vapor retarders shall be provided on the interior side of frame walls in Zones 5, 6, 7, 8 and Marine 4. Where a Class II vapor retarder is used in combination with foam plastic insulating sheathing installed as continuous insulation on the exterior side of frame walls, the continuous insulation shall comply with Table 1404.3.1. Use of a Class I interior vapor retarder in frame walls with a Class I vapor retarder on the exterior side shall require an approved design. The appropriate zone shall be selected in accordance with Chapter 3 [CE] of the International Energy Conservation Code-Commercial Provisions.

Exceptions:

1. Basement walls.
2. Below-grade portion of any wall.
3. Construction where moisture or its freezing will not damage the materials.
4. Conditions where Class III vapor retarders are ~~required~~ permitted in Section 1404.3.2.

Add new text as follows:

**TABLE 1404.3.1
CONTINUOUS INSULATION WITH CLASS II VAPOR RETARDER**

CLIMATE ZONE	PERMITTED CONDITIONS ^a
3	Continuous insulation with R-value ≥ 2 .
4, 5, and 6	Continuous insulation with R-value ≥ 3 over 2x4 wall. Continuous insulation with R-value ≥ 5 over 2x6 wall.
7	Continuous insulation with R-value ≥ 5 over 2x4 wall. Continuous insulation with R-value ≥ 7.5 over 2x6 wall.
8	Continuous insulation with R-value ≥ 7.5 over 2x4 wall. Continuous insulation with R-value ≥ 10 over 2x6 wall.

a. In addition to the vapor retarder, spray foam with a maximum permeance of 1.5 perms at the installed thickness, applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to comply with the continuous insulation requirement only for the moisture control purposes of this table where the spray foam R-value plus any continuous insulation R-value provided equals or exceeds the specified continuous insulation R-value.

Revise as follows:

1404.3.2 Class III vapor retarders. ~~Class III vapor retarders shall be permitted where any one of the conditions in Table 1404.3.2 is met. Only Class III vapor retarders shall be used on the interior side of frame walls where foam plastic insulating sheathing with a perm rating of less than 1 is applied in accordance with Table 1404.3.2 on the exterior side of the frame wall.~~

Reason:

As its primary objective, this proposal restores the ability to appropriately use a Class II interior vapor retarder where foam plastic insulating sheathing is used as continuous insulation on the exterior of buildings. This was permitted in earlier editions of the IBC, but not with appropriate requirements as now included in this proposal. This proposal has two practical benefits. First, it will better coordinate the requirements for vapor retarders with typical insulation requirements found in the International Energy Conservation Code for frame wall assemblies. Second, the proposed requirements in Table 1404.3.1 are identical to the format used in in existing Table 1404.3.2 for ease of use and compliance. They provide assurance that an adequate amount of continuous insulation is used together with a Class II interior vapor retarder to keep the interior of walls sufficiently warm (temperature moderated) to control the risk of condensation and moisture accumulation.

The continuous insulation requirements of proposed Table 1404.3.1 are based on more than 20-years of successful experience in the National Building Code of Canada as well as an extensive review of research, field data, analyses, and code requirements in the U.S. and Canada (ABTG, 2015; Crandell 2017); refer to the bibliography.

Use of a Class II interior vapor retarder with foam sheathing on the exterior has been shown to provide a very stable and dry wall assembly. In addition to the research and experience mentioned above, this has been more recently confirmed in a DOE and industry sponsored research project where various wall assemblies in 22 buildings across the colder climate zones of the U.S. were monitored for moisture performance (Shah and Kochkin, 2017). Regarding the use of Class II (e.g., Kraft paper) vapor retarders, the report found "very stable moisture content levels" and that their use "does not seem to alter the ability of walls with exterior foam sheathing to dry out." Consequently, the report recommends the "combination of exterior insulation and a Class II vapor retarder show promise as a technology for increased R-value with minimal changes in construction practices."

Finally, while there is adequate experience in the colder climates of the U.S. and Canada to justify use of a Class I interior vapor retarder (e.g., 4 mil poly) with foam plastic insulating sheathing on the exterior side of an assembly, this proposal requires an approved design for the case of a double vapor barrier assembly (e.g., materials classified as a Class I vapor retarder are used on both sides of the assembly). The National Building Code of Canada does permit the use of a Class I interior vapor retarder with low-perm foam plastic exterior insulation and requires provisions similar to those provided in proposed Table 1404.3.1. Furthermore, the study mentioned above also demonstrates that use of a Class I interior vapor retarder on walls with or without exterior insulation "show stable low moisture content levels" (Shah and Kochkin, 2017). But, due to concerns with low drying potential, it is generally cautioned that walls using a double vapor barrier (Class I vapor retarder on both sides) be "accompanied with air sealing details and drainage plane details to avoid or minimize the potential for water leaks or moisture accumulation" (Shah and Kochkin, 2017). Thus, while known to work favorably in appropriate conditions of use, the use of a double vapor barrier assembly may require some additional considerations to ensure performance and this should be a matter of design as required in this proposal.

Bibliography:

- Assessment of Hygrothermal Performance and Design Guidance for Modern Light-Frame Wall Assemblies, ASTM STP 1599, Crandell, J.H., 2017, https://www.astm.org/DIGITAL_LIBRARY/STP/PAGES/STP159920160097.htm
- Moisture Performance of High-R Wall Systems, Prepared for US DOE & NAHB by Home Innovation Research Labs, Kochkin, V. and Shah, N., 2017 (pending publication)

Cost Impact

The code change proposal will decrease the cost of construction .

Including the option to use a Class II vapor retarder with foam plastic insulating sheathing (or a Class I vapor retarder

with an approved design) will decrease cost and better enable cost-effective compliance with energy code requirements while maintaining good moisture performance.

Internal ID: 1014

FS121-18

IBC: 1404.3.1, 1404.3.2

Proponent: Mike Fischer, Kellen Company, representing The Polyisocyanurate Insulation Manufacturers Association (mfischer@kellencompany.com)

2018 International Building Code

Revise as follows:

1404.3.1 Class I and II vapor retarders. Class I and II vapor retarders shall not be provided on the interior side of frame walls in Zones 1 and 2. Class I vapor retarders shall not be provided on the interior side of frame walls in Zones 3 and 4 other than Marine 4. Class I or II vapor retarders shall be provided on the interior side of frame walls in Zones 5, 6, 7, 8 and Marine 4. The appropriate zone shall be selected in accordance with Chapter 3 [CE] of the International Energy Conservation Code-Commercial Provisions.

Exceptions:

1. Basement walls.
2. Below-grade portion of any wall.
3. Construction where moisture or its freezing will not damage the materials.
4. ~~Conditions where Class III vapor retarders are required in Section 1404.3.2.~~

1404.3.2 Class III vapor retarders. Class III vapor retarders shall be permitted ~~where for~~ any one of the conditions in Table 1404.3.2 ~~is met. Only Class III vapor retarders shall be used on the interior side of frame walls where foam plastic insulating sheathing with a perm rating of less than 1 is applied in accordance with Table 1404.3.2 on the exterior side of the frame wall walls.~~

Reason:

The clauses proposed for deletion were originally added to the code as an interim conservative measure while appropriate use of Class I and II vapor retarders on walls with foam plastic insulating sheathing were more thoroughly investigated. Now, an extensive review of data, analyses, and experience has been completed (refer to bibliography). The findings indicate that the concern with appropriate use of Class I and II vapor retarders concern is mainly a concern for walls without temperature moderation as provided by continuous insulation. Field data and analyses from several studies have demonstrated successful use of Class I and II vapor retarders on walls with exterior foam sheathing used as continuous insulation. As further confirmation, this method has been successfully used in Canada and explicitly recognized in the National Building Code of Canada since the 1995 edition. In addition, this proposal will make the IBC provisions consistent with the IRC provisions which were not changed to require use of only Class III vapor retarders with foam sheathing. Thus, this proposal will restore consistency between the IBC and IRC. It also simplifies the code.

Bibliography:

Assessment of Hygrothermal Performance and Design Guidance for Modern Light-Frame Wall Assemblies, ASTM STP1599, J. H. Crandell, 2017, pp.362-394, https://www.astm.org/DIGITAL_LIBRARY/STP/PAGES/STP159920160097.htm

Assessment of Water Vapor Control Methods for Modern Insulated Light-Frame Wall Assemblies, ABTG Research Report No. 1410-03, Applied Building Technology Group LLC, 2015, <https://www.appliedbuildingtech.com/rr/1410-03>

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal will allow (actually restore) vapor retarder options that provide at least equivalent performance for water vapor control at a lower cost than would occur where Class III vapor retarders are currently required to be used.

Internal ID: 1013

FS122-18

IBC: 1404.3.2, 1404.3.2.1 (New), 1404.3.2.2 (New), 1404.3.2.2.1 (New), TABLE 1404.3.2

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Building Code

Revise as follows:

1404.3.2 Class III vapor retarders. Class III vapor retarders shall be permitted where any one of the conditions in Table 1404.3.2 is met. ~~Only Class III vapor retarders shall be used on the interior side of frame walls where foam plastic insulating sheathing with a perm rating of less than 1 is applied in accordance with Table 1404.3.2 on the exterior side of the frame wall.~~

Add new text as follows:

1404.3.2.1 Foam plastic insulating sheathing for moisture control with Class III vapor retarders. .

Where foam plastic insulating sheathing with a perm rating of less than 1 is installed in accordance with Table 1404.3.2 on the exterior side of the frame wall, only Class III vapor retarders shall be used on the interior side of the frame wall.

1404.3.2.2 Spray foam plastic insulation for moisture control with Class III vapor retarders. . For purposes of compliance with Table 1404.3.2, spray foam with a maximum permeance of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum shall be deemed to meet the continuous insulation R-value requirement where the spray foam R-value meets or exceeds the specified continuous insulation R-value.

1404.3.2.2.1 Hybrid insulation for moisture control with Class III vapor retarders. . For the purposes of compliance with Table 1404.3.2, the combined R-values of spray foam plastic insulation and continuous insulation shall be permitted to be counted towards the continuous R-value requirement.

Revise as follows:

**TABLE 1404.3.2
CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^a
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R2.5 over 2 x 4 wall Continuous insulation with R-value \geq R3.75 over 2 x 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R5 over 2 x 4 wall Continuous insulation with R-value \geq R7.5 over 2 x 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R7.5 over 2 x 4 wall Continuous insulation with R-value \geq R11.25 over 2 x 6 wall
7 and 8	Continuous insulation with R-value \geq R10 over 2 x 4 wall Continuous insulation with R-value \geq R15 over 2 x 6 wall

For SI: 1 pound per cubic foot = 16 kg/m³.

~~a. Spray foam with a maximum permeance of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation requirement where the spray foam R-value meets or exceeds the specified insulating sheathing R-value.~~

Reason:

The current Table 1404.3.2 mandates continuous insulation for moisture control but provides an exception for spray foam in the cavity. The table does not currently permit a combination of continuous and cavity; this is inconsistent with the intent of the cavity option. Additionally, with prescriptive options in the IECC including hybrid insulation systems with a combination of cavity and continuous, this will help correlate the IBC and IECC requirements. The proposal adds clarifying language that clarifies how the combination of different insulating methods can provide appropriate moisture control so that the total required R-Value can be achieved by continuous, cavity, or a combination of insulation strategies.

Cost Impact

The code change proposal will decrease the cost of construction .

By adding options for insulation used to control moisture and condensation, the proposal increases flexibility which will include lower cost options.

Internal ID: 2387

FS123-18

IBC: 1404.3.2

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

2018 International Building Code

Revise as follows:

1404.3.2 Class III vapor retarders. Class III vapor retarders shall be permitted in Climate Zones 1 through 3 and where any one of the conditions in Table 1404.3.2 is met. Only Class III vapor retarders shall be used on the interior side of frame walls where foam plastic insulating sheathing with a perm rating of less than 1 is applied in accordance with Table 1404.3.2 on the exterior side of the frame wall.

Reason:

Class III vapor retarders should be permitted for use in Climate Zones 1 through 3. Currently, the code is unclear or implies they may not be permitted. In these warmer climates, the conditions of Table 1404.3.2 are not necessary. Therefore, the inclusion of Climate Zones 1-3 is provided in the text of Section 1404.3.2. This change will also make it clear that it is OK to use latex paints (many of which could be classified as a Class III vapor retarder) as interior finishes in these climate zones, even if not declared to be a vapor retarder.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification of the code with no cost impact.

Internal ID: 2342

FS124-18

IBC: 1404.3.2

Proponent: Kingston Chow, APA - The Engineered Wood Association, representing APA - The Engineered Wood Association (kingston.chow@apawood.org); Borjen Yeh, APA - The Engineered Wood Association, representing APA - The Engineered Wood Association (borjen.yeh@apawood.org)

2018 International Building Code

1404.3.2 Class III vapor retarders. Class III vapor retarders shall be permitted where any one of the conditions in Table 1404.3.2 is met. Only Class III vapor retarders shall be used on the interior side of frame walls where ~~foam plastic insulating sheathing~~ continuous insulation with a perm rating of less than 1 is applied in accordance with Table 1404.3.2 on the exterior side of the frame wall.

Reason:

This proposed change ensures language is consistent with Table 1404.3.2 (i.e., continuous insulation) and applies to other types of continuous insulation with a perm rating of less than 1 other than foam plastic insulating sheathing.

The reason the IBC requires an interior Class III vapor retarder in conjunction with low perm exterior foam plastic sheathing is to ensure at least one path for walls to dry when they get wet. While exterior continuous insulation helps to minimize one source of moisture accumulation in wall assemblies (condensation), wetting due to improper flashing and detailing, leaky windows, wind driven rain, etc. necessitates that drying of wall assemblies can take place. Therefore, the current requirement for ensuring drying to the interior should apply to any exterior continuous insulation with a perm rating less than 1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change proposal simply clarifies the terminology used in the provision.

Internal ID: 1693

FS125-18

IBC: TABLE 1404.3.2, 1404.3.2

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council

2018 International Building Code

Revise as follows:

**TABLE 1404.3.2
CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^a
Marine-4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R -value $\geq R2.5$ over 2 \times 4 wall Continuous insulation with R -value $\geq R3.75$ over 2 \times 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R -value $\geq R5$ over 2 \times 4 wall Continuous insulation with R -value $\geq R7.5$ over 2 \times 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R -value $\geq R7.5$ over 2 \times 4 wall Continuous insulation with R - value $\geq R11.25$ over 2 \times 6 wall
7 and 8	Continuous insulation with R -value $\geq R10$ over 2 \times 4 wall Continuous insulation with R -value $\geq R15$ over 2 \times 6 wall

For SI: 1 pound per cubic foot = 16 kg/m³.

- a. Spray foam with a maximum permanence of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation requirement where the spray foam R-value meets or exceeds the specified insulating sheathing R-value.

1404.3.2 Class III vapor retarders. Class III vapor retarders shall be permitted in Climate Zones 1 through 3 and where any one of the conditions in Table 1404.3.2 is met. Only Class III vapor retarders shall be used on the interior side of frame walls where foam plastic insulating sheathing with a perm rating of less than 1 is applied in accordance with Table 1404.3.2 on the exterior side of the frame wall.

Reason:

Section 1404.3.2 is revised to recognize that Class III vapor retarders also are permitted in Climate Zones 1-3 without having to comply with the conditions in Table 1404.3.2 intended for colder climate applications. This clarifies the code as intended and resolves an interpretation problem where it is unclear that Class III vapor retarders are OK to use in Climate Zones 1-3. In fact, latex paint often complies with a Class III vapor retarder and is commonly used in all climate zones for interior finish, even if not declared to be a Class III vapor retarder.

Table 1404.3.2 is revised so that the requirements for Climate Zone "Marine 4" are applied to all of Climate Zone 4. The Marine 4 climate zone is actually a warmer-in-winter climate zone than the remainder of Climate Zone 4. Thus, if conditions are necessary to control water vapor in Marine 4 it should also be required in all of Climate Zone 4 and especially in the "moist" (A) regions of Climate Zone 4. This need has been confirmed by experience, field data, testing and analysis in recent years. Refer to the bibliography for additional information and substantiation.

Bibliography:

Assessment of Hygrothermal Performance and Design Guidance for Modern Light-Frame Wall Assemblies, ASTM STP1599, J. H. Crandell, 2017, pp.362-394, https://www.astm.org/DIGITAL_LIBRARY/STP/PAGES/STP159920160097.htm

Assessment of Water Vapor Control Methods for Modern Insulated Light-Frame Wall Assemblies, ABTG Research Report No. 1410-03, Applied Building Technology Group LLC, 2015, <https://www.appliedbuildingtech.com/rr/1410-03>

Cost Impact

The code change proposal will increase the cost of construction .

While this proposal will potentially increase cost of using a Class III vapor retarder in much of Climate Zone 4 (not Marine 4), one interpretation is that this proposal actually adds the option of using a Class III vapor retarder in all of Climate Zone 4 and also in Climate Zones 1-3. In the latter case, the proposal may actually reduce costs by allowing interior latex paint to be used as the vapor retarder. From a moisture durability and risk standpoint, this proposal also should reduce associated costs after construction.

Internal ID: 1009

FS126-18

IBC: TABLE 1404.3.2

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingsscience.com)

2018 International Building Code

Revise as follows:

**TABLE 1404.3.2
CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^a
Marine- 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R -value $\geq R2.5$ over 2×4 wall Continuous insulation with R -value $\geq R3.75$ over 2×6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R -value $\geq R5$ over 2×4 wall Continuous insulation with R -value $\geq R7.5$ over 2×6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R -value $\geq R7.5$ over 2×4 wall Continuous insulation with R -value $\geq R11.25$ over 2×6 wall
7 and 8	Continuous insulation with R -value $\geq R10$ over 2×4 wall Continuous insulation with R -value $\geq R15$ over 2×6 wall

For SI: 1 pound per cubic foot = 16 kg/m³.

- a. Spray foam with a maximum permanence of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation requirement where the spray foam *R*-value meets or exceeds the specified insulating sheathing *R*-value.

Reason:

When Table 1405.3.2 was first added to the IBC (and IRC Table R702.7), only Climate Zone 4 Marine was addressed and not all of Climate Zone 4. Subsequent experience, field data, testing and analysis has demonstrated that these requirements should apply to all of Climate Zone 4, not just Climate Zone 4 Marine.

Cost Impact

The code change proposal will decrease the cost of construction .

This gives another option to zones 4A and 4B. Sometimes the option will be less expensive.

CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^a
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R2.5 over 2 x 4 wall Continuous insulation with R-value \geq R3.75 over 2 x 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R5 over 2 x 4 wall Continuous insulation with R-value \geq R7.5 over 2 x 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R7.5 over 2 x 4 wall Continuous insulation with R-value \geq R11.25 over 2 x 6 wall
7 and 8	Continuous insulation with R-value \geq R10 over 2 x 4 wall Continuous insulation with R-value \geq R15 over 2 x 6 wall
8	<u>Continuous insulation with R-value \geq 12.5 over 2x4 wall.</u> <u>Continuous insulation with R-value \geq 20 over 2x6 wall</u>

For SI: 1 pound per cubic foot = 16 kg/m³.

- a. Spray foam with a maximum permanence of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation requirement where the spray foam *R*-value meets or exceeds the specified insulating sheathing *R*-value.

Reason:

This proposal corrects an inadvertent error when Table 1404.3.2 was first included in the code. Climate Zone 8 was not intended to be included with Climate Zone 7. Climate Zone 8 is a colder climate and requires additional continuous insulation to maintain proper moisture control and equivalent performance. The proposed *R*-values for Climate Zone 8 are consistent with the experience and technical basis for provisions in the other climate zones addressed in Table 1404.3.2. Refer to the bibliography for additional information and substantiation.

Bibliography:

Assessment of Hygrothermal Performance and Design Guidance for Modern Light-Frame Wall Assemblies, ASTM STP1599, J. H. Crandell, 2017, pp.362-394, https://www.astm.org/DIGITAL_LIBRARY/STP/PAGES/STP159920160097.htm

Assessment of Water Vapor Control Methods for Modern Insulated Light-Frame Wall Assemblies, ABTG Research Report No. 1410-03, Applied Building Technology Group LLC, 2015, <https://www.appliedbuildingtech.com/rr/1410-03>

Cost Impact

The code change proposal will increase the cost of construction .

This proposed technical correction of the code will increase the cost of construction only where using a Class III vapor retarder (e.g. latex paint) in Climate Zone 8. However, other vapor retarder options and wall assembly options are unchanged so, technically, this should not increase the cost of construction where these other options are used.

FS128-18

IBC: TABLE 1404.3.2

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingsscience.com)

2018 International Building Code

Revise as follows:

**TABLE 1404.3.2
CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^a
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R2.5 over 2 x 4 wall Continuous insulation with R-value \geq R3.75 over 2 x 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R5 over 2 x 4 wall Continuous insulation with R-value \geq R7.5 over 2 x 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with R-value \geq R7.5 over 2 x 4 wall Continuous insulation with R-value \geq R11.25 over 2 x 6 wall
7 and 8	Continuous insulation with R-value \geq R10 over 2 x 4 wall Continuous insulation with R-value \geq R15 over 2 x 6 wall
8	<u>Continuous insulation with R-value \geq R12.5 over 2 x 4 wall</u> <u>Continuous insulation with R-value \geq R20 over 2 x 6 wall</u>

For SI: 1 pound per cubic foot = 16 kg/m³.

- a. Spray foam with a maximum permanence of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation requirement where the spray foam *R*-value meets or exceeds the specified insulating sheathing *R*-value.

Reason:

When Table 1404.3.2 was first added to the IBC (and IRC Table R702.7) Climate Zone 8 was inadvertently included with Climate Zone 7. This corrects that error. The technical justification for this can be found at the following link (specifically Table 2):

<https://buildingscience.com/documents/building-science-insights/bsi-100-hybrid-assemblies> as available January 10th, 2018

Cost Impact

The code change proposal will increase the cost of construction .

This change increases the insulation level, which in principal would cost more. However, the table has the incorrect value.

Internal ID: 1972

FS129-18

IBC: TABLE 1404.3.2

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Building Code

Revise as follows:

**TABLE 1404.3.2
CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^a
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R2.5 over 2 × 4 wall Continuous insulation with <i>R</i> -value \geq R3.75 over 2 × 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R5 over 2 × 4 wall Continuous insulation with <i>R</i> -value \geq R7.5 over 2 × 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R7.5 over 2 × 4 wall Continuous insulation with <i>R</i> -value \geq R11.25 over 2 × 6 wall
7 and 8	Continuous insulation with <i>R</i> -value \geq R10 over 2 × 4 wall Continuous insulation with <i>R</i> -value \geq R15 over 2 × 6 wall

For SI: 1 pound per cubic foot = 16 kg/m³.

- a. Compliance with the R-value requirement may be met by continuous insulation, spray foam, or a combination of continuous insulation and spray foam. Spray foam with shall have a maximum permeance of 1.5 perms at the installed thickness and shall be applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation requirement where the spray foam R value meets or exceeds the specified insulating sheathing R value-gypsum.
- b. For the purposes of compliance with Table 1404.3.2, the combined R-values of spray foam plastic insulation and continuous insulation shall be permitted to be counted towards the continuous R-value requirement.

Reason:

The current Table 1404.3.2 mandates continuous insulation for moisture control but provides an exception for spray foam in the cavity. The table does not currently permit a combination of continuous and cavity; this is inconsistent with the intent of the cavity option. Additionally, with prescriptive options in the IECC including hybrid insulation systems with a combination of cavity and continuous, this will help correlate the IBC and IECC requirements. The proposal simply modifies the table so that the total R-Value can be achieved by continuous, cavity, or a combination of insulation strategies.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal increases options for insulation used as condensation control by adding an option for a hybrid system. It adds no mandatory requirements.

Internal ID: 2382

FS130-18

IBC: TABLE 1404.3.2

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Building Code

Revise as follows:

**TABLE 1404.3.2
CLASS III VAPOR RETARDERS**

ZONE	CLASS III VAPOR RETARDERS PERMITTED FOR:^{a,b}
Marine 4	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R2.5 over 2 x 4 wall Continuous insulation with <i>R</i> -value \geq R3.75 over 2 x 6 wall
5	Vented cladding over wood structural panels Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R5 over 2 x 4 wall Continuous insulation with <i>R</i> -value \geq R7.5 over 2 x 6 wall
6	Vented cladding over fiberboard Vented cladding over gypsum Continuous insulation with <i>R</i> -value \geq R7.5 over 2 x 4 wall Continuous insulation with <i>R</i> -value \geq R11.25 over 2 x 6 wall
7 and 8	Continuous insulation with <i>R</i> -value \geq R10 over 2 x 4 wall Continuous insulation with <i>R</i> -value \geq R15 over 2 x 6 wall

For SI: 1 pound per cubic foot = 16 kg/m³.

a. Spray foam with a maximum permeance of 1.5 perms at the installed thickness applied to the interior cavity side of wood structural panels, fiberboard, insulating sheathing or gypsum is deemed to meet the continuous insulation moisture control requirement where the spray foam R-value meets or exceeds the specified insulating sheathing R-value.

b. The requirements in this table apply only to insulation used to control moisture in order to permit the use of Class III vapor retarders. The insulation materials used to satisfy this option also contribute to but do not supersede the thermal envelope requirements of the International Energy Conservation Code.

Reason:

The proposal clarifies that spray foam used to satisfy the continuous insulation requirements are intended to be used for moisture control. It adds an additional footnote to the table to clarify that the provisions of the IECC are not supplanted by this option.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is editorial.

Internal ID: 1951

FS131-18

IBC: 1404.3.3

Proponent: John Woestman, Kellen Co., representing Extruded Polystyrene Foam Association (XPSA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows:

1404.3.3 Material vapor retarder class. The *vapor retarder class* shall be based on the manufacturer's certified testing or a tested assembly.

The following shall be deemed to meet the class specified:

Class I: Sheet polyethylene, nonperforated aluminum foil with a perm rating of less than or equal to 0.1.

Class II: Kraft-faced fiberglass batts or vapor retarder paint applied in accordance with the manufacturer's instructions for a perm rating greater than 0.1 and less than or equal to 1.0.

Class III: Latex or enamel paint applied in accordance with the manufacturer's instructions for a perm rating of greater than 1.0 and less than or equal to 10.0.

Reason:

This proposal clarifies that where paints are used as vapor retarders they must be applied in accordance with the manufacturer's instructions to achieve the required perm rating for the vapor retarder class. Misuse or misapplication of paints that also may not be specifically recommended for use as vapor retarders has been shown to increase the risk of moisture problems in walls with Class III vapor retarders. Cases have been documented where paint applications have a water vapor permeance of more than three times greater than the maximum limit for Class III vapor retarders. As a result, walls intended to rely on Class III vapor retarders can experience an increased risk of moisture accumulation problems. This proposal will provide the ability to avoid this problem.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies the intent of the code and does not impact cost.

Internal ID: 1012

FS132-18

IBC: 1404.3.4

Proponent: Charles Clark Jr, Brick Industry Association, representing Brick Industry Association, representing the Masonry Alliance for Codes and Standards (cclark@bia.org)

2018 International Building Code

Revise as follows:

1404.3.4 Minimum ~~clear~~ airspaces and vented openings for vented cladding. For the purposes of this section, vented cladding shall include the following minimum clear airspaces:

1. Vinyl, polypropylene or horizontal aluminum siding applied over a weather-resistive barrier as specified in this chapter.
2. Brick veneer with ~~a clear~~ an airspace as specified in this code.
3. Other *approved* vented claddings.

Reason:

Although the use of the term "clear" in this text appears intended to refer to an airspace sufficiently unrestricted to permit air and water movement, this same term has been interpreted, in many cases, to mean that the presence of any mortar whatsoever within the airspace of a brick veneer cladding results in a non-code compliant condition for the entire brick veneer. Mortar fins and mortar droppings are an inherent part of masonry construction. It has been demonstrated that no matter how experienced the mason or how carefully the masonry is constructed, the brick veneer airspace will never be completely devoid of mortar.

However, empirical evidence has overwhelmingly confirmed that acceptable drainage performance exists even when the airspace contains mortar fins and mortar droppings. Removing the term "clear" from the IBC text allows respective material codes and standards to define the airspace condition in a manner appropriate to the cladding material.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed code change serves to clarify existing language and will not change the cost of construction, as it allows existing construction methods to be maintained.

Internal ID: 1598

FS133-18

IBC: 1404.4

Proponent: Mike Fischer, Kellen Company, representing The Polyisocyanurate Insulation Manufacturers Association (mfischer@kellencompany.com)

2018 International Building Code

Revise as follows:

1404.4 Flashing. Flashing shall be installed in such a manner so as to prevent moisture from entering the wall or to redirect that moisture to the ~~exterior surface of the exterior wall finish or to a water-resistive barrier complying with Section 1403.2 and that is part of a means of drainage complying with Section 1402.2.~~ Flashing shall be installed at the perimeters of exterior door and window assemblies, penetrations and terminations of *exterior wall* assemblies, *exterior wall* intersections with roofs, chimneys, porches, decks, balconies and similar projections and at built-in gutters and similar locations where moisture could enter the wall. Flashing with projecting flanges shall be installed on both sides and the ends of copings, under sills and continuously above projecting *trim*. Where self-adhered membranes are used as flashings of *fenestration* in wall assemblies, those self-adhered flashings shall comply with AAMA 711. Where fluid applied membranes are used as flashing for *exterior wall* openings, those fluid applied membrane flashings shall comply with AAMA 714.

Reason:

This proposal provides language to coordinate with similar language in the 2018 IRC Section R703.4 which appropriately recognizes that some flashing applications necessarily direct water to the water-resistive barrier surface where it is subsequently drained at flashing or weeps extending through the exterior wall covering.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is a clarification of the code and has no cost impact.

Internal ID: 992

FS134-18

IBC: 1405.1.1

Proponent: Ronald Nickson, Nickson Code Consulting, representing Rockwool (nicksoncodeconsulting@gmail.com)

2018 International Building Code

Revise as follows:

1405.1.1 Types I, II, III, IV and ~~IV~~V construction. On buildings of Types I, II, III, IV and ~~IV~~V construction, *exterior wall coverings* shall be permitted to be constructed of combustible materials, complying with the following limitations:

1. Combustible *exterior wall coverings* shall not exceed 10 percent of an *exterior wall* surface area where the fire separation distance is 5 feet (1524 mm) or less.
2. Combustible *exterior wall coverings* shall be limited to 40 feet (12 192 mm) in height above grade plane.
3. Combustible *exterior wall coverings* constructed of fire-retardant-treated wood complying with Section 2303.2 for exterior installation shall not be limited in wall surface area where the fire separation distance is 5 feet (1524 mm) or less and shall be permitted up to 60 feet (18 288 mm) in height above grade plane regardless of the fire separation distance.
4. Wood veneers shall comply with Section 1404.5.

Exception: Combustible exterior wall covering in Type V construction is not limited to 10 percent of the exterior wall surface.

Reason:

This proposal adds Type V construction to Section 1405 Combustible Materials on The Exterior Side of Exterior Walls, to be included for what is already required for Types I, II, III and IV construction. This is a companion change to a proposed new Section 1406.2 proposing to incorporate into the code fire test procedures to determine the impact different materials will have on the spread of a fire on the exterior wall and spreading into the attic. This change addresses ignitability based on the distance from the property line. Proposal 1402.6 address the methodology to determine if the fire will reach the attic.

Energy code requirements have prompted the construction industry to include combustible exterior continuous insulation that can be easily ignited by reflection from glazing or fires in adjacent buildings. Fire separation distance requirements are predicated on historical construction materials and have been deemed to provide a sufficient distance from property lines based on the radiation thresholds provided in Table 1405.1.1.1.2. Type V buildings have not needed exterior wall fire related restrictions because product combinations such as vinyl siding over OSB have been sufficiently fire-safe. The introduction of combustible materials over the OSB board as a result of energy code requirements without any fire testing requirements presents a high risk for ignition when exposed to fires from neighbouring buildings or other burning objects.

A report from NFPA Research entitled, Residential Structure Fires Originating On Outer Walls. Spreading On Exterior Walls or Trim, and Beginning On An Outer Wall with Plastic, January 2018, identifies the problem that now exists because of the increase use of unprotected combustible products used to meet the current energy code requirements. The report documents the number of residential fires where the item contributing most to flame spread was exterior sidewall covering and surface finish. This type of fire has increased dramatically in recent years causing an annual average of 50 casualties, 345 injuries and \$539 million in property damage.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The cost impact if any is minor. Some cost will be incurred by material manufacturers to determine compliance. Material and installation cost are basically natural.

Internal ID: 1791

FS135-18

IBC: 1405.1.1

Proponent: William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards (jthompson@ncma.org)

2018 International Building Code

Revise as follows:

1405.1.1 Types I, II, III and IV construction. On buildings of Types I, II, III and IV construction, *exterior wall coverings* shall be permitted to be constructed of combustible materials, complying with the following limitations:

1. Combustible *exterior wall coverings* shall not exceed 10 percent of an *exterior wall* surface area where the fire separation distance is 5 feet (1524 mm) or less.
2. Combustible *exterior wall coverings* shall be limited to 40 feet (12 192 mm) in height above grade plane.
3. Combustible *exterior wall coverings* constructed of fire-retardant-treated wood complying with Section 2303.2 for exterior installation shall not be limited in wall surface area where the fire separation distance is 5 feet (1524 mm) or less and shall be permitted up to 60 feet (18 288 mm) in height above grade plane regardless of the fire separation distance. Fire-retardant-treated-wood exterior wall coverings over 40 ft. shall also comply with Section 1402.5.
4. Wood veneers shall comply with Section 1404.5. Fire-retardant-treated-wood veneers over 40-feet shall also comply with Section 1402.5.

Reason:

Fire-retardant-treated wood (FRTW) exterior wall coverings and veneers are permitted to go to a height of 60 ft. on buildings of Type I, II, III and IV construction. However, FRTW is classified as a combustible material. Testing of these combustible exterior wall materials to NFPA 285 on buildings of Type I, II, III and IV construction is required in applications over 40ft unless it meets Exception #2 of 1402.5. This proposal helps to clarify this testing requirement for FRTW.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

This proposal is clarification for what is currently required in the code.

Internal ID: 1522

FS136-18

IBC: 202, 1406.2, 1408.2, 2602.1

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

SECTION 202 DEFINITIONS

[BF] EXTERIOR WALL ENVELOPE. A system or assembly of exterior wall components, including exterior wall ~~finish covering~~ materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

1406.2 Exterior wall ~~finish covering~~. MCM used as *exterior wall ~~finish covering~~* or as elements of balconies and similar projections and bay and oriel windows to provide cladding or weather resistance shall comply with Sections 1406.4 through 1406.14.

1408.2 Exterior wall ~~finish covering~~. HPL used as *exterior wall covering* or as elements of balconies and similar projections and bay and oriel windows to provide cladding or weather resistance shall comply with Sections 1408.4 through 1408.14.

2602.1 Exterior ~~finish wall covering~~ and ~~architectural trim~~. See Chapter 14 for requirements for *exterior wall ~~finish covering~~ and ~~architectural trim~~*.

Reason:

This code change proposal is basically editorial and clarification. The term exterior wall covering is defined in the code, but the term exterior wall finish is not defined. The exterior wall envelope contains exterior wall covering materials and other materials.

Chapter 14, in section 1405, deals with the requirements for combustible exterior wall coverings but there is no section dealing specifically with requirements for exterior wall finish. This may lead to concern that references to exterior wall finish refer to items that are different from those that are regulated by section 1405. The change in terminology may make it clear what is being referenced.

It is the intent of this proposal for "exterior wall covering" to be reflected as a defined term in the definition of Exterior Wall Envelope and sections 1406.2; 1408.2 and 3602.1

The only other place in ICC codes where the term exterior wall finish is used is in the residential code and that will not be addressed in group A.

The additional change in 2602.1 refers to the fact that the requirements in chapter 14 (in sections 1401.1, 1406.3, 1406.10.3, 1408.3 and 1408.10.3) all refer to architectural trim.

Note: This is the current IBC definition for **TRIM:** Picture molds, chair rails, baseboards, handrails, door and window frames and similar decorative or protective materials used in fixed applications.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

1. Grenfell fire, London England:

Buildings Across U.S. Are Wrapped in Same Panels That Fueled Deadly London Fire: <https://www.wsj.com/articles/built-to-burn-thousands-of-buildings-world-wide-are-wrapped-in-combustible-panels-1508858048>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is simply editorial and clarification.

Internal ID: 391

FS137-18

IBC: 1406.8

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

1406.8 Fire-resistance rating. Where MCM systems are used on *exterior walls* required to have a *fire-resistance rating* in accordance with Section 705, evidence shall be submitted to the *building official* that the required *fire-resistance rating* is maintained.

Exception: MCM systems which are part of an exterior wall envelope not containing foam plastic insulation, ~~which and~~ are installed on the outer surface of a fire-resistance-rated *exterior wall* in a manner such that the attachments do not penetrate through the entire *exterior wall* assembly, shall not be required to comply with this section.

Reason:

The definition of metal composite material (MCM), shown below, does not allow MCMs to contain foam plastic insulation. The definition of metal composite material (MCM) system, also shown below, indicates that this is an exterior wall covering.

Therefore, this section needs clarification because the foam plastic insulation cannot be contained within the MCM system, but foam plastic can be part of the same exterior wall envelope that also includes the MCM system and only if the entire exterior wall envelope does not contain foam plastic insulation is this exception valid.

METAL COMPOSITE MATERIAL (MCM). A factory manufactured panel consisting of metal skins bonded to both faces of a solid plastic core.

METAL COMPOSITE MATERIAL (MCM) SYSTEM. An exterior wall covering fabricated using MCM in a specific assembly including joints, seams, attachments, substrate, framing and other details as appropriate to a particular design.

EXTERIOR WALL ENVELOPE. A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is simply editorial and clarification.

Internal ID: 392

FS138-18

IBC: 1406.9, 1406.9.1 (New), 1406.9.2 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

~~1406.9 Surface burning characteristics. Fire testing.~~ Unless otherwise specified, MCM shall have a ~~flame spread index of 75 or less and a smoke developed index of 450 or less when tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723.~~ comply with Sections 1406.9.1 and 1406.9.2.

Add new text as follows:

1406.9.1 Surface burning characteristics. The MCM shall have a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723.

1406.9.2 Specifications. MCM shall be required to comply with the following:

1. MCM shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D1929.
2. The MCM shall conform to a combustibility classification of CC1.

Class CC1: Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D635.

Reason:

When amendments were proposed to the requirements in the 2009 IBC for MCM (2012 code cycle) the supporting justification was based on existing allowances for light-transmitting plastics included in Chapter 26. Due to substantial losses throughout the world, it has become apparent that the correlation between MCM and Light-transmitting plastics was not a valid comparison as related to fire risk of these very different building materials.

It does not make sense then that MCMs only need to meet the flame spread and ignition test under certain circumstances. They need to meet it always and this proposal adds the requirements in the general section. The requirement for smoke based on either ASTM D2843 or ASTM E84 is not being added because they already need to meet the smoke requirement based on ASTM E84 anyway so duplicate testing would be unnecessary. Of the two requirements based on ASTM D635 (also known as UL 94 HB) used for light-transmitting plastics, the one associated with CC2 (which is much weaker) is not being proposed because it would not be meaningful for a material required to meet a Class B in ASTM E84.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

3. Address Hotel Fire, Dubai https://en.wikipedia.org/wiki/The_Address_Downtown_Dubai January 8th, 2018

Cost Impact

The code change proposal will increase the cost of construction .

The additional performance and test requirements will add minimal cost to construction for initial testing of an MCM panel.

Proponent: Andy Williams, Metal Construction Association, representing Metal Construction Association (afwilliams@Connect2amc.com)

2018 International Building Code

Revise as follows:

1406.10 Type I, II, III and IV construction. Where installed on buildings of Type I, II, III and IV construction, MCMs and MCM systems shall comply with Sections 1406.10.1 through 1406.10.4, or Section 1406.11.1406.10.3, for installations up to 40 feet (12 192 mm) above grade plane. Where installed on buildings of Type I, II, III and IV construction, MCMs and MCM systems shall comply with Sections 1406.10.1 through 1406.10.4, for installations greater than 40 feet (12 192 mm) above grade plane.

Delete without substitution:

~~1406.11 Alternate conditions.~~

~~MCM and MCM systems shall not be required to comply with Sections 1406.10.1 through 1406.10.4 provided that such systems comply with Section 1406.11.1, 1406.11.2, 1406.11.3 or 1406.11.4.~~

~~**1406.11.1 Installations up to 40 feet in height.** MCM shall not be installed more than 40 feet (12 190 mm) in height above grade where installed in accordance with Sections 1406.11.1.1 and 1406.11.1.2.~~

~~**1406.11.1.1 Fire separation distance of 5 feet or less.** Where the *fire separation distance* is 5 feet (1524 mm) or less, the area of MCM shall not exceed 10 percent of the *exterior wall surface*.~~

~~**1406.11.1.2 Fire separation distance greater than 5 feet.** Where the *fire separation distance* is greater than 5 feet (1524 mm), the area of *exterior wall surface coverage* using MCM shall not be limited.~~

~~**1406.11.2 Installations up to 50 feet in height.** MCM shall not be installed more than 50 feet (15 240 mm) in height above grade where installed in accordance with Sections 1406.11.2.1 and 1406.11.2.2.~~

~~**1406.11.2.1 Self-ignition temperature.** MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~

~~**1406.11.2.2 Limitations.** Sections of MCM shall not exceed 300 square feet (27.9 m²) in area and shall be separated by not less than 4 feet (1219 mm) vertically.~~

~~**1406.11.3 Installations up to 75 feet in height (Option 1).** MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1406.11.3.1 through 1406.11.3.5.~~

~~**Exception:** Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be exempt from the height limitation.~~

~~**1406.11.3.1 Prohibited occupancies.** MCM shall not be permitted on buildings classified as Group A-1, A-2, H, I-2 or I-3 occupancies.~~

~~**1406.11.3.2 Nonfire-resistance-rated exterior walls.** MCM shall not be permitted on *exterior walls* required to have a *fire-resistance rating* by other provisions of this code.~~

~~1406.11.3.3 Specifications.~~

~~MCM shall be required to comply with all of the following:~~

- ~~1. MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~
- ~~2. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D635:
Class CC1: Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm) or in the thickness intended for use.~~

Class CC2: Materials that have a burning rate of $2\frac{1}{2}$ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm) or in the thickness intended for use.

1406.11.3.4 Area limitation and separation. The maximum area of a single MCM panel and the minimum vertical and horizontal separation requirements for MCM panels shall be as provided for in Table 1406.11.3.4. The maximum percentage of *exterior wall* area of any story covered with MCM panels shall not exceed that indicated in Table 1406.11.3.4 or the percentage of unprotected openings permitted by Section 705.8, whichever is smaller.

Exception: In buildings provided with flame barriers complying with Section 705.8.5 and extending 30 inches (760 mm) beyond the *exterior wall* in the plane of the floor, a vertical separation shall not be required at the floor other than that provided by the vertical thickness of the flame barrier.

TABLE 1406.11.3.4
AREA LIMITATION AND SEPARATION REQUIREMENTS FOR MCM PANELS

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

a. For reductions in the minimum vertical separation, see Section 1406.11.3.4.

1406.11.3.5 Automatic sprinkler system increases. Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the maximum percentage area of *exterior wall* of any story covered with MCM panels and the maximum square footage of a single area of MCM panels in Table 1406.11.3.4 shall be increased 100 percent. The area of MCM panels shall not exceed 50 percent of the *exterior wall* area of any story or the area permitted by Section 705.8 for unprotected openings, whichever is smaller.

1406.11.4 Installations up to 75 feet in height (Option 2). MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1406.11.4.1 through 1406.11.4.4.

Exception: Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be exempt from the height limitation.

1406.11.4.1 Minimum fire separation distance. MCM shall not be installed on any wall with a fire separation distance less than 30 feet (9 144 mm).

Exception: Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the fire separation distance shall be permitted to be reduced to not less than 20 feet (6 096 mm).

1406.11.4.2 Specifications.

MCM shall be required to comply with all of the following:

Class CC2:

1. MCM shall have a self ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.
2. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D635:

Class CC1: Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.

Materials that have a burning rate of 2³/₂ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.

1406.11.4.3 Area and size limitations. The aggregate area of MCM panels shall not exceed 25 percent of the area of any *exterior wall face* of the story on which those panels are installed. The area of a single MCM panel installed above the first story above grade plane shall not exceed 16 square feet (1.5 m²) and the vertical dimension of a single MCM panel shall not exceed 4 feet (1219 mm).

Exception: Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the maximum aggregate area of MCM panels shall be increased to 50 percent of the *exterior wall face* of the story on which those panels are installed and there shall not be a limit on the maximum dimension or area of a single MCM panel.

1406.11.4.4 Vertical separations. Flame barriers complying with Section 705.8 and extending 30 inches (762 mm) beyond the *exterior wall* or a vertical separation of not less than 4 feet (1219 mm) in height shall be provided to separate MCM panels located on the *exterior walls* at one story intervals.

Exception: Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason:

Fire events around the world have made everyone rethink how MCM panels fit within the construction landscape. While many, if not all, of the fires have involved product and or wall assemblies that would not have been allowed under the IBC, it is clear that there are questions with the allowable use of standard core and fire resistive MCM panels. The MCM Manufacturers that are members of the Metal Construction Association agree that to simplify the application of MCM that Section 1406.11 Alternate conditions, which is based on the allowable use of other combustible exterior envelope material within the IBC, should be removed. This will help to remove questions from both designers and code compliance officials on the appropriate product to use.

The clarification of MCM and MCM systems is added because 1406.10.1 specifically applies to the MCM "panel" (referred to as MCM in the IBC). 1406.10.2 through 1406.10.4 references both MCM and MCM System.

By using the 40 feet above grade plane limit as a trigger for MCM System compliance with NFPA 285, the product decision is simplified and the IBC is made more clear.

The majority of the domestic MCM manufacturers are represented as members of the Metal Construction Association

(MCA)

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Over time, the material cost difference between standard and fire resistive core has narrowed significantly. The cost difference in the choice of material should be minimal and, in many cases there may be no negative cost impact.

~~**Exception:** Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be exempt from the height limitation.~~

~~**1406.11.3.1 Prohibited occupancies.** MCM shall not be permitted on buildings classified as Group A-1, A-2, H, I-2 or I-3 occupancies.~~

~~**1406.11.3.2 Nonfire-resistance-rated exterior walls.** MCM shall not be permitted on *exterior walls* required to have a *fire-resistance rating* by other provisions of this code.~~

~~**1406.11.3.3 Specifications.** MCM shall be required to comply with all of the following:~~

- ~~1. MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~
- ~~2. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D635:
Class CC1: Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm) or in the thickness intended for use.
Class CC2: Materials that have a burning rate of 2¹/₂ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm) or in the thickness intended for use.~~

~~**1406.11.3.4 Area limitation and separation.** The maximum area of a single MCM panel and the minimum vertical and horizontal separation requirements for MCM panels shall be as provided for in Table 1406.11.3.4. The maximum percentage of *exterior wall* area of any story covered with MCM panels shall not exceed that indicated in Table 1406.11.3.4 or the percentage of unprotected openings permitted by Section 705.8, whichever is smaller.~~

~~**Exception:** In buildings provided with flame barriers complying with Section 705.8.5 and extending 30 inches (760 mm) beyond the *exterior wall* in the plane of the floor, a vertical separation shall not be required at the floor other than that provided by the vertical thickness of the flame barrier.~~

**TABLE 1406.11.3.4
AREA LIMITATION AND SEPARATION REQUIREMENTS FOR MCM PANELS**

FIRE SEPARATION DISTANCE (feet)	COMBUSTIBILITY CLASS OF MCM	MAXIMUM PERCENTAGE AREA OF EXTERIOR WALL COVERED WITH MCM PANELS	MAXIMUM SINGLE AREA OF MCM PANELS (square feet)	MINIMUM SEPARATION OF MCM PANELS (feet)	
				Vertical	Horizontal
Less than 6	—	Not Permitted	Not Permitted	—	—
6 or more but less than 11	CC1	10	50	8	4
	CC2	Not Permitted	Not Permitted	—	—
11 or more but less than or equal to 30	CC1	25	90	6	4
	CC2	15	70	8	4
More than 30	CC1	50	Not Limited	3 ^a	0
	CC2	50	100	6 ^a	3

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. For reductions in the minimum vertical separation, see Section 1406.11.3.4.

1406.11.3.5 Automatic sprinkler system increases. Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the maximum percentage area of *exterior wall* of any story covered with MCM panels and the maximum square footage of a single area of MCM panels in Table 1406.11.3.4 shall be increased 100 percent. The area of MCM panels shall not exceed 50 percent of the *exterior wall* area of any story or the area permitted by Section 705.8 for unprotected openings, whichever is smaller.

1406.11.4 Installations up to 75 feet in height (Option 2). MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1406.11.4.1 through 1406.11.4.4.

Exception: Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be exempt from the height limitation.

1406.11.4.1 Minimum fire separation distance. MCM shall not be installed on any wall with a fire separation distance less than 30 feet (9 144 mm).

Exception: Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the fire separation distance shall be permitted to be reduced to not less than 20 feet (6096 mm).

1406.11.4.2 Specifications. MCM shall be required to comply with all of the following:

1. MCM shall have a self ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.
2. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D635:
 - **Class CC1:** Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.
 - **Class CC2:** Materials that have a burning rate of 2¹/₂ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.

1406.11.4.3 Area and size limitations. The aggregate area of MCM panels shall not exceed 25 percent of the area of any *exterior wall* face of the *story* on which those panels are installed. The area of a single MCM panel installed above the first *story* above grade plane shall not exceed 16 square feet (1.5 m²) and the vertical dimension of a single MCM panel shall not exceed 4 feet (1219 mm).

Exception: Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the maximum aggregate area of MCM panels shall be increased to 50 percent of the *exterior wall* face of the *story* on which those panels are installed and there shall not be a limit on the maximum dimension or area of a single MCM panel.

1406.11.4.4 Vertical separations. Flame barriers complying with Section 705.8 and extending 30 inches (762 mm) beyond the *exterior wall* or a vertical separation of not less than 4 feet (1219 mm) in height shall be provided to separate MCM panels located on the *exterior walls* at one-story intervals.

Exception: Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason:

This proposal eliminates the current code allowances for alternate fire testing for building heights above 40 feet; current code has allowances for a) installations up to 50 feet and b) installations up to 75 feet - Option1 and Option2.

When MCM systems are installed in buildings of Type I through IV construction they always need to be separated from the interior of the building by a thermal barrier, unless they have been tested by one of the special approval tests, such as a room-corner test (NFPA 286, UL 1040 or UL 1715).

This proposal clarifies that, in buildings of such low heights above grade plane (up to 40 feet), testing to NFPA 285 is not required and a Class B (75 flame spread index) in ASTM E84 is sufficient and a Class A is not needed.

The requirements regarding fire resistance rating in 1406.8 must apply also.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference

calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

1. Grenfell fire, London England:

Buildings Across U.S. Are Wrapped in Same Panels That Fueled Deadly London Fire: <https://www.wsj.com/articles/built-to-burn-thousands-of-buildings-world-wide-are-wrapped-in-combustible-panels-1508858048>

<https://www.nytimes.com/2017/06/24/world/europe/grenfell-tower-london-fire.html>

2. Torch Tower Fire, Dubai

https://en.wikipedia.org/wiki/The_Marina_Torch January 8th, 2018

3. Address Hotel Fire, Dubai https://en.wikipedia.org/wiki/The_Address_Downtown_Dubai January 8th, 2018

Cost Impact

The code change proposal will increase the cost of construction .

The elimination of the current allowances allowing use of MCM to up to 75 on almost all buildings will lead to a more expensive fire-tested product being required for application above 40 feet.

Internal ID: 396

FS141-18

IBC: 1406.10, 1406.10.1, 1406.10.2, 1406.10.3

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

1406.10 Type I, II, III and IV construction. Where installed on buildings of Type I, II, III and IV construction, metal composite material (MCM systems) shall comply with Sections 1406.10.1 through ~~1406.10.4~~ 1406.10.3, or Section 1406.11.

1406.10.1 Surface-burning characteristics. MCM shall have a *flame spread index* of not more than 25 and a smoke-developed index of not more than 450 when tested ~~as an assembly~~ in the maximum thickness intended for use in accordance with ASTM E84 or UL 723.

1406.10.2 Thermal barriers. MCM shall be separated from the interior of a building by an approved thermal barrier consisting of 1/2 -inch (12.7 mm) gypsum wallboard or ~~a~~ material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.

Exceptions:

1. The MCM system is specifically approved based on tests conducted in accordance with NFPA 286 and with the acceptance criteria of Section 803.1.1.1, UL 1040 or UL 1715. Such testing shall be performed with the MCM in the maximum thickness intended for use. The MCM system shall include seams, joints and other typical details used in the installation and shall be tested in the manner intended for use.
2. The MCM is used as elements of balconies and similar projections, architectural trim or embellishments.

Delete without substitution:

~~**1406.10.3 Thermal barrier not required.** The thermal barrier specified for MCM in Section 1406.10.2 is not required where:~~

- ~~1. The MCM system is specifically approved based on tests conducted in accordance with NFPA 286 and with the acceptance criteria of Section 803.1.1.1, UL 1040 or UL 1715. Such testing shall be performed with the MCM in the maximum thickness intended for use. The MCM system shall include seams, joints and other typical details used in the installation and shall be tested in the manner intended for use.~~
- ~~2. The MCM is used as elements of balconies and similar projections, architectural trim or embellishments.~~

Revise as follows:

~~1406.10.4~~**1406.10.3 Full-scale tests.** The MCM system shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use.

Reason:

The testing for flame spread of the MCM when installed in buildings of Type I, II, III and IV construction needs to be of the MCM itself (i.e. the sandwich panel alone) and not of the system, which includes a series of other components, per the definitions below. That is why the term MCM is being replaced by "metal composite materials" and the phrase "as an assembly" is being removed. This is also consistent with the general testing for "metal composite materials" in section 1406.9.

METAL COMPOSITE MATERIAL (MCM). A factory manufactured panel consisting of metal skins bonded to both faces of a solid plastic core.

METAL COMPOSITE MATERIAL (MCM) SYSTEM. An exterior wall covering fabricated using MCM in a specific assembly including joints, seams, attachments, substrate, framing and other details as appropriate to a particular design.

The code change also moves the requirements to exempt the need from a thermal barrier from Section 1406.10.3 to an

exception to 1406.10.2

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

1. Grenfell fire, London England:

Buildings Across U.S. Are Wrapped in Same Panels That Fueled Deadly London Fire: <https://www.wsj.com/articles/built-to-burn-thousands-of-buildings-world-wide-are-wrapped-in-combustible-panels-1508858048>

Why Grenfell Tower Burned: Regulators Put Cost Before Safety
<https://www.nytimes.com/2017/06/24/world/europe/grenfell-tower-london-fire.html>

2. Torch Tower Fire, Dubai

https://en.wikipedia.org/wiki/The_Marina_Torch January 8th, 2018

3. Address Hotel Fire, Dubai https://en.wikipedia.org/wiki/The_Address_Downtown_Dubai January 8th, 2018

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply clarifies that the code is requiring the MCM panel to be tested and is editorial for better use and understanding of the requirements in this section

Internal ID: 441

FS142-18

IBC: 1406.11, 1406.11.1, 1406.11.4, 1406.11.4.1, 1406.11.4.2, 1406.11.4.3, 1406.11.4.4

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Building Code

Revise as follows:

1406.11 Alternate conditions. MCM and MCM systems shall ~~not~~ be required to comply with Sections 1406.10.1 through 1406.10.4 provided that such systems comply with Section 1406.11.1, 1406.11.2, 1406.11.3 or 1406.11.4 or 1406.11.3, as a function of the height of the installation.

1406.11.1 Installations up to 40 feet in height. MCM shall ~~not~~ be installed more than permitted to be installed up to 40 feet (12 190 mm) in height above grade plane where installed in accordance with Sections 1406.8, 1406.9, 1406.10.2, 1406.10.3 and with Sections 1406.11.1.1 and 1406.11.1.2.

1406.11.1.1 Fire separation distance of 5 feet or less. Where the *fire separation distance* is 5 feet (1524 mm) or less, the area of MCM shall not exceed 10 percent of the *exterior wall surface*.

1406.11.1.2 Fire separation distance greater than 5 feet. Where the *fire separation distance* is greater than 5 feet (1524 mm), the area of *exterior wall surface coverage* using MCM shall not be limited.

Delete without substitution:

~~**1406.11.4 Installations up to 75 feet in height (Option 2).** MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1406.11.4.1 through 1406.11.4.4.~~

~~**Exception:** Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be exempt from the height limitation.~~

~~**1406.11.4.1 Minimum fire separation distance.** MCM shall not be installed on any wall with a fire separation distance less than 30 feet (9 144 mm).~~

~~**Exception:** Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the fire separation distance shall be permitted to be reduced to not less than 20 feet (6 096 mm).~~

~~**1406.11.4.2 Specifications.** MCM shall be required to comply with all of the following:~~

- ~~1. MCM shall have a self ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~
- ~~2. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D635:
 - ~~• **Class CC1:** Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.~~
 - ~~• **Class CC2:** Materials that have a burning rate of 2¹/₂ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.~~~~

~~**1406.11.4.3 Area and size limitations.** The aggregate area of MCM panels shall not exceed 25 percent of the area of any *exterior wall face* of the *story* on which those panels are installed. The area of a single MCM panel installed above the first *story* above grade plane shall not exceed 16 square feet (1.5 m²) and the vertical dimension of a single MCM panel shall not exceed 4 feet (1219 mm).~~

~~**Exception:** Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the maximum aggregate area of MCM panels shall be increased to 50 percent of the *exterior wall face* of the *story* on which those panels are installed and there shall not be a limit on the maximum dimension or area of a single MCM panel.~~

~~**1406.11.4.4 Vertical separations.** Flame barriers complying with Section 705.8 and extending 30 inches (762 mm) beyond the *exterior wall* or a vertical separation of not less than 4 feet (1219 mm) in height shall be provided to separate MCM panels located on the *exterior walls* at one-story intervals.~~

~~**Exception:** Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.~~

Reason:

If the proposal to eliminate all alternate installations of MCM systems is believed to be too severe a change, a set of three proposals would provide adequate safety for use of these systems. This proposal handles all requirements for MCMs up to 40 ft in height and is followed by proposals that would handle requirements between 40 ft and 50 ft and requirements for installations between 50 ft and 75 ft.

The charging paragraph is proposed to be made into a positive requirement so that each subsection describes the requirements for such installations.

When MCM systems are installed in buildings of Type I through IV construction they always need to be separated from the interior of the building by a thermal barrier, unless they have been tested by one of the special approval tests, such as a room-corner test (NFPA 286, UL 1040 or UL 1715), as explained in sections 1406.10.2 and 1406.10.3. This proposal excludes MCM systems on buildings of such low heights above grade plane from testing to NFPA 285 and requires them to comply with a Class B (75 flame spread index) in ASTM E84 is sufficient and a Class A (as would be required in Section 1406.10.1) is not needed. The requirements regarding fire resistance rating in 1406.8 must apply also.

The revision states which sections need to be complied with and, therefore, a specific statement that MCM systems in installations up to 40 feet in height do not need to comply with NFPA 285 (section 1406.10.4) is not necessary.

The section 1406.11.4 is proposed to be deleted without substitution because both sections 1406.11.3 and 1406.11.4 deal with installations in buildings up to 75 feet in height (and even higher) and the two options need to be consolidated.

No specific information is needed about installations above 75 feet because they need to comply with the general requirements that the entire exterior wall envelope must be tested to NFPA 285 and meet the corresponding requirements.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal would impose additional fire safety requirements for MCM systems.

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Building Code

Revise as follows:

1406.11.2 Installations up to 50 feet in height. MCM shall ~~not be permitted to~~ be installed ~~more than up to~~ 50 feet (15 240mm) in height above grade ~~plane~~ where installed in accordance with Sections ~~1406.11.2.1 and 1406.11.2.2~~ 1406.8, 1406.9, 1406.10.1 through 1406.10.3 and with Section 1406.11.2.1. In such installations, the MCM systems on their own shall not be required to comply with Section 1406.10.4, but the entire exterior wall envelope shall be required to be tested with and comply with the acceptance criteria of NFPA 285.

Delete without substitution:

~~**1406.11.2.1 Self-ignition temperature.** MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~

Revise as follows:

~~**1406.11.2.2**~~ **1406.11.2.1 Limitations.** Sections of MCM shall not exceed 300 square feet (27.9 m²) in area and shall be separated by not less than 4 feet (1219 mm) vertically.

Delete without substitution:

~~**1406.11.4 Installations up to 75 feet in height (Option 2).** MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1406.11.4.1 through 1406.11.4.4.~~

~~**Exception:** Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall be exempt from the height limitation.~~

~~**1406.11.4.1 Minimum fire separation distance.** MCM shall not be installed on any wall with a fire separation distance less than 30 feet (9 144 mm).~~

~~**Exception:** Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the fire separation distance shall be permitted to be reduced to not less than 20 feet (6 096 mm).~~

~~**1406.11.4.2 Specifications.** MCM shall be required to comply with all of the following:~~

- ~~1. MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~
- ~~2. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D635:~~
 - ~~• **Class CC1:** Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.~~
 - ~~• **Class CC2:** Materials that have a burning rate of 2¹/₂ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use.~~

~~**1406.11.4.3 Area and size limitations.** The aggregate area of MCM panels shall not exceed 25 percent of the area of any exterior wall face of the story on which those panels are installed. The area of a single MCM panel installed above the first story above grade plane shall not exceed 16 square feet (1.5 m²) and the vertical dimension of a single MCM panel shall not exceed 4 feet (1219 mm).~~

~~**Exception:** Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the maximum aggregate area of MCM panels shall be increased to 50 percent of the exterior wall face of the story on which those panels are installed and there shall not be a limit on the maximum dimension or area of a single MCM panel.~~

~~**1406.11.4.4 Vertical separations.** Flame barriers complying with Section 705.8 and extending 30 inches (762 mm) beyond the exterior wall or a vertical separation of not less than 4 feet (1219 mm) in height shall be provided to separate MCM panels located on the exterior walls at one-story intervals.~~

Exception: Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason:

If it is believed that eliminating all alternate provisions for the use of MCM systems is too severe a change, this is the second of three proposals that provide an alternate approach to use these systems with added fire safety requirements. This proposal deals with systems to be installed at heights of 40 to 50 ft.

When MCM systems are installed in buildings of Type I through IV construction they always need to be separated from the interior of the building by a thermal barrier, unless they have been tested by one of the special approval tests, such as a room-corner test (NFPA 286, UL 1040 or UL 1715). Also, in buildings above 40 ft (and up to 50 ft) a Class A (25 flame spread index) in ASTM E84 is required but that testing to NFPA 285 is not required if there is a sufficient area limitation. The section on ignition temperature is proposed to be eliminated because it should apply to all MCM systems. The requirements regarding fire resistance rating in 1406.8 must apply also. The requirements regarding ignition temperature need to apply to all MCM, irrespective of height where they are installed.

The MCM systems themselves are not required to be tested to NFPA 285. However, the proposed wording clarifies that the entire exterior wall envelope must be tested to NFPA 285.

The alternate approach in sections 1406.11.4 is proposed to be deleted because it does not provide sufficient fire safety.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal imposes additional fire safety requirements for MCM systems.

IBC: 1406.11.3, 1406.11.3.1 (New), 1406.11.3.1.1, 1406.11.3.1.2, 1406.11.3.3, 1406.11.3.1.3, TABLE 1406.11.3.1.3, 1406.11.3.1.4, 1406.11.3.2 (New), 1406.11.3.2.1 (New), 1406.11.3.2.2 (New)

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Building Code

Revise as follows:

1406.11.3 Installations between 50 ft and up to 75 feet in height (Option 1) height. ~~MCM-MCMs shall not be installed more than be permitted to be installed between 50 feet (15 240 mm) and up to 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1406.11.3.1 through 1406.11.3.5.~~ **Exception:** ~~Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall be exempt from the height limitation.~~

~~1406.8, 1406.9, 1406.10.1, 1406.10.2, 1406.10.3, and also either 1406.11.3.1 or 1406.11.3.2. In such installations, the MCMs on their own shall not be required to comply with Section 1406.10.4, but the entire exterior wall envelope shall be required to be tested with, and comply with the acceptance criteria of, NFPA 285.~~

Add new text as follows:

1406.11.3.1 Fire separations not exceeding 30 ft. For buildings with fire separations not exceeding 30 feet (9 144 mm), MCMs shall be permitted up to a height of 75 feet where installed in accordance with Sections 1406.11.3.1.1 through 1406.11.3.1.4.

Revise as follows:

~~1406.11.3.1~~**1406.11.3.1.1 Prohibited occupancies.** ~~MCM-MCMs shall not be permitted on buildings classified as Group A-1, A-2, H, I-2 or I-3 occupancies.~~

~~1406.11.3.2~~**1406.11.3.1.2 Nonfire-resistance-rated exterior walls.** ~~MCM-MCMs shall not be permitted on exterior walls required to have a fire-resistance rating by other provisions of this code.~~

Delete without substitution:

~~1406.11.3.3 Specifications.~~ ~~MCM shall be required to comply with all of the following:~~

- ~~1. MCM shall have a self ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~
- ~~2. MCM shall conform to one of the following combustibility classifications when tested in accordance with ASTM D635:~~

~~Class CC1: Materials that have a burning extent of 1 inch (25 mm) or less when tested at a nominal thickness of 0.060 inch (1.5 mm) or in the thickness intended for use.~~

~~Class CC2: Materials that have a burning rate of 2¹/₂ inches per minute (1.06 mm/s) or less when tested at a nominal thickness of 0.060 inch (1.5 mm) or in the thickness intended for use.~~

Revise as follows:

~~1406.11.3.4~~**1406.11.3.1.3 Area limitation and separation.** ~~The maximum area of a single MCM panel system and the minimum vertical and horizontal separation requirements for MCM panels systems shall be as provided for in Table 1406.11.3.4.~~ 1406.11.3.1.3. The maximum percentage of exterior wall area on each side of any story covered with MCM panels systems shall not exceed that indicated in Table 1406.11.3.4-1406.11.3.1.3 or the percentage of unprotected openings permitted by Section 705.8, whichever is smaller.

Exception: In buildings provided with flame barriers complying with Section 705.8.5 and extending 30 inches (760 mm) beyond the exterior wall in the plane of the floor, a vertical separation shall not be required at the floor other than that provided by the vertical thickness of the flame barrier.

**TABLE 1406.11.3.4-1406.11.3.1.3
AREA LIMITATION AND SEPARATION REQUIREMENTS FOR MCM PANEL SYSTEMS**

FIRE SEPARATION DISTANCE (feet)	COMBUSTIBILITY CLASS OF MCM	MAXIMUM PERCENTAGE AREA OF EXTERIOR WALL COVERED WITH MCM SYSTEMS	MAXIMUM SINGLE AREA OF MCM SYSTEMS (square feet)	MINIMUM SEPARATION OF MCM SYSTEMS (feet)	
				Vertical	Horizontal
Less than 6	-	Not Permitted	Not Permitted	-	-
6 or more but less than 11	CC1	10	50	8	4
	CC2	Not Permitted	Not Permitted	Not Permitted	Not Permitted
11 or more but less than or equal to 30	CC1	25	90	6	4
	CC2	Not Permitted	Not Permitted	Not Permitted	Not Permitted
More than 30	CC1	50	Not Limited	3 ^a	0
	CC2	Not Permitted	Not Permitted	Not Permitted	Not Permitted

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. For reductions in the minimum vertical separation, see Section ~~1406.11.3.4~~1406.11.3.1.3.

~~1406.11.3.5~~1406.11.3.1.4 **Automatic sprinkler system increases.** Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the maximum percentage area of *exterior wall on each side* of any story covered with MCM ~~panels~~systems and the maximum square footage of a single area of MCM ~~panels~~systems in Table ~~1406.11.3.4~~1406.11.3.1.3 shall be increased 100 percent. The area of MCM ~~panels~~systems shall not exceed 50 percent of the *exterior wall area on each side* of any story or the area permitted by Section 705.8 for unprotected openings, whichever is smaller.

Add new text as follows:

1406.11.3.2 Fire separations exceeding 30 feet.. For buildings with fire separations exceeding 30 feet (9 144 mm), MCM shall be permitted where installed in accordance with Sections 1406.11.3.2.1 and 1406.11.3.2.2.

Exception: Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the maximum aggregate area of MCM systems shall be increased to 50 percent of the exterior wall face on each side of the story on which those MCM systems are installed and there shall not be a limit on the maximum dimension or area of a single MCM system.

1406.11.3.2.1 Area and size limitations. . The aggregate area of MCM systems shall not exceed 25 percent of the area of any exterior wall face of the story on which those MCM systems are installed. The area of a single MCM system installed above the first story above grade plane shall not exceed 16 square feet (1.5 m²) and the vertical dimension of a single MCM system shall not exceed 4 feet (1219 mm).

1406.11.3.2.2 Vertical separations. Flame barriers complying with Section 705.8 and extending 30 inches (762 mm) beyond the exterior wall or a vertical separation of not less than 4 feet (1219 mm) in height shall be provided to separate MCM systems located on the exterior walls at one-story intervals.

Reason:

This proposal contains all the requirements for installation of MCMs above 50 feet, if the committee is inclined not to prohibit all such installations. It eliminates the concept of "option 1" and "option 2".

The proposal does not permit exceptions for MCM installations based purely on the use of sprinklers inside the building. The proposal eliminates sprinkler exceptions from present sections 1406.11.3, 1406.11.4, 1406.11.4.1 and 1406.11.4.4. That means that there will be no blanket sprinkler exceptions for height limitations, vertical separations or fire separation distances. The reason for this is that sprinklers inside a building will not affect flame spread along the outside of the building and therefore the presence of sprinklers inside the building should not provide exception from testing to NFPA 285 or from height limitations. Sprinklers do not control outside fires. Allowance is retained for increasing areas of MCMs when the building is fully protected by sprinklers. It seems reasonable that sprinkler protection should allow greater areas of MCM use.

The proposal requires that any time the installation exceeds 75 feet the MCM system itself must be tested to NFPA 285 (as well as testing the entire exterior wall envelope to NFPA 285).

For installations between 50 ft and 75 feet it allows two options depending on whether the separation between buildings is over or under 30 feet.

For separations below 30 feet allowances are made with much more restricted areas and MCM systems are not allowed to be used if they only comply with CC2. Also it is made clear that the area limitations apply to every side of the building. Also, there are prohibited occupancies (A-1, A-2, H, I-2 and I-3, just like in the 2018 code) and MCMs cannot be installed if a fire resistance rating is required.

For separations above 30 feet MCMs are permitted with some severe area limitations, mirroring what is allowed today, but without the excessive exceptions for sprinklers inside the building.

The full text as the code would read if this is approved is attached.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal, which is the third of a group of 3 proposals on MCMs, will require more fire testing of these systems and result in better fire safety.

Internal ID: 848

FS145-18

IBC: 1406.11.3, 1406.11.4

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

1406.11.3 Installations up to 75 feet in height (Option 1). MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1406.11.3.1 through 1406.11.3.5.

~~**Exception:** Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall be exempt from the height limitation.~~

1406.11.4 Installations up to 75 feet in height (Option 2). MCM shall not be installed more than 75 feet (22 860 mm) in height above grade plane where installed in accordance with Sections 1406.11.4.1 through 1406.11.4.4.

~~**Exception:** Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall be exempt from the height limitation.~~

Reason:

This code change proposal removes the height exception for sprinklered buildings

MCM systems are the only systems in Chapter 14 of the IBC where the presence of sprinklers inside the building is the reason to eliminate the height and coverage limitations associated with fires along the exterior wall envelope. Such an exception that allows buildings of unlimited height to be used with MCM systems as part of the exterior wall envelope based on the presence of sprinklers inside the building is inappropriate because there is no fire department access for those buildings above 75 feet Note that installations that comply with the 1406.11 sections are not required to be tested to NFPA 285. This proposal removes the blanket sprinkler exceptions for height limitations. The reason for this is 1) that interior sprinkler systems for high rise buildings are not intended to control outside exposure fires and 2) therefore, sprinklers inside a building have a limited affect upon flame spread along the outside of the building. the presence of sprinklers inside the building should not provide a full exception from testing to NFPA 285 or from height limitations necessary to ensure a minimum level of safety.

According to an NFPA study published in 2014 (Fire Hazards of Exterior Wall Assemblies Containing Combustible Components), slightly more than half of the exterior facade fires originated from interior ignition. Sprinklers will help restrict an interior fire from reaching the exterior facade, but will have limited effect on exterior ignition or fire spread across combustible exterior wall assemblies..

Also keep in mind that when these fires occur, occupants have little choice but to evacuate and stairs are not designed for full building evacuation. It can be expected that evacuating occupants will encounter stairs overflowing with other evacuating occupants. As observed during the 63 story Address Hotel fire in Dubai on New Year's Eve 2015, these situations increase the tendency to panic and cause crushes. In addition, most stair pressurization systems take outside air from the roof, which can be expected to bring in contaminated air, decreasing the level of comfort for evacuating occupants. And, those aren't even the worst scenarios. When occupants evacuate stair enclosures at grade, they are greeted with flaming debris raining down on them.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building

exterior wall envelope.

1. Grenfell fire, London England:

Buildings Across U.S. Are Wrapped in Same Panels That Fueled Deadly London Fire: <https://www.wsj.com/articles/built-to-burn-thousands-of-buildings-world-wide-are-wrapped-in-combustible-panels-1508858048>

Why Grenfell Tower Burned: Regulators Put Cost Before Safety
<https://www.nytimes.com/2017/06/24/world/europe/grenfell-tower-london-fire.html>

2. Torch Tower Fire, Dubai

https://en.wikipedia.org/wiki/The_Marina_Torch January 8th, 2018

3. Address Hotel Fire, Dubai https://en.wikipedia.org/wiki/The_Address_Downtown_Dubai January 8th, 2018

Cost Impact

The code change proposal will increase the cost of construction .

The elimination of the exception allowing use of MCM to any height on a sprinklered building may lead to a more expensive fire-tested product being required for application above 75 feet.

Internal ID: 394

FS146-18

IBC: 1406.13

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

1406.13 Foam plastic insulation. Where MCM systems are included in an exterior wall envelope containing foam plastic insulation, the exterior wall envelope shall also comply with the requirements of Section 2603.

Reason:

This code change proposal clarifies when foam plastic insulation is permitted. By definition, foam plastic cannot be contained within the MCM system, but foam plastic can be part of the same exterior wall envelope that also includes the MCM system and the entire exterior wall envelope must then be tested appropriately as indicated in section 2603

The definition of metal composite material (MCM), shown below, does not allow MCMs to contain foam plastic insulation. The definition of metal composite material (MCM) system, also shown below, indicates that this is an exterior wall covering. However, section 2603.5 indicates that, whenever foam plastic insulation is included in exterior walls (meaning exterior wall envelopes) the exterior wall envelope must be tested to NFPA 285. Moreover, sections 2603.3 and 2603.4 indicate that the foam plastic insulation itself must meet the requirements of class B (flame spread index of 75 and smoke developed index of 450) when tested to ASTM E84, and the foam plastic insulation must be separated from the interior of the building by a thermal barrier (with some exceptions).

METAL COMPOSITE MATERIAL (MCM). A factory manufactured panel consisting of metal skins bonded to both faces of a solid plastic core.

METAL COMPOSITE MATERIAL (MCM) SYSTEM. An exterior wall covering fabricated using MCM in a specific assembly including joints, seams, attachments, substrate, framing and other details as appropriate to a particular design.

EXTERIOR WALL ENVELOPE. A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

FS147-18

IBC: 1408.10.3

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

1408.10.2 Thermal barriers. HPL shall be separated from the interior of a building by an approved thermal barrier consisting of 1/2-inch (12.7 mm) gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.

1408.10.3 Thermal barrier not required. The thermal barrier specified for HPL in Section 1408.10.2 is not required where:

1. The HPL system is specifically approved based on tests conducted in accordance with NFPA 286, and with the acceptance criteria of Section 803.1.2.1, or with UL 1040 or UL 1715. Such testing shall be performed with the HPL in the minimum and maximum thicknesses intended for use. The HPL system shall include seams, joints and other typical details used in the installation and shall be tested in the manner intended for use.
2. The HPL is used as elements of balconies and similar projections, architectural *trim* or embellishments.

Reason:

This code change proposal makes a revision regarding the reference to testing in accordance with UL 1040 and UL 1715. The references are retained but the option is added to use NFPA 286, with the corresponding criteria (in section 803.1.1.1), to be consistent with other references to UL 1040 and UL 1715.

NFPA 286 was developed long after UL 1040 and UL 1715 and was not therefore included in every section of the code. However, now NFPA 286 is used much more widely than UL 1040 or UL 1715. No other change is made in this proposal.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

FS149-18

IBC: 1408.10.4.1 (New), 2603.5.5.1 (New), Chapter 35

Proponent: John Harrington, FM Global, representing FM Global (john.harrington@fmglobal.com)

2018 International Building Code

1408.10.4 Full-scale tests. The HPL system shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the HPL system with the HPL in the minimum and maximum thicknesses intended for use.

Add new text as follows:

1408.10.4.1 Window Protection. Where window openings are provided within the installed wall assembly, they shall be covered as follows:

1. Where the assembly was tested per NFPA 285, provide protection as provided in the actual test.
2. Where the assembly was tested per ANSI/FM 4880, provide minimum 20 ga. (0.03595 in., 0.9 mm) steel flashing around the window opening, fastened at a maximum spacing of 16 inches. (406 mm) on center into the wall structure using minimum no. 10 (5 mm) screws.

2603.5.5 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
 - 2.1. There is no airspace between the insulation and the concrete or masonry.
 - 2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

2603.5.5.1 Window protection. Where window openings are provided within the installed wall assembly, they shall be covered as follows:

1. Where the assembly was tested per NFPA 285, provide protection as provided in the actual test.
2. Where the assembly was tested per ANSI/FM 4880, provide minimum 20 ga. (0.03595 in., 0.9 mm) steel flashing around the window opening, fastened at a maximum spacing of 16 in. (406 mm) on center into the wall structure using no. (5 mm) screws.

Update standard(s) as follows:

FM

FM Approvals
Headquarters Office 1151 Boston-
Providence Turnpike P.O. Box 9102
Norwood MA 02062

4880-2015~~2017~~:

Approval Standard for Class 1 Fire Rating of Building Panels or Interior Finish Materials

Reason:

Protection against fire exposure to the wall assembly cross-section around window openings must be provided in the installation to prevent fire spread within the cavity of the wall assembly.

Cost Impact

The code change proposal will increase the cost of construction .

Minimal cost increase for additional materials in walls so as to prevent fire spread within the wall cavity.

Internal ID: 1918

IBC: 1408.11, 1408.11.1, 1408.11.2, 1408.11.2.1, 1408.11.2.2

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

1408.11 Alternate conditions. HPL and HPL systems shall not be required to comply with Sections 1408.10.1 through 1408.10.4 provided that such systems comply with Section 1408.11.1 ~~or 1408.11.2.~~

1408.11.1 Installations up to 40 feet in height. HPL shall ~~not be installed more than permitted to be installed up to~~ 40 feet (12 190 mm) in height above grade plane where installed in accordance with ~~Sections 1408.11.1.1 and 1408.11.1.2.~~ Section 1408.11.1.1 or with Section 1408.11.1.2.

1408.11.1.1 Fire separation distance of 5 feet or less. Where the fire separation distance is 5 feet (1524 mm) or less, the area of HPL shall not exceed 10 percent of the *exterior wall* surface.

1408.11.1.2 Fire separation distance greater than 5 feet. Where the fire separation distance is greater than 5 feet (1524 mm), the area of *exterior wall* surface coverage using HPL shall not be limited.

Delete without substitution:

~~**1408.11.2 Installations up to 50 feet in height.** HPL shall not be installed more than 50 feet (15 240 mm) in height above grade plane where installed in accordance with Sections 1408.11.2.1 and 1408.11.2.2.~~

~~**1408.11.2.1 Self-ignition temperature.** HPL shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~

~~**1408.11.2.2 Limitations.** Sections of HPL shall not exceed 300 square feet (27.9 m²) in area and shall be separated by a minimum 4 feet (1219 mm) vertically.~~

Reason:

This proposal makes one change, consistent with the intent of ensuring that all combustible materials on the exterior walls are tested to NFPA 285 and for consistency with other sections of the code. This proposal is intended to address concerns with current language and requirements that could lead to fires like the one in Grenfell Tower (London, England).

The exception for HPL systems up to 50 ft in height to be tested to NFPA 285 is eliminated, consistent with the requirement that all combustibles exceeding 40 ft in height shall be tested. The testing for self-ignition temperature based on ASTM D1929 is not a very robust fire test and is not sufficient to provide assurance of adequate fire performance. The added criteria in the section proposed to be deleted do not ensure that there will be no flame spread upwards or sideways, as would be detected when testing to NFPA 285.

Note: Current IBC definitions:

HIGH-PRESSURE DECORATIVE EXTERIORGRADE COMPACT LAMINATE (HPL).

Panels consisting of layers of cellulose fibrous material impregnated with thermosetting resins and bonded together by a high-pressure process to form a homogeneous nonporous core suitable for exterior use.

HIGH-PRESSURE DECORATIVE EXTERIORGRADE COMPACT LAMINATE (HPL) YSTEM. An exterior wall covering fabricated using HPL in a specific assembly including

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all

proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

1. Grenfell fire, London England:

Buildings Across U.S. Are Wrapped in Same Panels That Fueled Deadly London Fire: <https://www.wsj.com/articles/built-to-burn-thousands-of-buildings-world-wide-are-wrapped-in-combustible-panels-1508858048>

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Building Code

Revise as follows:

1408.11 Alternate conditions. HPL and HPL systems shall not be required to comply with Sections 1408.10.1 through 1408.10.4 provided that such systems comply with Section ~~1408.11.1 or 1408.11.2~~ 1408.11.1.

1408.11.1 Installations up to 40 feet in height. HPL shall ~~not be installed more than permitted to be installed up to~~ 40 feet (12 190 mm) in height above grade plane where installed in accordance with Section ~~Section~~ 1408.11.1.1 ~~and or with Section~~ 1408.11.1.2.

1408.11.1.1 Fire separation distance of 5 feet or less. Where the fire separation distance is 5 feet (1524 mm) or less, the area of HPL shall not exceed 10 percent of the *exterior wall* surface.

1408.11.1.2 Fire separation distance greater than 5 feet. Where the fire separation distance is greater than 5 feet (1524 mm), the area of *exterior wall* surface coverage using HPL shall not be limited.

Delete without substitution:

~~**1408.11.2 Installations up to 50 feet in height.** HPL shall not be installed more than 50 feet (15 240 mm) in height above grade plane where installed in accordance with Sections 1408.11.2.1 and 1408.11.2.2.~~

~~**1408.11.2.1 Self-ignition temperature.** HPL shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.~~

~~**1408.11.2.2 Limitations.** Sections of HPL shall not exceed 300 square feet (27.9 m²) in area and shall be separated by a minimum 4 feet (1219 mm) vertically.~~

Reason:

This proposal makes a change consistent with the intent of ensuring that all combustible materials on the exterior walls are tested to NFPA 285 and for consistency with other sections of the code. This proposal is Intended to address concerns with current language and requirements that could lead to fires like the one in Grenfell Tower (London, England). The exception for HPL systems up to 50 ft in height that allows them to avoid having to be tested to NFPA 285 is eliminated, consistent with the requirement that all combustibles exceeding 40 ft in height shall be tested. The testing for self ignition temperature based on ASTM D1929 is not a very robust fire test and is not sufficient to provide assurance of adequate fire performance. The added criteria in the section proposed to be deleted do not ensure that there will be no flame spread upwards or sideways, as would be detected when testing to NFPA 285.

This means that all installations above 40 ft in height must be tested to NFPA 285.

Cost Impact

The code change proposal will increase the cost of construction .

The proposal will require that HPL systems used in construction over 40 ft in height must be tested to NFPA 285.

Internal ID: 1170

FS152-18

IBC: 1505.9

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Building Code

Revise as follows:

[BF] 1505.9 Rooftop mounted photovoltaic panel systems. Rooftop rack-mounted *photovoltaic panel systems* shall be tested, *listed* and identified with a fire classification in accordance with UL ~~1703~~ and UL-2703. The fire classification shall comply with Table 1505.1 based on the type of construction of the building.

Reason:

Fire classification for rooftop rack-mounted photovoltaic panel systems are determined in accordance with UL 2703.

UL 1703 includes partial fire testing of the photovoltaic panel, which is one of the components of the photovoltaic panel system. UL 2703 uses the results of that component testing, and includes further evaluation and testing of the photovoltaic panel system (i.e. the photovoltaic panel and the rack support system) to establish the Fire Classification for the system. UL 1703 is referenced within UL 2703.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Fire classification of these systems are determined in accordance with UL 2703 currently.

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BS] LIVE LOAD, ROOF. A load on a roof produced:

1. During maintenance by workers, equipment and materials;
2. During the life of the structure by movable objects such as planters or other similar small decorative appurtenances that are not occupancy related; or
3. By the use and occupancy of the roof such as for ~~roof gardens~~ landscaped roofs or assembly areas.

[F] 905.3.8 ~~Rooftop gardens and landscaped~~ Landscaped roofs. Buildings or structures that have ~~rooftop gardens or landscaped roofs~~ and that are equipped with a standpipe system shall have the standpipe system extended to the roof level on which the ~~rooftop garden or landscaped roof~~ is located.

[BF] 1505.10 ~~Roof gardens and landscaped~~ Landscaped roofs. ~~Roof gardens and landscaped~~ Landscaped roofs shall comply with Section 1505.1 and 1507.16 and shall be installed in accordance with ANSI/SPRI VF-~~1.1~~.

1507.16 Vegetative roofs, ~~roof gardens and landscaped roofs~~. ~~Vegetative roofs, roof gardens and landscaped roofs~~ shall comply with the requirements of this chapter, Section 1607.13.3 and the International Fire Code.

[BF] 1507.16.1 Structural fire resistance. The structural frame and roof construction supporting the load imposed on the roof by the ~~vegetative roof, roof gardens or landscaped roofs~~ shall comply with the requirements of Table ~~601.601~~.

TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_0 , AND MINIMUM CONCENTRATED LIVE LOADS g

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm²,

1 square foot = 0.0929 m²,

1 pound per square foot = 0.0479 kN/m², 1 pound = 0.004448 kN,

1 pound per cubic foot = 16 kg/m³.

- a. Floors in garages or portions of buildings used for the storage of motor vehicles shall be designed for the uniformly distributed live loads of this table or the following concentrated loads: (1) for garages restricted to passenger vehicles accommodating not more than nine passengers, 3,000 pounds acting on an area of 4¹/₂ inches by 4¹/₂ inches; (2) for mechanical parking structures without slab or deck that are used for storing passenger vehicles only, 2,250 pounds per wheel.
- b. The loading applies to stack room floors that support nonmobile, double-faced library book stacks, subject to the following limitations:
 1. The nominal book stack unit height shall not exceed 90 inches.
 2. The nominal shelf depth shall not exceed 12 inches for each face.
 3. Parallel rows of double-faced book stacks shall be separated by aisles not less than 36 inches wide.
- c. Design in accordance with ICC 300.
- d. Other uniform loads in accordance with an approved method containing provisions for truck loadings shall be considered where appropriate.
- e. The concentrated wheel load shall be applied on an area of 4.5 inches by 4.5 inches.
- f. The minimum concentrated load on stair treads shall be applied on an area of 2 inches by 2 inches. This load need not be assumed to act concurrently with the uniform load.
- g. Where snow loads occur that are in excess of the design conditions, the structure shall be designed to support the loads due to the increased loads caused by drift buildup or a greater snow design determined by the building official (see Section 1608).
- h. See Section 1604.8.3 for decks attached to exterior walls.
- i. Uninhabitable attics without storage are those where the maximum clear height between the joists and rafters is less than 42 inches, or where there are not two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses. This live load need not be assumed to act concurrently with any other live load requirements.
- j. Uninhabitable attics with storage are those where the maximum clear height between the joists and rafters is 42 inches or greater, or where there are two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses.

The live load need only be applied to those portions of the joists or truss bottom chords where both of the following conditions are met:

- i. The attic area is accessible from an opening not less than 20 inches in width by 30 inches in length that is located where the clear height in the attic is not less than 30 inches.
- ii. The slopes of the joists or truss bottom chords are not greater than two units vertical in 12 units horizontal.

The remaining portions of the joists or truss bottom chords shall be designed for a uniformly distributed concurrent live load of not less than 10 pounds per square foot.

- k. Attic spaces served by stairways other than the pull-down type shall be designed to support the minimum live load specified for habitable attics and sleeping rooms.
- l. Areas of occupiable roofs, other than ~~roof gardens~~ landscaped roofs and assembly areas, shall be designed for appropriate loads as approved by the building official. Unoccupied landscaped areas of roofs shall be designed in accordance with Section 1607.13.3.
- m. Live load reduction is not permitted.
- n. Live load reduction is only permitted in accordance with Section 1607.11.1.2 or Item 1 of Section 1607.11.2.
- o. Live load reduction is only permitted in accordance with Section 1607.11.1.3 or Item 2 of Section

1607.13.3 Occupiable roofs. Areas of roofs that are occupiable, such as *vegetative roofs*, ~~roof gardens~~ landscaped roofs or for assembly or other similar purposes, and marquees are permitted to have their uniformly distributed live loads reduced in accordance with Section 1607.11.

2018 International Fire Code

Revise as follows:

~~SECTION 317 ROOFTOP GARDENS AND LANDSCAPED ROOFS~~

317.1 General. ~~Rooftop gardens and landscaped~~ Landscaped roofs shall be installed and maintained in accordance with Sections 317.2 through 317.5 and Sections 1505 and 1507.16 of the International Building Code.

317.2 Rooftop garden or landscaped Landscaped roof size. ~~Rooftop garden or landscaped~~ Landscaped roof areas shall not exceed 15,625 square feet (1450 m²) in size for any single area with a maximum dimension of 125 feet (39 m) in length or width. A minimum 6-foot-wide (1.8 m) clearance consisting of a Class A-rated roof system complying with ASTM E108 or UL 790 shall be provided between adjacent ~~rooftop gardens or landscaped~~ roof areas.

317.3 Rooftop structure and equipment clearance. For all ~~vegetated roofing systems~~ vegetative roofs abutting combustible vertical surfaces, a Class A-rated roof system complying with ASTM E108 or UL 790 shall be achieved for a minimum 6-foot-wide (1829 mm) continuous border placed around rooftop structures and all rooftop equipment including, but not limited to, mechanical and machine rooms, penthouses, skylights, roof vents, solar panels, antenna supports and building service equipment.

317.4.3 Maintenance plan. The *fire code official* is authorized to require a maintenance plan for vegetation placed on roofs due to the size of a landscaped roof garden, materials used or where a fire hazard exists to the building or exposures due to the lack of maintenance.

504.3 Stairway access to roof. New buildings four or more stories above grade plane, except those with a roof slope greater than four units vertical in 12 units horizontal (33.3-percent slope), shall be provided with a *stairway* to the roof. *Stairway* access to the roof shall be in accordance with Section 1011.12. Such *stairway* shall be marked at street and floor levels with a sign indicating that the *stairway* continues to the roof. Where roofs are used for ~~roof gardens~~ landscaped roofs or for other purposes, *stairways* shall be provided as required for such occupancy classification.

905.3.8 Rooftop gardens and landscaped Landscaped roofs. Buildings or structures that have ~~rooftop gardens or landscaped~~ roofs and that are equipped with a standpipe system shall have the standpipe system extended to the roof level on which the ~~rooftop garden or landscaped~~ roof is located.

Reason:

This proposal is purely editorial, aligning terms and replacing two undefined terms with one.

While "vegetative roof" is a defined term (essentially part of the building envelope) the I-codes usually, but not always, use the undefined terms "roof garden" and "landscaped roofs" in conjunction with each other ("roof gardens and landscaped roofs"). Occasionally, they appear in conjunction with "vegetative roof." Based on the context of use, it appears the accepted concept is roof gardens and landscaped roofs are not part of the building envelope--they do not contribute to the waterproofing of the building--but instead are plantings that are placed on top of the roof system. Since neither term is defined, this code change simply chooses "landscaped roof" over "roof garden," as we think landscaping is the more generic term.

We believe we have correctly identified every place this change is necessary across the I-codes, based on word searches for forms of "vegetative," "landscape," and "garden," but this proposal only addresses changes to be made in the Group A codes. We are planning to submit a separate code change proposal to coordinate the terms in the IECC in Group B. Note the terms appear in IBC Section 1607.13.3.1 and IECC Section CA103, but these are not being changed, as none was necessary.

The other editorial change is in IFC 317.3, where "vegetated roofing system" is replaced with the defined term, "vegetative roof."

If direction is given by the Committee, we would be willing to submit a proposal for consideration by the Admin Committee in Group B that would define "landscaped roof," but we have chosen not to at this time in order to preserve the editorial nature of the proposal.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Because this proposal is purely editorial, there is no cost impact.

Internal ID: 242

FS154-18

IBC: 1509, 1509.1, 1509.2, 1509.3, 1509.4

Proponent: Jason Wilen AIA CDT RRO, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

2018 International Building Code

Delete without substitution:

~~SECTION 1509 RADIANT BARRIERS INSTALLED ABOVE DECK~~

~~**[BF] 1509.1 General.** A *radiant barrier* installed above a deck shall comply with Sections 1509.2 through 1509.4.~~

~~**[BF] 1509.2 Fire testing.** *Radiant barriers* shall be permitted for use above decks where the *radiant barrier* is covered with an *approved* roof covering and the system consisting of the *radiant barrier* and the roof covering complies with the requirements of either FM 4450 or UL 1256.~~

~~**[BF] 1509.3 Installation.** The low emittance surface of the *radiant barrier* shall face the continuous airspace between the *radiant barrier* and the roof covering.~~

~~**[BF] 1509.4 Material standards.** A *radiant barrier* installed above a deck shall comply with ASTM C1313/1313M.~~

Reason:

The radiant barriers section was added to the 2015 edition of IBC based on a proposal from the Reflective Insulation Manufacturer Association (RIMA). After receiving a number of questions from contractors; especially about the installation requirements in section 1509.3, NRCA contacted RIMA in an effort understand the intent of their original code proposal. As part of those discussions it was agreed that Section 1509 should be removed, and revised text will be submitted by RIMA to relocate and clarify radiant barrier provisions to IBC Section 1507.3—Clay and Concrete Tile as the above-roof deck application of the material is intended to be used exclusively with this roof covering.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change does not increase the stringency of the code.

Internal ID: 1199

FS155-18

IBC: 202 (New), 2603.1.1 (New), Chapter 35, ordinal

Proponent: Brian Tollisen, representing ICC Foam Plastic Insulation Standard Committee (Brian.Tollisen@dos.ny.gov)

2018 International Building Code

Add new definition as follows:

SPRAY-APPLIED FOAM PLASTIC. Single- and multi-component, spray-applied foam plastic insulation used in nonstructural applications which are installed at locations wherein the material is applied in a liquid or frothed state, permitted to free rise and cure in situ.

Add new text as follows:

2603.1.1 Spray-applied foam plastic. Single- and multiple-component spray-applied foam plastic insulation shall comply with the provisions of Section 2603 and ICC 1100-2018.

Add new standard(s) follows:

CHAPTER 35 REFERENCED STANDARDS

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001

1100-2018:

Standard for Spray-applied Foam Plastic Insulation

Reason:

The IBC contains requirements for thermal resistance of insulating materials but currently includes limited material standards for certain types of insulating materials. The purpose of this proposal is to introduce a performance standard for spray-applied foam plastic insulation. The standard establishes the minimum physical and performance properties as well as application requirements for spray-applied foam plastic insulations. This standard will benefit Code officials, spray-applied foam plastic insulation manufacturers, design professionals, product testing and certification agencies.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply adds a material performance standard to the code that reflects the current industry and construction practices.

Analysis: A review of the standard proposed for inclusion in the code, ICC 1100-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1347

FS156-18

IBC: 2603.4.1.5

Proponent: Bill McHugh, The McHugh Company, representing Chicago Roofing Contractors Association (Bill@mc-hugh.us)

2018 International Building Code

Revise as follows:

2603.4.1.5 Roofing. A thermal barrier is not required for foam plastic insulation that is a part of a Class A, B or C roof-covering assembly that is installed in accordance with the code and the manufacturer's instructions and is either constructed as described in Item 1 or tested as described in Item 2.

1. The roof assembly is separated from the interior of the building by an approved thermal barrier of 1/2" gypsum board or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Interior Test of NFPA 275 and wood structural panel sheathing not less than 0.47 inch (11.9 mm) in thickness bonded with exterior glue, with edges supported by blocking, tongue-and-groove joints, other approved type of edge support or an equivalent material.
2. The assembly with the foam plastic insulation satisfactorily passes NFPA 276 or UL 1256.

Reason:

In Chapter 26 of the International Building Code, the addition of either a 1/2" gypsum board or materials that would also comply based on testing should be allowed. This provides equal opportunity for all types of materials to protect foam roofing insulation from fire.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction by about \$1.00 - \$1.25US per square foot of roof area.

Exterior walls of buildings of Type V construction shall comply with Sections 2603.2, 2603.3 and 2603.4. Fireblocking shall be in accordance with Section 718.2.~~

2603.5 Exterior walls of buildings of any height.

Exterior walls of buildings of Type I, II, III or IV construction of any height shall comply with Sections 2603.5.1 through 2603.5.7. Exterior walls of cold storage buildings required to be constructed of noncombustible materials, where the building is more than one story in height, shall comply with the provisions of Sections 2603.5.1 through 2603.5.7. Exterior walls of buildings of Type V construction shall comply with Sections 2603.2, 2603.3 and 2603.4. Fireblocking shall be in accordance with Section 718.2.

Delete without substitution:

~~**2603.5.1 Fire-resistance-rated walls.** Where the wall is required to have a fire-resistance rating, data based on tests conducted in accordance with ASTM E119 or UL 263 shall be provided to substantiate that the fire-resistance rating is maintained.~~

~~**2603.5.2 Thermal barrier.** Any foam plastic insulation shall be separated from the building interior by a thermal barrier meeting the provisions of Section 2603.4, unless special approval is obtained on the basis of Section 2603.9.~~

~~**Exception:** One-story buildings complying with Section 2603.4.1.4.~~

~~**2603.5.3 Potential heat.** The potential heat of foam plastic insulation in any portion of the wall or panel shall not exceed the potential heat expressed in Btu per square foot (mj/m^2) of the foam plastic insulation contained in the wall assembly tested in accordance with Section 2603.5.5. The potential heat of the foam plastic insulation shall be determined by tests conducted in accordance with NFPA 259 and the results shall be expressed in Btu per square foot (mj/m^2).~~

~~**Exception:** One-story buildings complying with Section 2603.4.1.4.~~

~~**2603.5.4 Flame spread and smoke-developed indices.** Foam plastic insulation, exterior coatings and facings shall be tested separately in the thickness intended for use, but not to exceed 4 inches (102 mm), and shall each have a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723.~~

~~**Exception:** Prefabricated or factory-manufactured panels having minimum 0.020-inch (0.51 mm) aluminum facings and a total thickness of $\frac{1}{4}$ -inch (6.4 mm) or less are permitted to be tested as an assembly where the foam plastic core is not exposed in the course of construction.~~

~~**2603.5.5 Vertical and lateral fire propagation.** The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.~~

~~Exceptions:~~

- ~~1. One-story buildings complying with Section 2603.4.1.4.~~
- ~~2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:~~
 - ~~2.1. There is no airspace between the insulation and the concrete or masonry.~~
 - ~~2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E84 or UL 723 and the maximum airspace between the insulation~~

and the concrete or masonry is not more than 1 inch (25 mm).

2603.5.6 Label required. The edge or face of each piece, package or container of foam plastic insulation shall bear the label of an approved agency. The label shall contain the manufacturer's or distributor's identification, model number, serial number or definitive information describing the product or materials' performance characteristics and approved agency's identification.

2603.5.7 Ignition. Exterior walls shall not exhibit sustained flaming where tested in accordance with NFPA 268. Where a material is intended to be installed in more than one thickness, tests of the minimum and maximum thickness intended for use shall be performed.

Exception: Assemblies protected on the outside with one of the following:

1. A thermal barrier complying with Section 2603.4.
2. A minimum 1-inch (25 mm) thickness of concrete or masonry.
3. Glass fiber reinforced concrete panels of a minimum thickness of $\frac{3}{8}$ inch (9.5 mm).
4. Metal faced panels having minimum 0.019 inch thick (0.48 mm) aluminum or 0.016 inch thick (0.41 mm) corrosion resistant steel outer facings.
5. A minimum $\frac{7}{8}$ inch (22.2 mm) thickness of stucco complying with Section 2510.
6. A minimum $\frac{3}{4}$ inch (6.4 mm) thickness of fiber cement lap, panel or shingle siding complying with Section 1404.16 and Section 1404.16.1 or 1404.16.2.

Add new text as follows:

2603.5 Exterior walls containing foam plastic insulation. Exterior walls containing foam plastic insulation shall comply with Section 2603.5.1, or Section 2603.5.2 or Section 2603.5.3. Fireblocking shall be in accordance with Section 718.2.

2603.5.1 Buildings of Type I, II, III or IV construction of any height. Exterior wall assemblies with foam plastic insulation of buildings of Type I, II, III or IV construction of any height shall comply with Section 2603.5.4. The foam plastic insulation component shall comply with Section 2603.5.5.

2603.5.2 Exterior walls of buildings of Type V construction of any height. Foam plastic insulation used in exterior walls of buildings of Type V construction shall comply with Sections 2603.2, 2603.3 and 2603.4.

2603.5.2.1 Fire-resistance-rated walls. Where the exterior wall is required to have a fire-resistance rating, data based on tests conducted in accordance with ASTM E119 or UL 263 shall be provided to substantiate that the fire-resistance rating is maintained.

2603.5.3 Cold storage buildings of noncombustible materials more than one story in height. Exterior wall assemblies containing foam plastic insulation on cold storage buildings required to be constructed of noncombustible materials, where the building is more than one story in height, shall comply with Section 2603.5.4. The foam plastic insulation component shall comply with Section 2603.5.5.

2603.5.4 Exterior wall test requirements. Where exterior walls of buildings are required to comply with Sections 2603.5.1 or 2603.5.3, the wall assembly shall comply with Sections 2603.5.4.1 through 2603.5.4.3.

2603.5.4.1 Fire-resistance-rated walls. Where the exterior wall is required to have a fire-resistance rating, data based on tests conducted in accordance with ASTM E119 or UL 263 shall be provided to substantiate that the fire-resistance rating is maintained.

2603.5.4.2 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
 - 2.1. There is no airspace between the insulation and the concrete or masonry.
 - 2.2. The foam plastic insulation has a flame spread index of not more than 25 as determined

in accordance with ASTM E84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

2603.5.4.3 Ignition. The exterior wall assembly shall not exhibit sustained flaming where tested in accordance with NFPA 268. Where the foam plastic insulation is intended to be installed in more than one thickness, tests of the minimum and maximum thickness intended for use shall be performed.

Exceptions:

1. A thermal barrier complying with Section 2603.4.
2. A minimum 1-inch (25 mm) thickness of concrete or masonry.
3. Glass-fiber-reinforced concrete panels of a minimum thickness of 3/8 inch (9.5 mm).
4. Metal-faced panels having minimum 0.019-inch-thick (0.48 mm) aluminum or 0.016-inch-thick (0.41 mm) corrosion-resistant steel outer facings.
5. A minimum 7/8-inch (22.2 mm) thickness of stucco complying with Section 2510.
6. A minimum 1/4-inch (6.4 mm) thickness of fiber-cement lap, panel or shingle siding complying with Section 1404.16 and Section 1404.16.1 or 1404.16.2.

2603.5.5 Foam plastic insulation used in exterior walls. Where exterior walls of buildings are required to comply with Sections 2603.5.1 or 2603.5.3, the foam plastic insulation component shall comply with Sections 2603.5.5.1 through 2603.5.5.4.

2603.5.5.1 Thermal barrier. Any foam plastic insulation shall be separated from the building interior by a thermal barrier meeting the provisions of Section 2603.4, unless special approval is obtained on the basis of Section 2603.9.

Exception: One-story buildings complying with Section 2603.4.1.4...

2603.5.5.2 Potential heat. The potential heat of foam plastic insulation in any portion of the wall or panel shall not exceed the potential heat expressed in Btu per square feet (mj/m^2) of the foam plastic insulation contained in the wall assembly tested in accordance with Section 2603.5.4.2. The potential heat of the foam plastic insulation shall be determined by tests conducted in accordance with NFPA 259 and the results shall be expressed in Btu per square feet (mj/m^2).

Exception: One-story buildings complying with Section 2603.4.1.4.

2603.5.5.3 Flame spread and smoke-developed indices. Foam plastic insulation, and exterior coatings and facings shall be tested separately in the thickness intended for use, but not to exceed 4 inches (102 mm), and each shall have a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723.

Exception: Prefabricated or factory-manufactured panels having minimum 0.020-inch (0.51 mm) aluminum facings and a total thickness of 1/4 inch (6.4 mm) or less are permitted to be tested as an assembly where the foam plastic core is not exposed in the course of construction.

2603.5.5.4 Label required. The edge or face of each piece, package or container of foam plastic insulation shall bear the label of an approved agency. The label shall contain the manufacturer's or distributor's identification, model number, serial number or definitive information describing the product or materials' performance characteristics and approved agency's identification.

Reason:

With recent fire incidents, there has been increased attention on the fire performance of exterior walls containing combustible materials, such as foam plastic insulation. The 2018 IBC charging section, Section 2603.5, contains 3 different exterior walls, each with separate requirements, causing misunderstanding. Furthermore, sections related to requirements for the foam plastic component of the exterior wall are sprinkled throughout the section, causing additional confusion. This code change is a reorganization of the exterior wall section. No technical changes are included.

Separate sections are provided for

1. Exterior walls of Type I, II, III, IV construction of buildings of **any** height; (Note that the exception for one story buildings **applies only to those specifically described in Section 2603.4.1.4**)

2. Exterior walls of buildings of Type V construction has the appropriate pointers to the foam insulation requirements.
3. Exterior walls of cold storage buildings of noncombustible construction and more than one story in height;

Exterior wall assembly tests for exterior walls of Type I, II, III, IV construction of buildings of **any** height and exterior walls of cold storage buildings of noncombustible construction and more than one story in height are consolidated in Section 2603.5.4. Similarly, all testing requirements for the foam plastic insulation components for these building types are listed in Section 2603.5.5.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No technical changes are intended to be included in this proposal.

Internal ID: 2341

FS158-18

IBC: 2606.7.4, Chapter 35, 35

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Building Code

Revise as follows:

2606.7.4 Fire suppression system. In buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, plastic light-diffusing systems shall be protected both above and below unless the sprinkler system has been specifically approved for installation only above the light-diffusing ~~system.~~system, or the light-diffusing system is listed and labeled in accordance with UL 723S. Areas of light-diffusing systems that are protected in accordance with this section shall not be limited.

Add new standard(s) follows:

CHAPTER 35 REFERENCED STANDARDS

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096

723S-2006:

Drop-Out Ceilings Installed Beneath Automatic Sprinklers

Reason:

Section 2606.7.4 currently states plastic light-diffusing systems shall be protected both above and below unless the sprinkler system has been specifically approved for installation only above the light-diffusing system. This language places the burden for approving a system on the code official without providing any guidance on which to make that decision. This proposal is intended to provide the option of using a science based method for approving a drop-out light diffusing ceiling system listed and labeled for use beneath sprinkler systems.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The use of a drop-out ceiling system listed and labeled to UL 723S is being offered as an option to the use of a specifically approved sprinkler system already permitted in this Section. In addition, although UL 723S is not currently specified in the code, such listings have been used for years to approve drop-out ceiling systems. As such, this proposal does not mandate any change in construction practices.

Analysis: A review of the standard proposed for inclusion in the code, UL 723S-2006, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 375

FS159-18

IBC: 2607.3, 2607.5

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows:

2607.3 Height limitation. Light-transmitting plastics shall not be installed more than 75 feet (22 860 mm) above *grade plane*, ~~except as allowed by Section 2607.5.~~

2607.5 Automatic sprinkler system. Where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, the maximum percentage area of *exterior wall* in any *story* in light-transmitting plastic wall panels and the maximum square footage of a single area given in Table 2607.4 shall be increased 100 percent, but the area of light-transmitting plastic wall panels shall not exceed 50 percent of the wall area in any story, or the area permitted by Section 705.8 for unprotected openings, whichever is smaller. These installations shall ~~be exempt from height limitations~~ not be installed more than 75 feet (22 860 mm) above grade plane.

Reason:

This proposal eliminates the permission for light transmitting wall panels to be installed in unlimited heights when the building is protected by sprinklers. This is consistent with the proposed change for MCMs in chapter 14. There should be no allowance to use light transmitting wall panels in unlimited heights simply because of sprinkler exceptions, since sprinklers do not control outside fires.

According to an NFPA study published in 2014 (Fire Hazards of Exterior Wall Assemblies Containing Combustible Components), slightly more than half of the exterior facade fires originated from interior ignition. Sprinklers will help restrict an interior fire from reaching the exterior facade, but will have limited effect on exterior ignition or fire spread across combustible assemblies.

Also keep in mind that when these fires occur, occupants have little choice but to evacuate and stairs are not designed for full building evacuation. It can be expected that evacuating occupants will encounter stairs overflowing with other evacuating occupants. As observed during the 63 story Address Hotel fire in Dubai on New Year's Eve 2015, these situations increase the tendency to panic and cause crushes. In addition, most stair pressurization systems take outside air from the roof, which can be expected to bring in contaminated air, decreasing the level of comfort for evacuating occupants. And, those aren't even the worst scenarios. When occupants evacuate stair enclosures at grade, they are greeted with flaming debris raining down on them.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

1. Grenfell fire, London England:

Buildings Across U.S. Are Wrapped in Same Panels That Fueled Deadly London Fire: <https://www.wsj.com/articles/built-to-burn-thousands-of-buildings-world-wide-are-wrapped-in-combustible-panels-1508858048>

Why	Grenfell	Tower	Burned:	Regulators	Put	Cost	Before	Safety

<https://www.nytimes.com/2017/06/24/world/europe/grenfell-tower-london-fire.html>

2. Torch Tower Fire, Dubai

https://en.wikipedia.org/wiki/The_Marina_Torch January 8th, 2018

3. Address Hotel Fire, Dubai https://en.wikipedia.org/wiki/The_Address_Downtown_Dubai January 8th, 2018

Cost Impact

The code change proposal will increase the cost of construction .

The elimination of the current allowances allowing use of light transmitting plastics above 75 on almost all buildings which are equipped with fire sprinklers will lead to a more expensive fire-tested product being required for application above 40 feet.

Internal ID: 398

FS160-18

IBC: 2610.1, 2610.1.1 (New)

Proponent: Mike Fischer, Kellen Company, representing The Plastic Glazing Coalition of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Building Code

Revise as follows:

2610.1 Light-transmitting plastic glazing of skylight assemblies. Skylight assemblies glazed with light-transmitting plastic shall conform to the provisions of this section and Section 2606. ~~Unit skylights glazed with light-transmitting plastic shall comply with Section 2405.5.~~

Exception: Skylights in which the light-transmitting plastic conforms to the required roof-covering class in accordance with Section 1505.

Add new text as follows:

2610.1.1 Unit skylights. Unit skylights glazed with light-transmitting plastic shall comply with Section 2405.5.

Reason:

One of the problems with exceptions to code requirements is they are often unclear. In Section 2610.1, the code contains three provisions for light-transmitting plastics in skylights - compliance with Sections 2606, 2610, and 2405.5.

The exception covers skylights that meet the roof covering classifications in Section 1505 but fails to say exactly which provisions the skylights are exempted from. Is it Section 2405.5? Would a Class A Fire rating exempt the skylight from requirements? We think not.

It seems obvious that the intent of the code is not to exempt unit skylights from the requirements found in Section 2405.5. This proposal makes that important distinction. Furthermore, the intent was also to allow materials that can meet the roof assembly fire classification requirements to avoid additional testing that is redundant to the classification testing. Code officials should not have to study the code to infer what simple code language can easily state.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is editorial in nature and makes no technical changes to the code.

Internal ID: 2047

FS161-18

IBC: 2613.2

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Building Code

Revise as follows:

2613.2 Labeling and identification. Fiber-reinforced polymers shall be listed. Packages and containers of *fiber-reinforced polymer* and their components ~~delivered to the job site~~ shall bear the label of an approved agency showing the manufacturer's name, product listing, product identification and information sufficient to determine that the end use will comply with the code requirements.

Reason:

This proposal is intended to clarify these products shall be both listed and labeled. This terminology is consistent with the definitions of these terms and their use in numerous other Sections of the code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The changes are editorial and do not change construction requirements.

Internal ID: 376

2018 GROUP A – PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE – GENERAL

GENERAL CODE COMMITTEE

Gary Lewis, Chair
Chief Inspector
City of Summit
Summitt, NJ

Steven L. McDaniel, CPCA, Vice Chair
Building Official
City of Corning
Corning, NY

Matt Belcher
Rep: National Association of Home Builders
Principal
Verdatek Solutions LLC
Wildwood, MO

Brian Bishop, CBO
Deputy Building Official
City of Des Moines
Des Moines, IA

Amy T. Carpenter, AIA
Senior Designer/Project Manager-Vice President
SFCS Architects
Blue Bell, PA

John Catlett, MCP
Director of Codes & Standards
BOMA International
Washington, DC

Jenifer Gilliland, MPA
Code Development Analyst
City of Seattle
Seattle, WA

Raymond A. Grill, PE, LEED AP
Principal
Arup
Washington, DC

Ron E. Hampton, MCP, CBO
Field Inspector II
KY Department of Housing, Building & Const.
Div. Building Code Enforcement
Catlettsburg, KY

Eirene Knott, MCP, CBO, CFM
Director of Code Services
BRR Architecture
Merriam, KS

Thomas Pitchford, CBO
Chief Building Official
Greenwood, Village, CO

Michael Pokorny, PE
Firefighter/Rescuer III
Montgomery County Fire & Rescue Service
Aspen Hill, MD

Michael Shannon, PE, CBO
Development Services Director-Building Official
City of San Antonio, Development Services
Department
San Antonio, TX

Steven R. Winkel, FAIA, PE, CASp
Rep: The American Institute of Architects
Partner, West Coast Office Manager
The Preview Group, Inc.
Berkeley, CA

James M. Williams, AIA, PE, CE, SE, LEED AP
President
AE URBIA
South Jordan, UT

Staff Secretariat

Kermit Robinson
Senior Technical Staff
International Code Council
Western Regional Office
Brea, CA

Allan Bilka, RA
Senior Staff Architect
International Code Council
Central Regional Office
Country Club Hills, IL

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE – GENERAL

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some G code change proposals may not be included on this list, as they are being heard by another committee.

G1-18

IBC: SECTION 202, 202

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BG] ATRIUM. An opening connecting two or more stories other than ~~enclosed stairways~~ interior exit stairways or ramps, exit access stairways or ramps, elevators, hoistways, escalators, plumbing, electrical, air-conditioning or other equipment, which is closed at the top and not defined as a mall. Stories, as used in this definition, do not include balconies within assembly groups or mezzanines that comply with Section 505.

Reason:

The terms "interior exit stairways or ramps" and "exit access stairway or ramps" referenced in Chapter 10 were added in the 2012 and 2015 IBC. However, they were not referenced in the Atrium definition. This change is only intended to clean up the language and provide consistency within the code. It may be considered to be editorial.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change is editorial in nature. Therefore, there is no cost implication.

Internal ID: 210

G2-18

IBC: SECTION 202, 202

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BG] ATRIUM. An opening connecting two or more stories ~~other than enclosed stairways, elevators, hoistways, escalators, plumbing, electrical, air conditioning or other equipment, which is closed at the top and not defined as a mall. Stories other than those vertical openings listed at Sections 712.1.1 through 712.1.6 and Sections 712.1.8 through 712.1.14.~~ Stories, as used in this definition, do not include balconies within assembly ~~groups~~ occupancies or mezzanines that comply with Section 505.

Reason:

The current definition of ATRIUM can be confusing. It describes in simple terms what an atrium is. In an apparent attempt to provide clarification it also provides a partial list of what an atrium is not. Included in the list were enclosed stairways. Enclosed stairways could include both interior exit stairways and enclosed exit access stairways. Appropriate reference to unenclosed exit access stairways is not made. In any event, the other vertical openings list is incomplete. The present incomplete "laundry list" has been replaced with specific reference to all other applicable vertical openings listed at Section 712.1.

Fundamentally, vertical openings serve one of three purposes: utility, means of egress or architectural. This distinction is made within the proposed definition.

Additionally, an editorial correction was made to the ultimate sentence by changing assembly groups to assembly occupancies.

Approval of this proposal will provide clarification as to what constitutes an atrium for the benefit of code users.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is essentially editorial in nature.

Internal ID: 1547

G3-18

IBC: SECTION 202, 202 (New)

Proponent: Amanda Hickman, representing RIMA International (amanda@thehickmangroup.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

EMITTANCE The ratio of radiant heat flux emitted by a specimen to that emitted by a blackbody at the same temperature and under the same conditions.

Reason:

This definition is needed because the term emittance is used in various sections of the code and in the definition for radiant barrier. It is consistent with the definition found in ASHRAE and ASTM standards.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Adding a definition of EMITTANCE will neither increase or decrease construction costs. This is only a definition and is identical to the definition found in existing ASHRAE and ASTM standards.

Internal ID: 1090

G4-18

IBC: 202

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BE] GRADE FLOOR EMERGENCY ESCAPE AND RESCUE OPENING. ~~A window or other~~ An emergency escape and rescue opening located such that the ~~sill height~~ bottom of the clear opening is not more than 44 inches (1118 mm) above or below the finished ground level adjacent to the opening.

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

The phrase “grade floor emergency escape and rescue opening” is used in IBC 1030.2 and IRC R310.2.1. The definition should be for the phrase as utilized in the text. The definition for EEROs includes “windows, doors or other similar devices.” Using the defined term EERO instead of “windows and other openings” encompasses all options.

What is a ‘sill’ is not clear – the change to “bottom of the clear opening” will set a specific height for consistency with technical criteria.

There will be a Group B proposal for the IRC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This coordination of an existing definition with no technical changes to the text.

Internal ID: 455

G5-18 Part I

PART 1:IBC: 202; IFC: 202;

PART 2: IPMC: 202 (New)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

THIS IS A TWO PART CODE CHANGE. PART 1 WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. PART 2 WILL BE HEARD BY THE PROPERTY MAINTENANCE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEE.

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BE] EMERGENCY ESCAPE AND RESCUE OPENING. An operable exterior window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

2018 International Fire Code

SECTION 202 GENERAL DEFINITIONS

Revise as follows:

[BE] EMERGENCY ESCAPE AND RESCUE OPENING. An operable exterior window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

Internal ID: 454

G5-18 Part II

IPMC: SECTION 202, 202 (New)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Property Maintenance Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

EMERGENCY ESCAPE AND RESCUE OPENING. An operable window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

Reason:

The intent of this proposal is to coordinate the definitions for emergency escape and rescue openings (EERO) between IBC, IRC, IEBC, IPMC, IFC. The EERO is always an exterior opening, and this descriptor is in the definition in IRC. The definition should appear in all codes where there are criteria for EEROs, so the definition should be added to IPMC and IEBC.

There will be a code proposal in Group B to coordinate IRC and IEBC.

This is the start of a series of 11 proposals to coordinate the requirements for Emergency Escape and Rescue Opening (EERO) requirements, primarily in the IBC and IRC, but also in the IEBC, IPMC and IFC. Due to the code development schedule the proposals for IBC, IPMC and IFC will be proposed in Group A and the proposals for IRC and IEBC will be proposed in Group B.

So that it is clear what the result of these overall proposals will be, the following is a clean version of what the text for EERO would be if all proposals are approved. The one section in the IRC that the BCAC is not proposing to duplicate in the IBC is the allowance for a EERO to be located below a deck.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

This is what the EERO requirements would look like if all of the proposals are approved.

IBC

EMERGENCY ESCAPE AND RESCUE OPENING. An operable exterior window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

GRADE FLOOR EMERGENCY ESCAPE AND RESCUE OPENING. An emergency escape and rescue opening located such that the bottom of the clear opening is not more than 44 inches (1118 mm) above or below the finished ground level adjacent to the opening.

SECTION 1030

EMERGENCY ESCAPE AND RESCUE

1030.1 Where required. In addition to the means of egress required by this chapter emergency escape and rescue openings shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one exit or access to only one exit as permitted by Tables 1006.3.3(1) and 1006.3.3(2)
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth story above grade plane shall have no fewer than one emergency escape and rescue opening in accordance with this section. Where basements contain one or more sleeping rooms, an emergency escape and rescue openings shall be required in each sleeping room, but shall not be required in adjoining areas of the basement. Such openings shall open directly into a public way or to a yard or court that opens to a public way.

Exceptions:

1. Basements with a ceiling height of less than 80 inches (2032 mm) shall not be required to have emergency escape

and rescue openings.

2. Emergency escape and rescue openings are not required from basements or sleeping rooms that have an exit door or exit access door that opens directly into a public way or to a yard, court or exterior egress balcony that opens to a public way.

3. Basements used only to house mechanical equipment and having not more than 200 square feet (18.6 m²) in floor area shall not be required to have emergency escape and rescue openings.

4. Storm shelters are not required to comply with this section where the shelter is constructed in accordance with ICC 500.

5. Within individual dwelling and sleeping units in Groups R-2 and R-3, where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in basements shall not be required to have emergency escape and rescue openings provided that the basement has one of the following:

5.1. One means of egress and one emergency escape and rescue opening

5.2. Two means of egress.

1030.1.1 Operational constraints and opening control devices. Emergency escape and rescue openings shall be operational from inside the room without the use of keys or tools. Window opening control devices on windows serving as a required emergency escape and rescue opening shall comply with ASTM F2090.

1030.2 Emergency escape and rescue openings. Emergency escape and rescue opening shall have minimum dimensions in accordance with Section 1030.2.1 through 1030.2.3.

1030.2.1 Minimum size. Emergency escape and rescue openings shall have a minimum net clear opening of 5.7 square feet (0.53 m²).

Exception: The minimum net clear opening for grade-floor emergency escape and rescue openings shall be 5 square feet (0.46 m²).

1030.2.2 Minimum dimensions. The minimum net clear opening height dimension shall be 24 inches (610 mm). The minimum net clear opening width dimension shall be 20 inches (508 mm). The net clear opening dimensions shall be the result of normal operation of the opening.

1030.2.3 Maximum height from floor. Where a window is provided as the Emergency escape and rescue openings, such window shall have the bottom of the clear opening not greater than 44 inches (1118 mm) measured from the floor.

1030.3 Emergency escape and rescue doors. Where a door is provided as the required emergency escape and rescue opening, it shall be a swinging door or a sliding door.

1030.4 Area wells. An emergency escape and rescue opening with the bottom of the clear opening below the adjacent grade shall be provided with an area well in accordance with Sections 1030.4.1 through 1030.4.4.

1030.4.1 Minimum size. The minimum horizontal area of the area well shall be 9 square feet (0.84 m²), with a horizontal projection and width of not less than 36 inches (914 mm). The area well shall allow the emergency escape and rescue opening to be fully opened.

Exception: The ladder or steps required by Section 1030.4.2.1 shall be permitted to encroach not more than 6 inches (152 mm) into the required dimensions of the area well.

1030.4.2 Ladders or steps. Area wells with a vertical depth of more than 44 inches (1118 mm) shall be equipped with an approved permanently affixed ladder or steps. The ladder or steps shall not be obstructed by the emergency escape and rescue opening when the window or door is in the open position. Ladders or steps required by this section shall not be required to comply with Section 1011.

1030.4.2.1 Ladders. Ladders or rungs shall have an inside width of at least 12 inches (305 mm), shall project at least 3 inches (76 mm) from the wall and shall be spaced not more than 18 inches (457 mm) on center (o.c.) vertically for the full height of the area well.

1030.4.2.2 Steps. Steps shall have an inside width of at least 12 inches (305 mm), shall have minimum treads depth of 5 inches (127 mm) and a maximum riser height of 18 inches (457 mm) for the full height of the area well.

1030.4.3 Drainage. Area wells shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section 1805.

Exception: A drainage system for area wells is not required where the foundation is on well-drained soil or sand-gravel mixture soils in accordance with the United Soil Classification System, Group I Soils, in accordance with Section 1803.5.1.

1030.4.4 Bars, grilles, covers and screens. Where Bars, grilles, covers, screens or similar devices are placed

over emergency escape and rescue openings, bulkhead enclosures, or area wells that serve such openings the minimum net clear opening size shall comply with Section 1030.1.1 through 1030.2.2 and 1030.4. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the emergency escape and rescue opening.

IRC

[RB] EMERGENCY ESCAPE AND RESCUE OPENING. An operable exterior window, door or similar device that provides for a means of escape and access for rescue in the event of an emergency.

GRADE FLOOR EMERGENCY ESCAPE AND RESCUE OPENING. An emergency escape and rescue opening located such that the bottom of the clear opening is not more than 44 inches (1118 mm) above or below the finished ground level adjacent to the opening.

SECTION R310

EMERGENCY ESCAPE AND RESCUE OPENINGS

R310.1 Where required. Basements, habitable attics and every sleeping room shall have no fewer than one emergency escape and rescue opening in accordance with this section. Where basements contain one or more sleeping rooms, an emergency escape and rescue opening shall be required in each sleeping room, but shall not be required in adjoining areas of the basement. Such openings shall open directly into a public way, or to a yard or court that opens to a public way.

Exceptions:

1. Basements with a ceiling height of less than 80 inches (2032 mm) shall not be required to have emergency escape and rescue openings.
2. Emergency escape and rescue openings are not required from basements or sleeping rooms that have an exit door or exit access door that opens directly into a public way or to a yard, or that opens to a public way.
3. Basements used only to house mechanical equipment not exceeding a total floor area of 200 square feet (18.58 m²) shall not be required to have emergency escape and rescue openings.
4. Storm shelters are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Where the dwelling or townhouse is equipped with an automatic sprinkler system installed in accordance with Section P2904, sleeping rooms in basements shall not be required to have emergency escape and rescue openings provided that the basement has one of the following:
 - 5.1. One means of egress complying with Section R311 and one emergency escape and rescue opening.
 - 5.2. Two means of egress complying with Section R311.

R310.1.1 Operational constraints and opening control devices. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys, or tools. Window opening control devices on windows serving as a required emergency escape and rescue opening shall comply with ASTM F2090.

R310.2 Emergency escape and rescue openings. Emergency escape and rescue openings shall have minimum dimensions in accordance with Section R310.2.1 through R310.2.3.

R310.2.1 Minimum size. Emergency and escape rescue openings shall have a net clear opening of not less than 5.7 square feet (0.530 m²).

Exception: The minimum net clear opening for grade-floor emergency escape and rescue openings shall be 5 square feet (0.465 m²).

R310.2.2 Minimum dimensions. The minimum net clear opening height dimension shall be 24 inches (610 mm). The minimum net clear opening width dimension shall be 20 inches (508 mm). The net clear opening dimensions shall be the result of normal operation of the opening.

R310.2.3 Maximum height from floor. Where a window is provided as the emergency escape and rescue openings such window shall have the bottom of the clear opening not greater than 44 inches (1118 mm) above the floor.

R310.3 Emergency escape and rescue doors. Where a door is provided as the required emergency escape and rescue opening, it shall be a swinging door or a sliding door.

R310.4 Area wells. An emergency escape and rescue opening with the bottom of the clear opening below the adjacent grade shall be provided with an area well in accordance with Sections R310.4.1 through R310.4.4.

R310.4.1 Minimum size. The horizontal area of the area well shall be not less than 9 square feet (0.9 m²), with a horizontal projection and width of not less than 36 inches (914 mm). The area well shall allow the emergency escape and rescue opening to be fully opened.

Exception: The ladder or steps required by Section R310.4.2.1 shall be permitted to encroach not more than 6 inches (152 mm) into the required dimensions of the area well.

R310.4.2 Ladder and steps. Area wells with a vertical depth greater than 44 inches (1118 mm) shall be equipped with a an approved permanently affixed ladder or steps. The ladder or steps shall not be obstructed by the emergency escape and rescue opening when the window or door is in the open position. Ladders or steps required by this section shall not be required to comply with Section R311.7.

R310.4.2.1 Ladders. Ladders or rungs shall have an inside width of at least 12 inches (305 mm), shall project at least 3 inches (76 mm) from the wall and shall be spaced not more than 18 inches (457 mm) on center (o.c.) vertically for the full height of the area well.

R310.4.2.2 Steps. Steps shall have an inside width of at least 12 inches (305 mm), shall have minimum treads depth of 5 inches (127 mm) and a maximum riser height of 18 inches (457 mm) for the full height of the area well.

R310.4.3 Drainage. Area wells shall be designed for proper drainage by connecting to the building's foundation drainage system required by Section R405.1.

Exception: A drainage system for area wells is not required where the foundation is on well-drained soil or sand-gravel mixture soils in accordance with the United Soil Classification System, Group I Soils, as detailed in Table R405.1.

R310.4.4 Bars, grilles, covers and screens. Where bars, grilles, covers, screens or similar devices are placed over emergency escape and rescue openings, bulkhead enclosures, or area wells that serve such openings, the minimum net clear opening size shall comply with Sections R310.2 through R310.2.2 and R310.4.1. Such devices shall be releasable or removable from the inside without the use of a key or tool or force greater than that required for the normal operation of the escape and rescue opening.

R310.5 Emergency escape and rescue openings under decks and porches. Emergency escape and rescue openings installed under decks and porches shall be fully operable and provide a path not less than 36 inches (914 mm) in height to a yard or court.

IFC

[BE] EMERGENCY ESCAPE AND RESCUE OPENING. An operable exterior window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

403.10.3.6 Resident participation in drills. Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exception: Actual exiting from emergency escape and rescue openings shall not be required. Opening the emergency escape and rescue openings and signaling for help shall be an acceptable alternative.

1031.7 Emergency escape and rescue openings. Required emergency escape and rescue openings shall be maintained in accordance with the code in effect at the time of construction, and both of the following:

1. Required emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools.
2. Bars, grilles, grates or similar devices are allowed to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with the code that was in effect at the time of construction and the unit is equipped with smoke alarms installed in accordance with Section 907.2.11 of the International Building Code. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the emergency escape and rescue opening.

IEBC

[BE] EMERGENCY ESCAPE AND RESCUE OPENING. An operable exterior window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

IEBC (prescriptive method)

505.4 Emergency escape and rescue openings. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools.

Bars, grilles, grates or similar devices are allowed to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with the code that was in effect at the time of construction and the unit is equipped with smoke alarms installed in accordance with Section 907.2.11 of the International Building Code. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the emergency escape and rescue opening.

IEBC (Alterations Level 1)

701.4 Emergency escape and rescue openings. Emergency escape and rescue openings shall be operational

from the inside of the room without the use of keys or tools.

Bars, grilles, grates or similar devices are allowed to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with the code that was in effect at the time of construction and the unit is equipped with smoke alarms installed in accordance with Section 907.2.11 of the International Building Code. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the emergency escape and rescue opening.

IPMC

[BE] EMERGENCY ESCAPE AND RESCUE OPENING. An operable exterior window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

[F] 702.4 Emergency escape and rescue openings. Required emergency escape and rescue openings shall be maintained in accordance with the code in effect at the time of construction, and both of the following:

1. Required emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools.

2. Bars, grilles, grates or similar devices are permitted to be placed over emergency escape and rescue openings provided the minimum net clear opening size complies with the code that was in effect at the time of construction and the unit is equipped with smoke alarms installed in accordance with Section 907.2.11 of the International Building Code. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This coordination of an existing definition with no technical changes to the text.

IBC: SECTION 202, 202 (New)

Proponent: John Woestman, Kellen Co., representing Extruded Polystyrene Foam Association (XPSA)
(jwoestman@kellencompany.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

INSULATING SHEATHING A rigid panel or board insulation material having a thermal resistance of not less than R-2 of the core material with properties suitable for use on walls, floors, roofs, or foundations.

Reason:

This proposed definition is based on the similar definition in the IRC. The proposal improves the definition to better fit context of use of this term and material in the IBC and IRC. For example, the term "rigid panel" is added to recognize composite assemblies that are not homogenous. The clarification of use in walls, floors, roofs, and foundations reflects common use of foam plastic insulating sheathing materials. The current IRC definition is as follows:

INSULATING SHEATHING: An insulating board having a thermal resistance of not less than R-2 of the core material.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed definition is for a term already used in the IBC and will have no cost impact.

Internal ID: 978

G7-18

IBC: SECTION 202, 202

Proponent: Misty Guard, representing Bradley Corporation (Misty.Guard@bradleycorp.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BF] INTERIOR WALL AND CEILING FINISH. The exposed interior surfaces of buildings, including but not limited to: fixed or movable walls and partitions; ~~toilet room privacy partitions~~; columns; ceilings; and interior wainscoting, paneling or other finish applied structurally or for decoration, acoustical correction, surface insulation, structural fire resistance or similar purposes, but not including trim.

Reason:

Toilet partitions and urinal partitions are regulated by Section 1209. It was incorrect to add “toilet room privacy partitions” to the interior wall and ceiling finish. The important aspect of water closet and urinal partitions is the sanitation of the wall surfaces, as well as, the cleanability. Another important aspect is privacy when using plumbing fixtures. While the privacy for using a water closet seems obvious, studies have shown the plumbing industry the need to provide privacy even when using a urinal in the men’s room. Other considerations for water closet and urinal partitions are resistance to scratching and graffiti. Manufacturers have developed high quality partitions to meet the needs of commercial buildings.

The interior finish requirements are concerned with the fire aspects of a building component. However, there is no history of a fire concern with water closet and urinal partitions. A study was completed by NFPA Research entitled, “Non-Residential Structure Fires That Originated in Lavatories, Locker Rooms or Coat Check Rooms,” dated November 2017, authored by Marty Ahrens. The report shows no issue with water closet or urinal partitions. There are no fire deaths reported from fires originating in a commercial toilet room. Hence, the perceived fire hazard does not exist with partitions in commercial toilet rooms and bathrooms. It is more important to emphasize the sanitary and health issues as identified in Section 1209.

Bibliography:

Ahrens, M. (2017). Non-Residential Structure Fires that Originated in Lavatories, Locker Rooms or Coat Check Rooms. Quincy, MA: NFPA Research.

<https://www.dropbox.com/sh/0e177098908o5up/AADoei27Mnp3XfjaA9rreawQa?dl=0>: Established 1.24.18

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost associated with this change since the code change will merely provide other options for complying with the current requirements. There are no new mandatory requirements being added.

Internal ID: 1844

G8-18

IBC: SECTION 202, 202 (New)

Proponent: James Smith, American Wood Council, representing ICC Region III Code Development Committee (jsmith@awc.org); Edward Lisinski, City of West Allis, WI, representing Self (elisinski@westalliswi.gov)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

MOTOR VEHICLE. A vehicle on wheels or other conveyance system, having its own motor to propel the vehicle, and not running on rails or tracks, for use on land, streets, or highways; such as an automobile, truck, bus, forklift, and which is manually operated.

Reason:

The reason for this proposal is to eliminate the confusion about what types of vehicles are applied to the code sections that regulate "MOTOR VEHICLES". There are numerous code sections that apply to MOTOR VEHICLES, but even though there is a definition for "COMMERCIAL MOTOR VEHICLE", there is no clear definition as to what a MOTOR VEHICLE is even though the term is embedded in that other definition. The same is true for the definitions of "Private Garage" and "Repair Garage". There are 15 locations in the IBC and 5 sections in the IMC that include the term. If you go with a rudimentary explanation, it is a vehicle with a motor. That could include cars, trucks, motorcycles, boats, trains, lawnmowers, children's toys, electric golf carts, electric scooters, airplanes and many more vehicles. We feel it is clear that the code does not intend children's toys to be regulated by those sections and airplanes are regulated within the sections of the code referring to aircraft, or Aircraft-Related Occupancies (Section 412) and not intended to be also regulated by the Motor-Vehicle-Related Occupancies Section (Section 406) of the code. A clear definition ensures that all provisions of the code that have requirements for MOTOR VEHICLES are applied uniformly.

In reviewing the code provisions that regulated MOTOR VEHICLES we felt they could be grouped into three basic areas:

1. Impact protection from operator error
2. Fumes related to fuel vapor accumulation related to internal combustion powered motor vehicles that are not being operated
3. Fumes related to combustion of the internal combustion engines when the motor is being operated.

We believe the proposed definition should include all vehicles with motors that are intended to be regulated by the various code sections. For that reason the proposed definition excludes any vehicle used in the air, water or on rails. The definition would only include vehicles such as cars, motorcycles, trucks, buses, recreational vehicles, forklifts and similar vehicles that are stored, repaired or operated inside a building. Although a definition could be written to exclude vehicles that are powered by electric motors and which do not produce fumes associated with fuel of the combustion process, we did not feel there were enough of those to create two definitions in this proposal.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The addition of the definition is only being provided to assist users of the code when confronted by those code sections that regulate MOTOR VEHICLES. There are no added regulatory provisions.

Internal ID: 731

G9-18

IBC: SECTION 202, 202

Proponent: Mike Fischer, Kellen Company, representing The Plastic Glazing Coalition of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[B G] WALKWAY, PEDESTRIAN. A structure that provides a walkway used exclusively as ~~a~~ for pedestrian trafficway traffic.

Reason:

The IBC includes technical requirements for pedestrian walkways that are clearly intended for specific structures such as skybridges, elevated walkways, and similar structures. Unfortunately, the definition for pedestrian walkways is overly broad and would apply to sidewalks, paths, and similar lot features. By indicating that the walkway is an actual structure, the definition is more appropriately scoped.

Try this Google image search and see all of the different types of structures- including footpaths and sidewalks- that appear:

https://www.google.com/search?q=Pedestrian+Walkway&source=lnms&tbm=isch&sa=X&ved=0ahUKEwiohvisn9DYAhWK7IMKHRQ-BkEQ_AUICigB&biw=1536&bih=769

One such example of a code provision that is intended to apply to elevated bridges that connect two separate buildings is found in Section 3104.5.1:

3104.5.1 Fire barriers. Pedestrian walkways shall be separated from the interior of the building by not less than 2-hour fire barriers constructed in accordance with Section 707 and Sections 3104.5.1.1 through 3104.5.1.3.

The proposal cleans up the definition to ensure that provisions (such as the 2-hour rating above) for structures like skywalks or bridges aren't extended where they aren't intended to apply.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change is editorial in nature and makes no real technical changes to the code.

G10-18

IBC: 202

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com); Mike Fischer, Kellen Company, representing The Plastic Glazing Coalition of the American Chemistry Council

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Delete without substitution:

~~**[BF] PLASTIC, APPROVED.** Any thermoplastic, thermosetting or reinforced thermosetting plastic material that conforms to combustibility classifications specified in the section applicable to the application and plastic type.~~

Reason: Hirschler

This term (plastic, approved) is not used in ICC codes.

The term "approved plastic" is also not used in isolation but always in conjunction with a specific requirement.

In the 2015 IBC code there were 3 instances of generic references to "approved plastic" and they were removed by proposals S311 and S312. Proposal S311 revised section H106.1.1 to state "approved plastic complying with the requirements of Section 2606.4", which are the requirements for light transmitting plastics. Proposal S312 deleted the references to "approved plastic" and replaced them with references to plastics complying with section H107.1.1.

The codes do not have "approved plastics" just like they do not have "approved wood" or "approved steel" but the codes have (as they should) plastics that are approved for use only when they comply with certain requirements.

Fischer

The proposal removes an unnecessary and potentially confusing definition of "approved plastics". This definition is used only once in the code; there are many more instances where it could be applied- IF that is necessary. The IBC has a definition of approved and contains clear provisions for the materials covered by Section H106.1.1 with the reference to fire testing in Section 2606.4. It is unnecessary to have a definition that is redundant to the code requirements. Italicizing the word "approved" makes it clear the IBC definition of approved applies.

Note that it is the intent of this proposal that the word "approved" be italicized in the first sentence of Section H106.1.1. cdpACCESS would not allow this change. Section H106.1.1 is as follows.

H106.1.1 Internally illuminated signs. Except as provided for in Section 2611, where internally illuminated signs have facings of wood or of approved plastic complying with the requirements of Section 2606.4, the area of such facing section shall be not more than 120 square feet (11.16 m²) and the wiring for electric lighting shall be entirely enclosed in the sign cabinet with a clearance of not less than 2 inches (51 mm) from the facing material. The dimensional limitation of 120 square feet (11.16 m²) shall not apply to sign facing sections made from flame-resistant-coated fabric (ordinarily known as "flexible sign face plastic") that weighs less than 20 ounces per square yard (678 g/m²) and that, when tested in accordance with NFPA 701, meets the fire propagation performance requirements of both Test 1 and Test 2 or that, when tested in accordance with an approved test method, exhibits an average burn time of 2 seconds or less and a burning extent of 5.9 inches (150 mm) or less for 10 specimens.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This simply deletes an unused and misleading definition.

The proposal is editorial and changes no technical requirements.

Internal ID: 168

IBC: SECTION 202, 202

Proponent: Craig Conner, self, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingsscience.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BF] VAPOR PERMEABLE. The property of having a moisture vapor permeance rating of 5 perms (2.9×10^{-10} kg/Pa \times s \times m²) or greater, when tested in accordance with ~~the desiccant method using~~ Procedure A or Procedure B of ASTM E96. A vapor permeable material permits the passage of moisture vapor.

Reason:

Relying on only Procedure A is inaccurate and misleading. The existing code language limits the use of newer materials and systems such as “smart” materials that can be “tuned” to address moisture control issues in different climate zones. The existing definition applied to asphalt felts and Type D coated papers and dates back over a half a century. For Type D papers the original Federal Specification UUP-147 was issued in 1948. The technical rationale for this change can be found in the following link:

<https://buildingsscience.com/documents/building-science-insights/bsi-099-its-all-relative> (as accessed on January 10, 2018)

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This adds a test procedure that is more appropriate for some products.

IBC: SECTION 303.1.5 (New), 304.2 (New), 304.3 (New), 304.4 (New), 305.3 (New), 306.2.1 (New), 308.2, 308.3.1, 308.4, 309.3 (New), 310.1, 311.1.2 (New), 311.2.1 (New), 311.2.2 (New), 311.3, 311.3.1 (New), 312.2 (New), 312.3 (New)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

SECTION 303 ASSEMBLY GROUP A

303.1 Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

Add new text as follows:

303.1.5 Special amusement buildings. Special amusement buildings shall comply with Section 411.

SECTION 304 BUSINESS GROUP B

Revise as follows:

304.1 Business Group B. Business Group B occupancy includes, among others, the use of a building or structure, or a portion thereof, for office, professional or service-type transactions, including storage of records and accounts. Business occupancies shall include, but not be limited to, the following:

- Airport traffic control towers
- *Ambulatory care facilities*
- Animal hospitals, kennels and pounds
- Banks
- Barber and beauty shops
- Car wash
- Civic administration
- *Clinic, outpatient*
- Dry cleaning and laundries: pick-up and delivery stations and self-service
- Educational occupancies for students above the 12th grade, including higher education laboratories.
- Electronic data processing
- Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining facilities not more than 2,500 square feet (232 m²) in area.
- Laboratories: testing and research
- Motor vehicle showrooms
- Post offices
- Print shops
- Professional services (architects, attorneys, dentists, physicians, engineers, etc.)
- Radio and television stations
- Telephone exchanges
- Training and skill development not in a school or academic program (this shall include, but not be limited to, tutoring centers, martial arts studios, gymnastics and similar uses regardless of the ages served, and where not classified as a Group A occupancy).

Add new text as follows:

304.2 Airport traffic control towers. Airport traffic control towers shall comply with Section 412.2.

304.3 Ambulatory care facilities. Ambulatory care facilities shall comply with Section 422.

304.4 Higher education laboratories. Higher education laboratories shall comply with Section 428.

SECTION 305 EDUCATIONAL GROUP E

305.3 Storm shelters in Group E occupancies. Storm shelters shall be provided for Group E occupancies where required by Section 423.4.

SECTION 306 FACTORY GROUP F

Revise as follows:

306.2 Moderate-hazard factory industrial, Group F-1. Factory industrial uses that are not classified as Factory Industrial F-2 Low Hazard shall be classified as F-1 Moderate Hazard and shall include, but not be limited to, the following:

- Aircraft (manufacturing, not to include repair)
- Appliances
- Athletic equipment
- Automobiles and other motor vehicles
- Bakeries
- Beverages: over 16-percent alcohol content
- Bicycles
- Boats
- Brooms or brushes
- Business machines
- Cameras and photo equipment
- Canvas or similar fabric
- Carpets and rugs (includes cleaning)
- Clothing
- Construction and agricultural machinery
- Disinfectants
- Dry cleaning and dyeing
- Electric generation plants
- Electronics
- Engines (including rebuilding)
- Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining facilities more than 2,500 square feet (232 m²) in area.
- Furniture
- Hemp products
- Jute products
- Laundries
- Leather products
- Machinery
- Metals
- Millwork (sash and door)
- Motion pictures and television filming (without spectators)
- Musical instruments
- Optical goods

- Paper mills or products
- Photographic film
- Plastic products
- Printing or publishing
- Recreational vehicles
- Refuse incineration
- Shoes
- Soaps and detergents
- Textiles
- Tobacco
- Trailers
- Upholstering
- Wood; distillation
- Woodworking (cabinet)

Add new text as follows:

306.2.1 Aircraft manufacturing facilities. Aircraft manufacturing facilities shall comply with Section 412.6.

SECTION 308 INSTITUTIONAL GROUP I

Revise as follows:

308.2 Institutional Group I-1. Institutional Group I-1 occupancy shall include buildings, structures or portions thereof for more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised environment and receive custodial care. Buildings of Group I-1 shall be classified as one of the occupancy conditions specified in Section 308.2.1 or 308.2.2 ~~and shall comply with Section 420.~~ This group shall include, but not be limited to, the following:

- Alcohol and drug centers
- Assisted living facilities
- Congregate care facilities
- *Group homes*
- Halfway houses
- Residential board and care facilities
- Social rehabilitation facilities

308.3 Institutional Group I-2. Institutional Group I-2 occupancy shall include buildings and structures used for *medical care* on a 24-hour basis for more than five persons who are *incapable of self-preservation*. This group shall include, but not be limited to, the following:

- *Foster care facilities*
- *Detoxification facilities*
- *Hospitals*
- *Nursing homes*
- *Psychiatric hospitals*

308.3.1 Occupancy conditions. Buildings of Group I-2 shall be classified as one of the occupancy conditions specified in Section 308.3.1.1 or 308.3.1.2 ~~and shall comply with Section 407.~~

308.4 Institutional Group I-3. Institutional Group I-3 occupancy shall include buildings and structures that are inhabited by more than five persons who are under restraint or security. A Group I-3 facility is occupied by persons who are generally *incapable of self-preservation* due to security measures not under the occupants' control. This group shall include, but not be limited to, the following:

- Correctional centers
- Detention centers
- Jails
- Prerelease centers
- Prisons
- Reformatories

Buildings of Group I-3 shall be classified as one of the occupancy conditions specified in Sections 308.4.1 through 308.4.5 (~~see Section 408.1~~) and shall comply with Section 408.

SECTION 309 MERCANTILE GROUP M

Add new text as follows:

309.1 Mercantile Group M. Mercantile Group M occupancy includes, among others, the use of a building or structure or a portion thereof for the display and sale of merchandise, and involves stocks of goods, wares or merchandise incidental to such purposes and accessible to the public. Mercantile occupancies shall include, but not be limited to, the following:

- Department stores
- Drug stores
- Markets
- Greenhouses for display and sale of plants that provide public access.
- Motor fuel-dispensing facilities
- Retail or wholesale stores
- Sales rooms

309.3 Motor fuel-dispensing facilities. Motor fuel-dispensing facilities shall comply with Section 406.7.

SECTION 310 RESIDENTIAL GROUP R

Revise as follows:

310.1 Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the International Residential Code. Group R occupancies not constructed in accordance with the International Residential Code as permitted by Sections 301.4.1 and 301.4.2 shall comply with Section 420.

SECTION 311 STORAGE GROUP S

Add new text as follows:

311.1.2 Combustible storage. High-piled stock or rack storage, or attic, under-floor and concealed spaces used for storage of combustible materials, shall be in accordance with Section 413.

311.2 Moderate-hazard storage, Group S-1. Storage Group S-1 occupancies are buildings occupied for storage uses that are not classified as Group S-2, including, but not limited to, storage of the following:

- Aerosol products, Levels 2 and 3
- Aircraft hangar (storage and repair)
- Bags: cloth, burlap and paper
- Bamboos and rattan
- Baskets
- Belting: canvas and leather
- Books and paper in rolls or packs
- Boots and shoes

- Buttons, including cloth covered, pearl or bone
- Cardboard and cardboard boxes
- Clothing, woolen wearing apparel
- Cordage
- Dry boat storage (indoor)
- Furniture
- Furs
- Glues, mucilage, pastes and size
- Grains
- Horns and combs, other than celluloid
- Leather
- Linoleum
- Lumber
- Motor vehicle repair garages complying with the maximum allowable quantities of hazardous materials listed in Table 307.1(1) (see Section 406.8)
- Photo engravings
- Resilient flooring
- Self-service storage facility (mini-storage)
- Silks
- Soaps
- Sugar
- Tires, bulk storage of
- Tobacco, cigars, cigarettes and snuff
- Upholstery and mattresses
- Wax candles

311.2.1 Aircraft hangars. Aircraft hangars used for storage or repair shall comply with Section 412.3.

311.2.2 Motor vehicle repair garages. Motor vehicle repair garages shall comply with Section 406.8.

311.3 Low-hazard storage, Group S-2. Storage Group S-2 occupancies include, among others, buildings used for the storage of noncombustible materials such as products on wood pallets or in paper cartons with or without single thickness divisions; or in paper wrappings. Such products are permitted to have a negligible amount of plastic *trim*, such as knobs, handles or film wrapping. Group S-2 storage uses shall include, but not be limited to, storage of the following:

- Asbestos
- Beverages up to and including 16-percent alcohol in metal, glass or ceramic containers
- Cement in bags
- Chalk and crayons
- Dairy products in nonwaxed coated paper containers
- Dry cell batteries
- Electrical coils
- Electrical motors
- Empty cans
- Food products
- Foods in noncombustible containers
- Fresh fruits and vegetables in nonplastic trays or containers

- Frozen foods
- Glass
- Glass bottles, empty or filled with noncombustible liquids
- Gypsum board
- Inert pigments
- Ivory
- Meats
- Metal cabinets
- Metal desks with plastic tops and *trim*
- Metal parts
- Metals
- Mirrors
- Oil-filled and other types of distribution transformers
- ~~Parking~~ Public parking garages, open or enclosed
- Porcelain and pottery
- Stoves
- Talc and soapstones
- Washers and dryers

311.3.1 Public parking garages. Public parking garages shall comply with Section 406.4 and the additional requirements of Section 406.5 for open parking garages or Section 406.6 for enclosed parking garages.

SECTION 312 UTILITY AND MISCELLANEOUS GROUP U

312.2 Private garages and carports. Private garages and carports shall comply with Section 406.3.

312.3 Residential aircraft hangars. Aircraft hangars accessory to a one- or two-family residence shall comply with Section 412.4.

Reason:

During the 2015-2015 code development cycle, a series of proposals were submitted to relocate the bulk of the detailed use and occupancy requirements in Chapter 4 to other sections of the code, primarily Chapter 3. The primary justification was concern that some code users may overlook key Chapter 4 criteria that apply to their buildings. The proposals were all defeated, most of them overwhelmingly.

The concern still remains, especially as Chapter 4 remains a dumping ground for use- or occupancy-related provisions that don't have a clear home elsewhere in the code. The BCAC elected to revisit the issue, but rather than taking a chainsaw to the provisions and clearing out huge clumps opted for a more surgical approach. Primarily, the BCAC proposes to add a series of pointers from the appropriate occupancy groups in Chapter 3 to the relevant provisions in Chapter 4. Pointers to uses in Chapter 4 which can occur in a variety of different occupancy groups are added in Section 302. These changes will highlight for architects, engineers and building officials when detailed provisions in Chapter 4 apply to a building, or portion thereof, which they are designing or reviewing.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction. This is an editorial reorganization to place requirements in a more appropriate location.

G14-18

IBC: 303.1, 303.1.3

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

SECTION 303 ASSEMBLY GROUP A

Revise as follows:

303.1 Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption or awaiting transportation.

303.1.3 Associated with Group E occupancies. A room or space used for assembly purposes that is associated with a Group E occupancy, with an occupant load of 300 or less, is not considered a separate occupancy.

Reason:

To be consistent, the exceptions for assembly spaces in Section 303.1.1 through 303.1.4 (below) seem to indicate that the exceptions are intended for small spaces. However, the language in 303.1.3 has been widely interpreted. Some people feel this should be limited to spaces just typically open to students - such as libraries, music rooms, band rooms, and cafeterias. Others have interpreted this to include large gymnasiums and auditoriums with significant seating. While a school basketball game may be a school function, there would be students from another school, as well as significant number of the public, including a high percentage of families. The same concern for large number of the public also hold true in an auditorium.

303.1.1 Small buildings and tenant spaces. A building or tenant space used for assembly purposes with an occupantload of less than 50 persons shall be classified as a Group B occupancy.

303.1.2 Small assembly spaces. The following rooms and spaces shall not be classified as Assembly occupancies:

1. A room or space used for assembly purposes with an occupant load of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
2. A room or space used for assembly purposes that is less than 750 square feet (70 m2) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.

303.1.3 Associated with Group E occupancies. A room or space used for assembly purposes that is associated with a Group E occupancy is not considered a separate occupancy.

303.1.4 Accessory to places of religious worship. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 per room or space are not considered separate occupancies.

This also may be considered a conflict with Section 302.1 which states "A room or space that is intended to be occupied at different times for different purposes shall comply with all of the requirements that are applicable to each of the purposes for which the room or space will be occupied."

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will increase the cost of construction .

This code change proposal will increase the cost of construction. Sprinkler system installation in new construction for a Group A can vary from \$1.00 to \$3.00 per square foot. This proposal will require larger gymnasiums and auditoriums associated with a Group E occupancy to be protected with a fire suppression system in areas where the previous interpretation was to allow these larger spaces to be considered part of the Group E occupancy.

Internal ID: 183

G15-18 Part I

PART I - IBC: 303.4, 309.1

PART II - IBC: TABLE 1004.5, (IFC[BE] TABLE 1004.5)

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE GENERAL CODE DEVELOPMENT COMMITTEE. PART II WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows:

303.4 Assembly Group A-3. Group A-3 occupancy includes assembly uses intended for worship, recreation or amusement and other assembly uses not classified elsewhere in Group A including, but not limited to:

- Amusement arcades
- Art galleries more than 3,000 square feet
- Bowling alleys
- Community halls
- Courtrooms
- Dance halls (not including food or drink consumption)
- Exhibition halls
- Funeral parlors
- Greenhouses for the conservation and exhibition of plants that provide public access.
- Gymnasiums (without spectator seating)
- Indoor *swimming pools* (without spectator seating)
- Indoor tennis courts (without spectator seating)
- Lecture halls
- Libraries
- Museums
- *Places of religious worship*
- Pool and billiard parlors
- Waiting areas in transportation terminals

309.1 Mercantile Group M. Mercantile Group M occupancy includes, among others, the use of a building or structure or a portion thereof for the display and sale of merchandise, and involves stocks of goods, wares or merchandise incidental to such purposes and accessible to the public. Mercantile occupancies shall include, but not be limited to, the following:

- Art galleries 3,000 square feet or less
- Department stores
- Drug stores
- Markets
- Greenhouses for display and sale of plants that provide public access.
- Motor fuel-dispensing facilities
- Retail or wholesale stores
- Sales rooms

G15-18 Part II

IBC: TABLE 1004.5 (IFC[BE] TABLE 1004.5)

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

**TABLE 1004.5
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR^a
Accessory storage areas, mechanical equipment room	300 gross
Agricultural building	300 gross
Aircraft hangars	500 gross
Airport terminal	20 gross
Baggage claim	300 gross
Baggage handling	100 gross
Concourse Waiting areas	15 gross
Assembly	11 gross
Gaming floors (keno, slots, etc.)	30 net
Exhibit gallery and museum	
Assembly with fixed seats	See Section 1004.6
Assembly without fixed seats	7 net
Concentrated	5 net
(chairs only—not fixed)	15 net
Standing space	
Unconcentrated (tables and chairs)	
Bowling centers, allow 5 persons for each lane including 15 feet of runway, and for additional areas	7 net
Business areas	150 gross
Concentrated business use areas	See Section 1004.8
Courtrooms—other than fixed seating areas	40 net
Day care	35 net
Dormitories	50 gross
Educational	20 net
Classroom area	50 net
Shops and other vocational room areas	
Exercise rooms	50 gross
Group H-5 fabrication and manufacturing areas	200 gross
Industrial areas	100 gross
Institutional areas	240 gross
Inpatient treatment areas	100 gross
Outpatient areas	120 gross
Sleeping areas	
Kitchens, commercial	200 gross
Library	50 net
Reading rooms	100 gross
Stack area	
Locker rooms	50 gross
Mall buildings—covered and open	See Section 402.8.2
Mercantile	60 gross
<u>Art gallery</u>	<u>30 gross</u>
Storage stock, shipping areas	300 gross
Parking garages	200 gross
Residential	200 gross
Skating rinks, swimming pools	50 gross
Rink and pool	15 gross
Decks	
Stages and platforms	15 net
Warehouses	500 gross

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. Floor area in square feet per occupant.

Reason:

Provides limited sized art gallery space occupancy classification and the corresponding occupant load factor alignment in the code with the common business practices of selling artistic wares and goods.

This change will allow small commercial storefronts for retail sales of unique and limited-edition items to patrons browsing displayed works, interacting with sales people and making purchases, to be classified as Mercantile Occupancies. This change is similar in concept to the current small space allowances for an Assembly Occupancy to have a classification as a Business Occupancy.

This change maintains the required standards for hazards associated with the current occupancy classification of A-3 for Art Gallery spaces greater than 3,000 square feet and large Mercantile occupancies.

Cost Impact

The code change proposal will decrease the cost of construction .

This code revision has an anticipated cost benefit to the AHJ and building owners/tenants by a reduction in overall expenditures throughout the entire process of permitting, construction, inspection, and operation of retail type businesses in small spaces where an occupancy classification change is currently required. This revision may also provide a cost benefit to the AHJ by increasing business opportunities for individuals and organizations by reducing or eliminating the cost barriers of substantial alterations in these smaller spaces that are often associated with a change in occupancy classification.

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

LIQUID FUEL OR COMPRESSED GAS POWERED MOTOR VEHICLE A vehicle on wheels or other conveyance system, having its own liquid fuel or compressed gas powered motor to propel the vehicle, and not running on rails or tracks, for use on land, streets or highways, such as an automobile, truck, bus, forklift or similar motor vehicle, and which is manually operated.

Revise as follows:

[BG] OPEN PARKING GARAGE. A structure or portion of a structure with the openings as described in Section 406.5.2 on two or more sides that is used for the parking or storage of private liquid fuel or compressed gas powered motor vehicles as described in Section 406.5.3.

[BG] PRIVATE GARAGE. A building or portion of a building in which liquid fuel or compressed gas powered motor vehicles used by the owner or tenants of the building or buildings on the premises are stored or kept, without provisions for repairing or servicing such vehicles for profit.

[BG] REPAIR GARAGE. A building, structure or portion thereof used for servicing or repairing liquid fuel or compressed gas powered motor vehicles.

SECTION 306 FACTORY GROUP F

306.2 Moderate-hazard factory industrial, Group F-1. Factory industrial uses that are not classified as Factory Industrial F-2 Low Hazard shall be classified as F-1 Moderate Hazard and shall include, but not be limited to, the following:

- Aircraft (manufacturing, not to include repair)
- Appliances
- Athletic equipment
- Automobiles and other liquid fuel or compressed gas powered motor vehicles
- Bakeries
- Beverages: over 16-percent alcohol content
- Bicycles
- Boats
- Brooms or brushes
- Business machines
- Cameras and photo equipment
- Canvas or similar fabric
- Carpets and rugs (includes cleaning)
- Clothing
- Construction and agricultural machinery
- Disinfectants
- Dry cleaning and dyeing
- Electric generation plants

- Electronics
- Engines (including rebuilding)
- Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining facilities more than 2,500 square feet (232 m²) in area.
- Furniture
- Hemp products
- Jute products
- Laundries
- Leather products
- Machinery
- Metals
- Millwork (sash and door)
- Motion pictures and television filming (without spectators)
- Musical instruments
- Optical goods
- Paper mills or products
- Photographic film
- Plastic products
- Printing or publishing
- Recreational vehicles
- Refuse incineration
- Shoes
- Soaps and detergents
- Textiles
- Tobacco
- Trailers
- Upholstering
- Wood; distillation
- Woodworking (cabinet)

311.2 Moderate-hazard storage, Group S-1. Storage Group S-1 occupancies are buildings occupied for storage uses that are not classified as Group S-2, including, but not limited to, storage of the following:

- Aerosol products, Levels 2 and 3
- Aircraft hangar (storage and repair)
- Bags: cloth, burlap and paper
- Bamboos and rattan
- Baskets
- Belting: canvas and leather
- Books and paper in rolls or packs
- Boots and shoes
- Buttons, including cloth covered, pearl or bone
- Cardboard and cardboard boxes
- Clothing, woolen wearing apparel
- Cordage
- Dry boat storage (indoor)

- Furniture
- Furs
- Glues, mucilage, pastes and size
- Grains
- Horns and combs, other than celluloid
- Leather
- Linoleum
- Lumber
- ~~Motor~~ Liquid fuel or compressed gas powered motor vehicle repair garages complying with the maximum allowable quantities of hazardous materials listed in Table 307.1(1) (see Section 406.8)
- Photo engravings
- Resilient flooring
- Self-service storage facility (mini-storage)
- Silks
- Soaps
- Sugar
- Tires, bulk storage of
- Tobacco, cigars, cigarettes and snuff
- Upholstery and mattresses
- Wax candles

406.2.4 Floor surfaces. Floor surfaces shall be of concrete or similar approved noncombustible and nonabsorbent materials. The area of floor used for the parking of ~~automobiles or other~~ liquid fuel or compressed gas powered motor vehicles shall be sloped to facilitate the movement of liquids to a drain or toward the main vehicle entry doorway. The surface of vehicle fueling pads in motor fuel-dispensing facilities shall be in accordance with Section 406.7.1.

Exceptions:

1. Asphalt parking surfaces shall be permitted at ground level for public parking garages and private carports.
2. Floors of Group S-2 parking garages shall not be required to have a sloped surface.
3. Slip-resistant, nonabsorbent, interior floor finishes having a critical radiant flux not more than 0.45 W/cm², as determined by ASTM E648 or NFPA 253, shall be permitted in repair garages.

406.2.5 Sleeping rooms. Openings between a liquid fuel or compressed gas powered motor vehicle-related occupancy and a room used for sleeping purposes shall not be permitted.

406.5.4.1 Single use. Where the *open parking garage* is used exclusively for the parking or storage of private liquid fuel or compressed gas powered motor vehicles, and the building is without other uses, the area and height shall be permitted to comply with Table 406.5.4, along with increases allowed by Section 406.5.5.

Exception: The grade-level tier is permitted to contain an office, waiting and toilet rooms having a total combined area of not more than 1,000 square feet (93 m²). Such area need not be separated from the *open parking garage*.

In *open parking garages* having a spiral or sloping floor, the horizontal projection of the structure at any cross section shall not exceed the allowable area per parking tier. In the case of an *open parking garage* having a continuous spiral floor, each 9 feet 6 inches (2896 mm) of height, or portion thereof, shall be considered under these provisions to be a tier.

406.7.2 Canopies. Canopies under which fuels are dispensed shall have a clear, unobstructed height of not less than 13 feet 6 inches (4115 mm) to the lowest projecting element in the vehicle drive-through area. Canopies and their supports over pumps shall be of noncombustible materials, *fire-retardant-treated wood* complying with Chapter 23, heavy timber complying with Section 2304.11 or construction providing 1-hour *fire resistance*. Combustible materials used in or on a *canopy* shall comply with one of the following:

1. Shielded from the pumps by a noncombustible element of the *canopy*, or heavy timber complying

with Section 2304.11.

2. Plastics covered by aluminum facing having a thickness of not less than 0.010 inch (0.30 mm) or corrosion-resistant steel having a base metal thickness of not less than 0.016 inch (0.41 mm). The plastic shall have a *flame spread index* of 25 or less and a smoke-developed index of 450 or less when tested in the form intended for use in accordance with ASTM E84 or UL 723 and a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D1929.
3. Panels constructed of light-transmitting plastic materials shall be permitted to be installed in *canopies* erected over liquid fuel or compressed gas powered motor vehicle fuel-dispensing station fuel dispensers, provided that the panels are located not less than 10 feet (3048 mm) from any building on the same *lot* and face *yards* or streets not less than 40 feet (12 192 mm) in width on the other sides. The aggregate areas of plastics shall be not greater than 1,000 square feet (93 m²). The maximum area of any individual panel shall be not greater than 100 square feet (9.3 m²).

[F] 406.8.2 Gas detection system. Repair garages used for repair of liquid fuel or compressed gas powered motor vehicles fueled by nonodorized gases including but not limited to hydrogen and nonodorized LNG, shall be provided with a gas detection system that complies with Section 916. The gas detection system shall be designed to detect leakage of nonodorized gaseous fuel. Where lubrication or chassis service pits are provided in garages used for repairing nonodorized LNG-fueled vehicles, gas sensors shall be provided in such pits.

510.3 Group S-2 enclosed parking garage with Group S-2 open parking garage above. A Group S-2 enclosed parking garage with not more than one *story above grade plane* and located below a Group S-2 open *parking garage* shall be classified as a separate and distinct building for the purpose of determining the type of construction where all of the following conditions are met:

1. The allowable area of the building shall be such that the sum of the ratios of the actual area divided by the allowable area for each separate occupancy shall not exceed 1.
2. The Group S-2 enclosed parking garage is of Type I or II construction and is at least equal to the *fire-resistance* requirements of the Group S-2 *open parking garage*.
3. The height and the number of tiers of the Group S-2 *open parking garage* shall be limited as specified in Table 406.5.4.
4. The floor assembly separating the Group S-2 enclosed parking garage and Group S-2 *open parking garage* shall be protected as required for the floor assembly of the Group S-2 enclosed parking garage. Openings between the Group S-2 enclosed parking garage and Group S-2 *open parking garage*, except *exit* openings, shall not be required to be protected.
5. The Group S-2 enclosed parking garage is used exclusively for the parking or storage of private liquid fuel or compressed gas powered motor vehicles, but shall be permitted to contain an office, waiting room and toilet room having a total area of not more than 1,000 square feet (93 m²) and mechanical equipment rooms incidental to the operation of the building.

TABLE 1607.1

MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_0 , AND MINIMUM CONCENTRATED LIVE LOADS⁹

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm²,
1 square foot = 0.0929 m²,
1 pound per square foot = 0.0479 kN/m², 1 pound = 0.004448 kN,
1 pound per cubic foot = 16 kg/m³.

- a. Floors in garages or portions of buildings used for the storage of liquid fuel or compressed gas powered motor vehicles shall be designed for the uniformly distributed live loads of this table or the following concentrated loads: (1) for garages restricted to passenger vehicles accommodating not more than nine passengers, 3,000 pounds acting on an area of 4¹/₂ inches by 4¹/₂ inches; (2) for mechanical parking structures without slab or deck that are used for storing passenger vehicles only, 2,250 pounds per wheel.
- b. The loading applies to stack room floors that support nonmobile, double-faced library book stacks, subject to the following limitations:
 1. The nominal book stack unit height shall not exceed 90 inches.
 2. The nominal shelf depth shall not exceed 12 inches for each face.
 3. Parallel rows of double-faced book stacks shall be separated by aisles not less than 36 inches wide.
- c. Design in accordance with ICC 300.
- d. Other uniform loads in accordance with an approved method containing provisions for truck loadings shall be considered where appropriate.
- e. The concentrated wheel load shall be applied on an area of 4.5 inches by 4.5 inches.
- f. The minimum concentrated load on stair treads shall be applied on an area of 2 inches by 2 inches. This load need not be assumed to act concurrently with the uniform load.
- g. Where snow loads occur that are in excess of the design conditions, the structure shall be designed to support the loads due to the increased loads caused by drift buildup or a greater snow design determined by the building official (see Section 1608).
- h. See Section 1604.8.3 for decks attached to exterior walls.
- i. Uninhabitable attics without storage are those where the maximum clear height between the joists and rafters is less than 42 inches, or where there are not two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses. This live load need not be assumed to act concurrently with any other live load requirements.
- j. Uninhabitable attics with storage are those where the maximum clear height between the joists and rafters is 42 inches or greater, or where there are two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses.

The live load need only be applied to those portions of the joists or truss bottom chords where both of the following conditions are met:

 - i. The attic area is accessible from an opening not less than 20 inches in width by 30 inches in length that is located where the clear height in the attic is not less than 30 inches.
 - ii. The slopes of the joists or truss bottom chords are not greater than two units vertical in 12 units horizontal.

The remaining portions of the joists or truss bottom chords shall be designed for a uniformly distributed concurrent live load of not less than 10 pounds per square foot.
- k. Attic spaces served by stairways other than the pull-down type shall be designed to support the minimum live load specified for habitable attics and sleeping rooms.
- l. Areas of occupiable roofs, other than roof gardens and assembly areas, shall be designed for appropriate loads as approved by the building official. Unoccupied landscaped areas of roofs shall be designed in accordance with Section 1607.13.3.
- m. Live load reduction is not permitted.
- n. Live load reduction is only permitted in accordance with Section 1607.11.1.2 or Item 1 of Section 1607.11.2.

- o. Live load reduction is only permitted in accordance with Section 1607.11.1.3 or Item 2 of Section 1607.11.2.

Reason:

A similar code change proposal was submitted for a definition of a Motor Vehicle. While researching this code change proposal, we determined that most code sections relative to motor vehicles could be broken down into three categories:

1. Code sections dealing with impact protection from operator error.
2. Code sections dealing with fumes related to fuel vapor accumulation related to internal combustion engines that are not being operated.
3. Code sections dealing with fumes related to combustion of the internal combustion engines being operated (exhaust).

We felt that a second definition may help to separate the three issues and bring more clarity into what the issue is with a motor vehicle in each situation. We tried to apply the logic that if the code section is still relevant if the vehicle used is a fully electric golf cart or forklift, then it belongs with all Motor Vehicles...but if the code section only applies if the vehicle is emitting exhaust or fumes from the internal combustion engine, then it would fall into this second proposed definition.

We tried to identify all of the code sections in the IBC where we felt this separate definition would be appropriate. There may be additional reasons to use this definition in the IMC or IFC, but for this code change proposal, we did not pursue those at this time. We feel that each section identified would not make sense if the vehicle described is an electric golf cart or forklift which produces no or minimal exhaust or fumes.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The additional definition is only being provided to assist users of the code when confronted by those code sections that regulate Motor Vehicles, and help to define which types of motor vehicles need to be regulated by each code section. There are no added regulatory provisions.

Internal ID: 2046

G17-18

IBC: 306.2

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org); Robert Davidson, Davidson Code Concepts, LLC, representing Tesla, USA (rjd@davidsoncodeconcepts.com)

2018 International Building Code

Revise as follows:

306.2 Moderate-hazard factory industrial, Group F-1. Factory industrial uses that are not classified as Factory Industrial F-2 Low Hazard shall be classified as F-1 Moderate Hazard and shall include, but not be limited to, the following:

- Aircraft (manufacturing, not to include repair)
- Appliances
- Athletic equipment
- Automobiles and other motor vehicles
- Bakeries
- Beverages: over 16-percent alcohol content
- Bicycles
- Boats
- Brooms or brushes
- Business machines
- Cameras and photo equipment
- Canvas or similar fabric
- Carpets and rugs (includes cleaning)
- Clothing
- Construction and agricultural machinery
- Disinfectants
- Dry cleaning and dyeing
- Electric generation plants
- Electronics
- Energy storage systems (ESS) in dedicated use buildings
- Engines (including rebuilding)
- Food processing establishments and commercial kitchens not associated with restaurants, cafeterias and similar dining facilities more than 2,500 square feet (232 m²) in area.
- Furniture
- Hemp products
- Jute products
- Laundries
- Leather products
- Machinery
- Metals
- Millwork (sash and door)
- Motion pictures and television filming (without spectators)
- Musical instruments
- Optical goods
- Paper mills or products

- Photographic film
- Plastic products
- Printing or publishing
- Recreational vehicles
- Refuse incineration
- Shoes
- Soaps and detergents
- Textiles
- Tobacco
- Trailers
- Upholstering
- Wood; distillation
- Woodworking (cabinet)

Reason:

This proposal is a correlation issue with the FCAC IFC Section 1206 ESS rewrite. The FCAC looked at the hazards associated with dedicated use utility type ESS installations covered under the following section and decided that Group F-1 was an appropriate classification. For the most part they will serve the grid scale areas of ESS deployment and large facilities.

(IFC) 1206.7.2 Dedicated use buildings. For the purpose of Table 1206.7 dedicated use ESS buildings shall be classified as Group F-1 occupancies and comply with all the following.

The building shall only be used for ESS, electrical energy generation, and other electrical grid related operations.

Occupants in the rooms and areas containing ESS are limited to personnel that operate, maintain, service, test and repair the ESS and other energy systems.

No other occupancy types shall be permitted in the building.

Administrative and support personnel shall be permitted in areas within the buildings that do not contain ESS, provided:

The areas do not occupy more than 10 percent of the building area of the story in which they are located.

A means of egress is provided from the incidental use areas to the public way that does not require occupants to traverse through areas containing ESS or other energy system equipment.

(Also the administrative support areas are separated from the ESS by a 2 hour fire separation.)

When looking at the group classifications and expected fuel loads the F-1 fits the ESS Dedicated Use Building from that standpoint, especially since Electric Generation Plants are already an F-1 Group. ESS are part of the overall electric generation and storage. If ESS is installed in a building occupied by another group it will remain that Group and be required to have the increased fire protection features for the space the ESS occupies. That does not change from how the current code addresses ESS.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal provides correlation with an IFC proposal. The IFC proposal will actually decrease the cost of construction because it will allow larger ESS installations in dedicated use indoor locations to be in Group F-1 occupancies, rather than in H-2 occupancies.

G18-18

IBC: 306.3

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (sthomas@coloradocode.net)

2018 International Building Code

Revise as follows:

306.3 Low-hazard factory industrial, Group F-2. Factory industrial uses that involve the fabrication or manufacturing of noncombustible materials that during finishing, packing or processing do not involve a significant fire hazard shall be classified as F-2 occupancies and shall include, but not be limited to, the following:

- Beverages: up to and including 16-percent alcohol content
- Brick and masonry
- Ceramic products
- Foundries
- Glass products
- Gypsum
- Ice
- Metal products (fabrication and assembly)
- Water/sewer treatment facilities

Reason:

Just about every jurisdiction has a water or sewer treatment facility in them. However, many people have difficulty determining the occupancy classification. Therefore, we are proposing that these uses be added to the Group F-2 Occupancy list. These facilities are a low hazard occupancy with the exception of some hazardous materials used in the processing. The code has provisions to handle the use of these hazardous materials. The proposal provides users a clear classification of these facilities and makes it easier to use.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification of the code requirements.

Internal ID: 240

G19-18

IBC: SECTION [F]307.4, [F]307.5

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

SECTION 307 HIGH-HAZARD GROUP H

[F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in *control areas* complying with Section 414, based on the maximum allowable quantity limits for *control areas* set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the International Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the International Fire Code.

Revise as follows:

[F] 307.4 High-hazard Group H-2. Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning shall be classified as Group H-2. Such materials shall include, but not be limited to, the following:

- Class I, II or IIIA flammable or combustible liquids that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103.4 kPa).
- Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on ~~information~~ a dust hazard analysis prepared in accordance with Section ~~414.1.3.426.1~~ and NFPA 652.
- Cryogenic fluids, flammable.
- Flammable gases.
- Organic peroxides, Class I.
- Oxidizers, Class 3, that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103 kPa).
- Pyrophoric liquids, solids and gases, nondetonable.
- Unstable (reactive) materials, Class 3, nondetonable.
- Water-reactive materials, Class 3.

[F] 307.5 High-hazard Group H-3. Buildings and structures containing materials that readily support combustion or that pose a physical hazard shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

- Class I, II or IIIA flammable or combustible liquids that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less.
- Combustible fibers, other than densely packed baled cotton, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on ~~information~~ a dust hazard analysis prepared in accordance with Section ~~414.1.3.426.1~~ and NFPA 652.
- Consumer fireworks, 1.4G (Class C, Common)
- Cryogenic fluids, oxidizing
- Flammable solids
- Organic peroxides, Class II and III
- Oxidizers, Class 2
- Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15

pounds per square inch gauge (103 kPa) or less

- Oxidizing gases
- Unstable (reactive) materials, Class 2
- Water-reactive materials, Class 2

Reason:

This proposal is follow up work correlating the IBC and IFC provisions with the work done on Chapter 22 Combustible Dust and Chapter 37 Combustible Fibers in the IFC along with Section 426 of the IBC.

With the addition of NFPA 652 specific requirements are now applicable on how to perform a Dust Hazard Analysis for the purpose of characterizing a dust hazard and identifying building or operational features that need to be addressed to properly manage the hazard.

This proposal points the Combustible Dust and Combustible Fibers hazard classification language to the appropriate standard for developing the necessary information for submittal to the code official. A key hazard of combustible fibers within a building in addition to the fibers is a dust hazard and Chapter 37 Combustible Fibers in the IFC is linked to Chapter 22 Combustible Dust-Producing Operations already at Section 3703.5.

Both IBC Section 426.1 and Chapter 22 of the IFC apply NFPA 652 as the primary standard. Chapter 7 of NFPA 652 contains the requirements for conducting a Dust Hazard Analysis.

By modifying the language it will assist designers and code officials by ensuring a detailed analysis is performed providing information relevant to the specific hazards.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is a correlation based upon updated provisions in the codes. The cost impact should be neutral, though any time the language is improved there is a potential to eliminate unnecessary costs.

IBC: [F] 307.4, [F] 307.5

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

[F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in *control areas* complying with Section 414, based on the maximum allowable quantity limits for *control areas* set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the International Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the International Fire Code.

Revise as follows:

[F] 307.4 High-hazard Group H-2. Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning shall be classified as Group H-2. Such materials shall include, but not be limited to, the following:

- Class I, II or IIIA flammable or combustible liquids that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103.4 kPa).
-
- ~~Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.~~
Cryogenic fluids, flammable.
- Flammable gases.
- Organic peroxides, Class I.
- Oxidizers, Class 3, that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103 kPa).
- Pyrophoric liquids, solids and gases, nondetonable.
- Unstable (reactive) materials, Class 3, nondetonable.
- Water-reactive materials, Class 3.

[F] 307.5 High-hazard Group H-3. Buildings and structures containing materials that readily support combustion or that pose a physical hazard shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

- Class I, II or IIIA flammable or combustible liquids that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less.
-
- ~~Combustible fibers, other than densely packed baled cotton, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.~~
Consumer fireworks, 1.4G (Class C, Common)
- Cryogenic fluids, oxidizing
- Flammable solids
- Organic peroxides, Class II and III
- Oxidizers, Class 2

- Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less
- Oxidizing gases
- Unstable (reactive) materials, Class 2
- Water-reactive materials, Class 2

Reason:

This proposal is follow up work correlating the IBC and IFC provisions with the work done on Chapter 22 Combustible Dust and Chapter 37 Combustible Fibers in the IFC along with Section 426 of the IBC.

The proposal seeks to delete the listing of dust and combustible fibers from IBC Table 307.1(1) and IFC Table 5003.1.1(1).

The key reason for deleting the listings is because combustible dust is typically not a hazardous material, a small percentage may be, but the dust hazard classification is not a hazardous material issue. The same for combustible fibers.

2018 IBC

“SECTION 307 HIGH-HAZARD GROUP H

[F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in control areas complying with Section 414, based on the maximum allowable quantity limits for control areas set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the International Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the International Fire Code.”

“[F] HAZARDOUS MATERIALS. Those chemicals or substances that are physical hazards or health hazards as classified in Section 307 and the International Fire Code, whether the materials are in usable or waste condition.”

“[F] HEALTH HAZARD. A classification of a chemical for which there is statistically significant evidence that acute or chronic health effects are capable of occurring in exposed persons. The term “health hazard” includes chemicals that are toxic or highly toxic, and corrosive.”

“[F] PHYSICAL HAZARD. A chemical for which there is evidence that it is a combustible liquid, cryogenic fluid, explosive, flammable (solid, liquid or gas), organic peroxide (solid or liquid), oxidizer (solid or liquid), oxidizing gas, pyrophoric (solid, liquid or gas), unstable (reactive) material (solid, liquid or gas) or water-reactive material (solid or liquid).”

By scoping and definition, Section 307 applies to hazardous materials, chemicals. Combustible dust and combustible fiber hazards are not hazardous material or chemical hazards. So, in applying Section 307 on H Group occupancies you can only apply the requirements to those combustible dusts or combustible fibers that also happen to be chemicals.

The need for the hazardous group listings has been eliminated by work last cycle to update the combustible dust requirements of the code. Combustible fiber language was updated going into the 2015 IFC and that chapter points to the combustible dust chapter.

Previously there appeared to be an option to not mitigate a dust/fiber fire explosion hazard and default to an H Group Occupancy. That is no longer permitted. A facility, new or existing, must test to identify the hazard and then must take measures to manage the hazard.

2018 IBC

“SECTION [F] 426 COMBUSTIBLE DUSTS, GRAIN PROCESSING AND STORAGE

[F] 426.1 General. The provisions of Sections 426.1.1 through 426.1.7 shall apply to buildings in which materials that produce combustible dusts are stored or handled. Buildings that store or handle combustible dusts shall comply with NFPA 652 and the applicable provisions of NFPA 61, NFPA 85, NFPA 120, NFPA 484, NFPA 654, NFPA 655 and NFPA 664 and the International Fire Code.”

“2018 IFC

SECTION 2201

GENERAL 2201.1 Scope. The equipment, processes and operations involving dust explosion hazards shall comply with the provisions of this code and NFPA 652.”

“SECTION 2203 PRECAUTIONS

2203.1 Owner responsibility. The owner or operator of a facility with operations that manufacture, process, blend, convey, repackage, generate or handle potentially combustible dust or combustible particulate solids shall be responsible for compliance with the provisions of this code and NFPA 652.2203.2 Dust hazard analysis (DHA). The requirements of NFPA 652 apply to all new and existing facilities and operations with combustible dust hazard. Existing facilities shall have a dust hazard analysis (DHA) completed in accordance with Section 7.1.2 of NFPA 652.

The fire code official shall be authorized to order a dust hazard analysis to occur sooner if a combustible dust hazard has been identified in a facility that has not previously performed an analysis."

With the addition of the new NFPA 652 Standard on the Fundamentals of Combustible Dust as a core requirement in both the IBC and the IFC, currently written the code now requires the identified hazard to be addressed whether in a new or existing facility. This makes a H-2 or H-3 Group designation moot.

The activities will be designated appropriately as an F-1 or an S-1. Several occupancies currently listed in Groups F-1 and S-1 are occupancies that have material that require the assessment of the hazard presented.

During drafting of the proposal it was argued that the H-2 and H-3 classifications must remain because they are needed for a potential deflagration even though the codes now require the hazard to be managed because a deflagration could occur in case something goes wrong, or the code is not followed. The claim is that the H Group is a fail safe requirement. This argument is not supported by current code provisions where activities are not classified as high hazard currently in addition to the fact that the combustible dust hazards and combustible fiber hazards are not regulated by the scoping of Section 307 of the IBC or Chapter 50 of the IFC.

Section [F] 307.1.1 Uses other than Group H of the IBC has a laundry list of activities that are not to be classified as a Group H provided they comply with the codes otherwise that could present deflagration hazards if something goes wrong or the code is not complied with.

"1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of Section 416 and the International Fire Code."

A major hazard of flammable finishes is a deflagration. In many finish application activities you are creating the hazard by volatilizing the product. This is addressed through engineering controls and ignition hazard controls and in exchange for those code required controls they are not classified as an H-2 in case things go wrong or the code is not followed. The assumption is that the code will be followed.

"3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment."

If the material is enclosed in piping we automatically exclude the H Group regardless of amounts present. Even though we know a leak can cause a deflagration hazard, (and has). We assume code compliance addresses the safety issues.

"7. Refrigeration systems."

Even if the systems utilize flammable gas as a refrigerant, (actually this exception is because of the use of flammable gas as a refrigerant), which will cause a deflagration hazard if they leak. (And there have been deflagrations). The assumption is that the code will be followed.

"14. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the International Fire Code."

Again, we assume code compliance addresses the hazard.

Laboratories are a Group B even though they can have flammable gases or liquids present sufficient to cause a deflagration hazard if released.

The quantities of materials in Tables 5003.1.1(1) and IBC Table 307.1(1) do not consider deflagration potentials. If they did, the amount of material permitted would be tied directly to the size of the space and additional levels of protection for even the smallest amounts.

Based upon analysis, a single-family garage can be destroyed by a cup of gasoline that is fully volatilized and an ignition source is introduced. Yet we permit up to 30 gallons of flammable liquid to be present in any occupancy under the MAQ tables, 60 gallons if we provide sprinkler protection even though sprinkler protection has nothing to do with preventing a deflagration or mitigating its effects other than the post fire event potential. The fire code allows flammable liquid quantities beyond that needed for a deflagration to occur even in residential occupancies.

2018 IFC

"5704.3.4.2 Occupancy quantity limits. The following limits for quantities of stored flammable or combustible liquids shall not be exceeded:...

7. Group R occupancies: Quantities in Group R occupancies shall not exceed that necessary for maintenance purposes and operation of equipment, and shall not exceed quantities set forth in Table 5003.1.1(1)."

The same analogy can be used for the amount flammable gases permitted in a given space.

The removal of the H Group designations removes language that cannot be applied in most cases because the combustible dust or combustible fiber is not a hazardous material or chemical.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal recognizes improvement of the language in the IBC and IFC that occurred the last two cycles addressing the hazards presented by these activities. The net effect would be that a reduction is possible anytime the code is clarified and correlated eliminating unnecessary designations.

Internal ID: 1557

G21-18

IBC: 310.2

Proponent: Daniel Willham, County of Fairfax, Virginia, representing Virginia Building and Code Officials Association (VBCOA) (daniel.willham@fairfaxcounty.gov)

2018 International Building Code

Revise as follows:

310.2 Residential Group R-1. Residential Group R-1 occupancies containing *sleeping units* or more than two dwelling units where the occupants are primarily *transient* in nature, including:

- *Boarding houses (transient)* with more than 10 occupants
- *Congregate living facilities (transient)* with more than 10 occupants
- *Hotels (transient)*
- *Motels (transient)*

Reason:

There appears to be a gap in the code for hotels (transient) that provide dwelling units. As currently written, neither the R-1 nor the R-2 descriptions provide clear direction on the classification of hotels (transient) that provide dwelling units. The commentary clarifies that R-1 occupancies can contain either sleeping units, dwelling units, or both, but the code as written does not explicitly address transient residential occupancies that contain (more than two) dwelling units. The key characteristic of group R-1 occupancies is the transient nature of the occupants and not the absence of dwelling units. This proposal simply adds language for dwelling units that mirrors that used in the description of R-2 non-transient occupancies. With this clarification, the difference between R-1 and R-2 occupancies will be clearly defined to depend only on the transient or non-transient nature of the occupants, respectively. For reference, an excerpt from the IBC commentary (pg3-37) follows this change proposal.

living facilities are also classified as Group R. Specifically, these facilities are classified as Group R-4. Mainstreaming people who are recovering from alcohol or drug addiction and people who are developmentally disabled is reported to have therapeutic and social benefits. A residential environment often fosters this mainstreaming.

A building or part of a building is considered to be a residential occupancy if it is intended to be used for sleeping accommodations (including assisted living facilities) and is not an institutional occupancy. Institutional occupancies are similar to residential occupancies in many ways. However, they differ from each other in that institutional occupants are in a supervised environment, and, in the case of Groups I-2 and I-3 occupancies, are under some form of restraint or physical limitation that makes them incapable of complete self-preservation. The number of these occupants who are under supervision or are incapable of self-preservation is one distinguishing factor for being classified as an institutional or residential occupancy.

The term Group R refers collectively to the four individual residential occupancy classifications: Groups R-1, R-2, R-3 and R-4. These classifications are differentiated in the code based on the following criteria: 1. Whether the occupants are transient or nontransient in nature; 2. The type and number of dwelling units or sleeping units contained in a single building; and 3. The number of occupants in the facility.

310.2 Definitions. The following terms are defined in Chapter 2:

BOARDING HOUSE.
CONGREGATE LIVING FACILITIES.
DORMITORY.
GROUP HOME.
GUEST ROOM.
LODGING HOUSE.
PERSONAL CARE SERVICE.
TRANSIENT.

◆ This section lists terms that are specifically associated with the subject matter of this section. It is important to emphasize that these terms are not exclusively related to this section but may or may not also be applicable where the term is used elsewhere in the code.

Definitions of terms can help in the understanding and application of the code requirements. The purpose for including a list within this chapter is to provide more convenient access to terms which may have a specific or limited application within this chapter. For the complete definition and associated commentary, refer back to Chapter 2. Terms that are italicized provide a visual identification throughout the code that a definition exists for that term. The use and

application of all defined terms are set forth in Section 201.

310.3 Residential Group R-1. Residential Group R-1 occupancies containing sleeping units whose the occupants are primarily transient in nature, including:

Boarding houses (transient) with more than 10 occupants
Congregate living facilities (transient) with more than 10 occupants
Hotels (transient)
Motels (transient)

◆ The key characteristic of Group R-1 that differentiates it from other Group R occupancies is that the occupants are considered transient in nature (i.e., those whose length of stay is not more than 30 days). There is an expectation that the occupants are not as familiar with the building as those residents in nontransient facilities such as apartment buildings and single-family dwellings. If occupants are unfamiliar with their surroundings, they may not recognize potential hazards or be able to use the means of egress effectively.

The most common building types classified in Group R-1 are hotels, motels and boarding houses. Facilities classified as Group R-1 occupancies may include dwelling units, sleeping units, or a combination of both. Group R-1 occupancies do not typically have cooking facilities in the unit. When a unit is not equipped with cooking facilities, it does not meet the definition of a "dwelling unit" in Section 202. When this occurs, such units are treated as sleeping units for the application of code provisions (see Commentary Figure 310.3). A recent trend in development is the construction of "extended-stay hotels." While these units may have all of the characteristics of a typical dwelling unit (i.e., cooking, living, sleeping, eating, sanitation), the length of stay is still typically not more than 30 days. As such, these buildings would still be classified as Group R-1. If the length of stay is more than 30 days, these buildings would be classified as Group R-2. If a hotel offers rooms for short-term housing (i.e., more than 30 days), the facility must comply with the provisions for both Groups R-1 and R-2 (see Section 302.1).

Other occupancies are often found in buildings classified in Group R-1. These occupancies include nightclubs (Group A-2), restaurants (Group A-2), gift shops (Group M), business offices (Group B), health clubs (Group A-3) and storage facilities (Group S-1). When this occurs, the building is a mixed occupancy and is subject to the provisions of Section 508.

Transient congregate living facilities and boarding houses with 10 or fewer occupants can be constructed to the standards of Group R-3 occupancies rather than the general category of Group R-1. The primary intent of this provision is to permit bed-and-breakfast-type facilities to be established in existing single-family (one-family) structures. In comparison to the provision under Group R-2 which permits congregate living facilities with fewer than 16 nontransient

Bibliography:

2015 IBC Code and Commentary, Volume 1, International Code Council, 2015, pg. 3-37.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification which will not affect construction cost.

Internal ID: 1049

G22-18

IBC: 310.4.2

Proponent: Jeffrey Shapiro, representing IRC Fire Sprinkler Coalition (jeff.shapiro@intlcodeconsultants.com)

2018 International Building Code

Revise as follows:

310.4.1 Care facilities within a dwelling. Care facilities for five or fewer persons receiving care that are within a single-family dwelling are permitted to comply with the International Residential Code provided an *automatic sprinkler system* is installed in accordance with Section 903.3.1.3 or Section P2904 of the International Residential Code.

310.4.2 Lodging houses. Owner-occupied *lodging houses* with five or fewer *guest rooms* and 10 or fewer total occupants shall be permitted to be constructed in accordance with the International Residential Code provided an automatic sprinkler system is installed in accordance with Section 903.3.1.3 or Section P2904 of the International Residential Code.

Reason:

Correlation with the format of Section 310.5.1 (which is shown without change for reference) and IRC Section 101.2 Exception 2. Application of 310.5.1 and 310.5.2 with respect to the IRC reference is identical, and it makes not sense for one section to properly include the correlating text and the other to not include it. The allowance to skip the IBC and use the IRC for small lodging houses is only applicable where sprinklers are provided, and this change will clarify that you can't go to the IRC without including sprinklers.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Sprinklers are already required in these occupancies. The change will help to avoid misapplication of the codes and does not add a new mandate.

Internal ID: 2384

G23-18 Part I

IBC: 311.2, 311.3

Proponent: Jason Albers, representing Eden Prairie Fire Department (jalbers@edenprairie.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE GENERAL CODE DEVELOPMENT COMMITTEE. PART II WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows:

311.2 Moderate-hazard storage, Group S-1. Storage Group S-1 occupancies are buildings occupied for storage uses that are not classified as Group S-2, including, but not limited to, storage of the following:

Aerosol products, Levels 2 and 3

Aircraft repair hangar (~~storage and repair~~)

Bags: cloth, burlap and paper

Bamboos and rattan

Baskets

Belting: canvas and leather

Books and paper in rolls or packs

Boots and shoes

Buttons, including cloth covered, pearl or bone

Cardboard and cardboard boxes

Clothing, woolen wearing apparel

Cordage

Dry boat storage (indoor)

Furniture

Furs

Glues, mucilage, pastes and size

Grains

Horns and combs, other than celluloid

Leather

Linoleum

Lumber

Motor vehicle repair garages complying with the maximum allowable quantities of hazardous materials listed in Table 307.1(1) (see Section 406.8)

Photo engravings

Resilient flooring

Self-service storage facility (mini-storage)

Silks

Soaps

Sugar

Tires, bulk storage of

Tobacco, cigars, cigarettes and snuff

Upholstery and mattresses

Wax candles

311.3 Low-hazard storage, Group S-2. Storage Group S-2 occupancies include, among others, buildings used for

the storage of noncombustible materials such as products on wood pallets or in paper cartons with or without single thickness divisions; or in paper wrappings. Such products are permitted to have a negligible amount of plastic *trim*, such as knobs, handles or film wrapping. Group S-2 storage uses shall include, but not be limited to, storage of the following:

- Aircraft hangar fixed base operator (FBO)
- Asbestos
- Beverages up to and including 16-percent alcohol in metal, glass or ceramic containers
- Cement in bags
- Chalk and crayons
- Dairy products in nonwaxed coated paper containers
- Dry cell batteries
- Electrical coils
- Electrical motors
- Empty cans
- Food products
- Foods in noncombustible containers
- Fresh fruits and vegetables in nonplastic trays or containers
- Frozen foods
- Glass
- Glass bottles, empty or filled with noncombustible liquids
- Gypsum board
- Inert pigments
- Ivory
- Meats
- Metal cabinets
- Metal desks with plastic tops and *trim*
- Metal parts
- Metals
- Mirrors
- Oil-filled and other types of distribution transformers
- Parking garages, open or enclosed
- Porcelain and pottery
- Stoves
- Talc and soapstones
- Washers and dryers

G23-18 Part II

IFC: 914.8.3; IBC: [F] 412.3.6

Proponent: Jason Albers, representing Eden Prairie Fire Department (jalbers@edenprairie.org)

2018 International Fire Code

914.8.3 Fire suppression for aircraft hangars. Aircraft hangars shall be provided with a fire suppression system designed in accordance with NFPA 409, based on the classification for the hangar given in Table 914.8.3.

~~**Exception:** Where a fixed base operator has separate repair facilities on site, Group II hangars operated by a fixed base operator used for storage of transient aircraft only shall have a fire suppression system, but the system shall be exempt from foam requirements. Group II hangars as defined in NFPA 409 storing private aircraft without major maintenance or overhaul are exempt from foam suppression requirements.~~

2018 International Building Code

Revise as follows:

[F] 412.3.6 Fire suppression. Aircraft hangars shall be provided with a fire suppression system designed in accordance with NFPA 409, based on the classification for the hangar given in Table 412.3.6.

~~**Exception:** fixed base operator has separate repair facilities on site, Group II hangars operated by a fixed base operator used for storage of transient aircraft only shall have a fire suppression system, but the system is exempt from foam requirements. Group II hangars as defined in NFPA 409 storing private aircraft without major maintenance or overhaul are exempt from foam suppression requirements.~~

Reason:

If you follow the history of how we got to where we are today from the introduction of high expansion foam in airplane hangars, you will see that the original intent was to suppress fire under aircraft with expansive wing spans that would otherwise shelter the fire from overhead sprinkler heads. In 2009 there were two changes to the International fire code that directly impacted small municipal airports and the ability to build group II hangars without foam suppression.

A group II hangar as defined by NFPA 409 states the aircraft access door shall be 28 ft. or less and a single fire area between 20,000-40,000 square feet. 914.8.3 Made fixed base operators (FBO) in group II hangars require foam systems and made it exempt for hangars with transient aircraft. Prior to 2009 the language found in these sections allowed for group II hangars with fixed based operators to be exempt from foam requirements.

The occupancy classification also changed in 2009 putting all aircraft into the S-1 category. Prior to 2009 there were two separate classifications S-1 was for aircraft repair hangars and S-2 was all other aircraft hangars. It should be noted that automobile parking garages (open and closed) has remained an S-2 and did not change in 2009. The argument for changing the fixed base operator S-2 to an S-1 is due to the fuel stored in the wings of the aircraft. For comparison the auto ignition temperature of gasoline is 475 F and Jet fuel is 410 F making the fuels of concern very similar in nature, yet enclosed parking garages are protected by wet/dry fire sprinkler systems even though the fuel capacity at many parking garages far exceeds what is stored in the wings of an airplane.

Research:

Research on this subject was difficult to obtain, with that being said I could locate very little research that would have been sufficient to support change to the wording in 2009 either. Most of the research I was able to locate was over a decade old and conducted primarily by the Navy and Air Force. According to a study called Aircraft Hangar Fire Suppression Design Study by Scheffey and Wakelin (June 16, 2000) "All DoD service branches have been plagued with false activations involving foam-water deluge sprinkler systems over aircraft with open cockpits. These false activations have been caused by numerous sources including: lightning strikes which introduced transient voltage spikes into the fire alarm system; water hammers in aging underground water distribution systems; accidental releases by maintenance personnel; deliberate acts of vandalism; accidental activation of manual pull stations; failure of pressure relief valves at pumping stations; roof water leakage into overhead heat detection systems and, false activation of fire detection systems. This prompted all branches of DoD to pursue alternative fire protection designs, which would provide the desired level of protection." Furthermore the study continues to explore the cost of installing, operating, re-charging and maintaining these expensive systems.

Both the Air Force and Navy are looking for ways to remove or improve high-expansion foam in their hangars. The two services (Air Force, Navy) with highest potential for dollar loss are looking for ways to remove foam systems, yet the fire code is forcing privately owned hangars to comply with an un-necessary suppression system.

Bibliography:

Aircraft Hangar Fire Suppression Design Study Scheffey and Wakelin 2000

High Cost of Hangar System Discharge Johnson 2014 <http://thecodecoach.blogspot.com/2014/11/high-cost-of-hangar-system-discharge.html>

Cost Impact

The code change proposal will decrease the cost of construction .

Who would be impacted?

The groups that are affected by the current requirement of foam systems and the groups that will be affected if the language is changed, is significant. First, keeping foam systems as they are currently required in the IFC has a substantial impact on fixed base operators from a financial perspective as well as the employees from a safety perspective. Financially, the installation of high-expansion foam has a substantial cost, exceeding \$250,000 in many cases for the initial design and installation. I have recently been personally involved with the plan review and installation of a foam system with wet sprinklers and the cost exceeded \$400,000. The continued annual maintenance and inspections of these systems also has a substantial financial burden. The highest financial burden comes from lost business or inability to use airplanes that were affected by a discharge. Any plane that is exposed to a discharge can take up to six months to get flying again and many of the systems need to be replaced. (Johnson 11/5/14 <http://thecodecoach.blogspot.com/2014/11/high-cost-of-hangar-system-discharge.html>) Furthermore, in at least one case an employee of an FBO has died in an accidental discharge event of high-expansion foam. From the standpoint of the local municipality who has this type of hangar in their jurisdiction, there becomes a new topic that has to be trained on. This added training will add costs to the training budgets as well as additional inspections from the AHJ. In turn this becomes an additional cost to the FBO as well as the local fire department.

Internal ID: 3490

G24-18

IBC: 311.3

Proponent: Lawrence Cousin, representing Self

2018 International Building Code

Revise as follows:

311.3 Low-hazard storage, Group S-2. Storage Group S-2 occupancies include, among others, buildings used for the storage of noncombustible materials such as products on wood pallets or in paper cartons with or without single thickness divisions; or in paper wrappings. Such products are permitted to have a negligible amount of plastic *trim*, such as knobs, handles or film wrapping. Group S-2 storage uses shall include, but not be limited to, storage of the following:

- Asbestos
- Beverages up to and including 16-percent alcohol in metal, glass or ceramic containers
- Cement in bags
- Chalk and crayons
- Dairy products in nonwaxed coated paper containers
- Dry cell batteries
- Electrical coils
- Electrical motors
- Electrical room
- Empty cans
- Food products
- Foods in noncombustible containers
- Fresh fruits and vegetables in nonplastic trays or containers
- Frozen foods
- Glass
- Glass bottles, empty or filled with noncombustible liquids
- Gypsum board
- Inert pigments
- Ivory
- Meats
- Mechanical room
- Metal cabinets
- Metal desks with plastic tops and *trim*
- Metal parts
- Metals
- Mirrors
- Oil-filled and other types of distribution transformers
- Parking garages, open or enclosed
- Porcelain and pottery
- Stoves
- Talc and soapstones
- Washers and dryers

Reason:

This will ease the use of Tables in which Mechanical/Electrical room needs to be classified as Low-hazard storage (S-2) and benefit from the relief afforded by the code. A case in point is trying to increase the egress distance from Mechanical room to outside of a school building. The distance is restricted, but became generous when the Mechanical/Electrical room is interpreted as housing storage (S-2) materials.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

By adding a mechanical room and electrical room to S-2 occupancy it does not change how the room is constructed. The code still has requirements for how the room is constructed based on size or amps of equipment.

2018 International Building Code

Revise as follows:

312.1 General. Buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy. Group U shall include, but not be limited to, the following:

- Agricultural buildings
- Aircraft hangars, accessory to a one- or two-family residence (see Section 412.4)
- Barns
- Carports
- Communication equipment structures with a *gross floor area* of less than 1,500 square feet (139 m²)
- Fences more than ~~6-7~~ feet (~~1829-2134~~ mm) in height
- Grain silos, accessory to a residential occupancy
- Livestock shelters
- Private garages
- Retaining walls
- Sheds
- Stables
- Tanks
- Towers

Reason:

IBC Section 105.2 indicates that fences not over 7 feet in height are exempt from permits. IBC Section 312.1 indicates that fences more than 6 feet in height are to be considered as a Group U occupancy, therefore subject to current code requirements. It seems these two code sections should be consistent. The code requirements for a Group U occupancy cannot be enforced upon a 6 foot tall fence where fences not more than 7 feet in height are exempt.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No perceived impact to construction cost.

Internal ID: 2026

G26-18

IBC: [F] 402.7.2

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

SECTION 402 COVERED MALL AND OPEN MALL BUILDINGS

Revise as follows:

[F] 402.7 Emergency systems. *Covered and open mall buildings, anchor buildings and associated parking garages shall be provided with emergency systems complying with Sections 402.7.1 through 402.7.5.*

[F] 402.7.2 Smoke control. ~~Where a covered mall building contains an atrium, Atriums connecting three or more stories in covered mall buildings shall be provided with a smoke control system shall be provided in accordance with Section 909.404.5~~

~~**Exception:** A smoke control system is not required in covered mall buildings where an atrium connects only two stories.~~

Reason:

This proposal simply makes a more direct reference to the need for a smoke control system instead of sending the reader to Section 404.5 and through the exception. The technical requirements do not change. Smoke control is only required where an atrium connects 3 or more stories whether associated with a covered mall or other type of building.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply makes the provisions more direct as to when smoke control would be required in a covered mall building.

Internal ID: 185

G27-18

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Delete without substitution:

~~**403.2.2 Seismic considerations.** For seismic considerations, see Chapter 16.~~

Reason:

This proposal deletes the existing pointer to Chapter 16 for seismic considerations. The existing pointer was useful when Chapter 16 substantially copied seismic design requirements from ASCE 7, including direction on which seismic design methods were applicable to high-rise buildings and limitations on lateral force-resisting systems for buildings of certain heights in certain seismic design categories. All of that information with the exception of the basic information needed for a building official to verify the seismic ground motions and seismic design category has been removed from Chapter 16 and replaced with references to ASCE 7. Thus, the pointer is no longer needed.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

This is an editorial clarification and will therefore not increase or decrease the cost of construction.

Internal ID: 171

G28-18

IBC: [F] 403.3.2; IFC: 914.3.1.2

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE PROPOSAL WILL BE HEARD BY THE IFC COMMITTEE. PLEASE CONSULT THE AGENDA FOR THE IFC COMMITTEE.

2018 International Building Code

Revise as follows:

[F] 403.3.2 Water supply to required fire pumps. In all buildings that are more than 420 feet (128 m) in building height, and buildings of Type IVA and IVB construction that are more than 120 feet in building height, required fire pumps shall be supplied by connections to not fewer than two water mains located in different streets. Separate supply piping shall be provided between each connection to the water main and the pumps. Each connection and the supply piping between the connection and the pumps shall be sized to supply the flow and pressure required for the pumps to operate.

Exception: Two connections to the same main shall be permitted provided that the main is valved such that an interruption can be isolated so that the water supply will continue without interruption through not fewer than one of the connections.

2018 International Fire Code

914.3.1.2 Water supply to required fire pumps. In all buildings that are more than 420 feet (128 m) in building height, and buildings of Type IVA and IVB construction that are more than 120 feet in building height, required fire pumps shall be supplied by connections to not fewer than two water mains located in different streets. Separate supply piping shall be provided between each connection to the water main and the pumps. Each connection and the supply piping between the connection and the pumps shall be sized to supply the flow and pressure required for the pumps to operate.

Exception: Two connections to the same main shall be permitted provided that the main is valved such that an interruption can be isolated so that the water supply will continue without interruption through not fewer than one of the connections.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The Ad Hoc Committee has discussed a number of proposals to potentially increase the permitted height and area for Type IV structures, specifically mass timber buildings adding additional Types IVA, IVB & IVC. One of the basic requirements incorporated into these proposed increased heights and areas is the added active and passive protection features to these structures.

The Code Technology Committee, in response to the events of September 11, 2001, submitted proposals for water supply to super high-rise buildings of 420' and higher. This requirement was adopted due to the recognized importance of insuring a continuous water supply to the active fire protection systems in the event of a fire in these structures. This recommendation was highlighted in the National Institute of Standards and Technology's (NIST) report on the structural collapses on September 11th.

This code change proposal brings this same concept to Type IV structures of 120' and higher. This added protection feature would be unique to Type IVA and IVB construction (as proposed in a related code change - see table below) due to the potential contribution of the mass timber to the fuel load in the event of a fire. Due to the limitations of fire service aerial apparatus' ability to apply water to elevated floors the Ad Hoc Committee felt 120' was an appropriate height to initiate the requirement. Another consideration is that currently the code permits structures up to 85' so the committee identified the next level within the codes for additional requirements. Considerations were also given to the difficulty of fire service companies accessing elevated floors under fire conditions.

The Ad Hoc Committee has proposed greater permitted heights and areas of mass timber construction than those contained in the 2018 IBC. The Ad Hoc believes this code change proposal is an important component to these proposed increased heights and areas. If the permitted heights and areas of mass timber construction are raised it is imperative we adopt related code change proposals to insure the reliable performance of active and passive protection features to insure the safety of occupants and responding fire fighters.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no requirement or change in technical criteria for construction.

Internal ID: 457

G30-18

IBC: 404.1

Proponent: Sarah Rice, The Preview Group, representing Myself (srice@preview-group.com)

2018 International Building Code

Revise as follows:

404.1 General. In other than Group H occupancies, ~~and where permitted by Section 712.1.7~~, the provisions of Sections 404.1 through 404.10 shall apply to buildings or structures containing vertical openings defined as "Atriums."

Exception: Vertical openings that comply with Sections 712.1.1 through 712.1.3, and Sections 712.1.9 through 712.1.14.

Reason:

Regardless of the number of changes that people make to Section 404 (Atriums) and Section 712 (Vertical Openings), and the countless words the IBC Commentary uses to help the code user, numerous people still do not fully comprehend that the provisions found in Section 404 are NOT the only way allowed to protect a 2-story large "hole" in a floor/ceiling assembly in a building that only has 2 stories, i.e., a hole intended to allow daylight to move to another story.

In the IBC the construction of a floor/ceiling assembly is regulated by Section 711 (Floor and Roof Assemblies). And though not defined, in the IBC any "hole" in a floor ceiling assembly is considered to be a "vertical opening." Sorry to give a mini-seminar but it seems like people don't know that Section 711 specifically tells the code user that regardless of whether or not a floor/ceiling assembly has a fire rating, the continuity rule says "Assemblies shall be continuous without vertical openings, except as permitted by this section and Section 712.

Section 712 (Vertical Openings) contains 16 means by which "holes" in floors can be addressed. For a large "hole" in a floor/ceiling assembly that is intended to allow daylight to move to another story, Section 712 really offers only 2 options:

712.1.7 – Atriums (Section 404)

712.1.9 – Two-story openings

Even a new code user knows that if a word or term is italicized then there is a definition of the term in Chapter 2. And in reading Section 712.1.7 they will see that the term "atrium" is italicized. So off to Chapter 2 they go where they find the following definition – "**ATRIUM.** An opening connecting two or more stories other than enclosed stairways, elevators, hoistways, escalators, plumbing, electrical, air-conditioning or other equipment, which is closed at the top and not defined as a mall. Stories, as used in this definition, do not include balconies within assembly groups or mezzanines that comply with Section 505."

The "hole" outlined above meets the definition of "atrium" so hey, they are done – they know that it must be protected as outlined in Section 404. They NEVER got to the 2nd option in 712.1.9.

Several cycles ago, the 1st sentence in Section 404.1 was added to tell the code user that they only should have gotten to Section 404 through the use of Section 712.1.1, but based upon the number of questions I receive as a code consultant to architects, engineers, designers, owners, developers and even code official each year on this topic – this pointer has not worked.

Through the elimination of the pointer to Section 712.1.7 and the addition of the exception, this code change is intended to make it clear that not all 2-story vertical openings must comply with Section 404, but that the design option found in 712.1.9 IS ALWAYS another option.

Cost Impact

The code change proposal will increase the cost of construction .

If accepted the cost of construction may be decreased as not all of the provisions for an atrium will have to be included.

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows:

404.1 General. ~~In other than Group H occupancies, and where permitted by Section 712.1.7, the~~ The provisions of Sections 404.1 through 404.10 shall apply to buildings containing atriums. Atriums are not permitted in buildings or structures containing vertical openings defined as "Atriums."classified as Group H.

404.9 Exit access travel distance. *Exit access* travel distance for areas open to an *atrium* shall comply with the requirements of ~~this section.~~Section 1017.

Delete without substitution:

~~**404.9.1 Egress not through the atrium.** Where required access to the exits is not through the *atrium*, *exit access* travel distance shall comply with Section 1017.~~

~~**404.9.2 Exit access travel distance at the level of exit discharge.** Where the path of egress travel is through an *atrium* space, *exit access* travel distance at the *level of exit discharge* shall be determined in accordance with Section 1017.~~

~~**404.9.3 Exit access travel distance at other than the level of exit discharge.** Where the path of egress travel is not at the *level of exit discharge* from the *atrium*, that portion of the total permitted *exit access* travel distance that occurs within the *atrium* shall be not greater than 200 feet (60 960 mm).~~

Revise as follows:

404.10 Interior exit stairways. ~~Not greater than 50 percent~~ Discharge of *interior exit stairways* are permitted to egress through an atrium ~~on the *level of exit discharge* shall be~~ in accordance with Section 1028.

712.1.7 Atriums. ~~In other than Group H occupancies, atriums complying with Section 404 shall be permitted.~~ Atriums in buildings shall comply with Section 404.

**TABLE 1017.2
EXIT ACCESS TRAVEL DISTANCE^a**

OCCUPANCY	WITHOUT SPRINKLER SYSTEM (feet)	WITH SPRINKLER SYSTEM (feet)
A, E, F-1, M, R, S-1	200 ^e	250 ^b
I-1	Not Permitted	250 ^b
B	200	300 ^c
F-2, S-2, U	300	400 ^c
H-1	Not Permitted	75 ^d
H-2	Not Permitted	100 ^d
H-3	Not Permitted	150 ^d
H-4	Not Permitted	175 ^d
H-5	Not Permitted	200 ^c
I-2, I-3	Not Permitted	200 ^c
I-4	150	200 ^c

For SI: 1 foot = 304.8 mm.

- a. See the following sections for modifications to *exit access* travel distance requirements:

Section 402.8: For the distance limitation in malls.

~~Section 404.9: For the distance limitation through an atrium space.~~

Section 407.4: For the distance limitation in Group I-2.

Sections 408.6.1 and 408.8.1: For the distance limitations in Group I-3.

Section 411.3: For the distance limitation in special amusement buildings.

Section 412.6: For the distance limitations in aircraft manufacturing facilities.

Section 1006.2.2.2: For the distance limitation in refrigeration machinery rooms.

Section 1006.2.2.3: For the distance limitation in refrigerated rooms and spaces.

Section 1006.3.3: For buildings with one exit.

Section 1017.2.2: For increased distance limitation in Groups F-1 and S-1.

Section 1029.7: For increased limitation in assembly seating.

Section 3103.4: For temporary structures.

Section 3104.9: For pedestrian walkways.

- b. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.
- c. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
- d. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.1.
- e. Group R-3 and R-4 buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.

1017.3 Measurement. *Exit access* travel distance shall be measured from the most remote point of each room, area or space along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit.

Exception: In open parking garages, *exit access* travel distance is permitted to be measured to the closest riser of an *exit access stairway* or the closest slope of an *exit access ramp*.

1017.3.1 Exit access stairways and ramps. Travel distance on *exit access stairways* or *ramps* shall be included in the *exit access* travel distance measurement. The measurement along *stairways* shall be made on a plane parallel and tangent to the *stair tread nosings* in the center of the *stair* and landings. The measurement along *ramps* shall be made on the walking surface in the center of the *ramp* and landings.

Add new text as follows:

1017.3.2 Atriums. Exit access travel distance for areas open to an atrium shall comply with the requirements of this section.

1017.3.2.1 Egress not through the atrium. Where required access to the exits is not through the atrium, exit access travel distance shall comply with Section 1017.2.

1017.3.2.2 Exit access travel distance at the level of exit discharge. Where the path of egress travel is through an atrium space, exit access travel distance at the level of exit discharge shall be determined in accordance with Section 1017.2.

1017.3.2.3 Exit access travel distance at other than the level exit discharge. Where the path of egress travel is not at the level of exit discharge from the atrium, that portion of the total permitted exit access travel distance that occurs within the atrium shall be not greater than 200 feet (60 960 mm).

Revise as follows:

1028.1 General. Exits shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required exits.

Exceptions:

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including atriums, on the level of discharge provided that all of the following conditions are met:
 - 1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
 - 1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
 - 1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
 - 1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
 - 2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.
 - 2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
 - 2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708.

Exception: The maximum transmitted temperature rise is not required.

 - 2.4. The area is used only for *means of egress* and exits directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

Reason:

The purpose of this proposal is to relocate portions of the Section 404 atrium requirements to other appropriate portions of the IBC. As defined in Chapter 2, an atrium is a particular type of a vertical opening in a building or structure, but not the only method permitted by Chapter 7 for dealing with a vertical opening. A proposal last cycle (G51-15) attempted to relocate the entire Section 404 provisions into Section 712. While the proposal was disapproved by a vote of 8-6, there was support expressed for considering a relocation of these provisions if clarifications to the existing text were provided and at least a minimum set of provisions be retained in Chapter 4 as a starting point for addressing requirements specific to certain building features. This proposal retains Section 404 but makes some targeted relocations. In all cases, pointers are left in Section 404 so the link is not totally lost and code users still have Section 404 as a guide to all of the considerations for atriums. Requirements relative to exit access travel distance and interior exit stair discharge are also moved to Section 1017 and Section 1028 respectively. While these provisions perhaps appear specific to atriums, they are not entirely self-contained and clearly need to be evaluated as part of the general travel distance and exit discharge requirements for the building. For exit access travel distance, the

atrium-specific provisions are added under the exiting Section 1017.3 on measurement of exit access travel distance. For exit discharge, a reference to atriums is added under Exception #1 of Section 1028.1. Finally, the charging language is clarified. A circular reference between Section 404 and Section 712.1 is removed. The existing language, especially in Section 404, also makes it vague as to whether an atrium is allowed in a Group H building or structure, versus another method of treating a vertical opening. The implication (especially in Section 712.1) is that such an atrium is not permitted. The charging language in both sections is revised accordingly. In addition, an exception is added permitting a vertical opening meeting the definition of an atrium to be constructed in accordance with any of the other methods for treating a vertical opening (e.g. a shaft enclosure per Section 712.1.1 or a generic two-story opening per Section 712.1.9).

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction. This is an editorial reorganization to place requirements in a more appropriate location.

Internal ID: 174

G32-18

IBC: 404.5

Proponent: Sarah Rice, representing Myself (srice@preview-group.com)

2018 International Building Code

Revise as follows:

404.5 Smoke control. A smoke control system shall be installed in accordance with Section 909.

Exception-Exceptions:

1. In other than Group I-2, and Group I-1, Condition 2, smoke control is not required for *atriums* that connect only two stories.
2. A smoke control system is not required for atriums connecting more than two stories when all of the following are met:
 - 2.1. Only the 2 lowest stories shall be permitted to be open to the atrium.
 - 2.2. All stories above the lowest 2 stories shall be separated from the atrium in accordance with Section 404.6.

Reason:

As stated in Section 909, the purpose of a smoke control systems is to provide a tenable environment for the evacuation or relocation of occupants. A smoke control system is NOT intended for the preservation of contents, the timely restoration of operations or for assistance in fire suppression or overhaul activities. Smoke control systems that are required and regulated by the IBC serve a different purpose than the smoke- and heat-venting provisions found in Section 910 and they are not considered exhaust systems under Chapter 5 of the International Mechanical Code.

In an atrium that connects more than 2 stories, the smoke control systems is intended to maintained the height of the lowest horizontal surface of the smoke layer interface to at least 6 feet above any walking surface that forms a portion of a required egress system within the smoke zone for a period of not less than either 20 minutes or 1.5 times the calculated egress time, whichever is less.

But what if the only walking surfaces in the atrium are on the 2 lowest stories of the atrium? What if all the walls above the 2 lowest stories are solid without operable openings? What purpose does the smoke control system then serve? We contend none. And if the smoke control system has no real value, then why install it? See Figures 1 - 3 for examples of these spaces.

This proposed change seeks to exempt atriums that connect more than 2 stories from having to have a smoke control system when 1) there are no walking surfaces in the atrium above the 2 lowest stories and 2) there are no operable windows or doors above the 2 lowest stories in the atrium and 3) the walls of the atrium on the upper levels are constructed per Section 404.6 - atrium enclosures..

Cost Impact

The code change proposal will decrease the cost of construction .

The cost savings of not providing smoke control system in a building with an atrium will decrease the cost of construction.

Internal ID: 2381

G33-18

IBC: 404.6

Proponent: Raymond Grill, representing Self (ray.grill@arup.com)

2018 International Building Code

Revise as follows:

404.6 Enclosure of atriums. *Atrium* spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both.

Exceptions:

1. A *fire barrier* is not required where a glass wall forming a smoke partition is provided. The glass wall shall comply with all of the following:
 - 1.1. Automatic sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction;
 - 1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and
 - 1.3. Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $\frac{3}{4}$ -hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of up to three floors of the *atrium* provided that such spaces are accounted for in the design of the smoke control system.
4. A fire barrier is not required between the atrium and the adjoining spaces where the atrium is not required to be provided with a smoke control system.
5. A horizontal assembly is not required between the atrium and openings for escalators complying with Section 712.1.3.
6. A horizontal assembly is not required between the atrium and openings for exit access stairways and ramps complying with 1019.3.4.

Reason:

Floor openings for escalators and exit access stairways and ramps meeting the sections identified in the proposal are protected. The protection consists of draft curtains around the floor opening and additional sprinklers. The size of the floor opening is also limited. The provision of the draft curtain and sprinklers limit the potential of smoke spread through the opening and that communicate via these types of openings should not be considered to be part of the atrium.

Cost Impact

The code change proposal will decrease the cost of construction .

If levels that are connected via protected escalator or access stairway or ramp openings are considered part of the atrium, there are potentially significant costs associated with providing smoke control for those levels.

IBC: 202, (New), 404.6, 716.4 (New), 716.4.1 (New), 716.4.2 (New), 716.4.3 (New), Chapter 35

Proponent: Tessa Quinones, The Hickman Group, representing Smoke Guard (admin@thehickmangroup.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

SECTION 202 DEFINITIONS

FIRE PROTECTIVE CURTAIN ASSEMBLY. An assembly consisting of a fabric curtain, bottom bar, guides, coil, operating, and closing system.

404.6 Enclosure of atriums. *Atrium* spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both.

Exceptions:

1. A *fire barrier* is not required where a glass wall forming a smoke partition or a 20-minute fire protective curtain assembly is provided. The glass wall or fire protective curtain assembly shall comply with all of the following:
 - 1.1. Automatic sprinklers are provided along both sides of the separation wall, fire protective curtain assembly and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass or fire protective curtain assembly not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass or fire protective curtain assembly is wet upon activation of the sprinkler system without obstruction;
 - 1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and
 - 1.3. The fire protective curtain assembly shall be installed in accordance with Section 716.4 and shall be actuated in conjunction with the atrium smoke control system, and
 - ~~1.3.1.4.~~ Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $\frac{3}{4}$ -hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of up to three floors of the *atrium* provided that such spaces are accounted for in the design of the smoke control system.
4. A fire barrier is not required between the atrium and the adjoining spaces where the atrium is not required to be provided with a smoke control system.

Add new text as follows:

716.4 Fire protective curtain assembly. Approved fire protective curtain assemblies shall be constructed of any materials or assembly of component materials tested without hose stream in accordance with UL 10D, and shall comply with the Sections 716.4.1 through 716.4.3

716.4.1 Label. Fire protective curtain assemblies used as opening protectives in fire rated walls and smoke partitions shall be labeled in accordance with Section 716.2.9.

716.4.2 Smoke and draft control. Fire protective curtain assemblies used to protect openings where smoke and draft control assemblies are required shall comply with Section 716.2.1.4.

716.4.3 Installation. Fire protective curtain assemblies shall be installed in accordance with NFPA 80.

Add new standard(s) follows:

10D-14:

Standard for Fire Tests of Fire Protective Curtain Assemblies

Reason:

During the last cycle, FS 102-15 was disapproved at least in part on the proposed use of fabric fire protective curtain assemblies as an opening protective having a one-hour fire protection rating and to replace one hour fire barriers. This proposal allows the use of a 20-minute fire protective curtain assembly as an alternative to a non-rated glass wall when protected with sprinklers for the enclosure of an atrium. In addition, the proposal allows fire protective curtain assemblies as an opening protective as permitted by other sections of the IBC.

Both of these applications are consistent with the scope of UL 10D which reads:

These requirements cover the evaluation of fire protective curtain assemblies intended to provide supplemental passive fire protection as part of an engineered fire protection system. Fire protective curtain assemblies provide nonstructural separation only, and are not intended to be substituted for structural hourly rated partitions or opening protectives that have been tested for fire endurance and hose stream performance.

The proposed definition and uses are consistent with NFPA 80-2016 and UL 10D. Some products can also pass UL 1784 for an "S" label.

The proposed requirement that the assembly be "approved" in addition to "listed" allows the Code Official to specifically approve the proposed application.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The use of the fire protective curtain assembly is an option and as such, atria enclosures can continue to be constructed as currently permitted.

Analysis: A review of the standard proposed for inclusion in the code, UL 10D-14, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 2015

G35-18

IBC: 404.10.1 (New)

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new text as follows:

404.10.1 Exit stairs in an atrium. Where an atrium contains an interior exit stairway all the following shall be met:

1. The exit stair shall have access from a minimum of two directions.
2. The distance between an exit stair in an atrium, and a minimum of one exit stair enclosed in accordance with Section 1023.2 shall comply with Section 1007.1.1.
3. Exit access travel distance within the atrium shall be measured to the nosing of the landing at the top of the stair on each level served.
4. At least one exit shall not be located in the same atrium.

Reason:

An exit stair is currently permitted to be in an atrium enclosure by IBC Sections 2023.1 and 1023.2, which allows enclosure per Section 404.6. These new provisions for the conditions for use of an atrium for an exit stair adds four specific criteria for their use as an exit.

Provision 1 - Accessed from two directions

This means that the exit stair in the atrium must have two paths of travel to allow the occupants to pass by the stair.

Provision 2 - Separation distance

To make it clear that the exit stair in the atrium must be separated from at least one other exit stair meeting IBC Section 1023.2 by the minimum separation distance prescribed in Section 1007.1.1.

Provision 3 - Travel distance

The travel distance within the atrium to the exit stair in the atrium is to be measured to the nosing at the level the stair is serving.

Provision 4 - At least one exit is not in the atrium.

Requires that at least one exit is not permitted to be in the same atrium. The current provisions of Section 404.10 prohibit more than 50% of exit stairs from egressing through the atrium at the level of exit discharge.

Cost Impact

The code change proposal will decrease the cost of construction .

This change will facilitate design decisions, reduce the number of required exit enclosures in buildings with an atrium and help with review and approval, reducing the cost of construction.

Internal ID: 1694

G36-18

IBC: 406.2.4

Proponent: Stephen Skalko, representing Stephen V. Skalko, P.E. & Associates, LLC (svskalko@svskalko-pe.com); Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org); William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Jason Krohn, representing Precast/Prestressed Concrete Institute (jkrohn@pci.org)

2018 International Building Code

406.2.4 Floor surfaces. Floor surfaces shall be of concrete or similar approved noncombustible and nonabsorbent materials. The area of floor used for the parking of automobiles or other vehicles shall be sloped to facilitate the movement of liquids to a drain or toward the main vehicle entry doorway. The surface of vehicle fueling pads in motor fuel-dispensing facilities shall be in accordance with Section 406.7.1.

Exceptions:

1. Asphalt parking surfaces shall be permitted at ground level for public parking garages and private carports.
- ~~2. Floors of Group S-2 parking garages shall not be required to have a sloped surface.~~
- 3.2. Slip-resistant, nonabsorbent, interior floor finishes having a critical radiant flux not more than 0.45 W/cm², as determined by ASTM E648 or NFPA 253, shall be permitted in repair garages.

Reason:

The charging language in Section 406.1 specifies that all motor-vehicle-related occupancies, which includes open parking garages in accordance with 406.5 and enclosed parking garages in accordance with 406.6. Further, Section 406.2.4 requires floors in motor-vehicle-related occupancies to be of concrete or similar noncombustible and nonabsorbent materials, and be provided with a slope. However, Exception No. 2 to Section 406.2.4 creates confusion for the user because it exempts Group S-2 parking garages from the sloped floor provision. Per Section 311.3 open and enclosed parking garages are an S-2 occupancy group. By exempting Group S-2 parking garages from the sloped floor provisions Exception No. 2 renders the second sentence in the subsection meaningless. In addition, exempting parking garages from the sloped floor provisions is detrimental to the structure.

Exception No. 2 was introduced into the code with code change G78-06/07. The reason given was “Many larger parking structures are constructed with prefabricated materials that are difficult if not impossible to design to slope all surfaces”. This reason statement made no reference to studies or other technical information to indicate providing sloped floors in large parking structures of prefabricated materials is problematic. In fact, in the precast concrete industry, which represents the largest segment of the prefabricated materials industry used for parking garages, sloped floors are an essential part of the design of these types of structures to insure proper durability.

In Section 3.2 of Precast Prestressed Concrete Parking Structures: Recommended Practice for Design & Construction [1] poor drainage is listed as one of the major factors detrimental to a durable parking structure. Frequently vehicles can transport deleterious materials such as oils and deicing salts into the parking structures from the streets. Sloped floors provide a means to allow these materials to be removed from the deck surface by the vertical drainage systems. This reduces the likelihood that these deleterious materials will cause damage to the concrete wearing surface and the reinforcement within. Section 3.4.2 of the Recommended Practice is devoted to providing design guidance and construction techniques with sloped floors to achieve proper drainage in support of this durable design goal.

Section 6.2 of ACI 362.1R, Guide for the Design and Construction of Durable Concrete Parking Structures [2] also recommends that sloped floors be provided for parking structures to improve durability. This Guide suggests this is especially important since ponding water can result in increased deposits of chlorides in the concrete, which can be detrimental to the long term structural integrity of the structure.

Exception No. 2 should be deleted from Section 406.2.4 to eliminate the confusion in this section and preserve the durability of parking structures.

Bibliography:

[1] Precast Prestressed Concrete Parking Structures: Recommended Practice for Design & Construction, 3rd edition, 2015, Precast Prestressed Concrete Institute, Publication MNL-129-15, www.pci.org last visited December 2015

[2] ACI 362.1R-12 Guide for the Design and Construction of Durable Concrete Parking Structures, 2012 American Concrete Institute, Farmington Hills, MI 48331

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Deletion of the exception will not have an adverse impact on cost because common design and construction practice for parking garages already includes sloped floors in the design for durability.

Internal ID: 1540

G37-18

IBC: TABLE 406.5.4

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Stephen V. Skalko, P.E. & Associates, LLC (svskalko@svskalko-pe.com); Jason Krohn, representing Precast/Prestressed Concrete Institute (jkrohn@pci.org); William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org)

2018 International Building Code

Revise as follows:

**TABLE 406.5.4
OPEN PARKING GARAGES AREA AND HEIGHT**

TYPE OF CONSTRUCTION	AREA PER TIER (square feet)	HEIGHT (in tiers)		
		Ramp access	Mechanical access	
			Automatic sprinkler system	
			No	Yes
IA	Unlimited	Unlimited	Unlimited	Unlimited
IB	Unlimited	12 tiers	12 tiers	18 tiers
IIA	50,000 <u>75,000</u>	10 tiers	10 tiers	15 tiers
IIB	50,000	8 tiers	8 tiers	12 tiers
IV	50,000	4 tiers	4 tiers	4 tiers

For SI: 1 square foot = 0.0929 m².

Reason:

When the International Building Code (IBC) the drafting committees were developing the IBC, they commonly used the least stringent fire safety provisions from one of the legacy codes (i.e. BOCA National Building Code, Standard Building Code, Uniform Building Code) in establishing the requirements. However, for open parking garages the least stringent values in the Standard Building Code (SBC) were not used. The SBC permitted open parking structures of non-combustible construction with less fire resistance (i.e. SBC Type IV construction, IBC Type II construction) to be built up to 400,000 sqft in area per tier. This area value, which was placed in the SBC in the early 1980's, was based on the use of noncombustible materials for construction of the open parking structure, the open sided features for the parking structure which reduced the risk of adverse impact from vehicle fires and the documented low fire risk vehicles pose to the stability of open parking structures[1],[2].

Additional studies of fire experience in open parking structures in the United States since those earlier ones still supports the conclusion that vehicle fires pose a low risk of fire damage to the parking structure. The more recent analysis of parking garage structure fires (i.e. NFPA[3], Parking Market Research Company [4]) by the Fire Safety Committee of the Parking Consultants Council concluded that in about 98.7% of the fires no structural damage occurred due to the parking structure fires studied[5]. This suggests that the present values in Table 406.5.4 for Open Parking Garages of IBC Type II construction are more stringent than necessary based on the low risk of fire damage to the structural elements from vehicle fires and should be permitted to increase.

During the 2015 Group A cycle for code changes to the 2012 IBC, a similar code change was submitted by PCI for consideration (G101-15). The IBC General Code Committee recommended disapproval of the proposal at the code development hearing, suggesting there was merit to allow bigger open parking garages when constructed using buildings of fire resistive construction, however the table values proposed in G101-15 were considered too large. Based on that feedback PCI has modified the original proposal to reduce the area per tier permitted for Type IIA construction as reflected in this code change.

The area per tier proposed is based on a common open parking garage design utilizing a footprint of 240-feet X 315-feet (4 bays @ 60-ft/bay X 35 parking spaces @ 9-ft each), which totals 75,600 sf. The table value was rounded to 75,000 sf. This area per tier, based on 10 tiers, results in an aggregate parking area consistent with the aggregate allowable floor area for an enclosed sprinklered S-2 parking garage, per Tables 504.4 and 506.2.

Based on the low risk of vehicle fires and resulting damage, and the open sided features of these garages, this proposal will permit open parking garages of Type IIA construction to be built to areas like those permitted for sprinklered enclosed parking garages.

Bibliography:

[5] Parking Consultants Council Fire Safety Committee, Parking Structure Fire Facts, December 2008

Cost Impact

The code change proposal will decrease the cost of construction .

Permitting larger open parking garages of Type IIA construction will result in a reduction in cost without any compromise in fire safety through savings in material and construction methods required for open parking structures that would otherwise have to meet Type IB construction.

Internal ID: 1544

G38-18

IBC: 406.5.7, 1006.3.3 (IFC[BE] 1006.3.3)

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows:

406.5.7 Means of egress. ~~Where persons other than parking attendants are permitted, open~~ Open parking garages shall meet the *means of egress* requirements of Chapter 10. ~~Where persons other than parking attendants are not permitted, there shall be not fewer than two exit stairways. Each exit stairway shall be not less than 36 inches (914 mm) in width.~~ Lifts shall be permitted to be installed for use of employees only, provided that they are completely enclosed by noncombustible materials.

1006.3.3 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or occupied roof where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and common path of egress travel distance do not exceed the values in Table 1006.3.3(1) or 1006.3.3(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
- ~~3. Parking garages where vehicles are mechanically parked shall be permitted to have one exit or access to a single exit.~~
- ~~3.4.~~ Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
- ~~4.5.~~ Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
 - ~~4.1.5.1.~~ The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
 - ~~4.2.5.2.~~ Either the *exit* from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved independent exits*.

Reason:

The purpose of this change is to address limitations in requirements for means of egress components for parking garages. Section 406.5.7 where the requirements are different for attendants than for the general public in open parking garages. And Section 1006.3.3 which allows for a single exit or exit access for parking garages with mechanical parking.

Section 406.5.7 assumes there is a lower life hazard for attendant parking than when individuals park their own vehicles. Not only are the number of exits potentially reduced depending upon the size of the parking structure, the width is allowed to be 36 inches rather than the required 44 inches.

There is no justification to assume attendant valet parking presents a lower egress need than public parking. Just as public parking can have ebbs and flows so can valet parking. Every parking garage has times when there is peak usage, in the case of valet parking the number of attendants is increased based upon when the highest in and out flows are expected. Hotels for example might have a morning rush to leave and then an afternoon rush for arrivals.

The ebbs and flows are also different for where the parking garage is, a factor the code ignores. Some facilities may have attendant parking when they open, but down the line eliminate it for self parking. A factor not considered.

The main factor not considered is where the fire may be. Open parking garages do not have automatic fire suppression, the fires generate considerable heat, smoke, toxics, all of which can move anywhere on the fire floor based upon atmospheric conditions potentially blocking the path to the limited egress paths.

The reduction in the stairway widths also ignores the fact that the fire service will use the same stairways to gain access to the fire floor hauling equipment with them.

A good example of how the reduction in protection is convoluted is that in many cases the portion for valet parking is

open to the portion for public access separated only by barriers easily overcome by occupants if they actually have physical barriers. A fire on the level shared can impact both areas and/or can force the public to climb over a potential low barrier to escape through the valet area.

Section 406.5.7 is proposed to be modified to simply point to Chapter 10 for egress requirements and leave the allowance for employee lifts.

Section 1006.3.3 Exception 3 allows parking garages utilizing mechanical parking to have a single exit. There are no qualifications on size of the space or suppression requirements. There is no technical justification for allowing a single exit condition where the exit could be blocked by a fire event. The Commentary includes:

"Item 3 allows for one exit from all stories in a parking garage where the cars are mechanically parked. This is in recognition of the extremely low occupant load in this unique type of building. The single exit would be for maintenance and service personnel who could be on the different levels...."

So because employees are not part of the public their lives are worth less? What about the single fire event taking out the single stairway at a lower level? From a practical or a fire protection standpoint this has no justification.

This exception also ignores the fact that the stairways do double duty, egress and the fire service use the stairways to access the fire floor.

Since there is no justification for the single exit allowance from a life safety perspective or from a firefighting access viewpoint Exception 3 for Section 1006.3.3 is recommended for deletion.

An additional important factor to consider is that the materials in vehicles has changed to add more combustible synthetic material, thinner/lighter metals and a growing increase of alternative fueled vehicles, GH2, CNG, LPG and Lithium-Ion batteries. Electric Vehicle charging stations have been installed within parking garages to encourage their use.

Basically, the current requirements for parking garages, open or closed, in the codes are based on old vehicle concepts and studies.

Multi-vehicle large fires can occur and have occurred. As in any multi-story building, effective firefighting actions to protect life and property involved being able to quickly apply water to the fire. The type of fire and danger presented by that fire has increased as the use of alternative fueled vehicles has increased. Access is important to suppressing the fire with hose lines.

It's time the requirements for parking garages were improved recognizing the increased fire hazards and fuel loads presented by alternative fueled vehicles and vehicles with more plastic components.

Background material.

<http://www.urbanfiretraining.com/parking-garages>.

<http://www.firerescuemagazine.com/articles/print/volume-7/issue-2/strategy-and-tactics/fighting-vehicle-fires-in-parking-garages.html>

<http://www.fireengineering.com/ap-news/2018/01/01/parking-garage-fire-destroys-hundreds-of-cars-in-uk.html>

<https://www.youtube.com/watch?v=KVx6avRTNCA>

<https://www.youtube.com/watch?v=HK0U-PKJ1NE>

Cost Impact

The code change proposal will increase the cost of construction .

This code change will increase the cost of construction for open parking garages and parking garages with mechanical parking by requiring additional enclosed exit stairs.. But the increased is over weighed by the negative safety impact potential to occupants of the increase of fuel loads in today's parking garages.

Internal ID: 2304

Proponent: James Carver, El Segundo Fire Department, representing El Segundo Fire Department (JCarver@elsegundo.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

202 MECHANICAL-ACCESS ENCLOSED PARKING GARAGE An enclosed parking garage other than single car stacking systems which employs parking machines, lifts, elevators or other mechanical devices for vehicle moving from and to street level and in which public occupancy in the garage is prohibited in all areas except the vehicle access bay.

Add new text as follows:

406.6.4 Mechanical-access garages. Mechanical-access enclosed parking garages shall be in accordance with Sections 406.6.4.1 through 406.6.4.5.

406.6.4.1 Separation. Mechanical-access enclosed parking garages shall be separated from other occupancies and accessory uses by not less than 2-hour fire barriers constructed in accordance with Section 707 or by not less than 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

406.6.4.2 Smoke removal. A mechanical smoke removal system, in accordance with Section 910.4, shall be provided for all areas containing an enclosed mechanical-access parking garage.

406.6.4.3 Fire control equipment. The fire control equipment, consisting of the fire alarm control unit, mechanical ventilation controls and emergency shut down shall be provided in a room with exterior access. The room size and location shall be approved by the fire code official.

406.6.4.4 Firefighter access. Access doors shall be provided at the ground level for firefighter access as approved by the fire code official.

406.6.4.5 Emergency shutdown switch. A manually activated emergency shutdown switch shall be provided for use by emergency personnel.

Revise as follows:

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

N = No separation requirement.

NP = Not Permitted.

- a. See Section 420.
- b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but not to less than 1 hour.
- c. See Section ~~406.3.2~~ 406.3.2 and 406.6.4.
- d. Separation is not required between occupancies of the same classification.
- e. See Section 422.2 for ambulatory care facilities.
- f. Occupancy separations that serve to define fire area limits established in Chapter 9 for requiring fire protection systems shall also comply with Section 707.3.10 and Table 707.3.10 in accordance with Section 901.7.

2018 International Fire Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

202 MECHANICAL-ACCESS ENCLOSED PARKING GARAGE An enclosed parking garage, other than single car stacking system, which employs parking machines, lifts, elevators or other mechanical devices for vehicle moving from and to street level and in which public occupancy in the garage is prohibited in all areas except the vehicle access bay.

Add new text as follows:

903.2.10.2 Mechanical-access enclosed parking garages. An approved automatic sprinkler system shall be provided throughout buildings used for the storage of motor vehicles in a mechanical-access enclosed parking garage. The portion of the building that contains the mechanical-access enclosed parking garage shall be protected with a performance-based design specially engineered sprinkler system.

Revise as follows:

5705.3.7.3	Flammable and combustible liquid Group H-2 or H-3 areas
6004.1.2	Gas cabinets for highly toxic and toxic gas
6004.1.3	Exhausted enclosures for highly toxic and toxic gas
6004.2.2.6	Gas rooms for highly toxic and toxic gas
6004.3.3	Outdoor storage for highly toxic and toxic gas
6504.1.1	Pyroxylin plastic storage cabinets
6504.1.3	Pyroxylin plastic storage vaults
6504.2	Pyroxylin plastic storage and manufacturing

For SI: 1 cubic foot = 0.023 m³.

Reason:

Enclosed mechanical-access parking garages are being constructed in the United States on an increasing basis, yet there is no prescriptive code requirements for these occupancies. These occupancies are unique from the traditional open mechanical-access parking garage in that there are no openings, the entire structure is enclosed. These occupancies are more similar to automated high rack storage systems, they have no floors, no stairwells and no above ground level access, except maintenance walkways and ladders. With these being a silent occupancy type, the Code does not provide the code official with prescriptive requirements. There are fires involving parked vehicles with the vehicle parked and the ignition system off. If a fire were to occur in an enclosed mechanical-access parking garage, unless the local code authority required additional fire protection during construction, they do not have a point-setter to code requirements. Where these systems have been installed, there is not a consistent fire protection methodology to protecting these structures from a fire.

An enclosed mechanical-access parking garage offers many firefighting challenges; most are constructed in a building shell, without a floor system. The vehicles are parked in a cage/rack system, with no safe elevated access to the interior of the structure. With firefighter safety in mind and to have the ability to use fixed fire suppression to extinguish and/or control these fires, the code proposal is presented.

IFC Section 202 adds a definition for these occupancies. Open mechanical-access parking garages are defined in the Code, but do not pose the firefighting challenge as an enclosed mechanical access parking garage. An open parking garage has floors, stairwells, standpipe connections and natural ventilation. An enclosed garage is in a box, no stairwells or floors or standpipes for elevated firefighting, and no ventilation to remove the products of combustion, heat and super-heated gases.

IBC Section 406 6.1.3 is added to require a minimum 2-hour fire separation between these occupancies and other uses. If a fire were to occur in the occupancy, partitioning is needed to protect adjoining occupancies and other uses until the fire can be contained by the sprinkler system and mechanical ventilation.

IFC Section 320 is added to provide basic prescriptive requirements to provide for firefighter safety and to assist in the extinguishment of these fires, providing ground level access doors for firefighting operations, a room to consolidate the required fire control equipment, mechanical smoke removal and an emergency shut down switch. These occupancies are similar to high-piled automated storage systems. The general requirements are similar to high piled rack and automated storage requirements in Chapter 32.

IFC Section 903.2.10.2 is added to prescriptively require a performance-based designed sprinkler system. With the projected fire load in these occupancies and the inability to get water to the seat of the fire, a prescriptively designed sprinkler system is not anticipated to provide the required water for fire suppression.

Footnote c in IBC Table 508.4 is added to include the new section, 406.6.1.3.

Section 320 is being added to IFC Table 903.2.11.6 to the list of occupancies requiring additional fire suppression systems.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal is to provide prescriptive language for enclosed mechanical-access parking garages. These code requirements are being currently enforced as part of a performance-based design when approved and constructed. As the designed and builder will have prescriptive requirements, they will not be required to obtain an Alternative Materials and Methods approval for each project.

Internal ID: 1452

G40-18

IBC: 407.2.6, 407.2.7 (New); IFC: 904.13 (IBC[F] 904.13)

Proponent: John Williams, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

407.2.5 Nursing home housing units. In Group I-2, Condition 1 occupancies, in areas where nursing home residents are housed, shared living spaces, group meeting or multipurpose therapeutic spaces shall be permitted to be open to the *corridor*, where all of the following criteria are met:

1. The walls and ceilings of the space are constructed as required for *corridors*.
2. The spaces are not occupied as resident sleeping rooms, treatment rooms, incidental uses in accordance with Section 509, or hazardous uses.
3. The open space is protected by an automatic fire detection system installed in accordance with Section 907.
4. The *corridors* onto which the spaces open, in the same *smoke compartment*, are protected by an automatic fire detection system installed in accordance with Section 907, or the *smoke compartment* in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with Section 903.3.2.
5. The space is arranged so as not to obstruct access to the required *exits*.

Revise as follows:

407.2.6 Nursing home cooking facilities. In Group I-2, Condition 1 occupancies, rooms or spaces that contain a cooking facility with domestic cooking appliances shall be permitted to be open to the corridor where all of the following criteria are met:

1. The number of care recipients housed in the smoke compartment shall not be greater than 30.
2. The number of care recipients served by the cooking facility shall not be greater than 30.
3. Not more than one cooking facility area shall be permitted in a smoke compartment.
- ~~4. The types of domestic cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.~~
- ~~5.4.~~ The corridor shall be a clearly identified space delineated by construction or floor pattern, material or color.
- ~~6.5.~~ The space containing the domestic cooking facility shall be arranged so as not to obstruct access to the required exit.
- ~~7.6.~~ Domestic cooking hoods installed and constructed in accordance with Section 505 of the International Mechanical Codes shall be provided over cooktops and ranges. The cooking appliance shall comply with Section 407.2.7.
- ~~8. Cooktops and ranges shall be protected in accordance with Section 904.13.~~
- ~~9. A shut-off for the fuel and electrical power supply to the cooking equipment shall be provided in a location that is accessible only to staff.~~
- ~~10. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.~~
- ~~11. A portable fire extinguisher shall be provided. Installation shall be in accordance with Section 906, and the extinguisher shall be located within a 30 foot (9144 mm) distance of travel from each domestic cooking appliance.~~

Add new text as follows:

407.2.7 Domestic cooking appliances. In Group I-2 occupancies, installation of cooking appliances used in domestic cooking facilities shall comply with all of the following:

1. The types of cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.
2. Domestic cooking hoods installed and constructed in accordance with Section 505 of the

International Mechanical Code shall be provided over cooktops and ranges.

3. Cooktops and ranges shall be protected in accordance with Section 904.13.
4. A shut-off for the fuel and electrical power supply to the cooking equipment shall be provided in a location that is accessible only to staff.
5. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.
6. A portable fire extinguisher shall be provided. Installation shall be in accordance with Section 906, and the extinguisher shall be located within a 30-foot (9144 mm) distance of travel from each domestic cooking appliance.

2018 International Fire Code

Revise as follows:

904.13 Domestic cooking systems, facilities. Cooktops and ranges installed in the following occupancies shall be protected in accordance with Section 904.13.1:

1. In Group I-1 occupancies where domestic cooking facilities are installed in accordance with Section 420.8 of the International Building Code.
2. In Group I-2, ~~Condition 1~~ occupancies where domestic cooking facilities are installed in accordance with Section ~~407.2.6~~ 407.2.7 of the International Building Code.
3. In Group R-2 college dormitories where domestic cooking facilities are installed in accordance with Section 420.10 of the International Building Code.

Reason:

The intent of this proposal is for no technical change, but is to separate the requirements for domestic cooking appliances and exhaust from the allowance for that area to be open to the corridor in a nursing home. If someone wants to do a domestic cooking area in a room in a nursing home or hospital, such as for therapy or nutrition training purposes, they would still have to follow all the domestic cooking regulations for the equipment. This is also coordinated with the language for Group I-1 requirements in Section 420. This is not intended to change any of the provisions for the commercial cooking areas. The change in IFC is correlation only.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an editorial separation with no technical changes for cooking facilities open to the corridor. This is a clarification of a domestic cooking appliance if it is within a room in a Group I-2 - currently some code officials would ask for commercial hoods, others would ask for domestic hoods.

G41-18

IBC: 407.2.6

Proponent: John Williams, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

407.2.6 Nursing home cooking facilities. In Group I-2, Condition 1 occupancies, rooms or spaces that contain a cooking facility with domestic cooking appliances shall be permitted to be open to the corridor where all of the following criteria are met:

1. The number of care recipients housed in the smoke compartment shall not be greater than 30.
2. The number of care recipients served by the cooking facility shall not be greater than 30.
3. Not more than one cooking facility area shall be permitted in a smoke compartment.
4. The types of domestic cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.
5. The corridor shall be a clearly identified space delineated by construction or floor pattern, material or color.
6. The space containing the domestic cooking facility shall be arranged so as not to obstruct access to the required exit.
7. Domestic cooking hoods installed and constructed in accordance with Section 505 of the International Mechanical Code shall be provided over cooktops and ranges.
8. Cooktops and ranges shall be protected in accordance with Section 904.13.
9. A shut-off for the fuel and electrical power supply to the cooking equipment shall be provided in a location that is accessible only to staff.
10. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.
11. A portable fire extinguisher shall be provided. Installation shall be in accordance with Section 906, and the extinguisher shall be located within a 30-foot (9144 mm) distance of travel from each domestic cooking appliance.

Exceptions:

1. Cooktops and ranges located within smoke compartments with no patient sleeping or patient care areas are not required to comply with this section.
2. Cooktops and ranges used for care recipient training or nutritional counseling are not required to comply with Item 8 of this section.

Reason:

If the proposal to split this section is also accepted, the exceptions would be applicable to the new section dealing with the cooktops and ranges.

This section was originally added to the code to allow nursing homes to have a more home like atmosphere, including small dining rooms and kitchen areas available to serve and possibly used by residents. The intent of this proposal is to allow for some exceptions for other domestic cooking.

Exception 1: The idea of this proposal for kitchens that outside of patient sleeping areas, such as a break room in the business area of a hospital, to not have to provide the protection features required to kitchens shared by care recipients. Hospitals are required to be sprinklered and separated. In these limited situations additional protection, shut offs, timers and additional portable fire extinguishers are not justified.

Exception 2: Exception 2 - The idea of this proposal for kitchens in therapy areas or for nutrition counseling is to not have to provide the UL300A hood protection features required to kitchens shared by care recipients.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference

calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cooktops and ranges used for domestic purposes would still have to comply with the IMC for ventilation. This is a clarification for where additional protection, shut offs, timers and additional portable fire extinguishers are not needed.

Internal ID: 1295

G42-18

IBC: 407.3.1.1 (New), 710.5.2.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

407.3 Corridor wall construction. Corridor walls shall be constructed as smoke partitions in accordance with Section 710.

407.3.1 Corridor doors. Corridor doors, other than those in a wall required to be rated by Section 509.4 or for the enclosure of a vertical opening or an exit, shall not have a required *fire protection rating* and shall not be required to be equipped with *self-closing* or automatic-closing devices, but shall provide an effective barrier to limit the transfer of smoke and shall be equipped with positive latching. Roller latches are not permitted. Other doors shall conform to Section 716.

Add new text as follows:

407.3.1.1 Door construction. Doors in corridors not required to have a fire protection rating shall comply with the following:

1. Solid doors shall have close fitting operational tolerances, head and jamb stops.
2. Dutch style doors shall have an astragal, rabbet or bevel at the meeting edges of the upper and lower door sections. Both the upper and lower door sections shall have latching hardware. Dutch style door shall have hardware that connects the upper and lower sections to function as a single leaf.
3. To provide make-up air for exhaust systems in accordance with Section 1020.5, Exception1, doors are permitted to have louvers or to have a clearance between the bottom of the door and the floor surface that is 2/3 inches (19.1 mm) maximum.

710.5 Openings. Openings in smoke partitions shall comply with Sections 710.5.1 and 710.5.2.

710.5.1 Windows. Windows in smoke partitions shall be sealed to resist the free passage of smoke or be automatic-closing upon detection of smoke.

710.5.2 Doors. Doors in smoke partitions shall comply with Sections 710.5.2.1 through 710.5.2.3.

Revise as follows:

710.5.2.1 Louvers. Doors in smoke partitions shall not include louvers.

Exception: Where permitted in accordance with Section 407.3.1.1.

Reason:

There are various type of doors used in corridors of care facilities. The additional language provides clarity and guidance on how these various types of doors are configured. These minimum configuration requirements are basics that have existed in other sections of the code, particularly at section 709.5, Exception 1. Therefore, they have existed in care facilities for some time, and are being specifically quantified in Chapter 4 to align with the CMS federal standard (K362).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This adds requirement to explain what is required for a door to limit the transfer of smoke. However, it does not add cost to the healthcare industry because we already follow these requirements in the context of the CMS federal standard.

Internal ID: 602

G43-18

IBC: 407.4.4.1, 407.4.4.3

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows:

407.4.4 Group I-2 care suites. *Care suites* in Group I-2 shall comply with Sections 407.4.4.1 through 407.4.4.4 and either Section 407.4.4.5 or 407.4.4.6.

407.4.4.1 Exit access through care suites. *Exit* access from all other portions of a building not classified as a *care suite* shall not pass through a *care suite*. ~~In a *care suite* required to have more than one exit, one exit access is permitted to pass through an adjacent *care suite* provided that all of the other requirements of Sections 407.4 and 1016.2 are satisfied.~~

407.4.4.2 Separation. *Care suites* shall be separated from other portions of the building, including other care suites, by a smoke partition complying with Section 710.

407.4.4.3 Access to corridor. Every suite shall have a door leading directly to an exit access corridor or horizontal exit. Movement from habitable rooms within the suite shall not require passage through more than three doors and 100 feet (30 480 mm) distance of travel within the travel within the suite to a door leading to the exit access corridor or horizontal exit. Where a caresuite is required to have more than one exit access door by Section 407.4.4.5.2 or 407.4.4.6.2, the additional door shall lead directly to an exit access corridor, horizontal exit or an adjacent suite.

Exception-Exceptions:

1. The distance of travel shall be permitted to be increased to 125 feet (38 100 mm) where an automatic smoke detection system is provided throughout the *care suite* and installed in accordance with NFPA 72.
2. Where two or more exit access doors are required by Section 407.4.4.5.2 or 407.4.4.6.2, not more than one of the doors shall be permitted to be exit door to an exit stairway, exit ramp, exit passageway, or an exterior exit door.

Reason:

Since this section was heavily edited in the 2012 version of the code, the federal rules have changed. This change reflects those changes and provides additional clarity relating to the exit access options out of a suite. The federal regulations stopped counting number of intervening rooms, instead relying on overall travel (K256 and K257).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal allows for one door out of a suite to be an exit door. This allows for additional design flexibility without adding any additional requirements.

Internal ID: 599

G44-18

IBC: 407.4.4.3

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows:

407.4.4.3 Access to corridor. Movement from habitable rooms shall not require passage through more than three doors and 100 feet (30 480 mm) distance of travel within the suite.

~~**Exception:** The distance of travel shall be permitted to be increased to 125 feet (38 100 mm) where an automatic smoke detection system is provided throughout the care suite and installed in accordance with NFPA 72.~~

Reason:

Since this section was heavily edited in the 2012 version of the code, the federal rules have changed. Current federal requirements do not allow increase to 125ft travel distance (K225).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

Limitations on travel distance will limit flexibility and potentially increase construction cost.

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

NON-PATIENT-CARE SUITE. In Group I-2 occupancies, a group of rooms or spaces not intended for patient sleeping, patient care or treatment, where the suite is in compliance with the requirements of Section 407.4.5.

Add new text as follows:

407.4.5 Group I-2 non-patient-care suites. Non-patient-care suites in Group I-2 shall comply with Sections 407.4.5.1 through 407.4.5.3.

407.4.5.1 Exit access through non-patient-care suites. Exit access from all other portions of a building not classified as a non-patient-care suite shall not pass through a non-patient-care suite. In a non-patient-care suite required to have more than one exit, one exit access is permitted to pass through an adjacent care suite or non-patient-care suite provided that all of the other requirements of Section 407.4 and 1016.2 are satisfied.

407.4.5.2 Separation. Non-patient-care suites shall be separated from other portions of the building by a smoke partition complying with Section 710.

407.4.5.3 Area. Non-patient-care suites shall have an area not greater than 22,500 square feet (2092 m²).

Revise as follows:

407.4.1 Direct access to a corridor. Habitable rooms in Group I-2 occupancies shall have an *exit access* door leading directly to a *corridor*.

Exceptions:

1. Rooms with *exit* doors opening directly to the outside at ground level.
2. Rooms arranged as *care suites* complying with Section 407.4.4.
3. Rooms arranged as non-patient-care suites complying with Section 407.4.5.

Reason:

The 2012 IBC added the requirement in Section 407.4.1 for Group I-2 occupancies to provide direct access (no intervening spaces) to a corridor from "habitable" rooms. Exceptions are provided for rooms with direct exits to the exterior and for rooms arranged as "care suites." Both the direct corridor access requirement and the concept of care suites are very similar to the requirements for hospitals in the 2012 NFPA 101, which hospitals also must comply with in order to receive Medicare or Medicaid funds.

The term "habitable rooms" is not defined in Section 202 but the Code Commentary indicates that it includes not only patient sleeping rooms but also patient treatment rooms as well as staff areas such as staff lounges and staff work areas. The exception to direct corridor access for care suites allows necessary flexibility in the arrangement of patient rooms and other patient care areas. However, by definition, a care suite excludes staff lounges or staff work areas that are not directly related to supervision of care recipients within a suite. This frequently results in inefficient layouts for staff areas. In addition, since the term "habitable rooms" is interpreted very broadly by code officials, the configuration of small waiting areas is also often impacted.

The NFPA 101 provides flexibility through the use of "non-patient-care" suites which, for whatever reason, were not included in the 2012 IBC or subsequent editions. This proposal is intended to bring the IBC into closer alignment with the NFPA 101 in this regard and to provide for more efficient layouts of staff areas with no negative impact on patient safety.

Since most hospitals are of Type I construction, it would theoretically be possible to classify staff areas and other areas as Group B rather than Group I-2 as a way to allow intervening spaces and more efficient layouts. By using the nonseparated occupancies provisions of IBC 508.3, no separations would be required between such areas and adjacent hospital spaces. However, the NFPA 101, which also applies to hospitals, requires a 2 hour separation between other occupancies per Section 18.1.3.2. Thus, hospital designers are often faced with the choice between inefficient layouts and the needless expense of a 2 hour fire barrier.

Cost Impact

The code change proposal will decrease the cost of construction .

By incorporating non-patient-care suites into the design of hospitals, construction cost will be decreased through more efficient layouts with less space dedicated to corridors. Alternatively, construction cost will be reduced by eliminating the need to classify staff areas as Group B with a 2 hour occupancy separation.

G46-18

IBC: 407.6.1 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

407.6 Automatic-closing doors. Automatic-closing doors with hold-open devices shall comply with Sections 709.5 and 716.2.

Add new text as follows:

407.6.1 Activation of automatic-closing doors. Automatic-closing doors on hold-open devices in accordance with Section 716.2.6.6 shall also close upon activation of a fire alarm system, an automatic sprinkler system, or both. The automatic release of the hold open device on one door shall release all such doors within the same smoke compartment.

Reason:

This addition of this language is required in order to conform with Federal Standards and Centers for Medicaid and Medicare Services enforcement rules (K233). Doors that are required to be automatic-closing and on hold-open devices, were not clearly defined that they need to close upon all of these events, nor was it clear that all doors would need to close upon actuation of one door. This provides a higher level of life-safety for the residents and care recipients.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls

Cost Impact

The code change proposal will increase the cost of construction .

This may increase construction cost to interlock these doors with the fire alarm and sprinkler activation. This was already required to connect to the smoke detection system per Section 716.2.6.6. However, it does not add cost to the healthcare industry because certified facilities already follow these requirements in the context of the federal standards.

G47-18

IBC: 408.9

Proponent: Raymond Grill, Arup, representing Self (ray.grill@arup.com)

2018 International Building Code

Revise as follows:

408.9 Windowless buildings. For the purposes of this section, a windowless building or portion of a building is one with nonopenable windows, windows not readily breakable or without windows. Windowless buildings shall be provided with an engineered smoke control system to provide a tenable environment for exiting from the *smoke compartment* in ~~the area of fire origin in~~ accordance with Section 909 for each windowless *smoke compartment*.

Reason:

Providing a tenable environment within the area of fire origin can be impractical to impossible depending on the fire. Take an example of a fire within a cell. If an inmate were to utilize an accelerant to ignite combustibles within the cell, it would be immediately untenable. Detention centers are required to have at least two smoke compartments on stories providing inmate housing. The number of occupants in a smoke compartment and the travel distances within the compartment are limited to facilitate evacuation. Detention centers typically provide smoke control utilizing the pressure differential method to contain smoke to the compartment of origin. The current code language is often interpreted to mandate the exhaust method which no matter what rate of exhaust is provided, it cannot provide a tenable environment in the location of the fire origin.

A smoke control system is not required if operable or breakable windows are provided. There is no criteria for size or percentage of opening. Operable windows also can't provide a tenable environment within the area of origin. Provision of a smoke control system should not require a higher standard of protection than operable windows.

Cost Impact

The code change proposal will decrease the cost of construction .

Providing very high exhaust air changes can significantly increase the cost of construction.

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BG] SPECIAL AMUSEMENT BUILDING-AREA. A special amusement ~~building-area~~ is any temporary or permanent building or portion thereof that is occupied for amusement, entertainment or educational purposes and ~~that contains a device or system that conveys passengers or provides a walkway along, around or over a course in any direction so arranged that the means of egress path is not readily apparent due to visual or audio distractions or is intentionally confounded or is not readily available because of the nature of the attraction or mode of conveyance through the building or structure is arranged in a manner that:~~

1. Makes the means of egress path not readily apparent due to visual or audio distractions.
2. Intentionally confounds identification of the means of egress path.
3. Otherwise makes the means of egress path not readily available because of the nature of the attraction or mode of conveyance through the building or structure.

Add new definition as follows:

PUZZLE ROOM A puzzle room is a type of special amusement area in which occupants are encouraged to solve a challenge to escape from a room or series of rooms.

Revise as follows:

SECTION 411 SPECIAL AMUSEMENT BUILDINGSAREAS

411.1 General. *Special amusement ~~buildingsareas~~ having an occupant load of 50 or more shall comply with the requirements for the appropriate Group A occupancy and Sections 411.1 through ~~411.7-411.8.~~ Special amusement ~~buildingsareas~~ having an occupant load of less than 50 shall comply with the requirements for a Group B occupancy and Sections 411.1 through ~~411.7-411.8.~~*

Exception: *Special amusement ~~buildingsareas~~ or portions thereof that are without walls or a roof and constructed to prevent the accumulation of smoke need not comply with this section.*

~~For flammable decorative materials, see the International Fire Code.~~

Delete without substitution:

~~**[F] 411.2 Automatic fire detection.** *Special amusement buildings shall be equipped with an automatic fire detection system in accordance with Section 907.*~~

Revise as follows:

[F] 411.2 Automatic sprinkler system. Buildings containing special amusement areas shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. Where the special amusement area is temporary, the sprinkler water supply shall be of an approved temporary means.

Exception: Automatic sprinklers are not required where the total floor area of a temporary special amusement area is less than 1,000 square feet (93 m²) and the exit access travel distance from any point in the special amusement area to an exit is less than 50 feet (15 240 mm).

Add new text as follows:

411.3 Fire alarm system. Buildings containing special amusement areas shall be equipped with an automatic smoke detection system in accordance with 907.2.12.

Delete without substitution:

~~[F] 411.4 Alarm.~~ Actuation of a single ~~smoke detector~~, the ~~automatic sprinkler system~~ or other automatic fire detection device shall immediately sound an alarm at the building at a ~~constantly attended location~~ from which emergency action can be initiated including the capability of manual initiation of requirements in Section 907.2.11.

Revise as follows:

~~[F] 411.5-411.4 Emergency voice/alarm communications system.~~ An emergency voice/alarm communications system shall be provided in accordance with Sections 907.2.11 and 907.5.2.2, is permitted to serve as a public address system and shall be audible throughout the entire ~~special amusement building~~.

Add new text as follows:

411.5 Puzzle room exiting. Puzzle room exiting shall comply with one of the following:

1. Exiting in accordance with Chapter 10.
2. An alternative design approved by the building official.
3. Exit shall be open and readily available upon activation by the automatic fire alarm system, automatic sprinkler system, and a manual control at a constantly attended location.

Revise as follows:

411.6 Exit marking. Exit signs shall be installed at the required ~~exit~~ or ~~exit access doorways of serving special amusement buildings areas~~ in accordance with this section and Section 1013. ~~Approved~~ directional exit markings shall be provided. Where mirrors, mazes or other designs are utilized that disguise the path of egress travel such that they are not apparent, ~~approved~~ and listed low-level exit signs that comply with Section 1013.5, and directional path markings ~~listed~~ in accordance with UL 1994, shall be provided and located not more than 8 inches (203 mm) above the walking surface and on or near the path of egress travel. Such markings shall become visible in an emergency. The directional exit marking shall be activated by the automatic ~~fire-smoke~~ detection system and the ~~automatic sprinkler system~~ in accordance with Section 907.2.11.

411.6.1 Photoluminescent exit signs. Where ~~photoluminescent exit~~ signs are installed, activating light source and viewing distance shall be in accordance with the listing and markings of the signs.

411.7 Interior finish. The ~~interior finish~~ in special amusement areas shall be Class A in accordance with Section 803.1.

**TABLE 1017.2
EXIT ACCESS TRAVEL DISTANCE^a**

OCCUPANCY	WITHOUT SPRINKLER SYSTEM (feet)	WITH SPRINKLER SYSTEM (feet)
A, E, F-1, M, R, S-1	200 ^e	250 ^b
I-1	Not Permitted	250 ^b
B	200	300 ^c
F-2, S-2, U	300	400 ^c
H-1	Not Permitted	75 ^d
H-2	Not Permitted	100 ^d
H-3	Not Permitted	150 ^d
H-4	Not Permitted	175 ^d
H-5	Not Permitted	200 ^c
I-2, I-3	Not Permitted	200 ^c
I-4	150	200 ^c

For SI: 1 foot = 304.8 mm.

- a. See the following sections for modifications to *exit access* travel distance requirements:

Section 402.8: For the distance limitation in malls.

Section 404.9: For the distance limitation through an *atrium* space.

Section 407.4: For the distance limitation in Group I-2.

Sections 408.6.1 and 408.8.1: For the distance limitations in Group I-3.

Section ~~411.3~~411.2: For the distance limitation in special amusement ~~buildings~~ areas.

Section 412.6: For the distance limitations in aircraft manufacturing facilities.

Section 1006.2.2.2: For the distance limitation in refrigeration machinery rooms.

Section 1006.2.2.3: For the distance limitation in refrigerated rooms and spaces.

Section 1006.3.3: For buildings with one exit.

Section 1017.2.2: For increased distance limitation in Groups F-1 and S-1.

Section 1029.7: For increased limitation in assembly seating.

Section 3103.4: For temporary structures.

Section 3104.9: For pedestrian walkways.

- b. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.
- c. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
- d. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.1.
- e. Group R-3 and R-4 buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.

2018 International Fire Code

914.7 Special amusement ~~buildings~~ areas. Special amusement ~~buildings~~ areas shall comply with Sections 914.7.1 and 914.7.2.

914.7.1 Automatic sprinkler system. ~~Special Buildings containing special amusement buildings areas shall be~~ Special ~~Buildings~~ containing special amusement ~~buildings areas~~ areas shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1. Where the special amusement ~~building area~~ area is temporary, the sprinkler water supply shall be of an *approved* temporary means.

Exception: Automatic sprinklers are not required where the total floor area of a temporary special amusement ~~building area~~ area is less than 1,000 square feet (93 m²) and the *exit access* travel distance from any point in the special amusement area to an *exit* is less than 50 feet (15 240 mm).

914.7.2 Automatic smoke detection. Special amusement ~~buildings areas~~ areas shall be equipped with an automatic smoke detection system in accordance with Section 907.2.11.

3103.3.1 Special amusement ~~building area~~ area. Tents and other membrane structures erected as a special amusement ~~building area~~ area shall be equipped with an *automatic sprinkler system* in accordance with Section 411.3 of the International Building Code.

2018 International Code Council Performance Code

[BG] A103.1.9.12 SP-12, Special amusement ~~building area~~ area. A temporary, permanent or mobile area, building or structure that is occupied for amusement, entertainment or educational purposes and that contains a device or system that conveys passengers or provides a walkway along, around or over a course, in any direction, so arranged that means of egress are not readily apparent because of visual or audible distractions, or are intentionally confounded, or are not readily available because of the nature of the attraction or the mode of conveyance through the building or structure. It shall be assumed that:

1. Occupants, visitors and employees are awake, alert, predominantly able to exit without the assistance of others and unfamiliar with the area, building or structure.
2. Risk of injury and risk to health assumed by occupants, visitors and employees during their use of the area, building or structure are predominantly involuntary and high.
3. Public expectations regarding the protection afforded those occupying, visiting or working in such a an area, building, ~~or structure or portion thereof~~ are high.

Reason:

Puzzle rooms are a new business model where people are placed in a room and asked either to find a way out of the room or to find their way to the next room in the puzzle. The rooms are typically small and might otherwise be classified as a B occupancy under the current code. Each of these are designed in a way to provide a unique experience for the customer. This unique design incorporates a number of possible features to disorient the occupants and/or disguise the exit route. Such a design is contrary to the foundations of code specified exiting provisions.

This proposal seeks to establish criteria for puzzle rooms by incorporating them into the special amusement section. Since part of the appeal of this business model is that each experience is different, there is no way to prescriptively handle every situation. The language is fairly generic but gives guidance on providing reliable exiting in an emergency.

While researching this proposal, it was recognized that the special amusement building section needed some updating. The word "building" is changed to "area" and the fire alarm provisions were rewritten to correlate with section 907 of the fire code.

Cost Impact

The code change proposal will increase the cost of construction .

Many of these rooms may be classified currently as a B occupancy as they are not specifically called out in the code. As such, there are very little requirements for fire alarm or sprinkler systems. Depending on the size and configuration of the room(s), this provision would increase the cost of construction.

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Revise as follows:

[F] 415.6 Fire separation distance. Group H occupancies shall be located on property in accordance with the other provisions of this chapter. In Groups H-2 and H-3, not less than 25 percent of the perimeter wall of the occupancy shall be an *exterior wall*.

Exceptions:

1. ~~Liquid use, dispensing and mixing rooms having a floor area of not more than 500 square feet (46.5 m²) need not be located on the outer perimeter of the building where they are in accordance with the International Fire Code and NFPA 30.~~
2. ~~Liquid storage rooms having a floor area of not more than 1,000 square feet (93 m²) need not be located on the outer perimeter where they are in accordance with the International Fire Code and NFPA 30.~~
3. ~~Spray paint booths that comply with the International Fire Code need not be located on the outer perimeter.~~

Add new text as follows:

415.6.1 Liquid use, dispensing and mixing rooms and rooms for flammable or combustible liquid use, dispensing or mixing in open systems. Liquid use, dispensing and mixing rooms and rooms for flammable or combustible liquid use, dispensing or mixing in open systems, where vapors are emitted, having a floor area of not more than 500 square feet (46.5 m²) need not be located on the outer perimeter of the building where they are in accordance with the International Fire Code and NFPA 30.

415.6.2 Liquid storage rooms and rooms for flammable or combustible liquid use in closed systems. Liquid storage rooms and rooms for flammable or combustible liquid use in closed systems, where no vapors are emitted, having a floor area of not more than 1,000 square feet (93 m²) need not be located on the outer perimeter where they are in accordance with the International Fire Code and NFPA 30.

415.6.3 Spray paint booths. Spray paint booths that comply with the International Fire Code need not be located on the outer perimeter.

Revise as follows:

507.8.1.1.1 Liquid use, dispensing and mixing ~~rooms,~~ rooms and rooms for flammable or combustible liquid use dispensing or mixing in open systems. Liquid use, dispensing and mixing ~~rooms and~~ rooms for flammable or combustible liquid use, dispensing or mixing in open systems, where vapors are emitted, and having a floor area of not more than 500 square feet (46.5 m²) need not be located on the outer perimeter of the building where they are in accordance with the International Fire Code and NFPA 30.

507.8.1.1.2 Liquid storage ~~rooms,~~ rooms and rooms for flammable or combustible liquid use in closed systems. Liquid storage ~~rooms and~~ rooms for flammable or combustible liquid use in closed systems, where no vapors are emitted, having a floor area of not more than 1,000 square feet (93 m²) need not be located on the outer perimeter where they are in accordance with the International Fire Code and NFPA 30.

Reason:

The code currently addresses liquid use, dispensing and mixing rooms with open containers and storage rooms with closed containers, but it is silent on rooms with closed systems. The intent of this code change proposal is to limit the size of rooms with flammable or combustible liquid use in closed systems, when the rooms do not have 25 percent of their perimeter on an exterior wall.

Liquid use, dispensing and mixing room is defined in Chapter 2 as a room in which Class I, II and IIIA flammable or combustible liquids are used, dispensed or mixed in open containers. Liquid storage room is defined in Chapter 2 as a room classified as a Group H-3 occupancy used for the storage of flammable or combustible liquids in a closed condition.

A closed system is defined in Chapter 2 as the use of a solid or liquid hazardous material involving a closed vessel or system that remains closed during normal operations where vapors emitted by the product are not liberated outside of the vessel or system and the product is not exposed to the atmosphere during normal operations; and all uses of compressed gases. Examples of closed systems for solids and liquids include product conveyed through a piping system into a closed vessel, system or piece of equipment.

Recent projects have highlighted the fact that this code section currently only places limits on the size of rooms not on an exterior wall if they have open use, dispensing or mixing and if they have closed containers in storage. However, it does not address flammable or combustible liquid use in rooms with closed systems. Some applicants do not want to have 25 percent of the perimeter of a large H-3 occupancy with a closed system on an exterior wall. According to an ICC technical opinion about an unlimited area building: As discussed earlier, the code is silent about the extent of use-closed (process) systems involving flammable liquids in an unlimited area building when 25% of exterior wall access along the perimeter is not available. Admittedly, in your case, some perimeter access was still available but less than 25%. In addition, the proposed overall area of the "interior" Group H occupancy (process system) was within the permitted 25% allowed for interior Group H occupancies. With that being said, we also discussed the relative hazard of the proposed process system and the lack of a specific direct correlation with the requirements for inside storage and dispensing rooms. As such, final evaluation of the proposed operation is subject to the code official.

The hazard of flammable or combustible liquids in closed use is between open use and closed storage. In general it is more similar to closed storage, although sometimes flammable or combustible liquids in closed systems are pressurized, which can increase the hazard. This code change proposal would limit the size of rooms with flammable or combustible liquids in closed use systems, in the same way it limits the size of liquid storage rooms. This is consistent with the International Fire Code Chapter 50, Table 5003.1.1(1) which limits the amounts of flammable and combustible liquids in closed systems the same way it limits the amounts of flammable and combustible liquids in storage.

Specifying the limitations for rooms with flammable or combustible liquids in closed use will allow for better customer service. It will eliminate uncertainty for the code official and provide better consistency for applicants.

As part of this code change proposal, the code language in IBC 415.6 was made the rule instead of the exception, as in IBC 507.8.1.1.2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code is not clear in this area, so this code change proposal is to clarify the requirements to what it most closely resembles and what most jurisdictions enforce.

IBC: 415.7 (New), 415.7.1 (New), 415.7.2 (New), 415.7.3 (New), 415.7.4 (New), 415.7.5 (New), 415.7.6 (New)

Proponent: Tracie Dutter, Livermore-Pleasanton Fire Department, representing California Fire Chief's Association

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Add new text as follows:

415.7 Fire department access doors. Fire department access doors shall be provided in Group H occupancies in accordance with Sections 415.7.1 through 415.7.6

415.7.1 General. Grade level Group H occupancies required to have not less than 25 percent of the perimeter of the occupancy on an exterior wall shall have at least one exterior door in an approved location for fire department access.

415.7.2 Access to doors. Fire department access doors shall be able to be accessed without the use of a ladder.

415.7.3 Labeled. Fire department access doors shall be labeled on the exterior side with a sign that reads: "FIRE DEPARTMENT ACCESS DOOR DO NOT BLOCK" or other approved sign. Letters shall be a minimum height of 2 inches (51 mm) with a minimum stroke of 3/8 inch (10 mm) and on a contrasting background.

415.7.4 Door size and type. Fire department access doors shall be not less than 3 feet (914 mm) in width and 6 feet 8 inches (2032 mm) in height. Roll up doors shall not be considered fire department access doors unless approved.

415.7.5 Locking devices. Locking devices on fire department access doors shall be approved.

415.7.6 Key box. Where fire department access doors are required, a key box shall be installed in accordance with Section 506.1 of the International Fire Code. The key box shall contain keys or devices to allow for entry through the fire department access doors.

Reason:

This section specifies when Group H occupancies are required to have their perimeter on an exterior wall. According to the International Building Code Commentary, Section 415.6, this is "in order to provide adequate access for fire-fighting operations and venting of the products of combustion..." Also, Section 507.8.2 states "more ready access to the high-hazard occupancy from the exterior of the building gives the fire department the opportunity to respond more effectively to an incident." Applicants with large H occupancies don't always plan for an exterior door in the H room. Or if there is a door, it's not always in a location that allows for fire department access. Designers have pointed out that although the code requires the H occupancy to be on an exterior wall, the code does not require a door for fire department access. Since the intent of this section is to give the fire department access to the high-hazard occupancy from the exterior of the building, the fire code official should have the ability to require an exterior door in a location approved for fire department access. One of the legacy codes required an exterior access door for Liquid Use, Dispensing and Mixing Rooms and Liquid Storage Rooms over 500 square feet, but that requirement did not make the transition to the International Building Code. The code commentary does not address why it was not included in the International Building Code. This code change proposal would re-establish that requirement.

To be consistent with other parts of the code, the requirements for the fire department access door are consistent with the requirements for fire department access doors in the International Fire Code, Chapter 32, Section 3206.7.

Cost Impact

The code change proposal will increase the cost of construction .

If the applicant did not already plan to install an exterior door in the H occupancy room, this code change proposal will increase the cost of construction by the cost to install an exterior door. If the applicant is moving into an existing building, there may be an existing door that would work for fire department access. So in some cases there would be no change in the cost of construction and in other cases there would be a minimal cost increase.

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Revise as follows:

[F] 415.9 Group H-2, H-3 and H-4. Occupancies in Group H-2, H-3 and H-4 shall be constructed in accordance with Sections 415.9.1 through 415.9.3 the applicable provisions of this code, the International Mechanical Code and the International Fire Code.

[F] 415.9.1 Flammable and combustible liquids. The storage, handling, processing and transporting of flammable and combustible liquids in Group H-2 and H-3 occupancies shall be in accordance with Sections 415.9.1.1 through 415.9.1.9 the applicable provisions of this chapter, the International Mechanical Code and the International Fire Code.

Add new text as follows:

415.9.1.1 Flammable and combustible liquid tanks. The storage of flammable and combustible liquids in stationary tanks utilized for associated operations of building equipment or machinery in Group H-2 and H-3 occupancies, where the storage tank is located in a building of two or more occupancies, is not subject to height limitations of Section 504 where the following conditions exist:

1. The H-2 or H-3 use is separated from adjacent occupancies in accordance with the requirements of Section 508.4.
2. Where the storage tank is located within not more than one story of the building.
3. Where the tank and the room is designed, installed and protected in accordance with Sections 415.9.1.1.1 through 415.9.1.1.8.

Delete without substitution:

[F] 415.9.1.1 Mixed occupancies. ~~Where the storage tank area is located in a building of two or more occupancies and the quantity of liquid exceeds the maximum allowable quantity for one control area, the use shall be completely separated from adjacent occupancies in accordance with the requirements of Section 508.4.~~

[F] 415.9.1.1.1 Height exception. ~~Where storage tanks are located within a building not more than one story above grade plane, the height limitation of Section 504 shall not apply for Group H.~~

Revise as follows:

[F] 415.9.1.2 415.9.1.1.1 Tank protection. Storage tanks shall be noncombustible and protected from physical damage. *Fire barriers or horizontal assemblies* or both around the storage tanks shall be permitted as the method of protection from physical damage.

[F] 415.9.1.3 415.9.1.1.2 Tanks. Storage tanks shall be approved tanks conforming to the requirements of the International Fire Code.

[F] 415.9.1.4 415.9.1.1.3 Leakage containment. A liquid-tight containment area compatible with the stored liquid shall be provided. The method of spill control, drainage control and secondary containment shall be in accordance with the International Fire Code.

Exception: Rooms where only double-wall storage tanks conforming to Section 415.9.1.3 are used to store Class I, II and IIIA flammable and combustible liquids shall not be required to have a leakage containment area.

[F] ~~415.9.1.5~~ 415.9.1.1.4 Leakage alarm. An *approved* automatic alarm shall be provided to indicate a leak in a storage tank and room. The alarm shall sound an audible signal, 15 dBA above the ambient sound level, at every point of entry into the room in which the leaking storage tank is located. An *approved* sign shall be posted on every entry door to the tank storage room indicating the potential hazard of the interior room environment, or the sign shall state: WARNING, WHEN ALARM SOUNDS, THE ENVIRONMENT WITHIN THE ROOM MAY BE HAZARDOUS. The leakage alarm shall be supervised in accordance with Chapter 9 to transmit a trouble signal.

[F] ~~415.9.1.6~~ 415.9.1.1.5 Tank vent. Storage tank vents for Class I, II or IIIA liquids shall terminate to the outdoor air in accordance with the International Fire Code.

[F] ~~415.9.1.7~~ 415.9.1.1.6 Room ventilation. Storage tank areas storing Class I, II or IIIA liquids shall be provided with mechanical *ventilation*. The mechanical *ventilation system* shall be in accordance with the International Mechanical Code and the International Fire Code.

[F] ~~415.9.1.8~~ 415.9.1.1.7 Explosion venting. Where Class I liquids are being stored, explosion venting shall be provided in accordance with the International Fire Code.

[F] ~~415.9.1.9~~ 415.9.1.1.8 Tank openings other than vents. Tank openings other than vents from tanks inside buildings shall be designed to ensure that liquids or vapor concentrations are not released inside the building.

[F] 415.9.2 Liquefied petroleum gas facilities. The construction and installation of liquefied petroleum gas facilities shall be in accordance with the requirements of this code, the International Fire Code, the International Mechanical Code, the International Fuel Gas Code and NFPA 58.

[F] 415.9.3 Dry cleaning plants. The construction and installation of dry cleaning plants shall be in accordance with the requirements of this code, the International Mechanical Code, the International Plumbing Code and NFPA 32. Dry cleaning solvents and systems shall be classified in accordance with the International Fire Code.

Delete without substitution:

~~[F] 415.10 Groups H-3 and H-4.~~ Groups H-3 and H-4 shall be constructed in accordance with the applicable provisions of this code and the International Fire Code.

~~[F] 415.10.1 Flammable and combustible liquids.~~ The storage, handling, processing and transporting of flammable and combustible liquids in Group H-3 occupancies shall be in accordance with Section 415.9.1.

Revise as follows:

[F] ~~415.10.2~~ 415.9.4 Gas rooms. Where gas rooms are provided, such rooms shall be separated from other areas by not less than 1-hour *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.

[F] ~~415.10.3~~ 415.9.5 Floors in storage rooms. Floors in storage areas for corrosive liquids and highly toxic or toxic materials shall be of liquid-tight, noncombustible construction.

[F] ~~415.10.4~~ 415.9.6 Separation of highly toxic solids and liquids. Highly toxic solids and liquids not stored in *approved* hazardous materials storage cabinets shall be isolated from other hazardous materials storage by not less than 1-hour fire barriers constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.

Reason:

The original code sections in 415.9.1 came from the BOCA Building Code. It is our understanding that the intent was to allow tanks inside the building at a time when they were not allowed by NFPA 30. As an example a generator or fire pump, along with the associated diesel fuel tank could be allowed in the basement of a building. The room housing the tank would not be subject to height limitations if the tank and the room housing the tank was only one story tall. Please see attached original BOCA Building Code language. At some point, a decision was made to replace language such as "one story" to "one story above grade plane" throughout the code for other reasons such as consistency (e.g. in allowable area sections in Chapter 5). The language in this section accidentally changed from "one story" meaning the tank is only on a single floor to "one story above grade" in 415.9.1.1.1. The proposed code change clarifies the original intent of this code section. Also the language used to imply that the H-Occupancy is allowed on the different floors regardless of what else may be in the room. It is intended for tanks used for servicing building equipment. The

language as it is currently written implies facilities (such as major chemical manufacturing, etc.) with tanks can be on upper floors which is not the intent of this section.

418.2.1 Construction: Occupancies in Use Group H-1 shall not be located in buildings that are more than one story in height, have basements or other spaces below grade, or which are attached to other buildings. The minimum fire separation distance for all exterior walls of occupancies in Use Group H-1 shall be in accordance with the fire prevention code listed in Chapter 35. All floor surfaces shall be spark resistant.

418.2.2 Number of exits: There shall not be less than two exits from any area or space wherein Use Group H-1 materials are utilized or stored. All required exits shall discharge directly to the exterior of the building or structure.

418.3 Use Group H-2: Occupancies in Use Group H-2 shall be constructed in accordance with Sections 418.3.1 through 418.3.4 and the fire prevention code listed in Chapter 35.

418.3.1 Combustible dusts, grain processing and storage: The provisions of Sections 418.3.1.1 through 418.3.1.6 shall apply to all buildings in which materials that produce combustible dusts are stored or handled. Buildings which store or handle combustible dusts shall comply with the applicable provisions of NFPA 61, 65, 120, 651, 654, 655, 664 and 8503 and the fire prevention code listed in Chapter 35.

418.3.1.1 Type of construction and height exceptions: All buildings shall be of Type 1, Type 2 or Type 4 construction, within the height and area limitations of Table 503 for Use Group H-2; except that where erected of Type 1 or Type 2 construction, the heights and areas of grain elevators and similar structures shall be unlimited, and where of Type 4 construction, the maximum height shall be 65 feet (19812 mm) and except further that, in isolated areas, the maximum height of Type 4 structures shall be increased to 85 feet (25908 mm).

418.3.1.2 Grinding rooms: Every room or space occupied for grinding or other operations that produce combustible dusts shall be enclosed with floors and walls that have not less than a 2-hour fire-resistance rating where the area is not more than 3,000 square feet (279 m²), and not less than a 4-hour fire-resistance rating where the area is greater than 3,000 square feet (279 m²).

418.3.1.3 Conveyors: All conveyors, chutes, piping and similar equipment passing through the enclosures of rooms or spaces shall be constructed fire tight and vapor tight, and be of approved noncombustible materials complying with Section 3010.0.

418.3.1.4 Explosion relief: Means for explosion relief shall be provided as specified in Section 417.5.1, or spaces shall be equipped with the equivalent mechanical ventilation complying with the mechanical code listed in Chapter 35.

418.3.1.5 Grain elevators: Grain elevators, tank houses and buildings for similar occupancies shall not be located within 30 feet (9144 mm) of interior lot lines or structures on the same lot, except where erected along a railroad right-of-way.

418.3.1.6 Coal pockets: Coal pockets located less than 30 feet (9144 mm) from interior lot lines or from structures on the same lot shall be constructed of not less than Type

2A construction. Where more than 30 feet (9144 mm) from interior lot lines, or where erected along a railroad right-of-way, the minimum type of construction of such structures not more than 65 feet (19812 mm) in height shall be Type 4.

418.3.2 Flammable and combustible liquids: The storage, handling, processing and transporting of flammable and combustible liquids shall be in accordance with the mechanical code and the fire prevention code listed in Chapter 35. Where a Class I, II or IIIA flammable or combustible liquid is stored in tanks inside the building, the installation shall conform to Sections 418.3.2.1 through 418.3.2.10 and NFPA 30 listed in Chapter 35. The requirements shall only apply where tanks have an individual storage capacity that exceeds the exempt amounts specified in Tables 307.8(1) and 307.8(2). The fire area containing the tank(s) shall be classified as Use Group H-2.

418.3.2.1 Mixed use groups: Where the storage tank area is located in a building of two or more use groups, the Use Group H-2 fire area shall be completely separated from adjacent fire areas in accordance with the requirements of Section 313.1.2.

418.3.2.1.1 Height exception: Where storage tanks are located within only a single story, the height limitation of Section 503.3 shall not apply for the Use Group H-2 fire area.

418.3.2.2 Tank protection: All storage tanks shall be noncombustible and protected from physical damage. A fire separation assembly around the storage tank(s) shall be permitted to be classified as the method of protection from physical damage.

418.3.2.3 Tanks for Class I flammable liquid: All storage tanks for Class I flammable liquid shall be double-walled tanks. A double-walled tank shall consist of an approved tank conforming to the requirements of the fire prevention code listed in Chapter 35, installed within a completely enclosed noncombustible containment structure. The containment structure shall prevent the stored liquid from escaping into the room or area in which the tank is located. A leak detection alarm shall be provided to identify a leak of the primary wall of the tank. The alarm shall conform to Section 418.3.2.6.

418.3.2.4 Suppression: The Use Group H-2 fire area shall be equipped throughout with an approved automatic fire sprinkler system, installed in accordance with Section 906.2.1, or with a foam-extinguishing system. The automatic fire suppression system shall be supervised by method 1 of Section 924.1.

418.3.2.5 Leakage containment: A liquid-tight containment area compatible with the stored liquid shall be provided to retain 110 percent of the entire capacity of all the storage liquid in the event of a leak in a tank plus the capacity of the automatic fire suppression system activated for a period of 30 minutes. The storage tanks and the leakage containment area shall be provided with an ap-

proved method to drain manually the flammable or combustible liquid.

Exception: Rooms where only double-wall storage tanks conforming to Section 418.3.2.3 are used to store Class I, II and IIIA flammable and combustible liquids shall not be required to have a leakage containment area.

418.3.2.6 Leakage alarm: An approved automatic alarm shall be provided to indicate a leak in a storage tank and room. The alarm shall sound an audible signal, 15 dBA above the ambient sound level, at every point of entry into the room in which the leaking storage tank is located. An approved sign shall be posted on every entry door to the tank storage room indicating the potential hazard of the interior room environment, or the sign shall state, "Warning, when alarm sounds, the environment within the room may be hazardous." The leakage alarm shall also be supervised in accordance with Section 924.2 to transmit a trouble signal.

418.3.2.7 Tank vent: Storage tank vents shall terminate to the outdoor air. The vent termination shall be in an approved location a minimum of 12 feet (3658 mm) above adjacent ground level and 10 feet (3048 mm) from a door, window, ventilation intake opening, operable window or door.

418.3.2.8 Room ventilation: Storage tank areas storing Class I liquids, or Class II or IIIA liquids at temperatures above flash point, shall be ventilated at a rate sufficient to maintain the concentration of vapors within the area at or below 25 percent of the lower explosive limit. Ventilation requirements shall be determined by either calculations based on anticipated fugitive emissions or by sampling of the actual vapor concentration levels under normal operating conditions. The sampling shall be conducted at a 5-foot radius from each potential vapor source in the storage area. Provision shall be made for make-up air to avoid short-circuiting the ventilation.

418.3.2.9 Explosion venting: Where Class I liquids are being stored, explosion venting shall be provided in accordance with Section 417.5.

418.3.2.10 Tank openings other than vents: Tank openings other than vents from tanks inside buildings shall be designed to ensure that liquids or vapor concentrations are not released inside the building and shall conform to Sections 418.3.2.10.1 through 418.3.2.10.5.

418.3.2.10.1 Liquid tight: All tank openings at the maximum liquid level or below shall be liquid tight.

418.3.2.10.2 Closed: All tank openings above the maximum liquid level shall be normally closed.

418.3.2.10.3 External valve: Each connection through which liquid is capable of gravity flow from a tank inside a building shall be provided with an external valve located as close as practical to, but not more than 2 feet from, the shell of the tank.

418.3.2.10.4 Valves on transfer connections: Tanks storing Class I or Class II liquids shall be provided with

either a normally closed, remotely activated valve or an automatic-closing, heat-activated valve or other approved device on each liquid transfer connection below the liquid level, except for connections utilized for emergency disposal.

418.3.2.10.5 Overflow protection: Tanks shall be equipped with a device, or other means provided, to prevent overflow into the building.

418.3.3 Liquefied petroleum gas distribution facilities: The design and construction of propane, butane, propylene, butylene and other liquefied petroleum gas distribution facilities shall conform to the applicable provisions of Sections 418.3.3.1 through 418.3.3.2. The storage and handling of liquefied petroleum gas systems shall conform to the fire prevention code listed in Chapter 35. The design and installation of piping, equipment and systems which utilize liquefied petroleum gas shall be in accordance with the mechanical code listed in Chapter 35. Liquefied petroleum gas distribution facilities shall be ventilated in accordance with the mechanical code listed in Chapter 35 and Section 418.3.3.1.

418.3.3.1 Air movement: Liquefied petroleum gas distribution facilities shall be provided with air inlets and outlets arranged so that air movement across the floor of the facility will be uniform. The total area of both inlet and outlet openings shall be at least 1 square inch (645 mm²) for each 1 square foot (0.093 m²) of floor area. The bottom of such openings shall not be more than 6 inches (152 mm) above the floor.

418.3.3.2 Construction: Liquefied petroleum gas distribution facilities shall be constructed in accordance with Section 418.3.3.3 for separate buildings, Section 418.3.3.4 for attached buildings or Section 418.3.3.5 for rooms within buildings.

418.3.3.3 Separate buildings: Where located in separate buildings, liquefied petroleum gas distribution facilities shall be occupied exclusively for that purpose or for other purposes having similar hazards. Such buildings shall be limited to one story in height and shall conform to Sections 418.3.3.3.1 and 418.3.3.3.2.

418.3.3.3.1 Floors: The floor shall not be located below ground level and any spaces beneath the floor shall be solidly filled or shall be left unenclosed.

418.3.3.3.2 Materials: Walls, floors, ceilings, columns and roofs shall be constructed of noncombustible materials. Exterior walls, ceilings and roofs shall be constructed of material designed for explosion venting or, if of heavy construction such as solid brick masonry, concrete block or concrete, explosion-venting windows or panels in walls or roofs shall be provided having an explosion-venting area of at least 1 square foot (0.093 m²) for each 50 cubic feet (1.40 m³) of enclosed volume.

418.3.3.4 Attached buildings: Where liquefied petroleum gas distribution facilities are located in an attached structure, the attached perimeter shall not exceed 50 percent of the perimeter of the space enclosed and the facility shall comply with Sections 418.3.3.3 and 418.3.3.4.1. Where

Cost Impact

The code change proposal will not increase or decrease the cost of construction.

This is an editorial change to clean up the language and clarify what was intended by the code sections.

Internal ID: 1776

G52-18

IBC: [F]415.11.3.5, [F]415.11.3.5.1, [F]415.11.3.5.2, [F]415.11.3.5.3, [F]415.11.3.5.4, [F]415.11.3.5.5

Proponent: Patrick McLaughlin, representing Self (pmclaugma@aol.com)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Revise as follows:

[F] ~~415.11.3.5~~ **415.11.4 Emergency alarm system.** *Emergency alarm systems* shall be provided in accordance with this section and Sections 415.5.1 and ~~415.5.2~~ 415.5.2. The maximum allowable quantity per *control area* provisions shall not apply to *emergency alarm systems* required for HPM.

[F] ~~415.11.3.5.1~~ **415.11.4.1 Service corridors.** An *emergency alarm system* shall be provided in *service corridors*, with not fewer than one alarm device in each *service corridor*.

[F] ~~415.11.3.5.2~~ **415.11.4.2 Corridors and interior exit stairways and ramps.** Emergency alarms for *corridors*, *interior exit stairways* and *ramps* and *exit passageways* shall comply with Section ~~415.5.2~~ 415.5.2.

[F] ~~415.11.3.5.3~~ **415.11.4.3 Liquid storage rooms, HPM rooms and gas rooms.** Emergency alarms for liquid storage rooms, HPM rooms and gas rooms shall comply with Section ~~415.5.1~~ 415.5.1.

[F] ~~415.11.3.5.4~~ **415.11.4.4 Alarm-initiating devices.** An *approved* emergency telephone system, local alarm manual pull stations, or other *approved* alarm-initiating devices are allowed to be used as emergency alarm-initiating devices.

[F] ~~415.11.3.5.5~~ **415.11.4.5 Alarm signals.** Activation of the *emergency alarm system* shall sound a local alarm and transmit a signal to the emergency control station.

Reason:

This proposal simply pulls the emergency alarm requirements for semi-conductors out of the section on Service corridors. This is simply an editorial change as the emergency alarm system requirements should stand on their own.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This truly is a clarification and clean up of the code to properly place emergency alarm systems in their own subsection outside of the requirements for service corridors.

Internal ID: 282

G53-18

IBC: 420.4 (New)

Proponent: Sarah Rice, representing Myself (srice@preview-group.com)

2018 International Building Code

Add new text as follows:

420.4 Fire-resistance rating. Fire partitions and horizontal assemblies separating dwelling or sleeping units in the same building, and dwelling or sleeping units from other occupancies shall have a fire-resistance rating of not less than 1 hour.

Exception: Dwelling unit and sleeping unit separations in buildings of Types IIB, IIIB and VB construction shall have fire-resistance ratings of not less than 1/2 hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Reason:

Section 420 is where the requirement for dwelling and sleeping units to be separated from each other and other occupancies is found. Currently it tells the code user that the walls must be fire partitions and the floors must be horizontal assemblies, but in order to know what the fire ratings are to these assemblies you are forced to go to Sections 708.3 and 711.2.3. This code change proposes to bring the fire ratings into Section 420.

708.3 Fire-resistance rating. Fire partitions shall have a fire-resistance rating of not less than 1 hour.

Exceptions:

1. Corridor walls permitted to have a 1/2-hour fire resistance rating by Table 1020.1.
2. Dwelling unit and sleeping unit separations in buildings of Types IIB, IIIB and VB construction shall have fire-resistance ratings of not less than 1/2 hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Dwelling unit and sleeping unit separations in buildings of Types IIB, IIIB and VB construction shall have fire-resistance ratings of not less than 1/2 hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

711.2.3 Supporting construction. The supporting construction shall be protected to afford the required fire resistance rating of the horizontal assembly supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the horizontal assembly is not required to be fire-resistance rated at the following:

1. Horizontal assemblies at the separations of incidental uses as specified by Table 509 provided that the required fire-resistance rating does not exceed 1 hour.
2. Horizontal assemblies at the separations of dwelling units and sleeping units as required by Section 420.3.
3. Horizontal assemblies at smoke barriers constructed in accordance with Section 709.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is simply a correlative code change, duplicating information found in another section of the code.

Internal ID: 2376

G54-18

IBC: 420.2, 705.3

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

420.2 Separation walls. Walls separating *dwelling units* in the same building, walls separating *sleeping units* in the same building and walls separating *dwelling* or *sleeping units* from other occupancies contiguous to them in the same building shall be constructed as *fire partitions* in accordance with Section 708. Exterior walls separating units shall comply with Section 705.3.

Exceptions:

1. Where sleeping units include private bathrooms, walls between bedrooms and the associated private bathrooms are not required to be constructed as fire partitions.
2. Where sleeping units are constructed as suites, walls between bedrooms within the sleeping unit and the walls between the bedrooms and associated living spaces are not required to be constructed as fire partitions.
3. In Group R-3 and R-4 facilities, walls within the dwelling units or sleeping units are not required to be constructed as fire partitions.

705.3 Buildings on the same lot. For the purposes of determining the required wall and opening protection, projections and roof-covering requirements, buildings on the same lot and portions of the same building requiring dwelling or sleeping unit separation shall be assumed to have an imaginary line between them. Section 705.3 Exception 1 shall not be used where dwelling or sleeping unit separation is required.

Where a new building is to be erected on the same lot as an existing building, the location of the assumed imaginary line with relation to the existing building shall be such that the *exterior wall* and opening protection of the existing building meet the criteria as set forth in Sections 705.5 and 705.8.

Exceptions:

1. Two or more buildings on the same lot shall be either regulated as separate buildings or shall be considered as portions of one building if the aggregate area of such buildings is within the limits specified in Chapter 5 for a single building. Where the buildings contain different occupancy groups or are of different types of construction, the area shall be that allowed for the most restrictive occupancy or construction.
2. Where an S-2 parking garage of Construction Type I or IIA is erected on the same lot as a Group R-2 building, and there is no *fire separation distance* between these buildings, then the adjoining *exterior walls* between the buildings are permitted to have occupant use openings in accordance with Section 706.8. However, opening protectives in such openings shall only be required in the exterior wall of the S-2 parking garage, not in the exterior wall openings in the R-2 building, and these opening protectives in the exterior wall of the S-2 parking garage shall be not less than 1¹/₂-hour *fire protection rating*.

Reason:

The code requires fire-rated construction between dwelling units, but does not specifically address the situation where the separating wall is exterior. The provisions of 705.3 establish a means to determine the required fire rating and allowable openings for exterior walls of two buildings on the same lot. The same principles should be applied to the requirements for dwelling unit separation.

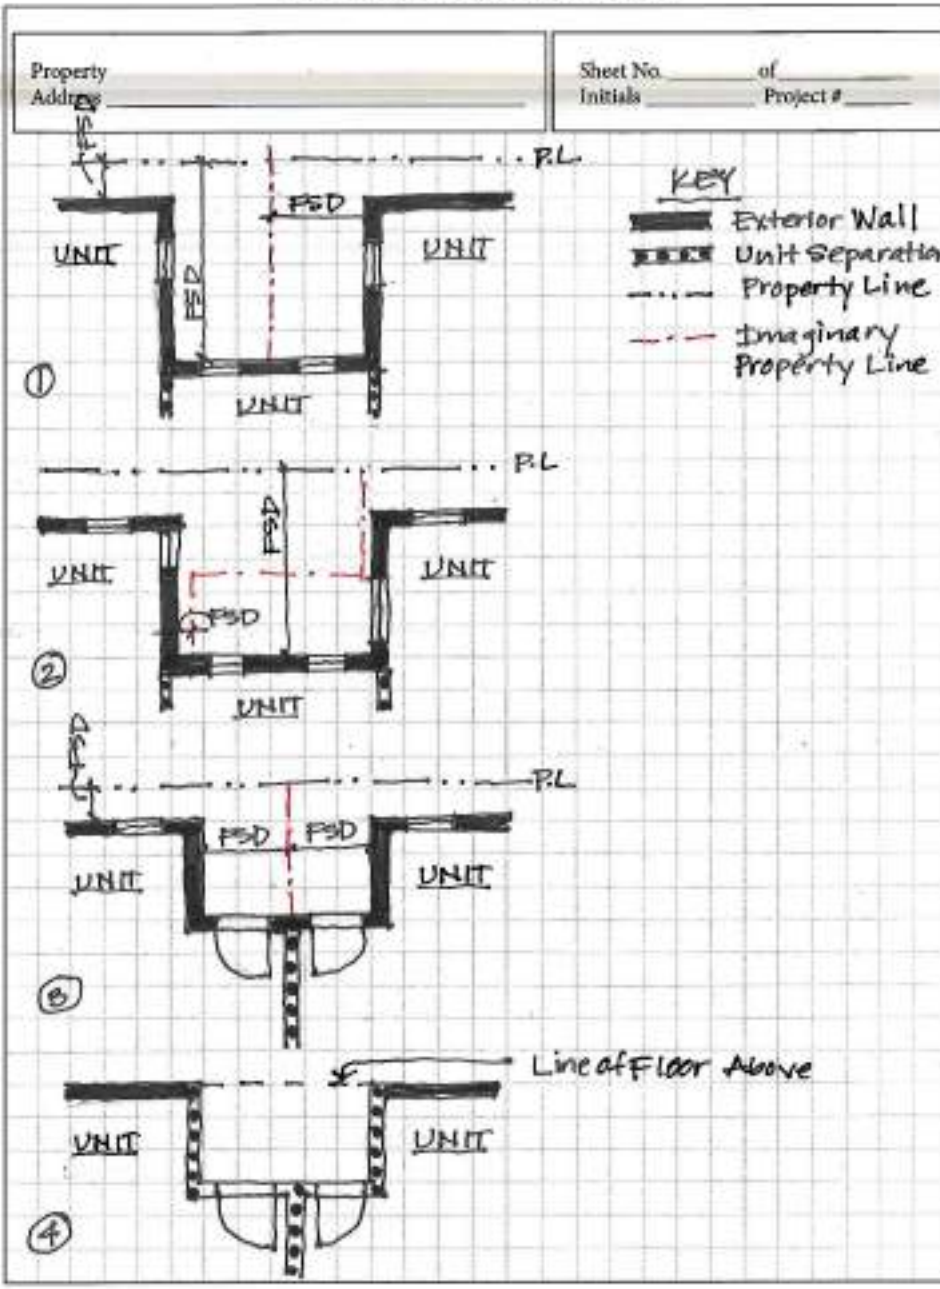

Dwelling unit separation is intended to prevent a fire in one unit from spreading to other units in a building. If adjacent units have unprotected openings in close proximity, fire can more readily spread between units, and to exterior balconies, cladding and roof.

With increasing demand for greater density housing, architects are designing more multifamily residential buildings with smaller units, often with windows on opposite sides of courts.

The provisions of Section 1206 control the minimum sizes of courts, but are silent on the fire-rating requirements, as this section is focused on light and ventilation.

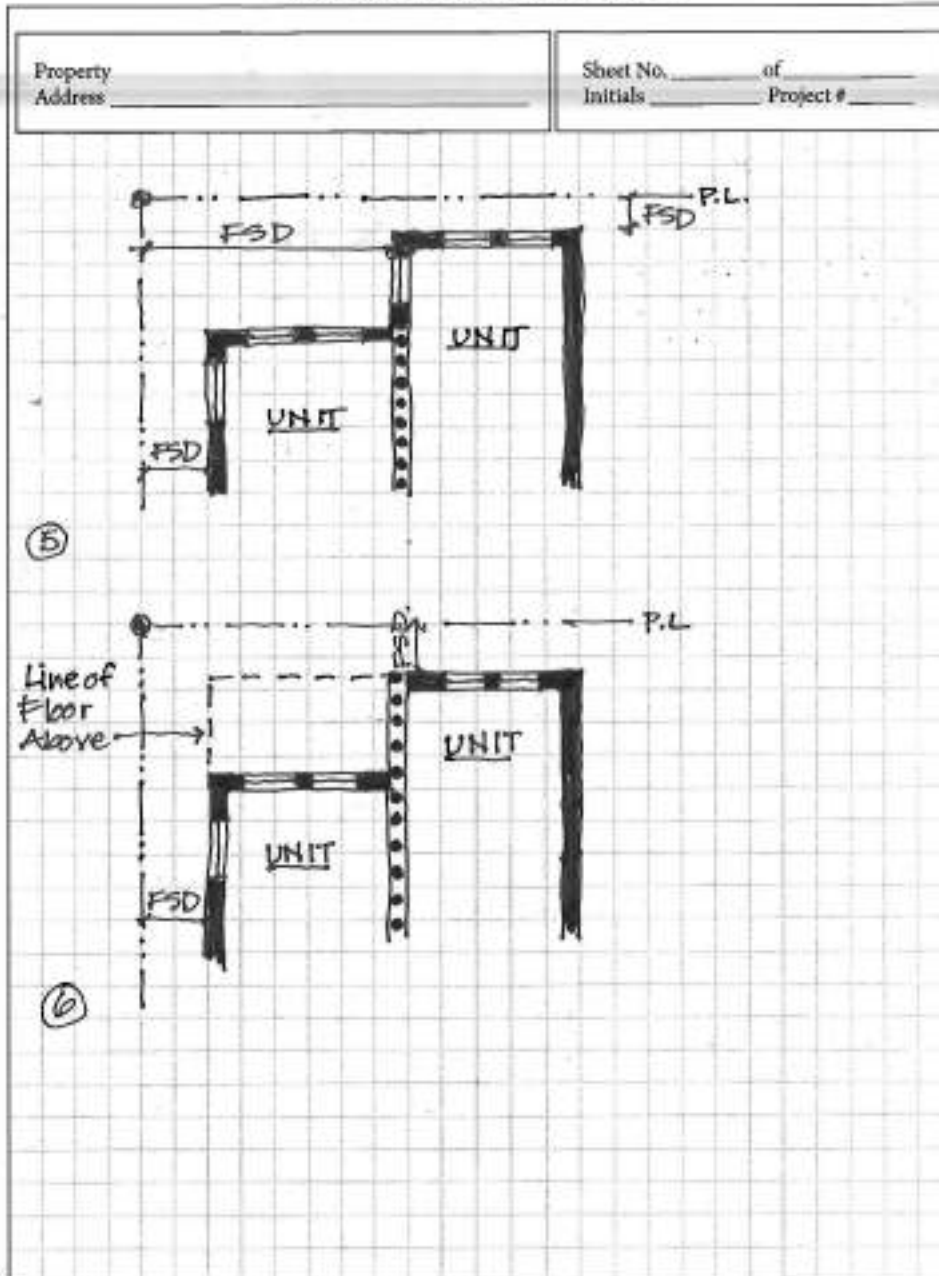

This revision will provide greater clarity for designers and increased safety and privacy for building residents.

Plan Review Calculations DPD

03.11

Plan Review Calculations DPD

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Minimal cost implications for construction. Potential property damage and life savings as fires are more likely to be limited to the unit of origin.

Internal ID: 1658

G55-18

IBC: 420.8, 420.8.1, 420.9 (New);

IFC: 904.13 (IBC[F] 904.13)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

420.7 Group I-1 assisted living housing units. In Group I-1 occupancies, where a fire-resistance corridor is provided in areas where assisted living residents are housed, shared living spaces, group meeting or multipurpose therapeutic spaces open to the corridor shall be in accordance with all of the following criteria:

1. The walls and ceilings of the space are constructed as required for corridors.
2. The spaces are not occupied as resident sleeping rooms, treatment rooms, incidental uses in accordance with Section 509, or hazardous uses.
3. The open space is protected by an automatic fire detection system installed in accordance with Section 907.
4. In Group I-1, Condition 1, the corridors onto which the spaces open are protected by an automatic fire detection system installed in accordance with Section 907, or the spaces are equipped throughout with quick-response sprinklers in accordance with Section 903.3.2.
5. In Group I-1, Condition 2, the corridors onto which the spaces open, in the same smoke compartment, are protected by an automatic fire detection system installed in accordance with Section 907, or the *smoke compartment* in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with Section 903.3.2.
6. The space is arranged so as not to obstruct access to the required *exits*.

Revise as follows:

420.8 Group I-1 cooking facilities. In Group I-1 occupancies, rooms or spaces that contain a cooking facilities facility with domestic cooking appliances shall ~~be in accordance with~~ be permitted to be open to the corridor where all of the following criteria are met:

1. In Group I-1, Condition 1 occupancies, the number of care recipients served by one cooking facility shall not be greater than 30.
2. In Group I-1, Condition 2 occupancies, the number of care recipients served by one cooking facility and within the same smoke compartment shall not be greater than 30.
- ~~3. The types of domestic cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.~~
- ~~4.3. The space containing the domestic cooking facilities shall be arranged so as not to obstruct access to the required exit.~~
- ~~5.4. Domestic cooking hoods installed and constructed in accordance with Section 505 of the International Mechanical Code shall be provided over cooktops or ranges. The cooking appliances shall comply with Section 420.9.~~
- ~~6. Cooktops and ranges shall be protected in accordance with Section 904.13.~~
- ~~7. A shutoff for the fuel and electrical supply to the cooking equipment shall be provided in a location that is accessible only to staff.~~
- ~~8. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.~~
- ~~9. A portable fire extinguisher shall be provided. Installation shall be in accordance with Section 906 and the extinguisher shall be located within a 30 foot (9144 mm) distance of travel from each domestic cooking appliance.~~

Delete without substitution:

~~**420.8.1 Cooking facilities open to the corridor.** Cooking facilities located in a room or space open to a corridor, aisle or common space shall comply with Section 420.8.~~

420.9 Domestic cooking appliances. In Group I-1 occupancies, installation of cooking appliance used in domestic cooking facilities shall comply with all of the following:

1. The types of cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.
2. Domestic cooking hoods installed and constructed in accordance with Section 505 of the International Mechanical Code shall be provided over cooktops or ranges.
3. Cooktops and ranges shall be protected in accordance with Section 904.13.
4. A shutoff for the fuel and electrical supply to the cooking equipment shall be provided in a location that is accessible only to staff.
5. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.
6. A portable fire extinguisher shall be provided. Installation shall be in accordance with Section 906 and the extinguisher shall be located within a 30-foot (9144 mm) distance of travel from each domestic cooking appliance.

2018 International Fire Code

Revise as follows:

904.13 Domestic cooking systems facilities. Cooktops and ranges installed in the following occupancies shall be protected in accordance with Section 904.13.1:

1. In Group I-1 occupancies where domestic cooking facilities are installed in accordance with Section ~~420.8~~ 420.9 of the International Building Code.
2. In Group I-2, Condition 1 occupancies where domestic cooking facilities are installed in accordance with Section 407.2.6 of the International Building Code.
3. In Group R-2 college dormitories where domestic cooking facilities are installed in accordance with Section 420.10 of the International Building Code.

Reason:

The intent of this proposal is for no technical change, but is to separate the requirements for domestic cooking appliances and exhaust from the allowance for that area to be open to the corridor in an assisted living facility. If someone wants to do a domestic cooking area in a room, such as for therapy or nutrition counseling purposes, they would still have to follow all the domestic cooking regulations for the equipment. This is also coordinated with the language for Group I-2, Condition 2 requirements in Section 407. This is not intended to change any of the provisions for the commercial cooking areas. The change in IFC is correlation only.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an editorial separation with no technical changes for cooking facilities open to the corridor. This is a clarification of a domestic cooking appliance if it is within a room in a Group I-1 (assisted living). Currently some code officials would ask for commercial hoods, others would ask for domestic hoods.

G56-18

IBC: 420.8

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

420.8 Group I-1 cooking facilities. In Group I-1 occupancies, rooms or spaces that contain cooking facilities with domestic cooking appliances shall be in accordance with all of the following criteria:

1. In Group I-1, Condition 1 occupancies, the number of care recipients served by one cooking facility shall not be greater than 30.
2. In Group I-1, Condition 2 occupancies, the number of care recipients served by one cooking facility and within the same smoke compartment shall not be greater than 30.
3. The types of domestic cooking appliances permitted shall be limited to ovens, cooktops, ranges, warmers and microwaves.
4. The space containing the domestic cooking facilities shall be arranged so as not to obstruct access to the required exit.
5. Domestic cooking hoods installed and constructed in accordance with Section 505 of the International Mechanical Code shall be provided over cooktops or ranges.
6. Cooktops and ranges shall be protected in accordance with Section 904.13.
7. A shutoff for the fuel and electrical supply to the cooking equipment shall be provided in a location that is accessible only to staff.
8. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.
9. A portable fire extinguisher shall be provided. Installation shall be in accordance with Section 906 and the extinguisher shall be located within a 30-foot (9144 mm) distance of travel from each domestic cooking appliance.

Exceptions:

1. Cooking facilities provided within care recipient's individual dwelling units are not required to comply with this section.
2. Cooktops and ranges used for care recipient training or nutritional counseling are not required to comply with Item 6 of this section.

Reason:

If the proposal to split this section is also accepted, the exceptions would be applicable to the new section dealing with the cooktops and ranges.

This section was originally added to the code to allow assisted living facilities to have a more home like atmosphere, including small dining rooms and kitchen areas available to serve and possibly used by residents. The intent of this proposal is to allow for some exceptions for other domestic cooking.

Exception 1 - In Group I-1, Condition 1, sometimes there is limited cooking permitted within the units. In these limited situations additional protection, shut offs, timers and additional portable fire extinguishers are not justified.

Exception 2 - The idea of this proposal for kitchens in therapy areas or for nutrition counseling to not have to provide the UL300A hood protection features required to kitchens shared by care recipients.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Cooktops and ranges used for domestic purposes would still have to comply with the IMC for ventilation. This is a clarification for where additional protection, shut offs, timers and additional portable fire extinguishers are not needed.

Internal ID: 1303

G57-18

IBC: 422.2

Proponent: Drew Dorrance, South Salt Lake City, representing South Salt Lake City (drd_007@hotmail.com)

2018 International Building Code

Revise as follows:

422.2 Separation. Ambulatory care facilities where the potential for four or more care recipients are to be incapable of self-preservation at any time shall be separated from adjacent spaces, corridors or tenants with a fire partition and a fire-rated horizontal assembly installed in accordance with ~~Section~~Sections 708 and 711.2

Reason:

Currently IBC section 422.2 addresses the vertical separation between ambulatory and non ambulatory care spaces. This section does not address a horizontal separation, when the same situation arises.

Cost Impact

The code change proposal will increase the cost of construction .

The cost for this change is directly impacted by the cost of a fire rated horizontal assembly, to include supporting construction.

Internal ID: 1471

G58-18

IBC: 422.1, 422.7 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

422.1 General. Occupancies classified as *ambulatory care facilities* shall comply with the provisions of Sections 422.1 through ~~422.6~~422.7 and other applicable provisions of this code.

Add new text as follows:

422.7 Domestic cooking. Installation of cooking appliances used in domestic cooking facilities shall comply with all of the following:

1. The types of cooking appliances permitted are limited to ovens, cooktops, ranges, warmers and microwaves
2. Domestic cooking hoods installed and constructed in accordance with Section 505 of the International Mechanical Code shall be provided over cooktops or ranges.
3. A shutoff for the fuel and electrical supply to the cooking equipment shall be provided in a location that is accessible only to staff.
4. A timer shall be provided that automatically deactivates the cooking appliances within a period of not more than 120 minutes.
5. A portable fire extinguisher shall be provided. Installation shall be in accordance with Section 906 and the extinguisher shall be located within a 30-foot (9144 mm) distance of travel from each domestic cooking appliance.

Reason:

Physical therapy areas sometimes have kitchens to train patients in how to operate safely when they are cooking at home or as part of nutrition counseling. If a domestic cooking facility is set up in an ambulatory care facility for physical therapy or training, it should be treated the same as in Group I-1 and I-2 for similar areas.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

Where someone wanted a cooking appliance for therapy or nutritional training, this would be an increase in requirements for the range and associated hood.

IBC: 423.1, 423.2, 423.3 (New), 423.3.1 (New), 423.3.2 (New)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

SECTION 423 STORM SHELTERS

Revise as follows:

423.1 General. This section applies to the construction of storm shelters constructed as separate detached buildings or constructed as rooms or spaces within buildings for the purpose of providing protection from storms that produce high winds, such as tornadoes and hurricanes during the storm. ~~Such structures shall be designated to be hurricane shelters, tornado shelters, or combined hurricane and tornado.~~ This section specifies where storm shelters are required and provides requirements for the design and construction of storm shelters. Design of facilities for use as emergency shelters after the storm are outside the scope of ICC 500 and shall comply with Table 1604.5 as a Risk Category IV Structure.

423.2 Construction. ~~In addition to other applicable requirements in this code, storm~~ Storm shelters shall be constructed in accordance with this code and ICC 500, and shall be designated as hurricane shelters, tornado shelters, or combined hurricane and tornado shelters. Buildings or structures that are also designated as emergency shelters shall also comply with Table 1604.5 as Risk Category IV structures. Any storm shelter not required by this section shall be permitted to be constructed provided such structures meet the requirements of this code and ICC 500.

Add new text as follows:

423.3 Occupancy classification. The occupancy classification for a storm shelter shall be determined in accordance with this section.

423.3.1 Dedicated storm shelters. A facility designed to be occupied solely as a storm shelter shall be classified as Group A-3 for the determination of requirements other than those covered in ICC 500.

Exceptions:

1. The occupancy category for dedicated storm shelters with an occupant load of less than 50 persons as determined in accordance with ICC 500 shall be in accordance with Section 303.
2. The occupancy category for a dedicated residential storm shelter shall be the Group R occupancy served.

423.3.2 Storm shelters within host buildings. Where designated storm shelters are constructed as a room or space within a host building which will normally be occupied for other purposes, the requirements of this code for the occupancy of the building, or the individual rooms or spaces thereof, shall apply unless otherwise required by ICC 500.

Reason:

ICC 500 contains specific requirements for determining the occupancy classification of storm shelters, whether constructed as a standalone building or as a room or space inside a host building which will normally be occupied for other purposes (e.g. a multi-purpose room in a Group E school or a conference room in a Group B office building). This code change adapts the occupancy language from ICC 500 and adds it to Section 423 where it will be directly accessible to all code users.

Occupancy classifications for storm shelters are broken down into four categories:

Dedicated storm shelters: Large community storm shelters may house hundreds of occupants. Thus, the ICC 500 committee deemed it appropriate to classify these shelters as Assembly Group A-3.

Small dedicated storm shelters: Some community shelters may only serve a small number of occupants. The ICC 500 committee deemed it appropriate to permit these smaller shelters to be classified as Group B as allowed by IBC Section 303.1.1

Shelters in a host building: Storm shelters constructed within a larger building as a room or space which will be used for other purposes under normal conditions (e.g. a multi-purpose room in a Group E school or a conference room in a Group B office building) are permitted to be classified using the occupancy category applicable to the space as it is normally used.

Residential storm shelters. Currently under ICC 500 these would be classified as Group B since they are limited to a maximum of 16 occupants, thus could use the Section 303.1.1 allowance. It is more appropriate that they be classified as Group R since that is the occupancy to which they are an accessory structure.

In addition, Sections 423.1 (General) and 423.2 (Construction) are revised to provide better scoping and charging language for storm shelters. The General paragraph is amended to highlight that Section 423 contains language requiring the installation of storm shelters in critical facilities such as fire stations, ambulance stations, and emergency operations centers (existing Section 423.3) and in Group E occupancies (existing Section 423.4). The requirement to classify storm shelters as hurricane, tornado, or both is relocated to the Construction provision, and a new paragraph is added to clarify that a storm shelter may be constructed in, or accessory to, any other buildings or structures governed by the IBC, where they would not otherwise be required, as long as the shelter complies with the appropriate requirements of the IBC and ICC 500. This is similar to language that exists in Section 901.2 for fire protection systems.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies the occupancy classifications of storm shelters by adding the requirements from ICC 500 to Section 423.

Internal ID: 2261

G60-18

IBC: 423.3, 423.4, 423.4.1, 423.4.2

Proponent: Benchmark Harris, representing self (bharris@huckabee-inc.com)

2018 International Building Code

Revise as follows:

423.3 Critical emergency operations. In areas where the shelter design wind speed for tornados in accordance with Figure 304.2(1) of ICC 500 is 250 mph, 911 call stations, emergency operation centers and fire, rescue, ambulance and police stations shall comply with Table 1604.5 as a Risk Category IV structure and shall be provided with a tornado storm shelter constructed in accordance with ICC 500.

423.4 Group E occupancies. In areas where the shelter design wind speed for tornados is 250 mph in accordance with Figure 304.2(1) of ICC 500, all Group E occupancies with an occupant load of 50 or more shall have a tornado storm shelter constructed in accordance with ICC 500.

Exceptions:

1. Group E day care facilities.
2. Group E occupancies accessory to places of religious worship.
3. Buildings meeting the requirements for tornado storm shelter design in ICC 500.

423.4.1 Required occupant capacity. The required occupant capacity of the tornado storm shelter shall include all of the buildings on the site and shall be the greater of the following:

1. The total occupant load of the classrooms, vocational rooms and offices in the Group E occupancy.
2. The occupant load of any indoor assembly space that is associated with the Group E occupancy.

Exceptions:

1. Where a new building is being added on an existing Group E site, and where the new building is not of sufficient size to accommodate the required occupant capacity of the storm shelter for all of the buildings on the site, the storm shelter shall at a minimum accommodate the required occupant capacity for the new building.
2. Where approved by the code official, the required occupant capacity of the shelter shall be permitted to be reduced by the occupant capacity of any existing tornado storm shelters on the site.

423.4.2 Location. Storm shelters shall be located within the buildings they serve or shall be located where the maximum distance of travel from not fewer than one exterior door of each building to a door of the tornado storm shelter serving that building does not exceed 1,000 feet (305 m).

Reason:

A storm shelter can be a tornado shelter, hurricane shelter or both. The design wind speed and debris impact criteria are less for hurricane shelters than for tornado shelters with a design wind speed of 250 mph. The intent of this provision is to require tornado storm shelters, not hurricane storm shelters.

For example, Guam is located in a region in which the design wind speed is 250 mph but they are also in a hurricane prone region where the design wind speed for hurricane shelters is less than 250 mph. This proposed change clarifies that it is not acceptable for a location like Guam to simply construct a hurricane storm shelter for E occupancy buildings with greater than 50 occupants; it is required to construct either a tornado storm shelter or a combined tornado and hurricane storm shelter.

Substantiation to support proposed change:

The following is an excerpt from “**Chapter 2: Definitions**” of THE 2018 IBC:

STORM SHELTER. A building, structure or portions thereof, constructed in accordance with ICC 500 and designated for use during a severe wind storm event, such as a hurricane or tornado.

Community storm shelter. A storm shelter not defined as a “Residential storm shelter.”

Residential storm shelter. A storm shelter servicing occupants of dwelling units and having an occupant load not exceeding 16 persons.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is to clarify the original code intent.

Internal ID: 2163

G61-18

IBC: 423.4

Proponent: Benchmark Harris, representing Self (bharris@huckabee-inc.com)

2018 International Building Code

Revise as follows:

423.4 Group E occupancies. In areas where the shelter design wind speed for tornados is 250 mph in accordance with Figure 304.2(1) of ICC 500, all Group E occupancies with an occupant load of 50 or more shall have a storm shelter constructed in accordance with ICC 500.

Exceptions:

1. Group E day care facilities that do not function as a school in which attendance by children is required by state law.
2. Group E occupancies accessory to places of religious worship.
3. Buildings meeting the requirements for shelter design in ICC 500.

Reason:

The purpose of the exception is to allow construction of a “day care” without a storm shelter. Day cares provide care to pre-school age children while parents are working and often provide care for Elementary or Middle School students before or after regular school hours. The intent of this exception is to not require tornado shelters for the children that are not required by state law to attend a public school or an equivalent education program. State Laws in all 50 States require attendance by children at a public school or equivalent educational program. Where children are in a day care at the choice of their parents or guardians, the parents or guardians have direct control over whether or not it is acceptable for their children to be in a facility without a tornado shelter.

However, because the IBC does not establish a maximum age limit on day care students, one could misinterpret the language in the 2018 IBC to allow considering an Elementary school as a day care so as to avoid requiring a tornado shelter.

Substantiation to support proposed change:

The following is Section 305 of the 2018 IBC. Section 305.2 does not establish a maximum age limit on day care students.

“SECTION 305

EDUCATIONAL GROUP E

305.1 Educational Group E.

Educational Group E occupancy includes, among others, the use of a building or structure, or a portion thereof, by six or more persons at any one time for educational purposes through the 12th grade.

305.1.1 Accessory to places of religious worship.

Religious educational rooms and religious auditoriums, which are accessory to places of religious worship in accordance with Section 303.1.4 and have occupant loads of less than 100 per room or space, shall be classified as Group A-3 occupancies.

Section 305.2 Group E, day care facilities.

This group includes buildings and structures or portions thereof occupied by more than five children older than 2 ½ years of age who receive educational, supervision or personal care services for fewer than 24 hours per day.

305.2.1 Within places of religious worship.

Rooms and spaces within places of religious worship providing such day care during religious functions shall be classified as part of the primary occupancy.

305.2.2 Five or fewer children.

A facility having five or fewer children receiving such day care shall be classified as part of the primary occupancy.

305.2.3 Five or fewer children in a dwelling unit.

A facility such as the above within a dwelling unit and having five or fewer children receiving such day care shall be classified as a Group R-3 occupancy or shall comply with the International Residential Code.”

Also, attached is a report on Compulsory School Age Requirements by the Education Commission of the States, which shows that all 50 States have minimum mandatory ages, which vary from State to State, generally from 5 to 8 years old but more commonly either 6 or 7 years old. This information was obtained for free online at

<http://www.ncsl.org/documents/educ/ECSCompulsoryAge.pdf> This link was established January 8, 2018

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies original code intent.

Internal ID: 2167

G62-18

IBC: 423.4

Proponent: Benchmark Harris, representing Self (bharris@huckabee-inc.com)

2018 International Building Code

Revise as follows:

423.4 Group E occupancies. In areas where the shelter design wind speed for tornados is 250 mph in accordance with Figure 304.2(1) of ICC 500, all Group E occupancies with an occupant load of 50 or more shall have a storm shelter constructed in accordance with ICC 500.

Exceptions:

1. Group E day care facilities.
2. ~~Group E occupancies~~ Religious educational rooms and religious auditoriums, which are accessory to places of religious worship.
3. Buildings meeting the requirements for shelter design in ICC 500.

Reason:

The phrase “religious educational rooms and religious auditoriums, which are accessory to places of religious worship” the appropriate phrase to identify building areas with a primarily religious function which should not be required to have shelters. The original language, on the other hand, could be incorrectly interpreted to waive the requirements for shelters in any private school as long as they simply have a religious affiliation. This incorrect interpretation would be discriminatory as it would not permit a waiver for private schools that do not have a religious affiliation.

Substantiation to support proposed change:

The following is Section 305 of the 2018 IBC. Section 305.1.1 uses the phrase “religious educational rooms and religious auditoriums, which are accessory to places of religious worship” (similar to the language used in Section 303.1.4).

“SECTION 305

EDUCATIONAL GROUP E

305.1 Educational Group E. Educational Group E occupancy includes, among others, the use of a building or structure, or a portion thereof, by six or more persons at any one time for educational purposes through the 12th grade.

305.1.1 Accessory to places of religious worship. Religious educational rooms and religious auditoriums, which are accessory to places of religious worship in accordance with Section 303.1.4 and have occupant loads of less than 100 per room or space, shall be classified as Group A-3 occupancies.

Section 305.2 Group E, day care facilities. This group includes buildings and structures or portions thereof occupied by more than five children older than 2 ½ years of age who receive educational, supervision or personal care services for fewer than 24 hours per day.

305.2.1 Within places of religious worship. Rooms and spaces within places of religious worship providing such day care during religious functions shall be classified as part of the primary occupancy.

305.2.2 Five or fewer children. A facility having five or fewer children receiving such day care shall be classified as part of the primary occupancy.

305.2.3 Five or fewer children in a dwelling unit. A facility such as the above within a dwelling unit and having five or fewer children receiving such day care shall be classified as a Group R-3 occupancy or shall comply with the International Residential Code.”

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is simply clarifying the original code intent.

Internal ID: 2212

G63-18

IBC: 423.4.1

Proponent: Daniel Dain, representing Self (daniel.dain@stantec.com)

2018 International Building Code

Revise as follows:

423.4.1 Required occupant capacity. The required occupant capacity of the storm shelter shall include all of the ~~buildings~~ Group E occupancies on the site and shall be the greater of the following:

1. The total occupant ~~load~~ capacity of the classrooms, vocational rooms and offices in the Group E occupancy.
2. The occupant ~~load~~ capacity of any indoor assembly space that is associated with the Group E occupancy.

Exceptions:

1. Where a new building is being added on an existing Group E site, and where the new building is not of sufficient size to accommodate the required occupant capacity of the storm shelter for all of the buildings on the site, the storm shelter shall at a minimum accommodate the required occupant capacity for the new building.
2. Where approved by the code official, the required occupant capacity of the shelter shall be permitted to be reduced by the occupant capacity of any existing storm shelters on the site.

Reason:

Below is the explanation for what IBC says regarding determining the **“Occupant Capacity”** for storm shelter. The suggestion would be to define this and use in lieu of “Occupant Load” because AHJ’s are having trouble distinguishing the difference. Code and fire officials are hung up on Chapter 10 Egress “occupant load” calculations for determining required shelter capacity.

2015 IBC

2015 IBC requires a storm shelter for E occupancies per Section 423. The section does not indicate or reference how to determine the occupant load. It does not reference anything in regards to egress, i.e. Chapter 10 or table 1004. Identifying the number of building occupants on a typical average school day has nothing to do with egress, it's not about fire exiting. It's about how much sf do we need to fit the building occupants. Section 1004.1 Design Occupant Load states “In determining means of egress requirements, the number of occupants for whom means of egress facilities are provided shall be determined in accordance with this section.”

The commentary in Section 423 states “Once the number of occupants to be accommodated is decided, ICC 500 provides details for the design and construction of the shelter”. It continues to state “It is not the intent to require the shelter to be designed for the total occupant load of the building that is used for means of egress. Where there is a situation where the classrooms would be empty if the gymnasium was full, such as an all-school assembly, or after-hours sporting event, the storm shelter can be designed to accommodate that occupant load.”

You will not find any reference in IBC 423, ICC 500, or FEMA P-361 to Chapter 10 of the IBC, it does not exist, that was never the intent. Keep in mind up until the 2015 IBC storm shelters were not required by occupancy type. If we designed a storm shelter at a rec center we would work with the owner to determine an appropriate capacity. For example, we may only have 5,000sf of usable space at $5/sf = 1,000$ occupants.

2018 IBC

Refer to text of EB 68-15, Dave Bowman ICC email, and 2015 IBC Storm Shelters AMENDED (which was issued by City of McKinney, TX).

The explanation of the ADDED Provisions states “Worse case occupant load is used for all spaces for fire exiting, but total occupant load for the building is excessive for storm shelter design. The determination for the required capacity of the shelter is based on the number of staff and students that will be in the school during a typical school day or any indoor assembly space that would be fully utilized outside school hours, whichever is greater. Thus, rather than the total occupant load of the building, the capacity of the shelter is appropriately based on occupant load described in the two scenarios described in Item 1 and 2.”

School districts may rely on enrollment data, fore Texas TEA capacity limits, and any other data or documentation they determine to identify the number of staff and students that will be in the school during a typical school day.

423.4.1 Required occupant capacity. The required occupant capacity of the storm shelter shall include all the buildings on the site, and shall be the greater of the following:

1. The total occupant load of the classrooms, vocational rooms and offices in the Group E occupancy.
2. The occupant load of any indoor assembly space that is associated with the Group E occupancy.

ICC 500

Chapter 5 of the ICC 500 requires 5 sf per person. A 35% reduction on top of that is significant to consider furniture, walls, etc and our calculation still gives us more sf than we need (xx sf required vs xx sf usable). Reversing the calculation we have enough sf after the reductions to hold xx people (divide usable sf by 5). Keep in mind they will put as many people as they can safely fit and the requirement is only for 2 hours. The redundancy and worst case is built into the calculations.

ICC 500 should be updated also:

202 Definitions

Storm Shelter Occupant Load Capacity. The occupant load capacity intended for a room or space when that space is in use as a storm shelter.

Link established 2.19.18

Cost Impact

The code change proposal will decrease the cost of construction .

The intent of this language is to clarify the commentary from the 2018 code proposed language that the intent when determining the occupant "capacity" of the storm shelter is not to use the building occupant "load" used for egress, which would result in shelters being over sized and higher construction costs.

Internal ID: 446

G64-18

IBC: 423.4.1

Proponent: Benchmark Harris, representing National Storm Shelter Association (bharris@huckabee-inc.com)

2018 International Building Code

Revise as follows:

423.4.1 Required occupant capacity. The required occupant capacity of the storm shelter shall include all of the buildings on the site and shall be the ~~greater of the following:~~

1. The total occupant load of the classrooms, vocational rooms and offices in the Group E occupancy.
2. ~~The occupant load of any indoor assembly space that is associated with the Group E occupancy.~~

Exceptions:

1. Where a new building is being added on an existing Group E site, and where the new building is not of sufficient size to accommodate the required occupant capacity of the storm shelter for all of the buildings on the site, the storm shelter shall at a minimum accommodate the required occupant capacity for the new building.
2. Where approved by the code official, the required occupant capacity of the shelter shall be permitted to be reduced by the occupant capacity of any existing storm shelters on the site.

Reason:

During normal daily use, there should not be more than the regular population of the school. If there is an assembly with more people than are regularly in the school, then adults have chosen to create that event and those adults have the ability to gauge the safety of venturing out and assembling. It should not be necessary to size the tornado shelter for indoor assembly events.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed code change simply clarifies the intent of the original code language.

Internal ID: 2124

G65-18

IBC: 423.4.1

Proponent: Benchmark Harris, representing self (bharris@huckabee-inc.com)

2018 International Building Code

Revise as follows:

423.4.1 Required occupant capacity. The required occupant capacity of the storm shelter shall include all of the buildings on the site and shall be the greater of the following:

1. The total occupant load of the classrooms, vocational rooms and offices in the Group E occupancy.
2. The occupant load of ~~any~~ the largest indoor assembly space that is associated with the Group E occupancy.

Exceptions:

1. Where a new building is being added on an existing Group E site, and where the new building is not of sufficient size to accommodate the required occupant capacity of the storm shelter for all of the buildings on the site, the storm shelter shall at a minimum accommodate the required occupant capacity for the new building.
2. Where approved by the code official, the required occupant capacity of the shelter shall be permitted to be reduced by the occupant capacity of any existing storm shelters on the site.

Reason:

The original language could be misinterpreted to indicate that item 2 of 423.4.1 refers to the occupant load of the sum of any indoor assembly spaces, whereas this provision should only require shelters accommodate the largest indoor assembly space because it is extremely unlikely that all indoor assembly spaces would be occupied to the maximum permitted fire egress limit and a significant tornado would strike the building.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply clarifies the code intent.

G66-18

IBC: 402.6.3, 424.1, 424.2, 424.3, 424.4, 424.5, 424.5.1 (New), [F] TABLE 903.2.11.6 IFC TABLE 903.2.11.6

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

402.6.3 Children's play-Play structures. ~~Children's play-Play~~ structures located within the ~~mall~~ of a ~~covered mall~~ building or within the perimeter line of an *open mall building* shall comply with Section 424. The horizontal separation between ~~children's~~ play structures, kiosks and similar structures within the *mall* shall be not less than 20 feet (6096 mm).

SECTION 424 CHILDREN'S PLAY STRUCTURES

424.1 General. ~~Children's play-Play~~ structures installed inside all occupancies covered by this code that exceed 10 feet (3048 mm) in height or 150 square feet (14 m²) in area shall comply with Sections 424.2 through 424.5.

424.2 Materials. ~~Children's play-Play~~ structures shall be constructed of noncombustible materials or of combustible materials that comply with the following:

1. *Fire-retardant-treated* wood complying with Section 2303.2.
2. Light-transmitting plastics complying with Section 2606.
3. Foam plastics (including the pipe foam used in soft-contained play equipment structures) having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance with UL 1975 or when tested in accordance with NFPA 289, using the 20 kW ignition source.
4. Aluminum composite material (ACM) meeting the requirements of Class A *interior finish* in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended for use.
5. Textiles and films complying with the fire propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701.
6. Plastic materials used to construct rigid components of soft-contained play equipment structures (such as tubes, windows, panels, junction boxes, pipes, slides and decks) exhibiting a peak rate of heat release not exceeding 400 kW/ m² when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation at a thickness of 6 mm.
7. Ball pool balls, used in soft-contained play equipment structures, having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance with UL 1975 or when tested in accordance with NFPA 289, using the 20 kW ignition source. The minimum specimen test size shall be 36 inches by 36 inches (914 mm by 914 mm) by an average of 21 inches (533 mm) deep, and the balls shall be held in a box constructed of galvanized steel poultry netting wire mesh.
8. Foam plastics shall be covered by a fabric, coating or film meeting the fire propagation performance criteria contained in Test Method 1 or Test Method 2, as appropriate, of NFPA 701.
9. The floor covering placed under the children's play structure shall exhibit a Class I interior floor finish classification, as described in Section 804, when tested in accordance with ASTM E648 or NFPA 253.
10. Interior finishes for structures exceeding 300 square feet (28 m²) in area or 10 feet (3048 mm) in height shall have a flame spread index not greater than that specified in Table 803.13 for the occupancy group and location designated. Interior wall and ceiling finish materials tested in accordance with NFPA 286 and meeting the acceptance criteria of Section 803.1.1.1, shall be permitted to be used where a Class A classification in accordance with ASTM E84 or UL 723 is required.

[F] 424.3 Fire protection. ~~Children's play-Play~~ structures shall be provided with the same level of *approved* fire suppression and detection devices required for other structures in the same occupancy.

424.4 Separation. ~~Children's play-Play~~ structures shall have a horizontal separation from building walls, partitions and from elements of the *means of egress* of not less than 5 feet (1524 mm). Children's playground structures shall have a horizontal separation from other children's play structures of not less than 20 feet (6090 mm).

424.5 Area limits. ~~Children's play~~ Play structures shall be not greater than 300 square feet (28 m²) in area, unless a special investigation, acceptable to the building official, has demonstrated adequate fire safety.

Add new text as follows:

424.5.1 Design. Play structures exceeding 300 square feet (28 m²) in area or 10 feet (3048 mm) in height shall be designed in accordance with Section 1601.1.

Revise as follows:

**[F] TABLE 903.2.11.6
ADDITIONAL REQUIRED SUPPRESSION SYSTEMS**

SECTION	SUBJECT
402.5, 402.6.2	Covered and open mall buildings
403.3	High-rise buildings
404.3	Atriums
405.3	Underground structures
407.6	Group I-2
410.7	Stages
411.4	Special amusement buildings
412.3.6	Airport traffic control towers
412.4.6, 412.4.6.1, 412.6.5	Aircraft hangars
415.11.11	Group H-5 HPM exhaust ducts
416.5	Flammable finishes
417.4	Drying rooms
419.5	<i>Live/work units</i>
424.3	Children's Play structures
427	Buildings containing laboratory suites
507	Unlimited area buildings
509.4	Incidental uses
1029.6.2.3	Smoke-protected assembly seating
IFC	Sprinkler system requirements as set forth in Section 903.2.11.6 of the International Fire Code

Reason:

Indoor play structures can cover a wide range of activities and are not limited to children’s play structures. Some examples of these are; indoor skydiving, permanent haunted houses, very large and tall rock climbing walls in gymnasiums of schools and universities, laser tag facilities with elevated and large structures having massive concealed spaces, Indoor archery ranges with foam 3d targets and any number of other indoor activities with recreational structures located within a building. A growing number of “I” Occupancy structures are now adding adult playgrounds. A climbing or skydiving facility may be well over 1000 sf in area/footprint and I have recently reviewed one over 42’ in height. The structure in many cases needs to be designed per IBC Chapter 16 and ASCE 7, in a seismic zone it may be considered a “nonbuilding structure or attachment” with special design considerations needed. There are often unique structural stability and anchorage requirements, plus many potential fire safety issues dealing with concealed spaces and flame spread requirements. I think this change will not clutter the section nor create confusion as 424.1 already calls out “Children’s Play Structures installed inside all occupancies. I have not altered the term “Children’s” in section 424.4 as I believe that is a very unique requirement applicable to children’s playground equipment and would not apply to other larger play structures where they meet the design and FLS requirements for finishes and fire protection by submitting a special Investigation to the building Official as noted in section 424.5.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal is primarily a revision that clarifies that play structures are not necessarily just used by children. The requirements apply regardless of this designation. I one were to interpret the code as meaning that this is an expansion of requirements, then this could be taken to be that the cost of construction is increased. Since the requirements for larger play structures is expanded somewhat, the cost of construction may increase.

G67-18

IBC: [F] 424.3

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

[F] 424.3 Fire protection. Children's play structures shall be provided with ~~the same level of approved fire suppression and detection devices~~ fire protection systems required for other structures in the same occupancy.

Reason:

The term suppression is used in several ways throughout the IFC. Suppression is not a defined term, but it means to extinguish the fire or is commonly used as a fire department response term. The IFC uses suppression in ways that are not related to fire extinguishment or fire department response. This proposal adjusts lists, and charging sections to hone in to the intent of the section and replaces with a more exclusive and defined term of fire protection system. A fire protection system is a sprinkler system, an alarm system, a standpipe system and on and on. It is a better term. This proposal is consistent with an FCAC proposal that revises this terminology throughout the IFC and IBC in Chapter 9 and other locations.

Cost Impact

The code change proposal will decrease the cost of construction .

Using defined terms in the code will save on mis-interpretation and mis-application of the code.

Internal ID: 1863

G68-18

IBC: 424.5

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Building Code

Revise as follows:

424.5 Area limits. Children's play structures complying with Section 424.2 shall be not greater than ~~300~~600 square feet (~~28~~56 m²) in area, unless a special investigation, acceptable to the building official, has demonstrated adequate fire safety.

Reason:

The requirements contained in sections 424.2 are sufficiently adequate for fire safety that it is unnecessary to limit the area to which they apply simply to the range of 150 square feet up to 300 square feet. Note that, also, there is a requirement, in 424.3, for including active fire protection in the compartment where the structure is installed (not in the children's play structure itself).

Cost Impact

The code change proposal will decrease the cost of construction .

This code proposal will make it unnecessary to conduct a fire hazard assessment for children play structures that are between 300 and 600 square feet in area, if they meet the requirements of 424.2.

Internal ID: 1028

G69-18

IBC: [F]426.1

Proponent: Ellie Klausbruckner, Klausbruckner & Associates Inc., representing Klausbruckner & Associates, Inc. (ek@klausbruckner.com)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Revise as follows:

[F] 426.1 General. The provisions of Sections 426.1.1 through 426.1.7 shall apply to buildings in which materials that produce combustible dusts are stored or handled. Buildings that store or handle combustible dusts shall comply with the applicable provisions of the International Fire Code. Where required by the fire code official, NFPA 652 and the applicable provisions of NFPA 61, NFPA 85, NFPA 120, NFPA 484, NFPA 654, NFPA 655 and NFPA 664 ~~and the International Fire Code shall apply.~~

Reason:

A complete revision of Chapter 22 of the IFC has been proposed. The chapter is intended to address many of the issues that concern fire departments (sources of ignition, duct collection, housekeeping, etc). NFPA 652 is a very useful standard and has been referenced in the new chapter should the fire code official require additional analysis. However it is no longer the only option for compliance. Therefore the language is revised to allow for the fire code official to require this analysis for more complicated uses and facilities, without the need to require it for every single facility that has or produces combustible dust.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposed code change will decrease the cost for complicated analysis during plan submittals and inspections phase of a construction project.

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

SECTION [F] 426 COMBUSTIBLE DUSTS, COMBUSTIBLE FIBERS, GRAIN PROCESSING AND STORAGE

Revise as follows:

[F] 426.1 General. ~~The provisions of Sections 426.1.1 through 426.1.7 shall apply to buildings in which materials that produce combustible dusts are stored or handled.~~ Buildings that store or handle combustible dusts or combustible fibers shall comply with NFPA 652 and the applicable provisions of NFPA 61, NFPA 85, NFPA 120, NFPA 484, NFPA 654, NFPA 655 and NFPA 664 and the International Fire Code. The provisions of Sections 426.2 through 426.8 shall apply as appropriate to buildings in which materials that produce combustible dusts are stored or handled.

[F] 426.1.1-426.2 Type of construction and height exceptions. Buildings shall be constructed in compliance with the height, number of stories and area limitations specified in Sections 504 and 506; except that where erected of Type I or II construction, the heights and areas of grain elevators and similar structures shall be unlimited, and where of Type IV construction, the maximum building height shall be 65 feet (19 812 mm) and except further that, in isolated areas, the maximum building height of Type IV structures shall be increased to 85 feet (25 908 mm).

[F] 426.1.2-426.3 Grinding rooms. Every room or space occupied for grinding or other operations that produce combustible dusts in such a manner that the ~~room or space is classified as a Group H-2 occupancy concentration and conditions create a fire or explosion hazard based a dust hazard analysis prepared in accordance with Section 426.1 and NEPA 652~~ shall be enclosed with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both. The fire-resistance rating of the enclosure shall be not less than 2 hours where the area is not more than 3,000 square feet (279 m²), and not less than 4 hours where the area is greater than 3,000 square feet (279 m²).

[F] 426.1.3-426.4 Conveyors. Conveyors, chutes, piping and similar equipment passing through the enclosures of rooms or spaces shall be constructed dirt tight and vapor tight, and be of *approved* noncombustible materials complying with Chapter 30.

[F] 426.1.4-426.5 Explosion control. Explosion control shall be provided as specified in the International Fire Code, ~~or spaces shall be equipped with the equivalent mechanical ventilation complying with the International Mechanical Code.~~

[F] 426.1.5-426.6 Grain elevators. Separation distance. Grain elevators, malt houses and buildings for ~~similar occupancies other operations that produce combustible dusts in such a manner that the concentration and conditions create a fire or explosion hazard based on a dust hazard analysis prepared in accordance with Section 426.1 and NFPA 652~~ shall not be located within 30 feet (9144 mm) of interior *lot lines* or structures on the same *lot*, except where erected along a railroad right-of-way.

[F] 426.1.6-426.7 Coal pockets. Coal pockets located less than 30 feet (9144 mm) from interior lot lines or from structures on the same lot shall be constructed of not less than Type IB construction. Where more than 30 feet (9144 mm) from interior *lot lines*, or where erected along a railroad right-of-way, the minimum type of construction of such structures not more than 65 feet (19 812 mm) in *building height* shall be Type IV.

[F] 426.1.7-426.8 Tire rebuilding. Buffing operations shall be located in a room separated from the remainder of the building housing the tire rebuilding or tire recapping operation by a 1-hour *fire barrier*.

Exception: Buffing operations are not required to be separated where all of the following conditions are met:

1. Buffing operations are equipped with an *approved* continuous automatic water-spray system directed at the point of cutting action.
2. Buffing machines are connected to particle-collecting systems providing a minimum air movement of 1,500 cubic feet per minute (cfm) (0.71 m³/s) in volume and 4,500 feet per minute

(fpm) (23 m/s) in-line velocity.

3. The collecting system shall discharge the rubber particles to an *approved* outdoor noncombustible or fire-resistant container, which is emptied at frequent intervals to prevent overflow.

Reason:

This proposal is follow up work correlating the IBC and IFC provisions with the work done on Chapter 22 Combustible Dust and Chapter 37 Combustible Fibers in the IFC along with Section 426 of the IBC. Last cycle IBC Section 426 and IFC Chapter 22 were updated to incorporate NFPA 652 Standard on the Fundamentals of Combustible Dust.

An editorial change has been made with the numbering of the subsections. They are not a running subsection to 426.1, each covers a topic that an occupancy with a combustible dust hazard might have to comply with. The numbering scheme is a holdover from when the requirements were buried within another portion of the code.

The section title is modified to add "Combustible Fibers". A key hazard of combustible fibers can be combustible dust. The addition will highlight the need to apply this section to designers and code officials.

Section 426.1 is modified by switching the order of the sentences and adding "combustible fibers". This is to ensure this section and the dust hazard analysis in NFPA 652 is applied across the board to combustible dust and combustible fiber occupancies.

Section 426.1.2 (New 426.3) is modified to replace the Group H-2 trigger with one that refers to conditions that create a fire or explosion hazard based upon a dust hazard analysis.

Section 426.1.4 (New 426.5) is modified by eliminating the explosion control alternative reference to the IMC. Ventilation can be a form of explosion control, but the correct path is through Section 911 of the IFC and its referenced standard NFPA 69.

Section 426.1.5 (New 426.6) has been re-titled to "Separation distance" to correctly identify the subject matter and in place of similar occupancies which is subjective the wording "other operations that produce combustible dusts in such a manner that the concentration and conditions create a fire or explosion hazard based on a Dust Hazard Analysis prepared in accordance with Section 426.1 and NFPA 652" has been inserted.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The intent of these changes is not to change the cost of construction, simply to clean up and correlate language to other changes in the codes. Any time correlation is improved the cost of construction can be reduced.

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

INDOOR HORTICULTURAL GROW STRUCTURE. An enclosed structure installed within buildings that creates a controlled environment for enhanced horticultural growing conditions utilizing an artificial light source.

Add new text as follows:

429 INDOOR HORTICULTURAL GROW STRUCTURES

429.1 General. Indoor horticultural grow structures installed and operated inside all occupancies covered by this code that exceed 5 feet (1524mm) in height and 32 square feet (3.0 m²) in floor area shall comply with Sections 429.2 through 429.8.

429.2 Materials.

Horticultural grow structures shall be constructed of noncombustible materials or of combustible materials that comply with the following:

1. Textiles and films complying with Test Method 2 of NFPA 701.
2. Foam plastics having a maximum heat-release rate not greater than 100 kilowatts when tested in accordance with UL 1975 or when tested in accordance with NFPA 289, using the 20 kW ignition source.
3. Solid plastic materials used to construct rigid components exhibiting a peak rate of heat release not exceeding 400 kW/ m² when tested in accordance with ASTM E1354 at an incident heat flux, of 50 kW/m²; in the horizontal orientation at a thickness of 6 mm.
4. Fire-retardant-treated wood complying with Section 2303.2.
5. Light-transmitting plastics complying with Section 2606.
6. Aluminum composite material (ACM) meeting the requirements meeting the requirements of Class A interior finish in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended for use.

429.3 Electrical wiring and equipment. Electrical wiring, luminaires and equipment shall be listed and labeled for the intended use and installed in accordance with the manufacturer's instructions and NFPA 70.

429.4 Carbon dioxide enrichment systems. Where provided, carbon dioxide enrichment systems shall comply with Section 5307.4 of the International Fire Code.

429.5 Heating appliances. Where heating appliances are installed, these devices shall be installed in accordance with the manufacturer's instructions and the requirements found in Chapter 9 of the International Mechanical Code.

429.6 Fire protection systems. All required fire protection systems shall be in accordance with section 901.2 of this Code. Clearance shall be maintained between automatic sprinklers and the top of horticultural grow structures in accordance with NFPA 13.

429.7 Clearance from ignition sources. Clearance between indoor horticultural grow structures and ignition sources such as luminaires, heaters and grow lamps shall be maintained in an approved manner.

429.8 Area limits. Indoor horticultural grow structures shall not exceed an aggregate 200 square feet (18.6 m²) of floor area per fire area, unless a special investigation, acceptable to the code official, has demonstrated adequate fire safety.

802.8 Indoor horticultural grow structures. The materials used to construct indoor horticultural grow structures shall comply with Section 429.

Internal ID: 1053

G71-18 Part II

IFC: SECTION 202, 202 (New), 801.2 (New), 802.1

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Fire Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

INDOOR HORTICULTURAL GROW STRUCTURE An enclosed structure installed within buildings that creates a controlled environment for enhanced horticultural growing conditions utilizing an artificial light source.

Add new text as follows:

801.2 Indoor horticultural grow structures. The materials used to construct horticultural grow structures in new and existing buildings shall comply with Section 429 of the International Building Code.

802.1 Definitions. INDOOR HORTICULTURAL GROW STRUCTURE.

Reason:

The definition of an Indoor Horticultural Grow Structure includes the use of an artificial light source to help differentiate it from a greenhouse operation which utilizes a sunlit environment.

Horticultural grow structures constructed of combustible materials are increasingly being used indoors in commercial and residential occupancies, and sizes vary from 2 ft. by 2 ft. to over 10 ft. by 20 ft. Examples of these products and related accessories can be found at:

[https://www.amazon.com/s/ref=sr_st_price-desc-rank?](https://www.amazon.com/s/ref=sr_st_price-desc-rank?keywords=Indoor+Grow+Tents&rh=i%3Aaps%2Ck%3AIndoor+Grow+Tents&qid=1514996452&sort=price-desc-rank)

[keywords=Indoor+Grow+Tents&rh=i%3Aaps%2Ck%3AIndoor+Grow+Tents&qid=1514996452&sort=price-desc-rank](https://www.amazon.com/s/ref=sr_st_price-desc-rank?keywords=Indoor+Grow+Tents&rh=i%3Aaps%2Ck%3AIndoor+Grow+Tents&qid=1514996452&sort=price-desc-rank)

There are several safety concerns that need to be addressed to ensure adequate safety is provided, which are addressed in the proposal and described as follows. The proposed requirements are similar to those included in IBC Section 424 for indoor children's play structures. Specific comments on the proposal include the following:

IFC Section 801.2 - The reference to IBC Section 429 is provided as a convenience to the user, and to clarify that the requirements apply to installations in new and existing buildings.

IBC Section 802.7 - This reference is provided for users who are looking for fabric and material flammability requirements for these structures.

Section 429.1 - Threshold size limitations are proposed to exclude smaller horticultural grow structures that represent less of a fire hazard compared to larger structures.

Section 429.2 - Requirements are similar to those in Section 424.2.

Section 429.4 - Carbon dioxide enrichment systems are sometimes sold as accessories for horticultural grow structures. A reference is provided to the IFC requirements covering these systems as a convenience to the code user.

Section 429.8 - The area limit concept is similar to that in Section 424, and allows the code official to address fire hazards with larger areas without having to invoke imminent hazard or hazard abatement requirements in the code.

Cost Impact

The code change proposal will increase the cost of construction .

This action will increase the cost of construction. There may be an additional cost of materials used to comply with Section 429.2, and to comply with the additional safety requirements.

Internal ID: 3509

G72-18

IBC: 202, 308.1.1(New), 429 (New), Chapter 35

Proponent: Dave Frable, U.S. General Services Administration, representing U.S. General Services Administration

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

LOCK-UP An area located within a building or structure having a predominant occupancy classification other than Group I-3, and where the occupants for penal or correctional purposes are detained for less than 24 hours by the use of security measures not under the occupants' control.

Add new text as follows:

308.1.1 Lock-ups. Lock-ups located within a building or structure having a predominant occupancy classification other than Group I-3, where the area has capacity for not more than 50 detainees, and where no individual is detained for 24 hours or more, shall comply with the requirements of the predominant occupancy of the building or structure in which the lock-up is located and with the requirements of Section 429. Lock-ups having a capacity for more than 50 detainees or where any individual is detained for 24 hours or more shall be classified as Group I-3 occupancy and shall comply with the other applicable requirements in this code.

429 LOCK-UPS

429.1 General. Lock-ups located within a building or structure having a predominant occupancy classification other than Group I-3, where the area has capacity for not more than 50 detainees, and where no individual is detained for 24 hours or more, shall comply with the provisions in Sections 429.1 through 429.5 and other applicable provisions of this code.

429.2 Automatic Sprinkler System. Buildings and structures where lock-ups are located shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

429.3 Fire Alarm System. Buildings and structures where lock-ups are located shall be equipped with a fire alarm system that initiates the occupant notification signal installed in accordance with Section 907.6.

429.4 Lock-up Criteria. The lock-up shall comply with the requirements for the predominant occupancy of the building in which the lockup is located, and the following criteria:

1. Doors and other physical restraints to free egress by detainees can be readily released by staff within 2-minutes of the onset of a fire or similar emergency.
2. Staff is in sufficient proximity to the lock-up so as to be able to cause the 2-minute release required by Item1 whenever detainees occupy the lockup.

Exception:Where staff is not in sufficient proximity to the lock-up so as to be able to cause the 2-minute release required by Item 2, an automatic smoke detection system shall be installed throughout the lock-up area installed in accordance with the requirements in NFPA 72.
3. Staff is authorized to cause the release required by Item 1.
4. Staff is trained and practiced in effecting the release required by Item1.
5. Where the release required by Item1 is caused by means of remote release, detainees are not to be restrained from evacuating without the assistance of others.
6. Where security operations necessitate the locking of required means of egress, the following shall apply:
 - 6.1. Detention-grade hardware complying with ASTM F 1577 shall be provided on swinging doors within the required means of egress.
 - 6.2. Sliding doors within the required means of egress shall be designed and engineered for detention and correctional use, and lock cylinders shall meet the cylinder test requirements of ASTM F 1577.

429.5 Fire department notification. The building owner/manager shall notify the fire department with responsibility to respond to the building or structure of the presence of the lockup.

Add new standard(s) follows:

ASTM

ASTM International

C700
West Conshohocken PA 19428-
2959
US

F1577-05 (2012):

Standard Test Methods for Detention locks for Swinging Doors

Analysis: A review of the standard proposed for inclusion in the code, [INSERT STANDARD], with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Reason:

The intent of this code change proposal is to address the subject matter of ‘lock-ups” where the occupants for penal or correctional purposes are detained for less than 24 hours by the use of security measures not under the occupants’ control. A lock-up is basically a holding area in which persons are detained with some degree of security imposed on them that are commonly located in different types of occupancies. For example, lockups are typically located in U.S. Customs and Border Protection facilities at border crossings, airports and seaports; prisoner holding facilities at courthouses; local police departments; security offices at sports stadia; security offices at shopping mall complexes; etc. Currently, the requirements within the IBC require “lock-ups” to meet the rigorous defend in place requirements applicable to Institutional Group I-3 occupancies. This code change proposal provides requirements specifically for lock-ups located in building and structures having a predominant occupancy classification other than Institutional Group I-3 occupancy and provides a reasonable set of safe guards applicable to the predominant occupancy of the building in which the lock-up is located. The subject provisions for lock-ups are meant to apply to holding areas having a capacity of not more than 50 detainees, in which no individual is detained for 24 hours or more. The threshold for the holding area to limit the capacity to not more than 50 detainees is based on the requirements in NFPA 101, Life Safety Code, and seems reasonable for processing/holding areas for facilities at border crossings, airports and seaports and prisoner holding facilities at courthouses.

Section 202 has been revised to include a new definition for a lock-up. Section 308 has also been revised to include a new sub-section 308.1 on lock-ups

A new Section 429, Lock-Ups has been created to provide a reasonable set of safe guards applicable for when a predominant occupancy of the building or structure has an occupancy classification other than Institutional Group I-3 occupancy in which the lock-up is located. For example, safe guards include, but are not limited to: an automatic sprinkler system throughout the building or structure, a fire alarm system, a 2-minute timeframe for trained staff to release the detainees or an option for the installation of a smoke detection system within the lock-up area if the 2-minute timeframe for trained staff to release the detainees cannot be met, detention-grade door hardware to improve reliability, and building owner/manager notification of the local responding fire department of the presence of the lock-up.

Please note that the subject code change proposal is based on the requirements for lock-ups in the National Fire Protection Association 101, Life Safety Code (2018 edition).

The intent of this proposal is to reference ASTM Standard F 1577-05 (2012), Standard Test Methods for Detention Locks for Swinging Doors to improve the reliability of detention-grade hardware for lock-ups.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

We believe the subject code change proposal to include lock-ups will not affect the cost of construction either way.

Requiring lock cylinders of detention door hardware to meet the cylinder test requirements of ASTM F 1577 may increase construction costs.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F1577-05 (2012), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

G73-18

IBC 503.1.4

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

503.1.4 Occupied roofs. A roof level or portion thereof shall be permitted to be used as an occupied roof provided the occupancy of the roof is an occupancy that is permitted by Table 504.4 for the story immediately below the roof. The area of the occupied roofs shall not be included in the *building area* as regulated by Section 506.

Exceptions:

1. The occupancy located on an occupied roof shall not be limited to the occupancies allowed on the *story* immediately below the roof where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and occupant notification ~~in accordance with Section 907.5~~ where required by Section 907.2 is provided in the area of the occupied roof.
2. Assembly occupancies shall be permitted on roofs of open parking spaces of Type I or Type II construction, in accordance with the exception to Section 903.2.1.6.

503.1.4.1 Enclosures over occupied roof areas. Elements or structures enclosing the occupied roof areas shall not extend more than 48 inches (1220 mm) above the surface of the occupied roof.

Exception: Penthouses constructed in accordance with Section 1510.2 and towers, domes, spires and cupolas constructed in accordance with Section 1510.5.

Reason:

This code change is needed to clarify exactly what is required for exception #1 of Section 503.1.4 in terms of providing occupant notification in the area of the occupied roof. This is done by replacing the reference to 907.5 with 907.2 which provides scoping for fire alarms based on the occupancy served on the occupied roof. Section 907.5 is referenced from 907.2 so once the scope of the fire alarm system is determined in 907.2 designers will then go to 907.5 to determine installation requirements.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is simply a clarification of the requirements. There will be no cost impact.

Internal ID: 85

G74-18

IBC: 503.1.4.1

Proponent: Jay Hyde, representing Sacramento Valley Association of Building Officials (jhyde@mogaveroarchitects.com)

2018 International Building Code

Revise as follows:

503.1.4.1 Enclosures surrounding occupied roof areas. Elements or structures enclosing occupied roof areas shall not extend more than 48 inches (1220 mm) above the surface of the occupied roof.

~~Exception~~**Exceptions:**

1. Penthouses constructed in accordance with Section 1510.2 and towers, domes, spires and cupolas constructed in accordance with Section 1510.5.
2. Exterior walls or fire walls of adjacent buildings in conformance with the following:
 - 2.1. The exterior sides of the occupied roof not surrounded by adjacent buildings, penthouses, towers, domes spires and cupolas shall have uniformly distributed parapets with a sill height not greater than 48 inches (1220 mm).
 - 2.2. The aggregate length of the parapets shall not be less than 40 percent of the total exterior wall.
 - 2.2.1. Parapets are not required to be distributed over 40 percent of the occupied roof perimeter where they are uniformly distributed over two opposing sides of the occupied roof.

Reason:

Buildings with occupied roofs may be located between two adjacent buildings restricting openness, access and ventilation. This proposal considers that the open side/ventilation requirements for open parking garages contained in IBC Section 406.5.2 will provide the necessary openness and ventilation for occupied roofs.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal will not increase or decrease the cost of construction because this exception is permissive, not mandatory: it permits a designer to locate an occupied roof on a building which is not freestanding.

Internal ID: 1417

G75-18

IBC: TABLE 504.3

For SI: 1 foot = 304.8 mm.

UL = Unlimited; NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the *International Fire Code*.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB and its various WGs held meetings, studied issues and sought input from various expert sources around the world. The TWB has posted those documents and input on its website for interested parties to follow its progress and to allow those parties to, in turn, provide input to the TWB.

At its first meeting, the TWB discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings:

No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.

No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.

No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.

No unusual fire department access issues.

Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.

Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

The comprehensive package of proposals from the TWB meet these performance objectives. The TWB also determined that fire testing was necessary to validate these concepts. At its first meeting, members discussed the nature and intention of fire testing so as to ensure meaningful results for the TWB and, more specifically, for the fire service. Subsequently a test plan was developed. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of joints, and to evaluate conditions for responding fire personnel. The Fire WG then refined the test plan, which was implemented with a series of five, full-scale, multiple-story building tests at the Alcohol, Tobacco and Firearms (ATF) laboratories in Beltsville, MD. The results of those tests, as well as testing conducted by others, helped form the basis upon which the Codes WG developed its code change proposals. This code change proposal is one of those developed by the Codes WG and approved by the TWB.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit:

<http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17

Allowable Height

This proposal addresses the allowable building height, in terms of feet, for the three new construction types proposed by the TWB. As set forth in the proposal to Section 602.4, the three new types of construction are Types IV-A, IV-B, and IV-C. The Committee examined each proposed type of construction for its safety and efficacy with regard to each occupancy type.

The following approach was used to develop proposed allowable heights of the new construction types, based on the conclusions of the Committee:

Based upon TWB review of fire safety and structural integrity performance, Type IV-B is equated to Type I-B for height (in feet). A noteworthy item to remember is that, per Section 403.2.1.1 of the IBC, Type IB construction is permitted to be reduced to 1-hour Fire Resistance rating; however, the TWB does not propose to allow the same reduction for Type IV-B. As a result, the comparison is between 2-hr mass timber construction that is partially exposed, versus 1-hr Type IB construction, and the Committee believes that 2-hr mass timber construction that is partially exposed per the limits of proposed Section 602.4 warrants the same heights as allowed for 1-hr Type I-B construction. It should be noted that the unprotected mass timber also needs to meet the 2 hour FRR, thus the protected area will likely be conservatively higher FRR than actually required;

Type IV-A should be somewhat larger than IV-B, as Type IV-A construction is entirely protected (no exposed mass timber permitted) and the required rating of the structure is equivalent to those required of Type I-A construction (3-hr rating for structural frame). However, the Committee did not find it acceptable to allow the unlimited heights of Type I-A to be applied to Type IV-A. Instead, the Committee applied a multiplier of 1.5 to the heights proposed for Type IV-B construction, in order to propose reasonable height allowances for IV-A construction;

The Committee viewed Type IV-C as similar to existing HT construction with the exception that IV-C has a 2 hour FRR where HT is acceptably fire resistant based on the large sizes of the members. As such, the height in feet is proposed to be equal to the height in feet of Type IV-HT. In terms of stories, however, the Committee proposed an additional number of stories for IV-C in recognition of its greater FRR.

4. While the base code seems to allow significant heights for buildings without sprinklers (e.g., Table 504.3 currently allows a height of 160 feet for NS Type I-B construction for many occupancy classifications), the Committee believes that no additional heights over what is already permitted for Type IV-HT would be proposed for the NS (non sprinklered) rows. As such, where separate rows are provided for heights for the NS situation, the proposed heights for Types IV-A, IV-B, and IV-C are the same as those heights already permitted for Type IV for the NS condition.

This methodology explains the majority of the recommendations here. Specifically, for occupancy groups A, B, E, F, I-4, M, R, S, U, the methodology described above accurately reflects how the height proposals were developed.

After undergoing this methodology to develop initial height recommendations, the Committee then applied professional judgment (from both a fire safety and a structural perspective), to develop a working draft table, cell by cell, for all occupancy types.

The exercise for establishing the allowable number of stories for the three new types of construction started with setting Type I-B allowances equivalent to Type IV-B. The tabular fire resistance ratings of building elements for these two types of construction is identical (not including the reduction permitted by 403.2.1.1), so the identical number of stories was deemed a reasonable starting point. From this point, the TWB Committee reviewed each occupancy classification to see if the Type I-B story allowance required adjustment.

Following is a summary of how allowable number of stories for sprinklered I-B were adjusted for IV-B:

A-1, A-2, A-3, A-4, A-5, B, E, H-1, H-5, I-1(1), I-1(2), I-2, I-3, I-4, R-1, R-2, R-3, R-4, U: no adjustment, same number of allowable stories as Type I-B.

F-1 and S-1: reduced from 12 to 7 (2 story increase from Type IV-HT)

F-2, M, S-2: reduced from 12 to 8 (2 story increase from Type IV-HT)

H-2: reduced from 3 to 2 (same as Type IV-HT)

H-3: reduced from 6 to 4 (same as IV-Type HT)

H-4: reduced from 8 to 7 (1 story increase from Type IV-HT)

Similarly, to establish the height in feet for Type IV-B:

A-1, A-2, A-3, A-4, A-5, B, E, F-1, F-2, I-4, M, R-1, R-2, R-3, R-4, S-1, S-2, U: same allowable height as I-B.

H-1, H-2, H-3: reduced from 180' to 90'

H-4: reduced from 180' to 100'

H-5: reduced from 160' to 90'

I-1(1): reduced from 180' to 120'

I-1(2): reduced from 180' to 65'

I-2: reduced from 180' to 65'

I-3: reduced from 180' to 120'

Adjusting IV-B up to IV-A for allowable number of stories:

A-1, A-2, A-3, A-4, A-5, B, E, F-2, I-4, M, R-1, R-2, R-3, R-4, S-1, S-2, U - 1.5 x IV-B number of stories

F-1, S-1 increase by 3 stories

H-1, H-3 same as IV-HT

H-2, H-4, H-5 increase by 1 story

I-1(1), I-1(2), I-2, I-3 increase by 2 stories

H-3 reduced from 6 to 4 (same as IV-HT)

H-4 reduced from 8 to 7 (1 story increase from IV-HT)

I-1(1), I-1(2), I-2, I-3, same as IV-HT

Adjusting IV-B to IV-A for building height:

A-1, A-2, A-3, A-4, A-5, B, E, F-1, F-2, H-1, H-5, I-1(1), I-3, I-4, M, R-1, R-2, R-3, R-4, S-1, S-2, U: multiply 1.5 x Type IV-B (180 ft.)

H-1, H-2 H-3, H-5: increase by 30 ft.

H-4: increase by 40 ft.

I-1(2), I-2: same as Type IV-HT

For instance, for Groups H-1, H-2, H-3, and H-5, while the table allows 160 feet for Type I-B construction, the Committee proposed a height of 90 feet for Type IV-B construction, and is using a multiplier of 1.33 to propose a height for Type IV-A construction of 120 feet height, intentionally made equal to the existing Heavy Timber heights.

For H-4, corrosives represent a health hazard (but not necessarily a fire hazard) to building occupants and first responders, the Committee believed that reduced heights were warranted. These are slightly greater than discussed above for the H-occupancy groups (140 feet versus 120 feet for IV-A construction, and 100 feet versus 90 feet for IV-B construction), but these still are far below what is permitted for Type I-B construction (180 feet permitted for the sprinklered condition), and is in recognition of the particular type of Hazardous occupancy covered by the H-4 occupancy group.

For Group I occupancies, there are two rows in the table, one being a row that includes I-1 Condition 1 and I-3 occupants (more capable of self-preservation) and the other being a row that includes I-1 Condition 2 and I-2 occupants (less capable of self-preservation). For I-1 Condition 1 and I-3 occupants, the Committee proposed a height of 120 feet for Type IV-B (versus 180 feet from the general methodology summarized above) and a height of 180 feet for Type IV-A (versus 270 feet from the general methodology summarized above). For those I-1 Condition 2 and I-2 occupants, the Committee took a very conservative approach and will only allow the heights that are already permitted by code for traditional Type IV construction.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and 1103.5 of the International Fire Code.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Reason:

Since development of the early building codes, and even with the International Building Code today, building size has typically been determined based on a combination of factors; (a) the occupancy type for the building; (b) the materials used to construct the building; and (c), the presence of automatic sprinkler protection. Regarding occupancy types, the fire loads associated with contents found in a particular occupancy group and the relative risk of danger to the occupants from fire because of the occupancy characteristics are considered. For the materials used to construct the building the presence of combustible materials used in the construction of the building structure itself are key. As the quantity of combustible materials decreases the relative risk of fire size, spread of fire to adjacent properties, and danger to the fire service are less such that the building sizes are allowed to increase. Another factor considered from a building materials aspect is the degree of fire resistance provided. When structural fire resistance is provided to the load carrying structural members the risk of damage to the structure or potential for collapse is also considered reduced. Finally, sprinkler protection has been utilized as a factor in allowing increases in the size of buildings. A good discussion of these concepts can be found in the report "Fire-Resistance Classifications of Building Construction", Report BMS92, National Bureau of Standards, October 7, 1942.

One thing of importance in the report is that buildings constructed of noncombustible materials and provided with at least 1-hour of fire resistance (classified as Fireproof construction in the report) were considered to be a much lower risk to the safety of the occupants and fire service, and to the spread of fire, than buildings constructed of noncombustible materials with little or no fire resistance (classified as Incombustible construction in the report). The same was said for buildings constructed with a combination of noncombustible exterior walls and interior combustible structural materials (classified as Exterior-Protected construction in the report). Hence the report advised that these noncombustible buildings with at least 1-hour fire resistance could be built to taller heights due to the lack of combustible materials in the structural systems combined with some level of fire resistance.

Unfortunately, when you look at Tables 504.3 and 504.4 in the 2018 International Building Code, building occupancies with low internal fire loads such as Group B, Business and Group R, Residential, when constructed of one-hour fire rated noncombustible construction (i.e. Type IIA), are not given due credit for the enhanced fire risk attributes when compared to buildings of one-hour fire resistance construction using a combination of noncombustible exterior walls and interior combustible structural materials (i.e. Types IIIA and Type IV). This is especially apparent when comparing these Group B and R occupancies to Group F, Factory and Group S, Storage Occupancies in Table 504.4.

Recognizing the lower fire risk of Type IIA construction compared to Type IIIA and Type IV construction, this code change proposes permitting Group B and Group R buildings of Type IIA construction to be built one story and 15-feet higher. These increases are attributed to elimination of the fire load present in the structural components, combined with the 1-hour fire resistance for these noncombustible structural elements, consistent with the fire safety premises for building construction types in BMS92. The new story heights are increased in proportion to the story heights/number of stories for existing buildings of Type IIA Group B and Group R, with rounding to be consistent with other values in Table 504.3.

Cost Impact

The code change proposal will decrease the cost of construction .

Presently Group B and R occupancy buildings of noncombustible construction with 1-hour fire resistance (i.e. Type IIA) are only allowed to be built to the same story height as buildings of Group B and R occupancy with a combination combustible/noncombustible construction and a 1-hour fire resistance (i.e. Type IIIA and IV). However, to build Group B or R occupancy buildings of noncombustible construction taller, the fire resistance of the structural elements (i.e. columns and floors) are required to be increased to 2-hours (i.e. Type IB construction).

This proposal recognizes the improved fire safety of Group B and R occupancy buildings of Type IIA construction, compared to Types IIIA and IV construction of the same occupancy groups, since Type IIA buildings have a reduced fire load associated with the reduced use of combustible structural components. Allowing one additional story height of Group B and R occupancy buildings without having to increase the fire resistance of columns and floors will reduce the cost of construction of these noncombustible buildings Group B and R occupancies.

Internal ID: 1541

G77-18

IBC: 504.4

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

504.4 Number of stories. The maximum number of *stories* above grade plane of a building shall not exceed the limits specified in Table 504.4.

Reason:

This very simple change matches the language of Section 504.4 to the language of Table 504.4. Absent this correction any “limit specified in the Table” could be misconstrued as the “number of stories of a building” by Section 504.4, and thereby include basement story(s).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change is a simple clarification of existing code requirements. No cost impact.

Footnotes of the table are unchanged.

Reason:

This code change proposal returns the maximum number of stories of sprinklered S-1 buildings to the 2006 IBC value of 4 stories. In 2009, the Code Technology Committee Balanced Fire Protection Features Study Group reduced the maximum number of stories permitted in some occupancies for unprotected construction (IIB & IIIB). The justification was that the I-Codes permitted only a single-story sprinkler height increase, so in order to match the permitted number of stories in the legacy codes for sprinklered buildings, unsprinklered buildings exceeded what was allowed. At the time, the study group chose not to propose modifying the sprinkler increase in the IBC. With the reformatting of the height-and-area provisions of the Code in 2015, we are now able to return to the 2006 maximum number of stories for a sprinklered building without affecting unsprinklered buildings.

This proposal seeks only to return to the 2006 story limit for sprinklered, S-1 noncombustible Type IIB buildings. These buildings were commonly constructed prior to the adoption by jurisdictions of the 2009 IBC, and we have seen no adverse effect on life safety or property protection.

Unsprinklered IBC Table 503 Values

Use Group	IBC	IBC
B	3	5
M	2	2
S-1	2	2
S-2	3	3
R* (13)	3	3

* - Applies for R-1, R-2 and R-3 Use Groups

In essence, these reductions would eliminate the anomalies created by the multi-story SBC sprinkler increase and drop the IBC value back to the next least restrictive legacy code (in these cases, the NBC).

The study group noted that the motivation for these recommendations was to address anomalies associated with unsprinklered 4 and 5 story buildings of nonrated construction. No evidence was submitted to suggest that the existing sprinklered height allowances for these buildings in either the IBC or the legacy codes had created an unsafe condition that requires correction.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
Assembly: ASF AMF DF

G119-07/08

Table 503

Proponent: Kate Dargan and David Collins, Co-Chairs, Code Technology Committee (CTC) Balanced Fire Protection Features Study Group

Revise table as follows:

**TABLE 503
 ALLOWABLE HEIGHT AND BUILDING AREAS^a
 Height limitations shown as stories and feet above grade planes.
 Area limitations as determined by the definition of "Area, building," per story**

GROUP	HGT(feet)	TYPE OF CONSTRUCTION

	A	UL	48,000	26,000	17,500	26,000	17,500	25,500	14,000	8,000

(Portions of table and footnotes not shown remain unchanged)

Reason: One area of concern identified for study by the Height and Area Task Group was 4 and 5 story buildings of unrated construction. The table below shows the occupancies in the IBC where that condition exists for sprinklered construction. In addition, the table shows the sprinklered height allowances for these occupancies in the legacy codes.

R* (13)	5	4	4	5
R(13R)	4	4	3	4

NA- Not Applicable NP- Not Permitted
 * - Applies for R-1, R-2 and R-3 Use Groups

The study group noted that for Use Group B, M, S-1, and R buildings of Type IIB or Type IIB construction, the allowance for 4 or 5 stories in the IBC was premised on the story heights allowed in the SBC. In all these instances, the SBC sprinklered height allowance for these Use Groups relied on a multiple story sprinkler increase. For example, for Use Group B, the SBC allowed 2 stories for unsprinklered construction and 5 stories for sprinklered construction. This exceeds the consistent one story sprinkler height increase incorporated in the IBC height and area provisions. Based on this review, the study group identified two anomalies from what was permitted by the legacy codes. First, the story height allowance for S-

2 use groups is not based on any of the legacy code allowances. Second, for Use Group B, M, S-1, and R (Type IIB and IIB construction), the IBC story height allowance for unsprinklered construction exceeds what was allowed by any of the legacy codes. For example, the maximum height for an unsprinklered Type IIB office building in any of the legacy codes was the NBC allowance for 3 stories. Currently, the IBC allows 4 stories for this condition. Rather than modify the sprinkler increase in the IBC, the study group suggested the following recommended story height changes:

Unsprinklered IBC Table 503 Values

R* (13)	3	3

* - Applies for R-1, R-2 and R-3 Use Groups

In essence, these reductions would eliminate the anomalies created by the multi-story SBC sprinkler increase and drop the IBC value back to the next least restrictive legacy code (in these cases, the NBC).

The study group noted that the motivation for these recommendations was to address anomalies associated with unsprinklered 4 and 5 story buildings of nonrated construction. No evidence was submitted to suggest that the existing sprinklered height allowances for these buildings in either the IBC or the legacy codes had created an unsafe condition that requires correction.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing: Committee: AS AM D
 Assembly: ASF AMF DF

G120-07/08

Table 503

Proponent: Kate Dargan and David Collins, Co-Chairs, Code Technology Committee (CTC) Balanced Fire Protection Features Study Group

Revise table as follows:

**TABLE 503
 ALLOWABLE HEIGHT AND BUILDING AREAS^a
 Height limitations shown as stories and feet above grade plane.
 Area limitations as determined by the definition of "Area, building," per story**

GROUP	HGT(feet)	TYPE OF CONSTRUCTION									
		TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V		
		A	B	A	B	A	B	HT	A	B	
	HGT(S)	UL	160	85	55	85	55	85	50	40	
S-2 ^{a, c}	S	UL	11	5	4-3	4	4-3	5	4	2	
	A	UL	79,000	39,000	26,000	39,000	26,000	38,500	21,000	13,500	

(Portions of table and footnotes not shown remain unchanged)

Reason: One area of concern identified for study by the Height and Area Task Group was 4 and 5 story buildings of unrated construction. The table below shows the occupancies in the IBC where that condition exists for sprinklered construction. In addition, the table shows the sprinklered height allowances for these occupancies in the legacy codes.

**Type IIB, Type IIB (Unprotected Construction)

R* (13)	5	4	4	5
R(13R)	4	4	3	4

NA- Not Applicable NP- Not Permitted

* - Applies for R-1, R-2 and R-3 Use Groups

Cost Impact

The code change proposal will decrease the cost of construction .

For S-1 buildings, this code change proposal allows a 4-story building to be Type IIB instead of having to be IIA, thus reducing the cost of requiring fire-rated construction.

G79-18

IBC: 504.4

Proponent: Keith Flanders, Cosentini Associates, representing self (kflanders@cosentini.com)

2018 International Building Code

Revise as follows:

504.4 Number of stories. The maximum number of *stories* of a building shall not exceed the limits specified in Table 504.4. An occupied roof is considered a story above grade unless otherwise specified as a portion of the story below by the provisions of this code.

Reason:

There is often a debate when an occupied roof may exceed the prescribed number of stories above grade plane. Adding this language seeks to clarify that an occupied roof should be considered a story above grade when determining the allowable number of stories for a building based on the type of construction.

If an occupied roof can be considered a mezzanine, it is not required to be considered a story above grade for the purposes of determining the allowable number of stories.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply provides clarification and is not intended as a change.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and 1103.5 of the International Fire Code.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB and its various WGs held meetings, studied issues and sought input from various expert sources around the world. The TWB has posted those documents and input on its website for interested parties to follow its progress and to allow those parties to, in turn, provide input to the TWB.

At its first meeting, the TWB discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings:

No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.

No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.

No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.

No unusual fire department access issues.

Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.

Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

The comprehensive package of proposals from the TWB meet these performance objectives.

The TWB also determined that fire testing was necessary to validate these concepts. At its first meeting, members discussed the nature and intention of fire testing so as to ensure meaningful results for the TWB and, more specifically, for the fire service. Subsequently a test plan was developed. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of joints, and to evaluate conditions for responding fire personnel. The Fire WG then refined the test plan, which was implemented with a series of five, full-scale, multiple-story building tests at the Alcohol, Tobacco and Firearms (ATF) laboratories in Beltsville, MD. The results of those tests, as well as testing conducted by others, helped form the basis upon which the Codes WG developed its code change proposals. This code change proposal is one of those developed by the Codes WG and approved by the TWB.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit: <http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17.

Number of Stories

This proposal addresses the building height, in terms of the number of stories, for the three new construction types proposed by the TWB. As set forth in the proposal to Section 602.4, the three new types of construction are Types IV-A, IV-B, and IV-C. The Committee examined each proposed type of construction for its safety and efficacy with regard to each occupancy.

The following approach was considered appropriate for the heights of the new construction types, based on the conclusions of the Committee:

Based upon TWB review of fire safety and structural integrity performance, Type IV-B is equated to Type I-B for height (in number of stories). A noteworthy item is that, per Section 403.2.1.1 of the IBC, Type I-B construction is permitted to be reduced to 1-hour Fire Resistance Rating (FRR); however, the TWB does not propose to allow the same reduction for Type IV-B. As a result, the comparison is between 2-hr mass timber construction that is permitted to be partially unprotected, versus 1-hr Type IB construction, and the Committee believes that 2-hr mass timber construction that is partially exposed per the limits of proposed Section 602.4 warrants the same heights as allowed for 1-hr Type I-B construction;

Type IV-A should be somewhat larger than IV-B, as Type IV-A construction is entirely protected (no exposed mass timber permitted) and the required rating of the structure is equivalent to those required of Type I-A construction (3-hr rating for structural frame). However, the Committee did not find it acceptable to allow the scale of heights (many of which are unlimited) of Type I-A to be applied to Type IV-A. Instead, the Committee applied a multiplier of 1.5 to the heights proposed for Type IV-B construction (rounded up or down based on judgment) in order to propose reasonable height allowances for IV-A construction;

The Committee viewed Type IV-C as sufficiently similar to existing HT construction, especially in terms of the percentage of exposed wood (it is permitted to be entirely unprotected), and the resulting contribution to fire. While the height in feet for Type IV-C is proposed to be equal to the height in feet of Type IV-HT, the Committee felt that additional stories was warranted in some cases. Therefore, in terms of stories, the Committee proposes additional number of stories for Type IV-C construction when compared to traditional Type IV heavy timber construction. The Committee feels that some recognition is warranted for the fire resistance rating requirements (Type IV-C has 2-hour rating on structural elements, whereas traditional Type IV Heavy Timber used dimensional wood, which is understood to yield an approximate fire resistance rating equivalent to about 1-hour construction) and provided that flexibility when developing height, in terms of stories, for Type IV-C construction. A multiplier of 1.5 was applied from the Type IV-HT heights to develop reasonable numbers of stories for Type IV-C construction.

While the base code seems to allow significant heights for buildings without sprinklers (e.g., Table 504.4 currently allows 11 stories for NS Type I-B construction for many occupancy classifications), the Committee believes that no additional heights over what is already permitted for Type IV should be proposed for the NS (non sprinklered) rows. As such, where separate rows are provided for heights for the NS condition, the proposed heights for Types IV-A, IV-B, and IV-C are the same as those heights already permitted for Type IV for the NS condition.

This methodology explains the majority of the recommendations included in this proposal. Specifically, for occupancy groups A, B, E, R, and U, the methodology described above accurately reflects how the height proposals were developed.

The Committee applied professional judgment (from both a fire safety and a structural perspective) to develop a draft table, cell by cell, for all occupancy types. After further examination, reduced heights were proposed for F, H, I, M, and S occupancy classifications.

For F-1 occupancies, the Committee proposed a height of 7 stories for Type IV-B construction (versus the 12 stories currently permitted for I-B construction). A multiplier of 1.5 was used to propose a height of 10 stories for Type IV-A construction (when rounded down). No additional height was proposed for Type IV-C construction (Type IV-C proposed at 5 stories, and 5 stories is already permitted by code for Type IV-HT).

For F-2 occupancies, again the Committee is proposing a reduced number of stories, with 8 stories for Type IV-B construction (versus 12 stories that would be derived from the methodology). Again, a multiplier of 1.5 was used to propose a height of 12 stories for Type IV-A construction. No additional height is proposed for Type IV-C construction (Type IV-C proposed at 6 stories, and 6 stories is already permitted by code for Type IV-HT).

A conservative approach also explains the proposed heights for Group H occupancies. For Group H-1, only 1 story buildings are permitted by Table 504.4 for all construction types, so the proposal was adjusted to also limit all of the new Type IV construction types to 1 story as well.

For Groups H-2, H-3, and H-5, heights were intentionally made equal to the existing Heavy Timber heights. In other words, there is no proposal to any increased heights over what is already allowed by code for these use groups.

Group H-4, being corrosives which represents a health hazard (but not necessarily a fire hazard) to occupants and first responders, was also reduced, slightly. The TWB proposes 7 stories for Type IV-B construction (equivalency to Type I-B would have yielded 8 stories). The proposal allows only 8 stories for Type IV-A construction. No additional height is proposed for Type IV-C construction (Type IV-C proposed at 6 stories, and 6 stories is already permitted by code for Type IV-HT).

For Group I, the Committee took a more conservative approach and proposed an equivalent number of stories for Type IV-A construction, as is provided for Type I-B construction (10 stories for both construction types and occupancy types). The allowable heights for Type IV-B construction were selected to fall between the 10 stories for Type IV-A and the number of stories for Type IV-C construction. The Committee proposed a height of 7 stories for I-1, and 6 stories for I-2. No additional height was proposed for Type IV-C construction (IV-C construction heights in floors is equal to the number of floors already allowed for Type IV-HT, 5 stories for I-1, 4 stories for I-2).

For Group M occupancies, the Committee again took a conservative approach, and proposed an equivalent number of stories for Type IV-A construction, as is provided for Type I-B construction (12 stories for both construction types). The proposal for Type IV-B construction is 8 stories which is based on the use of the multiplier of 1.5 with respect to the Type IV-A proposal. A modest increase (from 5 to 6 stories) is proposed for Type IV-C construction due to the higher requirement for structural fire-resistance.

For Group S, while the base code does not differentiate between S-1 and S-2 in Type I-B construction (both 12 stories), the Committee recognized that the base code does provide a difference for Group F (10 stories for F-1, 12 stories for F-2). As explained above, this led the Committee to propose lower heights for F-1, than for F-2. The Committee felt this was appropriate with respect to the hazard differences between F-1 and F-2. Rather than basing our proposal for S occupancies on the same starting point of 12 stories, the Committee decided to simply copy the proposed heights for Group F into the rows for Group S for both IV-A and IV-B construction types. No additional height is proposed for IV-C construction (IV-C proposed at 5 stories for both S-1 and S-2, same as existing Type IV-HT heights).

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

For SI: 1 square foot = 0.0929 m².

UL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one story above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; SM = Buildings two or more stories above grade plane equipped sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building area in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the International Fire Code.
- g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.
- i. The maximum allowable area for a single-story nonsprinklered Group U greenhouse is permitted to be 9,000 square feet, or the allowable area shall be permitted to comply with Table C102.1 of Appendix C.

Reason:

Tables 504.4 and 506.2 were introduced into the code by code change G101-12, submitted by the ICC Building Code Action Committee (BCAC), as part of a substantial overhaul of the height and area provisions. The new tables replaced Table 503. It was not the intent of G101-12 to make any changes to allowable building height or area rendered by these provisions, compared to what was previously allowed. This proposed change corrects two tabular value errors that went undetected in the original code change until after the completion of the 2012 cycle: the tabular story height numbers for Type IV Group S-2, and the allowable area factor for Type II-A Group I-3. The following is taken from the 2012 edition of the IBC which shows the height and areas for S-2 and I-3 as shown in Table 503, from which Tables 504.4 and 506.2 were derived.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will decrease the cost of construction .

This is a correction to the height and area tables based upon an error in previous code change submittals. The proposal will restore these values to the correct values. Will actually decrease the cost of construction compared to the current code because more lenient limitations are imposed.

Internal ID: 1548

G82-18

IBC: 505.2.1

Proponent: Todd Snider, West Coast Code Consultants (WC3), representing Self (Todd@KimballEng.com)

2018 International Building Code

Revise as follows:

505.2.1 Area limitation. The aggregate area of a *mezzanine* or *mezzanines* within a room shall be not greater than one-third of the floor area of ~~that a single room or space in which they are located, from which that mezzanine is accessed.~~ The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the *mezzanine* is located. In determining the allowable *mezzanine* area, the area of the *mezzanine* shall not be included in the floor area of the room.

Exceptions:

1. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Section 503.1.1 shall be not greater than two-thirds of the floor area of the room.
2. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction shall be not greater than one-half of the floor area of the room in buildings and structures equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 and an *approved emergency voice/alarm communication system* in accordance with Section 907.5.2.2.
3. The aggregate area of a *mezzanine* within a *dwelling unit* that is located in a building equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 shall not be greater than one-half of the floor area of the room, provided that:
 - 3.1. Except for enclosed closets and bathrooms, the *mezzanine* shall be open to the room in which such *mezzanine* is located;
 - 3.2. The opening to the room shall be unobstructed except for walls not more than 42 inches (1067 mm) in height, columns and posts; and
 - 3.3. Exceptions to Section 505.2.3 shall not be permitted.

Reason:

Proposed revision to add clarification to the room or space in which a mezzanine is located. The intent of mezzanines is that they are intended to be open to a room and it is no more hazardous to be located within the mezzanine of a room or space than to be in that room or space. Often times, however, this option is being used for mezzanines which are said to be located in one room the only egress is through a different room. For example in grocery floors they will use 1/3 the area of the sales floor but the access to the mezzanine is through the stock room.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The cost of this clarification is impossible to value. It will, at times, change design or layout that could increase or decrease cost.

Internal ID: 1175

G83-18

IBC: 505.2.3

Proponent: Ronald Clements Jr, Chesterfield County Building Inspection Department, representing Chesterfield County Building Inspection Department (clementsro@chesterfield.gov); Lee Kranz, City of Bellevue, WA Representing the Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov); Keith Flanders, representing self (kflanders@cosentini.com); Todd Snider (Todd@KimballEng.com)

2018 International Building Code

Revise as follows:

505.2.3 Openness. A *mezzanine* shall be open and unobstructed to the room in which such *mezzanine* is located except for walls not more than 42 inches (1067 mm) in height, columns and posts.

Exceptions:

1. Mezzanines or portions thereof are not required to be open to the room in which the *mezzanines* are located, provided that the *occupant load* of the aggregate area of the enclosed space is not greater than 10.
2. A *mezzanine* having two or more exits or access to exits is not required to be open to the room in which the *mezzanine* is located.
3. Mezzanines or portions thereof are not required to be open to the room in which the *mezzanines* are located, provided that the aggregate floor area of the enclosed space is not greater than 10 percent of the *mezzanine* area.
4. In industrial facilities, *mezzanines* used for control equipment are permitted to be glazed on all sides.
5. ~~In occupancies other than Groups II and I, which are no more than two stories above grade plane and equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, a *mezzanine* having two or more exits or access to exits shall not be required to be open to the room in which the *mezzanine* is located.~~

Reason:

Ron Clements

Per exception 2 to section 505.2.3, which was revised in the 2015 IBC, a mezzanine is not required to be open to the room in which the mezzanine is located if the mezzanine has two exits or access to two exits. Exception two has no qualifiers; therefore, exception two would always apply in the conditions listed for exception five. Since exception two will always apply without the sprinkler, story or occupancy group qualifiers required for use of exception five, exception five is no longer needed.

Keith Flanders

Exception 5 is no longer necessary as exception 2 was modified in previous cycles and is less restrictive. Per exception 2, a mezzanine having two or more exits or access to exits is not required to be open to the room in which the mezzanine is located. This is the same as the second part of exception 5, without the occupancy limitations or requirements for a sprinkler system.

Lee Kranz

Exception #5 of Section 505.2.3 is not needed because it is more restrictive and exception #2 in this section will govern in every case.

Todd Snider

Proposed revision to remove Exception 5, because it is redundant to Exception 2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost impact because the exception five that is proposed for deletion is obsolete.

For SI: 1 square foot = 0.0929 m².

UL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one story above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; SM = Buildings two or more stories above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building area in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the International Fire Code.
- g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.
- i. The maximum allowable area for a single-story nonsprinklered Group U greenhouse is permitted to be 9,000 square feet, or the allowable area shall be permitted to comply with Table C102.1 of Appendix C.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB and its various WGs held meetings, studied issues and sought input from various expert sources around the world. The TWB has posted those documents and input on its website for interested parties to follow its progress and to allow those parties to, in turn, provide input to the TWB.

At its first meeting, the TWB discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings:

No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.

No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.

No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.

No unusual fire department access issues.

Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.

Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

The comprehensive package of proposals from the TWB meet these performance objectives.

Allowable Area

In addressing this topic, it was necessary to develop height and area criteria to address each new type of construction being proposed. Relying upon each new type of construction proposed for tall wood buildings (Types IV-A, IV-B and IV-C), the committee examined each type of construction for its safety and efficacy with regard to each occupancy type. This proposal on allowable areas should be considered as a companion proposal to the height proposals. The three proposals were developed with regard to one another as well as with regard to the new types of construction.

The TWB also determined that fire testing was necessary to validate these concepts. At its first meeting, members discussed the nature and intention of fire testing so as to ensure meaningful results for the TWB and, more specifically, for the fire service. Subsequently a test plan was developed. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stairway. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of joints, and to evaluate conditions for responding fire personnel. The Fire WG then refined the test plan, which was implemented with a series of five full-scale, multiple-story building tests at the Alcohol, Tobacco and Firearms (ATF) laboratories in Beltsville, MD. The results of those tests, as well as testing conducted by others, helped the Committee form the basis upon which the Codes WG developed its code change proposals. This code change proposal is one of those developed by the Codes WG and adopted by the TWB.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit: <http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17.

Each proposed new type of construction was examined for its fire safety characteristics and compared to the existing, long-standing type of construction known as Heavy Timber. The committee found that it was reasonable to develop a multiplier which could be applied to the traditional HT areas. This was done for each new type of construction. Thus, the proposed new Type IV-C was 1.25 times the HT allowable area, IV-B was 2.00 times the HT allowable area and IV-A was 3.00 times the HT allowable area.

These multipliers were examined in terms of relative performance compared to traditional HT. They were reexamined on a case-by-case basis based upon relative hazard and occupancy classification. Some hazards were perceived to be greater and, thus, areas were adjusted downward to reflect the hazard. Other situations were similarly considered. For example, Hazardous and Institutional occupancies do not fully follow the multiplier method, as most areas for those occupancies were reduced from what the multiplier method would suggest.

Also, the committee reconsidered this proposal with respect to the companion height proposal. This review was to be sure that allowable areas were commensurate with the risk posed by being allowed on some particular story or at some height above grade plane.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Internal ID: 849

G85-18

IBC: 506.2.1, 506.2.3, 506.2.2, 506.2.4

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

Revise as follows:

506.2.1 Single-occupancy buildings. ~~The allowable area of each story of a single-occupancy building with no more than one story above grade plane shall be determined in accordance with Equation 5-1:~~

where:

A_a = Allowable area (square feet).

A_t = Tabular allowable area factor (NS, S1, S13R or S13D value, as applicable) in accordance with Table 506.2.

NS = Tabular allowable area factor in accordance with Table 506.2 for nonsprinklered building (regardless of whether the building is sprinklered).

I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

The allowable area per story of a single-occupancy building with a maximum of three stories above grade shall be determined by Equation 5-1. The allowable area per story of a single-occupancy building more than three stories above grade plane shall be determined in accordance with Equation 5-2:

$$A_a = [A_t + (NS \times I_f)] \times S_a \quad \text{(Equation 5-2)}$$

where:

A_a = Allowable area (square feet).

A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.

NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered building (regardless of whether the building is sprinklered).

I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

S_a = 3 where the actual number of stories above grade plane, exceeds three, or

S_a = 4 where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2.

The actual area of any individual floor shall not exceed the allowable area per Equation 5-1.

Delete without substitution:

506.2.3 Single-occupancy, multistory buildings. ~~The allowable area of a single-occupancy building with more than one story above grade plane shall be determined in accordance with Equation 5-2:~~

$$A_a = [A_t + (NS \times I_f)] \times S_a \quad \text{(Equation 5-2)}$$

where:

A_a = Allowable area (square feet):

A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.

NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered building (regardless of whether the building is sprinklered).

I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

S_a = Actual number of building stories above grade plane, not to exceed three. For buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2, use the actual number of building stories above grade plane, not to exceed four.

No individual story shall exceed the allowable area (A_a) as determined by Equation 5-2 using the value of $S_a = 1$.

Revise as follows:

506.2.2 Mixed-occupancy one-story buildings. The allowable area of a floor of a mixed-occupancy building with not more than one story above grade plane shall be determined in accordance with the applicable provisions of Section 508.1 based on Equation 5-1 for each applicable occupancy Section 508.3.2 for non separated occupancies and 508.4.2 for separated occupancies.

For buildings with more than three stories above grade plane, the total building area shall be such that the aggregate sum of the ratios of the actual area of each story divided by the allowable area of such stories, determined in accordance with Equation 5-3 based on the applicable provisions of Section 508.1, shall not exceed three.

$A_a = [A_t + (NS \times I_f)]$ (Equation 5-3)

where:

A_a = Allowable area (square feet).

A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.

NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered building, regardless of whether the building is sprinklered.

I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

Exception: For buildings designed as separated occupancies under Section 508.4 and equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2, the total building area shall be such that the aggregate sum of the ratios of the actual area of each story divided by the allowable area of such stories determined in accordance with Equation 5-3 based on the applicable provisions of Section 508.1, shall not exceed four.

Delete without substitution:

506.2.4 Mixed-occupancy, multistory buildings. Each story of a mixed-occupancy building with more than one story above grade plane shall individually comply with the applicable requirements of Section 508.1. For buildings with more than three stories above grade plane, the total building area shall be such that the aggregate sum of the ratios of the actual area of each story divided by the allowable area of such stories, determined in accordance with Equation 5-3 based on the applicable provisions of Section 508.1, shall not exceed three.

-

{Equation 5-3}

where:

A_a = Allowable area (square feet).

A_t = Tabular allowable area factor (NS, S13R, S13D or SM value, as applicable) in accordance with Table 506.2.

NS = Tabular allowable area factor in accordance with Table 506.2 for a nonsprinklered building (regardless of whether the building is sprinklered).

I_f = Area factor increase due to frontage (percent) as calculated in accordance with Section 506.3.

Exception: For buildings designed as separated occupancies under Section 508.4 and equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2, the total building area shall be such that the aggregate sum of the ratios of the actual area of each story divided by the allowable area of such stories determined in accordance with Equation 5-3 based on the applicable

Reason:

Several changes have been made to simplify the process of determining the maximum area of buildings since the 2012 edition of the IBC. However, the provisions for how to address the actual calculation and maximum building areas has not been modified.

This change attempts to follow the lead of those that put together the changes to consolidate the increases for area and height into tables removing the requirement to do the actual calculations for those adjustments. Users of the code often become confused with the provisions for single story buildings and multiple story buildings and then it becomes even more complicated with the application of multiple occupancies, accessory occupancies and incidental occupancies. The new language will remove some of that confusion.

506.2.1 currently only appears to address the area of a one-story building. In reality it affects the allowable area of any story of any building of any height. This change has simplified Section 506.2.1 to indicate that the allowable area of a story must be determined by equation 501. Then the requirements for the allowable area for the building that is over three stories must be calculated to determine the proportional limit.

By eliminating Section 506.2.3 the criteria for the allowable area of a single-occupancy building with more than one story can be found as part. In reality, it only controls single-occupancy buildings that are more than 3 stories. The first,

second and third story of any building is controlled by the allowed area in Equation 5-1. This change has directed the code user to apply Equation 5-2 to single-occupancy buildings with more than three stories. Finally, the language regarding an "individual story" is changed to be the actual area of an individual floor being limited by the area allowed by Equation 5-1 as allowed in 506.2.1.

506.2.2 currently parallels 506.2.1 and indicates that it only limits the allowable area of a one-story building, when in fact it also covers the allowed area of any story of any building of any height. It also implies that it is limited by Equation 5-1. In reality the requirements of Section 508.3.2 and 508.4.2 set the limits for mixed use unseparated and mixed use separated conditions. This change directs the code user to those sections for mixed-occupancy buildings.

506.2.4 duplicates the requirements for mixed-occupancy buildings but in lieu of going to the specific provisions in 508.1 for mixed-occupancy buildings it simply references 508.1. With the change to 506.2.2, this provision is not necessary as it has already been covered.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no change or impact from this change because it is simply an editorial reorganization of existing text

Internal ID: 1705

G86-18

IBC: 506.3.2, 506.3.3, 506.3.3 (New), Table 506.3.3 (New)

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net)

2018 International Building Code

Revise as follows:

506.3 Frontage increase. Every building shall adjoin or have access to a *public way* to receive an area factor increase based on frontage. Area factor increase shall be determined in accordance with Sections 506.3.1 through 506.3.3.

506.3.1 Minimum percentage of perimeter. To qualify for an area factor increase based on frontage, a building shall have not less than 25 percent of its perimeter on a *public way* or open space. Such open space shall be either on the same lot or dedicated for public use and shall be accessed from a street or approved *fire lane*.

506.3.2 Minimum frontage distance. To qualify for an area factor increase based on frontage, the *public way* or open space adjacent to the building perimeter shall have a minimum distance ~~(W)~~ of 20 feet (6096 mm) measured at right angles from the building face to any of the following:

1. The closest interior lot line.
2. The entire width of a street, alley or public way.
3. The exterior face of an adjacent building on the same property.

~~Where the value of W is greater than 30 feet (9144 mm), a value of 30 feet (9144 mm) shall be used in calculating the building area increase based on frontage, regardless of the actual width of the *public way* or open space. Where the value of W varies along the perimeter of the building, the calculation performed in accordance with Equation 5-5 shall be based on the weighted average calculated in accordance with Equation 5-4.~~

~~Equ5_4.jpg~~

~~(Equation 5-4)~~

~~where:~~

~~W (Width: weighted average) = Calculated width of *public way* or open space (feet).~~

~~L_p = Length of a portion of the exterior perimeter wall.~~

~~w_p = Width (≥ 20 feet) of a *public way* or open space associated with that portion of the exterior perimeter wall.~~

~~F = Building perimeter that fronts on a *public way* or open space having a width of 20 feet (6096 mm) or more.~~

~~**Exception:** Where a building meets the requirements of Section 507, as applicable, except for compliance with the minimum 60-foot (18 288 mm) *public way* or yard requirement, and the value of W is greater than 30 feet (9144 mm), the value of W shall not exceed 60 feet (18 288 mm).~~

~~The frontage increase shall be based on the smallest *public way* or open space that is 20 feet (6096 mm) or greater, and the percentage of building perimeter having a minimum 20 feet (6096 mm) *public way* or open space.~~

506.3.3 Amount of increase. The area factor increase based on frontage shall be determined in accordance with Equation 5-5:

~~$I_f = [F/P - 0.25]W/30$~~

~~$I_f = [F/P - 0.25]W/30$~~

~~(Equation 5-5)~~

~~where:~~

~~I_f = Area factor increase due to frontage.~~

~~F = Building perimeter that fronts on a *public way* or open space having minimum distance of 20 feet (6096 mm).~~

~~P = Perimeter of entire building (feet).~~

~~W = Width of *public way* or open space (feet) in accordance with Section 506.3.2.~~

~~Table 506.3.3.~~

~~$I_f = [F/P - 0.25]W/30$~~

Add new text as follows:

**Table 506.3.3
FRONTAGE INCREASE FACTOR**

<u>Percentage (%) of Perimeter</u>	<u>Open Space</u>			
	<u>0 to less than 20 Feet</u>	<u>20 to less than 25 Feet</u>	<u>25 to less than 30 Feet</u>	<u>30 Feet or greater</u>
<u>0 to less than 25</u>	<u>0</u>	<u>0</u>	<u>0</u>	<u>0</u>
<u>25 to less than 50</u>	<u>0</u>	<u>0.17</u>	<u>0.21</u>	<u>0.25</u>
<u>50 to less than 75</u>	<u>0</u>	<u>0.33</u>	<u>0.42</u>	<u>0.50</u>
<u>75 to 100</u>	<u>0</u>	<u>0.5</u>	<u>0.63</u>	<u>0.75</u>

Reason:

Calculating the frontage increase is a confusing process for little benefit. This proposal simplifies the process by creating a table outlining the increase based on the percentage of open space around the building and the distance of that open space. It still uses the concept of the percentage of open space around the building. The values in the table are based on the calculations using Equation 5-5. The proposal also deletes the confusing weighted average calculation that most people do not use.

For example, if you have a building that has a perimeter of open space of 63% and the smallest open space is 25 feet, the increase would be 0.42. Using the calculation in Equation 5-5, it would be 0.32. This is a 10% difference. The total increase for a Group B Occupancy of Type VB Construction would be 2,790 square feet using the equation and 3,780 using the table. This is a difference of 990 square feet. This is negligible in the overall scheme of allowable area calculations.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a simplification of an existing calculation in the code. It should not affect the cost of construction.

Internal ID: 1071

G87-18

IBC: 508.3.1.2

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

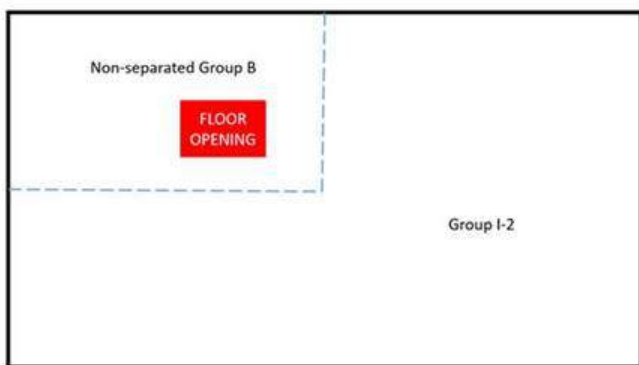

2018 International Building Code

Revise as follows:

508.3.1.2 Group I-2, Condition 2 occupancies. Where one of the nonseparated occupancies is Group I-2, Condition 2, the ~~most restrictive~~ requirements of Sections 407, 509 and 712 shall apply throughout the fire area containing the Group I-2 occupancy. The ~~most restrictive~~ requirements of Chapter 10 for Group I-2, Condition 2 shall apply to the path of egress from the Group I-2, Condition 2 occupancy up to and including the exit discharge.

Reason:

This section relates to the use of non-separated mixed uses in hospitals. Historically a hospital building has broadly been considered as an I-2 occupancy. However, designs are increasingly using this non-separated option to create situations that adversely impact the I-2 occupancy. This language was added in the previous cycle to with the intent to require certain non-separated facility designs to follow some of the basic requirements for Group I-2, Condition 2 hospitals. The goal was to point designers and code officials to four key components to consider when designing non-separated uses: Section 407 which contains specific healthcare requirements, Section 509 for incidental uses, Section 712 for vertical openings and Chapter 10 for egress. Failure to follow these could have adverse impacts on patients and staff. For example, unprotected floor openings allowed by 712 are prohibited in Group I-2, they are not prohibited in Group B. Without this section, a design would be allowed to punch a hole in the floor that adversely affects the I-2 patients on that floor.

An unintended consequence of the language is that by referencing the “most restrictive” requirements, the section prohibits the use of any exception permissible for Group I-2. It also doesn’t clearly identify which requirements should be considered. For example, we did not intend to apply Group H restrictions on these conditions just because they are more restrictive. There are several exceptions that should be maintained for these parts of the building, especially in Chapter 10. This change clarifies that all of the I-2 specific requirements apply, whether they are more or less restrictive.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will decrease the cost of construction .

This clarification would remove requirements for more restrictive provisions where hospital provisions apply.

Internal ID: 1288

G88-18

IBC: TABLE 508.4

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

H-5	2	NP	2	NP	2	NP	2	NP	2	NP	1	NP	NP	NP	1	NP	1	NP	N	NP

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

N = No separation requirement.

NP = Not Permitted.

- a. See Section 420.
- b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but not to less than 1 hour.
- c. See Section 406.3.2.
- d. Separation is not required between occupancies of the same classification.
- e. See Section 422.2 for ambulatory care facilities.
- f. Occupancy separations that serve to define fire area limits established in Chapter 9 for requiring fire protection systems shall also comply with Section 707.3.10 and Table 707.3.10 in accordance with Section 901.7.

Reason:

Filling in the balance of Table 508.4 will avoid confusion and make the table more clear and functional.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is an editorial change and adds no new requirements to the code.

Internal ID: 3018

G89-18

IBC: 508.4.4.1, 509.4.1.1 (New)

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Building Code

508.4.4 Separation. Individual occupancies shall be separated from adjacent occupancies in accordance with Table 508.4.

Revise as follows:

508.4.4.1 Construction. Required separations shall be *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both, so as to completely separate adjacent occupancies. Mass timber elements serving as fire barriers or horizontal assemblies to separate occupancies in Type IV-B or IV-C construction shall be separated from the interior of the building with an approved thermal barrier consisting of a minimum of $\frac{1}{2}$ inch (12.7 mm) gypsum board or a noncombustible equivalent.

Add new text as follows:

509.4.1.1 Type IV-B and IV-C construction. Where Table 509 specifies a fire-resistance-rated separation, mass timber elements serving as fire barriers or a horizontal assembly in Type IV-B or IV-C construction shall be separated from the interior of the incidental use with an approved thermal barrier consisting of a minimum of $\frac{1}{2}$ inch (12.7 mm) gypsum board or a noncombustible equivalent.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

This code change proposal represents one of many submitted designed to address a new type of construction called mass timber (e.g. new construction types IV-A, IV-B, and IV-C).

On this subject of “fire barriers,” the committee determined that additional measures were necessary to address cases where mass timber is serving as a fire barrier or horizontal assembly. Section 508.4 describes the third option for separating mixed occupancies within a building. Section 509.4 discusses the fire-resistance rated separation that is required for incidental uses within a larger use group. Section 509 also permits, when stated, protection by an automatic sprinkler system without fire barriers, however the construction enclosing the incidental use must resist the passage of smoke in accordance with Section 509.4.2.

The concern is that without any modifications to these provisions regulating separated occupancies and incidental uses, a fire barrier or horizontal assembly could be designed using mass timber that would comply with the fire resistance rating, but which would allow any exposed mass timber to contribute to the fuel load. This can occur in Types IV-B and IV-C construction.

The committee applied professional judgment by choosing to emulate the existing thermal barrier requirements by applying those requirements to these two sections. The intent of this proposal is to have the thermal barrier delay or prevent the ignition of the mass timber, thus delaying or preventing the mass timber’s contribution to the fuel load. This will also allow additional time for fire and life safety measures to be executed as well as allow first responders additional time to perform their services.

The committee’s intent is that the thermal barrier only needs to cover an exposed wood surface. The thermal barrier is not required in addition to any noncombustible protection that is required in Section 602.4, nor does it add to the fire resistance rating of the mass timber.

Mass timber walls or floors serving as fire barriers for separated uses (Section 508.4) would need to have a thermal barrier on both faces of the assembly.

For Section 509.4 (incidental use separations) the intent is to provide the thermal barrier only on the side where the hazard exists, that is, the side facing the incidental use. For example, if a mass timber floor assembly of the incidental use contains a noncombustible topping this provision would not require the addition of a thermal barrier on mass timber surfaces not facing the incidental use area. In addition, the thermal barrier would not be required if the sprinkler option is exercised.

It should be noted that this proposal is only addressing the contribution of exposed mass timber's face to the fuel load of a fire, and is not recommending any modifications to the fire resistance requirements of Sections 508 or 509 or to the other mass timber provisions.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

2018 International Building Code

Delete without substitution:

~~SECTION 419 LIVE/WORK UNITS~~

Revise as follows:

508.1 General. Each portion of a building shall be individually classified in accordance with Section 302.1. Where a building contains more than one occupancy group, the building or portion thereof shall comply with the applicable provisions of Section 508.2, 508.3 ~~or~~, 508.4, 508.5, or a combination of these sections.

Exceptions:

1. Occupancies separated in accordance with Section 510.
2. Where required by Table 415.6.2, areas of Group H-1, H-2 and H-3 occupancies shall be located in a *detached building* or structure.
3. ~~Uses within live/work units, complying with Section 419, are not considered separate occupancies.~~

~~419.1-508.5~~ **General/Live/Work Units.** A *live/work unit* shall comply with Sections ~~419.1-508.5~~ through ~~419.9-508.5.11~~.

Exception: Dwelling or sleeping units that include an office that is less than 10 percent of the area of the *dwelling unit* are permitted to be classified as *dwelling units* with accessory occupancies in accordance with Section 508.2.

~~419.1-1508.5.1~~ **Limitations.** All of the following shall apply to live/work areas:

1. The *live/work unit* is permitted to be not greater than 3,000 square feet (279 m²) in area.
2. The nonresidential area is permitted to be not more than 50 percent of the area of each *live/work unit*.
3. The nonresidential area function shall be limited to the first or main floor only of the *live/work unit*.
4. Not more than five nonresidential workers or employees are allowed to occupy the nonresidential area at any one time.

~~419.2-508.5.2~~ **Occupancies.** *Live/work units* shall be classified as a Group R-2 occupancy. Separation requirements found in Sections 420 and 508 shall not apply within the *live/work unit* where the *live/work unit* is in compliance with Section ~~419-508.5~~. Nonresidential uses that would otherwise be classified as either a Group H or S occupancy shall not be permitted in a *live/work unit*.

Exception: Storage shall be permitted in the *live/work unit* provided that the aggregate area of storage in the nonresidential portion of the *live/work unit* shall be limited to 10 percent of the space dedicated to nonresidential activities.

~~419.3-508.5.3~~ **Means of egress.** Except as modified by this section, the *means of egress* components for a *live/work unit* shall be designed in accordance with Chapter 10 for the function served.

~~419.3-1508.5.4~~ **Egress capacity.** The egress capacity for each element of the *live/work unit* shall be based on the occupant load for the function served in accordance with Table 1004.5.

~~419.3-2508.5.5~~ **Spiral stairways.** *Spiral stairways* that conform to the requirements of Section 1011.10 shall be permitted.

~~419.4-508.5.6~~ **Vertical openings.** Floor openings between floor levels of a *live/work unit* are permitted without enclosure.

[F] ~~419.5-508.5.7~~ **Fire protection.** The *live/work unit* shall be provided with a monitored *fire alarm* system where

required by Section 907.2.9 and an *automatic sprinkler system* in accordance with Section 903.2.8.

419-6508.5.8 Structural. Floors within a *live/work unit* shall be designed for the live loads in Table 1607.1, based on the function within the space.

419-7508.5.9 Accessibility. Accessibility shall be designed in accordance with Chapter 11 for the function served.

419-8508.5.10 Ventilation. The applicable *ventilation* requirements of the International Mechanical Code shall apply to each area within the *live/work unit* for the function within that space.

419-9508.5.11 Plumbing facilities. The nonresidential area of the *live/work unit* shall be provided with minimum plumbing facilities as specified by Chapter 29, based on the function of the nonresidential area. Where the nonresidential area of the *live/work unit* is required to be *accessible* by Section 1107.6.2.1, the plumbing fixtures specified by Chapter 29 shall be *accessible*.

Reason:

Relocating Section 419 on Live/Work Units to Section 508 Mixed Occupancies provides a clearer description under Mixed Use Occupancies since the unit is not only residential nor business use. An example is a doctor's office occupying part of a detached dwelling, or townhouses with an office, store or restaurant on the first floor and a residence occupying parts or all of upper floors.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an editorial relocation of existing requirements.

2018 International Building Code

Revise as follows:

**[F] TABLE 509
INCIDENTAL USES**

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu per hour input ^a	1 hour or provide automatic sprinkler system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower ^a	1 hour or provide automatic sprinkler system
Refrigerant machinery room ^a	1 hour or provide automatic sprinkler system
Hydrogen fuel gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Incinerator rooms ^a	2 hours and provide automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic sprinkler system
In Group E occupancies, laboratories and vocational shops not classified as Group H	1 hour or provide automatic sprinkler system
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
In ambulatory care facilities, laboratories not classified as Group H	1 hour or provide automatic sprinkler system
Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour
Stationary storage battery systems having an energy capacity greater than the threshold quantity specified in Table 1206.2 of the International Fire Code	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Electrical installations and transformers ^a	See Sections 110.26 through 110.34 and Sections 450.8 through 450.48 of NFPA 70 for protection and separation requirements.

For SI: 1 square foot = 0.0929 m², 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m³.

a. See Chapter 6 of the International Fire Code for additional construction related requirements.

Reason:

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

This is a simple footnote pointer so designers are aware of additional construction and/or installation requirements for these incidental use building systems that are located in Chapter 6 of the International Fire Code.

This proposal is part of a comprehensive update to IFC Chapter 6 by the F-CAC. F-CAC fully supports this proposal.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal adds a pointer to existing requirements in the IFC. No new or additional construction requirements are being introduced into the IBC.

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Revise as follows:

**[F] TABLE 509
INCIDENTAL USES**

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu perhour input	1 hour or provide automatic sprinkler system
Rooms with boilers where the largest piece of equipment is over 15psi and 10 horsepower	1 hour or provide automatic sprinkler system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Hydrogen fuel gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E,I and R occupancies.
Incinerator rooms	2 hours and provide automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies otherthan Group F	2 hours; or 1 hour and provide automatic sprinkler system
In Group E occupancies, laboratories and vocational shops notclassified as Group H	1 hour or provide automatic sprinkler system
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
In ambulatory care facilities, laboratories not classified as Group H	1 hour or provide automatic sprinkler system
Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour
Stationary storage battery systems having an energy capacity greater than the threshold quantity specified in Table 1206.2 of the International Fire Code	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Electrical installations and transformers	See Sections 110.26 through 110.34 and Sections 450.8 through 450.48 of NFPA 70 for protection and separation requirements.

For SI: 1 square foot = 0.0929 m², 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m³.

Reason:

This proposal eliminates stationary storage battery systems as incidental use from Table 509. A rewrite of the IFC Section 1206 has added extensive protection features to such installations including detection, suppression, fire separation, and explosion control, along with large scale testing to document the effectiveness of chosen protection levels. With the increased level of protection mandated by the IFC, there is no longer a need to limit such uses to 10% of a floor area as an incidental use.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will decrease the cost of construction .

Eliminating the incidental use 10% floor area restriction can reduce the cost of providing energy storage systems in mixed use buildings.

Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour
Stationary storage battery systems having an energy capacity greater than the threshold quantity specified in Table 1206.2 of the International Fire Code	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Electrical installations and transformers	See Sections 110.26 through 110.34 and Sections 450.8 through 450.48 of NFPA 70 for protection and separation requirements.

For SI: 1 square foot = 0.0929 m², 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m³.

509.2 Occupancy classification. Incidental uses shall not be individually classified in accordance with Section 302.1. Incidental uses shall be included in the building occupancies within which they are located.

Delete without substitution:

~~**509.3 Area limitations.** Incidental uses shall not occupy more than 10 percent of the *building area* of the story in which they are located.~~

Reason:

We submitted changes to eliminate the 10% area limitation on incidental uses over the last two code cycles. Each of those proposals were disapproved by the committee and the membership. We were told by the opponents, the way to fix the problem is to require incidental uses over 10% of the story area to be classified as an occupancy. Independently we each drafted a proposed change to say that if one incidental use; or an aggregate of incidental uses on a story exceeds the 10% limit that they would be classified as a distinct occupancy. The more we tried to provide rationale for such a change, to more the construct came crashing down.

The original purpose of incidental uses that are all specifically listed in Table 509 is to address a hazard of one type or another. Each of the uses in Table 509 poses a hazard to the balance of the primary use of the building or story. The solutions to address those risks are rated separations, automatic sprinkler system or both. The hazard exists whether the use is 5% of a story, 15% or a story or 50% of a story. The protection needs to be provided regardless of the area of the incidental use(s). The 10% limit is particularly impractical and onerous if strictly enforced on the health care industry. Laboratories, laundry rooms, maintenance shops, storage rooms; waste and linen collection - going over 10% is a frequent design issue.

The solution urged on us is to say things that are an incidental use when limited to 10% of the story (and part of the primary occupancy) are to be called a different occupancy when they get larger doesn't work either way you try to wrap the code around it.

A. Distinct uses - no longer incidental uses. If we say that these uses exceeding 10% of story are something else and no longer an incidental use, then the protections required by Table 509 disappear. If we assign other occupancies then we are left to rely on Section 508 mixed occupancies to provide protections. But often the protections will be less. In a non-separated approach you may get a fully sprinklered building, but you won't get rated separations. In a separated mixed occupancy approach you might get sprinklers; you might get rated separations; and sometimes you might get both, but you aren't going to be assured of the protections required for the smaller things allowed under incidental uses.

B. Distinct uses - but still incidental uses. If we say that these uses exceeding 10% are another occupancy AND remain an incidental use in order to preserve the protections. What have we done? We've proved that the 10% limit is meaningless because you are still getting the protections of incidental uses regardless of size.

A final point about assigning other occupancy categories to these uses (when exceeding 10%) is that the application of the code will be inconsistent from jurisdiction to jurisdiction; from project to project.

Eliminating the 10% limit makes sure that each of these uses in Table 509 will be consistently protected from project to project; jurisdiction to jurisdiction.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is intended to clarify the code language.

Internal ID: 239

G94-18

IBC: 510.2

Proponent: Lawrence Lincoln, Salt Lake City Corporation, representing Self (larry.lincoln@slcgov.com)

2018 International Building Code

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours. Where vertical offsets are provided as part of a *horizontal assembly*, the vertical offset and the structure supporting the vertical offset shall have a *fire-resistance rating* of not less than 3 hours.
2. The building below, including the *horizontal assembly*, is of Type IA construction.
3. *Shaft, stairway, ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.

Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

1. The building above the *horizontal assembly* is not required to be of Type I construction;
 2. The enclosure connects fewer than four *stories*; and
 3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. Where buildings above the horizontal assembly are of Type III, IV or V construction, stairways within enclosures specified in Item 3 shall be constructed of either noncombustible materials or fire retardant treated wood.

~~5.4-~~The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.

~~6.5-~~ The building below the *horizontal assembly* shall be protected throughout by an approved *automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.

~~7.6-~~The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

Reason:

IBC section 1011.7 requires that Stairway construction be built of materials consistent with the types permitted for the type of construction of the building. Buildings designed in accordance with section 510.2 are inherently of two different types of construction where the horizontal assembly is the dividing line. When taking into consideration the materials that would be consistent with the type of construction of the stairway construction within a fire-rated stair enclosure, the transition from combustible materials (above the horizontal assembly) to noncombustible materials (below the horizontal assembly) makes no sense within the fire-rated stair enclosure when the type of construction above the horizontal assembly is of type III, IV or V and the type of construction below the horizontal assembly is type I-A (required by section 510.2). In other words, it makes no sense to transition from combustible materials to noncombustible materials when you are within the same environment (the fire-rated stair enclosure). Please note that this code proposal would allow fire-retardant-treated wood as a construction material within that portion of the fire-rated stair enclosure that is part of the type I-A construction. Since fire is never anticipated to originate within a fire-rated stair enclosure, this allowance seems reasonable.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposed code change will decrease the cost of construction as this code change would lessen a code requirement.

Internal ID: 2337

G95-18

IBC: 510.2, 1011.7, 1023.2 (IFC[BE] 1011.7, 1023.2)

Proponent: Lee Kranz, representing City of Bellevue, WA (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours. Where vertical offsets are provided as part of a *horizontal assembly*, the vertical offset and the structure supporting the vertical offset shall have a *fire-resistance rating* of not less than 3 hours.
2. The building below, including the *horizontal assembly*, is of Type IA construction.
3. *Shaft, stairway, ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.

Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

1. The building above the *horizontal assembly* is not required to be of Type I construction;
 2. The enclosure connects fewer than four *stories*; and
 3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. Interior exit stairways located within the Type IA building are permitted to be of combustible materials where both of the following requirements are met:
 - 4.1. The building above the Type IA building is of Type III, IV, or V construction.
 - 4.2. The stairway located in the Type IA building is enclosed by 3-hour fire-resistance rated construction with opening protectives in accordance with Section 716.
 5. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less than 300, or Group B, M, R or S occupancies.
 - 5-6. The building below the *horizontal assembly* shall be protected throughout by an approved *automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
 - 6-7. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

1011.7 Stairway construction. *Stairways* shall be built of materials consistent with the types permitted for the type of construction of the building, ~~except that wood handrails shall be permitted for all types of construction.~~

Exceptions:

1. Wood handrails shall be permitted in all types of construction.
2. Interior exit stairway in accordance with Section 510.2

1023.2 Construction. Enclosures for interior exit *stairways* and *ramps* shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. *Interior exit stairway* and *ramp* enclosures shall have a *fire-resistance rating* of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit *stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. *Interior exit stairways* and *ramps* shall have a *fire-resistance rating* not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions:

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of

Section 408.3.8.

2. *Interior exit stairways* within an *atrium* enclosed in accordance with Section 404.6.
3. Interior exit stairway in accordance with Section 510.2.

Reason:

In podium buildings utilizing a 3-hour fire-resistance rated horizontal assembly constructed in accordance with Section 510.2 it is very common for the building above the horizontal assembly to be of combustible construction, including the landings, stair stringers and treads. The code currently requires that a transition be made from wood to metal, or some other non-combustible materials, within the stair enclosure at the point where the stair goes from being located in a combustible building to the Type IA non-combustible building. This is not practical or warranted. Fires do not typically start within the fire-resistance rated stair enclosure. Exception #4.2 of this proposal provides additional protection by requiring that the stair shaft be of not less than a 3-hour fire resistance rating with 3-hour rated door assemblies as required by Section 716. This essentially creates a vertical offset of the 3-hour horizontal assembly which is currently allowed by Section 510.2. This section states that "Where vertical offsets are provided as part of a horizontal assembly, the vertical offset and the structure supporting the vertical offset shall have a fire-resistance rating of not less than 3 hours."

We have also included two 'pointer' exceptions in Chapter 10. Without the pointer exceptions someone might argue that these Chapter 10 provisions are more restrictive and override the exception in 510.2. The exemption for wood handrails currently found in the text of Section 1011.7 has been reformatted by placing it into exception #1.

Cost Impact

The code change proposal will decrease the cost of construction .

Allowing stairs to be of combustible construction will be less expensive than if they were required to be of non-combustible materials. Also, the cost to design the stair will be reduced because a transition from wood to steel (or other non-combustible materials) will no longer be required.

Internal ID: 83

G96-18

IBC: 510.3

Proponent: David Collins, The American Institute of Architects, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

Revise as follows:

510.3 Group S-2 enclosed parking garage with Group S-2 open parking garage above. A Group S-2 enclosed parking garage with not more than one *story above grade plane* and located below a Group S-2 open *parking garage* shall be classified as a separate and distinct building for the purpose of determining the type of construction where all of the following conditions are met:

1. The allowable area of the building shall be such that the sum of the ratios of the actual area divided by the allowable area for each separate occupancy shall not exceed 1.
2. The Group S-2 enclosed parking garage is of Type I or II construction and is at least equal to the *fire-resistance* requirements of the Group S-2 *open parking garage*.
3. The height and the number of tiers of the Group S-2 *open parking garage* shall be limited as specified in Table 406.5.4.
4. The floor assembly separating the Group S-2 enclosed parking garage and Group S-2 *open parking garage* shall be protected as required for the floor assembly of the Group S-2 enclosed parking garage. Openings between the Group S-2 enclosed parking garage and Group S-2 *open parking garage*, except *exit* openings, shall not be required to be protected.
5. The Group S-2 enclosed parking garage is used exclusively for the parking or storage of private motor vehicles, but shall be permitted to contain an office, waiting room and toilet room having a total area of not more than 1,000 square feet (93 m²) and mechanical equipment rooms ~~incidental to associated with~~ the operation of the building.

Reason:

The use of the term incidental can be confused with Section 509 and the list in Table 509. Office, waiting room and toilet rooms are not "incidental" per Section 509.

Cost Impact

The code change proposal will decrease the cost of construction .

Reducing the confusion over what is permitted within a garage will reduce the time required for design, review and approval of projects and will thus reduce costs.

Internal ID: 1748

G97-18

IBC: 510.4

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

Revise as follows:

510.4 Parking beneath Group R. Where a ~~maximum one story above grade plane~~ Group S-2 parking garage, ~~one story above grade plane~~, enclosed or open, or combination thereof, of Type I construction or open of Type IV construction, with a grade entrance, is ~~provided under~~ located below a building of Group R building, the ~~Group S-2 parking garage and Group R building shall be considered separate and distinct buildings~~. The number of *stories* to be used in determining the minimum type of construction ~~of the Group R building~~ shall be measured from the floor above ~~such a the parking area garage~~. The floor assembly between the parking garage and the Group R above shall comply with the type of construction required for the parking garage and shall also provide a *fire-resistance rating* not less than the mixed occupancy separation required in Section 508.4. The maximum building height in feet shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the grade plane.

Reason:

The current language in this section is confusing and awkward. This section addresses the upper height limit in stories, but does not address it in feet.

Cost Impact

The code change proposal will decrease the cost of construction .

By clarifying the intent of the code the cost of design, review and approval of projects should be simplified and reduce the overall cost of construction.

Internal ID: 1749

G98-18

IBC: 510.5

Proponent: Lee Kranz, City of Bellevue, WA, representing City of Bellevue, WA (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

510.5 Group R-1 and R-2 buildings of Type IIIA construction. ~~The height limitation for~~ For buildings of Type IIIA construction in Groups R-1 and R-2 the maximum allowable height in Table 504.3 shall be increased to six stories and 75 feet (22 860 mm) by 10 feet and the maximum allowable number of stories in Table 504.4 shall be increased by one where the first floor assembly above the *basement* has a *fire-resistance rating* of not less than 3 hours and the floor area is subdivided by 2-hour fire-resistance-rated *fire walls* into areas of not more than 3,000 square feet (279 m2).

Reason:

The 20 foot increase in building height and one additional story specified in Section 504.2 of the 2012 IBC was deleted and replaced by Tables 504.3 and 504.4 in the 2015 IBC. Tables 504.3 and 504.4 include the increases that used to be specified in Section 504.2 of the 2012 IBC. This created an anomaly in Section 510.5 for height in the current code. Section 510.5 now specifies that the height for Group R-1 and R-2 of Type III-A construction shall be increased to 75' if the building complies with the conditions indicated in this section. Since the Tables already include the pre-calculated increases for sprinklers the increase indicated in Section 510.5 is lost in the translation. This proposal clarifies what the increases are in Section 510.5 and creates consistency with the height and story increases that were previously specified in Section 504.2 of the 2012 IBC. There are no substantive changes from the original provisions of Section 504.2 of the 2012 IBC proposed.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a correction to add clarity in the code. It will not impact the cost of construction.

Internal ID: 1127

G99-18

IBC: 510.8

Proponent: David Collins, The American Institute of Architects, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

Revise as follows:

510.8 Group B or M buildings with Group S-2 open parking garage above. Group B or M occupancies located below a Group S-2 *open parking garage* of a lesser type of construction shall be considered as a separate and distinct building from the Group S-2 *open parking garage* for the purpose of determining the type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 2 hours.
2. The occupancies in the building below the *horizontal assembly* are limited to Groups B and M.
3. The occupancy above the *horizontal assembly* is limited to a Group S-2 *open parking garage*.
4. The building below the *horizontal assembly* is of Type IA construction.

Exception: The building below the *horizontal assembly* shall be permitted to be of Type IB or II construction, but not less than the type of construction required for the Group S-2 *open parking garage* above, where the building below is not greater than *one story* in height above grade plane.

5. The height and area of the building below the *horizontal assembly* does not exceed the limits set forth in Section 503.
6. The height and area of the Group S-2 *open parking garage* does not exceed the limits set forth in Section 406.5. The height, in both feet and *stories*, of the Group S-2 *open parking garage* shall be measured from *grade plane* and shall include the building below the *horizontal assembly*.
7. Exits serving the Group S-2 open parking garage discharge directly shall discharge at grade with direct and unobstructed access to a street or public way and are separated from the building below the *horizontal assembly* by 2-hour *fire barriers* constructed in accordance with Section 707 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

Reason:

This section requires discharge from the parking garage directly to a street or public way which seems overly restrictive. This will allow an unobstructed path to be used to get access to the street or public way.

Cost Impact

The code change proposal will decrease the cost of construction .

The ambiguity in the code should be reduced by this change that will save money in the design of buildings, as well as the review and approval process.

IBC: 602.1, 602.2 (New), 602.2.1, 602.2.2, 602.2.3, , 602.2.4, 602.3 (New), , 602.3.1, 602.3.2, 602.3.3

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com)

2018 International Building Code

602.1 General. Buildings and structures erected or to be erected, altered or extended in height or area shall be classified in one of the five construction types defined in Sections ~~602.2-602.2.1~~ through ~~602.5-602.2.4~~. The building elements shall have a *fire-resistance rating* not less than that specified in Table 601 ~~and exterior and shall be constructed of materials as required by Sections 602.2 and 602.3 for the applicable type of construction.~~ Exterior walls shall have a *fire-resistance rating* not less than that specified in Table 602. Where required to have a *fire-resistance rating* by Table 601, building elements shall comply with the applicable provisions of Section 703.2. The protection of openings, ducts and air transfer openings in building elements shall not be required unless required by other provisions of this code.

602.2 Building element construction materials. Building elements listed in Table 601 shall be constructed of materials in accordance with the provisions of this section.

~~602.2.1~~ **Types I and II construction.** All building elements in buildings of Types I and II construction are those types of construction in which the building elements listed in Table 601 are of noncombustible materials, except as permitted in Section 603 and elsewhere in this code shall be constructed of noncombustible materials.

Exception: Combustible materials are permitted to be used as listed below and elsewhere in this code.

1. Fire-retardant-treated wood framing complying with Section 2303.2 shall be permitted as follows:
 - 1.1. Nonbearing partitions where the required fire-resistance rating is 2 hours or less.
 - 1.2. Nonbearing exterior walls where fire-resistance rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking. In buildings of Type IA construction exceeding two stories above grade plane, fire-retardant-treated wood is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
2. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a corridor serving an occupant load of 30 or more shall be permitted to be constructed of fire-retardant-treated wood, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
3. Stages and platforms constructed in accordance with Sections 410.3 and 410.4, respectively.
4. Wall construction of freezers and coolers of less than 1000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials where the building is protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Materials used on or within building elements in buildings of Type I or II construction shall comply with Section 602.3.

~~602.3~~ **602.2.2 Type III construction.** Exterior walls in buildings of Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code shall be constructed of materials complying with Section 602.2.1.

Exception:  Fire-retardant-treated wood framing and sheathing complying with Section 2303.2 shall be permitted within exterior wall assemblies of having a 2-hour fire-resistance-rating or less. Interior building elements in buildings of Type III construction shall be of any material permitted by this code.

~~602.4~~ **602.2.3 Type IV (Heavy Timber, HT) construction.** Exterior walls in buildings of Type IV construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are (Heavy Timber, HT) construction shall be constructed of materials complying with Section 602.2.1.

Exceptions:

1. Fire-retardant-treated wood framing and sheathing complying with Section 2303.2 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness and having a fire-resistance rating of 2-hours or less.
2. Cross-laminated timber complying with Section 2303.1.4 shall be permitted within exterior wall

assemblies not less than 6 inches (152 mm) in thickness and having a 2-hour fire-resistance rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:

- 2.1. Fire-retardant-treated wood sheathing complying with Section 2303.2 and not less than $\frac{15}{32}$ inch (12 mm) thick;
 - 2.2. Gypsum board not less than $\frac{1}{2}$ inch (12.7 mm) thick; or
 - 2.3. A noncombustible material.
3. Where a fire separation distance of 20 feet (6096 mm) or more is provided, wood columns and arches conforming to heavy timber sizes complying with Section 2304.11 shall be permitted.

Interior building elements shall be of solid wood, laminated wood, heavy timber (HT) or structural composite lumber (SCL) without concealed spaces. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, structural composite lumber (SCL), and cross-laminated timber and details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted.

Exception: Interior walls and partitions having not less than a 1-hour fire-resistance rating or heavy timber complying with Section 2304.11.2.2 shall be permitted.

~~**602.4.1 Fire-retardant-treated wood in exterior walls.** *Fire-retardant treated wood framing and sheathing complying with Section 2303.2 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less.*~~

~~**602.4.2 Cross-laminated timber in exterior walls.** *Cross-laminated timber complying with Section 2303.1.4 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:*~~

- ~~1. *Fire-retardant-treated wood sheathing complying with Section 2303.2 and not less than $\frac{15}{32}$ inch (12 mm) thick;*~~
- ~~2. *Gypsum board not less than $\frac{1}{2}$ inch (12.7 mm) thick; or*~~
- ~~3. *A noncombustible material.*~~

~~**602.4.3 Exterior structural members.** *Where a horizontal separation of 20 feet (6096 mm) or more is provided, wood columns and arches conforming to heavy timber sizes complying with Section 2304.11 shall be permitted to be used externally.*~~

~~**602.5602.2.4 Type V-V construction.** *All building elements in buildings of Type V construction is that type of construction in which the structural elements, exterior walls and interior walls are shall be constructed of any materials permitted by this code.*~~

602.3 Materials used on or within building elements. All construction materials used on or within building elements listed in Table 601 for buildings of Type I or II construction and exterior walls in Type III or IV (HT) construction shall be noncombustible, except that combustible materials are permitted to be used as listed below and elsewhere in this code.

1. Blocking such as for handrails, millwork, cabinets and window and door frames.
2. Millwork such as doors, door frames, window sashes and frames.
3. Trim installed in accordance with Section 806.
4. Nailing or furring strips in accordance with Section 803.15.
5. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
6. Combustible exterior wall coverings, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
7. Exterior plastic veneer installed in accordance with Section 2605.2.
8. Interior wall and ceiling finishes installed in accordance with Section 803.

9. Interior floor finish and floor covering materials installed in accordance with Section 804.
10. Finish flooring installed in accordance with Section 805.
11. Roof coverings that have an A, B or C classification.
12. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
13. Thermal and acoustical insulation, other than foam plastics, having a flame spread index of not more than 25.

Exceptions:

1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a flame spread index of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a flame spread index of not more than 200.
14. Foam plastics in accordance with Chapter 26.
 15. Light-transmitting plastics as permitted by Chapter 26.
 16. Mastics and caulking materials applied to provide flexible seals between components of exterior wall construction.
 17. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
 18. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of fire-resistance tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15 respectively.
 19. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
 20. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
 21. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
 22. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
 23. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

SECTION 603 COMBUSTIBLE MATERIAL IN TYPES I AND II CONSTRUCTION

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1: *Nonbearing partitions where the required fire-resistance rating is 2 hours or less.*
 - 1.2: *Nonbearing exterior walls where fire-resistance-rated construction is not required.*
 - 1.3: *Roof construction, including girders, trusses, framing and decking.*

Exception: In buildings of Type IA construction exceeding two stories above grade plane, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4: *Balconies, porches, decks and exterior stairways not used as required exits on buildings three stories or less above grade plane.*
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25:

Exceptions:

1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.

3. ~~Foam plastics in accordance with Chapter 26.~~
4. ~~Roof coverings that have an A, B or C classification.~~
5. ~~Interior floor finish and floor covering materials installed in accordance with Section 804.~~
6. ~~Millwork such as doors, door frames, window sashes and frames.~~
7. ~~Interior wall and ceiling finishes installed in accordance with Section 803.~~
8. ~~Trim installed in accordance with Section 806.~~
9. ~~Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.~~
10. ~~Finish flooring installed in accordance with Section 805.~~
11. ~~Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a corridor serving an occupant load of 30 or more shall be permitted to be constructed of fire-retardant-treated wood, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.~~
12. ~~Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.~~
13. ~~Combustible exterior wall coverings, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.~~
14. ~~Blocking such as for handrails, millwork, cabinets and window and door frames.~~
15. ~~Light-transmitting plastics as permitted by Chapter 26.~~
16. ~~Mastics and caulking materials applied to provide flexible seals between components of exterior wall construction.~~
17. ~~Exterior plastic veneer installed in accordance with Section 2605.2.~~
18. ~~Nailing or furring strips as permitted by Section 803.15.~~
19. ~~Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.~~
20. ~~Aggregates, component materials and admixtures as permitted by Section 703.2.2.~~
21. ~~Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of fire resistance tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.~~
22. ~~Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.~~
23. ~~Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.~~
24. ~~Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.~~
25. ~~Materials exposed within plenums complying with Section 602 of the International Mechanical Code.~~
26. ~~Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.~~

~~603.1-1602.3.1 Ducts.~~ The use of nonmetallic ducts shall be permitted where installed in accordance with the limitations of the International Mechanical Code.

~~603.1-2602.3.2 Piping.~~ The use of combustible piping materials shall be permitted where installed in accordance with the limitations of the International Mechanical Code and the International Plumbing Code.

~~603.1-3602.3.3 Electrical.~~ The use of electrical wiring methods with combustible insulation, tubing, raceways and related components shall be permitted where installed in accordance with the limitations of this code.

Reason:

During the last code development cycle the ICC Building Code Action Committee (BCAC) submitted a proposal that reorganized the combustible materials allowances presently contained in Section 603.1. The General Code Committee disapproved the proposal. The published statement explaining the committee action included, "the committee appreciated the effort to reorganize these provisions, but there were concerns that it was incomplete."

The Boeing Company agreed with the concept, but felt that the proposal was not as comprehensive as it should be.

Boeing rewrote the proposal and submitted it as a public comment. The public comment was approved by a 2/3 majority of those voting members in attendance at the public comment hearings. Subsequent to that action it was discovered that an exception relating to the use of fire-retardant materials in Type III buildings had been omitted. The Boeing Company contacted voting members to urge them to vote for disapproval of the public comment during the remote voting phase. The public comment was disapproved as a final action.

Based on the positive reaction to the concept of the public comment, a similar proposal is being submitted for this code development cycle. Necessarily, the proposal is updated so as to be based on 2018 IBC provisions. The major flaw with the BCAC proposal was that it redistributed the current items at Section 603.1 throughout the code. Although many dislike "laundry lists," in this case a "one stop shop" for the various combustible construction materials allowances greatly benefits building designers and code enforcement officials alike.

This proposal accomplishes two things. It rewords Section 602 provisions so that the construction materials provisions are easily understood. Currently, several provisions that represent exceptions to the base requirement for noncombustible materials are contained within the text. Those allowances are now appropriately identified as exceptions. Secondly, the proposal reorganizes the Section 603.1 items in a hierarchy based on their likelihood of use.

The provision is largely editorial. Some language has been clarified for functionality. For instance, current Section 602.4.3 states, "Where a horizontal separation of 20 feet or more is provided,..." Horizontal separation is a nebulous term with no defined end points. That term has been replaced by the more appropriate term "fire separation distance." Also, currently Section 603.1 indicates that the following items are applicable to Types I and II construction.

Literally interpreted, this would not allow for those items applicable to exterior wall construction to be permitted in buildings of Type III and IV construction. This proposal corrects that oversight.

What follows is a listing of the former and proposed locations for each of the Section 603.1 items.

<u>Former Section 603.1</u>	<u>Proposed Location</u>
1.)	602.2.1, Item 1
2.)	602.3, Item 13
3.)	602.3, Item 14
4.)	602.3, Item 11
5.)	602.3, Item 9
6.)	602.3, Item 2
7.)	602.3, Item 8
8.)	602.3, Item 3
9.)	602.3, Item 5
10.)	602.3, Item 10
11.)	602.2.1, Item 2
12.)	602.2.1, Item 3
13.)	602.3, Item 6
14.)	602.3, Item 1
15.)	602.3, Item 15
16.)	602.3, Item 16
17.)	602.3, Item 7
18.)	602.3, Item 4
19.)	602.3, Item 12
20.)	602.3, Item 17
21.)	602.3, Item 18
22.)	602.3, Item 19
23.)	602.3, Item 20
24.)	602.3, Item 21
25.)	602.3, Item 22
26.)	602.2.1, Item 4

This proposal essentially represents an overhaul of the Sections 602 and 603 construction materials provisions.

Approval of this proposal will result in more uniform interpretations of these fundamental code provisions by providing users with requirements that are in technical context with their given application based on the specific type of construction, exterior or interior wall, etc.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is essentially an editorial revision that changes no current requirements.

Internal ID: 1577

G101-18

IBC: TABLE 601

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows:

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary structural frame ^f (see Section 202)	3 ^{a, b}	2 ^{a, b}	1 ^b	0	1 ^b	0	HT	1 ^b	0
Bearing walls Exterior ^{e, f} Interior	3 3 ^a	2 2 ^a	1 1 ^a	0 0	2 1	2 0	2 1/HT ^g	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.
- g. Heavy timber bearing walls supporting more than two floors or more than a floor and a roof shall have a fire resistance rating of not less than 1 hour.

Reason:

Cross laminated timber was introduced into the 2015 IBC. Section 2304.11.2.2 and table 601 permit 4 inch heavy timber walls that do not have a fire resistance rating to serve as bearing walls in structures that could be as many as 6 stories tall for a group B occupancy building. Generally heavy timber dimensions for vertical elements result in building elements that have a fire resistance rating in the ballpark of 45 minutes to 1 hour or more. CLT walls as thin as 4 inches can support the tributary loads from floors of 5 stories but when a 4 inch thick CLT wall is fully loaded and exposed without protection, it may have an intrinsic structural fire resistance rating of less than 30 minutes. This is not a problem for columns because they tend to grow bigger with a commensurate intrinsic fire resistance as buildings get taller.

This proposal modifies Table 601 to require heavy timber bearing walls supporting more than two floors or a floor and a roof to be of 1-hour fire resistance rating or greater which is appropriate for vertical elements in mid-rise multi-story buildings. If a designer desires to have an exposed CLT bearing wall supporting multiple stories they may need to increase the thickness of the wall to provide 1 hour fire resistance rating. This may be calculated in accordance with Chapter 16 of the National Design Specification as allowed in Section 722.1 or they may need to utilize a tested wall.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction in certain instances of tall non-residential Type IV buildings. This proposal will not increase the cost of construction for Type IV residential occupancy groups because Section 420, Section 508.3.3 exception 2, and Section 711 already require bearing walls of Type IV construction to be a minimum of one hour fire resistance rated for R occupancy groups with no exceptions for sprinklers.

Internal ID: 1960

G102-18

IBC: TABLE 601

Proponent: Dennis Richardson, American Wood Council, representing American Wood Council (drichardson@awc.org)

2018 International Building Code

Revise as follows:

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary structural frame ^f (see Section 202)	3 ^{a, b}	2 ^{a, b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	HT	1 ^{b, c}	0
Bearing walls Exterior ^{e, f} Interior	3 3 ^a	2 2 ^a	1 1	0 0	2 1	2 0	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed for roof construction, including primary structural frame members, where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.

Reason:

The exception in footnote **c** for using heavy timber in roof construction has in the past been applied to all roof elements, including those that may fit within the definition of Primary Structural Frame, which came into the code later. However, some code officials have not permitted the use of footnote **c** for roof members that fit the definition of primary structural frame, since there is a separate row for primary structural frame in the table. We believe the correct interpretation is to allow the footnote to apply to all roof construction, including structural members that are part of the primary structural frame.

In the last cycle, a similar phrase, “including protection of primary structural frame members” and the qualifier “in roof construction” was approved for footnote **b**, which permits roof construction, including roof members that are part of the primary structural frame, to be unprotected when every part of the roof construction is more than 20 feet above the floor below (G167-15, AS). In a similar manner, this code change will clarify that footnote **c** is intended to permit all roof construction with a required rating of one hour or less to be heavy timber.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change clarifies interpretation of existing language giving more options to designers. Because of that it will not increase or decrease the cost of construction.

IBC: 202, TABLE 601, 704.4

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows:

[BG] PRIMARY STRUCTURAL FRAME. The primary structural frame shall include all of the following structural members:

1. The columns.
2. Structural members having direct connections to the columns, including girders, beams, trusses and spandrels.
3. Members of the floor construction and roof construction having direct connections to the columns.
4. ~~Bracing members—Members that are essential to the vertical stability of the primary structural frame under gravity loading shall be considered part of the primary structural frame whether or not the bracing member carries gravity loads.~~loading.

[BG] SECONDARY STRUCTURAL MEMBERS. The following structural members shall be considered secondary members and not part of the primary structural frame:

1. Structural members not having direct connections to the columns.
2. Members of the floor construction and roof construction not having direct connections to the columns.
3. Bracing members ~~other than those that are~~ not designated as part of the a primary structural frame of bearing wall.

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A	B	A	B	HT	A	B
Primary structural frame ^f (see Section 202)	3 ^{a, b}	2 ^{a, b}	1 ^b	0	1 ^b	0	HT	1 ^b	0
Bearing walls Exterior ^{e, f} Interior	3 3 ^a	2 2 ^a	1 1	0 0	2 1	2 0	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary structural members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary structural members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.

704.4 Protection of secondary structural members. Secondary structural members that are required to have protection to achieve a *fire-resistance rating* shall be protected by individual encasement protection.

Reason:

The definitions for the terms “primary structural frame” and “secondary members” are proposed to be modified so as to:

- update the terms to adequately address new technologies,
- to remove parts of the definition which could be considered archaic, and
- to remove what was viewed as redundant language.

The new technologies being addressed is mass timber (e.g. glu-laminated, structural composite, cross laminated). The proposed cleanup of this language will allow designers and code officials to better identify the structural characteristics, such as when an entire building is constructed of mass timber panels (e.g. no columns). This will also benefit the same parties when other new materials technologies enter the market.

The proposal focuses on modifying the “bracing members” subcategories where over time with modifications the current language has become difficult to distinguish between the two. One example being when a lateral support member does not act as an element that part of the vertical stability of the structure, what is it? When reviewed multiple responses were received suggesting the language in the definitions needed greater clarity.

The proposal also have removed language from “Primary Structural Frame” that was felt to be redundant (e.g. the term “bracing”)

These terms are used in Chapter 6 “Types of Construction,” Chapter 7 “Smoke and Fire Protection Features,” and Appendix L “Requirements for Fire Fighting Air Replenishing Systems,” and focus on the fire resistance characteristics of those structural elements. These terms are not used in Chapter 16 “Structural” nor the materials chapters of the IBC.

Adding the word “structural” to the term “Secondary structural member” clarifies the intent and link to the definition for “primary structural members”. The word “structural” is also added to the applicable portions of Table 601.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) and the ICC Fire Code Action Committee (FCAC). The BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>. The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal represents a clarification of the definitions to more clearly align with the original intent of the terms.

G104-18

IBC: TABLE 601

Proponent: Andrew Klein, representing Self Storage Association (andrew@asklein.com)

2018 International Building Code

Revise as follows:

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV HT	TYPE V	
	A	B	A ^a	B	A ^a	B		A ^a	B
Primary structural frame ^f (see Section 202)	3 ^{a, b}	2 ^{a, b}	1 ^b	0	1 ^b	0	HT	1 ^b	0
Bearing walls Exterior ^{e, f} Interior	3 3 ^a	2 2 ^a	1 1	0 0	2 1	2 0	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.
- g. Except in Group H, I and R occupancies where an automatic sprinkler system in accordance with Section 903.3.1.1 is required by Section 903.2, such system shall be allowed to be substituted for 1-hour fire-resistance-rated construction provided that the height and tabular allowable area factor of buildings are limited to the values specified in the NS rows of Tables 506.2 and Table 504.3. This substitution shall not be permitted for exterior walls.

Reason:

This proposal reinstates an exception that that was taken out in the 2015 IBC due to concerns over enforcement. It was argued that the previous language, which allowed a reduction in fire resistance ratings when a full NFPA 13 sprinkler system was installed but not needed, could not be accurately enforced because there are so many exceptions and reductions to the provisions of the code that are permitted by the installation of a sprinkler system.

It was further argued that there was no cost increase by taking out the footnote since those projects that are taking the one-hour reduction along with non-allowed trade-offs are non-compliant anyway. The footnote was taken out with the justification that it removed an unnecessary level of complication.

The deletion of the footnote provides a disincentive to sprinkler small buildings where sprinklers are not mandatory. Fire sprinklers are very effective in controlling fires in such buildings. Furthermore, this proposal provides easily enforceable language that is more consistent with the way in which the footnote had been successfully used since the first edition of the IBC and within the UBC legacy code prior to the IBC. Group H, I, and R occupancies that are required to have a full NFPA 13 sprinkler system may not take advantage of this footnote.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal allows a reduction in the fire-resistance rating of construction in some cases if automatic sprinklers are provided. Because the footnote is optional, it reasonable to assume it only be utilized to take advantage of the cost savings.

G105-18

IBC: TABLE 602

Proponent: Christopher Athari, Hoover Treated Wood Products, representing Hoover Treated Wood Products (cathari@frtw.com)

2018 International Building Code

Revise as follows:

TABLE 602**FIRE-RESISTANCE RATING REQUIREMENTS FOR EXTERIOR WALLS BASED ON FIRE SEPARATION DISTANCE^a,
d, g**

FIRE SEPARATION DISTANCE =X (feet)	TYPE OF CONSTRUCTION	OCCUPANCY GROUP H^e	OCCUPANCY GROUP F-1, M, S-1^f	OCCUPANCY GROUP A, B, E, F-2, I, Rⁱ, S-2, U^h
X < 5 ^b	All	3	2	1
5 ≤ X < 10	IA	3	2	1
	Others	2	1	1
10 ≤ X < 30	IA, IB	2	1	1 ^c
	IIA, VBA, IIIA	1	0	0
	Others	1	1	1 ^c
X ≥ 30	All	0	0	0

For SI: 1 foot = 304.8 mm.

- a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 601.
- b. See Section 706.1.1 for party walls.
- c. Open parking garages complying with Section 406 shall not be required to have a fire-resistance rating.
- d. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the story in which the wall is located.
- e. For special requirements for Group H occupancies, see Section 415.6.
- f. For special requirements for Group S aircraft hangars, see Section 412.3.1.
- g. Where Table 705.8 permits nonbearing exterior walls with unlimited area of unprotected openings, the required fire-resistance rating for the exterior walls is 0 hours.
- h. For a building containing only a Group U occupancy private garage or carport, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.
- i. For a Group R-3 building of Type II-B or Type V-B construction, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.

Reason:

It is inconsistent to require Type IIIB to have one hour fire resistance on the exterior of a wall but permit Type IIB and Type VB to have zero hour rating. Consider:

1. Type IIIB and IIB have the same allowable heights indicating they are considered equivalent. See table 504.3
2. Type IIIB has either small allowable areas or equal to Type IIB indicating they are considered nearly equivalent for protection from fire based on the occupancy. Table 506.2
3. The number of stories permitted for Type IIB and Type IIIB are the same. Exception: I-2 occupancies. See table 504.4
4. Both type IIB and IIIB construction a non-combustible exterior finish or cladding. See section 602.2 and 602.3
5. While no fire rating is assigned, it is recognized that the wall will have a rating less than one hour based on typical construction practices, Type IIIB with zero rating on the exterior side of the wall will perform as well or better than a zero hour rated Type IIB wall.
6. The fire rating from the interior side of a Type IIIB wall will have a two-hour rating or more in all cases. A Type IIB wall from the interior side can have no rating in some cases.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

It adds an option to the code to include IIIB. All other types of building are not modified, no option is being subtracted and thus I would suggest no cost impact.

If one were building IIB, VB, etc construction prior to code change, they may still do so after the code change. It remains the same. No one will be forced to use IIIB.

Internal ID: 880

G106-18

IBC: 602.3

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. *Fire-retardant-treated wood* framing and sheathing complying with Section 2303.2 shall be permitted within *exterior wall* assemblies of a 2-hour rating or less. Where a floor or roof assembly creates a membrane penetration in the exterior wall assembly of Type III construction, the materials within the penetration shall be noncombustible or fire-retardant-treated wood framing as permitted by this section.

Reason:

This addition of language provides clarification of what is considered part of the exterior wall assembly of Type III construction. Specifically, assemblies penetrating the exterior wall assembly in Type III construction are considered part of the exterior wall assembly.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no anticipated cost increase or decrease for this clarification.

Internal ID: 1664

G107-18

IBC: 602.3, 602.4.1, 602.4.2

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Masonry Alliance for Codes and Standards (svskalko@svskalko-pe.com); William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org)

2018 International Building Code

Revise as follows:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. ~~Nonbearing fire-retardant-treated wood framing within exterior wall assemblies of a 2-hour rating or less less provided the required fire resistance is maintained and the exposed outer and inner faces of such walls are noncombustible.~~

602.4.1 Fire-retardant-treated wood in exterior walls. ~~Fire~~Nonbearing fire-retardant-treated wood with Section 2303.2 shall be permitted within exterior wall assemblies not less than 6-inches in thickness with a 2-hour rating provided the required fire resistance is maintained and the exposed outer and inner faces of such walls are noncombustible.

602.4.2 Cross-laminated timber in exterior walls. Cross-laminated timber complying with Section 2303.1.4 or less, provided the exterior ~~surface and interior surfaces~~ of the cross-laminated timber ~~is~~are protected by one the following and the required fire resistance rating is maintained:

1. ~~Fire-retardant-treated wood sheathing complying with Section 2303.2 and not less than $1\frac{5}{32}$ inch (12 mm) thick;~~
2. Gypsum board not less than $\frac{1}{2}$ inch (12.7 mm) thick; or
3. A noncombustible material.

Reason:

Historically building construction types in older building codes and the previous legacy codes are described based on noncombustible and/or combustible materials utilized in the building structural elements. The construction types range from buildings with no combustible structural framing, to those with noncombustible exterior walls and some combustible structural framing on the interior of the building, to buildings where the majority of the structural framing is combustible. This concept of describing the building construction type based on these combinations of noncombustible and/or combustible materials is reflected in the types of construction found in the International Building Code.

Changes to the building code that allow the use of fire retardant treated wood for Types III and IV construction and cross-laminated lumber for Type IV construction have reduced the clarity in the code that these two types of construction are required to have the exterior load-bearing portions of the structure to be noncombustible materials. This is evident by the requirements in the first sentence to both 602.3 Type III and 602.4 Type IV specifying exterior walls to be noncombustible materials. It is implied, but not as clear by the language in the last sentence of 602.3 for Type III construction and in 602.4.1 and 602.4.2 of Type IV construction, where fire retardant treated wood and cross-laminated lumber are permitted to be used "within" the exterior wall. This term "within" indicates the combustible materials are permitted for use as a component in the exterior wall but the structural exterior wall is still required to be noncombustible.

For Types III and IV construction, the use of fire retardant treated wood (FRTW) in exterior walls of noncombustible construction embodied in the IBC language is presumed to come from the last edition of the Uniform Building Code (UBC). In the 1997 UBC edition, upon which portions of the IBC were based, Section 503.4.3 stated "In Types III and IV construction, approved fire-retardant treated wood framing may be used within the assembly of exterior walls when Table 5-A allows a fire resistive rating of 2-hours or less provided the required fire resistance is maintained and the exposed outer and inner faces of such walls are noncombustible". The 1997 UBC is presumed to be the source of this provision since the last editions of the BOCA National Building Code - NBBC (1996) and the Standard Building Code - SBC (1997) were consistent and did not permit FRTW, whether bearing or non-bearing, in exterior walls of Types III or IV construction.

This change will make clear that the bearing portion of the exterior walls in Types III and IV construction, with FRTW "within" the wall, must be noncombustible to qualify for that type of construction. In addition to the FRTW being "within" the exterior wall, the previous language whereby the fire resistance rating of any exterior wall is maintained and that the exposed outer and inner surfaces of such walls are noncombustible have been included for these and CLT
