exterior walls, consistent with the original provisions in the 1997 UBC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost impact from this change. It only clarifies the intent of the code.

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BS] WALL, LOAD-BEARING. Any wall meeting either of the following classifications:

1. Any metal or wood stud wall that supports more than 100 pounds per linear foot (1459 N/m) of vertical load in addition to its own weight.
2. Any *masonry* or concrete, or mass timber wall that supports more than 200 pounds per linear foot (2919 N/m) of vertical load in addition to its own weight.

Add new definition as follows:

MASS TIMBER. Structural elements of Type IV construction primarily of solid, built-up, panelized or engineered wood products that meet minimum cross section dimensions of Type IV construction.

NONCOMBUSTIBLE PROTECTION (FOR MASS TIMBER).

Noncombustible material, in accordance with Section 703.5, designed to increase the fire-resistance rating and delay the combustion of mass timber.

Revise as follows:

602.4 Type IV. ~~Type IV construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated wood, heavy timber (HT) or structural composite lumber (SCL) without concealed spaces. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, structural composite lumber (SCL), and cross-laminated timber and details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted. Interior walls and partitions not less than 1-hour fire-resistance rating or heavy timber complying with Section 2304.11.2.2 shall be permitted.~~

Type IV construction is that type of construction in which the building elements are mass timber or noncombustible materials and have fire resistance ratings in accordance with Table 601. Mass timber elements shall meet the fire resistance rating requirements of this section based on either the fire resistance rating of the noncombustible protection, the mass timber, or a combination of both and shall be determined in accordance with Section 703.2 or 703.3. The minimum dimensions and permitted materials for building elements shall comply with the provisions of this section and Section 2304.11. Mass timber elements of Types IV A, IV B and IV C construction shall be protected with noncombustible protection applied directly to the mass timber in accordance with Sections 602.4.1 through 602.4.3. The time assigned to the noncombustible protection shall be determined in accordance with Section 703.8 and comply with 722.7.

Cross-laminated timber shall be labeled as conforming to the heat performance requirements of Section 6.1.3.4 of DOC PS1 and have no delamination in any specimen, except where occurring at a localized characteristic when permitted in the product standard.

Exterior load-bearing walls and nonload-bearing walls shall be mass timber construction, or shall be of noncombustible construction.

Exception: Exterior load-bearing walls and nonload-bearing walls of Type IV-HT Construction in accordance with Section 602.4.4.

The interior building elements, including nonload-bearing walls and partitions, shall be of mass timber construction or of noncombustible construction.

Exception: Interior building elements and nonload-bearing walls and partitions of Type IV-HT Construction in

accordance with Section 602.4.4.

Combustible concealed spaces are not permitted except as otherwise indicated in Sections 602.4.1 through 602.4.4. Combustible stud spaces within light frame walls of Type IV-HT construction shall not be considered concealed spaces, but shall comply with Section 718.

In buildings of Type IV-A, B, and C, construction with an occupied floor located more than 75 feet above the lowest level of fire department access, up to and including 12 stories or 180 feet above grade plane, mass timber interior exit and elevator hoistway enclosures shall be protected in accordance with Section 602.4.1.2. In buildings greater than 12 stories or 180 feet above grade plane, interior exit and elevator hoistway enclosures shall be constructed of non-combustible materials.

Add new text as follows:

602.4.1 Type IV-A. Building elements in Type IV-A construction shall be protected in accordance with Sections 602.4.1.1 through 602.4.1.6. The required fire resistance rating of noncombustible elements and protected mass timber elements shall be determined in accordance with Section 703.2 or Section 703.3.

602.4.1.1 Exterior protection. The outside face of exterior walls of mass timber construction shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a). All components of the exterior wall covering, shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.1.2 Interior protection. Interior faces of all mass timber elements, including the inside faces of exterior mass timber walls and mass timber roofs, shall be protected with materials complying with Section 703.5

602.4.1.2.1 Protection time. Noncombustible protection shall contribute a time equal to or greater than times assigned in Table 722.7.1(a), but not less than 80 minutes. The use of materials and their respective protection contributions listed in Table 722.7.1(b) shall be permitted to be used for compliance with Section 722.7.1.

602.4.1.3 Floors. The floor assembly shall contain a noncombustible material not less than one inch in thickness above the mass timber. Floor finishes in accordance with Section 804 shall be permitted on top of the noncombustible material. The underside of floor assemblies shall be protected in accordance with 602.4.1.2.

602.4.1.4 Roofs. The interior surfaces of roof assemblies shall be protected in accordance with Section 602.4.1.2. Roof coverings in accordance with Chapter 15 shall be permitted on the outside surface of the roof assembly.

602.4.1.5 Concealed spaces. Concealed spaces shall not contain combustibles other than electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the International Mechanical Code, and shall comply with all applicable provisions of Section 718. Combustible construction forming concealed spaces shall be protected in accordance with Sections 602.4.1.2.

602.4.1.6 Shafts. Shafts shall be permitted in accordance with Sections 713 and Section 718. Both the shaft side and room side of mass timber elements shall be protected in accordance with Section 602.4.1.2.

602.4.2 Type IV-B. Building elements in Type IV-B construction shall be protected in accordance with Sections 602.4.2.1 through 602.4.2.6. The required fire resistance rating of noncombustible elements or mass timber elements shall be determined in accordance with Section 703.2 or Section 703.3.

602.4.2.1 Exterior protection. The outside face of exterior walls of mass timber construction shall be protected with non-combustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a). All components of the exterior wall covering shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354, and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.2.2 Interior protection. Interior faces of all mass timber elements, including the inside face of exterior mass timber walls and mass timber roofs, shall be protected, as required by this section, with materials complying with Section 703.5.

602.4.2.2.1 Protection time. Noncombustible protection shall contribute a time equal to or greater than times assigned in Table 722.7.1(a), but not less than 80 minutes. The use of materials and their respective protection contributions listed in Table 722.7.1(b) shall be permitted to be used for compliance with Section 722.7.1.

602.4.2.2.2 Protected area. All interior faces of all mass timber elements shall be protected in accordance with Section 602.4.2.2.1, including the inside face of exterior mass timber walls and mass timber roofs.

Exceptions: Unprotected portions of mass timber ceilings and walls complying with Section 602.4.2.2.4 and the following:

1. Unprotected portions of mass timber ceilings, including attached beams, shall be permitted and shall be limited to an area equal to 20% of the floor area in any dwelling unit or fire area; or
2. Unprotected portions of mass timber walls, including attached columns, shall be permitted and shall be limited to an area equal to 40% of the floor area in any dwelling unit or fire area; or
3. Unprotected portions of both walls and ceilings of mass timber, including attached columns and beams, in any dwelling unit or fire area shall be permitted in accordance with section 602.4.2.2.3.
4. Mass timber columns and beams which are not an integral portion of walls or ceilings, respectively, shall be permitted to be unprotected without restriction of either aggregate area or separation from one another.

602.4.2.2.3 Mixed unprotected areas. In each dwelling unit or fire area, where both portions of ceilings and portions of walls are unprotected, the total allowable unprotected area shall be determined in accordance with Equation 6-1.

$(U_{tc}/U_{ac}) + (U_{tw}/U_{aw}) \leq 1$ (Equation 6-1) where:

U_{tc} = Total unprotected mass timber ceiling areas

U_{ac} = Allowable unprotected mass timber ceiling area conforming to Section 602.4.2.2.2, Exception 1

U_{tw} = Total unprotected mass timber wall areas

U_{aw} = Allowable unprotected mass timber wall area conforming to Section 602.4.2.2.2, Exception 2

602.4.2.2.4 Separation distance between unprotected mass timber elements. In each dwelling unit or fire area, unprotected portions of mass timber walls and ceilings shall be not less than 15 feet from unprotected portions of other walls and ceilings, measured horizontally along the ceiling and from other unprotected portions of walls measured horizontally along the floor.

602.4.2.3 Floors. The floor assembly shall contain a noncombustible material not less than one inch in thickness above the mass timber. Floor finishes in accordance with Section 804 shall be permitted on top of the noncombustible material. The underside of floor assemblies shall be protected in accordance with Section 602.4.1.2.

602.4.2.4 Roofs. The interior surfaces of roof assemblies shall be protected in accordance with 602.4.2.2 except, in nonoccupiable spaces, they shall be treated as a concealed space with no portion left unprotected. Roof coverings in accordance with Chapter 15 shall be permitted on the outside surface of the roof assembly.

602.4.2.5 Concealed spaces. Concealed spaces shall not contain combustibles other than electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the International Mechanical Code, and shall comply with all applicable provisions of Section 718. Combustible construction forming concealed spaces shall be protected in accordance with Section 602.4.1.2.

602.4.2.6 Shafts. Shafts shall be permitted in accordance with Section 713 and Section 718. Both the shaft side and room side of mass timber elements shall be protected in accordance with Section 602.4.1.2.

602.4.3 Type IV-C. Building elements in Type IV-C construction shall be protected in accordance with Sections 602.4.3.1 through 602.4.3.6. The required fire resistance rating of building elements shall be determined in accordance with Section 703.2 or Section 703.3.

602.4.3.1 Exterior protection. The exterior side of walls of combustible construction shall be protected with non-

combustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a). All components of the exterior wall covering, shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.3.2 Interior protection. Mass timber elements are permitted to be unprotected.

602.4.3.3 Floors. Floor finishes in accordance with Section 804 shall be permitted on top of the floor construction.

602.4.3.4 Roofs. Roof coverings in accordance with Chapter 15 shall be permitted on the outside surface of the roof assembly.

602.4.3.5 Concealed spaces. Concealed spaces shall not contain combustibles other than electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the International Mechanical Code, and shall comply with all applicable provisions of Section 718. Combustible construction forming concealed spaces shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a).

602.4.3.6 Shafts. Shafts shall be permitted in accordance with Section 713 and Section 718. Shafts and elevator hoistway and interior exit stairway enclosures shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a), on both the inside of the shaft and the outside of the shaft.

602.4.4 Type IV-HT. Type IV construction (Heavy Timber, HT) is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated heavy timber or structural composite lumber (SCL), without concealed spaces. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, structural composite lumber (SCL) and cross laminated timber (CLT) and details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.4.1 or 602.4.4.2 shall be permitted. Interior walls and partitions not less than one hour fire resistance rating or heavy timber conforming with Section 2304.11.2.2 shall be permitted.

Revise as follows:

~~602.4.1~~602.4.4.1 Fire-retardant-treated wood in exterior walls. *Fire-retardant-treated wood* framing and sheathing complying with Section 2303.2 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less.

~~602.4.2~~602.4.4.2 Cross-laminated timber in exterior walls. *Cross-laminated timber* complying with Section 2303.1.4 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:

1. *Fire-retardant-treated wood* sheathing complying with Section 2303.2 and not less than ¹⁵/₃₂ inch (12 mm) thick;
2. *Gypsum board* not less than ¹/₂ inch (12.7 mm) thick; or
3. A noncombustible material.

~~602.4.3~~602.4.4.3 Exterior structural members. Where a horizontal separation of 20 feet (6096 mm) or more is provided, wood columns and arches conforming to heavy timber sizes complying with Section 2304.11 shall be permitted to be used externally.

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV				TYPE V	
	A	B	A	B	A	B	A	B	C	HT	A	B
Primary structural frame ^f (see Section 202)	3 ^{a, b}	2 ^{a, b}	1 ^b	0	1 ^b	0	3 ^a	2 ^a	2 ^a	HT	1 ^b	0
Bearing walls Exterior ^{e, f} Interior	3 3 ^a	2 2 ^a	1 1	0 0	2 1	2 0	3 3	2 2	2 2	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602											
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	1 1/2	1	1	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.

TABLE 602
FIRE-RESISTANCE RATING REQUIREMENTS FOR EXTERIOR WALLS BASED ON FIRE SEPARATION DISTANCE^a,
d, g

FIRE SEPARATION DISTANCE =X (feet)	TYPE OF CONSTRUCTION	OCCUPANCY GROUP H^e	OCCUPANCY GROUP F-1, M, S-1^f	OCCUPANCY GROUP A, B, E, F-2, I, Rⁱ, S-2, U^h
X < 5 ^b	All	3	2	1
5 ≤ X < 10	IA, <u>IVA</u>	3	2	11
	Others	2	1	
10 ≤ X < 30	IA, IB, <u>IVA, IVB</u>	2	1	1 ^c
	IIB, VB	1	0	0
	Others	1	1	1 ^c
X ≥ 30	All	0	0	0

For SI: 1 foot = 304.8 mm.

- a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 601.
- b. See Section 706.1.1 for party walls.
- c. Open parking garages complying with Section 406 shall not be required to have a fire-resistance rating.
- d. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the story in which the wall is located.
- e. For special requirements for Group H occupancies, see Section 415.6.
- f. For special requirements for Group S aircraft hangars, see Section 412.3.1.
- g. Where Table 705.8 permits nonbearing exterior walls with unlimited area of unprotected openings, the required fire-resistance rating for the exterior walls is 0 hours.
- h. For a building containing only a Group U occupancy private garage or carport, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.
- i. For a Group R-3 building of Type II-B or Type V-B construction, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB and its various WGs held meetings, studied issues and sought input from various expert sources around the world. The TWB has posted those documents and input on its website for interested parties to follow its progress and to allow those parties to, in turn, provide input to the TWB.

At its first meeting, the TWB discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings:

No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.

No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.

No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.

No unusual fire department access issues.

Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.

Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

The comprehensive package of proposals from the TWB meet these performance objectives.

Definitions

Included in the proposal for Section 602.4 are three new/revised definitions; Wall, Load-Bearing; Mass Timber; and Noncombustible protection (for mass timber). They are important to understanding the subsequent proposed change to Section 602.4.

Load-bearing wall: The modification to the term “load-bearing wall” has been updated to include “mass timber” as a category equivalent to that of masonry or concrete. Based on the research done by the wood trade associations, mass timber walls (e.g. sawn, glued-laminated, cross-laminated timbers) have the ability to support the minimum 200 pounds per linear foot vertical load requirement.

Mass Timber: The term “mass timber” is being proposed to represent both the legacy heavy timber (a.k.a. Type IV construction) and the three (3) new construction types that are proposed for Chapter 6 of the IBC. The purpose of creating this term and definition was to establish a single term which represented the various sawn and engineered timber products that are referenced in IBC Chapter 23 (Wood) and in PRG-320 “Standard for Performance-rated Cross-laminated Timber.”

“Noncombustible Protection (For Mass Timber): The definition of “Noncombustible Protection (For Mass Timber)” is

created to address the passive fire protection of mass timber. Mass timber is permitted to have its own fire-resistance rating (e.g., Mass Timber only) or have a fire resistance rating based on the fire resistance through a combination of the mass timber fire-resistance plus protection by non-combustible materials as defined in Section 703.5 (e.g., additional materials that delay the combustion of mass timber, such as gypsum board). While it is not common to list a code section number within a definition it was felt necessary in this case to ensure that the user was able to understand the intent. The protection by a non-combustible material will act to delay the combustion of the Mass Timber.

Types of Construction

The Committee recognized that tall, mass timber buildings around the world generally fell into three categories: one in which the mass timber was fully protected by noncombustible protection, a second type in which the protection was permitted to be omitted to expose the wood in certain limited amounts of walls or ceilings, and a third type in which the mass timber for the structure was permitted to be unprotected.

The TWB also determined that fire testing was necessary to validate these concepts. At its first meeting, members discussed the nature and intention of fire testing so as to ensure meaningful results for the TWB and, more specifically, for the fire service. Subsequently a test plan was developed. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stairway. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of joints, and to evaluate conditions for responding fire personnel. The Fire WG then refined the test plan, which was implemented with a series of five, full-scale, multiple-story building tests at the Alcohol, Tobacco and Firearms (ATF) laboratories in Beltsville, MD. The results of those tests, as well as testing conducted by others, helped form the basis upon which the Codes WG developed its code change proposals. This code change proposal is one of those developed by the Codes WG and approved by the TWB.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit: <http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17.

The completely protected type of construction, as noted above, is identified as Type IV-A. The protection is defined by a new section, 722.7, proposed in a separate code change. Testing has shown that mass timber construction protected with noncombustible protection, primarily multiple layers of 5/8-inch Type X gypsum board, can survive a complete burnout of a residential fuel load without engaging the mass timber in the fire. (See video or report above.) In considering this type of construction and its potential height and/or allowable area, the TWB wanted to make sure that code users realize that the protection specified in the text applies to all building elements. Thus, the text clearly requires protection for the floor surface, all wall and ceiling surfaces, the inside roof surfaces, the underside of floor surfaces, and shafts. In addition, Type IV-A construction is proposed to have the same fire resistance rating requirements as the existing Type I-A construction, which sets forth requirements for 2-hour and 3-hour structural elements. The specified fire resistance rating for Type IV-A construction is conservative in that the fire resistance rating of the structural elements was selected to be able to passively sustain the fuel loads associated with the various occupancies without the benefit of automatic sprinkler protection, and without involving the contribution of the structural members, similar to the strategy employed in the IBC for Type I construction.

Type IV-B allows some exposed wood surfaces of the ceiling, the walls or columns and beams. The amount of exposed surface permitted to be installed, as well as the required separation between unprotected portions, is clearly specified to limit the contribution of the structure in an interior fire. For example, two different walls may share the unprotected area but the two walls must be separated by a distance of 15 feet. Type IV-B has been subjected to the same fire tests under the same conditions as Type IV-A and the results demonstrate that a predictable char layer develops on mass timber in the same fashion as traditional sawn lumber, provided that substantial delamination is avoided. (See video or report above.) It should be noted that, while portions of the mass timber may be unprotected, concealed spaces, shafts and other specified areas are required to be fully protected by noncombustible protection. Type IV-B is provided with the same base fire resistance requirements as the existing Type I-B construction, which sets forth requirements for 2-hour structural elements. Please note that the allowance per IBC Section 403.2.1.1 to reduce I-B construction to 1-hour structural elements is not proposed for Type IV-B construction. Essentially, where a building is permitted to be constructed of I-B construction and has 1-hour protection, that same building will still require 2-hour structural elements for Type IV-B construction.

Type IV-C construction permits fully exposed mass timber. Important caveats are that concealed spaces, shafts, elevator hoistways, and interior exit stairway enclosures are not permitted to be exposed, but instead are required to have noncombustible protection. The IV-C construction is differentiated from traditional Heavy Timber construction in that Type IV-C construction is required to be 2-hour fire rated. While the added fire rating is required, the committee

does not propose any additional height, in terms of feet, for Type IV-C buildings; in other words, the height in feet for Type IV-C and Type IV-HT are identical. However, due to the added fire resistance ratings, the committee has proposed added floors for some occupancy groups of Type IV-C construction.

Tables 601 and 602: Included in the proposal are modification of Tables 601 and 602. This is necessary to set the performance requirement for these new types of construction based upon mass timber. It should be noted that these Fire Resistance Ratings are set to have the requirements similar to those of Type I construction. In other words, IV-A has the same FRR as I-A; IV-B has the same FRR as I-B. Because there is no Type I corollary to IV-C, it was set the same as IV-B. The IV-C has to achieve all its fire resistance by the performance of the mass timber itself because no noncombustible protection is required. This is reflected in greatly reduced permitted height, in both feet and stories, in other TWB proposals to Table 504.3, 504.4 and 506.2.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Analysis: The standards referenced in the changes in this proposal, DOC PS1, ASTM E1354, ASTM E84 and UL 723, are already referenced in the International Codes.

Internal ID: 852

G109-18

IBC: 602.4, 602.4.3 (New), 2304.11.3, 2304.11.4

Proponent: Dennis Richardson, American Wood Council, representing American Wood Council (drichardson@awc.org)

2018 International Building Code

Revise as follows:

602.4 Type IV. Type IV construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated wood, heavy timber (HT) or structural composite lumber (SCL) without concealed spaces, spaces or with concealed spaces complying with Section 602.4.3. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, structural composite lumber (SCL), and cross-laminated timber and details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted. Interior walls and partitions not less than 1-hour fire-resistance rating-rated or heavy timber complying with Section 2304.11.2.2 shall be permitted.

602.4.1 Fire-retardant-treated wood in exterior walls. *Fire-retardant-treated wood* framing and sheathing complying with Section 2303.2 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less.

602.4.2 Cross-laminated timber in exterior walls. *Cross-laminated timber* complying with Section 2303.1.4 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:

1. *Fire-retardant-treated wood* sheathing complying with Section 2303.2 and not less than $15/32$ inch (12 mm) thick;
2. *Gypsum board* not less than $1/2$ inch (12.7 mm) thick; or
3. A noncombustible material.

Add new text as follows:

602.4.3 Concealed spaces. Concealed spaces shall not contain combustible materials other than building elements and electrical, mechanical, fire protection, or plumbing materials and equipment. Concealed spaces shall comply with applicable provisions of Section 718. Concealed spaces shall be protected in accordance with one or more of the following:

1. The building shall be sprinklered throughout in accordance with Section 903.3.1.1 and automatic sprinklers shall also be provided in the concealed space.
2. The concealed space shall be completely filled with noncombustible insulation.
3. Surfaces within the concealed space shall be fully sheathed with not less than 5/8 inch Type X gypsum board.

Exception: Concealed spaces within interior walls and partitions with a one hour or greater fire resistance rating complying Section 2304.11.2.2 shall not require additional protection.

Revise as follows:

2304.11.3 Floors. Floors shall be without concealed spaces, spaces or with concealed spaces complying with Section 602.4.3. Wood floors shall be constructed in accordance with Section 2304.11.3.1 or 2304.11.3.2.

2304.11.4 Roof decks. Roofs shall be without concealed spaces and roof or with concealed spaces complying with Section 602.4.3. Roof decks shall be constructed in accordance with Section 2304.11.4.1 or 2304.11.4.2. Other types of decking shall be an alternative that provides equivalent fire resistance and structural properties. Where supported by a wall, roof decks shall be anchored to walls to resist forces determined in accordance with Chapter 16. Such anchors shall consist of steel bolts, lags, screws or *approved* hardware of sufficient strength to resist prescribed forces.

Reason:

The option of having protected concealed spaces in Type IV buildings is important to encourage the adaptive re-use of existing heavy timber buildings as well as to provide for the installation of mechanicals in Type IV cross laminated timber (CLT) construction. In addition to the current requirements for all concealed spaces in combustible construction, this change would require additional protection of the concealed spaces with sprinkler coverage, or eliminating all air space with noncombustible insulation, or covering all combustible surfaces with gypsum. These alternatives are the same protection required for concealed spaces in NFPA 13, except they are slightly more restrictive since 5/8-inch Type X gypsum is required in the one case. In addition, because the provisions are taken from NFPA 13, in order to use these provisions, the entire building must be protected by a sprinkler system complying with NFPA 13.

A similar change was recently successful in NFPA 220 and NFPA 5000. This proposal is more conservative in that it requires 5/8-inch Type X gypsum instead of 1/2 -inch gypsum in the alternative for sheathing combustible concealed spaces with gypsum in proposed section 602.4.3.

The change from “rating” to “rated” in Section 602.4 is editorial for good grammar.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Will not increase the cost of construction. The code change provides the option of having protected concealed spaces in Type IV HT buildings, therefore does not increase the cost of construction.

Internal ID: 1706

G110-18

IBC: 602.4.1, 602.4.2

Proponent: James Smith, American Wood Council, representing American Wood Council (jsmith@awc.org); Sam Francis, representing American Wood Council (sfrancis@awc.org)

2018 International Building Code

Revise as follows:

602.4.1 Fire-retardant-treated wood in exterior walls. *Fire-retardant-treated wood* framing and sheathing complying with Section 2303.2 shall be permitted within exterior wall assemblies ~~not less than 6 inches (152 mm) in thickness~~ with a 2-hour rating or less.

602.4.2 Cross-laminated timber in exterior walls. *Cross-laminated timber* ~~not less than 4 inches (102 mm) in thickness~~ complying with Section 2303.1.4 shall be permitted within exterior wall assemblies ~~not less than 6 inches (152 mm) in thickness~~ with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:

1. *Fire-retardant-treated wood* sheathing complying with Section 2303.2 and not less than $1\frac{5}{32}$ inch (12 mm) thick;
2. *Gypsum board* not less than $\frac{1}{2}$ inch (12.7 mm) thick; or
3. A noncombustible material.

Reason:

This code change corrects a correlation issue that was the result of two conflicting code changes that were both approved in the last cycle.

Code change 184-15, Approved as Submitted, eliminated the minimum thickness dimension of the exterior wall assembly for both Cross Laminated Timber (CLT) and Fire Retardant Treated Wood (FRTW) exterior walls, and introduced a minimum thickness for the CLT itself. G179-15, also Approved as Submitted, re-introduced the minimum wall assembly thickness into these sections in order to provide a re-organization of provisions without making any technical changes to the existing requirements. Correlation was made in favor of G179-15, having the effect of nullifying the action of G184-15, which was not anticipated.

The previous action on G184-15 should be affirmed by approval of this proposal for the same reasons it was originally approved: a minimum thickness for the CLT is a better parameter for structural integrity than an overall thickness of wall, since overall thickness could include exterior sheathing, cladding, and exterior insulation. This proposal will provide the thickness required for the CLT. In regard to FRTW exterior walls, the thickness of the assembly is not a significant factor, rather the required fire resistance rating is. A minimum thickness for the entire exterior wall assembly is unnecessary.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a correlation issue regarding two separate proposals Approved as Submitted. There are no technical changes that were not already approved in 2015.

Internal ID: 722

G111-18

IBC: 602.4.2

Proponent: Dennis Richardson, American Wood Council, representing American Wood Council (drichardson@awc.org)

2018 International Building Code

Revise as follows:

602.4.2 Cross-laminated timber in exterior walls. *Cross-laminated timber* complying with Section 2303.1.4 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or ~~less; provided the less.~~ ~~Heavy timber structural members appurtenant to the CLT exterior wall shall meet the requirements of Table 2304.11 and be fire-resistance rated as required for the exterior wall.~~ The exterior surface of the cross-laminated ~~timber is timber~~ and heavy timber elements shall be protected by one the following:

1. *Fire-retardant-treated wood* sheathing complying with Section 2303.2 and not less than $1\frac{5}{32}$ inch (12 mm) thick;
2. *Gypsum board* not less than $\frac{1}{2}$ inch (12.7 mm) thick; or
3. A noncombustible material.

Reason:

The code currently does not recognize that heavy timber members could be used as a beam, header, column or other boundary element within a wall of CLT. Glued laminated, SCL, or solid sawn heavy timber elements having the same rating, thickness, and protection as required for the CLT will have no significant difference in fire performance. This is a common sense approach to the current code, but should be made explicit.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change clarifies that additional heavy timber elements may be required as part of a CLT wall and they are permitted as part of the solid timber built up assembly. This clarifies the application of existing language and neither increases or decreases the cost of construction. It merely clarifies options that are currently used under common sense interpretation by the code official.

Internal ID: 1786

G112-18

IBC: 603.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or ~~less~~ less except in shaft enclosures within Group I-2 and ambulatory care facilities.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

 1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.

19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason:

This new language is required in order to conform with Federal Standards and CMS enforcement rules (K163). Fire-retardant (FRT) wood has previously not been considered equivalent to a non-combustible material, however codes have recently changed to permit FRT in certain locations. Centers for Medicaid and Medicare Services does not accept this material in shaft construction.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase cost based on the replacement of fire retardant treated (FRT) wood with metal studs or other construction. However, it does not add cost to the healthcare industry because certified facilities already follow these requirements in the context of the CMS federal standards.

Internal ID: 579

G113-18

IBC: 603.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception-Exceptions:

 1. In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 2. Group I-2, combustible roof construction shall be covered by minimum of a Class A roof covering or roof assembly, and shall be separated from the story below by a horizontal assembly with a fire-resistance rating of not less than 2 hours.
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

 1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.

16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason:

This proposal creates conformance with more restrictive federal certification requirements (K162). The goal here is to create a complete two hour assembly below the lowest combustible member. This creates added layers of protection for protect in place environment from fires originating in mechanical equipment, embers from adjacent fires, etc.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase cost based on the added 2-hour horizontal separation and potentially higher roof cover rating. However, it does not add cost to the healthcare industry because certified facilities already follow these requirements in the context of the CMS federal standards.

G114-18

IBC: 603.1

Proponent: Carl Martin, representing self (carl.martin@ncdoi.gov)

2018 International Building Code

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

 1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.

19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1. 27.
27. Wood nailers for parapet flashing and roof cants.

Reason:

Wood nailers used for roof parapets and cants are necessary for properly fastening roof materials and does not provide a significant amount of combustible material to the construction type.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change addresses common construction practice.

Internal ID: 570

G115-18

IBC: 603.1

Proponent: Misty Guard, Bradley Corporation, representing Bradley Corporation

2018 International Building Code

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

 1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.

19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
27. Toilet and urinal partitions installed in accordance with Section 1209.
28. Combustible lockers complying with Section 808.4 of the International Fire Code.

Reason:

Section 603.1 attempts to list all of the combustible materials installed in noncombustible buildings. However, there are two items not currently listed that are permitted by the code, partitions for plumbing fixtures and lockers. Both items are available in both combustible and noncombustible materials. Combustible partitions and lockers are currently permitted in the Building Code and Fire Code.

The proposed text will add reference to the appropriate sections of code. Toilet and urinal partitions are regulated by Section 1209. Lockers are listed in Section 808.4 of the International Fire Code.

This change will clarify the acceptance of combustible toilet and urinal partitions and lockers in noncombustible buildings.

G116-18 Part I

IBC: 1202.1, 1202.1.1 (New), 1202.1.2 (New)

Proponent: Keith Flanders, Cosentini Associates, representing self (kflanders@cosentini.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE GENERAL CODE DEVELOPMENT COMMITTEE. PART II WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows:

1202.1 General. Buildings shall be provided with natural ventilation in accordance with Section 1202.5, or mechanical ventilation in accordance with the International Mechanical Code. ~~Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour where tested with a blower door at a pressure 0.2 inch w.c. (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code Residential Provisions, the dwelling unit~~ Dwelling units shall be ventilated by mechanical means in accordance with Section 403 of the International Mechanical Code. in accordance with Section 1202.1.1 or Section 1202.1.2. *Ambulatory care facilities* and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407 of the International Mechanical Code.

Add new text as follows:

1202.1.1 Natural Ventilation. Dwelling units provided with natural ventilation in accordance with Section 1202.5 shall have an air infiltration rate of not less than 5 air changes per hour. The air infiltration rate shall be tested with a blower door at a pressure of 0.2 inch w.c. (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code.

1202.1.2 Mechanical Ventilation. Dwelling units provided with mechanical ventilation shall be in accordance with Section 403 of the International Mechanical Code.

Internal ID: 1042

G116-18 Part II

IMC: 401.2, 401.2.1 (New), 401.2.2 (New)

Proponent: Keith Flanders, Cosentini Associates, representing self (kflanders@cosentini.com)

2018 International Mechanical Code

Revise as follows:

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2 inch water column (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403.~~ Dwelling units shall be ventilated in accordance with the ventilation method specified in Section 401.2.1 or 401.2.2. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

Add new text as follows:

401.2.1 Natural Ventilation. Dwelling units shall be provided with natural ventilation in accordance with Section 402 and shall have an air infiltration rate of not less than 5 air changes per hour. The air infiltration rate shall be tested with a blower door at a pressure of 0.2 inch w.c. (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code.

401.2.2 Mechanical Ventilation. Dwelling units shall be provided with mechanical ventilation in accordance with Section 403.

Reason:

The provisions for ventilation from dwelling units has been modified in recent editions of the code creating unnecessary confusion among the building industry. Accordingly, this proposal seeks to clarify the requirements.

It is understood the intent is that all dwelling units must have mechanical ventilation unless they can meet the blower door test requirements of the IECC. This is not always how this section has been interpreted and therefore this proposal is sought as a clarification. See attached previous code change proposal for the original intent. Additionally, the 2012 IBC Significant Code Change documentation regarding the subject matter. Both attachments substantiate that the provisions are intended to apply to all dwelling units, not just dwelling units in residential buildings (3 stories or less) as defined by the IECC.

Also note that a formal interpretation regarding this matter was requested; however, it remained unresolved. See attached comments regarding the request.

1203.1

Mechanical Ventilation Required

CHANGE TYPE: Addition

CHANGE SUMMARY: The option of natural ventilation rather than mechanical ventilation is now unavailable when a dwelling unit is tested using a blower door test and it is determined that an adequate number of air changes are not provided.

2012 CODE: 1203.1 General. Buildings shall be provided with natural ventilation in accordance with Section 1203.4, or mechanical ventilation in accordance with the *International Mechanical Code*.

Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure 0.2 inch w.c. (50 Pa) in accordance with Section 402.4.1.2 of the *International Energy Conservation Code*, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403 of the *International Mechanical Code*.

CHANGE SIGNIFICANCE: As the building's thermal envelope gets tighter resulting in less outdoor air leaking into the building's interior, mechanical ventilation may be necessary to maintain the indoor air quality. For dwelling units, a measured cutoff point is provided and a reference is made to the applicable provisions of the *International Mechanical Code* for providing the necessary ventilation. It should be noted that the new text in the IBC does not require that a blower door test be conducted, but rather, acts on the results of any such test that is conducted. However, code users should be aware that Section 402.4.1.2 of the 2012 *International Energy Conservation Code* (IECC) does require that residential buildings conduct a blower door test to determine the amount of air leakage. Therefore, in jurisdictions that have adopted the IECC those blower door test results will be used to determine if the IBC requirement for a mechanical ventilation system is to be imposed. Because the IECC requires a maximum air leakage rate of 5 air changes per hour, any building other than those in Climate Zones 1 and 2 that have exactly 5 air changes per hour would need a mechanical ventilation system based on IBC Section 1203.1.

Blower door test determines air infiltration rate

Generally, the designer has a choice of either providing natural ventilation or mechanical ventilation. The option of using natural ventilation instead of mechanical ventilation is no longer permitted when the dwelling unit is tested using the blower door test and the infiltration level is below 5 air changes per hour (ACH). As building construction practices have improved, buildings have become tighter; as buildings become tighter, mechanical ventilation must be introduced to provide sufficient levels of ventilation to ensure indoor air quality. This 5-air-change requirement at the specified pressure provides a clear point to determine when infiltration is not adequate and must be supplemented by a mechanical system.

The 5 ACH limit was selected even though it is less than would generally be obtained by the IMC's requirement for 0.35 ACH of outdoor airflow for a dwelling using a mechanical ventilation system. By following the calculation procedures of the ASHRAE 136 standard, it can be shown that a natural infiltration rate of 0.35 ACH is equivalent to somewhere between 7 to 10 ACH at the specified pressure, depending on the local climatic conditions of the building. As fewer air changes are provided, the reliance on window operation is not sufficient and the concern for the effect on indoor air quality goes up. An additional source of justification for the 5 ACH limit is the National Association of Home Builder's (NAHB's) *National Green Building Standard* that requires whole-house mechanical ventilation when the infiltration rate falls below the 5 ACH value.

The actual effect of this change may be less than what it would first appear because most dwelling units do provide a mechanical ventilation system and do not rely on natural ventilation. If the dwelling unit is using a mechanical system, the IMC requires the necessary 0.35 ACH of outdoor airflow which is adequate for providing the proper ventilation.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification and not a change, therefore, it will not increase nor decrease the cost of construction.

Internal ID: 3418

G117-18

IBC: 1202.1

Proponent: Daniel buck, JRS Engineering, representing Air Barrier Association of America (dbuck@jrseengineering.com)

2018 International Building Code

Revise as follows:

1202.1 General. Buildings shall be provided with natural ventilation in accordance with the International Mechanical Code.

~~Where the air infiltration rate in a *dwelling unit* is less than 5 air changes per hour where tested with a blower door at a pressure 0.2 inch w.c. (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code - Residential Provisions, the *dwelling unit*~~*Dwelling units* shall be ventilated by mechanical means in accordance with Section 403 of the International Mechanical Code. *Ambulatory care facilities* and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407 of the International Mechanical Code.

Reason:

This change clarifies the implications of the existing code language. Under current code, Dwelling Units in multi-unit buildings, to which this commercial code would apply, are not required to be tested in accord with the referenced Section R402.4.1.2 of the International Energy Conservation Code - Residential Provisions. It is therefore impossible for design professionals or code officials to determine if the Dwelling Unit must be vented mechanically, unless additional voluntary testing is conducted. This testing also comes after construction is completed and adding additional mechanical ventilation at that phase could be very costly. However, if dwelling units are required to be tested in accord with section R402.4.1.2, they must have a resulting air infiltration rate of less than 5 air changes per hour. Therefore, the existing code language requirement for mechanical ventilation applies to all Dwelling Units that would meet the residential code. Eliminating this language all together would preserve the effect of the code, while clarifying the intent, and eliminating the reference to testing which is not required.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

For jurisdictions that adopt both the IBC and IECC, there will be no cost impact from this proposed change to existing code provisions.

Internal ID: 1570

G118-18

IBC: 202 (New), 1202.3

Proponent: Mike Fischer, Kellen Company, representing The Asphalt Roofing Manufacturers Association (mfischer@kellencompany.com)

2018 International Building Code

Add new definition as follows:

VAPOR DIFFUSION PORT.

An assembly constructed or installed within a roof assembly at an opening in the roof deck to convey water vapor from an unvented attic to the outside atmosphere.

Revise as follows:

1202.3 Unvented attic and unvented enclosed rafter assemblies. Unvented attics and unvented enclosed roof framing assemblies created by ceilings applied directly to the underside of the roof framing members/rafters and the structural roof sheathing at the top of the roof framing members shall be permitted where all of the following conditions are met:

1. The unvented attic space is completely within the *building thermal envelope*.
2. No interior Class I vapor retarders are installed on the ceiling side (*attic floor*) of the unvented attic assembly or on the ceiling side of the unvented enclosed roof framing assembly.
3. Where wood shingles or shakes are used, not less than a 1/4-inch (6.4 mm) vented airspace separates the shingles or shakes and the roofing underlayment above the structural sheathing.
4. In Climate Zones 5, 6, 7 and 8, any air-impermeable insulation shall be a Class II vapor retarder or shall have a Class II vapor retarder coating or covering in direct contact with the underside of the insulation.
5. ~~Insulation shall be located in accordance with the following~~comply with Item 5.1 or 5.2, and additionally Item 5.3:
 - 5.1. Item 5.1.1, 5.1.2, 5.1.3 or 5.1.4 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.
 - 5.1.1. Where only air-impermeable insulation is provided, it shall be applied in direct contact with the underside of the structural roof sheathing.
 - 5.1.2. Where air-permeable insulation is provided inside the building thermal envelope, it shall be installed in accordance with Item 5.1.1. In addition to the air-permeable insulation installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing in accordance with the R-values in Table 1202.3 for condensation control.
 - 5.1.3. Where both air-impermeable and air-permeable insulation are provided, the *air-impermeable insulation* shall be applied in direct contact with the underside of the structural roof sheathing in accordance with Item 5.1.1 and shall be in accordance with the R-values in Table 1202.3 for condensation control. The *air-permeable insulation* shall be installed directly under the *air-impermeable insulation*.
 - 5.1.4. Alternatively, sufficient rigid board or sheet insulation shall be installed directly above the structural roof sheathing to maintain the monthly average temperature of the underside of the structural roof sheathing above 45°F (7°C). For calculation purposes, an interior air temperature of 68°F (20°C) is assumed and the exterior air temperature is assumed to be the monthly average outside air temperature of the three coldest months.
 - 5.2. In climate zones 1, 2, and 3 where air-permeable insulation is installed in unvented attics it shall meet the following requirements: 1) An approved vapor diffusion port shall be installed not more than 12 inches (305mm) from the highest point of the roof, measured within the plane of the roof from the highest point of the roof to the lower edge of the port. 2) The port area shall be ≥ 1:600 of the ceiling area. Where there are multiple ports in the attic, the sum of the port areas shall be greater than or equal to the area requirement. The ports

shall be distributed equally throughout the attic space. 3) The vapor diffusion port shall include an approved vapor permeable and water-resistive membrane that is open to the outside air. The vapor permeable membrane in the vapor diffusion port shall have a vapor permeance rating of ≥ 20 perms when tested in accordance with Procedure A of ASTM E96. 4) The vapor diffusion port shall serve as an air barrier between the attic and the exterior of the building. 5) The vapor diffusion port shall protect the attic against the entrance of rain and snow. 6) Framing members and blocking shall not block the free flow of water vapor to the port. Not less than a 2-inch (50 mm) space shall be provided between any blocking and the roof sheathing. Air permeable insulation shall be permitted within that space. 7) The roof slope shall be $\geq 3:12$ (vertical/horizontal). 8) Where only air-permeable insulation is used, it shall be installed directly below the structural roof sheathing. 9) Air-impermeable insulation, if any, shall be directly above or below the structural roof sheathing and is not required to meet the R-value in Table 806.5. Where directly below the structural roof sheathing, there shall be no space between the air-impermeable and air-permeable insulation. 10) The air shall be supplied at a flow rate ≥ 50 CFM (23.6 L/s) per 1000 square foot of ceiling. The air shall be supplied from ductwork providing supply air to the occupiable space when the conditioning system is operating. Alternatively, the air shall be supplied by a supply fan when the conditioning system is operating.

5.3. Where preformed insulation board is used as the *air-impermeable insulation* layer, it shall be sealed at the perimeter of each individual sheet interior surface to form a continuous layer.

Exceptions:

1. Section 1202.3 does not apply to special use structures or enclosures such as swimming pool enclosures, data processing centers, hospitals or art galleries.
2. Section 1202.3 does not apply to enclosures in Climate Zones 5 through 8 that are humidified beyond 35 percent during the three coldest months.

Reason:

This proposal is the same as PC1 to RB 327-16, which was approved as submitted for the IRC. ARMA is concerned with the lack of detail regarding the vapor diffusion port in the IRC, and submitted this proposal to provide an option to improve the language for inclusion in the IBC with the thought to modify the IRC during group B. The risk of moisture damage to the roof deck, and subsequent issues with roof covering attachment should be addressed.

The proposal differs from the IRC as follows:

1. Modifies the definition of vapor diffusion port to clarify that it is an element of the attic space and is installed within the roof deck.
2. Provides guidance on the location of the vapor diffusion ports within the roof assembly.
3. States clearly that the vapor diffusion port contains a membrane material that is both vapor permeable and water resistive.

These modifications are consistent with the research report used as justification for the IRC provisions for air-permeable insulation in unvented attics. Without this change, the provisions lack appropriate detail to ensure proper performance.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal adds an optional insulation strategy to the IBC; it does not add any mandatory provisions.

Analysis: The standard referenced in this proposal, ASTM E96, is already referenced in the IBC.

IBC: 202 (New), 1202.3

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingsscience.com)

2018 International Building Code

Add new definition as follows:

VAPOR DIFFUSION PORT. An assembly constructed or installed within a roof assembly at an opening in the roof deck to convey water vapor from an unvented attic to the outside atmosphere.

Revise as follows:

1202.3 Unvented attic and unvented enclosed rafter assemblies. Unvented *attics* and unvented enclosed roof framing assemblies created by ceilings applied directly to the underside of the roof framing members/rafters and the structural roof sheathing at the top of the roof framing members shall be permitted where all of the following conditions are met:

1. The unvented *attic* space is completely within the *building thermal envelope*.
2. No interior Class I vapor retarders are installed on the ceiling side (*attic* floor) of the unvented *attic* assembly or on the ceiling side of the unvented enclosed roof framing assembly.
3. Where wood shingles or shakes are used, not less than a 1/4-inch (6.4 mm) vented airspace separates the shingles or shakes and the roofing underlayment above the structural sheathing.
4. In Climate Zones 5, 6, 7 and 8, any air-impermeable insulation shall be a Class II vapor retarder or shall have a Class II vapor retarder coating or covering in direct contact with the underside of the insulation.
5. ~~Insulation shall be located in accordance with the following:~~ Insulation shall comply with either Item 5.1 or 5.2, and additionally Item 5.3
 - 5.1. Item 5.1.1, 5.1.2, 5.1.3 or 5.1.4 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.
 - 5.1.1. Where only air-impermeable insulation is provided, it shall be applied in direct contact with the underside of the structural roof sheathing.
 - 5.1.2. Where air-permeable insulation is provided inside the building thermal envelope, it shall be installed in accordance with Item 5.1.1. In addition to the air-permeable insulation installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing in accordance with the *R*-values in Table 1202.3 for condensation control.
 - 5.1.3. Where both air-impermeable and air-permeable insulation are provided, the *air-impermeable insulation* shall be applied in direct contact with the underside of the structural roof sheathing in accordance with Item 5.1.1 and shall be in accordance with the *R*-values in Table 1202.3 for condensation control. The *air-permeable insulation* shall be installed directly under the *air-impermeable insulation*.
 - 5.1.4. Alternatively, sufficient rigid board or sheet insulation shall be installed directly above the structural roof sheathing to maintain the monthly average temperature of the underside of the structural roof sheathing above 45°F (7°C). For calculation purposes, an interior air temperature of 68°F (20°C) is assumed and the exterior air temperature is assumed to be the monthly average outside air temperature of the three coldest months.
 - 5.2. In climate zones 1, 2, and 3 air-permeable insulation installed in unvented attics shall meet the following requirements:
 - 5.2.1. A vapor diffusion port shall be installed not more than 12 inches (305mm) from the highest point of the roof, measured vertically from the highest point of the roof to the lower edge of the port.
 - 5.2.2. The port area shall be \geq 1:600 of the ceiling area. Where there are multiple ports in the attic, the sum of the port areas shall be greater than or equal to the area

requirement.

- 5.2.3. The vapor permeable membrane in the vapor diffusion port shall have a vapor permeance rating of ≥ 20 perms when tested in accordance with Procedure A of ASTM E96.
 - 5.2.4. The vapor diffusion port shall serve as an air barrier between the attic and the exterior of the building.
 - 5.2.5. The vapor diffusion port shall protect the attic against the entrance of rain and snow.
 - 5.2.6. Framing members and blocking shall not block the free flow of water vapor to the port. Not less than a 2-inch (50 mm) space shall be provided between any blocking and the roof sheathing. Air-permeable insulation shall be permitted within that space.
 - 5.2.7. The roof slope shall be $\geq 3:12$ (vertical/horizontal).
 - 5.2.8. Where only air-permeable insulation is used, it shall be installed directly below the structural roof sheathing, on top the attic floor, or on top of the ceiling.
 - 5.2.9. Where only air-permeable insulation is used and is installed directly below the structural roof sheathing, air shall be supplied at a flow rate ≥ 50 CFM (23.6 L/s) per 1000 ft² of ceiling.
- 5.3. The air shall be supplied from ductwork providing supply air to the occupiable space when the conditioning system is operating. Alternatively, the air shall be supplied by a supply fan when the conditioning system is operating. Where preformed insulation board is used as the *air-impermeable insulation* layer, it shall be sealed at the perimeter of each individual sheet interior surface to form a continuous layer.

Exceptions:

1. Section 1202.3 does not apply to special use structures or enclosures such as swimming pool enclosures, data processing centers, hospitals or art galleries.
2. Section 1202.3 does not apply to enclosures in Climate Zones 5 through 8 that are humidified beyond 35 percent during the three coldest months.

Reason:

Unvented attic assemblies have a record of success. Airtight attics also benefit energy efficiency. Unvented attic assemblies are most commonly constructed with spray polyurethane foam applied directly to the underside of the roof deck. This is a historically successful method of construction with over 20 years of experience. Another approach to unvented attic assemblies is to insulate over the top of the roof deck with rigid insulation boards.

The proposed code change allows the use of lower cost alternatives. Specifically, the proposed code change allows the use of blown cellulose, fiberglass batts, and blown fiberglass to construct unvented attic assemblies. The approach is limited to Climate Zones 1, 2 and 3 based on research and historic experience over the past decade. The proposed code change adds a vapor diffusion port/vent. The port acts as a moisture control measure, allowing moisture in the attic to be removed by vapor diffusion rather than by air change. This allows the attic assembly to remain airtight while providing a path for vapor moisture via vapor diffusion.

This allows alternatives to rigid board and spray polyurethane foam. Alternatives provides more material choices for designers, builders and consumers and may provide less expensive options for unvented attics. This same change was approved for the IRC last code cycle. This also allows insulation to be above the ceiling or on the attic floor. With air permeable insulation the insulation can be installed directly to the underside of the roof deck or at the floor or ceiling level of an attic assembly as moisture laden air is more buoyant than dry air and therefore the moisture will accumulate at the ridge and exit via the vapor diffusion port.

This proposal improves upon the 2018 IRC text by adding additional detail on the vapor diffusion port, consistent with the research used as substantiation for the original IRC code change. It modifies the definition of vapor diffusion port to clarify that it is an element of the attic space and is installed within the roof deck. It also provides guidance on the location of the vapor diffusion ports within the roof assembly, and clarifies that the vapor diffusion port contains a membrane material that is both vapor permeable and water resistive.

Adding new unvented attic options to the existing options provides additional benefits. In high wildfire regions the elimination of eave vents and air sealing the upper attic vents at ridges reduces the entry of embers. In hurricane zones the elimination of roof vents reduces the entry of rainwater during hurricane events.

The research work supporting this code change is an outgrowth of the original research work supporting unvented attic assemblies started in 1995 under the Department of Energy's Building America Program. The same technical team and the same technical rigor that supported the original code changes for unvented attics in the early 2000's are behind this proposed code change.

The technical rationale and research behind this code change can be found at Venting Vapor:

Cost Impact

The code change proposal will decrease the cost of construction .

This provides a new option for using additional insulation materials. In some cases those materials would reduce costs.

Analysis: The standard referenced in this proposal, ASTM E96, is already referenced in the IBC.

Internal ID: 1185

G120-18

IBC: SECTION 202, 202 (New), 1202.3

Proponent: Charles Haack, representing North American Insulation Manufacturers Association (chaack@naima.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new text as follows:

VAPOR DIFFUSION PORT. A passageway for conveying water vapor from an unvented attic to the outside atmosphere.

Revise as follows:

1202.3 Unvented attic and unvented enclosed rafter assemblies. Unvented *attics* and unvented enclosed roof framing assemblies created by ceilings applied directly to the underside of the roof framing members/rafters and the structural roof sheathing at the top of the roof framing members shall be permitted where all of the following conditions are met:

1. The unvented *attic* space is completely within the *building thermal envelope*.
2. No interior Class I vapor retarders are installed on the ceiling side (*attic* floor) of the unvented *attic* assembly or on the ceiling side of the unvented enclosed roof framing assembly.
3. Where wood shingles or shakes are used, not less than a 1/4-inch (6.4 mm) vented airspace separates the shingles or shakes and the roofing underlayment above the structural sheathing.
4. In Climate Zones 5, 6, 7 and 8, any air-impermeable insulation shall be a Class II vapor retarder or shall have a Class II vapor retarder coating or covering in direct contact with the underside of the insulation.
5. Insulation shall ~~be located in accordance with the following~~ comply with Item 5.3 and either Item 5.1 or 5.2:
 - 5.1. Item 5.1.1, 5.1.2, 5.1.3 or 5.1.4 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.
 - 5.1.1. Where only air-impermeable insulation is provided, it shall be applied in direct contact with the underside of the structural roof sheathing.
 - 5.1.2. Where air-permeable insulation is provided inside the building thermal envelope, it shall be installed in accordance with Item 5.1.1. In addition to the air-permeable insulation installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing in accordance with the *R-values* in Table 1202.3 for condensation control.
 - 5.1.3. Where both air-impermeable and air-permeable insulation are provided, the *air-impermeable insulation* shall be applied in direct contact with the underside of the structural roof sheathing in accordance with Item 5.1.1 and shall be in accordance with the *R-values* in Table 1202.3 for condensation control. The *air-permeable insulation* shall be installed directly under the *air-impermeable insulation*.
 - 5.1.4. Alternatively, sufficient rigid board or sheet insulation shall be installed directly above the structural roof sheathing to maintain the monthly average temperature of the underside of the structural roof sheathing above 45°F (7°C). For calculation purposes, an interior air temperature of 68°F (20°C) is assumed and the exterior air temperature is assumed to be the monthly average outside air temperature of the three coldest months.
 - 5.2. In Climate Zones 1, 2, and 3, air-permeable insulation installed in unvented attics shall meet the following requirements:
 - 5.2.1. An approved vapor diffusion port shall be installed not more than 12 inches (305 mm) from the highest point of the roof, measured vertically from the highest point of the roof to the lower edge of the port.
 - 5.2.2. The port area shall be greater than or equal to 1:600 of the ceiling area. Where there are multiple ports in the attic, the sum of the port areas shall be greater than

or equal to the area requirement.

- 5.2.3. The vapor-permeable membrane in the vapor diffusion port shall have a vapor permeance rating of greater than or equal to 20 perms when tested in accordance with Procedure A of ASTM E96.
- 5.2.4. The vapor diffusion port shall serve as an air barrier between the attic and the exterior of the building.
- 5.2.5. The vapor diffusion port shall protect the attic against the entrance of rain and snow.
- 5.2.6. Framing members and blocking shall not block the free flow of water vapor to the port. Not less than a 2-inch (51 mm) space shall be provided between any blocking and the roof sheathing. Air-permeable insulation shall be permitted within the space.
- 5.2.7. The roof slope shall be greater than or equal to 3:12 (vertical/horizontal).
- 5.2.8. Where only air-permeable insulation is used, it shall be installed directly below the structural roof sheathing.
- 5.2.9. Air-impermeable insulation, if any, shall be directly above or below the structural roof sheathing and is not required to meet the R-value in Table 806.5. Where directly below the structural roof sheathing, there shall be no space between the air-impermeable insulation and air-permeable insulation.
- 5.2.10. The air shall be supplied at a flow rate greater than or equal to 50 CFM (23.6 L/s) per 1,000 square feet (93 m²) of ceiling. The air shall be supplied from ductwork providing supply air to the occupiable space when the conditioning system is operating. Alternatively, the air shall be supplied by a supply fan when the conditioning system is operating.

- 5.3. Where preformed insulation board is used as the *air-impermeable insulation* layer, it shall be sealed at the perimeter of each individual sheet interior surface to form a continuous layer.

Exceptions:

- 1. Section 1202.3 does not apply to special use structures or enclosures such as swimming pool enclosures, data processing centers, hospitals or art galleries.
- 2. Section 1202.3 does not apply to enclosures in Climate Zones 5 through 8 that are humidified beyond 35 percent during the three coldest months.

Reason:

This exact code change has been approved and included in the 2018 International Residential Code and this proposal extends the same language to the International Building Code.

This proposal would expand the ability to use air-permeable insulation materials in Climate Zones 1, 2, and 3 supported by research and field testing during the past 10 years. The proposed code change allows the use of lower cost alternatives, including permitting the use of fiber glass, rock wool, or cellulose to construct unvented attic assemblies.

Unvented attic assemblies already have a record of success and unvented attic assemblies are most commonly constructed with spray polyurethane foam applied directly to the underside of the roof deck. This method of construction has over 20 years of documented successful implementation and experience. Another, but less common, approach to unvented attic assemblies is to insulate over the top of the roof deck with rigid insulation boards.

Unvented assemblies offer several benefits to builders and homebuyers including increased home energy efficiency, lower cost alternatives, and design flexibility. Unvented attic assemblies can reduce energy costs for homes with HVAC systems located in the attic by lowering the temperature of the air surrounding the system and reducing the loss of conditioned air to areas outside the conditioned space. Expanding the ability to use other materials including fiber glass, rock wool, and cellulose will increase competition and likely lower construction costs for unvented attic assemblies.

This proposed code change adds a vapor diffusion port/vent to the roof system. The port acts as a moisture control

measure, allowing moisture in the attic to be removed by vapor diffusion rather than by air change. This allows the attic assembly to remain airtight while providing a path for vapor moisture via vapor diffusion.

Adding new unvented attic options to the existing options provides additional benefits. In high wildfire regions, the elimination of eave vents and air sealing the upper attic vents at the ridges reduces the entry of embers. In hurricane zones, the elimination of roof vents reduces the entry of rainwater during hurricane events.

The research work supporting this code change is an outgrowth of the original research work supporting unvented attic assemblies started in 1995 under the Department of Energy's Building America program. The same technical team and the same technical rigor that supported the original code changes for unvented attics in the early 2000s are behind this proposed code change.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase the cost of construction and will provide options to builders and designers.

Analysis: The standard referenced in this proposal, ASTM E96, is already referenced in the IBC.

Internal ID: 1237

G121-18

IBC: 1204.1

Proponent: Peter Valkov, City of Fargo, ND, representing City of Fargo, North Dakota (pvalkov@cityoffargo.com); Christine Rose, City of Fargo, representing City of Fargo (crose@cityoffargo.com)

2018 International Building Code

Revise as follows:

1204.1 General. Every space intended for human occupancy shall be provided with natural light by means of exterior glazed openings in accordance with Section 1204.2 or shall be provided with artificial light in accordance with Section 1204.3. Exterior glazed openings shall open directly onto a *public way* or onto a *yard* or *court* in accordance with Section 1205.

In Group E and I-4 occupancies, rooms intended to be used as classrooms or day care rooms shall be provided with natural light. Artificial light shall not be substituted for such required natural light.

Reason:

I am driven to propose this change on behalf of all little members of our society who cannot propose this change themselves.

Through my profession, I am reviewing many day care and school plans. Every time I see a classroom without windows, every time I see day care using an old building purposed for store or storage and hastily re-purposed for day care without any regard for the need of natural light (and this happens too often), I feel extremely sad. I am also very concerned that we as a society force our kids to places that have no natural light. We force them as they do not have choice, or say, or option to make a decision.

Researching the importance of natural light for the health and the intellectual development in little children gives me hope such a change is more than needed and possible, it is long overdue.

Having discussed my idea with colleagues in the City of Fargo and design professionals from the area also provided me with positive feedback. Architects, I have spoken to, also confirmed this change is possible from a design standpoint and it won't provide burden on the schools and day care facilities alike.

Therefore, today, I state my hope this change is made integral part of the building code as a part of our constant quest for healthier and safer buildings. Buildings that promote better and more natural environment for those amongst us that need it the most!

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The need and requirement for windows is already a part of the International Building Code. Therefore, I do not foresee any changes in construction cost as a result from such a change.

Internal ID: 1578

G122-18

IBC: 1206.1

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

1206.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent *dwelling units* and *sleeping units* or between *dwelling units* and *sleeping units* and adjacent public areas. ~~such as halls, corridors, stairways or service areas.~~

Reason:

There are building designs where a dwelling unit or sleeping unit in a mixed occupancy building may be adjacent to a commercial space where airborne and structure-borne sound is significant and may interrupt the occupants of the dwelling or sleeping unit unless the common interior walls, partitions and floor/ceiling assemblies are designed to limit sound transmissions to an acceptable level. This proposal deletes the examples currently listed at the end of Section 1206.1 which effectively broadens the scope of uses where sound abatement requirements can be enforced and provides the building official with authority to require sound abatement when appropriate. Occupants of the affected dwelling units and sleeping units may not realize that additional sound abatement has been provided but the quality of their lives will improve as a result.

Cost Impact

The code change proposal will increase the cost of construction .

This code change has the potential to increase the cost of construction because there may be a need to provide sound abatement between dwelling units or sleeping units and adjacent public areas.

Internal ID: 86

G123-18

IBC: 1206.2, Chapter 35

Proponent: Tim Earl, representing The Gypsum Association (tearl@gbhinternational.com)

2018 International Building Code

Revise as follows:

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50 where tested in accordance with ASTM E90, or not less than 45 if field tested ~~, for airborne noise where tested in accordance with ASTM E90.~~ ASTM E336, for airborne noise. Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM ~~E90.~~ E90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

E336-17a:

Standard Test Method for Measurement of Airborne Sound Attenuation between Rooms in Buildings

Reason:

This change clarifies the appropriate ASTM test methods for airborne sound transmission. ASTM E90 is a laboratory measurement, and ASTM E336 is a field test. This proposal clarifies which test method to use.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change simply clarifies which test to use, with no impact on cost.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E336 -17a, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 222

G124-18

IBC: 1206.2

Proponent: Michael Schmeida, Gypsum Association, representing Gypsum Association (mschmeida@gypsum.org)

2018 International Building Code

Revise as follows:

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for airborne noise where tested in accordance with ASTM E90. Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by an engineering analysis either conducted or reviewed by an approved acoustical professional based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

Reason:

There are several engineering analysis tools for sound performance on the market. However, if the design professional is unfamiliar with acoustical engineering, they can be very misleading and therefore lead to a building performing under the expected performance levels. And as acoustical considerations are something most design professionals are not very familiar with at this point in time, the opportunity for error is above average. This change is intended to make sure that systems specified using the engineering analysis option are properly scrutinized by experts in acoustics and therefore are most likely going to perform as expected.

Cost Impact

The code change proposal will increase the cost of construction .

The estimated cost impact would be \$500. However, it should be pointed out that the engineering analysis is an option - there are other ways to meet the criteria of this section already mandated by the code where no additional cost would be incurred.

Internal ID: 565

G125-18

IBC: 1206.2, Chapter 35

Proponent: Michael Schmeida, representing Gypsum Association (mschmeida@gypsum.org)

2018 International Building Code

Revise as follows:

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for airborne noise where tested in accordance with ASTM E90. Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. Intersections between walls and floors and wall-to-wall intersections shall be sealed or otherwise treated in accordance to ASTM C919. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

C919-12(2017):

Standard Practice for Use of Sealants in Acoustical Applications

Reason:

This change addresses sound flanking paths not previously addressed, requiring intersections to be sealed. If unsealed, these paths can reduce the effectiveness of walls by at least 5 STC points versus the tested systems. A differential of 3 STC points becomes perceptible by humans and 5 points is the threshold at which it becomes a nuisance. Sound intrusion via these unsealed intersections can cause noticeable deterioration in sound isolation performance.

Nuisance noise has a measurable impact on human health. A report by the World Health Organization on noise effects and morbidity linked "noise annoyance" (as it was called in the report) to increased risk for several health issues including arthritic symptoms, hypertension, and migraines.

The code already contains requirements for sound transmission, but by not addressing intersections, it leaves a sound transmission path which can negate the effects of other measures taken to reduce sound transmission.

The handbook of sound engineers states that "an acoustical sealant is required to caulk all joints of a partition if the highest TL (transmission loss) is to be attained."

This simple and relatively inexpensive step will ensure sound transmission performance in actual installations lives up to the expectations set by laboratory testing.

Bibliography:

WHO LARES Final Report, Noise Effects on Morbidity, Niemann and Maschke, Berlin Center for Public Health

Handbook for Sound Engineers, Jones, D. (2008), pp. 77-78

Noise Control Manual for Residential Buildings, Harris, D.A., (1997), pp. 73-76.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal is estimated to add approximately \$20 per room requiring sealing to construction costs, for sealant and labor.

Analysis: A review of the standard proposed for inclusion in the code, ASTM C919-12(2017), with regard to the ICC

criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

2018 International Building Code

Add new text as follows:

SECTION 1207 ENHANCED CLASSROOM ACOUSTICS

1207.1 General. Enhanced classroom acoustics, where required in this section, shall comply with Section 808 of ICC A117.1.

1207.2 Where required. In Group E occupancies, enhanced classroom acoustics shall be provided in all classrooms with a volume of 20,000 cubic feet or less.

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001
US

ICC A117.1-092017:

Accessible and Usable Buildings and Facilities

Reason:

This proposal sets up a new section in the Chapter for Interior Environments; next to the section for sound transmission in residential occupancies. This section is proposed here and not in Chapter 11 because of the benefits of these provisions for all young children – thus following the codes history of mainstreaming’ requirements that may be related to accessibility, but apply broadly.

Research shows that good classroom acoustics are essential to support language acquisition and learning for all children, particularly younger children. For children who have hearing loss and those who use cochlear implants there is no substitute for a good acoustic environment. Assistive technologies typically only amplify the teacher and do not amplify discussions among children or between the teacher and individual child. Children with disabilities not related to hearing, such as autism and learning disabilities may be adversely affected by high ambient noise levels. Students that use a different language at home will also be able to listen more closely to fully understand the teacher and benefit from conversation among peers. Teachers report that a good acoustic environment actually assists in controlling the classroom, reducing the need to raise their voices, and promotes more civil behavior among students. Thus, good acoustic and low background noise in a classroom benefits everyone!

The standard size elementary classroom in the United States holds 25 to 30 students. Many states specify the minimum size at 700 sq.ft. – assuming 20 children in a room. The recommended size for a self-contained classroom is 800 to 960 sq.ft. for grade school; 700 to 840 sq.ft. for secondary school. Some researchers recommend up to 54 sq.ft. per child as optimum – 1620 sq.ft. for a 30 child classroom. Classrooms that are used for activities such as band, orchestra, choir or gym are significantly larger. Some lecture rooms in colleges are large enough to accommodate several hundred students.

The new technical criteria for classroom acoustics in the 2017 ICC A117.1 are limited to classrooms with a size under 20,000 cubic feet; assuming a 10 foot ceiling height, classrooms that are 2000 sq.ft. or less. While acoustics may be important to these larger classrooms, the criteria in ICC A117.1 Section 808 are intended to be applicable to standard size self-contained classrooms. This criteria are also not intended to apply to ancillary learning spaces, such as individual tutoring spaces, or other spaces where students may be, such as corridors or cafeterias.

Technical criteria includes a maximum reverberation time – achieved through either a performance or prescriptive method. The criteria also considers other sound sources – ambient sound and sound sources inside and outside the classrooms.

Cost Impact

The code change proposal will increase the cost of construction .

There will be acoustic requirements for classrooms, but not all spaces in new schools. Since this encompasses such a

broad range of options to comply, the cost may be limited to design choices. The work group intends to propose an exception for existing classrooms during Group B cycle.

Analysis: The 2009 edition of the ICC A117.1 standard is referenced in Chapter 35.

Internal ID: 554

G128-18

IBC: 1207.4

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

1207.4 Efficiency dwelling units. An efficiency living unit shall conform to the requirements of the code except as modified herein:

1. The unit shall have a living room of not less than 220 square feet (20.4 m²) of floor area. ~~An additional 100 square feet (9.3 m²) of floor area shall be provided for each occupant of such unit in excess of two.~~
2. The unit shall be provided with a separate closet.
3. The unit shall be provided with a kitchen sink, cooking appliance and refrigeration facilities, each having a clear working space of not less than 30 inches (762 mm) in front. Light and *ventilation* conforming to this code shall be provided.
4. The unit shall be provided with a separate bathroom containing a water closet, lavatory and bathtub or shower.

Reason:

Since there is no code path that calculates an occupant load exceeding two occupants unless the gross square footage of the efficiency dwelling unit exceeds 400 square feet, this language is not needed or enforceable.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No cost impact.

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows:

1207.4 Efficiency dwelling units. An efficiency living unit shall conform to the requirements of the code except as modified herein:

1. The unit shall have a living room of not less than ~~220~~190 square feet (~~20.4~~17.7 m²) of floor area. An additional 100 square feet (9.3 m²) of floor area shall be provided for each occupant of such unit in excess of two.
2. The unit shall be provided with a separate closet.
3. The unit shall be provided with a kitchen sink, cooking appliance and refrigeration facilities, each having a clear working space of not less than 30 inches (762 mm) in front. Light and *ventilation* conforming to this code shall be provided.
4. The unit shall be provided with a separate bathroom containing a water closet, lavatory and bathtub or shower.

Reason:

This proposal changes the living room/habitable space requirement of an efficiency dwelling unit to 190 square feet of floor area, so it is aligned and consistent with the requirements of a dwelling unit's net floor area per IBC Section 1207.3.

An efficiency dwelling unit is required to have more habitable space, more amenities, and a limit on occupants without providing additional floor area compared to a dwelling unit, when the only difference is the area configuration. When the occupant load of an efficiency dwelling unit is calculated indicating an excess of two occupants triggering the additional floor area requirement, there are no corresponding requirements for a dwelling unit of smaller square footage to provide additional space.

IBC Unit Standards:

Unit Type	Single Room	Other Habitable Rooms	Natural Light	Cooking	Sanitation Facility	Closet
Dwelling Unit	≥ 120 SF net floor area	≥ 70 SF* net floor area	Yes*	Yes Cooking facility/not defined	Yes	No
Efficiency Dwelling Unit	≥ 220 SF	N/A	Yes*	Yes Kitchen sink, cooking appliance, and refrigeration facilities	Yes required to be separate	Yes

*IBC allows an exception.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will provide a cost benefit by reducing construction expense through allowing smaller square footage standards for efficiency dwelling units.

Internal ID: 1806

IBC: 1207.4

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE GENERAL CODE DEVELOPMENT COMMITTEE. PART II WILL BE HEARD BY THE PROPERTY MAINTENANCE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows:

1207.4 Efficiency dwelling units. An efficiency ~~living-dwelling~~ unit shall conform to the requirements of the code except as modified herein:

1. The unit shall have a living room of not less than ~~220-190~~ square feet (~~20.4-17.6~~ m²) of floor area. An additional ~~100-70~~ square feet (~~9.3-6.5~~ m²) of floor area shall be provided for each occupant of such unit in excess of two.
2. The unit shall be provided with a separate closet.
3. ~~The~~ For other than Accessible, Type A and Type B dwelling units, the unit shall be provided with a kitchen sink, cooking appliance and ~~refrigeration facilities~~ refrigerator, each having a clear working space of not less than 30 inches (762 mm) in front. Light and *ventilation* conforming to this code shall be provided.
4. The unit shall be provided with a separate bathroom containing a water closet, lavatory and bathtub or shower.

Internal ID: 1579

G130-18 Part II

IPMC: 404.6

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Property Maintenance Code

Revise as follows:

404.6 Efficiency unit. Nothing in this section shall prohibit an efficiency ~~living~~ dwelling unit from meeting the following requirements:

1. A unit occupied by not more than one occupant shall have a minimum clear floor area of 120 square feet (11.2 m²). A unit occupied by not more than two *occupants* shall have a minimum clear floor area of ~~220-190~~ square feet (~~20.4-17.6~~ m²). A unit occupied by three *occupants* shall have a minimum clear floor area of ~~320-260~~ square feet (~~29.7-24.1~~ m²). These required areas shall be exclusive of the areas required by Items 2 and 3.
2. The unit shall be provided with a kitchen sink, cooking appliance and refrigeration facilities, each having a minimum clear working space of ~~30-40~~ inches (~~762-990~~ mm) in front. Light and *ventilation* conforming to this code shall be provided.

Exception:Dwelling units not required to be Accessible units, Type A units and Type B units shall have a clear working space of not less than 30 inches (762 mm) in front of the kitchen sink, cooking appliacne and refrigerator.
3. The unit shall be provided with a separate *bathroom* containing a water closet, lavatory and bathtub or shower.
4. The maximum number of *occupants* shall be three.

Reason:

The market is trending toward smaller living areas in multi-family R-2 structures particularly in urban areas. US Census statistics show that in 2000, app. 46,000 rental units built were less than 1,000 sq.ft. In 2015, 114,000 units and in 2016, 99,000 units were less than 1,000 sq.ft. The Urban Land Institute reported in 2013 that major Municipalities including New York City, San Francisco, Boston, Dallas and Philadelphia are allowing smaller apartments with Seattle and Portland (OR) having no minimum sizes. The proposed reduction allows for a modest decrease (13.6%) in the required living room area and (30%) in the floor area for each occupant of such unit in excess of two. Code Professionals are receiving proposals for dwelling units in R2 structures that are nonconforming with the minimum standards in the IBC.

The Room Area standard for dwelling units in BOCA and SBBC as well as the 2000 edition of IBC required that one room must have a minimum floor area of 150 sq.ft. This was reduced to 120 sq.ft in the 2003 IBC and remains today. The minimum living room area for efficiency units in the 2000 IBC is the same as the 2018 IBC. No reduction has been proposed even though the overall dwelling unit room area standard has been reduced. The proposal complies with the current language in IBC Section 1207.3. which requires that habitable rooms be at least 120 sq.ft.

IBC 1207.4: The change from "living unit" to "dwelling unit" is to use a defined term to describe these efficiency apartments. The change in Item 3 corrects potential existing conflicts with Chapter 10 of ICC A117.1. which requiring a clear working space of 40 inches in front of the kitchen sink, cooking appliance and refrigerator for Accessible, Type A or B units. The change from "refrigeration facilities" to "refrigerator" is to use a more clearly understood term, and eliminate someone believing that another type of fixture, such as a beer cooler, would be sufficient.

IPC 404.6: The changes to the IPC are for coordination with the revisions to the IBC for efficiency apartments.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal could decrease the cost of construction where efficiency apartments are built to the lower minimum sizes required by the text that is proposed.

Internal ID: 3398

G131-18

IBC: SECTION 202, 202 (New), 1207.4

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

DWELLING UNIT, EFFICIENCY. A dwelling unit where all permanent provisions for living, sleeping, eating and cooking are contained in a single room.

Revise as follows:

1207.4 Efficiency dwelling units. ~~An efficiency living unit~~ Efficiency dwelling units shall conform to the requirements of the code except as modified herein:

1. The unit shall have a living room of not less than 220 square feet (20.4 m²) of floor area. An additional 100 square feet (9.3 m²) of floor area shall be provided for each occupant of such unit in excess of two.
2. The unit shall be provided with a separate closet.
3. The unit shall be provided with a kitchen sink, cooking appliance and refrigeration facilities, each having a clear working space of not less than 30 inches (762 mm) in front. Light and *ventilation* conforming to this code shall be provided.
4. The unit shall be provided with a separate bathroom containing a water closet, lavatory and bathtub or shower.

Reason:

Efficiency dwelling units are regulated in IBC Section 1207.4. Currently there is no definition of efficiency dwelling unit found in the code which may create inconsistency in the enforcement of these provisions. Many design professionals and building officials have assumed that efficiency dwelling units are studio apartments having only one habitable room, a closet, restroom and facilities for cooking. This code change will provide the needed definition so consistent enforcement and understanding will be achieved. There are no substantive changes proposed other than adding this definition.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarrification only; no substantive changes are proposed so cost will remain the same as the current code.

Internal ID: 235

G132-18

IBC: [P]1209.3

Proponent: Gary Schenk, City of SeaTac, WA, representing Washington Association of Building Officials (gschenk@ci.seatac.wa.us); Lee Kranz, City of Bellevue, representing Washington Association of Building Officials Technical Code Development Committee (LKranz@bellevuewa.gov)

THIS PROPOSAL WILL BE HEARD BY THE INTERNATIONAL PLUMBING CODE COMMITTEE. SEE THE IPC-IPSDC HEARING ORDER.

2018 International Building Code

Revise as follows:

[P] 1209.3 Privacy. Public restrooms shall be visually screened from outside entry or exit doorways to ensure user privacy within the restroom. This provision shall also apply where mirrors would compromise personal privacy. Privacy at water closets and urinals shall be provided in accordance with Sections 1209.3.1 and 1209.3.2.

Exception: Visual screening shall not be required for single-occupant toilet rooms with a lockable door.

Reason:

Although this section currently has provisions for sidewall or partition urinal privacy within the restrooms, it does not address privacy from viewing the user at the fixture from outside of the restroom. It also addresses the placement of mirror reflection from the outside.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This would be a design feature and would not increase the cost of construction. Minimal design should be necessary.

Internal ID: 1961

G133-18

IBC: 1209.3.1, 1209.3.1.1 (New)

Proponent: Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (Eirene.Knott@brrarch.com)

2018 International Building Code

[P] 1209.3.1 Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 occupancy housing areas.

Add new text as follows:

1209.3.1.1 Water closet compartment size. Where a compartment is provided, the compartment shall be not less than 30 inches (762 mm) in width and not less than 60 inches (1524 mm) in depth for floor-mounted water closets and not less than 30 inches (762 mm) in width and 56 inches (1422) in depth for wall-hung water closets. The compartment shall provide not less than 21 inches (533 mm) of clearance in front of the water closet to any wall, fixture or door.

Reason:

This proposal is bringing language from the IPC into the IBC where designers that utilize the IBC can find this information more readily. Most architectural firms do not have an IPC in their office, but rather rely upon the IBC to provide the information needed for the design aspect of the project. This code change brings language directly from the IPC with specifics that will be utilized by a designer so that the toilet room layout will comply with the requirements of the IPC.

There is specific information in the IBC on the requirements for urinal partitions, so bringing language in specific to the toilet partitions would be a natural supplement to the information already provided

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is just adding language that already exists in the IPC so this will not impact the construction cost.

Analysis: This is a [P] controlled section. This is a matter of IBC-G Committee deciding whether it is appropriate to have the same language contained in the IPC placed in the IBC. Technical changes to this section should not be made by IBC-G.

Internal ID: 490

G134-18

IBC: 1209.3.1

Proponent: Todd Snider, West Coast Code Consultants (WC3), representing Self (Todd@KimballEng.com)

THIS PROPOSAL WILL BE HEARD BY THE INTERNATIONAL PLUMBING CODE COMMITTEE. SEE THE IPC-IPSDC HEARING ORDER.

2018 International Building Code

[P] 1209.3.1 Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy. The walls or partitions shall begin at a height not more than 12 inches from and extend not less than 72 inches above the finished floor surface.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 occupancy housing areas.

Reason:

Proposed revision to clarify privacy requirements for water closet compartment walls. Urinal partition walls have minimum dimensions but no dimensions have been provided for water closet partitions. This proposes to add requirements which will mirror the requirements for urinal partitions.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This new requirement should not add cost. It seems that often this requirement is followed, but seems important to add as a requirement.

2018 International Building Code

CHAPTER 12 INTERIOR ENVIRONMENT

Revise as follows:

1201.1 Scope. The provisions of this chapter shall govern ventilation, temperature control, lighting, *yards* and *courts*, sound transmission, room dimensions, surrounding materials ~~and~~, rodentproofing associated with the interior spaces of ~~buildings~~buildings, and radon.

Add new text as follows:

SECTION 1210 RADON

1210.1 Applicability. Section 1210 shall apply to use groups E and I located in radon zone 1 as defined in IRC Table AF101(1).

Exception:Compliance with Section 1210 shall not be required where the authority having jurisdiction has defined the radon zone as Zone 2 or 3.

1210.2 Radon testing. Radon testing shall be performed in accordance with Sections 1210.2.1 through 1210.2.11.

1210.2.1 Airtightness. Testing shall be performed after the building passes its airtightness test.

1210.2.2 Fan. Where the system includes a fan, testing shall be performed after the radon control system installation is complete and operating with the fan.

1210.2.3 Lowest level. Testing shall be performed at the lowest level that will be occupied, inclusive of unfinished spaces. Spaces that are physically separated and severed by different HVAC systems shall be tested separately.

1210.2.4 Spaces not tested. Testing shall not be performed in a closet, hallway, stairway, laundry room, furnace room, bathroom or kitchen.

1210.2.5 Test kits and monitors. Testing shall be performed with a commercially available test kit or with a continuous radon monitor that can be calibrated. Testing with test kits shall include two tests, which shall be averaged. Testing shall be in accordance with the testing device manufacturer's instructions.

1210.2.6 Testing agency. Testing shall be performed by the builder, a registered design professional or an approved third party.

1210.2.7 Time period. Testing shall extend at least 48 hours or to the minimum specified by the testing device manufacturer, which ever is longer. This initial testing shall be permitted to extend past occupancy.

1210.2.8 Test results. Test results shall be provided directly to the owner by the test lab or testing party. The test results shall be delivered before or after occupancy.

2010.2.9 Additional test kit. An additional pre-paid test kit shall be provided to the owner to use when they choose. The test kit shall include mailing, or emailing the results from the testing lab to the owner. The builder shall also be permitted to receive the test results.

1210.2.10 Test result. This section does not require a specific test result, rather it requires the test be performed and the results be provided to the registered design professional or owner.

1210.2.11 Test result report. The registered design professional or owner shall be informed prior to occupancy and in writing that "A radon test result of 4 pCi/L or above is the 'action level' set by the U.S. Environmental Protection Agency (EPA. EPA recommends radon reduction measures to lower radon levels below 4 pCi/L." Or "For a radon test result of 4 pCi/L or above [name of builder or jurisdiction having authority] recommends radon reduction measures to lower radon levels below 4 pCi/L."

1210.3 Radon reduction measures. Radon reduction measures shall be in accordance with Sections 1210.3.1 through 1210.3.6 and Table 1210.3.

1210.3.1 Soil-gas barriers and base course. A base course in accordance with Section 1805.4.1 shall be installed below slabs and foundations. There shall be a continuous base course under each soil-gas retarder that is separated by foundation walls or footings. Foundation walls and floors in contact with the soil shall be damp proofed or waterproofed in accordance with Section 1805. Punctures, tears and gaps around penetrations of the soil-gas retarder shall be repaired or covered with an additional soil-gas retarder. The soil-gas retarder shall be a continuous 6-mil (0.15 mm) polyethylene or an approved equivalent. Approved alternative soil gas collection areas, such as sealed crawlspaces, shall be permitted.

1210.3.2 Soil gas collection. There shall be an unobstructed path for soil gas flow within the base course and out through the vent in the roof. Soil gases below the foundation shall be collected by a perforated pipe with a diameter of not less than 4 inches (10 cm) and not less than 10 ft (3 m) in total length that is mechanically fastened to a tee with two horizontal openings within the base course for radon collection or an equivalent method. The tee fitting connection within the base course and the soil gas vent pipe that extends to the roof shall be designed to prevent clogging of the radon collection path. Alternately the soil gas collection shall be by approved radon collection mats or an equivalent approved method.

1210.3.3 Soil gas entry routes. Openings in slabs, soil-gas retarders, and joints such as plumbing, ground water control systems, soil-gas vent pipes, piping and structural supports, shall be sealed against air leakage at the penetrations with a polyurethane caulk, expanding foam or other approved sealing method. Gaps, seams and joints below grade in walls and footings that surround soil gas collection areas shall be closed with cementitious materials, damp proofing, or other approved products. Closure shall be provided to prevent air migration between the base course that serves soil gas collection and exterior foundation drain systems located outside of the walls or footings that surround the soil gas collection areas. Masonry unit walls below grade shall provide a barrier between soil gas and interior spaces, including but not limited to, barriers within the hollow masonry units, full grouting, solid masonry units or other approved method. Sumps intended for ground water control shall have gasketed lids or be otherwise sealed and shall not be connected to the soil-gas exhaust system.

1210.3.4 Soil gas vent. A gas-tight vent pipe not less than 3 to 4 inches in diameter shall extend from the soil-gas permeable layer through the roof. Alternately, the vent shall extend from the soil-gas permeable layer to at least 30 feet above grade and shall not be less than 4 feet vertically above or 10 feet horizontally away from operable windows, doors or skylights. The vent pipe shall be sloped to avoid collecting condensate or rainwater. The vent pipe size shall not be reduced at any location as it goes from gas collection to the roof. Exposed and visible interior vent pipes shall be identified with not less than one label reading "Radon Reduction System" on each floor and in habitable attics.

1210.3.5 Vent pipe diameter. The minimum vent pipe diameter shall be as specified in Table 1210.3.5.

TABLE 1210.3.5
Maximum Vented Foundation Area

Maximum Area Vented	Minimum Pipe Diameter
<u>2,500 ft² (232 m²)</u>	<u>3 inch (7.6 cm)</u>
<u>4,000 ft² (372 m²)</u>	<u>4 inch (10 cm)</u>
<u>Unlimited</u>	<u>6 inch (15.2 cm)</u>

1210.3.6 Multiple vented areas. In dwellings where interior footings or other barriers separate the soil- gas permeable layer, each area shall be fitted with an individual vent pipe. Vent pipes shall connect to a single vent that terminates above the roof or individual vent pipes shall terminate separately above the roof.

1210.3.7 Fan. Each sub-slab soil-gas exhaust system shall include a fan, or dedicated space for the post-construction installation of a fan. The electrical supply for the fan shall be located within 6 feet (1.8 m) of the fan.

Reason:

Radon in schools presents a significant health risk. Thousands of schools are affected by radon. EPA found that 41% of schools that had high radon were located geographically within Zone 1 (high radon potential), It is common knowledge that there is no way to know your building's radon level unless you test. Post-construction mitigation is very expensive; preventative measures, such as adding radon reducing features during construction, can save future costs and lives.

Cost Impact

The code change proposal will increase the cost of construction .

The cost of three test kits with prepaid analysis and prepaid postage is less than \$80, probably less than \$50 in builder quantity including tax. Where there were multiple spaces that are physically separated and served by different HVAC systems each space would incur that cost.

The cost of the measures in the building varies widely with building size. Many elements of the radon resistant features are already required by code; for example, the base coarse under the foundation, and air tightness for the building; these would not add cost for the radon system.

Internal ID: 1794

G136-18

IBC: 202, 503.1.4, 1510.2.2

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows:

[BG] PENTHOUSE. An enclosed, unoccupied rooftop structure used for sheltering mechanical and electrical equipment, tanks, elevators and related machinery, stairways and vertical shaft openings.

503.1.4 Occupied roofs. A roof level or portion thereof shall be permitted to be used as an occupied roof provided the occupancy of the roof is an occupancy that is permitted by Table 504.4 for the story immediately below the roof. The area of the occupied roofs shall not be included in the *building area* as regulated by Section 506. An occupied roof shall not be included in the building height or number of stories as regulated by Section 504 provided the penthouses and other enclosed roof structures comply with Section 1510.

Exceptions:

1. The occupancy located on an occupied roof shall not be limited to the occupancies allowed on the *story* immediately below the roof where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and occupant notification in accordance with Section 907.5 is provided in the area of the occupied roof.
2. Assembly occupancies shall be permitted on roofs of open parking spaces of Type I or Type II construction, in accordance with the exception to Section 903.2.1.6.

SECTION 1510 ROOFTOP STRUCTURES

[BG] 1510.1 General. The provisions of this section shall govern the construction of rooftop structures.

1510.1.1 Area limitation. The aggregate area of penthouses and other enclosed rooftop structures shall not exceed one-third the area of the supporting roof deck. Such penthouses and other enclosed rooftop structures shall not be required to be included in determining the building area or number of stories as regulated by Section 503.1. The area of such penthouses shall not be included in determining the fire area specified in Section 901.7.

[BG] 1510.2 Penthouses. Penthouses in compliance with Sections 1510.2.1 through 1510.2.5 shall be considered as a portion of the story directly below the roof deck on which such penthouses are located. Other penthouses shall be considered as an additional story of the building.

[BG] 1510.2.1 Height above roof deck. Penthouses constructed on buildings of other than Type I construction shall not exceed 18 feet (5486 mm) in height above the roof deck as measured to the average height of the roof of the penthouse. Penthouses located on the roof of buildings of Type I construction shall not be limited in height.

Exception: Where used to enclose tanks or elevators that travel to the roof level, penthouses shall be permitted to have a maximum height of 28 feet (8534 mm) above the roof deck.

[BG] 1510.2.2 Use limitations. Penthouses shall not be used for purposes other than the shelter of mechanical or electrical equipment, tanks, elevators and related machinery, stairways or vertical shaft openings in the roof ~~assembly~~ assembly, including ancillary spaces used to access elevators and stairways.

Reason:

This is part of a series of 3 proposals dealing with occupied roofs. See BCAC proposals to Section 1006 and 1009.

Although it was felt the original intent of the egress associated with occupied roofs was clear, we felt there were a few remaining provisions that left doubt as to what was intended. It had been reported that some code officials had interpreted the existing code provision to treat an unoccupied roof as an additional story so as to decrease the actual allowable stories in Chapter 5. To clarify that occupied roofs are not considered stories and are permitted to be used provide that egress is provided in accordance with all applicable sections of the IBC and IFC purposes in a manner “as if they were a story” without applying other “story” requirements like those associated with height and area limitations in Chapter 5 or fire area provisions of Chapter 9, we propose the above modifications as summarized below:

In Section 202, the definition of “PENTHOUSE” is proposed to be modified by adding the word “stairway”. This reinforces the existing and proposed language in Section 1510 that excludes certain allowable rooftop structures from being considered additional stories. The definition was not modified to include vestibule type areas as this is addressed in the proposed change to Section 1510.2.2.

The proposal in Section 503.1.4 Occupied roofs, adds a clarifying statement to support the concept that occupied roofs and other enclosed structures in Section 1510 are not an additional story.

Proposed modifications to Section 1510 Rooftop Structures include the additions of the word “Stairways” and the term, including ancillary spaces used to access elevators and stairways.” to Section 1510.2.2. Use Limitations.

As flat/ low-slope rooftops are increasingly, and intentionally, being designed and utilized for occupancies similar to those on occupied floor levels below, modifications to the current code are necessary to define rooftop structures that are occupied and ancillary to approved occupied roof uses and to clarify that these structures must comply with means of egress requirements, but are not a story for height and area limitations. In addition, the proposed modifications described above align the limitations for Occupied roof ancillary structures with those for penthouses as a reasonable approach based upon the shared characteristics of the two structure types.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/codedevelopment-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is a clarification reminder of the scope of requirements included in the identified sections.

IBC: 2703 (New), 2703.1 (New), 2703.2 (New), 2703.3 (New), 2703.4 (New), Chapter 35

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Building Code

Add new text as follows:

SECTION 2703 LIGHTNING PROTECTION SYSTEMS

2703.1 General. Where provided, lightning protection systems shall comply with Sections 2703.2 through 2703.4

2703.2 Installation. Lightning protection systems for all new buildings and additions shall be installed in accordance with one of the following methods:

1. NFPA 780.
2. UL 96A.
3. Other approved methods.

UL 96A shall not be utilized for structures used for the production, handling, or storage of ammunition, explosives, flammable liquids or gases, and other explosive ingredients including dust.

2703.3 Additions to existing systems. Where additions are constructed to a building containing a lightning protection system and the existing building's lightning protection system is connected to the new lightning protection system, the entire system shall be inspected and brought into compliance with current standards.

2703.4 Surge protection. Surge protection devices shall be installed for all normal and emergency electrical systems and all communications systems in accordance with Section 2703.2 and NFPA 70.

Add new standard(s) follows:

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096

96A-2016:

Standard for Installation Requirements for Lightning Protection Systems

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

780-17:

Standard for the Installation of Lightning Protection Systems

Reason:

Requirements pertaining to Lightning Protection Systems are not currently found within the building code. This code change does not require the installation of lightning protection systems, but simply provides guidance to those that are installing and inspecting lightning protection. NFPA 780 and UL 96A are two standards that are widely used within the industry, but are not very well known to code officials. These standards are in harmony with the provisions of the National Electrical Code, NFPA 70. UL 96A can be used for the installation and inspection of many lightning protection systems but the standard has limitations that are identified in this proposal. This proposal also recognizes the existence of other approved methods currently used, and thus this proposal is not intended to limit these installations. This proposal is intended to provide the code official with help in addressing the installation of these types of systems.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The cost will not increase since these requirements are being used today to install and inspect lightning protection systems.

Analysis: A review of the standards proposed for inclusion in the code, NFPA 780-17 and UL 96A-2016, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 234

G138-18

IBC: 3001.2

Proponent: Andrew Cid, Barrier Free Solutions For The Deaf and Hard of Hearing, representing Barrier Free Solutions For The Deaf and Hard of Hearing

2018 International Building Code

Revise as follows:

3001.2 Emergency elevator communication systems for the deaf, hard of hearing and speech

impaired. An emergency two-way communication system shall be ~~provided~~provided. The system shall provide visible text and audible modes that:

1. ~~Is a visual and text based and a video based 24/7 live interactive system.~~When operating in each mode, includes a live interactive system that allows back and forth conversation between the elevator occupants and emergency personnel;
2. ~~Is fully accessible by the deaf, hard of hearing and speech impaired, and shall include voice only options for hearing individuals. Has the ability to communicate with emergency personnel utilizing existing video conferencing technology, chat/text software or other approved technology.~~operational when the elevator is operational; and
3. Allows elevator occupants to select the text-based or audible mode depending on their communication needs to interact with emergency personnel.

Reason:

This proposal is submitted as there is no new standard published, as of this writing, under the ASME a17 in support of IBC 2018 3001.2. This code proposal also provides additional direction and clarification for industry. Underlined wording is added text to capture the intent of the proposal. This proposal clarifies as to what type of feature and assistance is required and shall be provided regards to the utilization of a text-based system (consisting of keyboard, visual indicators and button indicators) by an entrapped Deaf or Hard of Hearing passenger(s).

I have been working with a dedicated group of industry professionals who have been working hard to develop an a17 standard for 3001.2. My participation in these ASME efforts for the past 3 years have been exciting and productive in attempting to improve the standard to include criteria for these systems. However, the ASME a17 EOC reviews are not yet completed and finalized to my satisfaction to the current code.

It is unfortunate that due to code hearing revision schedules between the ICC and the A17 Emergency Operations Committee where the ICC has a 1/8/18 proposal closing date and the A17 committee may have some possible revisions to 2.27 of A17.1 later this year reflecting provisions addressing two-way communication incorporating video means. It is hopeful that work continues on proposed revisions to 2.27 satisfying the intent of the original provisions of 3001.2. It is recognized that as a general practice that the applicable standard as referenced by the IBC contain the necessary text and provisions and it is the intent that once the A17 committee has developed the necessary language that incorporates the provisions of 3001.2 that this section could be removed. But until such time, recognizing that the A17.1 document revision schedule may not permit inclusion for the 2021 IBC edition, the provisions of 3001.2 need to be maintained.

Unfortunately, I have been the target of recent threats, bullying and intimidation by some individuals who are attempting to discredit me or disrupt our standard language efforts. As a result, I fear for my safety and well being. However, I will continue working to provide assistance to industry, to Fire/Life Safety and First Responders in their jobs in helping others, and to provide access to 50M Deaf & Hard of Hearing citizens.

I hope the IBC committee, industry representatives, and the ICC voters, especially the professional First Responders, agree with this proposal. If approved, this will be effective 2021 and the a17 will hopefully be in place by then to support 3001.2.

Cost Impact

The code change proposal will increase the cost of construction .

The code change proposal may increase the cost of construction by a minimum of less than \$250 (the approximate cost of a keyboard component and several visual indicators)..

Internal ID: 808

G139-18

IBC: 3001.2, DOJ (New)

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org)

2018 International Building Code

Revise as follows:

3001.2 Emergency elevator communication systems for the deaf, hard of hearing and speech impaired. ~~An emergency two-way communication system shall be provided that:~~

- ~~1. Is a visual and text based and a video based 24/7 live interactive system.~~
- ~~2. Is fully The elevator emergency communication shall provide effective communication as required by Section 36.303 of ADA Title III. The emergency communication shall be installed in accordance with the provisions of ASME A17.1/CSA B44 and NFPA 72 and shall be accessible by the deaf, hard of hearing and speech impaired, and shall include voice-only options for hearing individuals.~~
- ~~3. Has the ability to communicate with emergency personnel utilizing existing video conferencing technology, chat/text software or other approved technology available twenty-four hours a day, seven days a week, as a live interactive system.~~

Add new standard(s) follows:

DOJ United States Department of Justice Civil Rights Division

ADA Title III Regulations - Americans with Disabilities Act, Public Accommodations and Commercial Facilities

Reason:

Section 3001 defines the scope and reference standards for elevator Emergency Communication design requirements. This proposal removes an elevator design requirements from the building code, restoring it to the reference standards. The added reference to the ADA Title III is the regulation specifically for effective communication with the deaf, hard of hearing and speech impaired.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal will neither increase or decrease the cost of construction because it is simply restoring the technical requirements to the reference standards as opposed to including them in the IBC.

Analysis:

A review of DOJ ADA Title III Regulations, as proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

ASME A17.1/CSA B44 and NFPA 72, as referenced in this proposal, are currently referenced in the code.

Internal ID: 1274

G140-18

IBC: 3002.3, 3002.3.1 (New)

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows:

3002.3 Emergency signs for other than occupant evacuation elevators... Where other than occupant evacuation elevators are provided, an *approved* pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the ~~exit stairways~~ exits and not to use the elevators in case of fire. The sign shall read: IN CASE OF FIRE, ELEVATORS ARE OUT OF SERVICE. USE EXIT STAIRS.

~~Exceptions~~ **Exception:**

- ~~1.~~ The emergency sign shall not be required for elevators that are part of an accessible *means of egress* complying with Section 1009.4.
- ~~2.~~ The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008.

Add new text as follows:

3002.3.1 Emergency signs for occupant evacuation elevators. Where occupant evacuation elevators are provided, an approved pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use occupant evacuation elevators in the event of fire. The sign shall read: IN CASE OF FIRE, THIS OCCUPANT EVACUATION ELEVATOR IS AVAILABLE FOR EXITING THE BUILDING.

Analysis: Duplicated text in the International Fire Code not shown for brevity.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6 of the Fire Code. While the Code Committees will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal correlates with the series of proposals to the IFC Chapter 6 submitted by the F-CAC for correlation of Elevator requirements and specification of required signage for all elevators.

This proposal addresses the emergency signage for the elevators in the IBC and the IFC. The changes are reflected in the IBC as these are the parent sections for these requirements. If approved this language will be duplicated in Chapter 6 of the IFC. This also correlates with the signage requirements in ASME A17.1. Exit stairways were changed to "exits" because there could be ramps instead of stairways.

Two distinct sections are established between occupant evacuation elevators and other than those elevators.

This proposal also adds standardized language to both the IBC and the IFC for occupant evacuation elevator signage to ensure consistency between codes and to provide clear and concise building occupant instruction for their use.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) in support of the FCAC's efforts. BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact

The code change proposal will decrease the cost of construction.

By providing standardized language for the emergency signs for occupant evacuation elevators, and correlating for consistency the standardized language for other elevators.

Internal ID: 407

G141-18

IBC: 3003.1 (New)

Proponent: Keith Flanders, Cosentini Associates, representing self (kflanders@cosentini.com)

2018 International Building Code

Add new text as follows:

3003.1 Elevator Power. Upon loss of power, elevators shall be relocated to the lobby or the nearest floor level and the hoistway doors shall be opened.

Reason:

The applicable codes for elevators and vertical lifts do not currently require a means to lower to the nearest floor or lobby upon loss of power. Where the elevators are not provided with standby power, this leads to occupants becoming entrapped and require assistance from a responding fire department. There is often confusion as to whether this is required, and many may think it is common sense. However, there is nothing in the codes that explicitly requires such an action upon loss of power. Accordingly, this code change proposal includes the specific language to avoid any further confusion and to limit the possibility of occupants becoming entrapped.

Cost Impact

The code change proposal will increase the cost of construction .

This may have a slight impact on the cost of construction; however, it is often included regardless and therefore may not have an impact.

Internal ID: 1019

G142-18

IBC: 3007.1

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org)

2018 International Building Code

3007.1 General. Where required by Section 403.6.1, every floor above and including the lowest level of fire department vehicle access of the building shall be served by fire service access elevators complying with Sections 3007.1 through 3007.9. Except as modified in this section, fire service access elevators shall be installed in accordance with this chapter and ASME A17.1/CSA B44.

~~Exception~~ Exceptions:

1. Elevators that only service an open or enclosed parking garage and the lobby of the building shall not be required to serve as fire service access elevators.
2. The elevator shall not be required to serve the top floor of a building where that floor is utilized only for equipment for building systems.

Reason:

To align with Section 403.6.1 which addresses occupied floors.

Cost Impact

The code change proposal will decrease the cost of construction .

This would decrease the cost of construction because it would not require an extension on top of the roof of the building so that the elevator could serve an unoccupied floor.

Internal ID: 1449

G143-18

IBC: 3005.4

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org)

2018 International Building Code

3005.4 Machine rooms, control rooms, machinery spaces, and control spaces. ~~Elevator machine rooms, control rooms, control spaces and machinery spaces outside of but attached to a hoistway that have openings into the hoistway.~~ The following rooms and spaces shall be enclosed with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or ~~both~~ both:

1. Machine rooms
2. Control rooms
3. Control spaces
4. Machinery spaces outside of the hoistway enclosure

The *fire-resistance rating* shall be not less than the required rating of the hoistway enclosure served by the machinery. Openings in the *fire barriers* shall be protected with assemblies having a fire protection rating not less than that required for the hoistway enclosure doors.

Exceptions:

1. For other than fire service access elevators and occupant evacuation elevators, where machine rooms, machinery spaces, control rooms and control spaces do not abut and do not have openings to the hoistway enclosure they serve, the *fire barriers* constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both, shall be permitted to be reduced to a 1-hour *fire-resistance rating*.
2. For other than fire service access elevators and occupant evacuation elevators, in buildings four *stories* or less above *grade plane* where machine room, machinery spaces, control rooms and control spaces do not abut and do not have openings to the hoistway enclosure they serve, the machine room, machinery spaces, control rooms and control spaces are not required to be fire-resistance rated.

Reason:

There was some confusion with the current wording that the phrase " outside of but attached to a hoistway that have openings into the hoistway" as to how it relates to machine rooms. Essentially this could be possibly interpreted that if no openings to the hoistway exist that a fire resistance rated enclosure would not be required. Control rooms and control spaces should be treated no differently for separation requirements so the added phrase is not necessary. This section is essentially an extension of the hoistway protection.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no impact since this is just a clarification of the language.

Internal ID: 1451

G144-18

IBC: 3007.3

Proponent: John Mengedoht, representing NBBJ (jmengedoht@nbbj.com)

2018 International Building Code

Revise as follows:

3007.3 Water protection. Water from the operation of an automatic sprinkler system outside the enclosed lobby shall be prevented from infiltrating into the hoistway enclosure by means of a curb and elevator entrance floor levels not less than 1 inch (25.4 mm) above floor areas outside of the lobby area or in accordance with ~~an~~ other approved method-methods.

Reason:

2018 IBC Section 3007.3 does not establish any criteria for an approved method of preventing water from entering the hoistway for fire service access elevators. Establishing a 1 inch height as a minimum for a curb at the hoistway and for the floor at the elevator entrances provides criteria for one approach without the need for floor drains or trench drains, which are an infection risk in high rise hospitals and generally not preferred in high rise office buildings. The 1 inch height is more than necessary to prevent water intrusion into a hoistway but allows for buildings where floors may not be particularly level and might slope downward toward the building core.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Establishing one reasonable method of compliance does not rule out other approved solutions and does not increase cost unless a lower height than 1 inch has been widely accepted by code officials previously.

Internal ID: 2290

G145-18

IBC: 3007.8.1, 3008.8.2

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows:

3007.8.1 Protection of ~~wiring or cables~~ equipment, control wiring, power wiring and ductwork.

Equipment control wiring, power wiring and ductwork shall be independent of other building ventilation or pressurization systems and shall be protected in accordance with Section 909.20.6.1.

~~Wires or cables that are located outside of the elevator hoistway and machine room and that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation and fire-detecting systems to fire service access elevators shall be protected using one of the following methods:~~

- ~~1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 2 hours.~~
- ~~2. Electrical circuit protective systems shall have a *fire-resistance rating* of not less than 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.~~
- ~~3. Construction having a *fire-resistance rating* of not less than 2 hours.~~

Exception: Wiring and cables to control signals are not required to be protected provided that wiring and cables do not serve Phase II emergency in-car operations.

3008.8.2 Protection of ~~wiring or cables~~ equipment, control wiring, power wiring and ductwork.

Equipment, control wiring, power wiring and ductwork shall be independent of other building ventilation or pressurization systems and shall be protected in accordance with Section 909.20.6.1.

~~Wires or cables that are located outside of the elevator hoistway, machine room, control room and control space and that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation and fire-detecting systems to occupant evacuation elevators shall be protected using one of the following methods:~~

- ~~1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 2 hours.~~
- ~~2. Electrical circuit protective systems shall have a *fire-resistance rating* of not less than 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.~~
- ~~3. Construction having a *fire-resistance rating* of not less than 2 hours.~~

Exception: Wiring and cables to control signals are not required to be protected provided that wiring and cables do not serve Phase II emergency in-car operation.

Reason:

The scope of this proposal adds "equipment" and "ductwork" to the list of items needing fire-resistance rated protection for Fire Service Access Elevators and Occupant Evacuation Elevators. It replaces the current text with a reference to Section 909.20.6.1. These established protection measures for pressurized stair enclosures will create a consistent approach for pressurized hoistways. This proposal references Section 909.20.6.1 which includes not only the wiring but also the equipment and ductwork associated the pressurization of the shaft and are critical components of this life-safety system. The exception related to protection of wiring and cables for control signals is maintained in both subsections.

Cost Impact

The code change proposal will increase the cost of construction .

There will be additional cost associated with protection of the pressurization fan and ductwork which are not currently required in the code.

Internal ID: 89

G146-18

IBC: 3102.3, 3102.6.1.1

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Building Code

Revise as follows:

3102.3 Type of construction. Noncombustible membrane structures shall be classified as Type IIB construction. Noncombustible frame or cable-supported structures covered by an *approved* membrane in accordance with Section 3102.3.1 shall be classified as Type IIB construction. Heavy timber frame-supported structures covered by an *approved* membrane in accordance with Section 3102.3.1 shall be classified as Type IV-HT construction. Other membrane structures shall be classified as Type V construction.

Exception: Plastic less than 30 feet (9144 mm) above any floor used in greenhouses, where occupancy by the general public is not authorized, and for aquaculture pond covers is not required to meet the fire propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701.

3102.6.1.1 Membrane. A membrane meeting the fire propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 shall be permitted to be used as the roof or as a skylight on buildings of Type IIB, III, IV-HT and V construction, provided that the membrane is not less than 20 feet (6096 mm) above any floor, balcony or gallery.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

This code change will result in consistency with the purpose and scope which was to leave intact the current Type IV heavy timber provisions. The HT category was created to differentiate the three (3) new categories of “mass timber”, where HT represents the long established heavy timber category that has been in the ICC family of codes, and the predecessor legacy codes, for decades.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
3308.4 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit <http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, please visit <http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Internal ID: 949

G147-18

IBC: SECTION 202, 202 (New), 3103.1

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance (rnix@zoomtown.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows:

SPECIAL EVENT STRUCTURE. Any ground-supported structure, platform, stage, stage scaffolding or rigging, canopy, tower or similar structure supporting entertainment-related equipment or signage.

Revise as follows:

3103.1 General. The provisions of Sections 3103.1 through 3103.4 shall apply to structures erected for a period of less than 180 days. ~~Tents~~Special event structures, tents, umbrella structures and other membrane structures erected for a period of less than 180 days shall also comply with the International Fire Code. ~~Those erected for a longer period of time shall comply with applicable sections of this code.~~

Reason:

These structures are covered under the scope of IBC Chapter 31, Special Construction. IBC Section 3103 addresses installations <180 days, which are considered "temporary". Temporary tents, any type of membrane covered structure and special events structures are therefore within the scope of IBC Chapter 31, section 3102 and/or section 3103. All of these structures except special event structures are referred to IFC Chapter 31. The IFC has added new requirements in Chapter 31 for special events structures, therefore special event structures must also be referred from IBC Chapter 31 to IFC Chapter 31.

Building Code Officials and others using the IBC as a primary code reference require the proper guidance and direction to IFC Chapter 31. In the last code change cycle, F308-16 replaced the IFC term temporary stage canopy with the term temporary special events structure. Therefore, Temporary special events structures are now covered under the purview of IFC Chapter 31. Coordination with IBC Chapter 31 was both implied and intended to occur as a result of F308-16, due to the special construction and temporary characteristics of these structures. However, that coordination did not occur. This CCP ensures proper coordination between IFC and IBC as intended in the last code change cycle.

This proposed definition for Special Events Structures in IBC is slightly different than that used in IFC, because the word "temporary" is implied by the corresponding IBC section 3103, where these structures are currently mentioned.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change adds a definition for clarity along with a pointer for code coordination.

Internal ID: 311

G148-18

IBC: 3111.1.1, 3111.2, 3111.3.2, 3111.3.3

Proponent: Joseph Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (JoeCainPE@gmail.com)

2018 International Building Code

Revise as follows:

3111.1.1 Wind resistance. Rooftop-mounted photovoltaic ~~panels and modules~~ (PV) panel systems and solar thermal collectors shall be designed in accordance with Section 1609.

3111.2 Solar thermal systems. Solar thermal systems shall be designed and installed in accordance with ~~Section 2606.12~~ this section, the International Plumbing Code, the International Mechanical Code and the International Fire Code. Where light-transmitting plastic covers are used, solar thermal collectors shall be designed in accordance with Section 2606.12.

3111.3.2 Fire classification. Rooftop-mounted photovoltaic (PV) panel systems shall have a fire classification in accordance with Section 1505.9. ~~Building-integrated photovoltaic systems~~ BIPV systems installed as the roof covering shall have a fire classification in accordance with Section 1505.8.

3111.3.3 Building-integrated photovoltaic (BIPV) systems. ~~Building-integrated photovoltaic systems that serve as roof coverings~~ BIPV systems installed as the roof covering shall be designed and installed in accordance with Section ~~1507.18-1507.~~

Reason:

Section 3111.1.1 Wind resistance is modified to use the defined term "photovoltaic (PV) panel systems" including the abbreviation PV, and to clarify it is the system designed in accordance with Section 1609, not just PV panels and modules.

Section 3111.2 Solar thermal systems is modified to consider that not all solar thermal collectors incorporate light transmitting plastics.

Section 3111.3.2 Fire classification is modified to use the defined term "photovoltaic (PV) panel systems, including the abbreviation "PV." It is also modified to clarify that the reference to section 1505.8 applies only to BIPV systems installed as the roof covering.

Section 3111.3.3 Building-integrated photovoltaic (BIPV) systems is modified to include the BIPV abbreviation/acronym. It is also modified to include the language "installed as the roof covering," consistent with Section 1505.8 language. The reference to Chapter 15 is corrected to Section 1507, as requirements for BIPV roof covering products are found throughout Section 1507, not just in 1507.18, which is specific to photovoltaic (BIPV) shingles.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Editorial changes only. No changes to technical requirements.

2018 International Building Code

Add new text as follows:

3112 PUBLIC USE RESTROOM BUILDINGS IN FLOOD HAZARD AREAS

3112.1 General. Public use restroom buildings that contain toilet rooms, bathrooms, showers and changing rooms, and those portions of buildings that contain toilet rooms, bathrooms, showers and changing rooms, and where such buildings and portions of buildings are intended for public use and located on publicly owned lands in flood hazard areas, shall comply with the requirements of this section. Public use restrooms that are not elevated or dry floodproofed in accordance with Section 1612 shall comply with Section 3112.2. Portions of buildings that include uses other than public use toilet rooms, bathrooms, showers and changing rooms shall comply with Section 1612.

3112.2 Flood resistance. Public use restrooms that are located in flood hazard areas shall comply with the requirements of ASCE 24, except for elevation requirements, and shall comply with all of the following criteria:

1. The building footprint is not more than 1,500 square feet.
2. Located, designed and constructed to resist the effects of flood hazards and flood loads to minimize flood damage from a combination of wind and water loads associated with the base flood.
3. Anchored to prevent flotation, collapse or lateral movement resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy during conditions of the base flood.
4. Constructed of flood damage-resistant materials.
5. Where enclosed by walls, the walls have flood openings.
6. Mechanical and electrical systems are located above the base flood elevation.
7. Plumbing fixtures and plumbing connections are located above the base flood elevation.
8. An emergency plan, approved by the jurisdiction, is submitted to the building official where the building design specifies implementation of protection measures prior to the onset of flooding conditions.

Exceptions:

1. Minimum electric service required to address life safety and electric code requirements is permitted below the base flood elevation.
2. Plumbing fixtures and connections are permitted below the base flood elevation provided the fixtures and connections are designed and installed to minimize or eliminate infiltration of floodwaters into the sanitary sewage system and discharges from sanitary sewage systems into floodwaters.

Reason:

Thousands of communities and state agencies have public open space and parks along rivers and shorelines. Many communities experience economic value from tourism and public access to areas that feature water resources. Under the current requirements of the IBC, restrooms for public use that are located in flood hazard areas must meet the same requirements as residential and commercial buildings. In flood hazard areas other than coastal high hazard areas and Coastal A Zones (i.e., in flood zones identified on Federal Emergency Management Agency Flood Insurance Rate Maps with the letter "A"), restroom buildings must either be elevated or dry floodproofed to or above the elevations required by the IBC/ASCE 24. In coastal high hazard areas (flood Zone V) and Coastal A Zones, restroom buildings must be elevated to or above the elevations required by the IBC/ASCE 24.

In Florida and other coastal states, this has resulted in construction of public use restrooms as high as 6 to 18 feet above grade. This poses many challenges, not the least of which is access. Figures 1, 2, 3 and 4 (below) illustrate

elevated restrooms with long ramps. While ramps can be built to meet ADA requirements, to reach some heights required in some flood hazard areas the ramps may be as long as 300 feet. In coastal high hazard areas, such ramps likely conflict with the NFIP requirements that elevated buildings be “free of obstruction,” and the presence of such ramps would likely interfere with the ability of walls around enclosures to break away under flood conditions. Those same provisions are required by IBC Section 1612, Flood Loads, which references ASCE 24, Flood Resistant Design and Construction.

Long ramps defeat accessibility when the distance of travel still renders restroom facilities inaccessible to many persons with disabilities or limited mobility. Although the IBC (and FEMA) permits elevators to extend below the base flood elevation, installing elevators to provide access to elevated public use restrooms is expensive and creates many maintenance issues, and a high rate of failure to function, especially in beach areas where blowing sand and windborne salt aerosols create corrosive conditions.

This proposal creates a new section in IBC Chapter 31, Special Construction to limit the scope to public use restrooms that include public use toilet rooms, bathrooms, showers and changing rooms and spaces. Portions of such buildings that include other uses would have to fully comply with the elevation and other flood resistant requirements of IBC Section 1612, Flood Loads, which references ASCE 24, Flood Resistant Design and Construction.

In recognition that most public use restrooms are built on public land using public funds, the proposal is to limit the potential financial losses associated with flooded public facilities in two ways: by limiting the footprint to not more than 1,500 square feet and by specifying design requirements that minimize or eliminate physical damage when flooding occurs. Enabling public use restrooms to be designed to withstand the hydrodynamic and hydrostatic loads below the base flood elevation is an appropriate alternative to the extremely high cost for design, construction and maintenance of highly elevated public restrooms and their required access ramps or elevators.

Although the proposed design requirements are intended to preclude significant damage during flood conditions up to and including conditions of the design flood (e.g., the base or 100-year flood), more severe floods can and do occur. Figure 5 (below) illustrates one modest design option that demonstrates the feasibility of the proposal. It shows a small masonry restroom on a beach after Hurricane Irma pushed onshore. The drawings for the building show below-grade piling support and it appears the masonry units were filled. Despite approximately 6-8 feet of flooding (including waves), there is no evidence of structural damage and the non-structural damage appears readily repairable.

The proposal includes requirements for flood resistance similar to those found in IBC Appendix G, Section G1001 for Utility and Miscellaneous Group U and similar to the requirements of ASCE 24-14 for Flood Design Class 1 (which is essentially equivalent to Structure/Risk Category I). Those requirements effectively are the same as the NFIP requirements in 44 Code of Federal Regulations Section 60.3(a)(3)(ii), (iii), and (iv). FEMA deems the flood provisions of the I-Codes, with reference to ASCE 24, to meet or exceed the requirements of the National Flood Insurance Program (NFIP).

The intent is to allow public use restrooms to be at-grade or above-grade but below the base flood (partially elevated), provided they meet the design requirements listed in 3112.2. The proponent acknowledges that, at present, FEMA guidance states that restroom buildings and comfort stations in coastal high hazard areas must be elevated and meet the same design and construction requirements as other buildings. This proposal is intended to meet the intent of all NFIP requirements, except elevation requirements, to minimize flood damage, while acknowledging the special needs and access required or appropriate for public use restrooms. The Florida Floodplain Management Association prepared a white paper on this subject: Policy and Design Options for Public Restrooms in Special Flood Hazard Areas (2014), www.FLfloods.org/ffmawhitepaper.

Figure 1. Florida, flood Zone V. Ramp wraps around entire building. Has composting toilets, battery and solar electric system, emergency plan requires pumping out tank and filling with clean water.

Figure 2. Coastal Mississippi, flood Zone V. This facility cost \$1.1 million.

Figure 3. Florida, Gulf Coast, flood Zone V. Ramp built after original elevator determined to be unsustainable due to significant maintenance problems.

Figure 4. Southwest Florida, flood Zone V. Extensive ramp wraps around three sides.

Figure 5. Florida, after Hurricane Irma, flood Zone V. No evidence of structural damage after estimated 5 ft stillwater plus waves. From upper left: facing beach, side, interior, rear.

Bibliography:

Policy and Design Options for Public Restrooms in Special Flood Hazard Areas, Florida Floodplain Management Associations, 2014. 55 pages. www.FLfloods.org/ffmawhitepaper

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal will lower the initial cost of construction and lower routine and long-term facility maintenance. The cost to construct as specified in this proposal to resist the effects of flood hazards and flood loads may be somewhat higher than a typical non-elevated restroom building that is not designed to resist flood loads and flood damage (not currently allowed). However, the cost for construction under the proposal will be less than the cost to elevate and provide and maintain elevators and extensive ramp systems (current method of compliance).

Internal ID: 1094

G150-18

IBC: 3112.4, 3112.5

Proponent: Mike Fischer, Kellen Company, representing The Plastic Glazing Coalition of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Building Code

3112.4 Glass and glazing. Glass and glazing used in *greenhouses* shall comply with Section 2405.

Revise as follows:

3112.5 Light-transmitting plastics. Light-transmitting ~~plastics shall be permitted in lieu of plain glass~~ plastic used as glazing in greenhouses ~~and~~ shall comply with Section 2405 and Section 2606.

Reason:

The current section 3112.5 for light transmitting plastics in greenhouses reads almost as an exception to Section 3112.4 for glass in greenhouses when in fact they contain separate provisions. This change clarifies that the glazing provisions in Section 2405 apply to light-transmitting plastics used as glazing, and maintains the reference to Section 2606.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is editorial and changes no technical provisions.

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new definition as follows:

INTERMODAL SHIPPING CONTAINER. A six-sided steel unit originally constructed as a general cargo container used for the transport of goods and materials.

Revise as follows:

3101.1 Scope. The provisions of this chapter shall govern special building construction including *membrane structures*, temporary structures, *pedestrian walkways* and tunnels, automatic vehicular gates, awnings and *canopies*, marquees, signs, towers, antennas, relocatable buildings, swimming pool enclosures and safety devices, ~~and solar energy systems.~~ ~~systems~~ and intermodal shipping containers.

Add new text as follows:

SECTION 3114 INTERMODAL SHIPPING CONTAINERS

3114.1 General. The provisions of Section 3114 and other applicable sections of this code, shall apply to intermodal shipping containers that are repurposed for use as buildings or structures or as a part of buildings or structures.

Exceptions:

1. Intermodal shipping containers previously approved as existing relocatable buildings complying with Chapter 14 of the International Existing Building Code.
2. Stationary storage battery arrays located in intermodal shipping containers complying with Chapter 12 of the International Fire Code.
3. Intermodal shipping containers that are listed as equipment complying with the standard for equipment, such as air chillers, engine generators, modular data centers, and other similar equipment.

3114.2 Construction Documents. The construction documents shall contain information to verify the dimensions and establish the physical properties of the steel components, and wood floor components, of the intermodal shipping container in addition to the information required by Sections 107 and 1603.

3114.3 Intermodal shipping container information. Intermodal shipping containers shall bear an existing data plate containing the following information as required by ISO 6346 and verified by an approved agency. A report of the verification process and findings shall be provided to the building owner.

1. Manufacturer's name or identification number
2. Date manufactured.
3. Safety approval number.
4. Identification number.
5. Maximum operating gross mass (kg) (Lbs)
6. Allowable stacking load for 1.8G (kg) (lbs)
7. Transverse racking test force (Newtons)
8. Valid maintenance examination date

Where approved by the building official, the markings and existing data plate are permitted to be removed from the intermodal shipping containers before they are repurposed for use as buildings or structures or as a part of buildings or structures.

3114.4 Protection against decay and termites. Wood structural floors of intermodal shipping containers shall be protected from decay and termites in accordance with the applicable provisions of Section 2304.12.1.1.

3114.5 Under-floor ventilation. The space between the bottom of the floor joists and the earth under any intermodal shipping container, except spaces occupied by basements and cellars, shall be provided with ventilation in accordance with Section 1202.4.

3114.6 Roof assemblies. Intermodal shipping container roof assemblies shall comply with the applicable requirements of Chapter 15.

Exception: Single-unit stand-alone intermodal shipping containers not attached to, or stacked vertically over, other intermodal shipping containers, buildings or structures.

3114.7 Joints and voids. Joints and voids that create concealed spaces between intermodal shipping containers, that are connected or stacked, at fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved fire-resistant joint system in accordance with Section 715.

3114.8 Structural. Intermodal shipping containers which conform to ISO 1496-1 that are repurposed for use as buildings or structures, or as a part of buildings or structures, shall be designed in accordance with Chapter 16 and this section.

3114.8.1 Foundations. Intermodal shipping containers repurposed for use as a permanent building or structure shall be supported on foundations or other supporting structures designed and constructed in accordance with Chapters 16 through 23 of this code.

3114.8.1.1 Anchorage. Intermodal shipping containers shall be anchored to foundations or other supporting structures as necessary to provide a continuous load path for all applicable design and environmental loads in accordance with Chapter 16.

3114.8.2 Welds. All new welds and connections shall be equal to or greater than the original connections.

3114.8.3 Structural design. The structural design for the intermodal shipping containers repurposed for use as a building or structure, or as part of a building or structure, shall comply with Section 3114.8.4 or 3114.8.5.

3114.8.4 Detailed design procedure. A structural analysis meeting the requirements of this section shall be provided to the building official to demonstrate the structural adequacy of the intermodal shipping containers.

Exception: Intermodal shipping containers designed in accordance with Section 3114.8.5.

3114.8.4.1 Material properties. Structural material properties for existing intermodal shipping container steel components shall be established by material testing where the steel grade and composition cannot be identified by the manufacturer's designation as to manufacture and mill test.

3114.8.4.2 Seismic design parameters. The appropriate detailing requirements of ASCE 7; response modification coefficient, R ; overstrength factor, Ω_0 ; deflection amplification factor, C_d ; and limits on structural height, h_n , for the corrugated shear wall is permitted to be developed in accordance with generally accepted procedures where approved by the building official in accordance with Section 104.11.

3114.8.4.3 Allowable shear value. The allowable shear values for the intermodal shipping container corrugated steel sheet panel side walls and end walls shall be demonstrated by testing and analysis accordance with Section 104.11. Where penetrations are made in the side walls or end walls designated as part of the lateral force-resisting system, the penetrations shall be substantiated by rational analysis.

3114.8.5 Simplified structural design of single-unit containers. Single-unit intermodal shipping containers conforming to the limitations of Section 3114.8.5.1 shall be permitted to be designed in accordance with the simplified structural design provisions of Section 3114.8.5.

3114.8.5.1 Limitations. Use of Section 3114.8.5 is subject to all the following limitations:

1. The intermodal shipping container shall be a single-unit, stand-alone unit supported on a foundation and shall not be in contact with or supporting any other shipping container or other structure.
2. The intermodal shipping container top and bottom rails, corner castings, and columns or any portion thereof shall not be notched, cut, or removed in any manner.

3. The intermodal shipping container shall be erected in a level and horizontal position with the floor located at the bottom.
4. The intermodal shipping container shall be located in Seismic Design Category A, B, C or D.

3114.8.5.2 Simplified structural design. Where permitted by Section 3114.8.5.1, single-unit, stand-alone intermodal shipping containers shall be designed using the following assumptions for the corrugated steel shear walls:

1. The appropriate detailing requirements contained in Chapters 16 through 23.
2. Response modification coefficient, $R=2$,
3. Overstrength factor, $\Omega_0=2.5$,
4. Deflection amplification factor, $C_d = 2$, and
5. Limits on structural height, $h_n = 9.5$ feet (2,900 mm).

3114.8.5.3 Allowable shear. The allowable shear for the corrugated steel side walls (longitudinal) and end walls (transverse) for wind design and for seismic design using the coefficients of Section 3114.8.5.2 shall be permitted to have the allowable shear values set forth in Table 3114.8.5.3 provided that all of the following conditions are met:

1. The total linear length of all openings in any individual side walls or end walls shall be limited to not more than 50% of the length of that side walls or end walls, as shown in Figure 3114.8.5.3(1).
2. Any full height wall length, or portion thereof, less than 4 feet (305 mm) long shall not be considered as a portion of the lateral force-resisting system, as shown in Figure 3114.8.5.3(2).
3. All side walls or end walls used as part of the lateral force-resisting system shall have an existing or new boundary element on all sides to form a continuous load path, or paths, with adequate strength and stiffness to transfer all forces from the point of application to the final point of resistance, as shown in Figure 3114.8.5.3(3).
4. Where openings are made in container walls, floors, or roofs for doors, windows and other openings:
 - 4.1 The openings shall be framed with steel elements that are designed in accordance with Chapter 16 and Chapter 22.
 - 4.2. The cross section and material grade of any new steel element shall be equal to or greater than the steel element removed.
5. A maximum of one penetration not greater than a 6-inch (152 mm) diameter hole for conduits, pipes, tubes or vents, or not greater than 16 square inches (10,322 sq mm) for electrical boxes, is permitted for each individual 8 foot length (2,438 mm) lateral force resisting wall. Penetrations located in walls that are not part of the wall lateral force resisting system shall not be limited in size or quantity. Existing intermodal shipping container vents shall not be considered a penetration, as shown in Figure 3114.8.5.3(4).
6. End wall door or doors designated as part of the lateral force-resisting system shall be welded closed.

ISO 668: 2013:

Series 1 Freight Containers - Classifications, dimensions and ratings

ISO 1496-1: 2013:

Series 1 Freight Containers - Specification and Testing - Part 1: General Cargo Containers for General Purposes

ISO 6346: 1995, with Amendment 3: 2012:

Freight Containers - Coding, Identification and marking

Reason:

This code change purpose is to introduce intermodal shipping containers into the International Building Code based on requests by code officials in the U.S. Prior to this proposal, several jurisdictions had created their own individual regulations or ordinances, or had administered additional requirements beyond the code (e.g. Section 104.11 "Alternative materials, design and methods of construction and equipment") so as to be comfortable to ensure a safe structure. This code change proposal is in response to those requests to develop a set of consistent code provisions which cover the minimum safety requirements, but which do not duplicate existing code provisions.

This proposal covers:

Creation of a new definition in order to separate the container from other I-code sections which refer to, but intentionally do not define, shipping containers,

Creating exceptions so to differentiate the intermodal shipping container from other code sections which could be interpreted as applying to intermodal shipping containers under other applications (e.g. temporary storage, relocatable buildings, energy storage facilities, and listed equipment),

Verification of containers construction, condition, and structural integrity to assist the structural engineer in the evaluation for building construction,

References to other sections concerning foundations, decay and termite control, crawlspace ventilation, roof assemblies, interior finishes, and joints/intersections.

Introduction of structural provisions unique to intermodal shipping containers and which do not duplicate the existing structural requirements, and

Addition of three ISO standards for reference.

Chapter 2 - New definition - A new definition has been created in order that these provisions can be adequately enforced and not confused the other multiple varieties of definitions of containers currently in the market.

Section 3114.1 - This represents the charging statement that outlines the requirements for containers, and list the appropriate exceptions with the I-codes in order to coordinate with other provisions that may appear similar in nature and where intermodal shipping containers could possibly be used in those other applications.

Section 3114.2 - Construction documents - These provision emphasize the material requirements as specified in this section.

Section 3114.3 - Verification - These provisions focus on the characteristics of the intermodal shipping container prior to it being repurposed. In this case the provisions require a straight forward inspection by an approved agency, and verification of the data plate which is normally found on intermodal shipping containers. There was an intent not to specify who the approved agency would be for two reasons; 1) so as to allow the code official or state law(s) to handle this aspect recognizing that in each jurisdiction their requirements may be different, and 2) to avoid dictating an international agreement onto jurisdictions that are currently employed by the shipping and container manufacturers worldwide today. In this case, the standards are regulated by the International Convention of Safe Containers (CSC) that have policies and procedures for inspecting containers worldwide. These procedures include policies for Approved

Continuous Examination Program (ACEP) at the time the container is used in production, and policies for third party inspection agencies. The list shown in this section is a extract from the ISO standard and serves as a reference of items to be verified in order to validate the type of container.

3114.4 through 3114.6 - While we have strived to focus on only those provisions that recognize the unique aspects of intermodal shipping containers, we felt that some direction references were appropriate. In this case specific pointers are provided to foundations, decay and termite control, crawlspace ventilation, and roof requirements addressing drainage and weather protection.

3114.7 - Joints and voids - This provision is provided to address the interstitial spaces that may be created when multiple intermodal shipping containers are connected or stacked, whereby that concealed space between the containers is protected to prevent fire and hot gasses from passing between containers.

Section 3114.8 - Structural - The structural provisions are divided into multiple categories, as follows: 1) the general characteristics for all containers; 2) engineered structural design; and 3) simplified method for single-unit stand-alone container.

3114.8.1 - Foundations or supports - Provisions have been included to outline the two options for securing the container; a foundation or the connection to another structure. This provision makes it clear that the load path anchorage is required for all containers and to ensure the designed performance provided by the remainder of the structural provisions.

3114.8.2 - Welds - An additional provision has been added to require that any new welds be designed and installed with welds of greater structural capabilities.

Section 3114.8.4 - Detailed structural analysis - The detailed analysis engineering approach represents the general engineering practice allowed for all other types of building constructions. For this section the engineer of record is allowed to practice as they normally would for any other building type. As may be noted much of this section requires submission through the alternative means and methods provisions in order to obtain a permit as information about intermodal shipping containers is not readily listed in the IBC provisions or referenced standards.

Section 3114.8.5 - Simplified analysis - The concept for the single container approach is to make the design and construction process simpler. The provisions include a strict listing of limitations for use of these provisions. The proposal also provides structural design information, and pre-established shear wall information that is contained in the ISO 1496-1 standard, which is used to design and construct intermodal shipping containers. The shear wall values were obtained from the ISO 1496-1 standard through engineering analysis using a factor of safety of 5. In addition, a provision was installed to limit the number and size of openings and service holes within the container, as well as to prevent building owners or designers from embellishing the size to something most engineers would define as an opening. This method is intended to address the simple structure approach and provide available information for use by the structural engineer to supplement their work.

Chapter 35 - Referenced Standards - Included with this proposal are three ISO standards which are relevant to the intermodal shipping container's construction. These standards are part of the industry standards regulated by the International Convention of Safe Containers (CSC) that have policies and procedures for inspecting containers worldwide.

BCAC - The International Code Council's Building Code Action Committee (BCAC) was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

The ICC Building Code Action Committee created a task group to facilitate the development of this proposal. Members of the assigned task group included representatives from: City of Long Beach, CA; County of Mecklenburg, NC; Modular Building Institute; American Iron and Steel Institute; Underwriters Laboratories; and the Portland Cement Association. Additional contacts included the State of California (Division of State Architect, Housing and Community Development), City of San Diego; City of Los Angeles, CA; City of Seattle; Clark County, NV; Falcon Structures, RADCO a Twining Company, SEABOX Company, FEMA ATC Seismic Code Support Committee, and other guests who provided their individual expertise.

Cost Impact

The code change proposal will decrease the cost of construction .

The code change proposal will decrease the cost of construction. This new code section will provide clarity on how to consistently design with, permit, and field inspect shipping containers that are repurposed for building construction. Current use of repurposed intermodal shipping containers requires the building owner or designee to submit through

the alternative means and methods administrative provisions.

Analysis: A review of the standards proposed for inclusion in the code, ISO 668, ISO 1496-1 and ISO 6346, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1586

G152-18

IBC: D102.2.5

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Building Code

Revise as follows:

D102.2.5 Structural fire rating. Walls, floors, roofs and their supporting structural members shall be not less than 1-hour fire-resistance-rated construction.

Exceptions:

1. Buildings of Type IV-HT construction.
2. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
3. Automobile parking structures.
4. Buildings surrounded on all sides by a permanently open space of not less than 30 feet (9144 mm).
5. Partitions complying with Section 603.1, Item 11.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

This code change proposal will result in consistency with the purpose and scope which was to leave intact the current Type IV heavy timber provisions. The HT category was created to differentiate the three (3) new categories of “mass timber”, where HT represents the long established heavy timber category that has been in the ICC family of codes, and the predecessor legacy codes for decades.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
3308.4 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit <http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, please visit <http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

IBC: SECTION H102, H102.1, 202, H105.2, H105.3, H105.4, H105.5, H109.2

Proponent: Richard Milne, representing self

2018 International Building Code

SECTION H102 DEFINITIONS

H102.1 General. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 of this code for general definitions.

Delete without substitution:

~~**COMBINATION SIGN.** A sign incorporating any combination of the features of pole, projecting and roof signs.~~

~~**DISPLAY SIGN.** The area made available by the sign structure for the purpose of displaying the advertising message.~~

Revise as follows:

~~**GROUND SIGN, MONUMENT OR ENCLOSED PYLON SIGN, also defined as a ground sign.** A billboard or similar type of sign that is supported by one or more uprights, poles or braces in or upon the ground other than a combination sign or pole sign, as defined by this code.~~ sign that is supported by an internal structure embedded in the ground, but has a full fascia covering or is created to rest entirely upon the ground. Definition to include all pre-fabricated EPS structures and similar prefabricated monument style signs. Ground signs are defined as a fully fabricated sign that extended to the ground. Ground signs can include EPS structures that rest upon the ground but are supported and anchored internally by embedded poles, or signs that are supported by an external structure that is clad or built to be an integral part of the sign design (a rock pillar on either side supporting the sign structure in between, so long as the sign structure touches the ground, as an example). Ground signs shall not exceed 10 feet in overall height. Internal or external supports shall be embedded into the ground to required local code depth.

~~**POLE SIGN-SIGN (Freestanding sign)** A sign wholly supported by a sign structure in the ground. Pole signs shall have visible supports to the main message area. Pole signs shall be no less than 36" from grade to bottom of sign or as local code dictates within sight triangles.~~

~~**ROOF SIGN.** A sign erected on or above a roof or parapet of a building or structure. Roof sign structures are to be supported entirely by an approved structure fastened to the roof deck or surrounding parapet.~~

H105.2 Permits, drawings and specifications. Where a permit is required, as provided in Chapter 1, construction documents shall be required. These documents shall show the dimensions, material and required details of construction, including loads, stresses and anchors.
All signs are required to be permitted where required.

Ground signs 32 square feet and under are not required to provide engineer drawings for load and stresses.

Pole signs 32 square feet and under and less than 12 feet to the top of the sign are not required to provide engineer drawings for load and stresses.

H105.3 Wind load. Signs shall be designed and constructed to withstand wind pressure as provided for in Chapter ~~16.16.~~

Ground signs 32 square feet and under and fully supported by an internal structure and resting on the ground are exempt from this section.

Pole signs 32 square feet and under and 12 feet or less to the top of the sign are exempt from this section.

Delete without substitution:

~~**H105.4 Seismic load.** Signs designed to withstand wind pressures shall be considered capable of withstanding earthquake loads, except as provided for in Chapter 16.16.~~

Revise as follows:

H105.5 Working stresses. In outdoor advertising display signs (billboards, freestanding signs or projecting signs over 32 square feet and above 20 feet from grade), the allowable working stresses shall conform to the requirements

of Chapter ~~16-16~~. The working stresses of wire rope and its fastenings shall not exceed 25 percent of the ultimate strength of the rope or fasteners.

Exceptions:

1. The allowable working stresses for steel and wood shall be in accordance with the provisions of Chapters 22 and ~~23-23~~.
2. The working strength of chains, cables, guys or steel rods shall not exceed one-fifth of the ultimate strength of such chains, cables, guys or steel.

H109.2 Required clearance. The bottom coping of every ~~ground~~ freestanding sign shall be not less than 3 feet (914 mm) above the ground or street level, ~~which space can be filled with platform decorative trim or light wooden construction or as defined by local codes within a working sight triangle.~~

Reason:

Inaccurate or overlapping definitions.

Pylon,
Freestanding,
Pole

Ground,
Monument

Cost Impact

The code change proposal will decrease the cost of construction .

For small sign shops (5 employees and under or under \$100K gross annual revenue) the current codes as defined require substantial investments with outside engineering firms for engineered drawings for signage that should not

require such drawings. As the current code stands, for example, I would need an engineered drawing for wind load, stresses and concrete psi ratings for something as small as 4 square feet on a single pole 6 feet from grade.

2018 International Building Code

Add new text as follows:

APPENDIX P MATERIAL EMISSIONS

SECTION P101 GENERAL

P101.1 Scope. Site applied or installed adhesives and sealants, architectural coatings, floor, ceiling and wall assemblies and systems and insulation that are located on the interior side of the building envelope shall comply with Sections P102 through P107. Emission testing shall be performed by an ISO/IEC 17025 accredited laboratory that has the CDPH/EHLB/Standard Method v1.2, USEPA Method TO-17 and ASTM Standard Method D5197 within the scope of its accreditation. Approved agencies that are deeming products compliant with the product emission requirements shall be accredited to ISO/IEC 17065 and have the relevant certification program in the scope of their accreditation.

SECTION P102 DEFINITIONS

P102.1 General. The following words and terms shall, for the purposes of this appendix, have the following meanings shown herein.

VOLATILE ORGANIC COMPOUND (VOC). A chemical compound based on carbon chains or rings that typically contain hydrogen and sometimes contain oxygen, nitrogen and other elements, and that has a boiling point in the range from (50°C to 100°C) to (240°C to 260°C).

SECTION P103 ADHESIVES AND SEALANTS

P103.1 General. Not less than 85 percent by weight or volume, of site-applied adhesives and sealants shall comply with the VOC content limits specified in Table P103.1(1) or the VOC emissions limits specified in Table P103.1(2). The VOC content adhesives, sealants and sealant primers shall be determined and limited in accordance with SCAQMD Rule 1168. HVAC duct sealants shall be classified as "Other" category within the SCAQMD Rule 1168 sealants table. The provisions of this section shall not apply to adhesives and sealants subject to state or federal consumer product VOC regulations. HVAC duct sealants shall be classified as "Other" category within the SCAQMD Rule 1168 sealants table.

Compliance with Table P103.1(2) shall be determined utilizing test methodology incorporated by reference in the CDPH/EHLB/Standard Method v1.2 and shall comply with the limit requirements for either office or classroom spaces, regardless of the space type.

Exceptions: The following solvent welding and sealant products are not required to comply with the emissions or the VOC content requirements of this section

1. Cleaners, solvent cements and primers used with plastic piping and conduit in plumbing, fire suppression and electrical systems.
2. HVAC air duct sealants where the air temperature of the space in which they are applied is less than 40°F (4.5°C).

TABLE P103.1(1)
SITE APPLIED ADHESIVE AND SEALANT VOC LIMITS ^{a, b}

Adhesive	VOC Limit g/l
Indoor carpet adhesives	50
Carpet Pad adhesives	50
Outdoor carpet adhesives	150
Wood flooring adhesive	100
Rubber floor adhesive	60
Subfloor adhesives	50
Ceramic tile adhesives	65
VCT and asphalt tile adhesives	50
Dry wall and panel adhesives	50
cove base adhesives	50
Multipurpose construction adhesives	70
Structural glazing adhesives	100
Single ply roof membrane adhesives	250
Architectural sealants	250
Architectural Sealant Primer	
Non-porous	250
Porous	775
Modified bituminous sealant primer	500
Other sealant primers	750
CPVC solvent cement	490
PVC solvent cement	510
ABS solvent cement	325
Plastic cement welding	250
Adhesive primer for plastic	550
Contact Adhesive	80

<u>Special Purpose Contact Adhesive</u>	<u>250</u>
<u>Structural wood member adhesive</u>	<u>140</u>

a. VOC limit less water and less exempt compounds in grams/liter (g/l)

b. For low-solid adhesives and sealants, the VOC limit is expressed in grams/liter of material as specified in SCAQMD Rule 1168. For all other adhesives and sealants, the VOC limits are expressed as grams of VOC per liter of adhesive or sealant less water and less exempt compounds as specified in Rule 1168.

TABLE P103.1(2)
VOC EMISSION LIMITS

VOC	LIMIT
Individual VOC's	<1/2 CA chronic REL ^a
Formaldehyde	< 9 µg/m ³ or < 7 ppb

a. CDPH/EHLB/Standard Method v1.2 Chronic Reference Exposure Level (CREL).

SECTION P104 ARCHITECTURAL COATINGS

P104.1 General. Not less than 85 percent of the weight or volume of site-applied architectural coatings specified in this section shall comply with either VOC content limits established in Table P104.1(1) or the VOC emissions limits in Table P103.1(2)

1. Anticorrosive coatings.
2. Basement specialty coatings.
3. Concrete/masonry sealers.
4. Concrete curing compounds.
5. Dry fog coatings.
6. Faux finish coatings.
7. Fire-resistive coatings.
8. Flat and non-flat topcoats.
9. Floor coatings.
10. Graphic arts (sign) coatings.
11. High-temperature coatings.
12. Industrial maintenance coatings.
13. Low solids coatings
14. Mastic texture coatings
15. Metallic pigmented coatings.
16. Multicolor coatings.
17. Pretreatment wash primers.
18. Primers
19. Reactive penetrating sealers.
20. Recycled coatings.
21. Shellacs, clear and opaque.
22. Specialty primers.
23. Stains
24. Stone consolidants.
25. Swimming pool coatings.
26. Tub- and tile-refining coatings.
27. Under coaters.
28. Waterproofing membranes.
29. Wood coatings including clear wood finishes.
30. Wood preservatives.
31. Zinc primers.

Compliance with Table P103.1(2) shall be determined utilizing test methodology incorporated by reference in the CDPH/EHLB/Standard Method v1.2 and shall comply with the limit requirements for either office or classroom spaces of the space type.

TABLE P104.1(1)
VOC CONTENT LIMITS FOR ARCHITECTURAL COATINGS ^{a,b}

Coating Category	Limit ^c g/l
Flat coatings	50
Non-flat coatings	100-
Non-flat high gloss coatings	250
Aluminum roof coatings	400
Basement specialty coatings	400
Bituminous roof coatings	50
Bituminous roof primers	350
Bond breakers	350
Concrete curing compounds	350
Concrete/masonry sealers	100
Driveway sealers	50
Dry fog coatings	150
Faux finishing coatings	350
Fire resistive coatings	350
Floor coatings	100
Form-release compounds	250
Graphic arts (sign) coatings	500
High temperature coatings	420
Industrial maintenance coatings	250
Low solids coatings	120 ^d
Magnesite cement coatings	450
Mastic texture coatings	100
Metallic pigmented coatings	500
Multi-color coatings	250
Pre-treatment wash primers	420
Primers, sealers and undercoaters	100
Reactive penetrating sealers	350
Recycled coatings	250
Roof coatings	50
Rust Preventative Coatings	250
Shellacs, clear	730
Shellacs, opaque	550
Specialty primers and sealers	100
Stains	250
Stone Consolidants	450
Swimming pool coatings	340
Traffic marking coatings	100
Tub and tile refinish coatings	420
Waterproof membranes	250
Wood coatings	275
Wood preservatives	350
Zinc-rich primers	340

- a. The specified limits remain in effect unless revised limits are provided in subsequent columns of the table.
- b. Table P104.1(1) architectural coating regulatory category and VOC content compliance determination shall conform to the California Air Resources Board Suggested Control Measure for Architectural Coatings.
- c. Limits are expressed as VOC Regulatory (except as noted) thinned to the manufacturer's maximum thinning recommendation, excluding any colorant added to tint bases.
- d. Limit is expressed as VOC actual.

SECTION P105 FLOORING

P105.1 General. A minimum of 85 percent of the total area of flooring installed within the interior of the building shall comply with the VOC limits in Table P103.1(2). Where flooring with more than one distinct product layer is installed, the emissions from each layer shall comply with these requirements. Compliance with Table P103.1(2) shall be determined utilizing test methodology incorporated by reference in the CDPH/EHLB/Standard Method v1.2 and shall comply with the limit requirements for either office or classroom spaces regardless of the space type.

P105.1.1 Deemed to comply. Floor covering materials that are composed of the following materials shall be deemed to comply with the VOC emission limits in Table P103.1(2). Where these products include integral organic-based surface coatings, binders or sealants or are installed using adhesives, sealants, paints or coatings, those products shall be subject to other requirements of this appendix.

1. Ceramic and concrete tile.
2. Natural stone.
3. Gypsum plaster.
4. Concrete masonry.
5. Clay masonry.
6. Metal.

SECTION P106 CEILING AND WALL ASSEMBLIES AND SYSTEMS

P106.1 General. A minimum of 85 percent of the total area of ceiling and wall assemblies and systems installed shall comply with VOC limits in Table P103.1(2). Where assemblies and systems have more than one distinct product layer are installed, the emissions from each layer shall comply with these requirements. Compliance with Table P103.1(2) shall be determined utilizing test methodology incorporated by reference in the CDPH/EHLB/Standard Method v1.2 and shall comply with the limit requirements for either office or classroom spaces regardless of the space type.

P106.1.1 Deemed to comply. Ceiling and wall assembly and system materials that are composed of the following materials shall be deemed to comply with the VOC limits in Table P103.1(2). Where these products include integral organic-based surface coatings, binders or sealants or are installed using adhesives, sealants, paints or coatings, those products shall be subject to other requirements of this appendix.

1. Ceramic and concrete tile.
2. Natural stone.
3. Gypsum plaster.
4. Concrete masonry.
5. Clay masonry.
6. Metal.

SECTION P107 INSULATION

P107.1 General. Not less than 85 percent of insulation, by square feet, installed shall comply with the VOC limits in Table P103.1(2). Compliance with Table P103.1(2) shall be determined utilizing test methodology incorporated by reference in the CDPH/EHLB/Standard Method v1.2 and shall comply with the limit requirements for either office or classroom spaces regardless of the space type.

CDPH California Department of Public Health, 850 Marina Bay Parkway, Richmond, CA 94804
CDPH California Department of Public Health, 850 Marina Bay Parkway, Richmond, CA 94804

CDPH/EHLB/Standard Method v1.2' Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers Version 1.2"; January 2017, California Department of Public Health.

Reason:

In the last couple of decades our building codes have pushed for tighter building envelopes, more efficient and mechanical ventilation, with the goal of conserving energy and preserving water tightness. But this changes the indoor environment to a potentially adverse environment for occupants. Good indoor air quality (IAQ) is predicated on three factors, correct ventilation, correct filtration, and source control. As our codes have evolved we've done well to focus on the first two (correct ventilation and filtration), but have not sufficiently addressed source control. Various materials we regularly use in the construction and fit out of our buildings have emissions of volatile organic compounds (VOC). Limiting the emissions to an acceptable level has been established as the method for source control.

The material emission requirements detailed in this proposal are based on commonly found VOC in our indoor environment that can come off of products. The California Office of Environmental Health Hazard Assessment (CA OEHHA) and California Department of Public Health (CDPH) developed the list of 35 individual VOC that are in each requirement. Numerous studies from around the globe show that exposure to high levels of some of the commonly found VOC detailed in these requirements can cause not only severe discomfort, but headaches, nose bleeds, increased asthma attacks, the onset of asthma, and potential long-term health effects. Some of these studies even show that continued exposure to some of these VOC can lead to an increase in C-reactive protein levels in human subjects, which is the body's response to inflammation.

Section 101.3 of the IBC, states, "The purpose of this code is to establish the minimum requirements to provide a reasonable level of safety, public health and general welfare...". With the potential issues indoor occupants can receive due to poor indoor air quality, the intent of the IBC implores us to put source control in to protect public health and general welfare. Chapter 12 of the IBC governs the Interior Environment and has provisions for ventilation and

surrounding materials associated with the interior spaces of buildings.

Many different stakeholder groups, including but not limited to, researchers, health officials, manufacturers, laboratories, and governmental representatives, have been involved in the development of the referenced test methods, many of the studies, and in the codification of these requirements previously. North American and many global manufacturers have embraced the lowering of emissions in the name of source control and there are thousands of product that have proven to satisfy the proposed criteria in this section, at competitive prices, which ensures there is enough supply to satisfy the demand. With these thousands of products available the cost of development and purchase has steadily come down to levels that are on par with other products. Code officials, designers, installers, and building owners have many free resources to find compliant products and manufacturers even have ways to prove compliance to these requirements on their own.

Builders will be able to show compliance in much the same way as they show compliance to many other fire, electrical, and other safety requirements in the codes. As with those other requirements, there are numerous laboratories around the globe that meet the qualifications to perform the tests required in this proposal. Numerous ISO 17065 accredited third-parties around the globe also supply certifications that prove compliance to these requirements as well, so code officials have approved agencies that they already use and trust to help them prove compliance to these parameters.

These requirements have been in the International Green Construction Code (IgCC) and ASHRAE 189.1 since their inception and hundreds of authorities having jurisdictions already have these requirements in place, from large cities such as Washington DC, Dallas, TX, or Baltimore, MD to smaller jurisdictions such as Merced, CA, Scottsdale, AZ, Carbondale, CO, North Bend, WA, and Boynton Beach, FL. Products are available throughout the nation and builders are aware of how to find these products and show compliance to these requirements. As these types of requirements have been in green building codes and ratings systems for over a decade most North American manufacturers have many if not all of their products compliant with the requirements detailed above.

The 85% level detailed in the requirements was originally put in to the other code documents in recognition of the nature of construction. Some of the products in the requirements are products that are common from project to project and sometimes construction teams will utilize a little of the left over product from previous projects to complete a new project. While this is not ideal for the potential emissions emitted into the indoor environment, the overall impact of having to rip out all of the potentially impacted products for the small potential amount of emissions from the up to 15% of non-compliance products.

Some of the products detailed below are deemed not to need permits in the IBC and therefore may not be seen by the code official, but IBC 105.2 states, "Exemptions from permit requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this jurisdiction." If there is a potential issue for indoor occupants the code should still cover it even if an AHJ decides that it doesn't want to require documentation to detail compliance as the Intent detailed in Section 101.3 of the IBC brings us back to ensure health and general welfare. Including these minimum material emission restrictions in the IBC will ensure that all building occupants, not just those fortunate enough to be in a 'sustainable' building will be protected from harmful chemicals and pollutants.

The proposal adds new reference standard to Chapter 35 which have been previously referenced in the International Green Construction Code and they have been proven to be appropriate and acceptable for making the evaluations of VOC content and emissions that are detailed in the proposal.

In closing, the reasons for these requirements are:

As our building and energy codes require tighter and tighter buildings with less and less air changes, we need to ensure that all three pillars of good indoor air quality are addressed in codes.

Almost all North American manufacturers have products that already show compliance to these requirements, but some of our most recent issues have come with some products brought in from overseas.

Providing a reasonable level of safety, public health and general welfare is the stated purpose of this code. With the availability of products, ease of compliance review, and potential improvements in the indoor environment, these requirements fit the purpose of the IBC without extraordinary burden to any of the levels of building.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). The proposal was brought to the BCAC by the ICC Sustainability, Energy, High Performance Code Action Committee (SEHPCAC). Both CACs were established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC and SEHPCAC have each held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

California Air Resources Board Suggested Control Measure for Architectural Coatings, February 1, 2008
(https://www.arb.ca.gov/coatings/arch/Approved_2007_SCM.pdf)

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No impact should happen as these requirements have been in building codes and rating systems for over a decade. Due to this most manufacturers have products that meet these requirements already. In fact numerous manufacturers don't make a product that doesn't meet these requirements.

Analysis: A review of the new standards proposed for inclusion in the code, ISO/IEC 17065-12 and USEPA Method TO-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

The other standards referenced in the changes by this proposal, ISO/IEC 17025, CDPH/EHLB Standard Method v1.2, ASTM D5197, SCAQMD Rule 1168 and CEPA Suggested Control Measures for Architectural Coatings, are currently referenced in other I-Codes.

Internal ID: 1062

IBC Structural Code Change Proposals

The following code change proposals are labeled as structural code change proposals because they are proposals for changes to sections in chapters of the International Building Code that are designated as the responsibility of the IBC-Structural Code Development Committee (see page ix of the Introductory pages of this monograph), which meets in the Group B cycle in 2019. However the changes included in this Group A code development cycle are to sections of the code that have been prefaced with a [BF] or [BG], meaning that they are the responsibility of a different IBC Code Development Committee—either the IBC-Fire Safety Committee [BF] or the IBC-General Committee [BG].

The committee assigned for each code change proposal is indicated in a banner statement near the beginning of the proposal. Both the IBC-Fire Safety and the IBC-General hearing orders are include here for your reference.

2018 GROUP A – PROPOSED CHANGES TO THE INTERNATIONAL BUILDING CODE – FIRE SAFETY

FIRE SAFETY CODE COMMITTEE

Kenneth E. Bush, Chair

Rep: National Association of State Fire Marshals
Chief Fire Protection Engineer
Maryland State Fire Marshal's Office
Easton, MD

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL PROPERTY MAINTENANCE CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some FS code change proposals may not be included on this list, as they are being heard by another committee.

S1-18

IBC: [P]1502.1, [P]1502.2

Proponent: Jason Wilen AIA CDT RRO, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS PROPOSAL WILL BE HEARD BY THE INTERNATIONAL PLUMBING CODE COMMITTEE. SEE THE IPC-IPSDC HEARING AGENDA.

2018 International Building Code

Revise as follows:

[P] 1502.1 General. Design and installation of roof drainage systems shall comply with this Section and Section 1611 of this code ~~and Sections 1106 and 1108, as applicable, and Chapter 11~~ of the International Plumbing Code.

[P] 1502.2 Secondary (emergency overflow) drains or scuppers. Where roof drains are required, secondary (emergency overflow) roof drains or scuppers shall be provided where the roof perimeter construction extends above the roof in such a manner that water will be entrapped if the primary drains allow buildup for any reason. The installation and sizing of secondary emergency overflow drains, leaders and conductors shall comply with ~~Sections 1106 and 1108, as applicable, Section 1611 of this code and Chapter 11~~ of the International Plumbing Code.

Reason:

The proposed change provides a pointer to IBC Section 1611—Rain Loads. This pointer makes sure a designer considers the structural-related requirements for roof drainage system design that are currently in the structural section of the code. Additionally, we proposed to modify the references to sections in the International Plumbing Code. Currently, only Section 1106—Size of Conductors, Leaders and Storms Drains and Section 1108—Secondary (Emergency) Roof Drains are referenced where other sections in Chapter 11 may be relevant for a particular project. This problem is remedied by referencing IPC Chapter 11 as opposed to specific subsections.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change does not increase the stringency of the code.

Internal ID: 1215

S2-18

IBC: 1505.2

Proponent: Jason Wilen AIA CDT RRO, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

[BF] 1505.2 Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be *listed* and identified as Class A by an *approved* testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry or an exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a roof deck on noncombustible framing.
3. Class A roof assemblies include minimum 16 ounce per square foot (0.0416 kg/m²) copper sheets installed over combustible decks.
4. Class A roof assemblies include slate installed over ASTM ~~D226~~-D4869, Type ~~II~~ underlayment over combustible decks.

Reason:

Currently a ASTM D226, Type II underlayment is listed as an underlayment for slate as part of exception 4 but its use as an underlayment is not included in the scope of ASTM D226. An identical underlayment for slate roofing listed in Table 1507.1.1(1) underlayment Types is ASTM D4869, Type IV. ASTM D4869's scope includes the use of the material as an underlayment, so we propose changing the reference in exception 4 to ASTM D4869, Type IV as referenced in Table 1507.1.1(1). It is our intent to submit a code change in Group B to remove the reference to ASTM D226, Type II from Table 1507.1.1(1).

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Adding an equivalent option for an underlayment already listed in the code does not change the stringency of the existing exception.

Staff Analysis: The referenced standard in this proposal, ASTM D4869, is currently referenced in the I-Codes.

Internal ID: 1197

S3-18

IBC: 1505.8, 1505.9

Proponent: Joseph Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (JoeCainPE@gmail.com)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1505.8 Building-integrated photovoltaic (BIPV) products. *Building-integrated photovoltaic-BIPV products* installed as the roof covering shall be tested, *listed* and *labeled* for fire classification in accordance with Section 1505.1.

[BF] 1505.9 Rooftop-mounted photovoltaic (PV) panel systems. Rooftop ~~rack-mounted~~ *photovoltaic (PV) panel systems* shall be tested, *listed* and identified with a fire classification in accordance with UL 1703 and UL 2703. The fire classification shall comply with Table 1505.1 based on the type of construction of the building.

Reason:

This proposal includes editorial changes only, and does not change technical requirements.

The definition of Building-Integrated Photovoltaic (BIPV) Products in Chapter 2 already includes the shortened acronym BIPV. As BIPV products become more popular, the code can be made easier to read by moving toward use of the abbreviation/acronym "BIPV" instead of the 11-syllable long term. By using the full term and abbreviation/acronym in the title of Section 1505.8 (as in the Chapter 2 definition), the reader will understand the meaning of BIPV.

Similarly, the abbreviation "PV" entered the 2018 IFC in Section 1204.1. Even though the abbreviation "PV" is not yet included in IBC Chapter 2 definitions, language can be clear if both "photovoltaic" and "PV" terms are used. The definitions themselves cannot be revised until Group B, as they are preceded by [BS]. This usage will set up the code for a transition to greater use of the abbreviation.

In Section 1505.9, the language "Rooftop rack-mounted" is revised to "Rooftop-mounted" because there are an increasing number of rooftop mounted systems that are "rail-less" or "rail-free." These systems use the module frame as the bending member, and do not appear to be installed on a "rack." This proposed language improves Section 1505.9 by using language consistent with other sections of these codes, and consistent with a growing number of mounting systems in the marketplace.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal includes editorial changes only, and does not change technical requirements.

Internal ID: 1996

S4-18

IBC: 1505.9

Proponent: Jason Wilen AIA CDT RRO, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1505.9 Rooftop mounted photovoltaic panel systems. Rooftop rack-mounted *photovoltaic panel systems* shall be tested, *listed* and identified with a fire classification in accordance with UL 1703 and UL 2703. Listed systems shall include roof-mounting hardware. The fire classification shall comply with Table 1505.1 based on the type of construction of the building.

Reason:

The purpose of this change is to remedy a potential unintended consequence of adopted reference standards. It is important that roof mounting hardware be part of tested rooftop mounted photovoltaic panel system listings required by IBC Section 1505.9. If such hardware is not included in listings such hardware would be unregulated and mounting methods such as pieces of untreated lumber could potentially be used with unknown impacts on fire-related performance. There is lack of consensus within the roofing industry regarding systems listed according to UL 2703, "Standard for Mounting Systems, Mounting Devices, Clamping/Retention Devices, and Ground Lugs for Use with Flat-Plate Photovoltaic Modules and Panels." UL 2703 is not clear regarding the inclusion of roof-mounting hardware. NRCA has requested and UL has established a work group to issue an official interpretation, but the issue date of the interpretation is open-ended. It seems prudent to add a clarifying statement to code text as we believe it makes clear the intent of the code section.

Cost Impact

The code change proposal will increase the cost of construction .

The magnitude of cost impact cannot be determined until UL issues their interpretation. It is possible some systems may need to be retested with roof-mounting hardware and that some hardware may need to be improved to obtain desired test results.

Internal ID: 1218

S5-18

IBC: 1505.10

Proponent: Jason Wilen AIA CDT RRO, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1505.10 Roof gardens and landscaped roofs. Roof gardens and landscaped roofs shall ~~comply be~~ classified in accordance with Section 1505.1 and comply with Section 1507.16 and shall be installed in accordance with ANSI/SPRI VF-1, Section 317 of the International Fire Code.

Reason:

The purpose of this change is to simplify and to better cross-reference related I-Code sections. IFC Section 317—Rooftop Gardens and Landscaped Roofs references IBC Sections 1505.1 and 1507.16 as does IBC Section 1505.10 where the change is being proposed. The reference to IFC Section 317 makes users aware of related I-Code provisions already on the books. Deleting the reference to ANSI/SPRI VF-1 makes sense because IFC Section 317 contains provisions with the same scope as ANSI/SPRI VF-1, therefore VF-1 is not needed. Additionally, VF-1 is problematic because the portion of the documents subject to a consensus process (2 pages of text) contains multiple references to a 4-page commentary that is not subject to public review.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change does not increase the stringency of the code.

Internal ID: 1221

S6-18

IBC: 1507.3.10 (New), 1507.3.10.1 (New), 1507.3.10.2 (New), 1507.3.10.3 (New), 1507.3.10.4 (New)

Proponent: Amanda Hickman, The Hickman Group, representing RIMA International (amanda@thehickmangroup.com)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Delete without substitution:

~~SECTION 1509 RADIANT BARRIERS INSTALLED ABOVE DECK~~

~~**[BF] 1509.1 General.** A *radiant barrier* installed above a deck shall comply with Sections 1509.2 through 1509.4.~~

~~**[BF] 1509.2 Fire testing.** *Radiant barriers* shall be permitted for use above decks where the *radiant barrier* is covered with an *approved* roof covering and the system consisting of the *radiant barrier* and the roof covering complies with the requirements of either FM 4450 or UL 1256.~~

~~**[BF] 1509.3 Installation.** The low emittance surface of the *radiant barrier* shall face the continuous airspace between the *radiant barrier* and the roof covering.~~

~~**[BF] 1509.4 Material standards.** A *radiant barrier* installed above a deck shall comply with ASTM C1313/1313M.~~

Add new text as follows:

1507.3.10 Radiant barrier. Where a radiant barrier is installed above a roof deck under clay or concrete tile, it shall comply with Sections 1507.3.10.1 through 1507.3.10.4

1507.3.10.1 Installation. Radiant barriers shall only be installed between a batten and a counter batten. A low-emittance surface of the radiant barrier shall face the airspace between the radiant barrier and roof deck.

1507.3.10.2 Material fire testing. The radiant barrier material shall have a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723, with test specimen preparation and mounting in accordance with ASTM E2599.

1507.3.10.3 Assembly fire testing. The roof assembly, including the radiant barrier, shall comply with the requirements of a Class A, B, or C roof assembly when classified as required by Section 1505.1.

1507.3.10.4 Material standards. Radiant barrier materials shall comply with ASTM C1313/C1313M.

Reason:

This proposal is submitted as a compromise between RIMA International and National Roofing Contractors Association (NRCA). NRCA approached RIMA with an interest to move section 1509 to 1507. The current language in 1509 is adequate; however, in the spirit of consensus, and because radiant barriers are often used in conjunction with concrete or clay tile, the proposed move of the radiant barrier language from 1509 to a new section in section 1507 Clay and Concrete Tile was developed.

The proposed new section 1507.3.10.2 was drafted based on the requirements in Chapter 14 for water resistive barriers: testing the radiant barrier (on its own) to both ASTM E1354 and ASTM E84 test standards. ASTM E2599 test standard is recommended as the test specimen preparation and mounting method since it is specific to radiant barriers (and some other materials); ASTM E2404 is applicable to water resistive barriers.

A fire classification is required for all roof assemblies per Section 1505. Adding the proposed Section 1507.3.10.3 requires assembly testing of the entire roof covering system. Therefore, the addition of the radiant barrier to any roof assembly will result in a fire classification for the roof assembly as required by Section 1505, just like all other roof assemblies.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This will neither increase or decrease construction costs as radiant barriers are not mandatory, the proposal only moves 1509 language to 1507; and the revisions are minor.

Staff Analysis: The referenced standards within this proposal are currently referenced in the I-Codes.

S7-18

IBC: [BF] 1508.1

Proponent: Bill McHugh, The McHugh Company, representing Chicago Roofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1508.1 General. The use of above-deck thermal insulation shall be permitted provided that such insulation is covered with an approved roof covering and passes the tests of NFPA 276 or UL 1256 when tested as an assembly.

Exceptions:

1. Foam plastic roof insulation shall conform to the material and installation requirements of Chapter 26 and separated by an assembly having a minimum 30 minute fire-resistance rating.
2. Where a concrete roof deck is used and the above-deck thermal insulation is covered with an approved roof covering.

Reason:

The purpose of this proposal is to add safety for when foam plastic insulation is allowed to be used on roof assemblies. Foam plastic insulation is a great product but needs additional protection from fire, especially in roofing configurations. It seems in Chapter 26 that there is an exception that allows foam plastic insulation to be direct applied to wood sheathing but not metal decking. Regardless of roof deck type, it is important to protect the building with a 30 minute fire-resistance rated assembly as a thermal barrier.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction by about \$1.00 - \$1.25US per square foot of roofing area.

Internal ID: 1723

S8-18

IBC: [BF] 1508.1

Proponent: Bill McHugh, The McHugh Company, representing Chicago Roofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

[BF] 1508.1 General. The use of above-deck thermal insulation shall be permitted provided that such insulation is covered with an approved roof covering and passes the tests of NFPA 276 or UL 1256 when tested as an assembly.

Exceptions:

1. Foam plastic roof insulation shall conform to the material and installation requirements of Chapter 26 and be separated from the interior of the building by 1/2-inch gypsum board.
2. Where a concrete roof deck is used and the above-deck thermal insulation is covered with an approved roof covering.

Reason:

The purpose of this proposal is to add safety for when foam plastic roof insulation is allowed to be used on roof assemblies. Foam plastic insulation is a great product but needs additional protection from fire, especially in roofing configurations. It seems in Chapter 26, there is an exception that allows foam plastic insulation to be direct applied to wood sheathing, but not to metal decks. Regardless of the deck type, there can be fire transmitted to the plastic roof insulation, hence the addition of 1/2" gypsum board in cases where the plastic insulation is used.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of the roof by \$1.00US - \$1.25US per square foot of roof area when mechanically fastened.

S9-18

IBC: 1508.1

Proponent: Bill McHugh, representing Chicago Roofing Contractors Association (billmchugh-jr@att.net)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1508.1 General. The use of above-deck thermal insulation shall be permitted provided that such insulation is covered with an approved roof covering and passes the tests of NFPA 276 or UL 1256 when tested as an assembly.

Exceptions:

1. Foam plastic roof insulation shall conform to the material and installation requirements of Chapter 26.
2. Where a concrete or composite metal and concrete roof deck is used and the above-deck thermal insulation is covered with an approved roof covering.

Reason:

The purpose of this proposal is to add an option to the allowable exceptions in the code. Currently the exception is limited to concrete roof deck and does not include a composite metal and concrete roof deck.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not increase the cost of construction as it provides an alternative to the type of concrete roof deck used for foam plastic insulation.

IBC: 1510.1.1, 1510.2, 1510.2.1, 1510.2.2

Proponent: Jay Hyde, representing Sacramento Valley Association of Building Officials
(jhyde@mogaveroarchitects.com)

THIS PROPOSAL WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE IBC-G HEARING AGENDA.

2018 International Building Code

Revise as follows:

1510.1.1 Area limitation. The aggregate area of penthouses and other enclosed rooftop structures shall not exceed one-third the area of the supporting roof deck. The aggregate area of Occupied Rooftop Structures and Penthouses in conformance with Section 1502.2 shall not exceed ten percent of the area of the roof. Such penthouses and other enclosed rooftop structures shall not be required to be included in determining the building area or number of stories as regulated by Section 503.1. The area of such penthouses shall not be included in determining the fire area specified in Section 901.7.

[BG] 1510.2 Penthouses and Occupied Rooftop Structures.. Penthouses and Occupied Rooftop Structures in compliance with Sections 1510.2.1 through 1510.2.5 shall be considered as a portion of the story directly below the roof deck on which such penthouses are located. Other penthouses shall be considered as an additional story of the building.

[BG] 1510.2.1 Height above roof deck. Penthouses and occupied rooftop structures constructed on buildings of other than Type I construction shall not exceed 18 feet (5486 mm) in height above the roof deck as measured to the average height of the roof of the penthouse. Penthouses located on the roof of buildings of Type I construction shall not be limited in height.

Exception: Where used to enclose tanks or elevators that travel to the roof level, penthouses shall be permitted to have a maximum height of 28 feet (8534 mm) above the roof deck.

[BG] 1510.2.2 Use limitations.

1. Penthouses shall not be used for purposes other than the shelter of mechanical or electrical equipment, tanks, elevators and related machinery, or vertical shaft openings in the roof assembly.
2. Occupied rooftop structures shall be accessory to the adjacent occupied roof in conformance with Section 508.2.

Reason:

Occupied roofs generally require some support space for functionality. The IBC recognizes the importance of limited area accessory occupancies within a building. This code change proposal would allow similar reasoning to be applied to occupied roofs. The 10% limitation is the same limitation for accessory occupancies in IBC Section 508.2.3.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is permissive, it permits a designer to include a limited-scope occupied penthouse as an accessory to an adjacent roof but it does not require an accessory occupied penthouse. If a designer chooses to include an occupied penthouse, the cost of construction will increase but the designer may not choose to include a occupied penthouse in the project, in which instance there would be no change in cost.

IBC: 1510.2.4

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

THIS PROPOSAL WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE IBC-G HEARING AGENDA.

2018 International Building Code

[BG] 1510.2.4 Type of construction. Penthouses shall be constructed ~~with walls, floors and roofs of building elements~~ as required for the type of construction of the building on which such penthouses are built.

Exceptions:

1. On buildings of Type I construction, the exterior walls and roofs of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating. The exterior walls and roofs of penthouses with a fire separation distance of 20 feet (6096 mm) or greater shall not be required to have a fire-resistance rating.
2. On buildings of Type I construction two stories or less in height above grade plane or of Type II construction, the exterior walls and roofs of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating or a lesser fire-resistance rating as required by Table 602 and be constructed of *fire-retardant-treated wood*. The exterior walls and roofs of penthouses with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be constructed of fire-retardant-treated wood and shall not be required to have a fire-resistance rating. Interior framing and walls shall be permitted to be constructed of *fire-retardant-treated wood*.
3. On buildings of Type III, IV or V construction, the exterior walls of penthouses with a *fire separation distance* greater than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be permitted to have not less than a 1-hour fire-resistance rating or a lesser fire-resistance rating as required by Table 602. On buildings of Type III, IV or VA construction, the exterior walls of penthouses with a *fire separation distance* of 20 feet (6096 mm) or greater shall be permitted to be of heavy timber construction complying with Sections 602.4 and 2304.11 or noncombustible construction or *fire-retardant-treated wood* and shall not be required to have a fire-resistance rating.

Reason:

The addition of "Building element" is more fitting. See Table 601.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase or decrease the cost of construction because the proposal simply substitutes terms to more clearly reflect the intent of the code.

Internal ID: 1481

S12-18

IBC: 1510.7.2

Proponent: Jason Wilen AIA CDT RRO, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

THIS PROPOSAL WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE IBC-G HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BG] 1510.7.2 Photovoltaic panels and modules. Rooftop-mounted *photovoltaic panels* and *modules* shall be *listed* and labeled in accordance with UL 1703 and UL 2703 and shall be installed in accordance with the manufacturer's instructions.

Reason:

Last code cycle a reference to UL 2703 was added to IBC Section 1505.9—Rooftop mounted photovoltaic panel systems. A reference to UL 2703 should also be added to IBC 1510.7.2—Photovoltaic panels and modules to be consistent with the requirements in IBC Section 1505 as both sections are dealing with the same topic.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change does not increase the stringency of the code.

Staff Analysis: The standard referenced in this proposal, UL 2703, is currently referenced in the I-Codes.

Internal ID: 1198

S13-18

IBC: 1510.7, 1510.7.1, 1510.7.2, 1512, 1512.1

THIS PROPOSAL WILL BE HEARD BY THE IBC GENERAL CODE COMMITTEE. SEE THE IBC-G HEARING AGENDA.

2018 International Building Code

Delete without substitution:

~~**[BG] 1510.7 Photovoltaic panels and modules.** Rooftop-mounted *photovoltaic panels* and *modules* shall be designed in accordance with this section.~~

~~**[BG] 1510.7.1 Fire classification.** Rooftop-mounted *photovoltaic panels* and *modules* shall have the fire classification in accordance with Section 1505.9.~~

~~**[BG] 1510.7.2 Photovoltaic panels and modules.** Rooftop-mounted *photovoltaic panels* and *modules* shall be *listed* and labeled in accordance with UL 1703 and shall be installed in accordance with the manufacturer's instructions.~~

~~**SECTION 1512 PHOTOVOLTAIC PANELS AND MODULES**~~

~~**1512.1 Photovoltaic panels and modules.** *Photovoltaic panels* and *modules* installed on a roof or as an integral part of a roof assembly shall comply with the requirements of this code and the International Fire Code.~~

Reason:

This proposal seeks to strike out IBC Sections 1510.7 and 1512, as they are entirely redundant with corresponding portions of IBC Section 3111. Section 3111 was expanded and improved during the 2018 IBC development cycle, with the intent of providing and improved and consolidated "road map" of requirements for solar energy systems. There is nothing unique in Section 1510.7 or 1512. In fact, these sections fall short of the improved language in Section 3111.

Section 1510.7 is redundant with IBC Section 3111.3:

1510.7 Photovoltaic panels and modules. Rooftop-mounted photovoltaic panels and modules shall be designed in accordance with this section.

3111.3 Photovoltaic solar energy systems. Photovoltaic solar energy systems shall be designed and installed in accordance with this section, the International Fire Code, NFPA 70 and the manufacturers installation instructions.

Section 1510.7.1 is redundant with IBC Section 3111.3.2:

1510.7.1 Fire classification. Rooftop-mounted photovoltaic panels and modules shall have the fire classification in accordance with Section 1505.9.

3111.3.2 Fire classification. Rooftop-mounted photovoltaic systems shall have a fire classification in accordance with Section 1505.9. Building-integrated photovoltaic systems shall have a fire classification in accordance with Section 1505.8.

Section 1510.7.2 is redundant with IBC Section 3111.3.1:

1510.7.2 Photovoltaic panels and modules. Rooftop-mounted photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703 and shall be installed in accordance with manufacturer's instructions.

3111.3.1 Equipment. Photovoltaic panels and modules shall be listed and labeled in accordance with UL 1703. Inverters shall be listed and labeled in accordance with UL 1741. Systems connected to the utility grid shall use inverters listed for utility interaction.

IBC Section 1512 is redundant with IBC Section 3111.3:

1512.1 Photovoltaic panels and modules. Photovoltaic panels and modules installed on a roof or as an integral part of a roof assembly shall comply with the requirements of this code and the International Fire Code.

3111.3 Photovoltaic solar energy systems. Photovoltaic solar energy systems shall be designed and installed in accordance with this section, the International Fire Code, NFPA 70 and the manufacturers installation instructions.

In each case, IBC Section 3111 does a better job of listing requirements in a cohesive manner. Sections 1510.7 and 1512 fall short of the guidance provided in the "road map" of Section 3111. The important technical requirements in Sections 1505.8 and 1505.9 remain in Chapter 15, and they are referenced in Section 3111.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposals only removes redundant language from the IBC, and does not change any technical requirement.

Internal ID: 1999

S14-18

IBC: 1705.14

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1705.14 Sprayed fire-resistant materials. *Special inspections* and tests of sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be performed in accordance with Sections 1705.14.1 through 1705.14.6. *Special inspections* shall be based on the fire-resistance design as designated in the *approved construction documents*. The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. *Special inspections* and tests shall be performed after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, and before concealed, where applicable.

Reason:

The installation of SFRM fireproofing takes place early in the project when there is clear access to the beams, columns, trusses and horizontal assemblies. This installation to the manufacturers installation instructions and the listing needs to take place before the installation of the mechanical, electrical, plumbing (MEP) and ceilings takes place. SFRM fireproofing application does not take place while the MEP or ceiling contractors are working. It's not efficient.

This proposal aims to clarify that the fireproofing inspection takes place while the SFRM fireproofing application takes place rather than after. It is much more costly to repair any areas that are not in compliance with the listing if the MEP and ceilings contractors have mobilized.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal makes the code reflect the way that SFRM Fireproofing is inspected currently. If the inspection is to take lace after the SFRM contractor has demobilized, cost of construction will increase.

Internal ID: 1974

S15-18

IBC: 1705.14

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (billmchugh-jr@att.net)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1705.14 Sprayed fire-resistant materials. *Special inspections* and tests of sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be performed in accordance with Sections 1705.14.1 through 1705.14.6. *Special inspections* shall be based on the fire-resistance design as designated in the *approved construction documents*. The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. *Special inspections* and tests shall be performed during construction with an addition visual inspection after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, where applicable.

Reason:

The way the current language reads is confusing and contrary to the way that fireproofing is currently inspected. The special inspection process for sprayed fire-resistive materials (SFRM) fireproofing has been conducted during the SFRM installation process for decades. The code seems to imply that the inspection not take place during construction and instead be performed at a much later time in the project. The code states that the inspection shall take place after the installation of the "rough in" of Mechanical, Electrical and Plumbing (MEP) and ceilings with very strong language.

The purpose of this code proposal is to clarify that the SFRM inspection takes place at the installation phase as is commonly practiced today on jobsites. The proposal also states that an additional visual inspection takes place before the "rough in" as stated in the code. This is to find any areas where the MEP or ceiling contractors might have unintentionally removed SFRM fireproofing and repair those areas.

The inspection after rough installation of various mechanical, electrical and plumbing (MEP), ceiling assembly items as stated in the code is more expensive and not practical. Should it be determined that the complete inspection only be performed after the MEP "rough in", the repairs made to deficiencies would increase the cost of construction significantly. The fireproofing applicator is usually demobilized once this MEP and ceiling "rough in" has started. This means another mobilization. It also makes repairs, if required, difficult or impossible to access due to pipes, cables, ductwork, and ceilings blocking the ability to get to those places to spray fire-resistive materials.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Should it be determined that the SFRM Special inspection take place only after the "rough in" of the mechanical, electrical and plumbing and or ceilings, cost of construction will increase.

Internal ID: 1970

S16-18

IBC: 1705.14

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1705.14 Sprayed fire-resistant materials. *Special inspections* and tests of sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be performed in accordance with Sections 1705.14.1 through 1705.14.6. *Special inspections* shall be based on the fire-resistance design as designated in the *approved construction documents*. The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. *Special inspections* and tests shall be performed after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, where applicable. The required sample size shall not exceed 110% of that specified by the referenced standards in Sections 1705.14.4.1 through 1704.14.4.9.

Reason:

The code states that a minimum amount of inspection is to take place but not a maximum. The inspection agency has no limit to the amount of inspection that can be conducted, which seems unreasonable. As such, this code proposal brings a degree of reason and prevents "over-inspection" to the special inspection process and undue cost to the building owner and manager.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code proposal changes a variable expense with an unknown maximum into a more fixed amount due to the limits of inspection.

2018 International Building Code

Revise as follows:

[BF] 1705.14 Sprayed fire-resistant materials. *Special inspections* and tests of sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be performed in accordance with Sections 1705.14.1 through 1705.14.6. *Special inspections* shall be based on the fire-resistance design as designated in the *approved construction documents*. The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. *Special inspections* and tests shall be performed in accordance with ASTM XXXX after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, where applicable.

Delete without substitution:

~~**[BF] 1705.14.1 Physical and visual tests.** The *special inspections* and tests shall include the following to demonstrate compliance with the listing and the *fire resistance rating*:~~

- ~~1. Condition of substrates.~~
- ~~2. Thickness of application.~~
- ~~3. Density in pounds per cubic foot (kg/m³).~~
- ~~4. Bond strength adhesion/cohesion.~~
- ~~5. Condition of finished application.~~

~~**[BF] 1705.14.2 Structural member surface conditions.** The surfaces shall be prepared in accordance with the *approved fire resistance design* and the written instructions of *approved manufacturers*. The prepared surface of structural members to be sprayed shall be inspected by the special inspector before the application of the sprayed fire-resistant material.~~

~~**[BF] 1705.14.3 Application.** The substrate shall have a minimum ambient temperature before and after application as specified in the written instructions of *approved manufacturers*. The area for application shall be ventilated during and after application as required by the written instructions of *approved manufacturers*.~~

~~**[BF] 1705.14.4 Thickness.** Not more than 10 percent of the thickness measurements of the sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be less than the thickness required by the *approved fire resistance design*, and none shall be less than the minimum allowable thickness required by Section 1705.14.4.1.~~

~~**[BF] 1705.14.4.1 Minimum allowable thickness.** For design thicknesses 1 inch (25 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus 1/4 inch (6.4 mm). For design thicknesses less than 1 inch (25 mm), the minimum allowable individual thickness shall be the design thickness minus 25 percent. Thickness shall be determined in accordance with ASTM E605. Samples of the sprayed fire-resistant materials shall be selected in accordance with Sections 1705.14.4.2 and 1705.14.4.3.~~

~~**[BF] 1705.14.4.2 Floor, roof and wall assemblies.** The thickness of the sprayed fire-resistant material applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E605, making not less than four measurements for each 1,000 square feet (93 m²) of the sprayed area, or portion thereof, in each story.~~

~~**[BF] 1705.14.4.3 Cellular decks.** Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305 mm by 305 mm) in size. Not fewer than four measurements shall be made, located symmetrically within the square area.~~

[BF] 1705.14.4.4 Fluted decks. Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305 mm by 305 mm) in size. Not fewer than four measurements shall be made, located symmetrically within the square area, including one each of the following: valley, crest and sides. The average of the measurements shall be reported.

[BF] 1705.14.4.5 Structural members. The thickness of the sprayed fire resistant material applied to structural members shall be determined in accordance with ASTM E605. Thickness testing shall be performed on not less than 25 percent of the structural members on each floor.

[BF] 1705.14.4.6 Beams and girders. At beams and girders thickness measurements shall be made at nine locations around the beam or girder at each end of a 12-inch (305 mm) length.

[BF] 1705.14.4.7 Joists and trusses. At joists and trusses, thickness measurements shall be made at seven locations around the joist or truss at each end of a 12-inch (305 mm) length.

[BF] 1705.14.4.8 Wide-flanged columns. At wide flanged columns, thickness measurements shall be made at 12 locations around the column at each end of a 12-inch (305 mm) length.

[BF] 1705.14.4.9 Hollow structural section and pipe columns. At hollow structural section and pipe columns, thickness measurements shall be made at not fewer than four locations around the column at each end of a 12-inch (305 mm) length.

[BF] 1705.14.5 Density. The density of the sprayed fire resistant material shall be not less than the density specified in the approved fire resistance design. Density of the sprayed fire resistant material shall be determined in accordance with ASTM E605. The test samples for determining the density of the sprayed fire resistant materials shall be selected as follows:

1. From each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) or portion thereof of the sprayed area in each story.
2. From beams, girders, trusses and columns at the rate of not less than one sample for each type of structural member for each 2,500 square feet (232 m²) of floor area or portion thereof in each story.

[BF] 1705.14.6 Bond strength. The cohesive/adhesive bond strength of the cured sprayed fire resistant material applied to floor, roof and wall assemblies and structural members shall be not less than 150 pounds per square foot (psf) (7.18 kN/m²). The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E736 by testing in-place samples of the sprayed fire resistant material selected in accordance with Sections 1705.14.6.1 through 1705.14.6.3.

[BF] 1705.14.6.1 Floor, roof and wall assemblies. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire resistant materials shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) of the sprayed area, or portion thereof, in each story.

[BF] 1705.14.6.2 Structural members. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire resistant materials shall be selected from beams, girders, trusses, columns and other structural members at the rate of not less than one sample for each type of structural member for each 2,500 square feet (232 m²) of floor area or portion thereof in each story.

[BF] 1705.14.6.3 Primer, paint and encapsulant bond tests. Bond tests to qualify a primer, paint or encapsulant shall be conducted where the sprayed fire resistant material is applied to a primed, painted or encapsulated surface for which acceptable bond strength performance between these coatings and the fire resistant material has not been determined. A bonding agent approved by the SFRM manufacturer shall be applied to a primed, painted or encapsulated surface where the bond strengths are found to be less than required values.

Add new standard(s) follows:

C700
West Conshohocken PA 19428-

Draft Standard WK54567 - 2018:

Practice for the On-Site Inspection of Installed Fire Resistive Material with Annex and Appendix

Reason:

Special inspection for sprayed fire-resistive materials (SFRM) fireproofing has been in the International Building Code for many years. To date, the requirements have been prescriptive and in the IBC, Chapter 17. Over the past few years, the contractors, manufacturers and consultants of SFRM Fireproofing have come together to build an inspection standard at ASTM. The document is the result of the industry efforts to come to consensus with this new standard. We respectfully submit this document for insertion into the 2021 IBC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The reason the proposal will not increase the cost of construction is that the methods used for inspection are the same as is in Chapter 17 of the IBC currently.

Analysis: A review of the standard proposed for inclusion in the code, ASTM - WK54567-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1934

S18-18

IBC: 1705.15, Chapter 35, ordinal

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1705.15 Mastic and intumescent fire-resistant coatings. *Special inspections* and tests for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be performed in accordance with ~~AWCI-12-B. Draft ASTM Standard WK54767. Draft ASTM Standard WK54567.~~ *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*.

Add new standard(s) follows:

CHAPTER 35 REFERENCED STANDARDS

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

Draft Standard WK54567 - 2018:

Practice for the On-Site Inspection of Installed Fire Resistive Material with Annex and Appendix

Reason:

The Intumescent fire-resistant coatings industry - contractors, manufacturers and consultants - worked together at ASTM to build a new consensus standard for special inspection of mastic and intumescent fire-resistant coatings. We respectfully submit this standard for insertion into the International Building Code, Chapter 17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal takes a new standard and improves on existing documents in the code resulting in uniform special inspection of fire-resistant coatings.

Analysis: A review of the standard proposed for inclusion in the code, ASTM - WK54567-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1958

S19-18

IBC: 1705.15

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1705.15 Mastic and intumescent fire-resistant coatings. *Special inspections* and tests for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be performed in accordance with AWCI 12-B. *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*. Special Inspections and tests shall be performed after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, and before concealed, where applicable.

Reason:

The special inspection of fireproofing needs to take place before the mechanical, electrical and plumbing, sprinkler, suspension systems and ceilings are 'roughed in' or installed. This proposal is to clarify in the code when the inspection is to take place, which is both as the fireproofing is installed and also visually after the rough in takes place.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies that inspection of fireproofing takes place as it currently does now meaning no increase in cost.

Internal ID: 2142

S20-18

IBC: 1705.15

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1705.15 Mastic and intumescent fire-resistant coatings. *Special inspections* and tests for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be performed in accordance with AWCI 12-B. *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*. Additional inspections and tests shall not exceed an additional amount of 10 percent than required in AWCI-12-B.

Reason:

The code states that a minimum amount of inspection is to take place but not a maximum amount of inspection. The inspection agency has no limit to the amount of inspection that can be conducted if this is not added to this section on special inspections. The maximum number comes from another standard that has been in the IBC Special Inspection Section for the past code cycles, ASTM E 2174 for Firestop Special Inspection.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal limits the amount of inspection to a reasonable amount of maximum inspection to the code. It changes a variable expense to the building owner into a more fixed cost item.

Staff Analysis:The referenced standard within this proposal, AWCI 12-B, is currently referenced in the I-codes.

Internal ID: 2130

S21-18

IBC: 1705.17

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows:

[BF] 1705.17 Fire-resistant penetrations and joints. In high-rise buildings ~~or~~ in buildings assigned to *Risk Category III or IV, or fire areas containing Group R occupancies with an occupant load greater than 250, special inspections for through-penetrations, membrane penetration firestops, fire-resistant joint systems and perimeter fire barrier systems that are tested and listed* in accordance with Sections 714.4.1.2, 714.5.1.2, 715.3 and 715.4 shall be in accordance with Section 1705.17.1 or 1705.17.2.

Reason:

Fire resistance rated compartmentation is a critical fire protection feature in many buildings with Group R occupancies. When through penetration firestop systems and fire resistant joint systems are not properly installed, the integrity of the compartmentation is compromised. The existing requirement for special inspections is proposed to be expanded to include larger buildings with Group R occupancies. The occupant load of 250 is consistent with what is used to define Group E occupancies that are Category III. Without this change, the special inspection requirement would only apply to Group R occupancies in high-rise buildings.

Cost Impact

The code change proposal will increase the cost of construction .

The addition of this special inspection requirement does increase the cost of construction which will vary based on the quality management system of the firestop contractor.

Internal ID: 2361

S22-18

IBC: 1705.19 (New)

Proponent: Brian Tollisen, Division of Building Standards and Codes, NYS Dept. of State, representing Division of Building Standards and Codes, New York State Department of State (Brian.Tollisen@dos.ny.gov)

THIS PROPOSAL WILL BE HEARD BY THE INTERNATIONAL FIRE CODE COMMITTEE. SEE THE IFC HEARING AGENDA.

2018 International Building Code

Add new text as follows:

1705.19 Electrical Construction. Electrical components, appliances, equipment and systems governed by NFPA 70 shall be inspected by an approved special inspector with expertise in NFPA 70 and electrical construction.

Reason:

The inspection of electrical construction is an activity that many building officials do not have the expertise to complete. This type of inspection should be included as a special inspection in Chapter 17.

Cost Impact

The code change proposal will increase the cost of construction .

Since this is a new requirement, it is assumed that it will add cost to a construction project.

Staff Analysis: The referenced standard in this proposal, NFPA 70, is currently referenced in the I-Codes.

Internal ID: 1419

TENTATIVE ORDER OF DISCUSSION 2018 PROPOSED CHANGES TO THE INTERNATIONAL FIRE CODE

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Proposed changes which impact the same subject have been grouped to permit consideration in consecutive changes.

Proposed change numbers that are indented are those which are being heard out of numerical order. Indentation does not necessarily indicate that one change is related to another. Proposed changes may be grouped for purposes of discussion at the hearing at the discretion of the chair. Note that some F code change proposals may not be included on this list, as they are being heard by another committee.

IFC: 105.6.3 (New)

Proponent: Bruce Kral, West Metro Fire Protection District, representing West Metro Fire Protection District (bkral@westmetrofire.org)

2018 International Fire Code

Add new text as follows:

105.6.3 Assisted Living. An operational permit is required to operate an assisted living facility.

Reason:

With the increasing complexity of the definitions for I-1 and R-4 occupancies and the associated mobility criteria it is vital to ensure that the requirements for resident mobility, staffing levels and the emergency planning elements of Chapter 4 are complied with in assisted living facilities on an ongoing basis. The elderly population is growing quickly and with the desire for “aging in place” many people are now living in facilities not designed or managed in a way that addresses their declining mobility. Assisted living facilities must be assessed regularly to ensure the features of the building occupancy type and capabilities of the staff are in line with the needs of the residents. An operational permit creates the vehicle for fire departments to evaluate the conditions within the facility and enforce compliance based on the facility’s occupancy type.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No increase in construction costs would be created with this proposal as this is related to an operational permit only and is not related to construction.

Internal ID: 1266

F2-18

IFC: 202 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new definition as follows:

ACTIVE RF EMITTING DEVICE. Any type of circuit component that requires an AC or DC power source with the ability to electrically control electron flow and/or amplification of RF signal, including but not limited to signal boosters, repeaters, Bi-directional amplifiers, Fiber Distributed Antenna Systems.

DELIVERED AUDIO QUALITY (DAQ). A measure of audio quality over a transmission medium. This metric is often used to quantify the quality of audio heard over a radio system. DAQ levels are defined by the following scale: DAQ 1 = Unusable. Speech is present but not understandable. DAQ 2 = Speech is understandable with considerable effort. Requires frequent repartition due to noise or distortion. DAQ 3 = Speech understandable with slight effort. Requires occasional repetition due to noise or distortion. DAQ 3.4 = Speech understandable without repetition. Some noise or distortion present. DAQ 4 = Speech easily understandable. Little noise or distortion. DAQ 5 = Perfect. No distortion or noise discernible.

RF RADIO FREQUENCY(RF). A measurement representing the oscillation rate of electromagnetic radiation spectrum, or electromagnetic radio waves, from Public Safety frequency bands as specified by the fire code official.

PASSIVE RF EMITTING DEVICE. A device that does not require an external AC or DC source of power for its operation, and does not provide amplification of the RF signal including but not limited to coax, couplers, splitters and passive antennas.

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

During training sessions with code officials throughout the US there have been numerous discussions about what these terms as used within the code actually mean. This proposal does not change any of the technical provisions of Section 510 but simply provides definitions to clarify the intent of terms utilized within the code language related to in-building public safety communications.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not change any of the technical provisions of Section 510 but simply provides definitions to clarify the intent of terms utilized within the code language related to in-building public safety communications. Since it is simply clarification cost will not increase.

2018 International Fire Code

BATTERY TYPES.

Flow battery. A type of storage battery that includes chemical components dissolved in two different liquids. Ion exchange, which provides the flow of electrical current, occurs through the membrane while both liquids circulate in their respective spaces.

Lead-acid battery. A storage battery that is comprised of lead electrodes immersed in a solution of water and sulphuric acid electrolyte.

Lithium-ion battery. A storage battery with lithium ions serving as the charge carriers of the battery. The electrolyte is a polymer mixture of carbonates with an inorganic salt and can be in a liquid or a gelled polymer form. Lithiated metal oxide is typically a cathode and forms of carbon or graphite typically form the anode.

Nickel-cadmium (Ni-Cd) battery. An alkaline storage battery in which the positive active material is nickel oxide, the negative contains cadmium and the electrolyte is a solution of water and potassium hydroxide.

Preengineered stationary storage battery system. An energy storage system consisting of batteries, a battery management system, components and modules that are produced in a factory, designed to comprise the system when assembled on the job site.

Prepackaged stationary storage battery system. An energy storage system consisting of batteries, a battery management system, components and modules that is factory assembled and shipped as a complete unit for installation at the job site.

Sodium-beta storage battery. A storage battery, also referred to as a Na-beta battery or NBB, which uses a solid beta-alumina electrolyte membrane that selectively allows sodium ion transport between a positive electrode such as metal halide and a negative sodium electrode.

Stationary storage battery. A group of electrochemical cells interconnected to supply a nominal voltage of DC power to a suitably connected electrical load, designed for service in a permanent location.

Reason:

Lead acid batteries need water to operate. Only about 30% of the electrolyte is sulfuric acid. The balance is water.

Nickel Cadmium batteries require water to operate. Only about 30% of the electrolyte is comprised of potassium hydroxide. The balance is water.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change simply adds information to 2 definitions.

Internal ID: 1900

F4-18 Part I

IFC: 202 (New)

Proponent: Dave Frable, U.S. General Services Administration, representing U.S. General Services Administration

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IBC-FS COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

Add new definition as follows:

LIFE SAFETY SYSTEMS. Systems, devices, and equipment that enhance or facilitates evacuation, smoke control, compartmentation, and/or isolation.

Internal ID: 1861

F4-18 Part II

IBC: 202 (New)

Proponent: Dave Frable, U.S. General Services Administration, representing U.S. General Services Administration

2018 International Building Code

Add new definition as follows:

LIFE SAFETY SYSTEMS. Systems, devices, and equipment that enhance or facilitates evacuation, smoke control, compartmentation, and/or isolation.

Reason:

The intent of this code change proposal is to define the term “life safety system”. The subject term is used in the title of IFC and IBC Chapter 9, Fire Protection and Life Safety Systems and throughout Chapter 9 but is not defined. In addition, the term “fire protection system” is defined; however, “life safety system is not.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a definition and will not affect the cost of construction and is simply a clarification of intent.

Internal ID: 3486

F5-18

IFC: 202

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

HIGH-PILED COMBUSTIBLE STORAGE. Storage of combustible materials in closely packed piles or combustible materials on pallets, in racks or on shelves where the top of storage is greater than 12 feet (3658 mm) in height. Where required by the fire code official, high-piled combustible storage also includes certain high-hazard commodities, such as rubber tires, Group A plastics, flammable liquids, idle pallets and similar commodities, where the top of storage is greater than 6 feet (1829 mm) in height. Any Group S occupancy exceeding 12,000 sq. ft. that has a clear height in excess of 14 feet, making it possible to be used for storage in excess of 12 feet, shall be considered to be high-piled storage.

Reason:

We have had this amendment regionally in the North Texas for many years. The primary issue was construction of facilities proposing to not store high-piled, then later Fire Inspections discovered high-piled storage resulting in retroactive requirements to comply with high-piled storage requirements due to the change of use. This became an enforcement nightmare for the subject jurisdiction. Requiring compliance with the high-piled storage provisions up front results in ease of flexibility of use of the building in the future in this regard.

Cost Impact

The code change proposal will increase the cost of construction .

There is a potential to increase the cost of construction by requiring compliance with Chapter 32 for high-piled storage. In excess of 12,000 sq. ft., the occupancy should already require sprinkler protection, but the additional requirements of Chapter 32 would now apply as well as the High-piled storage permit in 105.7.

Proponent: Bo Manalo, EcoSmart Inc., representing EcoSmart Inc. (bo@ecosmartfire.com)

2018 International Fire Code

Add new definition as follows:

OPEN FLAME. A flame that is generated by any material or device in a sustained and controlled manner and that is not securely enclosed by non-combustible material, such as a candle that is unenclosed or enclosed in a globe or lantern, or a gas light lantern, but not a flame contained in a furnace or other similar approved device, equipment or system.

Add new text as follows:

SECTION 302 DEFINITIONS

302.1 Definitions.

The following terms are defined in Chapter 2:

BONFIRE.

HI-BOY.

HIGH-VOLTAGE TRANSMISSION LINE.

OPEN BURNING.

OPEN FLAME.

PORTABLE OUTDOOR FIREPLACE.

POWERED INDUSTRIAL TRUCK.

RECREATIONAL FIRE.

SKY LANTERN.

Reason:

Section 308 of the Fire Code shows the provisions for Open Flames but without definition, unlike the other provisions in Section 307 for Open Burning, Recreational Fires, and Portable Outdoor Fireplace (all defined in Chapter 2). This proposal gives consistency and definition to the frequently used term and helps provide better guidance to the user. The definition is derived from the FDNY Fire Code definition of Open Flame.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This will not increase the cost of construction or compliance as it is simply a clarification of what constitutes an “open flame.”

Internal ID: 1928

F7-18

IFC: 202

Proponent: Ken Brouillette, representing Seattle Fire Department (ken.brouillette@seattle.gov)

2018 International Fire Code

Revise as follows:

OUTDOOR ASSEMBLY EVENT. ~~An outdoor gathering of persons for any purpose.~~ Private or public event conducted outdoors and having a planned attendance of 500 or more or confines 100 or more attendees by permanent or temporary installations of barriers or fencing. This definition does not include events held at Group R-3 occupancies.

Reason:

The current definition was too broad and by adding a projected occupant load of 500 or more would help to reduce the all encompassing existing definition.

The 500 threshold was chosen as it is the threshold for requiring a crowd manager in 403.12.3. The 100 or more when the attendees are restricted in movement was based on the occupant load necessary for a Place of Assembly permit in the City of Seattle.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal is regarding outdoor assemblies and would not require any changes to existing construction or require any new construction to occur.

IFC: 304, 304.4 (New)

Proponent: Matthew Dobson, Vinyl Siding Institute, representing Suburban Exterior Fire Work Group (mdobson@vinylsiding.org); Richard Swan, International Association of Fire Fighters, representing International Association of Fire Fighters (rswan@iaff.org)

2018 International Fire Code

Revise as follows:

SECTION 304 COMBUSTIBLE WASTE AND LANDSCAPING MATERIAL

Add new text as follows:

304.4 Mulch. Combustible landscaping mulch shall not be placed within 3 feet of combustible walls, roofs, or other combustible components of Group R buildings of Type V construction.

Reason:

Over the past code cycles there has been concern over smoker habits, combustible mulch, and the potential hazard they pose with combustion of exterior walls. The Suburban Exterior Fire Work Group, a group of fire service members, UL fire fighter safety institute, and other material stakeholders has been focused on this issue over the past 18 months.

The problem identified is the spread of fire from the exterior into to the unprotected attic space and then spreading quickly to other parts of the building.

The group has taken a 3 prong approach to address the issue:

1. Regulate the human risk by prohibiting smoking near exterior doors.
2. Remove combustible material/mulch from near the outside of combustible wall assemblies.
3. Create a block to slow down any fires that occur in the above described setting.

Over the decade, fire departments in the Washington, DC region have been confronted with structure fires which have demonstrated a consistent pattern of starting on the outside. These fires have the potential for rapid loss of structural integrity and catastrophic collapse before occupants are alerted. As attention has grown locally, it is apparent that this type of fire is becoming common on a national basis.

These fires tend to follow a distinct pattern. These fires start at a low point on the exterior and spread vertically along the exterior wall producing flammable gases, which are readily admitted into the attic area through ventilation soffits. If not cooled, these heated gases accumulate and combust, creating rapidly spreading fire conditions in the attic area, often without occupant awareness. The unchecked fire often results in full roof involvement, creating a dangerous and difficult situation for occupants and fire fighters.

The group examined a number of structure fires which have exhibited the pattern described above. There is agreement over 3 common aspects. First, these fires often result from careless smoking habits. Second, when the smoking materials are not properly disposed of, they often come into contact with combustible materials adjacent to a building and, very commonly, this is mulch. And, last, the combustible exterior wall is a factor in the the growth of these fires into the attic space.

The careless smoker is an impediment to effective fire prevention efforts. The fire service has consistently provided data that shows smoking is the leading cause of fatal fires in the United States. Public fire and life safety efforts have been reasonably effective at communicating the message to not smoke in bed, and various medical organizations have demonstrated the health risk associated with "second hand" smoke. We now see that people are routinely smoking outside, at or near the entrance to a building, which increases the possibility of an accidental ignition of outside combustibles. If one were to chronicle the actions of today's smoker, it would likely show the last action they take when exiting a building is to "light up." When returning inside, they often drop the cigarette near the entrance. Many smokers seem to believe that dropping a match or cigarette onto the ground or into a flower pot is an effective method of extinguishment, however, this behavior often places the smoking material directly into the mulch, initiating the low fire described earlier.

Mulch has become a common exterior decorative material which aids in suppressing weed growth while enhancing a building's curb appeal. However, most mulch is a dead organic material, comprised of chipped wood, tree bark or pine needles. Mulch is most effective when it is maintained in a moist state, however it can dry out very quickly and become a readily ignitable fuel source. Because of its relatively small mass in comparison to its surface area, when ignited, it

will progress and sustain open flame.

The group discussed a method in which to proceed, the interest being to address, in the quickest manner, industrial and social changes which could reduce the possibility of a fire on the outside of a building. Each aspect presents unique challenges for fire prevention efforts:

1. Changing the behavior of the smoker is an ongoing and difficult challenge, especially as social pressures have resulted in regulatory changes to require people to smoke outside of a building. Further development of the “fire safe” cigarette, by way of testing using mulch, could be deemed too costly for the industry, and would have no effect on improper disposal of matches. Thus, the quickest and most practical strategy for this aspect of the problem is to expand public fire and life safety education to focus on the hazards of improper disposal of smoking materials, coupled with enforcement of applicable requirements for regulation of smoking and disposal of products. However, in this age of “information overflow” it is questionable if this would result in widespread behavioral changes for smokers.
2. Regulating the use and placement of mulch, that the study group believes could have the quickest and most significant impact toward reducing the exterior fire problem, while additional strategies to address the other problems noted are pursued.

The use of wood and wood related mulch for building decoration is purely optional. It is not a required construction component under current building codes. Therefore, regulations to curtail its use or require that it be separated from a building’s combustible exterior are reasonable and could be codified on a national basis. On a large scale, the mere action of creating separation of combustible materials has been a wildland fire tactic for years. Several states and local jurisdictions have already employed this theory by either recommending or requiring that wood-based mulch be separated from exterior combustible walls:

1. The Virginia Department of Forestry recommends to “provide a minimum of an 18 inch clearance between landscaping mulch beds and combustible building materials” and to “ensure proper clearance to electric devices, such as decorative lights, by following the manufacturer’s instructions;”
2. In Raleigh, NC, following a disastrous fire in a multi-family building, the city passed a pine straw mulch ordinance that bans the use of pine straw as ground cover within 10 feet of multi-family dwellings. The ordinance exempts 1 and 2-family dwellings, however, the city strongly encourages these homeowners to comply with the pine straw restrictions;
3. The Commonwealth of Massachusetts prohibits the new application of mulch within 18 inches around combustible exteriors of buildings, such as wood or vinyl but not brick or concrete. Residential buildings with six units or less are exempted from this regulation, but it is recommended that all homeowners adopt these safety practices. The regulation applies to all other buildings including commercial properties.
4. Ventura County, CA prohibits mulch and wood chips within the required “defensible space” zone (which ranges from 0’ to 30’ from the exterior of a building).

This small sampling of jurisdictions has produced enough evidence to lead the study group to suggest the possible introduction of a code proposal to require separation, or non-application, of wood-based mulch in proximity to combustible exterior walls.

The proposed protected soffit approach will require a form of blocking outside of exterior doorways and garage doors. These proposed material have been required in North Carolina for over 5 years and are accepted to provide some form of blocking that will slow down the movement of fire from the outside to the attic space, effectively helping to address the issue and allow fire service more time put out the fire.

We think this approach is effective, efficient, and cost effective.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change should not impact the cost of construction as this requirement is addressing only the placement of landscape materials.

Proponent: Gene Boecker, Code Consultants, Inc., representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Fire Code

304.1.3 Space underneath seats. Spaces underneath grandstand and bleacher seats shall be kept free from combustible and flammable materials. Except where enclosed in not less than 1-hour fire-resistance-rated construction in accordance with the International Building Code.

Revise as follows:

304.1.3.1 Spaces underneath grandstands and bleachers. ~~Spaces~~ Enclosed spaces underneath grandstands and bleachers shall not be occupied ~~or utilized for purposes other than means of egress~~ except where equipped with an *automatic sprinkler system* in accordance with Section 903.2.1.5.1, or separated with fire barriers and horizontal assemblies in accordance with Section 1029.1.1.1.

903.2.1.4 Group A-4. An *automatic sprinkler system* shall be provided throughout stories containing Group A-4 occupancies and throughout all stories from the Group A-4 occupancy to and including the levels of exit discharge serving that occupancy where one of the following conditions exists:

1. The *fire area* exceeds 12,000 square feet (1115 m²).
2. The *fire area* has an *occupant load* of 300 or more.
3. The *fire area* is located on a floor other than a *level of exit discharge* serving such occupancies.

903.2.1.5 Group A-5. An *automatic sprinkler system* shall be provided for all enclosed Group A-5 accessory use areas in excess of 1,000 square feet (93 m²).

903.2.1.5.1 Spaces under grandstands or bleachers. Enclosed spaces under *grandstands* or *bleachers* shall be equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1 where either of the following exist:

1. The enclosed area is 1,000 square feet (93 m²) or less and is not ~~constructed~~ separated in accordance with Section 1029.1.1.1.
2. The enclosed area exceeds 1,000 square feet (93 m²).

Exception: Toilet rooms and ticket booths complying with Section 1029.1.1.1 are not required to comply with this section.

[BE] 1029.1.1 Bleachers. *Bleachers, grandstands* and *folding and telescopic seating*, that are not building elements, shall comply with ICC 300.

[BE] 1029.1.1.1 Spaces under grandstands and bleachers. Spaces under *grandstands* or *bleachers* shall be separated by *fire barriers* complying with Section 707 of the International Building Code and *horizontal assemblies* complying with Section 711 of the International Building Code with not less than 1-hour fire-resistance-rated construction.

Exceptions:

1. Ticket booths less than 100 square feet (9 m²) in area.
2. Toilet rooms.
3. Other accessory use areas 1,000 square feet (93 m²) or less in area and equipped with an automatic sprinkler system in accordance with Section 903.3.1.1.
4. In Group A-4 where an automatic sprinkler system is not required in accordance with Section 903.2.1.4.

Reason:

F153-16 AM, from FCAC made some revisions for bleachers and grandstands that ended up pointing out some inconsistencies.

Bleachers can be in Group A-4 and A-5 occupancies. The current language is written only for Group A-5. Exception 4 is added to 1029.1.1.1 for consistency with 903.2.1.4.

By changing all the relevant sections to 'enclosed' areas under bleachers there is consistency across all the requirements for under bleachers. It is not the intent to prohibit an open air vomitory system of egress under large bleacher systems. Also, then if the means of egress is open, it does not have to be considered in the sprinkler requirements. If the means of egress is enclosed, it should be included.

Section 1029.1.1.1 currently allows for bathrooms under the grandstands to not be sprinklered. These could be larger than 1,000 sq.ft. so Section 903.2.1.5.1 and 1029.1.1.1 are not aligned.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification and alignment of requirements. There are no new requirements.

Proponent: William Freer, representing New York State Office of Fire Prevention and Control (wfreer@dhses.ny.gov)

2018 International Fire Code

Revise as follows:

304.3.2 Capacity exceeding 5.33 cubic feet. Containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m³) shall be provided with lids. Containers and lids shall be constructed of noncombustible materials or of combustible materials with a peak rate of heat release not exceeding 300 kW/m² where tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation

Exception: ~~Wastebaskets complying with Section 808.1 or listed and labeled in accordance with FM 6921.~~

304.3.4 Capacity of 1 cubic yard or more. Dumpsters with an individual capacity of 1.0 cubic yard [200 gallons (0.76 m³)] or more shall not be stored in buildings or placed within 5 feet (1524 mm) of combustible walls, openings or combustible roof eave lines unless the dumpsters are constructed of noncombustible materials or of combustible materials with a peak rate of heat release not exceeding 300 kW/m² where tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. orientation or listed and labeled in accordance with FM 6921.

Exceptions:

1. Dumpsters in areas protected by an *approved automatic sprinkler system* installed throughout in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3.
2. Storage in a structure shall not be prohibited where the structure is of Type I or IIA construction, located not less than 10 feet (3048 mm) from other buildings and used exclusively for dumpster or container storage.

~~808.1.1304.3.5~~ **Wastebaskets and linen containers in Group I-1, I-2 and I-3 occupancies and Group B ambulatory care facilities.** ~~Wastebaskets, Waste and linen containers and other waste containers, including their lids, located in Group I-1, I-2 and I-3 occupancies and Group B ambulatory care facilities shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Metal wastebaskets and other metal orientation or listed and labeled in accordance with FM 6921. Metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be listed in accordance with UL 1315 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room and constructed in accordance with Table 509 of the International Building Code.~~

Exception: Recycling containers complying with Section 808.1.2 are not required to be stored in waste and linen collection rooms.

~~808.1.1304.3.5.1~~ **Capacity density.** The average capacity density of containers located in an individual room or space, other than waste and linen collection rooms, shall not be greater than 0.5 gal/ft² (20.4 L/m²).

~~808.1.2304.3.5.2~~ **Recycling clean waste containers.** Recycling clean waste containers, including their lids, shall not exceed an individual capacity of 96 gallons (363 L).

~~808.2305.3.6~~ **Waste containers with a capacity of 20 gallons or more in Group R-2 college and university dormitories.** Waste containers, including their lids, located in Group R-2 college and university dormitories, and with a capacity of 20 gallons (75.7 L) or more, shall be constructed of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Metal wastebaskets and other metal orientation or listed and labeled in accordance with FM 6921. Metal waste containers with a capacity of 20 gallons (75.7 L) or more shall be listed in accordance with UL 1315 and shall be provided with a noncombustible lid. Portable containers exceeding 32 gallons (121 L) shall be stored in an area classified as a waste and linen collection room constructed in accordance with Table 509 of the International Building Code.

Add new standard(s) follows:

FM

FM Approvals
Headquarters Office 1151 Boston-
Providence Turnpike P.O. Box 9102
Norwood MA 02062

FM 6921- 2014:

Containers for Combustible Waste

Reason:

This code change puts all all of the waste container requirements into the same section and makes it easier on the CEO to enforce. It also eliminates the term wastebasket which is not defined in the code and replaces it with waste container.

This code change also allows an alternative compliance method, using FM 6921. The FM test is a performance based design method, while the current UL test is based on heat release rates.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change clarifies the requirements of the code and allows for other options for compliance which may decrease the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, FM 6921-2014 Containers for Combustible Waste, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1060

F11-18

IFC: 105.6.15 (New), 202 (New), 308.3.2

Proponent: Ken Brouillette, Seattle Fire Department, representing Seattle Fire Department
(ken.brouillette@seattle.gov)

2018 International Fire Code

Add new text as follows:

105.6.15 Flame effects before an audience. An operational permit is required to use flame effects before an audience in connection with Group A, B or E occupancies, covered malls and outdoor assembly events.

Add new definition as follows:

FLAME EFFECT. The combustion of solids, liquids, or gases to produce thermal, physical, visual, or audible phenomena before an audience.

Revise as follows:

308.3.2 ~~Theatrical performances.~~ Performances before an audience. Where *approved*, open-flames, open-flame devices and flame effects used in conjunction with ~~theatrical performances~~ before an audience are allowed to be used in venues protected by an approved automatic sprinkler systems in accordance with Section 903.3.1.1 and where adequate safety precautions have been taken in accordance with NFPA 160.

Reason:

Flame performances are being conducted throughout the United States. The IFC did not have any direct regulations. This language in this proposal was adopted in the City of Seattle to give guidance to performers and others conducting this activity inside of venues. The additional requirement of only allowing this activity inside of a venue that is protected with an approved automatic fire sprinkler system is just a common sense approach.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase or decrease the cost of construction because it pertains to existing buildings that could be used for the presentation of flame effects before an audience.

Internal ID: 1393

F12-18

IFC: 310.2, 310.2.1 (New), 310.3, 310.6

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Revise as follows:

310.2 Prohibited areas. Smoking shall be prohibited where conditions are such as to make smoking a hazard, and in spaces where flammable or combustible materials are stored or handled.

Exception: In Group I-2 occupancies, patients shall be permitted to smoke in designated patient care areas, based on clinical needs of the patient.

Add new text as follows:

310.2.1 Group I-2. In Group I-2 occupancies smoking shall be prohibited in patient care areas, or where oxygen is used, stored or handled.

Revise as follows:

310.3 "No Smoking" signs. The *fire code official* is authorized to order the posting of "No Smoking" signs or the international symbol for no smoking in a conspicuous location in each structure or location in which smoking is prohibited. The content, lettering, size, color and location of required "No Smoking" signs shall be *approved*.

Exception: ~~In Group I-2 occupancies where smoking is prohibited,~~ "No Smoking" signs are not required in interior locations of the facility where signs are displayed at all major entrances into the facility.

310.6 Ash trays. Where smoking is permitted, suitable noncombustible ash trays or match receivers shall be provided on each table and at other appropriate locations. In Group I-2 occupancies, non-combustible, metal containers with self-closing covers, shall be provide in areas where smoking is permitted.

Reason:

The signage exception from the 2015 cycle is moved to a dedicated paragraph for I-2 occupancies. Certain allowances for smoking by patients or residents are added to the K-Tag, so breaking out the occupancy into its own paragraph makes sense. Psychiatric allowances are also needed to manage smoking, particularly among behavioral health addiction patients. Use of the term "designated" enables the facility to establish specific, limited areas for this function, and enables the care provider to put the patient in the correct environment.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an operational requirement only, with no technical changes for construction.

Internal ID: 691

IFC: 310.9 (New)

Proponent: Matthew Dobson, Vinyl Siding Institute, representing Suburban Exterior Fire Work Group (mdobson@vinylsiding.org); Richard Swan, representing International Association of Fire Fighters (rswan@iaff.org)

2018 International Fire Code

Add new text as follows:

310.9 Group R. Smoking shall be prohibited within 25 feet of any exterior door of Group R buildings of Type V construction.

Reason:

Over the past code cycles there has been concern over smoker habits, combustible mulch, and the potential hazard they pose with combustion of exterior walls. The Suburban Exterior Fire Work Group, a group of fire service members, UL fire fighter safety institute, and other material stakeholders has been focused on this issue over the past 18 months.

The problem identified is the spread of fire from the exterior into to the unprotected attic space and then spreading quickly to other parts of the building.

The group has taken a 3 prong approach to address the issue:

Regulate the human risk by prohibiting smoking near exterior doors.

Remove combustible material/mulch from near the outside of combustible wall assemblies.

Create a block to slow down any fires that occur in the above described setting.

The proposed protected soffit approach, contained in a proposal for the IBC, will require a form of blocking outside of exterior doorways and garage doors in the soffit area. These proposed material have been required in North Carolina for over 5 years and are accepted to provide some form of blocking that will slow down the movement of fire from the outside to the attic space, effectively helping to address the issue and allow fire service more time put out the fire. Testing on these protected soffits are currently underway to show the effectiveness of these assemblies both vented and unvented.

Over the decade, fire departments in the Washington, DC region have been confronted with structure fires which have demonstrated a consistent pattern of starting on the outside. These fires have the potential for rapid loss of structural integrity and catastrophic collapse before occupants are alerted. As attention has grown locally, it is apparent that this type of fire is becoming common on a national basis.

These fires tend to follow a distinct pattern. These fires start at a low point on the exterior and spread vertically along the exterior wall producing flammable gases, which are readily admitted into the attic area through ventilation soffits. If not cooled, these heated gases accumulate and combust, creating rapidly spreading fire conditions in the attic area, often without occupant awareness. The unchecked fire often results in full roof involvement, creating a dangerous and difficult situation for occupants and fire fighters.

The group examined a number of structure fires which have exhibited the pattern described above. There is agreement over 3 common aspects. First, these fires often result from careless smoking habits. Second, when the smoking materials are not properly disposed of, they often come into contact with combustible materials adjacent to a building and, very commonly, this is mulch. And, last, the combustible exterior wall is a factor in the the growth of these fires into the attic space.

The careless smoker is an impediment to effective fire prevention efforts. The fire service has consistently provided data that shows smoking is the leading cause of fatal fires in the United States. Public fire and life safety efforts have been reasonably effective at communicating the message to not smoke in bed, and various medical organizations have demonstrated the health risk associated with "second hand" smoke. We now see that people are routinely smoking outside, at or near the entrance to a building, which increases the possibility of an accidental ignition of outside combustibles. If one were to chronicle the actions of today's smoker, it would likely show the last action they take when exiting a building is to "light up." When returning inside, they often drop the cigarette near the entrance. Many smokers seem to believe that dropping a match or cigarette onto the ground or into a flower pot is an effective method of extinguishment, however, this behavior often places the smoking material directly into the mulch, initiating the low fire described earlier.

Mulch has become a common exterior decorative material which aids in suppressing weed growth while enhancing a building's curb appeal. However, most mulch is a dead organic material, comprised of chipped wood, tree bark or pine needles. Mulch is most effective when it is maintained in a moist state, however it can dry out very quickly and become a readily ignitable fuel source. Because of its relatively small mass in comparison to its surface area, when ignited, it

will progress and sustain open flame.

The group discussed a method in which to proceed, the interest being to address, in the quickest manner, industrial and social changes which could reduce the possibility of a fire on the outside of a building. Each aspect presents unique challenges for fire prevention efforts:

1. Changing the behavior of the smoker is an ongoing and difficult challenge, especially as social pressures have resulted in regulatory changes to require people to smoke outside of a building. Further development of the “fire safe” cigarette, by way of testing using mulch, could be deemed too costly for the industry, and would have no effect on improper disposal of matches. Thus, the quickest and most practical strategy for this aspect of the problem is to expand public fire and life safety education to focus on the hazards of improper disposal of smoking materials, coupled with enforcement of applicable requirements for regulation of smoking and disposal of products. However, in this age of “information overflow” it is questionable if this would result in widespread behavioral changes for smokers;
2. Regulating the use and placement of mulch, that the study group believes could have the quickest and most significant impact toward reducing the exterior fire problem, while additional strategies to address the other problems noted are pursued.

The use of wood and wood related mulch for building decoration is purely optional. It is not a required construction component under current building codes. Therefore, regulations to curtail its use or require that it be separated from a building’s combustible exterior are reasonable and could be codified on a national basis. On a large scale, the mere action of creating separation of combustible materials has been a wildland fire tactic for years. Several states and local jurisdictions have already employed this theory by either recommending or requiring that wood-based mulch be separated from exterior combustible walls:

1. The Virginia Department of Forestry recommends to “provide a minimum of an 18 inch clearance between landscaping mulch beds and combustible building materials” and to “ensure proper clearance to electric devices, such as decorative lights, by following the manufacturer’s instructions;”
2. In Raleigh, NC, following a disastrous fire in a multi-family building, the city passed a pine straw mulch ordinance that bans the use of pine straw as ground cover within 10 feet of multi-family dwellings. The ordinance exempts 1 and 2-family dwellings, however, the city strongly encourages these homeowners to comply with the pine straw restrictions;
3. The Commonwealth of Massachusetts prohibits the new application of mulch within 18 inches around combustible exteriors of buildings, such as wood or vinyl but not brick or concrete. Residential buildings with six units or less are exempted from this regulation, but it is recommended that all homeowners adopt these safety practices. The regulation applies to all other buildings including commercial properties.
4. Ventura County, CA prohibits mulch and wood chips within the required “defensible space” zone (which ranges from 0’ to 30’ from the exterior of a building).

This small sampling of jurisdictions has produced enough evidence for a code proposal to require separation, or non-application, of wood-based mulch in proximity to combustible exterior walls.

We think this approach is effective, efficient, and cost effective.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is intended to modify human behavior and will not impact the cost of construction.

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IFC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Fire Code

Add new text as follows:

311.2.2 Fire protection. Fire alarm, automatic sprinkler systems and stand-pipe systems shall be maintained in an operable condition at all times.

Exceptions:

1. Where the premises have been cleared of all combustible materials and debris and, in the opinion of the *fire code official*, the type of construction, *fire separation distance* and security of the premises do not create a fire hazard.
2. Where *approved* by the *fire code official*, buildings that will not be heated and where *fire protection systems* will be exposed to freezing temperatures, fire alarm and automatic sprinkler systems are permitted to be placed out of service and standpipes are permitted to be maintained as dry systems (without an automatic water supply), provided that the building does not have contents or storage, and windows, doors and other openings are secured to prohibit entry by unauthorized persons.
3. Where *approved* by the *fire code official*, fire alarm and automatic sprinkler systems are permitted to be placed out of service in seasonally occupied buildings: that will not be heated; where fire protection systems will be exposed to freezing temperatures; where *fire areas* do not exceed 12,000 square feet (1115 m²); and that do not store motor vehicles or hazardous materials.

403.11.1.2 Lease plan. In addition to the requirements of Section 404.2.2, a lease plan that includes the following information shall be prepared for each covered and open mall building:

1. Each occupancy, including identification of tenant.
2. Exits from each tenant space.
3. Fire protection features, including the following:
 - 3.1. Fire department connections.
 - 3.2. Fire command center.
 - 3.3. Smoke management system controls.
 - 3.4. Elevators, elevator machine rooms and controls.
 - 3.5. Hose valve outlets.
 - 3.6. Sprinkler and standpipe control valves.
 - 3.7. Automatic Areas protected with automatic sprinkler systems and automatic fire-extinguishing system areas systems.
 - 3.8. Automatic fire detector zones.
 - 3.9. Fire ~~barriers-walls~~, fire barriers, fire partitions

[BE] 1010.3.2 Security access turnstiles. Security access turnstiles that inhibit travel in the direction of egress utilizing a physical barrier shall be permitted to be considered as a component of the means of egress, provided that all of the following criteria are met:

1. The building is protected throughout by an ~~approved, supervised~~ automatic sprinkler system in accordance with Section 903.3.1.1.

2. Each security access turnstile lane configuration has a minimum clear passage width of 22 inches (559 mm).
3. Any security access turnstile lane configuration providing a clear passage width of less than 32 inches (810 mm) shall be credited with a maximum egress capacity of 50 persons.
4. Any security access turnstile lane configuration providing a clear passage width of 32 inches (810 mm) or more shall be credited with a maximum egress capacity as calculated in accordance with Section 1005.
5. Each secured physical barrier shall automatically retract or swing to an unobstructed open position in the direction of egress, under each of the following conditions:
 - 5.1. Upon loss of power to the turnstile or any part of the access control system that secures the physical barrier.
 - 5.2. Upon actuation of a clearly identified manual release device with ready access that results in direct interruption of power to each secured physical barrier, after which such barriers remain in the open position for not less than 30 seconds. The manual release device shall be positioned at one of the following locations:
 - 5.2.1. On the egress side of each security access turnstile lane.
 - 5.2.2. At an approved location where it can be actuated by an employee assigned to the area at all times that the building is occupied.
 - 5.3. Upon actuation of the building fire alarm system, if provided, after which the physical barrier remains in the open position until the fire alarm system is manually reset.

Exception: Actuation of a manual fire alarm box.
 - 5.4. Upon actuation of the building automatic sprinkler system or fire detection system, after which the physical barrier remains in the open position until the fire alarm system is manually reset.

2018 International Building Code

[F] 428.3.9 Automatic fire-extinguishing sprinkler systems. Buildings containing laboratory suites shall be equipped throughout with an ~~approved~~ *approved automatic sprinkler system* in accordance with Section 903.3.1.1.

506.2.2.1 Group H-2 or H-3 mixed occupancies. For a building containing Group H-2 or H-3 occupancies, the allowable area shall be determined in accordance with Section 508.4.2, with the automatic sprinkler system increase applicable only to the portions of the building not classified as Group H-2 or H-3.

506.2.4.1 Group H-2 or H-3 mixed occupancies. For a building containing Group H-2 or H-3 occupancies, the allowable area shall be determined in accordance with Section 508.4.2, with the automatic sprinkler system increase applicable only to the portions of the building not classified as Group H-2 or H-3.

1705.12.6 Plumbing, mechanical and electrical components. Periodic special inspection of plumbing, mechanical and electrical components shall be required for the following:

1. Anchorage of electrical equipment for emergency and standby power systems in structures assigned to *Seismic Design Category C, D, E or F*.
2. Anchorage of other electrical equipment in structures assigned to *Seismic Design Category E or F*.
3. Installation and anchorage of piping systems designed to carry hazardous materials and their associated mechanical units in structures assigned to *Seismic Design Category C, D, E or F*.
4. Installation and anchorage of ductwork designed to carry hazardous materials in structures assigned to *Seismic Design Category C, D, E or F*.
5. Installation and anchorage of vibration isolation systems in structures assigned to *Seismic Design Category C, D, E or F* where the *approved construction documents* require a nominal clearance of $\frac{1}{4}$ inch (6.4 mm) or less between the equipment support frame and restraint.
6. Installation of mechanical and electrical equipment, including duct work, piping systems and their structural supports, where automatic ~~fire~~-sprinkler systems are installed in structures assigned to *Seismic Design Category C, D, E or F* to verify one of the following:
 - 6.1. Minimum clearances have been provided as required by Section 13.2.3 ASCE/SEI 7.

- 6.2. A nominal clearance of not less than 3 inches (76 mm) has been provided between ~~fire protection~~ automatic sprinkler system drops and sprigs and: structural members not used collectively or independently to support the sprinklers; equipment attached to the building structure; and other systems' piping.

Where flexible sprinkler hose fittings are used, special inspection of minimum clearances is not required.

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread and smoke-developed indices.

Exceptions:

1. Smoke-developed index for interior *trim* as provided for in Section 2604.2.
2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic ~~fire~~ sprinkler system in accordance with Section 903.3.1.1. The approved *automatic sprinkler system* shall be provided in both the room and that part of the building in which the room is located.
3. Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly provided that the assembly with the foam plastic insulation satisfactorily passes NFPA 276 or UL 1256. The smoke-developed index shall not be limited for roof applications.
4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided that the end use is approved in accordance with Section 2603.9 using the maximum thickness and density intended for use.
5. Flame spread and smoke-developed indices for foam plastic interior signs in *covered and open mall buildings* provided that the signs comply with Section 402.6.4.

3104.5.3 Open sides on walkway. Where the distance between the connected buildings is more than 10 feet (3048 mm), the walls at the intersection of the *pedestrian walkway* and each building need not be fire-resistance rated provided that both sidewalls of the *pedestrian walkway* are not less than 50 percent open with the open area uniformly distributed to prevent the accumulation of smoke and *toxic* gases. The roof of the walkway shall be located not more than 40 feet (12 160 mm) above *grade plane*, and the walkway shall only be permitted to connect to the third or lower story of each building.

Exception: Where the *pedestrian walkway* is protected with a ~~an~~ automatic sprinkler system in accordance with Section 903.3.1.1, the roof of the walkway shall be located not more than 55 feet (16 764 mm) above *grade plane* and the walkway shall only be permitted to connect to the fifth or lower story of each building.

2606.7.4 ~~Fire suppression~~ Automatic sprinkler system. In buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, plastic light-diffusing systems shall be protected both above and below unless the sprinkler system has been specifically approved for installation only above the light-diffusing system. Areas of light-diffusing systems that are protected in accordance with this section shall not be limited.

2018 International Existing Building Code

1203.4 Transoms. In ~~fully sprinklered~~ buildings with automatic sprinkler systems of Group R-1, R-2 or R-3 occupancy, existing transoms in corridors and other fire-resistance-rated walls may be maintained if fixed in the closed position. A sprinkler shall be installed on each side of the transom.

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

2018 International Residential Code

Revise as follows:

R101.2 Scope. The provisions of this code shall apply to the construction, *alteration*, movement, enlargement, replacement, repair, *equipment*, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and *townhouses* not more than three stories above *grade plane* in height with a separate means of egress and their *accessory structures* not more than three stories above *grade plane* in height.

Exception: The following shall be permitted to be constructed in accordance with this code where provided with a ~~residential fire~~ an automatic sprinkler system complying with Section P2904:

1. Live/work units located in *townhouses* and complying with the requirements of Section 419 of the International Building Code.
2. Owner-occupied lodging houses with five or fewer guestrooms.
3. A care facility with five or fewer persons receiving custodial care within a dwelling unit.
4. A care facility with five or fewer persons receiving medical care within a dwelling unit.
5. A care facility for five or fewer persons receiving care that are within a single-family dwelling.

R302.2.2 Common walls. Common walls separating *townhouses* shall be assigned a fire-resistance rating in accordance with Item 1 or 2. The common wall shared by two *townhouses* shall be constructed without plumbing or mechanical equipment, ducts or vents in the cavity of the common wall. The wall shall be rated for fire exposure from both sides and shall extend to and be tight against exterior walls and the underside of the roof sheathing. Electrical installations shall be in accordance with Chapters 34 through 43. Penetrations of the membrane of common walls for electrical outlet boxes shall be in accordance with Section R302.4.

1. Where a ~~fire~~ an automatic sprinkler system in accordance with Section P2904 is provided, the common wall shall be not less than a 1-hour fire-resistance-rated wall assembly tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code.
2. Where a ~~fire~~ an automatic sprinkler system in accordance with Section P2904 is not provided, the common wall shall be not less than a 2-hour fire-resistance-rated wall assembly tested in accordance with ASTM E119, UL 263 or Section 703.3 of the International Building Code.

SECTION R313 AUTOMATIC FIRE-SPRINKLER SYSTEMS

R313.1 Townhouse automatic fire sprinkler systems. An automatic ~~residential fire~~ sprinkler system shall be installed in *townhouses*.

Exception: An automatic ~~residential fire~~ sprinkler system shall not be required where *additions* or *alterations* are made to existing *townhouses* that do not have an automatic ~~residential fire~~ sprinkler system installed.

R313.1.1 Design and installation. Automatic ~~residential fire~~ sprinkler systems for *townhouses* shall be designed and installed in accordance with Section P2904 or NFPA 13D.

R313.2 One- and two-family dwellings automatic fire sprinkler systems. An automatic ~~residential fire~~ sprinkler system shall be installed in one- and two-family *dwellings*.

Exception: An automatic ~~residential fire~~ sprinkler system shall not be required for *additions* or *alterations* to existing buildings that are not already provided with an automatic ~~residential~~ sprinkler system.

R313.2.1 Design and installation. Automatic ~~residential fire~~ sprinkler systems shall be designed and installed in accordance with Section P2904 or NFPA 13D.

R325.3 Area limitation. The aggregate area of a mezzanine or mezzanines shall be not greater than one-third of the floor area of the room or space in which they are located. The enclosed portion of a room shall not be included in a

determination of the floor area of the room in which the *mezzanine* is located.

Exception: The aggregate area of a mezzanine located within a dwelling unit equipped with ~~a fire~~ an automatic sprinkler system in accordance with Section P2904 shall not be greater than one-half of the floor area of the room, provided that the mezzanine meets all of the following requirements:

1. Except for enclosed closets and bathrooms, the mezzanine is open to the room in which such mezzanine is located.
2. The opening to the room is unobstructed except for walls not more than 42 inches (1067 mm) in height, columns and posts.
3. The exceptions to Section R325.5 are not applied.

**TABLE P2902.3
APPLICATION FOR BACKFLOW PREVENTERS**

DEVICE	DEGREE OF HAZARD^a	APPLICATION^b	APPLICABLE STANDARDS
Backflow Prevention Assemblies			
Double-check backflow prevention assembly and double-check fire protection backflow prevention assembly	Low hazard	Backpressure or back siphonage Sizes $\frac{3}{8}$ " - 16"	ASSE 1015, AWWA C510, CSA B64.5, CSA B64.5.1
Double-check detector fire protection backflow prevention assemblies	Low hazard	Backpressure or back siphonage Sizes 2" - 16"	ASSE 1048
Pressure vacuum breaker assembly	High or low hazard	Back siphonage only Sizes $\frac{1}{2}$ " - 2"	ASSE 1020, CSA B64.1.2
Reduced pressure principle backflow prevention assembly and reduced pressure principle fire protection backflow prevention assembly	High or low hazard	Backpressure or back siphonage Sizes $\frac{3}{8}$ " - 16"	ASSE 1013, AWWA C511, CSA B64.4, CSA B64.4.1
Reduced pressure detector fire protection backflow prevention assemblies	o	Back siphonage or backpressure (Automatic fire-sprinkler systems)	ASSE 1047
Spill-resistant vacuum breaker	High or low hazard	Back siphonage only Sizes $\frac{1}{4}$ " - 2"	ASSE 1056, CSA B64.1.3
Backflow Preventer Plumbing Devices			
Anti siphon-type fill valves for gravity water closet flush tanks	High hazard	Back siphonage only	ASSE 1002/ASME A112.1002/CSA B125.12, CSA B125.3
Backflow preventer with intermediate atmospheric vents	Low hazard	Backpressure or back siphonage Sizes $\frac{1}{4}$ " - $\frac{3}{8}$ "	ASSE 1012, CSA B64.3
Dual-check-valve-type backflow preventers	Low hazard	Backpressure or back siphonage Sizes $\frac{1}{4}$ " - 1"	ASSE 1024, CSA B64.6
Hose-connection backflow preventer	High or low hazard	Low head backpressure, rated working pressure backpressure or back siphonage Sizes $\frac{1}{2}$ " - 1"	ASSE 1052, CSA B64.2.1.1
Hose-connection vacuum breaker	High or low hazard	Low head backpressure or back siphonage Sizes $\frac{1}{2}$ ", $\frac{3}{4}$ ", 1"	ASSE 1011, CSA B64.2, CSA B64.2.1
Laboratory faucet	High or low hazard	Low head backpressure	ASSE 1035, CSA B64.7

backflow preventer		and backsiphonage	
Pipe-applied atmospheric-type vacuum breaker	High or low hazard	Backsiphonage only Sizes 1/4" - 4"	ASSE 1001, CSA B64.1.1
Vacuum breaker wall hydrants, frost-resistant, automatic-draining type	High or low hazard	Low head backpressure or backsiphonage Sizes 3/4" - 1"	ASSE 1019, CSA B64.2.2
Other Means Or Methods			
Air gap	High or low hazard	Backsiphonage only	ASME A112.1.2
Air gap fittings for use with plumbing fixtures, appliances and appurtenances	High or low hazard	Backsiphonage or backpressure	ASME A112.1.3

For SI: 1 inch = 25.4 mm.

- a. Low hazard—See Pollution (Section R202).
- b. High hazard—See Contamination (Section R202).

P2902.5.4.1 Additives or nonpotable source. Where systems contain chemical additives or antifreeze, or where systems are connected to a nonpotable secondary water supply, the potable water supply shall be protected against backflow by a reduced pressure principle backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly. Where chemical additives or antifreeze is added to only a portion of an automatic fire sprinkler system or standpipe system, the reduced pressure principle fire protection backflow preventer shall be permitted to be located so as to isolate that portion of the system.

P2902.5.4 Connections to automatic fire sprinkler systems. The potable water supply to automatic fire sprinkler systems shall be protected against backflow by a double-check backflow prevention assembly, a double-check fire protection backflow prevention assembly, a reduced pressure principle backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly.

Exception: Where sprinkler systems are installed in accordance with Section P2904.1, backflow protection for the water supply system shall not be required.

P2904.1 General. The design and installation of residential fire automatic sprinkler systems shall be in accordance with NFPA 13D or Section P2904, which shall be considered to be equivalent to NFPA 13D. Partial residential sprinkler systems shall be permitted to be installed only in buildings not required to be equipped with a residential sprinkler system. Section P2904 shall apply to stand-alone and multipurpose wet-pipe sprinkler systems that do not include the use of antifreeze. A multipurpose fire sprinkler system shall provide domestic water to both fire sprinklers and plumbing fixtures. A stand-alone sprinkler system shall be separate and independent from the water distribution system. A backflow preventer shall not be required to separate a sprinkler system from the water distribution system, provided that the sprinkler system complies with all of the following:

1. The system complies with NFPA 13D or Section P2904.
2. The piping material complies with Section P2906.
3. The system does not contain antifreeze.
4. The system does not have a fire department connection.

2018 International Plumbing Code

**TABLE 608.1
APPLICATION OF BACKFLOW PREVENTERS**

DEVICE	DEGREE OF HAZARD^a	APPLICATION^b	APPLICABLE STANDARDS
Backflow prevention assemblies:			
Double check backflow prevention assembly and double check fire protection backflow prevention assembly	Low hazard	Backpressure or backsiphonage Sizes 3/8" - 16"	ASSE 1015, AWWA C510, CSA B64.5, CSA B64.5.1
Double check detector fire protection backflow prevention assemblies	Low hazard	Backpressure or backsiphonage Sizes 2" - 16"	ASSE 1048
Pressure vacuum breaker assembly	High or low hazard	Backsiphonage only Sizes 1/2" - 2"	ASSE 1020, CSA B64.1.2
Reduced pressure principle backflow prevention assembly and reduced pressure principle fire protection backflow assembly	High or low hazard	Backpressure or backsiphonage Sizes 3/8" - 16"	ASSE 1013, AWWA C511, CSA B64.4, CSA B64.4.1
Reduced pressure detector fire protection backflow prevention assemblies	High or low hazard	Backsiphonage or backpressure (automatic fire sprinkler systems)	ASSE 1047
Spill-resistant vacuum breaker assembly	High or low hazard	Backsiphonage only Sizes 1/4" - 2"	ASSE 1056; CSA B64.1.3
Backflow preventer plumbing devices:			
Antisiphon-type fill valves for gravity water closet flush tanks	High hazard	Backsiphonage only	ASSE 1002/ASME A112.1002/CSA B125.12, CSA B125.3
Backflow preventer for carbonated beverage machines	Low hazard	Backpressure or backsiphonage Sizes 1/4" - 3/8"	ASSE 1022
Backflow preventer with intermediate atmospheric vents	Low hazard	Backpressure or backsiphonage Sizes 1/4" - 3/4"	ASSE 1012, CSA B64.3
Dual-check-valve-type backflow preventer	Low hazard	Backpressure or backsiphonage Sizes 1/4" - 1"	ASSE 1024, CSA B64.6
Hose connection backflow preventer	High or low hazard	Low head backpressure, rated working pressure, backpressure or backsiphonage Sizes 1/2" - 1"	ASME A112.21.3, ASSE 1052, CSA B64.2.1.1
Hose connection vacuum breaker	High or low hazard	Low head backpressure or backsiphonage Sizes 1/2", 3/4", 1"	ASME A112.21.3, ASSE 1011, CSA B64.2, CSA B64.2.1
Laboratory faucet backflow preventer	High or low hazard	Low head backpressure and backsiphonage	ASSE 1035, CSA B64.7
Pipe-applied atmospheric-type vacuum breaker	High or low hazard	Backsiphonage only Sizes 1/4" - 4"	ASSE 1001, CSA B64.1.1
Vacuum breaker wall hydrants, frost-resistant, automatic-draining-type	High or low hazard	Low head backpressure or backsiphonage Sizes 3/4", 1"	ASME A112.21.3, ASSE 1019, CSA B64.2.2
Other means or methods:			
Air gap	High or low hazard	Backsiphonage or backpressure	ASME A112.1.2
Air gap fittings for use with plumbing fixtures, appliances and appurtenances	High or low hazard	Backsiphonage or backpressure	ASME A112.1.3
Barometric loop	High or low hazard	Backsiphonage only	(See Section 608.14.4)

For SI: 1 inch = 25.4 mm.

- a. Low hazard—See Pollution (Section 202).
- b. High hazard—See Contamination (Section 202).

608.17.4 Connections to automatic fire-sprinkler systems and standpipe systems. The potable water supply to automatic fire-sprinkler systems and standpipe systems shall be protected against backflow by a double check backflow prevention assembly, a double check fire protection backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly.

Exceptions:

1. Where systems are installed as a portion of the water distribution system in accordance with the requirements of this code and are not provided with a fire department connection, isolation of the water supply system shall not be required.
2. Isolation of the water distribution system is not required for deluge, preaction or dry pipe systems.

608.17.4.1 Additives or nonpotable source. Where systems under continuous pressure contain chemical additives or antifreeze, or where systems are connected to a nonpotable secondary water supply, the potable water supply shall be protected against backflow by a reduced pressure principle backflow prevention assembly or a reduced pressure principle fire protection backflow prevention assembly. Where chemical additives or antifreeze are added to only a portion of an automatic fire-sprinkler system or standpipe system, the reduced pressure principle backflow prevention assembly or the reduced pressure principle fire protection backflow prevention assembly shall be permitted to be located so as to isolate that portion of the system. Where systems are not under continuous pressure, the potable water supply shall be protected against backflow by an air gap or an atmospheric vacuum breaker conforming to ASSE 1001 or CSA B64.1.1.

Reason:

Across the I codes there are varying ways to describe an automatic sprinkler system. This proposal correlates several of the I codes to use the defined term of automatic sprinkler system. This allows for a better understanding of the term and application. Other proposals have been submitted to make several sprinkler and fire protection correlations and improvements.

Each section noted in this proposal has been changed to clarify what type of system is installed. In many cases, it is a simple deletion of the word "fire" or an added "automatic" and changes are to refer to the italicized term of automatic sprinkler system as is defined. Some sections are technical changes to reflect the intent of the code, for example the term "suppression" is used when clearly a sprinkler system is meant. Some areas a suppression and sprinkler system are meant for the fire protection.

In the IRC, several "residential" terms are removed and "automatic" inserted. The IRC, just as the other codes, use multiple ways to require the same system. It is appropriate to use the same italicized defined term of automatic sprinkler system.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Correlation

Internal ID: 3514

F15-18

IFC: 314.4

Proponent: Stephen DiGiovanni, Clark County, representing self (sdigiovanni@clarkcountynv.gov)

2018 International Fire Code

Revise as follows:

314.4 Vehicles. Liquid-fueled or gaseous-fueled vehicles, aircraft, boats or other motorcraft shall not be located indoors except as follows:

1. The engine starting system is made inoperable or batteries are disconnected except where the *fire code official* requires that the batteries remain connected to maintain safety features.
2. Fuel in fuel tanks does not exceed one-quarter tank or 5 gallons (19 L) (whichever is least).
3. Fuel tanks and fill openings are closed and sealed to prevent tampering.
4. Vehicles, aircraft, boats or other motorcraft equipment are not fueled or defueled within the building.

Reason:

There are two instances of past experience that have driven this code change in Southern Nevada. First, there are temporary displays of aircraft that have occurred, and the proposal intends to ensure that these aircraft are defueled prior to being located indoors for the purpose of display. Second, there are conventions that are almost entirely to show off accessories in vehicles, which require electrical power from the car battery. By allowing the battery to remain connected, while disabling the starting system, the accessories can be displayed, while mitigating the hazard of running vehicles in an assembly space.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not address building construction. It may cause a complication (which may require added expenses) for anyone that previously displayed aircraft indoors without following these requirements. With respect to the part about the engine starting system, that is only an option that is being provided, so there is no required increase in cost due to that change.

Internal ID: 937

F16-18

IFC: 315.1, 315.1.1 (New)

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Revise as follows:

315.1 General. Storage shall be in accordance with Sections 315.2 through 315.6. Outdoor pallet storage shall be in accordance with Sections 315.2 and 315.7.

~~**Exception:** Wood and wood composite pallets stored outdoors at pallet manufacturing and recycling facilities and complying with Section 2810.~~

Add new text as follows:

315.1.1 Outdoor storage. When stored outdoors, at pallet manufacturing and recycling facilities, plastic and plastic composite pallets listed and labeled in accordance with FM 4996, and wood and wood composite pallets, shall be permitted to comply with Section 2810.

Reason:

Many plastic pallets are constructed with materials that exhibit excellent fire performance, namely it is possible that they perform better than wood pallets. This is the case for pallets that have been made with plastics which have inherently good fire performance or with plastics that have been fire retarded. Both UL and FM label and list plastic pallets that meet a very severe fire test that involves full scale stacks of pallets. The FM standard, namely FM 4996, has been designed so that plastic pallets that meet the test are considered by FM as equivalent to wood pallets, both indoors and outdoors.

Testing using the tests above and using heat release tests has demonstrated that some plastic pallets can have not only equivalent fire performance to wood pallets but maybe even better fire performance. Several manufacturers of plastic pallets offer pallets that have been listed and labeled to the above standards. See some links below.

<http://prostack.com/products/plastic-pallets/fm-approved-plastic-pallets/>

<http://packagingrevolution.net/plastic-pallet-manufacturer-receives-fm-approval-for-halogen-free-pallets/>

<http://www.rpmpasticpallets.com/products/fire-retardant-pallets/>

The IFC contains a section (3206.4.1.1) which states that "Plastic pallets listed and labeled in accordance with UL 2335 or FM 4996 shall be treated as wood pallets for determining required sprinkler protection." In view of this section and the listing and labeling by FM, plastic pallets listed and labeled to FM 4996 should be treated the same as wood pallets for outside storage in manufacturing and recycling facilities also, without changing the new section 2810 which is specific to wood pallets. The recommendation is simply that the same storage requirements should apply.

Concerns have been expressed that the fire performance of the plastic pallets that have been listed and labeled to FM 4996 may decrease over time. It is important to note two issues with regard to that:

(1) plastic materials used for manufacturing plastic pallets are not coated to achieve the appropriate fire performance in the fire test but are compounded so that the pallet material is homogeneous. The additives (if any are used) are incorporated into the material and mixed in before the material is made into the product (such as the pallet). Therefore this is different than the effect of treating fabrics or wood with fire retardant additives, which is done after the fabric is woven or spun and is typically superficial. Similarly the treatment to wood products is made after the wood is harvested and is not an integral portion of the wood.

(2) facilities that manufacture or recycle pallets are unlikely to store their products for long periods before sale and, therefore, the storage of these plastic pallets outdoors is likely to be of a relatively short duration.

Note that the plastic pallets to which this proposal applies will have to be labeled to indicate that they have been listed to FM 4996.

Bibliography:

FM 4996 - Approval Standard for Classification of Pallets and Other Material Handling Products as Equivalent to Wood Pallets - available at FM Global web site

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal would allow more leeway for storage of plastic pallets listed and labeled to FM 4996 in facilities that manufacture or recycle them, without affecting fire safety.

Internal ID: 882

F17-18

IFC: 315.3.2, 1031.2, 3311.3 (New)

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

315.3.2 Means of egress. Combustible materials shall not be stored in *exits*, fire-resistance-rated corridors or enclosures for *stairways* and *ramps*. Combustible materials in the means of egress during construction, demolition, remodeling or alterations shall comply with Section 3311.3.

1031.2 Reliability. Required *exit accesses*, *exits* and *exit discharges* shall be continuously maintained free from obstructions or impediments to full instant use in the case of fire or other emergency where the building area served by the *means of egress* is occupied. An *exit*, fire-resistance-rated corridor or *exit passageway* shall not be used for any purpose that interferes with a *means of egress*.

3311.3 Storage. Combustible materials associated with construction, demolition, remodeling or alterations to an occupied structure shall not be stored in exits, fire-resistance-rated corridors, enclosures for stairways and ramps, or exit access corridors serving an occupant load of 30 or more.

Exceptions:

1. Where the only occupants are construction workers.
2. Combustible materials that are temporarily accumulated to support work being performed when workers are present.

Reason:

This proposal is intended to correct an anomaly that occurred when two unrelated proposals by different submitters collided in impact when the 2012 codes were printed and causes some to believe fire-resistance-rated corridors are not "exits".

I had submitted a proposal that included modifying then Section 1030.2, (now 1031.2), by taking language that existed in other portions of Chapter 10 and adding them to 1030.2 since the requirements were ones that not only applied at the time of construction, but must be maintained for the life of the building or structure. (Proposal F151-09/10 attached).

The International Fire Code Development Committee approved the proposal.

The main premise was protecting "exits" and including existing language that stated "An exit or exit passageway shall not be used for any purpose other than as a means of egress."

Note that though Section 3311.3 was not part of the code when the anomaly occurred, it has been added to this submittal because it includes all fire-resistance rated paths of travel and additionally includes exit access corridors which could be non-rated paths of travel

At the time my proposal (F151-09/10) was submitted and approved the definition of exit in the code was:

"EXIT. That portion of a means of egress system which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel between the exit access and the exit discharge . Exits include exterior exit doors at the level of exit discharge , vertical exit enclosures , exit passageways , exterior exit stairways , exterior exit ramps and horizontal exits.

That definition included fire-resistance-rated corridors by virtue of the first sentence and represented what historically was considered an exit.

Unfortunately during that cycle a separate proposal in front of another committee included a proposal that changed the definition of an exit to:

"EXIT. That portion of a means of egress system between the exit access and the exit discharge or public way. Exit components include exterior exit doors at the level of exit discharge, interior exit stairways, interior exit ramps, exit passageways, exterior exit stairways and exterior exit ramps and horizontal exits."

The definition currently reads:

"[BE] EXIT. That portion of a means of egress system between the exit access and the exit discharge or public way. Exit components include exterior exit doors at the level of exit discharge, interior exit stairways and ramps, exit

passageways, exterior exit stairways and ramps and horizontal exits.

[BE] EXIT ACCESS. That portion of a means of egress system that leads from any occupied portion of a building or structure to an exit."

Because of the new definition and some language in the commentary generically referring to corridors as exit access, it is no longer clear if a fire-resistance-rated corridor is included in the two fire code sections addressing exits as intended by the proposal approved by the committee. The need to protect a fire-resistant-rated corridor is as important as protecting an exit passageway and other types of exits as documented by the following section:

"[BE] 1020.6 Corridor continuity. Fire-resistance-rated corridors shall be continuous from the point of entry to an exit, and shall not be interrupted by intervening rooms. Where the path of egress travel within a fire-resistance-rated corridor to the exit includes travel along unenclosed exit access stairways or ramps, the fire-resistance-rating shall be continuous for the length of the stairway or ramp and for the length of the connecting corridor on the adjacent floor leading to the exit.

Exceptions:

1. Foyers, lobbies or reception rooms constructed as required for corridors shall not be construed as intervening rooms.
2. Enclosed elevator lobbies as permitted by Item 1 of Section 1016.2 shall not be construed as intervening rooms."

By adding the wording "fire-resistance-rated corridor" to the two sections in this proposal the intent of the committee approval of F151-09/10 will be met.

F151-09/10

1030.2, 1030.2.1, 1030.6, 1030.9 (New)

Proponent: Robert J Davidson, Code Consultant/Alan Shuman, President, representing the National Association of State Fire Marshals (NASFM)

1. Revise as follows:

1030.2 Reliability. Required exit accesses, exits or exit discharges shall be continuously maintained free from obstructions or impediments to full instant use in the case of fire or other emergency when the areas served by such exits are occupied. An exit or exit passageway shall not be used for any purpose other than as a means of egress.

1030.2.1 Security devices and egress locks. Security devices affecting means of egress shall be subject to approval of the fire code official. Special locking arrangements including, but not limited to access-controlled egress doors, security grills, locks and latches, and delayed egress locks shall be installed and maintained as required by this chapter.

1030.6 Finishes, furnishings and decorations. Means of egress doors shall be readily maintained in such a manner as to be distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Furnishings, decorations or other objects shall not be placed so as to obstruct exits, access thereto, egress therefrom, or visibility thereof. Hangings and draperies shall not be placed over exit doors or otherwise be located to conceal or obstruct an exit. Mirrors shall not be placed on exit doors. Mirrors shall not be placed in or adjacent to any exit in such a manner as to confuse the direction of exit.

2. Add new text as follows:

1030.9 Floor identification signs. The floor identification signs required by Sections 1022.8 and 4504.22 shall be maintained in an approved manner.

Reason: The proposed modification Section 1030.2 has taken language that currently exists in Sections 1020.1 and 1023.1 and added it to this section since the requirement is one that not only applies at the time of construction, but must be maintained for the life of the building or structure.

1020.1 General. Exits shall comply with Sections 1020 through 1026 and the applicable requirements of Section 1003 through 1012. An exit shall not be used for any purpose that interferes with its function as a means of egress. Once a given level of exit protection is achieved, such level of protection shall not be reduced until arrival of the exit discharge.

1023.1 Exit passageway. Exit passageways serving as an exit component in a means of egress system shall comply with the requirements of this section. An exit passageway shall not be used for any purpose other than as a means of egress.

The last sentence of Section 1030.2 addressing "security" is a special topic and has been separated out and designated as 1030.2.1. Language has been added to make it clear any of a number of methods used to control the use of or secure egress doors must be done in compliance with Chapter 10, which has specific provisions governing the installations when approved.

The proposed change to 1030.6 takes a restriction found in Section 1008.1 that equally applies to new construction, but also must be addressed through the life of the building or structure. It is not uncommon for a building owner to refinish the inside of an occupancy and paint or otherwise apply a matching finish to a door and the surrounding wall making the door indistinguishable. This commonly occurs with murals that are painted on walls of corridors.

1008.1 Doors. Means of egress doors shall meet the requirements of this section. Doors serving a means of egress system shall meet the requirements of this section and Section 1017.2. Doors provided for egress purposes in numbers greater than required by this code shall meet the requirements of this section.

Means of egress doors shall be readily distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Mirrors or similar reflecting materials shall not be used on means of egress doors. Means of egress doors shall not be concealed by curtains, drapes, decorations or similar materials.

A new Section 1030.9 is proposed which references the language found in existing Section 1022.8. The requirement for the maintenance of signs designating floor levels in interior stairway exit enclosures has equal importance in existing buildings.

Cost Impact: The code change proposal will not increase the cost of construction other than the signs needed for compliance with proposed Section 1022.8.

Public Hearing:	Committee:	AS	AM	D
	Assembly:	ASF	AMF	DF

ICCFLENAME: DAVIDSON-SHUMAN-F3-1030.2.DOC

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Since this proposal addresses a topic that deals with maintenance of a exit path during day to day activities, it does not impact the cost of construction.

Analysis: Note that this proposal includes sections that are part of an errata to the 2018 IFC. Section 315.3.2 the second sentence is new and Section 3311.3 is a new section to the 2018 that was inadvertently missed during publication.

F18-18

IFC: 315.8 (New); IBC: [F] 307.1, [F]307.4

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Tesla, USA
(rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Add new text as follows:

315.8 Used or Off Specification Lithium-Ion Batteries. The storage of used or off specification lithium-ion batteries shall comply with the following as appropriate:

1. Gathering locations in occupancies other than those involving Mercantile occupancy battery recycling activities shall comply with Section 315.8.1.
2. Mercantile occupancy battery sale recycling activities shall comply with Section 315.8.2.
3. Indoor collection and storage activities exceeding the limitations of Sections 315.8.1 or Section 315.8.2 occurring in mixed occupancy buildings shall comply with Section 315.8.3.
4. Indoor storage and recycling activities in detached buildings shall comply with Section 315.8.4.
5. Outdoor storage shall comply with Section 315.8.5.

315.8.1 Gathering locations. Indoor storage of used and off specification lithium-ion batteries being gathered for shipment to recycling facilities shall be in rooms or spaces protected by an automatic sprinkler system complying with Section 903.3.1.1. Batteries quantities shall not exceed one cubic ft. (0.03 m³) per fire area, and the batteries shall be stored in open top noncombustible containers spaced a minimum 3 ft. (914 mm) from combustible materials and a minimum 10 feet (3048 mm) from exits from the room, space or building.

315.8.2 Mercantile battery sale recycling locations. Rooms or spaces associated with mercantile battery sale recycling activities shall not exceed 100 sq. ft. in size. The rooms or spaces shall be separated from the remainder of the building areas by two-hour fire barriers constructed in accordance with Section 707 of the International Building Code and two-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate. The room or space shall be protected by a radiant-energy detection system installed in accordance with NFPA 72 and shall be protected by an automatic sprinkler system designed and installed in accordance with Section 903.3.1.1.

315.8.3 Indoor storage in mixed occupancies. Mixed occupancy indoor storage and recycling activities not meeting the limitations of Section 315.8.1 or Section 315.8.2 shall be classified as a Group H-2 occupancy and shall be in rooms or spaces not exceeding 5000 sq. ft. (464 m²) in area separated from the remainder of the building areas by three-hour fire barriers constructed in accordance with Section 707 of the International Building Code and three-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate.

Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³) with a 5 foot separation to the next pile. Piles shall not be located within 10 feet of exits from the room, space or building.

315.8.3.1 Prevention and Mitigation. Occupancies storing used or off specification lithium-ion batteries shall have a plan approved by the fire code official that provides for the prevention of fire incidents and includes early detection mitigation measures.

315.8.3.2 Fire detection. The room or space shall be protected by a radiant-energy detection system installed in accordance with Section 907.

315.8.3.3 Fire suppression. The building the battery storage is located in shall be provided with an automatic fire suppression system installed in accordance with Section 903.1.1. The Group H-2 battery storage room or space shall be protected by a NFPA 15 water spray automatic suppression system installed in accordance with Section 904.12 with a density based on large scale fire testing complying with Section 1206.2.11.

315.8.3.4 Explosion protection. Explosion protection shall be installed in accordance with Section 911.

315.8.4 Detached buildings. Indoor storage and recycling activities shall be permitted in Group H-2 detached buildings located more than 100 feet (30.5 M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards. The storage shall comply with the following:

1. Individual rooms or areas inside the building shall not exceed 7,000 sq ft (650 m²) and shall be are separated from other areas by three hour fire barriers constructed in accordance with Section 707 of the International Building Code and three-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate.
2. The building shall be protected by a radiant-energy detection system installed in accordance with Section 907.
3. Any area containing lithium-ion batteries shall be protected by a NFPA 15 water spray automatic suppression system installed in accordance with Section 904.12 with a density based on large scale fire testing complying with Section 1206.2.11.
4. Explosion protection shall be installed in accordance with Section 911.
5. Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³) with a 5 foot separation to other piles, walls, appliances and equipment. Piles shall not be located within 10 feet of exits from the room, space or building. There shall be no more than 64 piles per room or space.
6. A plan approved by the fire code official that provides for the prevention of fire incidents and includes early detection mitigation measures.

315.8.5 Outdoor storage. Outdoor storage shall comply with the following:

1. Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³).
2. Piles located outdoors shall be separated by a minimum 100 feet (30.5 M) from the following exposures:
 - 2.1 Lot lines
 - 2.2 Public ways
 - 2.3 Buildings
 - 2.4 Stored combustible materials
 - 2.5 Hazardous materials
 - 2.6 High-piled stock
 - 2.7 Other exposure hazards

Exception: Clearances are permitted to be reduced to 3 ft. (914 mm) when a 3-hour free standing fire barrier, suitable for exterior use, and extending 15 ft. (1.5 m) above and extending 15 ft (1.5 m) beyond the physical boundary of the pile is provided to protect the exposure.

2018 International Building Code

[F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in *control areas* complying with Section 414, based on the maximum allowable quantity limits for *control areas* set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the International Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the International Fire Code.

Revise as follows:

[F] 307.4 High-hazard Group H-2. Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning shall be classified as Group H-2. Such materials shall include, but not be limited to, the following:

- Class I, II or IIIA flammable or combustible liquids that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103.4 kPa).
- Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.

- Cryogenic fluids, flammable.
- Flammable gases.
- Organic peroxides, Class I.
- Oxidizers, Class 3, that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103 kPa).
- Pyrophoric liquids, solids and gases, nondetonable.
- Storage of used or off specification lithium-ion batteries in mixed use or detached buildings shall be in accordance with Section 315.8 of the International Fire Code.
- Unstable (reactive) materials, Class 3, nondetonable.
- Water-reactive materials, Class 3.

Reason:

Lithium-ion batteries have significant fire and explosion hazards and there have been some serious fires and explosions associated with storage of used batteries in recycling and disposal facilities, including a serious event in Hilden Germany that seriously injured three fire fighters.

This proposal adds requirements for protecting storage of lithium-ion batteries being stored on premise prior to sending to recycling or disposal facilities, and for storage at recycling or disposal facilities. The requirements are broken down to address those with a small collection area, mercantile occupancies that have collection areas for returned batteries, storage at recycling or disposal facilities in mixed use buildings and storage at recycling or disposal facilities in detached buildings. The hazard is addressed by adding requirements for fire protection features, amounts that can be present, and fire-resistant construction separation. The larger areas permitted for storage at recycling or disposal facilities in mixed use and detached buildings will be classified as an H-2 Group. The outdoor storage setback requirements are consistent with setback requirements for outdoor electrochemical energy storage system installations.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

However this will limit the facilities where used or off specification lithium-ion batteries can be stored.

Internal ID: 315

F19-18

IFC: 317.2

Proponent: Jason Wilen AIA CDT RRO, National Roofing Contractors Association (NRCA), representing National Roofing Contractors Association (NRCA) (jwilen@nrca.net)

2018 International Fire Code

Revise as follows:

317.2 Rooftop garden or landscaped roof size. Rooftop garden or landscaped roof areas shall not exceed 15,625 square feet (1450 m²) in size for any single area with a maximum dimension of 125 feet (39 m) in length or width. A minimum 6-foot-wide (1.8 m) clearance consisting of a listed Class A ~~rated roof system complying roof assembly~~ tested in accordance with ASTM E108 or UL 790 shall be provided between adjacent rooftop gardens or landscaped roof areas.

Reason:

The purpose of this change is to improve the consistency of similar text noted in multiple I-Codes. The reference to a “Class A rated roof system” in Section 317.2 is similar to text in IBC Section 1505.1; the IBC section that establishes how Class A roof assemblies are determined. The proposed change borrows text from IBC Section 1505.1 improving consistency and making clear an assembly (not a system) evaluation is necessary as per ASTM E108 and UL 790—the test methods referenced in both IFC section 317.2 and IBC section 1505.1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change does not change the stringency of the code.

Internal ID: 1224

F20-18

IFC: 319.9.1.3, Chapter 80, CSA Group (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

319.9.1.3 CNG container construction. CNG containers shall be an NGV-2 cylinder.

Add new standard(s) follows:

CHAPTER 80 REFERENCED STANDARDS

CSA Group

CSA/ANSI NGV 2-2016

Compressed natural gas vehicle fuel containers

Reason:

During the development cycle for 2018 IFC Section 319 was added to address requirements for mobile food preparation vehicles. Section 319.3.1.3 required that natural gas supply be from containers listed as NGV-2 containers. However, the NGV-2 reference standard was not included with the reference standards of Chapter 80. This proposal attempts to fix the oversight by referencing the latest edition of the standard.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is simply adding the appropriate referenced standard and will have no cost impact. The standard is already referenced.

Analysis: A review of the standard proposed for inclusion in the code, CSA/ANSI NGV 2-2016, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 289

F21-18

IFC: SECTION 320 (New), 320.1 (New)

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Add new text as follows:

SECTION 320 ARTIFICIAL DECORATIVE VEGETATION

320.1 General. Artificial decorative vegetation placed outdoors, either within 30 feet (9140 mm) of a building, or on an occupied roof of a building, shall comply with Sections 807.4.1 and 807.4.2

Reason:

There is abundant evidence that combustible materials outdoors can cause severe fires that can spread to a nearby building. One example is artificial decorative vegetation. The recent fire at the Cosmopolitan Hotel in Las Vegas (which involved unregulated decorative vegetation) has demonstrated that combustible materials in occupiable roofs can also cause significant fire damage. The distance of 30 feet was chosen because it is considered the distance beyond which accessory structures in wildland areas cease being a serious fire safety concern. The fire testing recommended (807.4.1) is the same as for indoor artificial vegetation, namely either NFPA 701 (test methods 1 or 2, as appropriate, based on the type of material) or NFPA 289, with a 20 kW ignition source. The additional requirement (807.4.2) is that no unlisted electrical wiring or lighting is permitted on the decorative vegetation item.

Cost Impact

The code change proposal will increase the cost of construction .

Artificial decorative vegetation used outdoors near a building or on a roof will have to be fire tested.

Internal ID: 2327

F22-18

IFC: 105.6.1 (New), 202(New), 301.2, 302.1, 320 (New), Chapter 80

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

105.6.1 Additive Manufacturing. An operational permit is required to conduct additive manufacturing operations as covered in Section 320.3.

3D PRINTER. A machine used in the additive manufacturing process for fabricating objects through the deposition of a material using a print head, nozzle, or another printer technology.

ADDITIVE MANUFACTURING. A process of joining materials to make objects from 3D model data, usually layer upon layer, sometimes referred to as 3D printing. The Code recognizes two types of additive manufacturing:

Industrial additive manufacturing. 3D printing that uses equipment external to the 3D printer for feed of powders or dust collection.

Non-industrial additive manufacturing. 3D printing which exclusively uses self-contained 3D printing equipment without external powder supply, dust collection system, or inert gas supply.

Revise as follows:

301.2 Permits. Permits shall be required as set forth in Section 105.6 for the activities or uses regulated by Sections 306, 307, 308, 315 and ~~315-320~~.

302.1 Definitions. The following terms are defined in Chapter 2:

3D PRINTER.

ADDITIVE MANUFACTURING.

BONFIRE.

HI-BOY.

HIGH-VOLTAGE TRANSMISSION LINE.

OPEN BURNING.

PORTABLE OUTDOOR FIREPLACE.

POWERED INDUSTRIAL TRUCK.

RECREATIONAL FIRE.

SKY LANTERN.

Add new text as follows:

SECTION 320 ADDITIVE MANUFACTURING (3D PRINTING)

320.1 General. Additive manufacturing equipment and operations shall comply with Section 320.

320.1.1 Scope. Additive manufacturing shall comply with one of the following:

1. Non-industrial additive manufacturing shall comply with Section 320.2.
2. Industrial additive manufacturing shall comply with Section 320.3.

320.2 Non-industrial additive manufacturing. Non-industrial additive manufacturing equipment and operations shall comply with Section 320.2.1 through 320.2.5.

320.2.1 Industrial manufacturing. Non-industrial additive manufacturing equipment and operations shall comply

with Section 320.2. Additive manufacturing equipment and operations that do not comply with 320.2.1 through 320.2.5 shall comply with Section 320.3.

320.2.2 Listing. 3D printers used in non-industrial additive manufacturing shall be listed and labeled in accordance with UL 60950-1 or UL 62368-1. The listing shall also verify:

1. The 3D printers are self-contained and do not utility ancillary equipment, other than pre-packaged production materials.
2. The operation of the 3D printers will not create a hazardous (classified) environment outside of the unit's outer enclosure as defined in NFPA 70, Article 500.
3. The 3D printers are only intended for use with maximum 30 liter prepackaged production materials, which are investigated with the 3D printer and identified in the manufacturer's instruction.

320.2.3 Installation, operation and maintenance. 3D printers shall be installed, operated and maintained in accordance with this Code, the listing and the manufacturer's instructions.

320.2.4 Installation limitations. Non-industrial additive manufacturing shall be limited to installations and operations that comply with all of the following:

1. Do not utilize external dust collection systems.
2. Do not utilize external inert gas supplies for creating an inert environment.
3. Do not utilize automated external powder feed or sieve features.
4. Do not utilize hazardous materials in excess of the maximum allowable quantities regulated by Chapter 50.

320.2.5 Occupancies. Non-industrial additive manufacturing shall be permitted in all occupancy groups.

320.3 Industrial additive manufacturing. Industrial additive manufacturing equipment and operations shall comply with Section 320.3.1 through 320.3.9.

320.3.1 Additive manufacturing operations and equipment. Additive manufacturing operations and equipment that do not comply with Section 320.2 shall comply with Section 320.3.

320.3.2 Permits required. Permits shall be obtained from the fire code official in accordance with Section 105.6 prior to engaging in industrial additive manufacturing operations.

320.3.3 Listing. 3D printers used in industrial additive manufacturing shall be listed and labeled in accordance with UL 2011 or approved for the application based on a field evaluation conducted by an approved agency.

320.3.4 Installation, operation and maintenance. Industrial additive manufacturing equipment shall be installed, operated and maintained in accordance with this code, the manufacturer's instructions and where applicable the listing.

320.3.5 Combustible dusts and metals. Industrial additive manufacturing operations that use or generate combustible dust or combustible metals shall comply with Chapter 22, Chapter 50 and this section.

320.3.5.1 Powder evaluation. Printing powders used in industrial additive manufacturing operations shall be tested for combustibility in accordance with NFPA 484 or 654 as applicable. A copy of test reports shall be provided to the fire code official upon request.

320.3.5.2 Combustible (non-metallic) dusts. Industrial additive manufacturing that uses combustible (non-metallic) dusts shall comply with NFPA 654.

320.3.5.3 Combustible metals. Industrial additive manufacturing operations that use combustible metals shall also comply with NFPA 484.

320.3.5.4 Ancillary equipment. Ancillary equipment provided for recycling, sieving, vacuuming or handling combustible powders shall be designed and approved for such use.

320.3.6 Hazardous materials. Industrial additive manufacturing operations that use hazardous materials exceeding the maximum allowable quantities shall comply with Chapter 50.

320.3.7 Technical assistance. Where required by the fire code official, a report evaluating the acceptability of technologies, processes, products, facilities, materials and uses associated with the operation shall be provided in accordance with 104.7.2 and approved.

320.3.8 Performance based design alternative. Where approved by the fire code official, buildings and facilities where industrial additive manufacturing is performed shall be permitted to comply with the performance based design options in Section 5001.3 as an alternative to compliance with the other requirements set forth in this Section.

320.2.9 Occupancies. Industrial additive manufacturing shall only be conducted in the occupancy groups associated with manufacturing operation, and permitted by the Chapter 50 maximum allowable quantity tables. Where approved, the requirements in Section 320.3.6 shall be permitted to provide the technical basis for determining compliance with Table 5003.1.1(1), footnote q.

Add new standard(s) follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

2011-06:

Factory Automation Equipment

60950-1—14:

Information Technology Equipment - Safety Requirements

62368-1—14:

Audio/video, Information and Communication Technology Equipment - Safety Requirements

Reason:

The use of additive manufacturing, often referred to as 3D printing, is becoming more prevalent in industrial and non-industrial applications. This proposal introduces basic safety requirements for these operations.

Non-industrial additive manufacturing - 3D printers are available for less than \$500 and are being used in classrooms, offices and businesses for producing customized products and prototypes. Section 320.2 establishes basic safety requirements for this self-contained equipment, which includes pre-packaged production materials. The product listing is being relied upon to verify that the equipment operates safely and does not create a hazardous (classified) area outside of the unit.

Industrial use additive manufacturing - Section 320.3 covers 3D additive manufacturing operations, which includes all operations that aren't covered by Section 320.2. These are typically industrial operations using external powder feed supplies, dust collection systems and/or inert gas supplies. Some of the requirements for industrial operations are as follows:

320.3.3 requires the industrial 3D printer to be listed to UL 2011, but includes an option for non-listed equipment to be approved based on a field evaluation.

320.3.6 was added due to the new unique challenges some jurisdictions may face in approving industrial additive manufacturing operations. Among other resources they can use is a risk assessment conducted in accordance with the UL 3400 Outline of Investigation for Additive Manufacturing Facility Safety Management, which is applicable where parts are manufactured using powder-based additive manufacturing techniques.

This section also includes a pointer to the Section 5001.3 performance based design option, which has been used in some industrial additive manufacturing operations.

An operational permit is required for industrial additive operations.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

There is no significant cost increase for non-industrial additive manufacturing covered by Section 320.2, unless the price of listed equipment is higher than non-listed equipment. There are increased costs for industrial additive manufacturing operations that might be related to obtaining listed equipment, and the operational permit fees.

Analysis: A review of the standard proposed for inclusion in the code, UL 2011-06, UL 60950-1-14, and UL 62368-1—14, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

IFC: SECTION 320 (New), 320.1 (New), 320.2 (New), 320.3 (New), 320.4 (New), 320.5 (New), 320.6 (New)

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Add new text as follows:

SECTION 320 OUTDOOR FURNITURE AFFIXED OUTSIDE BUILDINGS

320.1 General. Outdoor furniture, such as benches, that are affixed outside buildings, shall be considered storage and shall comply with section 315 and this section.

Exception: Outdoor furniture placed beneath overhead projections from buildings where automatic sprinklers are installed under such projections in accordance with Section 315.4.1.

320.2 Distance from buildings. Furniture placed outdoors shall not be affixed within 5 feet (1524 mm) of any building, except if it is labeled as having complied with any one of Sections 320.3 through 320.6.

320.3 Traditional materials. The furniture shall be constructed entirely of wood, identified for outdoor use, and non-combustible materials, complying with Section 703.5.1 of the International Building Code.

320.4 Plastic composites. The furniture shall be constructed entirely of materials that meet all the requirements for plastic composite deck boards, in accordance with section 2612 of the International Building Code.

320.5 Heat release. The furniture shall be constructed entirely of materials intended for outdoor use that exhibit a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation.

320.6 Full scale testing. The furniture shall be constructed entirely of materials intended for outdoor use and the entire item of furniture shall exhibit a maximum rate of heat release not exceeding 100 kW when tested in accordance with NFPA 289, using the 20 kW ignition source.

Reason:

Section 315 of the IFC addresses storage, including, particularly, storage beneath overhead projections from buildings (Section 315.4.1). However, storage is defined as something intended for future use. The IFC code does not make it clear whether items placed permanently (for example by being secured or screwed in place) near a building (or against a building) for their immediate use are necessarily considered to be “stored” and whether the storage section applies.

It has been found that when plastic benches are attached to buildings and placed underneath overhead projections, they can result in severe fires that can destroy the overhang and then continue to destroy the building itself. ATF conducted tests on several plastic lumber benches simulating an actual incident. In the incident, a plastic lumber bench attached to a brick wall, from the outside, at a school and under an overhang, was ignited with a small ignition source (child’s coat) and the entire school was destroyed soon after ignition. Tests conducted by GBH International showed that a Southern Yellow Pine (standard park bench lumber) would have performed much better and that even some plastic lumber materials could have done much better. The maximum heat release rate of plastic lumber bench ignited in this type of scenario is very high and can be above 4 MW, while the wood bench did not ignite the overhang. An attached set of pictures and information shows key results.

It is interesting that the IFC does an excellent job in regulating garbage cans and laundry carts placed near buildings (even if they are not secured in place) but it does not regulate park benches, or other park furniture.

It has been explained that the practice of placing park benches under an overhang is a common feature in areas where rain is frequent, for protection.

The code proposal would allow benches, or other outdoor furniture, constructed of wood or of non-combustible materials without further requirements (traditional materials).

If plastic benches (or plastic composite benches) are proposed to be placed near buildings, the proposal states that they need to comply with one of the following: (a) the same requirements as plastic composites used for deck boards (i.e. section 2612 of the IBC), (b) the same heat release results from ASTM E1354 that materials used for garbage cans or laundry carts are required to meet (i.e. section 304.3 or 318.1) or the same heat release results as decorative

materials (i.e. section 807.3) or foam plastic exhibit booths (i.e. section 807.5.1) are required to meet.

At the same time the code proposal clarifies that combustible products placed for immediate use outside buildings must comply with the same storage requirements as those stored for future use, in section 315. This means that if the furniture is placed beneath overhead projections, automatic sprinklers must be installed under such projections, per 315.4.1, as shown below.

315.4.1 Storage beneath overhead projections from buildings. Where buildings are protected by an automatic sprinkler system, the outdoor storage, display and handling of combustible materials under eaves, canopies or other projections or overhangs are prohibited except where automatic sprinklers are installed under such eaves, canopies or other projections or overhangs.

Cost Impact

The code change proposal will increase the cost of construction .

This code proposal will require that outdoor furniture affixed near a building must have improved fire performance, which will improve fire safety.

F24-18

IFC: 403.3, 403.3.1, 403.3.2, 403.3.3, 403.3.4, 403.8.2

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

403.4 Group B occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for buildings containing a Group B occupancy where the Group B occupancy has an *occupant load* of 500 or more persons or more than 100 persons above or below the lowest *level of exit discharge* and for buildings having an ambulatory care facility.

Revise as follows:

~~403.3.4~~**403.4.1 Ambulatory care facilities.** Ambulatory care facilities shall comply with the requirements of Sections 401, 403.3.1 through 403.3.4 and 404 through 406.

~~403.3.14~~**403.4.1.1 Fire evacuation plan.** The fire safety and evacuation plan required by Section 404 shall include a description of special staff actions. This shall include procedures for stabilizing patients in a defend-in-place response, staged evacuation, or full evacuation in conjunction with the entire building if part of a multitenant facility.

~~403.3.24~~**403.4.1.1.1 Fire safety plan.** A copy of the plan shall be maintained at the facility at all times. The plan shall include all of the following in addition to the requirements of Section 404:

1. Locations of patients who are rendered incapable of self-preservation.
2. Maximum number of patients rendered incapable of self-preservation.
3. Area and extent of each ambulatory care facility.
4. Location of adjacent smoke compartments or refuge areas, where required.
5. Path of travel to adjacent smoke compartments.
6. Location of any special locking, delayed egress or access control arrangements.

~~403.3.34~~**403.4.1.2 Staff training.** Employees shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by the staff not less than every two months. A copy of the plan shall be readily available at all times within the facility.

~~403.3.44~~**403.4.1.3 Emergency evacuation drills.** Emergency evacuation drills shall comply with Section 405.

Exception: The movement of patients to safe areas or to the exterior of the building is not required.

403.8 Group I occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group I occupancies. Group I occupancies shall comply with Sections 403.8.1 through 403.8.3.4.

403.8.1 Group I-1 occupancies. Group I-1 occupancies shall comply with Sections 403.8.1.1 through 403.8.1.7.

403.8.2 Group I-2 occupancies. Group I-2 occupancies shall comply with Sections ~~401,~~403.8.2.1 through 403.8.2.3 and ~~404~~ through 406.

403.8.3 Group I-3 occupancies. Group I-3 occupancies shall comply with Sections 403.8.3.1 through 403.8.3.4.

403.10 Group R occupancies. Group R occupancies shall comply with Sections 403.10.1 through 403.10.3.6.

403.10.3 Group R-4 occupancies. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group R-4 occupancies. Group R-4 occupancies shall comply with Sections 403.10.3.1 through 403.10.3.6.

Reason:

This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. At the end of this reason is a clean version of what these

sections would look like if all the proposals pass.

This proposal moves specific ambulatory care facility criteria so that it is a subset of Group B. Per the last phrase in Section 403.4 – so this is where it belongs. In Section 403.8.2, the reference to 401 and 404 through 406 is inconsistent and not necessary – These sections would already be required where applicable.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC), and ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

The following is the Fire and Safety Evacuation plans for ambulatory care, Group I-1, I-2, I-3 and R-4 if all proposals pass.

403.4 Group B occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for buildings containing a Group B occupancy where the Group B occupancy has an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge and for buildings having an ambulatory care facility.

403.4.1 Ambulatory care facilities. Ambulatory care facilities shall comply with the requirements of Sections 403.3.1 through 403.3.4.

403.4.1.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include a description of special staff actions. This shall include procedures for stabilizing care recipients in a defend-in-place response, staged evacuation, or full evacuation in conjunction with the entire building if part of a multitenant facility.

403.4.1.1.1 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plans shall include all of the following in addition to the requirements of Section 404.2.2:

1. Locations of care recipients who are rendered incapable of self-preservation.
2. Maximum number of care recipients rendered incapable of self-preservation.
3. Area and extent of each ambulatory care facility.
4. Location of any special locking-arrangements.

403.4.1.2 Staff training. Staff shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by the staff at intervals not exceeding three months. Training of new staff shall be provided promptly upon entrance to duty.

Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

403.8 Group I occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group I occupancies. Group I occupancies shall comply with Sections 403.8.1 through 403.8.3.4.

403.8.1 Group I-1 occupancies. Group I-1 occupancies shall comply with Sections 403.8.1.1 through 403.8.1.7.

403.8.1.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include a description of special staff actions. The plans shall include all of the following in addition to the requirements of Section 404.

Procedures for full evacuation of care recipients

In Group I-1, Condition 2, procedures for staged evacuation of care recipients through a refuge area in an adjacent smoke compartment and then to an exterior assembly point.

Shall be amended or revised upon admission of any care recipients with unusual needs.

403.8.1.1.2 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plans shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of care recipients sleeping rooms.
2. Location of special locking or egress control arrangements.

403.8.1.2 Staff training. Staff shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by staff at intervals not exceeding three months. Training of new staff shall be provided promptly upon entrance to duty.

Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

403.8.1.3 Resident training. Residents capable of assisting in their own evacuation shall be trained in the proper actions to take in the event of a fire. In Group I-1, Condition 2 occupancies, training shall include evacuation through an adjacent smoke compartment and then to an exterior assembly point. The training shall include actions to take if the primary escape route is blocked. Residents shall be trained to assist each other in case of fire to the extent their physical and mental abilities permit them to do so without additional personal risk.

403.8.1.4 Drill frequency. In addition to the evacuation drills required in Section 405.2, staff shall participate in drills an additional two times a year on each shift. Twelve drills with all occupants shall be conducted in the first year of operation.

403.8.2 Group I-2 occupancies. Group I-2 occupancies shall comply with Sections 403.8.2.1 through 403.8.2.3.

403.8.2.1 Fire safety and evacuation plan. The fire safety and evacuation plans required by Section 404 shall include a description of special staff actions. The plans shall include all of the following in addition to the requirements of Section 404.

1. Procedures for evacuation for care recipients with needs for containment or restraint and post-evacuation containment, where present.
2. A written plan for maintenance of the means of egress.
3. Procedure for a defend-in-place strategy.
4. Procedures for a full-floor or building evacuation, where necessary.

In Group I-2, Condition 2, shall be amended or revised upon admission of any care recipients with unusual needs.

403.8.2.1.1 Fire safety plan. A copy of the plan shall be maintained at the facility at all times. Plans shall include all of the following in addition to the requirements of Section 404.2.2:

1. Location and number of care recipients sleeping rooms and operating rooms.
2. Location of special locking, ~~delayed egress or access control~~ arrangements.

403.8.2.2 Staff training. Staff shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by staff at intervals not exceeding three months. Training of new staff shall be provided promptly upon entrance to duty.

Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

403.8.3 Group I-3 occupancies. Group I-3 occupancies shall comply with Sections 403.8.3.1 through 403.8.3.4.

403.8.3.1 Fire safety and evacuation plan. The fire safety and evacuation plans required by Section 404 shall include a description of special staff actions. Plans shall include all of the following in addition to the requirements of Section 404.

1. Procedures for evacuation for detainees with needs for containment or restraint and post-evacuation containment, where present.
2. Procedure for a defend-in-place strategy.
3. Procedures for a full-floor or building evacuation, where necessary.

403.8.3.1.1 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. Plans shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of cells.
2. Location of special locking arrangements.

403.8.3.2 Staff training. Staff shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by staff at intervals not exceeding three months. Training of new staff shall be provided promptly upon entrance to duty.

Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

403.8.3.3 Staffing. Group I-3 occupancies shall be provided with 24-hour staffing. A staff person shall be within three floors or 300 feet (91 440 mm) horizontal distance of the access door of each resident housing area. In Group I-3 Conditions 3, 4 and 5, as defined in Chapter 2, the arrangement shall be such that the staff involved can start release

of locks necessary for emergency evacuation or rescue and initiate other necessary emergency actions within 2 minutes of an alarm.

Exception: A staff person shall not be required to be within three floors or 300 feet (91 440 mm) horizontal distance of the access door of each resident housing area in areas in which all locks are unlocked remotely and automatically in accordance with Section 408.4 of the International Building Code.

403.8.3.4 Notification. Provisions shall be made for residents in Group I-3 Conditions 3, 4 and 5, as defined in Chapter 2, to readily notify staff of an emergency.

403.8.3.5 Keys. Keys necessary for unlocking doors installed in a means of egress shall be individually identifiable by both touch and sight.

403.10 Group R occupancies. Group R occupancies shall comply with Sections 403.10.1 through 403.10.3.6.

403.10.3 Group R-4 occupancies. An approved fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for Group R-4 occupancies. Group R-4 occupancies shall comply with Sections 403.10.3.1 through 403.10.3.6.

403.10.3.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include a description of special staff actions. The plans shall include the procedures necessary for full evacuation of care recipients, and shall be amended or revised upon admission of a care recipients with unusual needs.

403.10.3.1.1 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of ~~resident~~ care recipients sleeping rooms.
2. Location of special locking or ~~egress control~~ arrangements.

403.10.3.2 Staff training. Staff shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by staff at intervals not exceeding three months. Training of new staff shall be provided promptly upon entrance to duty.

Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

403.10.3.3 Resident training. Residents capable of assisting in their own evacuation shall be trained in the proper actions to take in the event of a fire. The training shall include actions to take if the primary escape route is blocked. Residents shall be trained to assist each other in case of fire to the extent their physical and mental abilities permit them to do so without additional personal risk.

403.10.3.4 Drill frequency. In addition to the evacuation drills required in Section 405.2, staff shall participate in drills an additional two times a year on each shift . Twelve drills with all occupants shall be conducted in the first year of operation.

SECTION 404

FIRE SAFETY, EVACUATION AND LOCKDOWN PLANS

404.3 Maintenance. Fire safety and evacuation plans and lockdown plans shall be reviewed or updated annually or as necessitated by changes in staff assignments, occupancy or the physical arrangement of the building.

404.4 Availability. Fire safety and evacuation plans and lockdown plans shall be available in the workplace for reference and review by employees, and copies shall be furnished to the fire code official for review on request.

404.4.1 Distribution. The fire safety and evacuation plans and lockdown plans shall be distributed to the tenants and building service employees by the owner or owner's agent. Tenants shall distribute to their employees applicable parts of the fire safety plan and lockdown plans affecting the employees' actions in the event of a fire or other emergency.

SECTION 405

EMERGENCY DRILLS

405.1 General. Emergency fire and evacuation drills complying with Sections 405.2 through 405.9 shall be conducted not less than annually where fire safety and evacuation plans are required by Section 403 or where required by the fire code official. Lockdown plan drills shall be conducted in accordance with the approved plan. Such drills shall not be substituted for fire and evacuation drills required by Section 405.2. Drills shall be designed in cooperation with the local authorities.

405.2 Occupant participation. Emergency fire and evacuation drills shall involve the actual evacuation of occupants to a selected assembly point and shall provide occupants with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exceptions:

In Ambulatory Care Facilities and Group I-2 the movement of care recipients to a safe area or to the exterior of the building is not required.

In Group I-1, Condition 2 the assembly point for residents is permitted to be within an adjacent smoke compartment.

In Group R-4, actual exiting from emergency escape and rescue openings shall not be required. Opening the emergency escape and rescue opening and signaling for help shall be an acceptable alternative.

In Group I-3, Conditions 2 through 5 where a defend-in-place response is permitted, the assembly point for detainees is permitted to be within an adjacent smoke compartment.

In Group I-3, Conditions 2 through 5, movement of detainees to an assembly point is not required where there are security concerns.

405.2 Frequency. Required emergency evacuation drills shall be held at the intervals specified in Table 405.2 or more frequently where necessary to familiarize all occupants with the drill procedure.

TABLE 405.2

FIRE AND EVACUATION DRILL FREQUENCY AND PARTICIPATION

□Insert table image

a. Emergency evacuation drills are required in Group B buildings required to have fire and safety evacuation plans in accordance with Section 403.4.

b. Emergency evacuation drills in Group R-2 college and university buildings shall be in accordance with Section 403.10.2.1. Other Group R-2 occupancies shall be in accordance with Section 403.10.2.2.

c. In Groups I-1 and R-4, see Section 403.8.1.4 and 403.10.3.4 for additional drills for staff.

405.3 Leadership. Responsibility for the planning and conduct of drills shall be assigned to competent persons designated to exercise leadership.

405.4 Time. Drills shall be held at unexpected times and under varying conditions to simulate the unusual conditions that occur in case of fire.

Exceptions:

In severe climates, the fire code official shall have the authority to modify the emergency evacuation drill termination points and frequency.

In Groups I-1, I-2, I-3 and R-4, where staff only emergency evacuation drills are conducted after visiting hours or where care recipients are expected to be asleep, a coded announcement shall be an acceptable alternative to audible alarms.

405.5 Record keeping. Records shall be maintained of required emergency evacuation drills and include the following information:

1. Identity of the person conducting the drill.
2. Date and time of the drill.
3. Notification method used.
4. Employees on duty and participating.
5. Number of occupants evacuated.
6. Special conditions simulated.
7. Problems encountered.
8. Weather conditions when occupants were evacuated.
9. Time required to accomplish complete evacuation.

405.6 Notification. Where required by the fire code official, prior notification of emergency evacuation drills shall be given to the fire code official.

405.7 Initiation. Where a fire alarm system is provided, emergency evacuation drills shall be initiated by activating the fire alarm system.

405.8 Accountability. As building occupants arrive at the assembly point, efforts shall be made to determine if all occupants have been successfully evacuated or have been accounted for.

Exception: In Group I-2 and ambulatory care facilities, the movement of care recipients to safe areas or to the exterior of the building is not required.

405.9 Recall and reentry. An electrically or mechanically operated signal used to recall occupants after an evacuation shall be separate and distinct from the signal used to initiate the evacuation. The recall signal initiation means shall be manually operated and under the control of the person in charge of the premises or the official in charge of the incident. Persons shall not reenter the premises until authorized to do so by the official in charge.

Group A	Quarterly	Employees
Group B ^a	Annually	All occupants
Group B (Ambulatory care facilities)	Quarterly on each shift	Staff
Group B ^b (Clinic, outpatient)	Annually	Staff
Group E	Monthly	All occupants
Group F	Annually	Employees
Group I-1 ^c	Semiannually on each shift	All occupants

2018 International Fire Code

Revise as follows:

403.3.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include a description of special staff actions. This shall include procedures for stabilizing ~~patients~~care recipients in a defend-in-place response, staged evacuation, or full evacuation in conjunction with the entire building if part of a multitenant facility.

403.8.1.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include ~~special employee actions, including fire protection procedures necessary for residents, and shall a description~~of special staff actions. Plans shall include all fo the following in addition to the requirements of Section 404.

1. Procedures for full evacuation of care recipients.
2. In Group I-1, Condition 2, procedures for staged evacuation of care recipients through a refuge area in an adjacent smoke compartment and then to an exterior assembly point.
3. Shall be amended or revised upon admission of any resident~~care recipient~~ with unusual needs.

Delete without substitution:

~~**403.8.1.1.1 Fire evacuation plan.** The fire evacuation plan required by Section 404 shall include a description of special staff actions. In addition to the requirements of Section 404, plans in Group I-1, Condition 2 occupancies shall include procedures for evacuation through a refuge area in an adjacent smoke compartment and then to an exterior assembly point.~~

403.8.2.1 Fire safety and evacuation plans, plan. The fire safety and evacuation plans required by Section 404 shall include a description of special staff *actions*. Plans shall include all of the following in addition to the requirements of Section 404.

1. Procedures for evacuation for ~~patients~~care recipients with needs for containment or restraint and post-evacuation containment, where present.
2. A written plan for maintenance of the means of egress.
3. Procedure for a defend-in-place strategy.
4. Procedures for a full-floor or building evacuation, where necessary.
5. In Group I-2, Condition 2, shall be amended or revised upon admission of any care recipients with unusual needs.

Add new text as follows:

403.8.3.1 Fire safety and evacuation plans.. The fire safety and evacuation plans required by Section 404 shall include a description of special staff actions. Plans shall include all of the following in addition to the requirements of Section 404.

1. Procedures for evacuation for detainees with needs for containment or restraint and post-evacuation containment, where present.
2. Procedure for a defend-in-place strategy.
3. Procedures for a full-floor or building evacuation, where necessary.

Revise as follows:

403.10.3.1 Fire safety and evacuation plan. The fire safety and evacuation plan required by Section 404 shall include ~~special employee actions, including fire protection~~a description of special staff actions. Plans shall include procedures necessary for residents~~full evacuation of care recipients~~, and shall be amended or revised upon admission of a residentcare recipients ~~with unusual needs.~~

Reason:

This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized.

In Group I-1, Condition 2 and Group R-4, Condition 2 have separation, but this is a staged evacuation, not a defend-in place like a nursing home or hospital, therefore the items specific to defend in place are not included.

This proposal addresses consistent use of the term “employee” vs. “staff” because everyone in the building may not be an employee – example: doctors, interns, security – but still have responsibilities during an emergency. All patients and residents have been changed to care recipients to be consistent with the definitions for these types of facilities.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These are operational requirements for emergency responders, resident and staff safety.

2018 International Fire Code

Revise as follows:

403.3.2 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include all of the following in addition to the requirements of Section 404:

1. Locations of ~~patients-care recipients~~ who are rendered incapable of self-preservation.
2. Maximum number of ~~patients-care recipients~~ rendered incapable of self-preservation.
3. Area and extent of each ambulatory care facility.
4. ~~Location of adjacent smoke compartments or refuge areas, where required.~~
5. ~~Path of travel to adjacent smoke compartments.~~
6. Location of any special locking ~~, delayed egress or access control~~ arrangements.

403.8.1.1.2 Fire safety plans-plan. A copy of the fire safety plan shall be maintained at the facility at all times. ~~Plans-The plan~~ shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of ~~resident-care recipient~~ sleeping rooms.
2. Location of special locking or egress control arrangements.

403.8.2.2 Fire safety plans-plan. A copy of the plan shall be maintained at the facility at all times. ~~Plans-The plan~~ shall include all of the following in addition to the requirements of Section 404.2.2:

1. Location and number of ~~patient-care recipients~~ sleeping rooms and operating rooms.
2. ~~Location of adjacent smoke compartments or refuge areas.~~
3. ~~Path of travel to adjacent smoke compartments.~~
4. Location of special locking ~~, delayed egress or access control~~ arrangements.
5. ~~Location of elevators utilized for patient movement in accordance with the fire safety plan, where provided.~~

Add new text as follows:

403.8.3.1 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of cells.
2. Location of special locking arrangements.

Revise as follows:

403.10.3.1.1 Fire safety plans. A copy of the fire safety plan shall be maintained at the facility at all times. ~~Plans-The plan~~ shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of ~~resident-care recipient~~ sleeping rooms.
2. Location of special locking ~~or egress control~~ arrangements.

Reason:

This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what these changes will look like if all pass.

Group I-1, Condition 2 includes smoke compartments. When looking at adding smoke compartments, refuge area and

path of travel, it was noted that this is already stated in 404.2.1 Item 1 and 404.2.2 Items 2.2 and 4.5. Therefore it is proposed to remove form Ambulatory care and Group I-2. Assisted evacuation is addressed in 404.2.1 Item 4 and 404.2.2 Item 2.3.

All patients and residents have been changed to care recipients to be consistent with the definitions for these types of facilities.

Last cycle there was a lot of work on the different locking systems. There should be a consistent and generic reference for these locking systems - "location of special locking arrangements". This will eliminate a laundry list and improve coordination over time as locking arrangements for ingress and egress are added.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

403.3.3 Staff training. ~~Employees-Staff~~ shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by the staff ~~not less than every two months. A copy of the plan shall be readily available at all times within the facility.~~ at intervals not exceeding three months. Training of new staff shall be provided promptly upon entrance to duty. Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

403.8.1.2 Employee-Staff training. ~~Employees-Staff~~ shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by ~~employees-staff~~ at intervals not exceeding ~~two-three~~ months. ~~A copy of the plan shall be readily available at all times within the facility.~~ Training of new staff shall be provided promptly upon entrance to duty. Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

Add new text as follows:

403.8.2.3 Staff training. Staff shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by staff at intervals not exceeding three months. Training of new staff shall be provided promptly upon entrance to duty. Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

Revise as follows:

403.8.3.1 Employee-Staff training. ~~Employees-Staff~~ shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment. Training of new employees periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by staff at intervals not exceeding three months. Training of new staff shall be provided promptly upon entrance to duty. Refresher training shall be provided not less than annually. Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

403.8.3.2 Employee-staffing-Staffing. ~~Group I-3 occupancies shall be provided with 24-hour staffing. An employee-A staff person~~ shall be within three floors or 300 feet (91 440 mm) horizontal distance of the access door of each resident housing area. In Group I-3 Conditions 3, 4 and 5, as defined in Chapter 2, the arrangement shall be such that the ~~employee-staff~~ involved can start release of locks necessary for emergency evacuation or rescue and initiate other necessary emergency actions within 2 minutes of an alarm.

Exception: ~~An employee-A staff person~~ shall not be required to be within three floors or 300 feet (91 440 mm) horizontal distance of the access door of each resident housing area in areas in which all locks are unlocked remotely and automatically in accordance with Section 408.4 of the International Building Code.

403.8.3.3 Notification. Provisions shall be made for residents in Group I-3 Conditions 3, 4 and 5, as defined in Chapter 2, to readily notify ~~an employee-staff~~ of an emergency.

403.10.3.2 Employee-Staff training. ~~Employees-Staff~~ shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by ~~employees-staff~~ at intervals not exceeding ~~two-three~~ months. ~~A copy of the plan shall be readily available at all times within the facility.~~ Training of new staff shall be provided promptly upon entrance to duty. Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.

Reason:

This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what

these changes will look like if all pass.

The criteria is not consistent is using the term “employee” or “staff”. Consistent use of the term “employee” vs. “staff” because everyone in the building may not be an employee – example: doctors, interns, security – but still have responsibilities during an emergency.

It is important for employees within these facilities to be trained, including training for new employees and review of the plan. The language is revised to be consistent, and added to Group I-2 and I-3. Currently ambulatory care facilities, Group I-1 and R-4 requires review of the evacuation plans every two months. If the review is every three months, the fire drills required can be considered part of the review. The current requirement is not clear on what would meet the requirements and we could find no technical justification for the two months.

The sentence about a copy of the plan being available is deleted because it is already stated in Section 404.4.

Where fire extinguishers are provided, the staff should be trained in their use.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These are operational requirements for emergency responders, resident and staff safety so will not affect construction costs.

IFC: 403.3.4, 403.8.1.6, 403.8.2.3, 403.10.3.6, 405.1, 405.2 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Delete without substitution:

~~403.3.4 Emergency evacuation drills.~~ Emergency evacuation drills shall comply with Section 405.

~~Exception:~~ The movement of patients to safe areas or to the exterior of the building is not required.

~~403.8.1.6 Resident participation in drills.~~ Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Revise as follows:

403.8.2.3 Emergency evacuation drills. Emergency evacuation drills shall comply with Section 405.

Exceptions Exception:

- ~~1. The movement of patients to safe areas or to the exterior of the building is not required.~~
- ~~2. Where emergency evacuation drills are conducted after visiting hours or where patients or residents are expected to be asleep, a coded announcement shall be an acceptable alternative to audible alarms.~~

Delete without substitution:

~~403.10.3.6 Resident participation in drills.~~ Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

~~Exception:~~ Actual exiting from emergency escape and rescue windows shall not be required. Opening the emergency escape and rescue window and signaling for help shall be an acceptable alternative.

Revise as follows:

405.1 General. Emergency fire and evacuation drills complying with Sections 405.2 through 405.9 shall be conducted not less than annually where fire safety and evacuation plans are required by Section 403 or where required by the *fire code official*. Drills shall be designed in cooperation with the local authorities.

Add new text as follows:

405.2 Occupant participation. Emergency fire and evacuation drills shall involve the actual evacuation of occupants to a selected assembly point and shall provide occupants with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exceptions:

1. In Ambulatory Care Facilities and Group I-2 the movement of care recipients to a safe area or to the exterior of the building is not required.
2. In Group I-1, Condition 2 the assembly point for residents is permitted to be within an adjacent smoke compartment.
3. In Group R-4, actual exiting from emergency escape and rescue openings shall not be required. Opening the emergency escape and rescue opening and signaling for help shall be an acceptable alternative.
4. In Group I-3, Conditions 2 through 5 where a defend-in-place response is permitted, the assembly point for detainees is permitted to be within an adjacent smoke compartment.

5. In Group I-3, Conditions 2 through 5, movement of detainees is not required to an assembly point is not required where there are security concerns.

Reason:

This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what these changes will look like if all pass.

The requirements for drills in Section 405 never really say where you move to during a drill. It is only implied in IFC 405.8 when it mentions accountability at assembly points.

How to leave and get to an assembly point is stated for Group I-1 and R-4, but does not recognize the new requirements for smoke compartments in Group I-1, Condition 2. It is implied by the exceptions in ambulatory care and Group I-2 that drills are for moving to smoke compartments by having exception for movement of patients in beds. This should be stated at the beginning of the drill requirements for all facilities.

The exceptions for drills should be in the drill section specifically. The exceptions could stay in the specific requirements, but only if Section 405 included a description of what was supposed to happen for drills, otherwise the reference to Section 405 does not make sense.

Exception 4 ad 5 are in recognition of detainee participation in drills for jails.

Note: If both exceptions to 403.8.2.3 are removed (exception 1 is addressed under a different proposal), the whole section is redundant text and should be removed.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These are operational requirements for emergency responders, resident and staff safety and will not affect construction costs.

IFC: 403.7.1, 403.7.1.1, 403.7.1.2, 403.7.1.3, 403.7.1.4

Proponent: Joe McElvaney, representing self (joe.mcelvaney@gmail.com)

2018 International Fire Code

Revise as follows:

403.7.1 Group H-5 occupancies. Emergency plan. ~~An emergency plan shall be established for Group H-5 occupancies shall comply in accordance with Sections 403.7.1.1 through 403.7.1.4.~~

403.7.1.1 Plans and diagrams. In addition to the requirements of Section 404 and Section 407.6, plans and diagrams shall be maintained in approved locations indicating the approximate plan for each area, the amount and type of ~~HPM hazardous material's~~ stored, handled and used, locations of shutoff valves for ~~HPM hazardous materials~~ supply piping, emergency telephone locations and locations of exits.

403.7.1.2 Plan updating. The plans and diagrams required by Sections 404, 403.7.1.1 and 407.6 shall be maintained up to date and the *fire code official* and fire department shall be informed of major changes.

403.7.1.3 Emergency response team. Responsible persons shall be designated as an on-site emergency response team and trained to be liaison personnel for the fire department. These persons shall aid the fire department in ~~preplanning pre-planning~~ emergency responses, identifying locations where ~~HPM is hazardous materials are stored~~, handled and used, and be familiar with the chemical nature of such material. An adequate number of personnel for each work shift shall be designated.

403.7.1.4 Emergency drills. Emergency drills of the on-site emergency response team shall be conducted on a regular basis but not less than once every three months. Records of drills conducted shall be maintained.

Reason:

The current code allow requires plans and emergency response team/liasion person and drills for H-5 occupancies. this proposal would now required these items within section 403.7.1.1 - 403.7.1.4 for all H occupancies.

These H occupancies are high hazard occupancies that have a direct impact to the employees working in a H occupancies, the public and the first responders. By having these requirements would could say that life and property loss may be reduce if an event s would occur by having these plans and emergency response teams/liasion person.

One should remember that H-1 are those site that can have a detonation, H-2 are those site that can have a deflagration or accelerated burning, H-3 are those sate that have physical hazards, H-4 are those site that have health hazards.

All these H occupancies exceed the MAQ for the Physical and/or Health hazard and the number of control areas allowed by the fire code.

Cost Impact

The code change proposal will increase the cost of construction .

The current code only requires this information and response team/liasion person for H- 5 occupancies which are semiconductor fabrication facilities.

This code change would require this to all H occupancies that have exceeded the allow amount of physical and /or health hazards and the number of control areas allowed by the fire code.

This cost should be small since these occupancies should have plans and diagrams of theirs site and new item's for them would be drills and emergency response team/liasion person

IFC: 403.8.1.3, 403.10.3.3

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

403.8.1.3 Resident training. Residents capable of assisting in their own evacuation shall be trained in the proper actions to take in the event of a fire. In Group I-1, Condition 2 occupancies, training shall include evacuation through an adjacent smoke compartment and then to an exterior assembly point. The training shall include actions to take if the primary escape route is blocked. ~~Where the resident is given rehabilitation or habilitation training, methods of fire prevention and actions to take in the event of a fire shall be a part of the rehabilitation training program.~~ Residents shall be trained to assist each other in case of fire to the extent their physical and mental abilities permit them to do so without additional personal risk.

403.10.3.3 Resident training. Residents capable of assisting in their own evacuation shall be trained in the proper actions to take in the event of a fire. The training shall include actions to take if the primary escape route is blocked. ~~Where the resident is given rehabilitation or habilitation training, methods of fire prevention and actions to take in the event of a fire shall be a part of the rehabilitation training program.~~ Residents shall be trained to assist each other in case of fire to the extent their physical and mental abilities permit them to do so without additional personal risk.

Reason:

This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what these changes will look like if all pass.

The sentence proposed to be struck is unclear as to application. It is ineffective to train someone for something outside of the environment they are in.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a deletion of a requirement for resident training therefore the cost of compliance will not increase.

IFC: 403.8.1.4, 403.10.3.4, 405.2, TABLE 405.2

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

403.8.1.4 Drill frequency. In addition to the evacuation drills required in Section 405.2, ~~employees-staff~~ shall participate in drills an additional two times a year on each shift. Twelve drills with all occupants shall be conducted in the first year of operation. Drills are not required to comply with the time requirements of Section 405.4.

403.10.3.4 Drill frequency. In addition to the evacuation drills required in Section 405.2, ~~employees-staff~~ shall participate in drills an additional two times a year on each shift. Twelve drills with all occupants shall be conducted in the first year of operation.

405.2 Frequency. Required emergency evacuation drills shall be held at the intervals specified in Table 405.2 or more frequently where necessary to familiarize all occupants with the drill procedure.

**TABLE 405.2
FIRE AND EVACUATION DRILL FREQUENCY AND PARTICIPATION**

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group A	Quarterly	Employees-Staff
Group B ^b	Annually	All occupants
Group B ^c (Ambulatory care facilities)	Quarterly on each shift ^a	Employees-Staff
Group B ^b (Clinic, outpatient)	Annually	Employees-Staff
Group E	Monthly ^a	All occupants
Group F	Annually	Employees
Group I-1	Semiannually on each shift ^a	All occupants
Group I-2	Quarterly on each shift ^a	Employees-Staff
Group I-3	Quarterly on each shift ^a	Employees-Staff
Group I-4	Monthly on each shift ^a	All occupants
Group R-1	Quarterly on each shift	Employees
Group R-2 ^d	Four annually	All occupants
Group R-4	Semiannually on each shift ^a	All occupants

- a. In severe climates, the fire code official shall have the authority to modify the emergency evacuation drill frequency.
- b. Emergency evacuation drills are required in Group B buildings required to have fire and safety evacuation plans in accordance with Section 403.4.
- c. Emergency evacuation drills are required in ambulatory care facilities in accordance with Section 403.3.
- d. Emergency evacuation drills in Group R-2 college and university buildings shall be in accordance with Section 403.10.2.1. Other Group R-2 occupancies shall be in accordance with Section 403.10.2.2.
- e. In Groups I-1 and R-4, see Section 403.8.1.4 and 403.10.3.4 for additional drills for staff.

Reason:

This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what these changes will look like if all pass.

In healthcare facilities, often doctors, interns or nurses are by contract – so they are not all employees. However, they must be trained and act during any emergencies. Therefore, the term staff is more relevant than employees. Footnotes are added for Group I-1 and R-4 so that there is a pointer for additional drills required for staff only.

Group B – In footnote b, the reference back to fire and safety evacuation plans will keep the same threshold for requirements, and will reduce the chance that over time the numbers could be changed in one place and not the other.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These are operational requirements for emergency responders, resident and staff safety and will not affect the cost of construction.

Internal ID: 682

IFC: 403.8.1.4, 403.8.1.5, 403.8.1.7, 403.8.2.3, 403.10.3.5, 405.2, TABLE 405.2, 405.4, 405.8

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

403.8.1.4 Drill frequency. In addition to the evacuation drills required in Section 405.2, employees shall participate in drills an additional two times a year on each shift. Twelve drills with all occupants shall be conducted in the first year of operation. ~~Drills are not required to comply with the time requirements of Section 405.4.~~

Delete without substitution:

~~**403.8.1.5 Drill times.** Drill times are not required to comply with Section 405.4.~~

~~**403.8.1.7 Emergency evacuation drill deferral.** In severe climates, the *fire code official* shall have the authority to modify the emergency evacuation drill frequency specified in Section 405.2.~~

Revise as follows:

403.8.2.3 Emergency evacuation drills. Emergency evacuation drills shall comply with Section 405.

Exceptions Exception:

1. The movement of patients to safe areas or to the exterior of the building is not required.
2. ~~Where emergency evacuation drills are conducted after visiting hours or where patients or residents are expected to be asleep, a coded announcement shall be an acceptable alternative to audible alarms.~~

Delete without substitution:

~~**403.10.3.5 Drill times.** Drill times are not required to comply with Section 405.4.~~

405.2 Frequency. Required emergency evacuation drills shall be held at the intervals specified in Table 405.2 or more frequently where necessary to familiarize all occupants with the drill procedure.

Revise as follows:

**TABLE 405.2
FIRE AND EVACUATION DRILL FREQUENCY AND PARTICIPATION**

GROUP OR OCCUPANCY	FREQUENCY	PARTICIPATION
Group A	Quarterly	Employees
Group B ^b	Annually	All occupants
Group B ^c (Ambulatory care facilities)	Quarterly on each shift ^a	Employees
Group B ^b (Clinic, outpatient)	Annually	Employees
Group E	Monthly ^a	All occupants
Group F	Annually	Employees
Group I-1	Semiannually on each shift ^a	All occupants
Group I-2	Quarterly on each shift ^a	Employees
Group I-3	Quarterly on each shift ^a	Employees
Group I-4	Monthly on each shift ^a	All occupants
Group R-1	Quarterly on each shift	Employees
Group R-2 ^d	Four annually	All occupants
Group R-4	Semiannually on each shift ^a	All occupants

- ~~a. In severe climates, the fire code official shall have the authority to modify the emergency evacuation drill frequency.~~
- ~~b. a. Emergency evacuation drills are required in Group B buildings having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge.~~
- ~~c. Emergency evacuation drills are required in ambulatory care facilities in accordance with Section 403.3.~~
- ~~d. b. Emergency evacuation drills in Group R-2 college and university buildings shall be in accordance with Section 403.10.2.1. Other Group R-2 occupancies shall be in accordance with Section 403.10.2.2.~~

405.4 Time. Drills shall be held at unexpected times and under varying conditions to simulate the unusual conditions that occur in case of fire.

Exceptions:

1. In severe climates, the fire code official shall have the authority to modify the emergency evacuation drill termination points and frequency.
2. In Groups I-1, I-2, I-3 and R-4, where staff only emergency evacuation drills are conducted after visiting hours or where care recipients are expected to be asleep, a coded announcement shall be an acceptable alternative to audible alarms.

405.8 Accountability. As building occupants arrive at the assembly point, efforts shall be made to determine if all occupants have been successfully evacuated or have been accounted for.

Exception: In Group I-2 and ambulatory care facilities, the movement of care recipients to safe areas or to the exterior of the building is not required.

Reason:

There are no technical changes, this is a reorganization. This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what these changes will look like if all pass.

Group I-1 and R-4 allow for the timing to not be “unexpected time and under varying conditions”. We believe this was to not startle patients at night while they are sleeping. However, both types of facilities require additional drills for staff at all shifts. It seems more appropriate to follow the exception under Group I-2, Exception 2 as well as also allow this for jails.

The exception for severe weather is stated only for Group I-1, in Section 403.8.1.7. However, Table 405 foot note a, allows the fire department to make a similar call for Ambulatory Care, Group E, all Group I-1 and R-4. It seems more appropriate just to make a general statement in Section 405.2 since the fire department could always make this call for any drill.

Section 403.8.2.3 Exception 1 is addressed in another proposal. If both proposal's are accepted, this section can be deleted. The reference in the main text to Section 405 if redundant.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These are operational requirements for emergency responders, resident and staff safety therefore will not affect the cost of construction.

Internal ID: 685

F33-18

IFC: 403.8.2.4 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Add new text as follows:

403.8.2.4 Fire loss prevention in operating rooms. Fire protection features and procedures for fire loss prevention in surgical operating rooms shall comply with NFPA 99, Section 15.13.

Reason:

Adding a reference to NFPA 99 for fire loss prevention in operating rooms ensure capturing the intent of the concepts to be used in this setting. These concepts outlined in the reference document describe material and source segregation. Specific reference to 'fire loss prevention' in the proposed sentence makes the purpose of the requirement clearer. Operating rooms are subject to potential fires if flammable materials are exposed to accelerants ignited by cautery or surgical procedures. NFPA 99 is the standard for systems and procedures to be used in I-2, Condition 2 hospitals. Chapter 4 of the IFC is the appropriate location to address fire prevention in this setting. This code change is proposed to align with federal standards (K933).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

This may require additional fire protection devices in operating rooms for patient safety. However, it does not add cost to the healthcare industry because we already follow these requirements in the context of the federal standard.

Internal ID: 699

F34-18

IFC: 403.10.2.3

Proponent: William Freer, New York State Office of Fire Prevention and Control, representing New York State Office of Fire Prevention and Control (wfreer@dhses.ny.gov)

2018 International Fire Code

Revise as follows:

403.10.2.3 Evacuation diagrams for dormitories. A diagram depicting two evacuation routes shall be posted on or immediately adjacent to every required egress door from each dormitory *sleeping or dwelling unit*. Evacuation diagrams shall be reviewed and updated as needed to maintain accuracy.

Reason:

This code change is to help clarify the requirement for purposes of compliance and enforcement. The current code states uses the term sleeping unit but doesn't take into account that many dormitories now include dwelling units as well. Based on the definition of sleeping unit, it is confusing whether or not evacuation diagrams would be required in suite style dormitories and therefore not consistently applied.

This change will also allow the code enforcement official the ability to require the diagram on the door to the corridor as compared to the door from the sleeping unit.

Cost Impact

The code change proposal will decrease the cost of construction .

This code proposal may decrease the cost of construction where a diagram is required at the dwelling unit door as compared to the sleeping unit door, less diagrams would be required.

Internal ID: 1057

F35-18

IFC: 403.10.3.6

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

403.10.3.6 Resident participation in drills. Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exception: Actual exiting from emergency escape and rescue ~~windows-openings~~ shall not be required. Opening the emergency escape and rescue ~~window-openings~~ and signaling for help shall be an acceptable alternative.

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the I-codes. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information.

This section is only applicable under fire and safety plans for Group R-4. IFC 403.10.3.6 says "window" instead of opening. This should be revised to use the defined term. This also addresses situations such as balcony doors instead of windows.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal addresses an operational/practice drill and is not a construction requirement.

Internal ID: 456

F36-18

IFC: 403.12.2, 403.12.3.1, 403.12.3.3

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance (rnix@zoomtown.com)

2018 International Fire Code

Revise as follows:

403.12.2 Public safety plan for gatherings. Where the *fire code official* determines that an indoor or outdoor gathering of persons has an adverse impact on public safety through diminished access to buildings, structures, fire hydrants and fire apparatus access roads or where such gatherings adversely affect public safety services of any kind, the *fire code official* shall have the authority to order the development of or prescribe a public safety plan that provides an *approved* level of public safety and addresses the following items:

1. Emergency vehicle ingress and egress.
2. Fire protection.
3. Emergency egress or escape routes.
4. Emergency medical services.
5. Public assembly areas.
6. The directing of both attendees and vehicles, including the parking of vehicles.
7. Vendor and food concession distribution.
8. The need for the presence of law enforcement.
9. The need for fire and emergency medical services personnel.
10. The need for a weather monitoring person designated person(s) to monitor weather, and to implement emergency procedures in accordance with the event public safety plan.

403.12.3.1 Number of crowd managers. Not fewer than two trained crowd managers, and not fewer than one trained crowd manager for each 250 persons or portion thereof, shall be provided for the gathering.

Exceptions:

1. ~~Outdoor events with fewer than 1,000 persons in attendance shall not require crowd managers.~~
- ~~2.1.~~ Assembly occupancies used exclusively for religious worship with an occupant load not exceeding 1,000 shall not require crowd managers.
- ~~3.2.~~ The number of crowd managers shall be reduced where, in the opinion of the *fire code official*, the fire protection provided by the facility and the nature of the event warrant a reduction.

403.12.3.3 Duties. The duties of crowd managers shall include, but not be limited to:

1. Conduct an inspection of the area of responsibility and identify and address any egress barriers.
2. Conduct an inspection of the area of responsibility to identify and mitigate any fire hazards.
3. Verify compliance with all permit conditions, including those governing pyrotechnics and other special effects.
4. Establish and maintain open communication with the event designated person(s) at all times during the event
- ~~5.~~ Direct and assist the event attendees in evacuation during an emergency.
- ~~5-6.~~ Assist emergency response personnel where requested.
- ~~6-7.~~ Other duties required by the *fire code official*.
- ~~7-8.~~ Other duties as specified in the fire safety plan.

Reason:

The first change, in 403.12.2 item 10, clarifies that a designated weather monitoring person is an important consideration for an approved level of public safety. This correlates with Section 3106.4.2, which already requires a weather monitoring person upon request of the FCO. If the FCO determines such a person is needed, then that person

has one of the most important tasks potentially occurring at an outdoor assembly event: evacuation in accordance with the public safety plan.

403.12.3.1 currently allows an exception to the trained crowd management requirement for outdoor assembly events with occupancy less than 1,000. This is inconsistent with the basic requirement established by 403.12.3.1, and the exception places an undue burden on the designated (weather monitoring) person, if so required by the FCO under 403.12.2. The second proposed change, in 403.12.3.1, removes the exception for outdoor assembly events, such that anytime a designated (weather monitoring) person is required by the FCO, that designated person will also have support personnel should an evacuation become necessary. The minimum number of trained crowd managers required is already established at one per 250 persons by 403.12.3.1.

Accordingly, the third proposed change, in section 403.12.3.3, adds a communication requirement to the list of trained crowd manager responsibilities.

Recent event tragedies in the US and around the world (Wood Dale Festival tent collapse; New Hampshire Circus Tent collapse, Brazil EDM festival and others) have proven the importance of weather monitoring, and of trained personnel to properly direct the public. Weather monitoring is a critically important prevention tool. Trained Crowd Managers are critically important to incident mitigation.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The first proposed change has no direct impact on cost of construction. Since the proposed change modifies an existing risk assessment item in the FCO's public safety plan checklist of requirements, any cost impact is directly related to the FCO's risk assessment and reduction requirements, and not to the requirement itself.

The second proposed change has no impact on cost of construction. Removing the exception for outdoor events maintains consistency with the existing requirement, which is irrespective of indoor or outdoor events. The net staff increase for events <1,000 persons is 1 or 2 additional staff. The cost of additional staff is inconsequential compared to the overall monetary cost of event production.

The third proposed change has no impact on cost of construction, as it clarifies an implied reasonable requirement for staff responsibilities when such staff is already required per the event public safety plan.

Internal ID: 1158

F37-18

IFC: 404.1

Proponent: Joe McElvaney, self, representing Self (joemcelvaney@gmail.com)

2018 International Fire Code

Revise as follows:

404.1 General. ~~Where required by Section 403, fire~~ Fire safety, evacuation and lockdown plans shall comply with Sections 404.2 through 404.4.1.

Reason:

As currently written section 404 would only apply to those occupancies in section 403 to have fire safety, evacuation and/or lockdown plans.

However section 403 does not required any occupancies to have a lockdown plan.

Plus if an owner wishes to have a fire safety, evacuation plan and/or lockdownplan, it would make sense to use the same requirement/format for those occupancies as outline in section 404

Cost Impact

The code change proposal will increase the cost of construction .

This code change will increase the cost of construction, by requiring all occupancies that are required or not required to have a fire safety, evacuation and/or lockdown plan to use the same outline/format as called out in IFC section 404.

Internal ID: 433

F38-18

IFC: 404.2.2

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com); William Kramer, School District of Philadelphia, representing School District of Philadelphia (wkramer@philasd.org)

2018 International Fire Code

Revise as follows:

404.2.2 Fire safety plans. Fire safety plans shall include the following:

1. The procedure for reporting a fire or other emergency.
2. The life safety strategy including the following:
 - 2.1. Procedures for notifying occupants, including areas with a private mode alarm system.
 - 2.2. Procedures for occupants under a defend-in-place response.
 - 2.3. Procedures for evacuating occupants, including those who need evacuation assistance.
3. Site plans indicating the following:
 - 3.1. The occupancy assembly point.
 - 3.2. The locations of fire hydrants.
 - 3.3. The normal routes of fire department vehicle access.
4. Floor plans identifying the locations of the following:
 - 4.1. Exits.
 - 4.2. Primary evacuation routes.
 - 4.3. Secondary evacuation routes.
 - 4.4. Accessible egress routes.
 - 4.4.1. Areas of refuge.
 - 4.4.2. Exterior areas for assisted rescue.
 - 4.5. Refuge areas associated with *smoke barriers* and *horizontal exits*.
 - 4.6. Manual fire alarm boxes.
 - 4.7. Portable fire extinguishers.
 - 4.8. Occupant-use hose stations.
 - 4.9. Fire alarm annunciators and controls.
5. A list of major fire hazards associated with the normal use and occupancy of the premises, including maintenance and housekeeping procedures.
6. Identification and assignment of personnel responsible for maintenance of systems and equipment installed to prevent or control fires.
7. Identification and assignment of personnel responsible for maintenance, housekeeping and controlling fuel hazard sources.
8. Exterior doors shall be identified on plans with the exposure side alphabetical prefix that coincides with the National Incident Management System exterior Incident command system (ICS) division designation coupled with sequential numeric door number assignments.

Reason:

The IFC does not include recommendations for exterior door numbering that is in compliance with incident management procedures. Due to the lack this being addressed in the IFC for emergency planning purposes a number of agencies have developed recommendations that are not in compliance with NIMS. The most common recommendation starts with the main entrance door being labeled as 1, and then sequentially clockwise around the building.

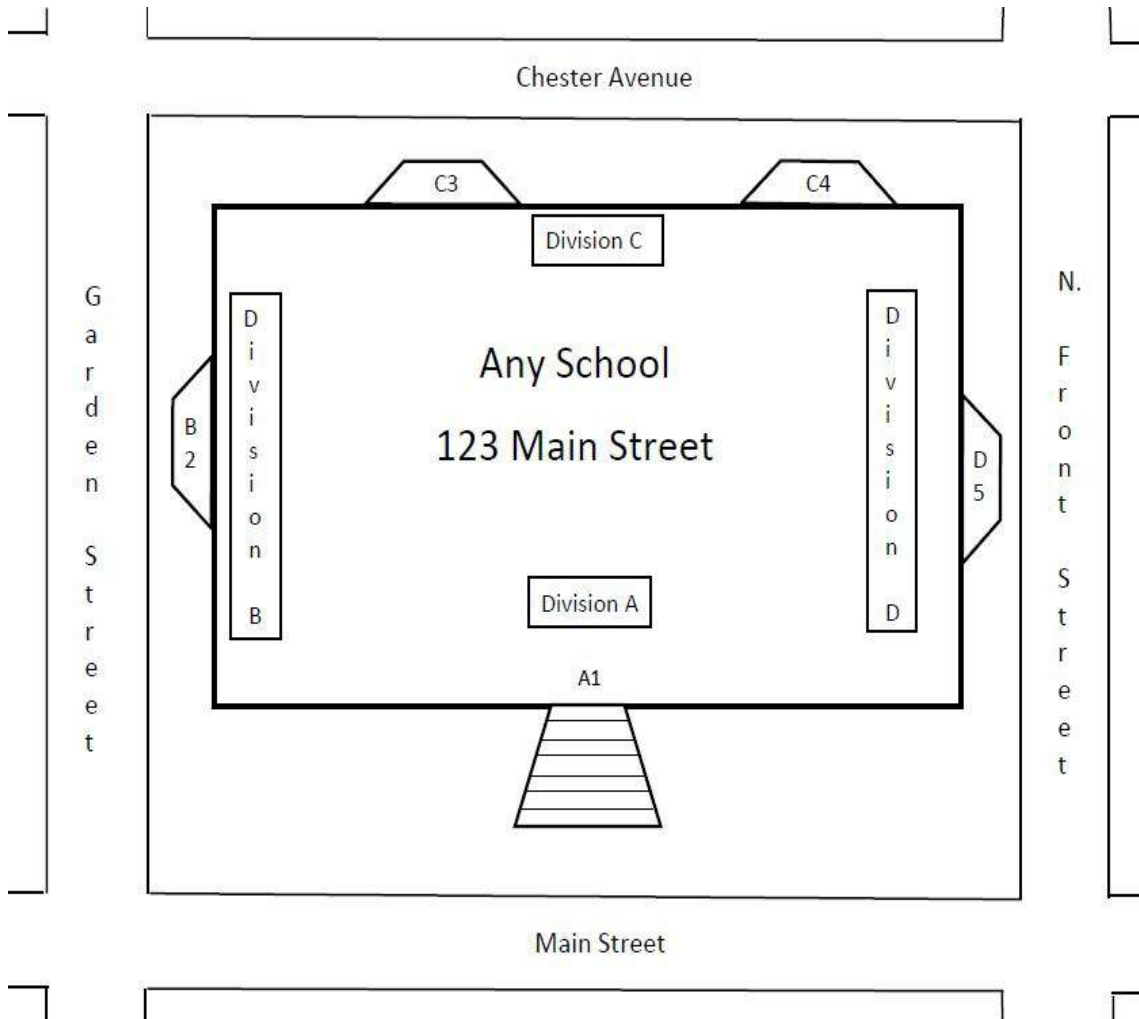

In an emergency situation, especially one that requires mutual aid, it is imperative that we know where our assignments are. In addition, should we run into an emergency inside a building we need to be able to quickly identify where the person in need is located. By failing to utilize the geographic locations of ICS we have failed to ensure a

quick, effective and safe response.

A simple fix is to require that a prefix be utilized that coincides with the exterior ICS division designations. Therefore, the main entrance would be Door A1. From a response perspective if I am responding to an active shooter situation, or other emergency, in a school and I am ordered to report to Door 4, I have no idea where that is. However, if I am ordered to report to Door C4 I know it is in the rear of the building. Likewise, if I am an officer in need of assistance from inside a building and can see an exit door that is labeled from the inside, if it is Door 5, no one except those familiar with the building will know where that is. If however, that same door is labeled D5, everyone knows it is on the right side of the building.

The adoption of a nationwide system of managing incidents and events starts with the basic knowledge that everyone is speaking the same language. That starts with the geographic divisions of an incident. Therefore, the simple addition of adding a prefix and number for exterior doors of a building and requiring them to be labeled inside and outside, is paramount for officer and occupant safety. I am requesting that the ICC consider adding these requirements to the IFC.

This proposal adds a requirement that in preparing fire safety plans the exterior doors be designated and indicated utilizing alphanumeric designations coinciding with the ICS division side and the sequential door number.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal has no impact on the cost of construction. It has a minimal cost impact on the preparation of fire safety plans.

Internal ID: 1692

F39-18

IFC: 404.2.3, 404.3, 404.4, 404.4.1, 405, 405.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Delete without substitution:

~~**404.2.3 Lockdown plans.** Lockdown plans shall only be permitted where such plans are approved by the *fire code official* and are in compliance with Sections 404.2.3.1 and 404.2.3.2.~~

Revise as follows:

404.3 Maintenance. Fire safety and evacuation plans and lockdown plans shall be reviewed or updated annually or as necessitated by changes in staff assignments, occupancy or the physical arrangement of the building.

404.4 Availability. Fire safety and evacuation plans and lockdown plans shall be available in the workplace for reference and review by employees, and copies shall be furnished to the fire code official for review on request.

404.4.1 Distribution. The fire safety and evacuation plans and lockdown plans shall be distributed to the tenants and building service employees by the owner or owner's agent. Tenants shall distribute to their employees applicable parts of the fire safety plan and lockdown plans affecting the employees' actions in the event of a fire or other emergency.

SECTION 405 EMERGENCY EVACUATION DRILLS

405.1 General. Emergency fire and evacuation drills complying with Sections 405.2 through 405.9 shall be conducted not less than annually where fire safety and evacuation plans are required by Section 403 or where required by the *fire code official*. Lockdown plan drills shall be conducted in accordance with the approved plan. Such drills shall not be substituted for fire and evacuation drills required by Section 405.2. Drills shall be designed in cooperation with the local authorities.

Reason:

This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what these changes will look like if all pass.

A hospital can have lock down plans related to a possible infant or child abduction. There are similar situation where there are concerns patient's wandering or leaving the facility - such as dementia, addition recovery or psychiatric wards.

The current list of information seems appropriate for lock down plans in hospitals. However, it was noted that the requirements were not carried through into the provisions for maintenance, availability, distribution and drills.

Section 405 is labeled emergency evacuation drills, but does not mention the drills required for lockdowns - which, while they may start with locking-down, still include eventual directed evacuation. The last section of the lock-down plans, which mentions drills, is moved to the general section under emergency drills to clarify this.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested

parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These are operational requirements for emergency responders, resident and staff safety

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

2018 International Fire Code

503.1.1 Buildings and facilities. *Approved* fire apparatus access roads shall be provided for every facility, building or portion of a building hereafter constructed or moved into or within the jurisdiction. The fire apparatus access road shall comply with the requirements of this section and shall extend to within 150 feet (45 720 mm) of all portions of the facility and all portions of the *exterior walls* of the first story of the building as measured by an *approved* route around the exterior of the building or facility.

Exceptions:

1. The *fire code official* is authorized to increase the dimension of 150 feet (45 720 mm) where any of the following conditions occur:
 - 1.1. The building is equipped throughout with an ~~approved~~ *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or ~~903.3.1.3~~ 903.3.1.3.
 - 1.2. Fire apparatus access roads cannot be installed because of location on property, topography, waterways, nonnegotiable grades or other similar conditions, and an *approved* alternative means of fire protection is provided.
 - 1.3. There are not more than two Group R-3 or Group U occupancies.
2. Where approved by the *fire code official*, fire apparatus access roads shall be permitted to be exempted or modified for solar photovoltaic power generation facilities.

507.5.1 Where required. Where a portion of the facility or building hereafter constructed or moved into or within the jurisdiction is more than 400 feet (122 m) from a hydrant on a fire apparatus access road, as measured by an *approved* route around the exterior of the facility or building, on-site fire hydrants and mains shall be provided where required by the *fire code official*.

Exceptions:

1. For Group R-3 and Group U occupancies, the distance requirement shall be 600 feet (183 m).
2. For buildings equipped throughout with an ~~approved~~ *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the distance requirement shall be 600 feet (183 m).

805.1.1.2 Heat release rate. Newly introduced upholstered furniture shall have limited rates of heat release when tested in accordance with ASTM E1537 or California Technical Bulletin 133, as follows:

1. The peak rate of heat release for the single upholstered furniture item shall not exceed 80 kW.

Exception: Upholstered furniture in rooms or spaces protected by an ~~approved~~ *automatic sprinkler system* installed in accordance with Section ~~903.3.1.1~~ 903.3.1.1.
2. The total heat released by the single upholstered furniture item during the first 10 minutes of the test shall not exceed 25 megajoules (MJ).

Exception: Upholstered furniture in rooms or spaces protected by an ~~approved~~ *automatic*

sprinkler system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.

805.1.2.2 Heat release rate. Newly introduced mattresses shall have limited rates of heat release when tested in accordance with ASTM E1590 or California Technical Bulletin 129, as follows:

1. The peak rate of heat release for the single mattress shall not exceed 100 kW.
Exception: Mattresses in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.
2. The total heat released by the single mattress during the first 10 minutes of the test shall not exceed 25 MJ.
Exception: Mattresses in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.

805.2.1.2 Heat release rate. Newly introduced upholstered furniture shall have limited rates of heat release when tested in accordance with ASTM E1537 or California Technical Bulletin 133, as follows:

1. The peak rate of heat release for the single upholstered furniture item shall not exceed 80 kW.
Exception: Upholstered furniture in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.
2. The total heat released by the single upholstered furniture item during the first 10 minutes of the test shall not exceed 25 MJ.
Exception: Upholstered furniture in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.

805.2.2.2 Heat release rate. Newly introduced mattresses shall have limited rates of heat release when tested in accordance with ASTM E1590 or California Technical Bulletin 129, as follows:

1. The peak rate of heat release for the single mattress shall not exceed 100 kW.
Exception: Mattresses in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.
2. The total heat released by the single mattress during the first 10 minutes of the test shall not exceed 25 MJ.
Exception: Mattresses in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.

805.4.1.2 Heat release rate. Newly introduced upholstered furniture shall have limited rates of heat release when tested in accordance with ASTM E1537 or California Technical Bulletin 133, as follows:

1. The peak rate of heat release for the single upholstered furniture item shall not exceed 80 kW.
Exception: Upholstered furniture in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.
2. The total heat released by the single upholstered furniture item during the first 10 minutes of the test shall not exceed 25 MJ.
Exception: Upholstered furniture in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.

805.4.2.2 Heat release rate. Newly introduced mattresses shall have limited rates of heat release when tested in accordance with ASTM E1590 or California Technical Bulletin 129, as follows:

1. The peak rate of heat release for the single mattress shall not exceed 100 kW.
Exception: Mattresses in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.
2. The total heat released by the single mattress during the first 10 minutes of the test shall not exceed 25 MJ.
Exception: Mattresses in rooms or spaces protected by an ~~approved-automatic sprinkler~~ system installed in accordance with Section ~~903.3.1.1~~903.3.1.1.

806.1.1 Restricted occupancies. Natural cut trees shall be prohibited within ambulatory care facilities and Group A, E, I-1, I-2, I-3, I-4, M, R-1, R-2 and R-4 occupancies.

Exceptions:

1. Trees located in areas protected by an ~~approved~~ *automatic sprinkler* system installed in accordance with Section 903.3.1.1 or 903.3.1.2 shall not be prohibited in Groups A, E, M, R-1 and R-2.
2. Trees shall be allowed within *dwelling units* in Group R-2 occupancies.

807.2 Combustible decorative materials. In Groups A, B, E, I, M and R-1 and in dormitories in Group R-2, curtains, draperies, fabric hangings and other similar combustible decorative materials suspended from walls or ceilings shall comply with Section 807.3 and shall not exceed 10 percent of the specific wall or ceiling area to which such materials are attached.

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered to be *interior finish*, shall comply with Section 803 and shall not be considered *decorative materials* or furnishings.

Exceptions:

1. In auditoriums in Group A, the permissible amount of curtains, draperies, fabric hangings and similar combustible decorative material suspended from walls or ceilings shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an ~~approved~~ *automatic sprinkler* system in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.15 of the International Building Code Code.
2. In Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and similar decorative materials suspended from walls or ceilings shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with an ~~approved~~ *automatic sprinkler system* installed in accordance with Section ~~903.3.1~~ 903.3.1.
3. In Group B and M occupancies, the amount of combustible fabric partitions suspended from the ceiling and not supported by the floor shall comply with Section 807.3 and shall not be limited.
4. The 10-percent limit shall not apply to curtains, draperies, fabric hangings and similar combustible decorative materials used as window coverings.

807.4 Artificial decorative vegetation. Artificial decorative vegetation shall comply with this section and the requirements of Sections 806.2 and ~~806.3~~ 806.3. Natural decorative vegetation shall comply with Section ~~806~~ 806.

Exception: Testing of artificial vegetation is not required in Group I-1; Group I-2, Condition 1; Group R-2; Group R-3; or Group R-4 occupancies equipped throughout with an ~~approved~~ *automatic sprinkler* system installed in accordance with Section 903.3.1, where such artificial vegetation complies with the following:

1. Wreaths and other decorative items on doors shall not obstruct the door operation and shall not exceed 50 percent of the surface area of the door.
2. Decorative artificial vegetation shall be limited to not more than 30 percent of the wall area to which it is attached.
3. Decorative artificial vegetation not on doors or walls shall not exceed 3 feet (914 mm) in any dimension.

807.5.2.1 Storage in corridors and lobbies. Clothing and personal effects shall not be stored in *corridors* and lobbies.

Exceptions:

1. *Corridors* protected by an ~~approved~~ *automatic sprinkler* system installed in accordance with Section ~~903.3.1.1~~ 903.3.1.1.
2. *Corridors* protected by an *approved* fire alarm system installed in accordance with Section ~~907~~ 907.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

807.5.3.1 Group I-1 and I-2 Condition 1 within units. In Group I-1 and Group I-2 Condition 1 occupancies, equipped throughout with an ~~approved~~ *automatic sprinkler* system installed in accordance with Section 903.3.1.1, within

sleeping units and dwelling units, combustible decorative materials placed on walls shall be limited to not more than 50 percent of the wall area to which they are attached.

807.5.3.4 Other areas in Groups I-1 and I-2. In Group I-1 and I-2 occupancies, in areas not equipped throughout with an ~~approved~~ automatic sprinkler system, combustible decorative materials shall be of such limited quantities that a hazard of fire development or spread is not present.

807.5.3.3 In Group I-2, Condition 2. In Group I-2, Condition 2 occupancies, equipped throughout with an ~~approved~~ automatic sprinkler system installed in accordance with Section 903.3.1.1, combustible decorative materials placed on walls shall be limited to not more than 30 percent of the wall area to which they are attached.

807.5.3.2 In Group I-1 and I-2, Condition 1 for areas other than within units. In Group I-1 and Group I-2, Condition 1 occupancies, equipped throughout with an ~~approved~~ automatic sprinkler system installed in accordance with Section 903.3.1.1, combustible decorative materials placed on walls in areas other than within dwelling and sleeping units shall be limited to not more than 30 percent of the wall area to which they are attached.

807.5.5.1 Storage in corridors and lobbies. Clothing and personal effects shall not be stored in corridors and lobbies.

Exceptions:

1. Corridors protected by an ~~approved~~ automatic sprinkler system installed in accordance with Section ~~903.3.1.1~~ 903.3.1.1.
2. Corridors protected by an approved fire alarm system installed in accordance with Section ~~907.907~~.
3. Storage in metal lockers, provided the minimum required egress width is maintained.

903.1.1 Alternative protection. Alternative automatic fire-extinguishing systems complying with Section 904 shall be permitted instead of automatic sprinkler system protection where recognized by the applicable standard and approved by the fire code official.

903.2 Where required. ~~Approved~~ Automatic automatic sprinkler systems in new buildings and structures shall be provided in the locations described in Sections 903.2.1 through ~~903.2.12~~ 903.2.12.

Exception: Spaces or areas in telecommunications buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided that those spaces or areas are equipped throughout with an automatic smoke detection system in accordance with Section 907.2 and are separated from the remainder of the building by not less than 1-hour fire barriers constructed in accordance with Section 707 of the International Building Code or not less than 2-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both.

903.2.11.1.3 Basements. Where any portion of a basement is located more than 75 feet (22 860 mm) from openings required by Section 903.2.11.1, or where walls, partitions or other obstructions are installed that restrict the application of water from hose streams, the basement shall be equipped throughout with an ~~approved~~ automatic sprinkler system.

903.2.11.1.2 Openings on one side only. Where openings in a story are provided on only one side and the opposite wall of such story is more than 75 feet (22 860 mm) from such openings, the story shall be equipped throughout with an ~~approved~~ automatic sprinkler system, or openings shall be provided on not fewer than two sides of the story.

903.2.11.2 Rubbish and linen chutes. An automatic sprinkler system shall be installed at the top of rubbish and linen chutes and in their terminal rooms. Chutes shall have additional ~~sprinkler heads~~ sprinklers installed at alternate floors and at the lowest intake. Where a rubbish chute extends through a building more than one floor below the lowest intake, the extension shall have sprinklers installed that are recessed from the drop area of the chute and protected from freezing in accordance with Section ~~903.3.1.1~~ 903.3.1.1. Such sprinklers shall be installed at alternate floors, beginning with the second level below the last intake and ending with the floor above the discharge. Access to sprinklers in chutes shall be provided for servicing.

903.3.1 Standards. ~~Sprinkler~~ Automatic sprinkler systems shall be designed and installed in accordance with Section 903.3.1.1, unless otherwise permitted by Sections 903.3.1.2 and 903.3.1.3 and other chapters of this code, as applicable.

903.5 Testing and maintenance. ~~Sprinkler~~ Automatic sprinkler systems shall be tested and maintained in accordance with Section ~~901.901~~.

904.12.5.3 Fusible link and sprinkler head replacement. Fusible links and automatic ~~sprinkler heads~~ ~~sprinklers~~ shall be replaced annually, and other protection devices shall be serviced or replaced in accordance with the manufacturer's instructions.

Exception: Frangible bulbs are not required to be replaced annually.

905.4.1 Protection. Risers and laterals of Class I standpipe systems not located within an *interior exit stairway* shall be protected by a degree of *fire resistance* equal to that required for vertical enclosures in the building in which they are located.

Exception: In buildings equipped throughout with an ~~approved~~ ~~automatic~~ automatic sprinkler system, laterals that are not located within an *interior exit stairway* are not required to be enclosed within fire-resistance-rated construction.

907.2.3 Group E. A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. Where *automatic sprinkler systems* or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an *occupant load* of 50 or less.
2. Emergency voice/alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual fire alarm system initiates an *approved* occupant notification signal in accordance with Section 907.5.
3. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
 - 3.1. Interior *corridors* are protected by smoke detectors.
 - 3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by *heat detectors* or other *approved* detection devices.
 - 3.3. Shops and laboratories involving dusts or vapors are protected by *heat detectors* or other *approved* detection devices.
4. Manual fire alarm boxes shall not be required in Group E occupancies where all of the following apply:
 - 4.1. The building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
 - 4.2. The emergency voice/alarm communication system will activate on sprinkler water flow.
 - 4.3. Manual activation is provided from a normally occupied location.

907.2.9.1 Manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group R-2 occupancies where any of the following conditions apply:

1. Any *dwelling unit* or *sleeping unit* is located three or more stories above the lowest *level of exit discharge*.
2. Any *dwelling unit* or *sleeping unit* is located more than one story below the highest *level of exit discharge* of exits serving the *dwelling unit* or *sleeping unit*.
3. The building contains more than 16 *dwelling units* or *sleeping units*.

Exceptions:

1. A fire alarm system is not required in buildings not more than two stories in height where all *dwelling units* or *sleeping units* and contiguous attic and crawl spaces are separated from each other and public or common areas by not less than 1-hour *fire partitions* and each *dwelling unit* or *sleeping unit* has an *exit* directly to a *public way*, *egress court* or yard.
2. Manual fire alarm boxes are not required where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and the occupant notification appliances will automatically activate throughout the notification zones upon a sprinkler water flow.
3. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling*

units and are protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that *dwelling units* either have a *means of egress* door opening directly to an exterior *exit access* that leads directly to the *exits* or are served by open-ended *corridors* designed in accordance with Section 1027.6, Exception 3.

910.2 Where required. Smoke and heat vents or a mechanical smoke removal system shall be installed as required by Sections 910.2.1 and 910.2.2.

Exceptions:

1. Frozen food warehouses used solely for storage of Class I and II commodities where protected by an ~~approved~~ *automatic sprinkler system*.
2. Smoke and heat removal shall not be required in areas of buildings equipped with early suppression fast-response (ESFR) sprinklers.

910.4.1 Automatic sprinklers required. The building shall be equipped throughout with an ~~approved automatic sprinkler system~~ in accordance with Section ~~903.3.1.1~~ 903.3.1.1.

914.4.1 Automatic sprinkler system. An ~~approved automatic sprinkler system~~ shall be installed throughout the entire building.

Exceptions:

1. That area of a building adjacent to or above the atrium need not be sprinklered, provided that portion of the building is separated from the atrium portion by not less than a 2-hour *fire barrier* constructed in accordance with Section 707 of the International Building Code or *horizontal assemblies* constructed in accordance with Section 711 of the International Building Code, or both.
2. Where the ceiling of the atrium is more than 55 feet (16 764 mm) above the floor, sprinkler protection at the ceiling of the atrium is not required.

[BE] 1006.2.2.3 Refrigerated rooms or spaces. Rooms or spaces having a floor area larger than 1,000 square feet (93 m²), containing a refrigerant evaporator and maintained at a temperature below 68°F (20°C), shall have access to not less than two *exits* or *exit access doorways*.

Exit access travel distance shall be determined as specified in Section 1017.1, but all portions of a refrigerated room or space shall be within 150 feet (45 720 mm) of an *exit* or *exit access doorway* where such rooms are not protected by an ~~approved automatic sprinkler system~~. Egress is allowed through adjoining refrigerated rooms or spaces.

Exception: Where using refrigerants in quantities limited to the amounts based on the volume set forth in the International Mechanical Code.

[BE] 1010.3.2 Security access turnstiles. Security access turnstiles that inhibit travel in the direction of egress utilizing a physical barrier shall be permitted to be considered as a component of the means of egress, provided that all of the following criteria are met:

1. The building is protected throughout by an ~~approved, supervised automatic sprinkler system~~ in accordance with Section 903.3.1.1.
2. Each security access turnstile lane configuration has a minimum clear passage width of 22 inches (559 mm).
3. Any security access turnstile lane configuration providing a clear passage width of less than 32 inches (810 mm) shall be credited with a maximum egress capacity of 50 persons.
4. Any security access turnstile lane configuration providing a clear passage width of 32 inches (810 mm) or more shall be credited with a maximum egress capacity as calculated in accordance with Section 1005.
5. Each secured physical barrier shall automatically retract or swing to an unobstructed open position in the direction of egress, under each of the following conditions:
 - 5.1. Upon loss of power to the turnstile or any part of the access control system that secures the physical barrier.
 - 5.2. Upon actuation of a clearly identified manual release device with ready access that results

in direct interruption of power to each secured physical barrier, after which such barriers remain in the open position for not less than 30 seconds. The manual release device shall be positioned at one of the following locations:

- 5.2.1. On the egress side of each security access turnstile lane.
- 5.2.2. At an approved location where it can be actuated by an employee assigned to the area at all times that the building is occupied.
- 5.3. Upon actuation of the building fire alarm system, if provided, after which the physical barrier remains in the open position until the fire alarm system is manually reset.

Exception: Actuation of a manual fire alarm box.

- 5.4. Upon actuation of the building automatic sprinkler or fire detection system, after which the physical barrier remains in the open position until the fire alarm system is manually reset.

Revise as follows:

[BE] 1028.1 General. Exits shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*.

Exceptions:

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas on the *level of discharge* provided that all of the following conditions are met:
 - 1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior exit door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
 - 1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
 - 1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an ~~approved~~ *automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall either be equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
 - 1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the exit discharge door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit discharge door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the interior *exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
 - 2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp* enclosure.
 - 2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
 - 2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708 of the International Building Code.

Exception: The maximum transmitted temperature rise is not required.
 - 2.4. The area is used only for *means of egress* and *exits* directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the

exterior of the building.

[BE] 1029.6.2.3 Automatic sprinklers. Enclosed areas with walls and ceilings in buildings or structures containing *smoke-protected assembly seating* shall be protected with an ~~approved~~ *automatic sprinkler system* in accordance with Section ~~903.3.1.1-903.3.1.1~~.

Exceptions:

1. The floor area used for contests, performances or entertainment provided that the roof construction is more than 50 feet (15 240 mm) above the floor level and the use is restricted to low fire hazard uses.
2. Press boxes and storage facilities less than 1,000 square feet (93 m²) in area.
3. Outdoor seating facilities where seating and the *means of egress* in the seating area are essentially open to the outside.

1103.4.9.3 Automatic sprinkler system. Chutes shall be equipped with an ~~approved~~ *automatic sprinkler system* in accordance with Section ~~903.2.11.2-903.2.11.2~~.

1103.5.3 Group I-2, Condition 2. In addition to the requirements of Section 1103.5.2, existing buildings of Group I-2, Condition 2 occupancy shall be equipped throughout with an ~~approved~~ *automatic sprinkler system* in accordance with Section ~~903.3.1.1-903.3.1.1~~. The *automatic sprinkler system* shall be installed as established by the adopting ordinance. [DATE BY WHICH SPRINKLER SYSTEM MUST BE INSTALLED].

1103.5.4 Pyroxylin plastics. An *automatic sprinkler system* shall be provided throughout existing buildings where cellulose nitrate film or pyroxylin plastics are manufactured, stored or handled in quantities exceeding 100 pounds (45 kg). Vaults located within buildings for the storage of raw pyroxylin shall be protected with an ~~approved~~ *automatic sprinkler system* capable of discharging 1.66 gallons per minute per square foot (68 L/min/m²) over the area of the vault.

1103.7.6 Group R-2. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in existing Group R-2 occupancies more than three stories in height or with more than 16 *dwelling or sleeping units*.

Exceptions:

1. Where each living unit is separated from other contiguous living units by *fire barriers* having a *fire-resistance rating* of not less than ³/₄ hour, and where each living unit has either its own independent *exit* or its own independent stairway or ramp discharging at grade.
2. A separate fire alarm system is not required in buildings that are equipped throughout with an ~~approved~~ *supervised automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and having a local alarm to notify all occupants.
3. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units* and are protected by an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that *dwelling units* either have a *means of egress* door opening directly to an exterior *exit* access that leads directly to the *exits* or are served by open-ended *corridors* designed in accordance with Section 1027.6, Exception 3.
4. A fire alarm system is not required in buildings that do not have interior *corridors* serving *dwelling units*, do not exceed three stories in height and comply with both of the following:
 - 4.1. Each *dwelling unit* is separated from other contiguous *dwelling units* by *fire barriers* having a *fire-resistance rating* of not less than ³/₄ hour.
 - 4.2. Each *dwelling unit* is provided with hard-wired, interconnected smoke alarms as required for new construction in Section ~~907.2.10-907.2.10~~.

[BE] 1104.16.2 Opening protectives. Doors and windows within 10 feet (3048 mm) of fire escape *stairways* shall be protected with ³/₄-hour opening protectives.

Exception: Opening protectives shall not be required in buildings equipped throughout with an ~~approved~~ *automatic sprinkler system*.

1104.17 Corridor construction. Corridors serving an occupant load greater than 30 and the openings therein shall provide an effective barrier to resist the movement of smoke. Transoms, louvers, doors and other openings shall be kept closed or be self-closing. In Group I-2, corridors in areas housing patient sleeping or care rooms shall comply with

Section ~~1105.5~~, 1105.5.

Exceptions:

1. *Corridors* in occupancies other than in Group H, that are equipped throughout with an ~~approved~~ *automatic sprinkler system*.
2. *Corridors* in occupancies in Group E where each room utilized for instruction or assembly has not less than one-half of the required *means of egress* doors opening directly to the exterior of the building at ground level.
3. *Corridors* that are in accordance with the International Building Code.

1104.17.1 Corridor openings. Openings in *corridor* walls shall comply with the requirements of the International Building Code.

Exceptions:

1. Where 20-minute fire door assemblies are required, solid wood doors not less than 1.75 inches (44 mm) thick or insulated steel doors are allowed.
2. Openings protected with fixed wire glass set in steel frames.
3. Openings covered with 0.5-inch (12.7 mm) gypsum wallboard or 0.75-inch (19.1 mm) plywood on the room side.
4. Opening protection is not required where the building is equipped throughout with an ~~approved~~ *automatic sprinkler system*.

2309.3.1.5.2 Fire-extinguishing-Automatic sprinkler systems. Fuel-dispensing areas under canopies shall be equipped throughout with an ~~approved~~ *automatic sprinkler system* in accordance with Section ~~903.3.1.1~~, 903.3.1.1. The design of the sprinkler system shall be not less than that required for Extra Hazard Group 2 occupancies. Operation of the sprinkler system shall activate the emergency functions of Sections 2309.3.1.5.3 and ~~2309.3.1.5.4~~, 2309.3.1.5.4.

2404.2 Location of spray-finishing operations. Spray-finishing operations conducted in buildings used for Group A, E, I or R occupancies shall be located in a spray room protected with an ~~approved~~ *automatic sprinkler system* installed in accordance with Section 903.3.1.1 and separated vertically and horizontally from the remainder of the building by *fire barrier* walls and horizontal assemblies with not less than a 1-hour *fire-resistance rating* in accordance with the International Building Code. In other occupancies, spray-finishing operations shall be conducted in a spray room, spray booth or limited spraying space *approved* for such use.

Exceptions:

1. Automobile undercoating spray operations and spray-on automotive lining operations conducted in areas with *approved* natural or mechanical ventilation shall be exempt from the provisions of Section 2404 when *approved* and where utilizing Class IIIA or IIIB *combustible liquids*.
2. In buildings other than Group A, E, I or R occupancies, *approved* limited spraying space in accordance with Section ~~2404.9~~, 2404.9.
3. Resin application areas used for manufacturing of reinforced plastics complying with Section 2409 shall not be required to be located in a spray room, spray booth or spraying space.

2404.4 Fire protection. Spray booths and spray rooms shall be protected by an ~~approved~~ *automatic fire-extinguishing* ~~a fire protection~~ system complying with Chapter ~~9-9~~, 9-9. Protection shall extend to exhaust plenums, exhaust ducts and both sides of dry filters where such filters are used.

2404.5.2 Protection of sprinklers. Automatic sprinklers installed in *flammable vapor areas* shall be protected from the accumulation of residue from spraying operations in an *approved* manner. Bags used as a protective covering shall be 0.003-inch-thick (0.076 mm) ~~polyethylene or cellophane or shall be~~ thin paper. Automatic sprinklers contaminated by overspray particles shall be replaced with new automatic sprinklers.

2405.2 Location of dip-tank operations. Dip-tank operations conducted in buildings used for Group A, I or R occupancies shall be located in a room designed for that purpose, equipped with an ~~approved~~ *automatic sprinkler system* and separated vertically and horizontally from other areas in accordance with the International Building Code.

2405.4.1 Fixed fire -extinguishing-protection equipment. An ~~approved~~ *automatic fire -extinguishing-protection* system or dip-tank cover in accordance with Section 2405.3.4 shall be provided for the following dip tanks:

1. Dip tanks less than 150 gallons (568 L) in capacity or 10 square feet (0.93 m²) in liquid surface area.
2. Dip tanks containing a liquid with a *flash point* below 110°F (43°C) used in such manner that the liquid temperature could equal or be greater than its *flash point* from artificial or natural causes, and having both a capacity of more than 10 gallons (37.9 L) and a liquid surface area of more than 4 square feet (0.37 m²).

2405.4.1.1 Fire ~~extinguishing~~ protection system. An ~~approved automatic fire extinguishing protection system~~ shall be provided for dip tanks with a 150-gallon (568 L) or more capacity or 10 square feet (0.93 m²) or larger in a liquid surface area. Fire-extinguishing system design shall be in accordance with NFPA ~~34-34~~.

2405.9.4 Fire protection. Hardening and tempering tanks greater than 500 gallons (1893 L) in capacity or 25 square feet (2.3 m²) in liquid surface area shall be protected by an ~~approved automatic fire extinguishing protection system~~ complying with Chapter ~~9-9~~.

2407.4 Fire protection. Areas used for electrostatic spray finishing with fixed equipment shall be protected with an ~~approved automatic fire extinguishing protection system~~ complying with Chapter 9 and Section ~~2407.4.1-2407.4.1~~.

2703.10 Automatic sprinkler system. An ~~approved automatic sprinkler system~~ shall be provided in accordance with Sections 2703.10.1 through 2703.10.5 and Chapter 9.

2703.10.2 Gas cabinets and exhausted enclosures. An ~~approved automatic sprinkler system~~ shall be provided in gas cabinets and exhausted enclosures containing HPM *compressed gases*.

Exception: Gas cabinets located in an HPM room other than those cabinets containing pyrophoric gases.

2703.10.3 Pass-throughs in existing exit access corridors. Pass-throughs in existing *exit access corridors* shall be protected by an ~~approved automatic sprinkler system~~.

2703.10.4 Exhaust ducts for HPM. An ~~approved automatic sprinkler system~~ shall be provided in exhaust ducts conveying gases, vapors, fumes, mists or dusts generated from HPM in accordance with this section and the International Mechanical Code.

2703.10.4.1 Metallic and noncombustible nonmetallic exhaust ducts. An ~~approved automatic sprinkler system~~ shall be provided in metallic and noncombustible nonmetallic exhaust ducts where all of the following conditions apply:

1. Where the largest cross-sectional diameter is equal to or greater than 10 inches (254 mm).
2. The ducts are within the building.
3. The ducts are conveying flammable gases, vapors or fumes.

2703.10.4.1.1 Sprinkler head locations. Automatic sprinklers shall be installed at 12-foot (3658 mm) intervals in horizontal ducts and at changes in direction. In vertical runs, automatic sprinklers shall be installed at the top and at alternate floor levels.

2703.10.4.2 Combustible nonmetallic exhaust ducts. An ~~approved automatic sprinkler system~~ shall be provided in combustible nonmetallic exhaust ducts where the largest cross-sectional diameter of the duct is equal to or greater than 10 inches (254 mm).

Exceptions:

1. Ducts *listed or approved* for applications without *automatic sprinkler system* protection.
2. Ducts not more than 12 feet (3658 mm) in length installed below ceiling level.

2807.3 Pile fire protection. Automatic sprinkler protection shall be provided in conveyor tunnels and combustible enclosures that pass under a pile. Combustible or enclosed conveyor systems shall be equipped with an ~~approved automatic sprinkler system~~.

2808.7 Pile fire protection. Automatic sprinkler protection shall be provided in conveyor tunnels and combustible enclosures that pass under a pile. Combustible conveyor systems and enclosed conveyor systems shall be equipped with an ~~approved automatic sprinkler system~~.

**TABLE 3206.2
GENERAL FIRE PROTECTION AND LIFE SAFETY REQUIREMENTS**

COMMODITY CLASS	SIZE OF HIGH-PILED STORAGE AREA ^a (square feet) (see Sections 3206.2 and 3206.3)	ALL STORAGE AREAS (See Sections 3206, 3207 and 3208) ^b				SOLID-PILED STORAGE, SHELF STORAGE AND PALLETIZED STORAGE (see Section 3207.3)

For SI: 1 foot = 304.8 mm, 1 cubic foot = 0.02832 m³, 1 square foot = 0.0929 m².

- a. Where automatic sprinklers are required for reasons other than those in Chapter 32, the portion of the sprinkler system protecting the high-piled storage area shall be designed and installed in accordance with Sections 3207 and 3208.
- b. For aisles, see Section 3206.10.
- c. Piles shall be separated by aisles complying with Section 3206.10.
- d. For storage in excess of the height indicated, special fire protection shall be provided in accordance with Note f where required by the fire code official. See Chapters 51 and 57 for special limitations for aerosols and flammable and combustible liquids, respectively.
- e. For storage exceeding 30 feet in height, Option 1 shall be used.
- f. Special fire protection provisions including, but not limited to, fire protection of exposed steel columns; increased sprinkler density; additional in-rack sprinklers, without associated reductions in ceiling sprinkler density; or additional fire department hose connections shall be provided where required by the fire code official.
- g. Not required where an automatic fire-extinguishing system is designed and installed to protect the high-piled storage area in accordance with Sections 3207 and 3208.
- h. Not required where storage areas are protected by either early suppression fast response (ESFR) sprinkler systems or control mode special application sprinklers with a response time index of 50 (m • s)^{1/2} or less that are listed to control a fire in the stored commodities with 12 or fewer sprinklers, installed in accordance with NFPA 13.
- i. Not required in frozen food warehouses used solely for storage of Class I and II commodities where protected by an ~~approved~~ automatic sprinkler system.

3207.2 Fire protection. Where automatic sprinklers are required by Table 3206.2, an ~~approved~~ automatic sprinkler system shall be installed throughout the building or to 1-hour fire barriers constructed in accordance with Section 707 of the International Building Code. Openings in such *fire barriers* shall be protected by opening protectives having a 1-hour *fire protection rating*. The design and installation of the *automatic sprinkler system* and other applicable fire protection shall be in accordance with the International Building Code and NFPA 13.

3208.2 Fire protection. Where automatic sprinklers are required by Table 3206.2, an ~~approved~~ automatic sprinkler system shall be installed throughout the building or to 1-hour *fire barriers* constructed in accordance with Section 707 of the International Building Code. Openings in such *fire barriers* shall be protected by opening protectives having a 1-hour *fire protection rating*. The design and installation of the *automatic sprinkler system* and other applicable fire protection shall be in accordance with Section 903.3.1.1 and the International Building Code.

3209.2 Automatic ~~sprinklers~~ sprinkler system. Where automatic sprinklers are required by Table 3206.2, the building shall be equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1.

3803.1.7 Automatic ~~fire-extinguishing~~ sprinkler systems. New laboratories in new or existing buildings that increase maximum allowable quantities of hazardous materials based on the requirements in this chapter shall be equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1.

3804.1.1.9 Automatic ~~fire-extinguishing~~ sprinkler systems. Buildings containing laboratory suites shall be equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1.

TABLE 5003.1.1(1)

For SI: 1 cubic foot = 0.02832 m³, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NA = Not Applicable, NL = Not Limited, UD = Unclassified Detonable.

- a. For use of control areas, see Section 5003.8.3.
- b. The aggregate quantity in use and storage shall not exceed the quantity listed for storage.
- c. The quantities of alcoholic beverages in retail and wholesale sales occupancies shall not be limited providing the liquids are packaged in individual containers not exceeding 1.3 gallons. In retail and wholesale sales occupancies, the quantities of medicines, foodstuff or consumer products and cosmetics containing not more than 50 percent by volume of water-miscible liquids with the remainder of the solutions not being flammable shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons.
- d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with a ~~non-approved~~ automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e applies, the increase for both notes shall be applied accumulatively.
- e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, day boxes, gas cabinets, gas rooms, exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10. Where Note d applies, the increase for both notes shall be applied accumulatively.
- f. Quantities shall not be limited in a building equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1.
- g. Allowed only in buildings equipped throughout with an ~~approved~~ automatic sprinkler system.
- h. Containing not more than the maximum allowable quantity per control area of Class IA, Class IB or Class IC flammable liquids.
- i. The maximum allowable quantity shall not apply to fuel oil storage complying with Section 603.3.2.
- j. Quantities in parenthesis indicate quantity units in parenthesis at the head of each column.
- k. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed where such materials are necessary for maintenance purposes, operation or sanitation of equipment where the storage containers and the manner of storage are approved.
- l. Net weight of pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks including packaging shall be used.
- m. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.
- n. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with Section 5003.11, see Table 5003.11.1.
- o. Densely-packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.
- p. The following shall not be included in determining the maximum allowable quantities:
 1. Liquid or gaseous fuel in fuel tanks on vehicles.
 2. Liquid or gaseous fuel in fuel tanks on motorized equipment operated in accordance with this code.
 3. Gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code.
 4. Liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code.
 5. Alcohol-based hand rubs classified as Class I or II liquids in dispensers that are installed in accordance with Sections 5705.5 and 5705.5.1. The location of the alcohol-based hand rub (ABHR) dispensers shall be provided in the construction documents.
- q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.7.2.

**TABLE 5003.1.1(2)
 MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF HAZARDOUS MATERIAL POSING A HEALTH
 HAZARD^{a, c, f, h, i}**

MATERIAL	STORAGE ^b			USE-CLOSED SYSTEMS ^b			USE-OPEN SYSTEMS ^b	
	Solid pounds ^c	Liquid gallons(pounds) ^c	Gas cubic feet at NTP(pounds) ^c	Solid pounds ^c	Liquid gallons(pounds) ^c	Gas cubic feet at NTP(pounds) ^c	Solid pounds ^d	Liquid gallons(pounds) ^d
Corrosives	5,000	500	Gaseous 810 ^e Liquefied (150)	5,000	500	Gaseous 810 ^e Liquefied (150)	1,000	100
Highly Toxics	10	(10)	Gaseous 20 ^e Liquefied (4) ^e	10	(10)	Gaseous 20 ^e Liquefied (4) ^e	3	(3)
Toxics	500	(500)	Gaseous 810 ^e Liquefied (150) ^e	500	(500)	Gaseous 810 ^e Liquefied (150) ^e	125	(125)

For SI: 1 cubic foot = 0.02832 m³, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

- a. For use of control areas, see Section 5003.8.3.
- b. The aggregate quantity in use and storage shall not exceed the quantity listed for storage.
- c. In retail and wholesale sales occupancies, the quantities of medicines, foodstuff or consumer products and cosmetics, containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solutions not being flammable, shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons.
- d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e also applies, the increase for both notes shall be applied accumulatively.
- e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, gas cabinets or exhausted enclosures. Where Note d applies, the increase for both notes shall be applied accumulatively.
- f. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with Section 5003.11, see Table 5003.11.1.
- g. Allowed only where stored in approved exhausted gas cabinets or exhausted enclosures.
- h. Quantities in parentheses indicate quantity units in parentheses at the head of each column.
- i. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.

TABLE 5003.11.1
MAXIMUM ALLOWABLE QUANTITY PER INDOOR AND OUT DOOR CONTROL AREA IN GROUP M AND S
~~**OCCUPANCIES—NONFLAMMABLE OCCUPANCIES—NONFLAMMABLE SOLIDS, NONFLAMMABLE AND**~~
NONCOMBUSTIBLE LIQUIDS^{d, e, f}

CONDITION		MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA	
Material^a	Class	Solids (pounds)	Liquids (gallons)
A. HEALTH-HAZARD MATERIALS—NONFLAMMABLE AND NONCOMBUSTIBLE SOLIDS AND LIQUIDS			
1. Corrosives ^{b, c}	Not Applicable	9,750	975
2. Highly Toxics	Not Applicable	20 ^{b, c}	2 ^{b, c}
3. Toxics ^{b, c}	Not Applicable	1,000	100
B. PHYSICAL-HAZARD MATERIALS—NONFLAMMABLE AND NONCOMBUSTIBLE SOLIDS AND LIQUIDS			
1. Oxidizers ^{b, c}	4	Not Allowed	Not Allowed
	3	1,350 ^g	135
	2	2,250 ^h	225
	1	18,000 ^{i, j}	1,800 ^{i, j}
2. Unstable (Reactives) ^{b, c}	4	Not Allowed	Not Allowed
	3	550	55
	2	1,150	115
	1	Not Limited	Not Limited
3. Water Reactives	3 ^{b, c}	550	55
	2 ^{b, c}	1,150	115
	1	Not Limited	Not Limited

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L, 1 cubic foot = 0.02832 m³.

- a. Hazard categories are as specified in Section 5001.2.2.
- b. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1. Where Note c applies, the increase for both notes shall be applied accumulatively.
- c. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets in accordance with Section 5003.8. Where Note b applies, the increase for both notes shall be applied accumulatively.
- d. See Table 5003.8.3.2 for design and number of control areas.
- e. Maximum allowable quantities for other hazardous material categories shall be in accordance with Section 5003.1.
- f. Maximum allowable quantities shall be increased 100 percent in outdoor control areas.
- g. Maximum allowable quantities shall be increased to 2,250 pounds where individual packages are in the original sealed containers from the manufacturer or packager and do not exceed 10 pounds each.
- h. Maximum allowable quantities shall be increased to 4,500 pounds where individual packages are in the original sealed containers from the manufacturer or packager and do not exceed 10 pounds each.
- i. Quantities are unlimited where protected by an automatic sprinkler system.
- j. Quantities are unlimited in an outdoor control area.

5004.5 Automatic sprinkler systems. Indoor storage areas and storage buildings shall be equipped throughout with an ~~approved~~ *automatic sprinkler system* in accordance with Section 903.3.1.1. The design of the sprinkler system shall be not less than that required for Ordinary Hazard Group 2 with a minimum design area of 3,000 square feet (279 m²). Where the materials or storage arrangement are required by other regulations to be provided with a higher level of sprinkler system protection, the higher level of sprinkler system protection shall be provided.

TABLE 5104.3.1**NONSEGREGATED STORAGE OF LEVEL 2 AND 3 AEROSOL PRODUCTS IN GENERAL PURPOSE WAREHOUSES^b**

AEROSOL LEVEL	MAXIMUM NET WEIGHT PER FLOOR (pounds)^b			
	Palletized or solid-pile storage		Rack storage	
	Unprotected	Protected^a	Unprotected	Protected^a
2	2,500	12,000	2,500	24,000
3	1,000	12,000	1,000	24,000
Combination 2 and 3	2,500	12,000	2,500	24,000

For SI: 1 foot = 304.8 mm, 1 pound = 0.454 kg, 1 square foot = 0.0929 m².

- a. ~~Approved automatic~~ Automatic sprinkler system protection and storage arrangements shall comply with NFPA 30B. Sprinkler system protection shall extend 20 feet beyond the storage area containing the aerosol products.
- b. Storage quantities indicated are the maximum permitted in any 50,000- square-foot area.

**TABLE 5104.3.2
SEGREGATED STORAGE OF LEVEL 2 AND 3 AEROSOL PRODUCTS IN GENERAL PURPOSE WAREHOUSES**

STORAGE SEPARATION	MAXIMUM SEGREGATED STORAGE AREA ^a		SPRINKLER REQUIREMENTS
	Percentage of building area (percent)	Area limitation (square feet)	
Separation area ^{e, f}	15	20,000	Notes b, c
Chain-link fence enclosure ^d	20	20,000	Notes b, c
1-hour fire-resistance-rated interior walls	20	30,000	Note b
2-hour fire-resistance-rated interior walls	25	40,000	Note b
3-hour fire-resistance-rated interior walls	30	50,000	Note b

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. The maximum segregated storage area shall be limited to the smaller of the two areas resulting from the percentage of building area limitation and the area limitation.
- b. Automatic sprinkler system protection in aerosol product storage areas shall comply with NFPA 30B and be approved. Building areas not containing aerosol product storage shall be equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1.
- c. Automatic sprinkler system protection in aerosol product storage areas shall comply with NFPA 30B and be approved. Sprinkler system protection shall extend a minimum 20 feet beyond the aerosol storage area.
- d. Chain-link fence enclosures shall comply with Section 5104.3.2.1.
- e. A separation area shall be defined as an area extending outward from the periphery of the segregated aerosol product storage area as follows.
 1. The limits of the aerosol product storage shall be clearly marked on the floor.
 2. The separation distance shall be not less than 25 feet and maintained clear of all materials with a commodity classification greater than Class III in accordance with Section 903.3.1.1.
- f. Separation areas shall only be permitted where approved.

5104.5.2 Storage rooms greater than 500 square feet. The storage of aerosol products in flammable liquid storage rooms greater than 500 square feet (46 m²) in area shall not exceed the following quantities:

1. A net weight of 2,500 pounds (1135 kg) of Level 2 aerosol products.
2. A net weight of 1,000 pounds (454 kg) of Level 3 aerosol products.
3. A combined net weight of 2,500 pounds (1135 kg) of Level 2 and 3 aerosol products.

The maximum aggregate storage quantity of Level 2 and 3 aerosol products permitted in separate inside storage rooms protected by an ~~approved~~ automatic sprinkler system in accordance with NFPA 30B shall be 5,000 pounds (2270 kg).

5704.2.9.2.3 Fire protection of supports. Supports or pilings for above-ground tanks storing Class I, II or IIIA liquids elevated more than 12 inches (305 mm) above grade shall have a *fire-resistance rating* of not less than 2 hours in accordance with the fire exposure criteria specified in ASTM E1529.

Exceptions:

1. Structural supports tested as part of a protected above-ground tank in accordance with UL 2085.
2. Stationary tanks located outside of buildings where protected by an *approved* water-spray system designed in accordance with Chapter 9 and NFPA 15.
3. Stationary tanks located inside of buildings equipped throughout with an ~~approved~~ automatic sprinkler system designed in accordance with Section 903.3.1.1.

**TABLE 5704.3.4.1
 MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF FLAMMABLE AND COMBUSTIBLE LIQUIDS IN
 WHOLESALE AND RETAIL SALES OCCUPANCIES^a**

TYPE OF LIQUID	MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA (gallons)		
	Sprinklered^b in accordance with footnote densities and arrangements	Sprinklered in accordance with Tables 5704.3.6.3(4) through 5704.3.6.3(8) and Table 5704.3.7.5.1	Nonsprinklered
Class IA	60	60	30
Class IB, IC, II and IIIA	7,500 ^c	15,000 ^c	1,600
Class IIIB	Unlimited	Unlimited	13,200

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m², 1 gallon = 3.785 L, 1 gallon per minute per square foot = 40.75 L/min/m².

- a. Control areas shall be separated from each other by not less than a 1-hour fire barrier.
- b. To be considered as sprinklered, a building shall be equipped throughout with an ~~approved~~ automatic sprinkler system with a design providing minimum densities as follows:
 1. For uncartoned commodities on shelves 6 feet or less in height where the ceiling height does not exceed 18 feet, quantities are those allowed with a minimum sprinkler design density of Ordinary Hazard Group 2.
 2. For cartoned, palletized or racked commodities where storage is 4 feet 6 inches or less in height and where the ceiling height does not exceed 18 feet, quantities are those allowed with a minimum sprinkler design density of 0.21 gallon per minute per square foot over the most remote 1,500-square-foot area.
- c. Where wholesale and retail sales or storage areas exceed 50,000 square feet in area, the maximum allowable quantities are allowed to be increased by 2 percent for each 1,000 square feet of area in excess of 50,000 square feet, up to not more than 100 percent of the table amounts. A control area separation is not required. The cumulative amounts, including amounts attained by having an additional control area, shall not exceed 30,000 gallons.

5704.3.6.2 Container capacity. Containers for Class I liquids shall not exceed a capacity of 5 gallons (19 L).

Exception: Metal containers not exceeding 55 gallons (208 L) are allowed to store up to 240 gallons (908 L) of the *maximum allowable quantity per control area* of Class IB and IC liquids in a *control area*. The building shall be equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Table 5704.3.4.1. The containers shall be provided with plastic caps without cap seals and shall be stored upright. Containers shall not be stacked or stored in racks and shall not be located in areas open to the public.

5705.3.6.2.3 Solvent quantity limits. Solvent quantities shall be limited as follows:

1. Machines without remote solvent reservoirs shall be limited to quantities set forth in Section 5705.3.5.
2. Machines with remote solvent reservoirs using Class I liquids shall be limited to quantities set forth in Section 5705.3.5.
3. Machines with remote solvent reservoirs using Class II liquids shall be limited to 35 gallons (132 L) per machine. The total quantities shall not exceed an aggregate of 240 gallons (908 L) per *control area* in buildings not equipped throughout with an ~~approved~~ automatic sprinkler system and an aggregate of 480 gallons (1817 L) per *control area* in buildings equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1.
4. Machines with remote solvent reservoirs using Class IIIA liquids shall be limited to 80 gallons (303 L) per machine.

5705.3.7.3 Fire protection. Rooms or buildings classified in accordance with the International Building Code as Group H-2 or H-3 occupancies shall be equipped with an ~~approved automatic fire-extinguishing~~ approved automatic sprinkler system in accordance with Chapter 9.

5705.5 Alcohol-based hand rubs classified as Class I or II liquids. The use of wall-mounted dispensers containing alcohol-based hand rubs classified as Class I or II liquids shall be in accordance with all of the following:

1. The maximum capacity of each dispenser shall be 68 ounces (2 L).
2. The minimum separation between dispensers shall be 48 inches (1219 mm).
3. The dispensers shall not be installed above, below, or closer than 1 inch (25 mm) to an electrical receptacle, switch, appliance, device or other ignition source. The wall space between the dispenser and the floor or intervening counter top shall be free of electrical receptacles, switches, appliances, devices or other ignition sources.
4. Dispensers shall be mounted so that the bottom of the dispenser is not less than 42 inches (1067 mm) and not more than 48 inches (1219 mm) above the finished floor.
5. Dispensers shall not release their contents except when the dispenser is manually activated. Facilities shall be permitted to install and use automatically activated ~~"touch-free"~~ "touch free" alcohol-based hand-rub dispensing devices with the following requirements:

- 5.1. The facility or persons responsible for the dispensers shall test the dispensers each time a new refill is installed in accordance with the manufacturer's care and use instructions.
- 5.2. Dispensers shall be designed and must operate in a manner that ensures accidental or malicious activations of the dispensing device are minimized. At a minimum, all devices subject to or used in accordance with this section shall have the following safety features:
 - 5.2.1. Any activations of the dispenser shall only occur when an object is placed within 4 inches (98 mm) of the sensing device.
 - 5.2.2. The dispenser shall not dispense more than the amount required for hand hygiene consistent with label instructions as regulated by the United States Food and Drug Administration (USFDA).
 - 5.2.3. An object placed within the activation zone and left in place will cause only one activation.
6. Storage and use of alcohol-based hand rubs shall be in accordance with the applicable provisions of Sections 5704 and 5705.
7. Dispensers installed in occupancies with carpeted floors shall only be allowed in smoke compartments or *fire areas* equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

6003.2.5 Weather protection for highly toxic liquids and ~~solids—outdoor~~ solids—outdoor storage or use. Where overhead weather protection is provided for outdoor storage or use of highly toxic liquids or solids, and the weather protection is attached to a building, the storage or use area shall either be equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1, or storage or use vessels shall be fire resistive. Weather protection shall be provided in accordance with Section 5004.13 for storage and Section 5005.3.9 for use.

6504.1.1 Storage of incoming material. Where raw material in excess of 25 pounds (11 kg) is received in a building or *fire area*, an ~~approved~~ vented cabinet or approved vented vault equipped with an ~~approved~~ automatic sprinkler system shall be provided for the storage of material.

6004.1.2 Gas cabinets. Gas cabinets containing highly toxic or toxic *compressed gases* shall comply with Section 5003.8.6 and the following requirements:

1. The average ventilation velocity at the face of gas cabinet access ports or windows shall be not less than 200 feet per minute (1.02 m/s) with not less than 150 feet per minute (0.76 m/s) at any point of the access port or window.
2. Gas cabinets shall be connected to an exhaust system.
3. Gas cabinets shall not be used as the sole means of exhaust for any room or area.
4. The maximum number of cylinders located in a single gas cabinet shall not exceed three, except that cabinets containing cylinders not exceeding 1 pound (0.454 kg) net contents are allowed to contain up to 100 cylinders.
5. Gas cabinets required by Section 6004.2 or 6004.3 shall be equipped with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1. Alternative fire-extinguishing systems shall not be used.

6004.1.3 Exhausted enclosures. Exhausted enclosures containing highly toxic or toxic *compressed gases* shall comply with Section 5003.8.5 and the following requirements:

1. The average ventilation velocity at the face of the enclosure shall be not less than 200 feet per minute (1.02 m/s) with not less than 150 feet per minute (0.76 m/s).
2. Exhausted enclosures shall be connected to an exhaust system.
3. Exhausted enclosures shall not be used as the sole means of exhaust for any room or area.
4. Exhausted enclosures required by Section 6004.2 or 6004.3 shall be equipped with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1. Alternative fire-extinguishing systems shall not be used.

6004.2.2.6 Gas rooms. Gas rooms shall comply with Section 5003.8.4 and both of the following requirements:

1. The exhaust ventilation from gas rooms shall be directed to an exhaust system.
2. Gas rooms shall be equipped with an ~~approved~~ automatic sprinkler system. Alternative fire-extinguishing systems shall not be used.

6004.3.3 Outdoor storage weather protection for portable tanks and cylinders. Weather protection in accordance with Section 5004.13 shall be provided for portable tanks and cylinders located outdoors and not within gas cabinets or exhausted enclosures. The storage area shall be equipped with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1.

Exception: An automatic sprinkler system is not required where:

1. All materials under the weather protection structure, including hazardous materials and the containers in which they are stored, are non-combustible.
2. The weather protection structure is located not less than 30 feet (9144 mm) from combustible materials or structures or is separated from such materials or structures using a fire barrier complying with Section 6004.3.2.1.1.

6504.2 Fire protection. The manufacture or storage of articles of cellulose nitrate (pyroxylin) plastic in quantities exceeding 100 pounds (45 kg) shall be located in a building or portion thereof equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1.

6704.1.3 Waterproof room. Rooms or areas used for the storage of water-reactive solids and liquids shall be constructed in a manner that resists the penetration of water through the use of waterproof materials. Piping carrying water for other than ~~approved~~ automatic sprinkler systems shall not be within such rooms or areas.

B105.3 Water supply for buildings equipped with an automatic sprinkler system. For buildings equipped with an ~~approved~~ automatic sprinkler system, the water supply shall be capable of providing the greater of:

1. The automatic sprinkler system demand, including hose stream allowance.
2. The required fire flow.

**TABLE C102.1
REQUIRED NUMBER AND SPACING OF FIRE HYDRANT Sh**

FIRE-FLOW REQUIREMENT (gpm)	MINIMUM NUMBER OF HYDRANTS	AVERAGE SPACING BETWEEN HYDRANTS^{a, b, c, f, g}(feet)	MAXIMUM DISTANCE FROM ANY POINT ON STREET OR ROAD FRONTAGE TO A HYDRANT^{d, f, g}
1,750 or less	1	500	250
1,751-2,250	2	450	225
2,251-2,750	3	450	225
2,751-3,250	3	400	225
3,251-4,000	4	350	210
4,001-5,000	5	300	180
5,001-5,500	6	300	180
5,501-6,000	6	250	150
6,001-7,000	7	250	150
7,001 or more	8 or more ^e	200	120

For SI: 1 foot = 304.8 mm, 1 gallon per minute = 3.785 L/m.

- a. Reduce by 100 feet for dead-end streets or roads.
- b. Where streets are provided with median dividers that cannot be crossed by fire fighters pulling hose lines, or where arterial streets are provided with four or more traffic lanes and have a traffic count of more than 30,000 vehicles per day, hydrant spacing shall average 500 feet on each side of the street and be arranged on an alternating basis.
- c. Where new water mains are extended along streets where hydrants are not needed for protection of structures or similar fire problems, fire hydrants shall be provided at spacing not to exceed 1,000 feet to provide for transportation hazards.
- d. Reduce by 50 feet for dead-end streets or roads.
- e. One hydrant for each 1,000 gallons per minute or fraction thereof.
- f. A 50-percent spacing increase shall be permitted where the building is equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1 of the International Fire Code.
- g. A 25-percent spacing increase shall be permitted where the building is equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.2 or 903.3.1.3 of the International Fire Code or Section P2904 of the International Residential Code.
- h. The fire code official is authorized to modify the location, number and distribution of fire hydrants based on site-specific constraints and hazards.

D104.2 Buildings exceeding 62,000 square feet in area. Buildings or facilities having a gross *building area* of more than 62,000 square feet (5760 m²) shall be provided with two separate and *approved* fire apparatus access roads.

Exception: Projects having a gross *building area* of up to 124,000 square feet (11 520 m²) that have a single *approved* fire apparatus access road where all buildings are equipped throughout with ~~approved~~ automatic sprinkler systems.

D106.1 Projects having more than 100 dwelling units. Multiple-family residential projects having more than 100 *dwelling units* shall be equipped throughout with two separate and *approved* fire apparatus access roads.

Exception: Projects having up to 200 *dwelling units* shall have not fewer than one *approved* fire apparatus access road where all buildings, including nonresidential occupancies, are equipped throughout with ~~approved~~ automatic sprinkler systems installed in accordance with Section 903.3.1.1 or 903.3.1.2.

D106.2 Projects having more than 200 dwelling units. Multiple-family residential projects having more than 200 *dwelling units* shall be provided with two separate and *approved* fire apparatus access roads regardless of whether they are equipped with an ~~approved~~ automatic sprinkler system.

D107.1 One- or two-family dwelling residential developments. Developments of one- or two-family *dwelling* where the number of *dwelling units* exceeds 30 shall be provided with two separate and *approved* fire apparatus access roads.

Exceptions:

1. Where there are more than 30 *dwelling units* on a single public or private fire apparatus access road and all *dwelling units* are equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, access from two directions shall not be required.
2. The number of *dwelling units* on a single fire apparatus access road shall not be increased unless fire apparatus access roads will connect with future development, as determined by the *fire code official*.

K102.5.3 Automatic sprinkler system. Chutes shall be equipped with an ~~approved~~ automatic sprinkler system in accordance with Section 903.2.11.2.

N105.4 Automatic sprinkler systems. An ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1 shall be provided in multiple-level booths exceeding 400 square feet (37.2 m²) in floor area per level.

N106.1 Automatic sprinkler systems. An ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1 of this code shall be provided in covered booths exceeding 100 square feet (9.3 m²) in floor area per level.

[F] TABLE 307.1(2)

MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF HAZARDOUS MATERIALS POSING A HEALTH HAZARD^{a, c, f, h, i}

MATERIAL	STORAGE ^b			USE-CLOSED SYSTEMS ^b		
	Solid pounds ^{d, e}	Liquid gallons (pounds) ^{d, e}	Gas cubic feet at NTP (pounds) ^d	Solid pounds ^d	Liquid gallons (pounds) ^d	Gas cubic feet at NTP (pounds)
Corrosives	5,000	500	Gaseous 810 ^e Liquefied (150)	5,000	500	Gaseous 810 ^e Liquefied (150)
Highly Toxic	10	(10)	Gaseous 20 ^g Liquefied (4) ^g	10	(10)	Gaseous 20 ^g Liquefied (4) ^g
Toxic	500	(500)	Gaseous 810 ^e Liquefied (150) ^e	500	(500)	Gaseous 810 ^e Liquefied (150) ^e

For SI: 1 cubic foot = 0.028 m³, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

- a. For use of control areas, see Section 414.2.
- b. The aggregate quantity in use and storage shall not exceed the quantity listed for storage.
- c. In retail and wholesale sales occupancies, the quantities of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solutions not being flammable, shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons.
- d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an ~~approved~~ automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e also applies, the increase for both notes shall be applied accumulatively.
- e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, gas cabinets or exhausted enclosures as specified in the International Fire Code. Where Note d also applies, the increase for both notes shall be applied accumulatively.
- f. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with Section 414.2.5, see Tables 414.2.5(1) and 414.2.5(2).
- g. Allowed only where stored in approved exhausted gas cabinets or exhausted enclosures as specified in the International Fire Code.
- h. Quantities in parentheses indicate quantity units in parentheses at the head of each column.
- i. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2 of the International Fire Code.

402.6.2 Kiosks. Kiosks and similar structures (temporary or permanent) located within the *mall* of a *covered mall building* or within the perimeter line of an *open mall building* shall meet the following requirements:

1. Combustible kiosks or other structures shall not be located within a *covered* or *open mall* unless constructed of any of the following materials:
 - 1.1. *Fire-retardant-treated* wood complying with Section 2303.2.
 - 1.2. Foam plastics having a maximum heat release rate not greater than 100 kW (105 Btu/h) when tested in accordance with the exhibit booth protocol in UL 1975 or when tested in accordance with NFPA 289 using the 20 kW ignition source.
 - 1.3. Aluminum composite material (ACM) meeting the requirements of Class A *interior finish* in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended.
2. Kiosks or similar structures located within the mall shall be provided with ~~approved~~ automatic *sprinkler system* and detection devices.
3. The horizontal separation between kiosks or groupings thereof and other structures within the *mall* shall be not less than 20 feet (6096 mm).
4. Each kiosk or similar structure or groupings thereof shall have an area not greater than 300 square feet (28 m²).

413.2 Attic, under-floor and concealed spaces. *Attic*, under-floor and concealed spaces used for storage of combustible materials shall be protected on the storage side as required for 1-hour fire-resistance-rated construction. Openings shall be protected by assemblies that are *self-closing* and are of noncombustible construction or solid wood core not less than 1³/₄ inch (45 mm) in thickness.

Exception: Neither fire-resistance-rated construction nor opening protectives are required in any of the following locations:

1. Areas protected by ~~approved~~ automatic *sprinkler systems*.
2. Group R-3 and U occupancies.

[F] TABLE 414.2.5(2)

MAXIMUM ALLOWABLE QUANTITY OF FLAMMABLE AND COMBUSTIBLE LIQUIDS IN WHOLESALE AND RETAIL SALES OCCUPANCIES PER CONTROL AREA^a

TYPE OF LIQUID	MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA (gallons)		
	Sprinklered in accordance with note b densities and arrangements	Sprinklered in accordance with Tables 5704.3.6.3(4) through 5704.3.6.3(8) and 5704.3.7.5.1 of the International Fire Code	Nonsprinklered
Class IA	60	60	30
Class IB, IC, II and IIIA	7,500 ^c	15,000 ^c	1,600
Class IIIB	Unlimited	Unlimited	13,200

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m², 1 gallon = 3.785 L, 1 gallon per minute per square foot = 40.75 L/min/m².

- a. Control areas shall be separated from each other by not less than a 1-hour fire barrier wall.
- b. To be considered as sprinklered, a building shall be equipped throughout with an ~~approved~~ automatic sprinkler system with a design providing minimum densities as follows:
 1. For uncartoned commodities on shelves 6 feet or less in height where the ceiling height does not exceed 18 feet, quantities are those permitted with a minimum sprinkler design density of Ordinary Hazard Group 2.
 2. For cartoned, palletized or racked commodities where storage is 4 feet 6 inches or less in height and where the ceiling height does not exceed 18 feet, quantities are those permitted with a minimum sprinkler design density of 0.21 gallon per minute per square foot over the most remote 1,500-square-foot area.
- c. Where wholesale and retail sales or storage areas exceed 50,000 square feet in area, the maximum allowable quantities are allowed to be increased by 2 percent for each 1,000 square feet of area in excess of 50,000 square feet, up to not more than 100 percent of the table amounts. A control area separation is not required. The cumulative amounts, including amounts attained by having an additional control area, shall not exceed 30,000 gallons.

[F] 415.11.11 Automatic sprinkler system protection in exhaust ducts for HPM. An ~~approved~~ automatic sprinkler system shall be provided in exhaust ducts conveying gases, vapors, fumes, mists or dusts generated from HPM in accordance with Sections 415.11.11.1 through 415.11.11.3 and the International Mechanical Code.

[F] 415.11.11.1 Metallic and noncombustible nonmetallic exhaust ducts. An ~~approved~~ automatic sprinkler system shall be provided in metallic and noncombustible nonmetallic exhaust ducts where all of the following conditions apply:

1. Where the largest cross-sectional diameter is equal to or greater than 10 inches (254 mm).
2. The ducts are within the building.
3. The ducts are conveying flammable gases, vapors or fumes.

[F] 415.11.2 Corridors. *Corridors* shall comply with Chapter 10 and shall be separated from *fabrication areas* as specified in Section 415.11.1.2. *Corridors* shall not contain HPM and shall not be used for transporting such materials except through closed piping systems as provided in Section 415.11.6.4.

Exception: Where existing *fabrication areas* are altered or modified, HPM is allowed to be transported in existing *corridors*, subject to the following conditions:

1. Nonproduction HPM is allowed to be transported in *corridors* if utilized for maintenance, lab work and testing.
2. Where existing *fabrication areas* are altered or modified, HPM is allowed to be transported in existing *corridors*, subject to the following conditions:
 - 2.1. *Corridors.* *Corridors* adjacent to the *fabrication area* where the alteration work is to be done shall comply with Section 1020 for a length determined as follows:
 - 2.1.1. The length of the common wall of the *corridor* and the *fabrication area*; and
 - 2.1.2. For the distance along the *corridor* to the point of entry of HPM into the *corridor* serving that *fabrication area*.
 - 2.2. *Emergency alarm system.* There shall be an emergency telephone system, a local manual alarm station or other *approved* alarm-initiating device within *corridors* at not more than 150-foot (45 720 mm) intervals and at each exit and doorway. The signal shall be relayed to an *approved* central, proprietary or remote station service or the emergency control station and shall initiate a local audible alarm.
 - 2.3. *Pass-throughs.* *Self-closing* doors having a *fire protection rating* of not less than 1 hour shall separate pass-throughs from existing *corridors*. Pass-throughs shall be constructed as required for the *corridors* and protected by an ~~approved~~ automatic sprinkler system.

[F] 415.8.5 Waterproof room. Rooms or areas used for the storage of water-reactive solids and liquids shall be constructed in a manner that resists the penetration of water through the use of waterproof materials. Piping carrying

water for other than ~~approved~~ *automatic sprinkler systems* shall not be within such rooms or areas.

[F] 428.3.9 Automatic fire-extinguishing sprinkler systems. Buildings containing laboratory suites shall be equipped throughout with an ~~approved~~ *automatic sprinkler system* in accordance with Section 903.3.1.1.

505.2.1 Area limitation. The aggregate area of a *mezzanine* or *mezzanines* within a room shall be not greater than one-third of the floor area of that room or space in which they are located. The enclosed portion of a room shall not be included in a determination of the floor area of the room in which the *mezzanine* is located. In determining the allowable *mezzanine* area, the area of the *mezzanine* shall not be included in the floor area of the room.

~~approved~~

Exceptions:

1. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Section 503.1.1 shall be not greater than two-thirds of the floor area of the room.
2. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction shall be not greater than one-half of the floor area of the room in buildings and structures equipped throughout with an

~~approved~~

1. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Section 503.1.1 shall be not greater than two-thirds of the floor area of the room.
2. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction shall be not greater than one-half of the floor area of the room in buildings and structures equipped throughout with an

1. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction for special industrial occupancies in accordance with Section 503.1.1 shall be not greater than two-thirds of the floor area of the room.
2. The aggregate area of *mezzanines* in buildings and structures of Type I or II construction shall be not greater than one-half of the floor area of the room in buildings and structures equipped throughout with an

automatic sprinkler system in accordance with Section 903.3.1.1 and a n *approved emergency voice/alarm communication system* in accordance with Section 907.5.2.2.

automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 shall not be greater than one-half of the floor area of the room, provided that:

automatic sprinkler system in accordance with Section 903.3.1.1 and a n *approved emergency voice/alarm communication system* in accordance with Section 907.5.2.2.

automatic sprinkler system in accordance with Section 903.3.1.1 and a n *approved emergency voice/alarm communication system* in accordance with Section 907.5.2.2.

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours. Where vertical offsets are provided as part of a *horizontal assembly*, the vertical offset and the structure supporting the vertical offset shall have a *fire-resistance rating* of not less than 3 hours.
2. The building below, including the *horizontal assembly*, is of Type IA construction.
3. *Shaft, stairway, ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.

Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

1. The building above the *horizontal assembly* is not required to be of Type I construction;

2. The enclosure connects fewer than four *stories*; and
3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less than 300, or Group B, M, R or S occupancies.
5. The building below the *horizontal assembly* shall be protected throughout by an approved *automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
6. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

713.11 Enclosure at the bottom. Shafts that do not extend to the bottom of the building or structure shall comply with one of the following:

1. They shall be enclosed at the lowest level with construction of the same *fire-resistance rating* as the lowest floor through which the shaft passes, but not less than the rating required for the shaft enclosure.
2. They shall terminate in a room having a use related to the purpose of the shaft. The room shall be separated from the remainder of the building by *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. The *fire-resistance rating* and opening protectives shall be not less than the protection required for the shaft enclosure.
3. They shall be protected by *approved fire dampers* installed in accordance with their listing at the lowest floor level within the shaft enclosure.

Exceptions:

1. The fire-resistance-rated room separation is not required, provided that the only openings in or penetrations of the shaft enclosure to the interior of the building occur at the bottom. The bottom of the shaft shall be closed off around the penetrating items with materials permitted by Section 718.3.1 for draftstopping, or the room shall be provided with an ~~approved~~ *automatic sprinkler system*.
2. A shaft enclosure containing a waste or linen chute shall not be used for any other purpose and shall discharge in a room protected in accordance with Section 713.13.4.
3. The fire-resistance-rated room separation and the protection at the bottom of the shaft are not required provided that there are no combustibles in the shaft and there are no openings or other penetrations through the shaft enclosure to the interior of the building.

713.13.6 Automatic sprinkler system. An ~~approved~~ *automatic sprinkler system* shall be installed in accordance with Section 903.2.11.2.

[F] 806.2 Combustible decorative materials. In Groups A, B, E, I, M and R-1 and in dormitories in Group R-2, curtains, draperies, fabric hangings and similar combustible decorative materials suspended from walls or ceilings shall comply with Section 806.4 and shall not exceed 10 percent of the specific wall or ceiling area to which such materials are attached.

Fixed or movable walls and partitions, paneling, wall pads and crash pads applied structurally or for decoration, acoustical correction, surface insulation or other purposes shall be considered to be *interior finish*, shall comply with Section 803 and shall not be considered to be *decorative materials* or furnishings.

Exceptions:

1. In auditoriums in Group A, the permissible amount of curtains, draperies, fabric hangings and similar combustible decorative materials suspended from walls or ceilings shall not exceed 75 percent of the aggregate wall area where the building is equipped throughout with an ~~approved~~ *automatic sprinkler system* in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.15 of this code.
2. In Group R-2 dormitories, within sleeping units and dwelling units, the permissible amount of curtains, draperies, fabric hangings and similar decorative materials suspended from walls or ceiling shall not exceed 50 percent of the aggregate wall areas where the building is equipped throughout with an ~~approved~~ *automatic sprinkler system* installed in accordance with Section

903.3.1.

3. In Group B and M occupancies, the amount of combustible fabric partitions suspended from the ceiling and not supported by the floor shall comply with Section 806.4 and shall not be limited.
4. The 10-percent limit shall not apply to curtains, draperies, fabric hangings and similar combustible decorative materials used as window coverings.

[F] 903.2 Where required. ~~Approved Automatic~~ *automatic sprinkler systems* in new buildings and structures shall be provided in the locations described in Sections 903.2.1 through 903.2.12.

Exception: Spaces or areas in telecommunications buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided that those spaces or areas are equipped throughout with an *automatic smoke detection system* in accordance with Section 907.2 and are separated from the remainder of the building by not less than 1-hour *fire barriers* constructed in accordance with Section 707 or not less than 2-hour *horizontal assemblies* constructed in accordance with Section 711, or both.

[F] 903.2.11.1.2 Openings on one side only. Where openings in a *story* are provided on only one side and the opposite wall of such *story* is more than 75 feet (22 860 mm) from such openings, the *story* shall be equipped throughout with an ~~approved automatic~~ *sprinkler system*, or openings shall be provided on not fewer than two sides of the *story*.

[F] 903.2.11.1.3 Basements. Where any portion of a *basement* is located more than 75 feet (22 860 mm) from openings required by Section 903.2.11.1, or where walls, partitions or other obstructions are installed that restrict the application of water from hose streams, the *basement* shall be equipped throughout with an ~~approved automatic~~ *sprinkler system*.

[F] 905.4.1 Protection. Risers and laterals of Class I standpipe systems not located within an *interior exit stairway* shall be protected by a degree of *fire resistance* equal to that required for vertical enclosures in the building in which they are located.

Exception: In buildings equipped throughout with an ~~approved automatic~~ *sprinkler system*, laterals that are not located within an *interior exit stairway* are not required to be enclosed within fire-resistance-rated construction.

[F] 907.2.3 Group E. A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. Where *automatic sprinkler systems* or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an *occupant load* of 50 or less.
2. Emergency voice/alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual fire alarm system initiates an *approved* occupant notification signal in accordance with Section 907.5.
3. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
 - 3.1. Interior *corridors* are protected by smoke detectors.
 - 3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by *heat detectors* or other *approved* detection devices.
 - 3.3. Shops and laboratories involving dusts or vapors are protected by *heat detectors* or other *approved* detection devices.
4. Manual fire alarm boxes shall not be required in Group E occupancies where all of the following apply:
 - 4.1. The building is equipped throughout with an ~~approved automatic~~ *sprinkler system* installed in accordance with Section 903.3.1.1.
 - 4.2. The emergency voice/alarm communication system will activate on sprinkler waterflow.
 - 4.3. Manual activation is provided from a normally occupied location.

[F] 907.2.9.1 Manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group R-2 occupancies where any of the following

conditions apply:

1. Any *dwelling unit* or *sleeping unit* is located three or more *stories* above the lowest *level of exit discharge*.
2. Any *dwelling unit* or *sleeping unit* is located more than one story below the highest *level of exit discharge* of *exits* serving the *dwelling unit* or *sleeping unit*.
3. The building contains more than 16 *dwelling units* or *sleeping units*.

Exceptions:

1. A fire alarm system is not required in buildings not more than two stories in height where all *dwelling units* or *sleeping units* and contiguous *attic* and crawl spaces are separated from each other and public or common areas by not less than 1-hour *fire partitions* and each *dwelling unit* or *sleeping unit* has an *exit* directly to a *public way*, *egress court* or *yard*.
2. Manual fire alarm boxes are not required where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and the occupant notification appliances will automatically activate throughout the notification zones upon a sprinkler water flow.
3. A fire alarm system is not required in buildings that do not have interior *corridors* serving dwelling units and are protected by an ~~approved~~ *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that *dwelling units* either have a *means of egress* door opening directly to an exterior *exit access* that leads directly to the exits or are served by open-ended *corridors* designed in accordance with Section 1027.6, Exception 3.

[F] 910.2 Where required. Smoke and heat vents or a mechanical smoke removal system shall be installed as required by Sections 910.2.1 and 910.2.2.

Exceptions:

1. Frozen food warehouses used solely for storage of Class I and II commodities where protected by an *approved automatic sprinkler system*.
2. Smoke and heat removal shall not be required in areas of buildings equipped with early suppression fast-response (ESFR) sprinklers.
3. Smoke and heat removal shall not be required in areas of buildings equipped with control mode special application sprinklers with a response time index of 50 (m · s)^{1/2} or less that are listed to control a fire in stored commodities with 12 or fewer sprinklers.

910.4.1 Automatic sprinklers required. The building shall be equipped throughout with an ~~approved~~ *automatic sprinkler system* in accordance with Section 903.3.1.1.

1006.2.2.3 Refrigerated rooms or spaces. Rooms or spaces having a floor area larger than 1,000 square feet (93 m²), containing a refrigerant evaporator and maintained at a temperature below 68°F (20°C), shall have access to not less than two *exits* or *exit access doorways*.

Exit access travel distance shall be determined as specified in Section 1017.1, but all portions of a refrigerated room or space shall be within 150 feet (45 720 mm) of an *exit* or *exit access doorway* where such rooms are not protected by an ~~approved~~ *automatic sprinkler system*. Egress is allowed through adjoining refrigerated rooms or spaces.

Exception: Where using refrigerants in quantities limited to the amounts based on the volume set forth in the International Mechanical Code.

1010.3.2 Security access turnstiles. Security access turnstiles that inhibit travel in the direction of egress utilizing a physical barrier shall be permitted to be considered as a component of the *means of egress*, provided that all of the following criteria are met:

1. The building is protected throughout by an *automatic sprinkler system* in accordance with Section 903.3.1.1.
2. Each security access turnstile lane configuration has a minimum clear passage width of 22 inches (559 mm).
3. Any security access turnstile lane configuration providing a clear passage width of less than 32 inches (810 mm) shall be credited with a maximum egress capacity of 50 persons.
4. Any security access turnstile lane configuration providing a clear passage width of 32 inches (810

mm) or more shall be credited with a maximum egress capacity as calculated in accordance with Section 1005.

5. Each secured physical barrier shall automatically retract or swing to an unobstructed open position in the direction of egress, under each of the following conditions:
 - 5.1. Upon loss of power to the turnstile or any part of the access control system that secures the physical barrier.
 - 5.2. Upon actuation of a clearly identified manual release device with ready access that results in direct interruption of power to each secured physical barrier, after which such barriers remain in the open position for not less than 30 seconds. The manual release device shall be positioned at one of the following locations:
 - 5.2.1. On the egress side of each security access turnstile lane.
 - 5.2.2. At an *approved* location where it can be actuated by an employee assigned to the area at all times that the building is occupied.
 - 5.3. Upon actuation of the building *fire alarm system*, if provided, after which the physical barrier remains in the open position until the *fire alarm system* is manually reset.

Exception: Actuation of a manual fire alarm box.
 - 5.4. Upon actuation of the building automatic sprinkler or fire detection system, after which the physical barrier remains in the open position until the *fire alarm system* is manually reset.

1028.1 General. *Exits* shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*.

Exceptions:

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas on the level of discharge provided that all of the following conditions are met:
 - 1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
 - 1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
 - 1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an ~~approved~~ *automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
 - 1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
 - 2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.
 - 2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
 - 2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition*

constructed in accordance with Section 708.

Exception: The maximum transmitted temperature rise is not required.

- 2.4. The area is used only for *means of egress* and *exits* directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

1029.6.2.3 Automatic sprinklers. Enclosed areas with walls and ceilings in buildings or structures containing *smoke-protected assembly seating* shall be protected with an ~~approved~~ *automatic sprinkler system* in accordance with Section 903.3.1.1.

Exceptions:

1. The floor area used for contests, performances or entertainment provided that the roof construction is more than 50 feet (15 240 mm) above the floor level and the use is restricted to low fire hazard uses.
2. Press boxes and storage facilities less than 1,000 square feet (93 m²) in area.
3. Outdoor seating facilities where seating and the *means of egress* in the seating area are essentially open to the outside.

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread and smoke-developed indices.

Exceptions:

1. Smoke-developed index for interior *trim* as provided for in Section 2604.2.
2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic fire sprinkler system in accordance with Section 903.3.1.1. The ~~approved~~ *automatic sprinkler system* shall be provided in both the room and that part of the building in which the room is located.
3. Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly provided that the assembly with the foam plastic insulation satisfactorily passes NFPA 276 or UL 1256. The smoke-developed index shall not be limited for roof applications.
4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided that the end use is approved in accordance with Section 2603.9 using the maximum thickness and density intended for use.
5. Flame spread and smoke-developed indices for foam plastic interior signs in *covered and open mall buildings* provided that the signs comply with Section 402.6.4.

C102.3 Two-story unlimited area. The area of a two-story Group U agricultural building shall not be limited if the building is surrounded and adjoined by *public ways* or *yards* not less than 60 feet (18 288 mm) in width and is provided with an ~~approved~~ *automatic sprinkler system* throughout in accordance with Section 903.3.1.1.

2018 International Existing Building Code

504.5 Opening protectives. Doors and windows within 10 feet (3048 mm) of fire escape stairways shall be protected with ³/₄-hour opening protectives.

Exception: Opening protection shall not be required in buildings equipped throughout with an ~~approved~~ automatic sprinkler system.

802.2.1 Existing vertical openings. Existing interior vertical openings connecting two or more floors shall be enclosed with *approved* assemblies having a fire-resistance rating of not less than 1 hour with *approved* opening protectives.

Exceptions:

1. Where vertical opening enclosure is not required by the International Building Code or the International Fire Code.
2. Interior vertical openings other than stairways may be blocked at the floor and ceiling of the *work area* by installation of not less than 2 inches (51 mm) of solid wood or equivalent construction.
3. The enclosure shall not be required where:
 - 3.1. Connecting the main floor and mezzanines; or
 - 3.2. All of the following conditions are met:
 - 3.2.1. The communicating area has a low-hazard occupancy or has a moderate-hazard occupancy that is protected throughout by an automatic sprinkler system.
 - 3.2.2. The lowest or next-to-the-lowest level is a street floor.
 - 3.2.3. The entire area is open and unobstructed in a manner such that it is reasonable to assume that a fire in any part of the interconnected spaces will be readily obvious to all of the occupants.
 - 3.2.4. Exit capacity is sufficient to provide egress simultaneously for all occupants of all levels by considering all areas to be a single floor area for the determination of required exit capacity.
 - 3.2.5. Each floor level, considered separately, has not less than one-half of its individual required exit capacity provided by an exit or exits leading directly out of that level without having to traverse another communicating floor level or be exposed to the smoke or fire spreading from another communicating floor level.
4. In Group A occupancies, a minimum 30-minute enclosure shall be provided to protect all vertical openings not exceeding three stories.
5. In Group B occupancies, a minimum 30-minute enclosure shall be provided to protect all vertical openings not exceeding three stories. This enclosure, or the enclosure specified in Section 802.2.1, shall not be required in the following locations:
 - 5.1. Buildings not exceeding 3,000 square feet (279 m²) per floor.
 - 5.2. Buildings protected throughout by an *approved* automatic fire sprinkler system.
6. In Group E occupancies, the enclosure shall not be required for vertical openings not exceeding three stories where the building is protected throughout by an *approved* automatic fire sprinkler system.
7. In Group F occupancies, the enclosure shall not be required in the following locations:
 - 7.1. Vertical openings not exceeding three stories.
 - 7.2. Special-purpose occupancies where necessary for manufacturing operations and direct access is provided to not fewer than one protected stairway.
 - 7.3. Buildings protected throughout by an *approved* automatic sprinkler system.
8. In Group H occupancies, the enclosure shall not be required for vertical openings not exceeding three stories where necessary for manufacturing operations and every floor level has direct access to not fewer than two remote enclosed stairways or other *approved* exits.
9. In Group M occupancies, a minimum 30-minute enclosure shall be provided to protect all vertical openings not exceeding three stories. This enclosure, or the enclosure specified in Section 802.2.1, shall not be required in the following locations:
 - 9.1. Openings connecting only two floor levels.
 - 9.2. Occupancies protected throughout by an *approved* automatic sprinkler system.
10. In Group R-1 occupancies, the enclosure shall not be required for vertical openings not exceeding three stories in the following locations:
 - 10.1. Buildings protected throughout by an *approved* automatic sprinkler system.
 - 10.2. Buildings with less than 25 dwelling units or sleeping units where every sleeping room above the second floor is provided with direct access to a fire escape or other *approved* second exit by means of an *approved* exterior door or window having a sill height of not greater than 44 inches (1118 mm) and where both of the following conditions are met:

- 10.2.1. Any exit access corridor exceeding 8 feet (2438 mm) in length that serves two means of egress, one of which is an unprotected vertical opening, shall have not fewer than one of the means of egress separated from the vertical opening by a 1-hour fire barrier.
- 10.2.2. The building is protected throughout by an automatic fire alarm system, installed and supervised in accordance with the International Building Code.
- 11. In Group R-2 occupancies, a minimum 30-minute enclosure shall be provided to protect all vertical openings not exceeding three stories. This enclosure, or the enclosure specified in Section 802.2.1, shall not be required in the following locations:
 - 11.1. Vertical openings not exceeding two stories with not more than four dwelling units per floor.
 - 11.2. Buildings protected throughout by an *approved* automatic sprinkler system.
 - 11.3. Buildings with not more than four dwelling units per floor where every sleeping room above the second floor is provided with direct access to a fire escape or other *approved* second exit by means of an *approved* exterior door or window having a sill height of not greater than 44 inches (1118 mm) and the building is protected throughout by an automatic fire alarm system complying with Section 803.4.
- 12. One- and two-family dwellings.
- 13. Group S occupancies where connecting not more than two floor levels or where connecting not more than three floor levels and the structure is equipped throughout with an *approved* automatic sprinkler system.
- 14. Group S occupancies where vertical opening protection is not required for open parking garages and ramps.

803.1.1 Corridor ratings. Where an ~~approved~~ automatic sprinkler system is installed throughout the story, the required fire-resistance rating for any corridor located on the story shall be permitted to be reduced in accordance with the International Building Code. In order to be considered for a corridor rating reduction, such system shall provide coverage for the stairway landings serving the floor and the intermediate landings immediately below.

805.3.1.2.1 Fire escape access and details. Fire escapes shall comply with all of the following requirements:

- 1. Occupants shall have unobstructed access to the fire escape without having to pass through a room subject to locking.
- 2. Access to a new fire escape shall be through a door, except that windows shall be permitted to provide access from single dwelling units or sleeping units in Group R-1, R-2 and I-1 occupancies or to provide access from spaces having a maximum occupant load of 10 in other occupancy classifications.
 - 2.1. The window shall have a minimum net clear opening of 5.7 square feet (0.53 m²) or 5 square feet (0.46 m²) where located at grade.
 - 2.2. The minimum net clear opening height shall be 24 inches (610 mm) and net clear opening width shall be 20 inches (508 mm).
 - 2.3. The bottom of the clear opening shall not be greater than 44 inches (1118 mm) above the floor.
 - 2.4. The operation of the window shall comply with the operational constraints of the International Building Code.
- 3. Newly constructed fire escapes shall be permitted only where exterior stairways cannot be utilized because of lot lines limiting the stairway size or because of the sidewalks, alleys, or roads at grade level.
- 4. Openings within 10 feet (3048 mm) of fire escape stairways shall be protected by fire assemblies having minimum ³/₄-hour fire-resistance ratings.

Exception: Opening protection shall not be required in buildings equipped throughout with an ~~approved~~ automatic sprinkler system.
- 5. In all buildings of Group E occupancy, up to and including the 12th grade, buildings of Group I occupancy, rooming houses and childcare centers, ladders of any type are prohibited on fire escapes used as a required means of egress.

805.5.1 Corridor doors. Corridor doors in the *work area* shall not be constructed of hollow core wood and shall not contain louvers. Dwelling unit or sleeping unit corridor doors in *work areas* in buildings of Groups R-1, R-2, and I-1 shall be not less than 1³/₈-inch (35 mm) solid core wood or *approved* equivalent and shall not have any glass panels, other than *approved* wired glass or other *approved* glazing material in metal frames. Dwelling unit or sleeping unit corridor doors in *work areas* in buildings of Groups R-1, R-2, and I-1 shall be equipped with *approved* door closers. Replacement doors shall be 1³/₄-inch (44 mm) solid bonded wood core or *approved* equivalent, unless the existing frame will accommodate only a 1³/₈-inch (35 mm) door.

Exceptions:

1. Corridor doors within a dwelling unit or sleeping unit.
2. Existing doors meeting the requirements of *Guidelines on Fire Ratings of Archaic Materials and Assemblies* (IEBC Resource A) for a rating of 15 minutes or more shall be accepted as meeting the provisions of this requirement.
3. Existing doors in buildings protected throughout with an *approved* automatic sprinkler system shall be required only to resist smoke, be reasonably tight fitting, and shall not contain louvers.
4. In group homes with not more than 15 occupants and that are protected with an *approved* automatic detection system, closing devices are not required.
5. Door assemblies having a fire protection rating of not less than 20 minutes.

1011.7.3 Other vertical shafts. Interior vertical shafts other than stairways, including but not limited to elevator hoistways and service and utility shafts, shall be enclosed as required by the International Building Code where there is a change of use to a higher-hazard category as specified in Table 1011.4.

Exceptions:

1. Existing 1-hour interior shaft enclosures shall be accepted where a higher rating is required.
2. Vertical openings, other than stairways, in buildings of other than Group I occupancy and connecting less than six stories shall not be required to be enclosed if the entire building is provided with an ~~*approved*~~ automatic sprinkler system.

1204.4 Occupancy separation. Required occupancy separations of 1 hour may be omitted where the building is provided with an ~~*approved*~~ automatic sprinkler system throughout.

Reason:

The I codes define that an automatic sprinkler system (*italicized*) is installed according to a referenced standard. The installation standards, NFPA 13, NFPA 13R, and NFPA 13D, are all referenced by the code and are all enforced. Having *approved* (*italicized*) as a defined term in front of another defined term, automatic sprinkler system (*italicized*) implies another level or step for approval. When the I code text states, "approved automatic sprinkler system" , it appears that the installation standard or actual installation has to be approved again by the code official. Removing *approved* in front of another defined term does not remove any authority from the code official, furthermore, the code is inconsistent in the use of *approved* automatic sprinkler system and automatic sprinkler system throughout all of the I codes. This proposal seeks to make the I code documents consistent.

Cost Impact

The code change proposal will decrease the cost of construction .

Removing *approved* decreases the cost of construction as it saves time when interpreting the code.

Proponent: Kevin Duerr-Clark, representing New York State Department of State (kevin.duerr-clark@dos.ny.gov)

2018 International Fire Code

Revise as follows:

503.2.2 Authority. The *fire code official* shall have the authority to ~~require or permit modifications~~ modify the required access widths of fire apparatus access roads in accordance with one of the following:

1. To require an increase to the required access widths where they are inadequate for fire or rescue operations or where necessary to meet the public safety objectives of the jurisdiction.
2. To permit a decrease to the required access widths where necessary provided that any such decreased access width is sufficient for fire or rescue operations.

Reason:

The 2015 codes changed “increase” to “modifications” and added the “or where necessary to meet the public safety objectives of the jurisdiction.” Additionally, the 2015 commentary states:

“Fire departments respond to many types of emergency situations and the jurisdictions they serve may have traffic safety criteria that impact the design of access roadways used by emergency response vehicles. This section authorizes the fire code official to require greater, or to allow lesser, access-width dimensions based on the size and maneuverability of the anticipated emergency response apparatus, including mutual-aid apparatus from neighboring communities or agencies, among other considerations.”

This proposal is intended to clarify the changes made to this code section in 2015. By changing it to specifically allow an increase or decrease, it makes it clear the intent was to now allow a decrease as well as an increase. The change also ensures the overall goal is to maintain sufficient access to the buildings, regardless of whether the change is an increase or a decrease. Lastly, to meet the public safety objectives was isolated to the increase option only as the proposed change now simply permits the decrease for any reason provided access is still sufficient. This minimizes the chances of misusing this exception by decreasing the fire safety and access to a building in lieu of some other public safety provision.

The example used to defend this proposed change was a jurisdiction wanting to decrease the width of the access road to allow for sidewalks and a tree lawn. The way the code is currently written, one could argue that the jurisdiction has a public safety objective to provide sidewalks, therefore, is justified in the decrease. It does not require them to verify the fire safety objectives are maintained or that access is still sufficient. With this change, however, the jurisdiction will need to justify that the decrease will still provide sufficient access and the fire safety objectives

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal simply clarifies a provision that already existed.

Proponent: Adria Reinertson, Riverside County Fire Department, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)

2018 International Fire Code

Revise as follows:

508.1 General. Where required by other sections of this code and in all buildings classified as high-rise buildings by the International Building Code and in all F-1 and S-1 Occupancies with a building footprint of over 500,000 square feet, a fire command center for fire department operations shall be provided and shall comply with Sections 508.1.1 through ~~508.1.6-508.1.7~~

508.1.1 Location and access. ~~The location and accessibility of the fire command center shall be approved by the fire code official.~~ shall be provided with access from fire apparatus access roads and shall have direct access from the building exterior at the lowest level of fire department access.

508.1.3 Size. The fire command center shall be not less than 0.015 percent of the total building area of the facility served or 200 square feet (19 m²) in area, whichever is greater, with a minimum dimension of 0.7 times the square root of the room area or 10 feet (3048 mm), whichever is greater.

Where a fire command is required for Group F-1 and S-1 occupancies with a building footprint greater than 500,000 square feet in area the fire command center shall have a minimum size of 96 square feet (9 m²) with a minimum dimension of 8 feet (2348 mm) where approved by the fire code official.

Add new text as follows:

508.1.7 Fire command center identification. The fire command center shall be identified by a permanent easily visible sign stating "Fire Command Center" located on the door to the fire command center.

2018 International Building Code

[F] 911.1 General. Where required by other sections of this code and in buildings classified as high-rise buildings by this code and in all F-1 and S-1 Occupancies with a building footprint of over 500,000 square feet a fire command center for fire department operations shall be provided and shall comply with Sections 911.1.1 through ~~911.1.6-911.1.7~~.

[F] 911.1.1 Location and access. ~~The location and accessibility of the fire command center shall be approved by the fire code official.~~ provided with access from fire apparatus access roads and shall have direct access from the building exterior at the lowest level of fire department access.

[F] 911.1.3 Size. The room shall be not less than 200 square feet (19 m²) with a minimum dimension of 10 feet (3048 mm).

Where a fire command is required for Group F-1 and S-1 occupancies with a building footprint greater than 500,000 square feet in area the fire command center shall have a minimum size of 96 square feet (9 m²) with a minimum dimension of 8 feet (2348 mm) where approved by the fire code official.

[F] 911.7 Fire command center identification. The fire command center shall be identified by a permanent easily visible sign stating "Fire Command Center" located on the door to the fire command center.

Reason:

Fire Operations at large, horizontal buildings in excess of 500,000 square feet can be just as challenging for firefighters as operating at high-rise buildings. Adding a fire control room to these types of buildings will allow the incident commander to see at a glance, in one protected location, where the fire is, the building layout, and any active fire protection to provide the best strategy possible to mitigate the problem and protect the lives of firefighters. The items required in the fire control room in Section 508.1.6 would be limited to those already in the building and would not require items otherwise not required by the construction of the building.

Section 508.1, 508.1.3, and 508.1.6: These sections have been amended to require fire command centers for structures larger than 500,000 square feet in size. To put into context, the Fire Command Center would be triggered when the buildings are approximately 5 times the typical Costco Warehouse store and approximately 3 times the size of a typical Walmart Supercenter. Large structures of this size pose numerous challenges to emergency responders due to

the large amounts of fuel loads from the storage, manufacturing and/or processing of flammable/combustible commodities and other processes within the building. Challenges include wide distribution of smoke throughout the structure, difficulty for firefighters to locate and reach the fire and difficulty in search and evacuation of the public, employees and firefighters. These structures typically require numerous fire protection, early suppression and detection systems that may include, but are not limited to, fire pumps, multiple fire sprinkler systems, advanced fire alarm systems, smoke control systems, and refrigeration gas detection system(s). During a fire, the incident commander must have the ability to readily identify the status of the various suppression and detection systems and have access to other building information details that may include, but are not limited to, building floor plans, high-pile/rack storage details, smoke control/ventilation systems, fire sprinkler zoning details, mechanical refrigeration equipment and piping details, and hazardous materials data sheets along with quantities and storage/use locations. A fire command center provides a centralized location for the incident commander to review details about the building and the incident and to effectively coordinate emergency responders and suppression activities with increased efficiency and speed. The Riverside County Fire Department has experienced several incidents in buildings with and without Fire Command Centers. Incident Commanders found that having detailed information on built in fire protection systems and controls, building schematics and hazardous materials storage plans were vital towards mitigating the event. When this information was not available, firefighting personnel were forced to operate upon assumptions and much less information. In addition, this increased efficiency and speed results in facilities returning to operation more expeditiously after incidents or false alarms thereby reducing loss of revenue for the business.

Section 508.1.1 & 508.1.8: These sections are added to identify the approved location of the fire command center and to indicate signage requirements for the entrance door.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal would require that a 96 square foot rated room be added to the building, an estimated .06% increase to the cost of construction, utilizing 500,000 square feet as the model. The applicable items listed in 508.1.6 will already be in the building so the cost to locate them in the fire command center rather than throughout the building will not increase costs.

2018 International Fire Code

Revise as follows:

508.1.6 Required features. The *fire command center* shall comply with NFPA 72 and shall contain the following features:

1. The emergency voice/alarm communication system control unit.
2. The fire department communications system.
3. Fire detection and alarm system annunciator.
4. Annunciator unit visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air distribution systems.
6. The fire fighter's control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking *interior exit stairway* doors simultaneously.
8. Sprinkler valve and water-flow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. Fire pump status indicators.
12. Schematic building plans indicating the typical floor plan and detailing the building core, *means of egress, fire protection systems, fire-fighter air-replenishment systems, fire-fighting equipment and fire department access, and the location of fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions.*
13. An *approved* Building Information Card that includes, but is not limited to, all of the following information:
 - 13.1. General building information that includes: property name, address, the number of floors in the building above and below grade, use and occupancy classification (for mixed uses, identify the different types of occupancies on each floor) and the estimated building population during the day, night and weekend;
 - 13.2. Building emergency contact information that includes: a list of the building's emergency contacts including but not limited to building manager, building engineer and their respective work phone number, cell phone number and e-mail address;
 - 13.3. Building construction information that includes: the type of building construction including but not limited to floors, walls, columns and roof assembly;
 - 13.4. *Exit access stairway* and *exit stairway* information that includes: number of *exit access stairways* and *exit stairways* in building; each *exit access stairway* and *exit stairway* designation and floors served; location where each *exit access stairway* and *exit stairway* discharges, *interior exit stairways* that are pressurized; *exit stairways* provided with emergency lighting; each *exit stairway* that allows reentry; *exit stairways* providing roof access; elevator information that includes: number of elevator banks, elevator bank designation, elevator car numbers and respective floors that they serve; location of elevator machine rooms, control rooms and control spaces; location of sky lobby; and location of freight elevator banks;
 - 13.5. Building services and system information that includes: location of mechanical rooms, location of building management system, location and capacity of all fuel oil tanks, location of emergency generator and location of natural gas service;
 - 13.6. *Fire protection system* information that includes: location of standpipes, location of fire pump room, location of fire department connections, floors protected by automatic sprinklers and location of different types of *automatic sprinkler systems* installed including but not limited to dry, wet and pre-action;

- 13.7. Hazardous material information that includes: location and quantity of hazardous material.
14. Work table.
15. Generator supervision devices, manual start and transfer features.
16. Public address system, where specifically required by other sections of this code.
17. Elevator fire recall switch in accordance with ASME A17.1/CSA B44.
18. Elevator emergency or standby power selector switch(es) (labelled "elevator emergency power"), where emergency or standby building power is provided and the emergency or standby building power is provided-not sufficient to operate all elevators and associated equipment simultaneously.

2018 International Building Code

Revise as follows:

[F] 911.1.6 Required features. The fire command center shall comply with NFPA 72 and shall contain all of the following features:

1. The emergency voice/alarm communication system control unit.
2. The fire department communications system.
3. Fire detection and alarm system annunciator.
4. Annunciator unit visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air distribution systems.
6. The fire fighter's control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking *interior exit stairway* doors simultaneously.
8. Sprinkler valve and waterflow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. Fire pump status indicators.
12. Schematic building plans indicating the typical floor plan and detailing the building core, *means of egress*, fire protection systems, fire fighter air replenishment system, fire-fighting equipment and fire department access and the location of *fire walls, fire barriers, fire partitions, smoke barriers* and smoke partitions.
13. An *approved* Building Information Card that contains, but is not limited to, the following information:
 - 13.1. General building information that includes: property name, address, the number of floors in the building above and below grade, use and occupancy classification (for mixed uses, identify the different types of occupancies on each floor), and the estimated building population during the day, night and weekend.
 - 13.2. Building emergency contact information that includes: a list of the building's emergency contacts including but not limited to building manager and building engineer and their respective work phone number, cell phone number, e-mail address.
 - 13.3. Building construction information that includes: the type of building construction including but not limited to floors, walls, columns, and roof assembly.
 - 13.4. *Exit access* and *exit stairway* information that includes: number of *exit access* and *exit stairways* in the building, each *exit access* and *exit stairway* designation and floors served, location where each *exit access* and *exit stairway* discharges, *interior exit stairways* that are pressurized, *exit stairways* provided with emergency lighting, each *exit stairway* that allows reentry, *exit stairways* providing roof access; elevator information that includes: number of elevator banks, elevator bank designation, elevator car numbers and respective floors that they serve; location of elevator machine rooms, control rooms and control spaces; location of sky lobby, location of freight elevator banks.
 - 13.5. Building services and system information that includes: location of mechanical rooms, location of building management system, location and capacity of all fuel oil tanks, location of emergency generator, location of natural gas service.

- 13.6. Fire protection system information that includes: location of standpipes, location of fire pump room, location of fire department connections, floors protected by automatic sprinklers, location of different types of *automatic sprinkler systems* installed including, but not limited to, dry, wet and pre-action.
- 13.7 Hazardous material information that includes: location of hazardous material, quantity of hazardous material.
14. Work table.
15. Generator supervision devices, manual start and transfer features.
16. Public address system, where specifically required by other sections of this code.
17. Elevator fire recall switch in accordance with ASME A17.1/BSA 44.
18. Elevator emergency or standby power selector switch(es) (labelled "elevator emergency power"), where emergency or standby building power is provided.~~provided and the emergency or standby building power is provided~~ not sufficient to operate all elevators and associated equipment simultaneously.

Reason:

To clarify that no switch is needed if the emergency or standby power is sufficient to operate all elevators and associated equipment simultaneously.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No change to cost since it is a clarification

 - 13.3. Building construction information that includes: the type of building construction including but not limited to floors, walls, columns, and roof assembly.
 - 13.4. *Exit access* and *exit stairway* information that includes: number of *exit access* and *exit stairways* in the building, each *exit access* and *exit stairway* designation and floors served, location where each *exit access* and *exit stairway* discharges, *interior exit stairways* that are pressurized, *exit stairways* provided with emergency lighting, each *exit stairway* that allows reentry, *exit stairways* providing roof access; elevator information that includes: number of elevator banks, elevator bank designation, elevator car numbers and respective floors that they serve; location of elevator machine rooms, control rooms and control spaces; location of sky lobby, location of freight elevator banks.
 - 13.5. Building services and system information that includes: location of mechanical rooms, location of building management system, location and capacity of all fuel oil tanks, location of emergency generator, location of natural gas service.

- 13.6. Fire protection system information that includes: location of standpipes, location of fire pump room, location of fire department connections, floors protected by automatic sprinklers, location of different types of *automatic sprinkler systems* installed including, but not limited to, dry, wet and pre-action.
- 13.7 Hazardous material information that includes: location of hazardous material, quantity of hazardous material.
14. Work table.
15. Generator supervision devices, manual start and transfer features.
16. Public address system, where specifically required by other sections of this code.
17. Elevator fire recall switch in accordance with ASME A17.1/BSA 44.
18. Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.
19. A locking document storage cabinet of an approved type listed in accordance with UL 1037 to safely secure the required plans and Building Information Card outlined above.

Reason:

This section requires immediate access to certain plans and documents necessary for use by responding emergency personnel. The securing of these documents is currently not required by the code. Once the documents are given to the owner, they either never make it to the command center or they are lost within the first year of operation. As building owners and plant engineers change, plans can all most never be replaced and thus cannot be relied upon to be available to responding emergency personnel. The document storage cabinet can also house important keys necessary to operate control features within the fire command center such as smoke control and elevator control systems. Material safety data sheets are often needed immediately upon arrival. Relying on computer systems has in some cases proven to be unreliable. In most cases fire service personnel do not have passwords or often time access rights to the system or the ability to navigate the system in a timely manor. Most buildings of this nature do not have 24 hour plant engineers on site to assist with gathering this critical information. The document storage cabinet shall be of an approved type listed in accordance with UL 1037 to provide antitheft protection for the documents.

Cost Impact

The code change proposal will increase the cost of construction .

The estimated cost of a document storage cabinet is \$900.00

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

SECTION 510 EMERGENCY RESPONDER RADIO COMMUNICATION COVERAGE

510.1 Emergency responder radio communication coverage in new buildings. ~~New buildings shall have approved radio~~ Emergency communication coverage for emergency responders shall be provided in all new buildings. Emergency communication coverage within the building shall be based on the existing coverage levels of the public safety communication systems utilized by the jurisdiction, measured at the exterior of the building. This section shall not require improvement of the existing public safety communication systems.

Exceptions:

1. Where *approved* by the building official and the *fire code official*, a wired communication system in accordance with Section 907.2.12.2 shall be permitted to be installed or maintained instead of an *approved* radio coverage system.
2. Where it is determined by the *fire code official* that the radio coverage system is not needed.
3. In facilities where emergency responder radio coverage is required and such systems, components or equipment required could have a negative impact on the normal operations of that facility, the *fire code official* shall have the authority to accept an automatically activated emergency responder radio coverage system.

510.2 Emergency responder radio communication coverage in existing buildings. Existing buildings shall be provided with ~~approved radio~~ emergency communication coverage for emergency responders as required in Chapter 11.

510.3 Permit required. A construction permit for the installation of or modification to emergency ~~responder radio~~ communication coverage systems and related equipment is required as specified in Section 105.7.6. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

510.4 Technical requirements. Systems, components and equipment required to provide the emergency ~~responder radio~~ communication coverage system shall comply with Sections 510.4.1 through 510.4.2.8.

510.4.1 Emergency responder communication enhancement coverage system signal strength. The building shall be considered to have acceptable emergency ~~responder communications enhancement~~ communication system coverage when signal strength measurements in 95 percent of all areas on each floor of the building meet the signal strength requirements in Sections 510.4.1.1 through 510.4.1.3.

510.4.2 System design. The emergency ~~responder radio~~ communication coverage system shall be designed in accordance with Sections 510.4.2.1 through 510.4.2.8 and NFPA 1221.

510.4.2.1 Amplification systems and components. Buildings and structures that cannot support the required level of ~~radio~~ emergency communication coverage shall be equipped with systems and components to enhance the ~~public safety~~ radio signals and achieve the required level of ~~radio~~ emergency communication coverage specified in Sections 510.4.1 through 510.4.1.3. ~~Public safety communications enhancement~~ Emergency communication systems utilizing radio-frequency-emitting devices and cabling shall be approved by the *fire code official*. Prior to installation, all RF-emitting devices shall have the certification of the radio licensing authority and be suitable for public safety use.

510.4.2.2 Technical criteria. The *fire code official* shall maintain a document providing the specific technical information and requirements for the emergency ~~responder communications~~ communication coverage system. This document shall contain, but not be limited to, the various frequencies required, the location of radio sites, the effective radiated power of radio sites, the maximum propagation delay in microseconds, the applications being used and other supporting technical information necessary for system design.

510.4.2.3 Standby power. Emergency ~~responder radio communication coverage~~ systems shall be provided with dedicated standby batteries or provided with 2-hour standby batteries and connected to the facility generator power system in accordance with Section 1203. The standby power supply shall be capable of operating the emergency ~~responder radio communication coverage~~ system at 100-percent system capacity for a duration of not less than 12 hours.

510.4.2.4 Signal booster requirements. If used, signal boosters shall meet the following requirements:

1. All signal booster components shall be contained in a National Electrical Manufacturer's Association (NEMA) 4-type waterproof cabinet.
2. Battery systems used for the emergency power source shall be contained in a NEMA 3R or higher-rated cabinet.
3. Equipment shall have FCC or other radio licensing authority certification and be suitable for public safety use prior to installation.
4. Where a donor antenna exists, isolation shall be maintained between the donor antenna and all inside antennas to not less than 20dB greater than the system gain under all operating conditions.
5. Bi-Directional Amplifiers (BDAs) used in emergency ~~responder radio communication coverage~~ systems shall have oscillation prevention circuitry.
6. The installation of amplification systems or systems that operate on or provide the means to cause interference on any emergency ~~responder radio communication coverage networks-network~~ shall be coordinated and approved by the *fire code official*.

510.4.2.5 System monitoring. The emergency ~~responder radio enhancement communication coverage~~ system shall be monitored by a listed *fire alarm control unit*, or where approved by the *fire code official*, shall sound an audible signal at a constantly attended on-site location. Automatic supervisory signals shall include the following:

1. Loss of normal AC power supply.
2. System battery charger(s) failure.
3. Malfunction of the donor antenna(s).
4. Failure of active RF-emitting device(s).
5. Low-battery capacity at 70-percent reduction of operating capacity.
6. Failure of critical system components.
7. The communications link between the *fire alarm system* and the emergency ~~responder radio enhancement communication coverage~~ system.

510.4.2.6 Additional frequencies and change of frequencies. The emergency ~~responder radio communication coverage~~ system shall be capable of modification or expansion in the event frequency changes are required by the FCC or other radio licensing authority, or additional frequencies are made available by the FCC or other radio licensing authority.

510.4.2.7 Design documents. The *fire code official* shall have the authority to require "as built" design documents and specifications for emergency ~~responder communications communication coverage~~ systems. The documents shall be in a format acceptable to the *fire code official*.

510.4.2.8 Radio communication antenna density. Systems shall be engineered to minimize the near-far effect. ~~Radio enhancement~~ Emergency communication coverage system designs shall include sufficient antenna density to address reduced gain conditions.

Exceptions:

1. Class A narrow band signal booster devices with independent AGC/ALC circuits per channel.
2. Systems where all portable devices within the same band use active power control features.

510.5 Installation requirements. The installation of the ~~public safety radio emergency communication coverage~~ system shall be in accordance with NFPA 1221 and Sections 510.5.1 through 510.5.4.

510.5.3 Acceptance test procedure. Where an emergency ~~responder radio communication coverage~~ system is required, and upon completion of installation, the building *owner* shall have the radio system tested to verify that two-

way coverage on each floor of the building is not less than 95 percent. The test procedure shall be conducted as follows:

1. Each floor of the building shall be divided into a grid of 20 approximately equal test areas.
2. The test shall be conducted using a calibrated portable radio of the latest brand and model used by the agency talking through the agency's radio communications system or equipment approved by the fire code official.
3. Failure of more than one test area shall result in failure of the test.
4. In the event that two of the test areas fail the test, in order to be more statistically accurate, the floor shall be permitted to be divided into 40 equal test areas. Failure of not more than two nonadjacent test areas shall not result in failure of the test. If the system fails the 40-area test, the system shall be altered to meet the 95-percent coverage requirement.
5. A test location approximately in the center of each test area shall be selected for the test, with the radio enabled to verify two-way communications to and from the outside of the building through the public agency's radio communications system. Once the test location has been selected, that location shall represent the entire test area. Failure in the selected test location shall be considered to be a failure of that test area. Additional test locations shall not be permitted.
6. The gain values of all amplifiers shall be measured and the test measurement results shall be kept on file with the building *owner* so that the measurements can be verified during annual tests. In the event that the measurement results become lost, the building *owner* shall be required to rerun the acceptance test to reestablish the gain values.
7. As part of the installation, a spectrum analyzer or other suitable test equipment shall be utilized to ensure spurious oscillations are not being generated by the subject signal booster. This test shall be conducted at the time of installation and at subsequent annual inspections.
8. Systems incorporating Class B signal-booster devices or Class B broadband fiber remote devices shall be tested using two portable radios simultaneously conducting subjective voice quality checks. One portable radio shall be positioned not greater than 10 feet (3048 mm) from ~~the~~an indoor antenna. The second portable radio shall be positioned at a distance that represents the farthest distance from any indoor antenna. With both portable radios simultaneously keyed up on different frequencies within the same band, subjective audio testing shall be conducted and comply with DAQ levels as specified in Sections 510.4.1.1 and 510.4.1.2.

510.5.4 FCC compliance. The emergency ~~responder radio communication~~ coverage system installation and components shall comply with all applicable federal regulations including, but not limited to, FCC 47 CFR Part 90.219.

510.6 Maintenance. The emergency ~~responder radio communication~~ coverage system shall be maintained operational at all times in accordance with Sections 510.6.1 through 510.6.4.

510.6.1 Testing and proof of compliance. The owner of the building or owner's authorized agent shall have the emergency ~~responder radio communication~~ coverage system shall be inspected and tested annually or where structural changes occur including additions or remodels that could materially change the original field performance tests. Testing shall consist of the following:

1. In-building coverage test as described in Section 510.5.3.
2. Signal boosters shall be tested to verify that the gain is the same as it was upon initial installation and acceptance or set to optimize the performance of the system.
3. Backup batteries and power supplies shall be tested under load of a period of 1 hour to verify that they will properly operate during an actual power outage. If within the 1-hour test period the battery exhibits symptoms of failure, the test shall be extended for additional 1-hour periods until the integrity of the battery can be determined.
4. ~~Other~~All active components shall be checked to verify operation within the manufacturer's specifications. ~~5.~~

At the conclusion of the testing, a report, which shall verify compliance with Section 510.5.3, shall be submitted to the *fire code official*.

510.6.2 Additional frequencies. The building *owner* shall modify or expand the emergency ~~responder radio communication~~ coverage system at his or her expense in the event frequency changes are required by the FCC or

other radio licensing authority, or additional frequencies are made available by the FCC or other radio licensing authority. Prior approval of a ~~public safety radio~~ an emergency communication coverage system on previous frequencies does not exempt this section.

510.6.3 Nonpublic safety system. Where other nonpublic safety amplification systems installed in buildings reduce the performance or cause interference with the emergency ~~responder communications~~ communication coverage system, the nonpublic safety amplification system shall be corrected or removed.

[A] 105.7.6 Emergency ~~responder radio~~ communication coverage system. A construction permit is required for installation of or modification to emergency ~~responder radio~~ communication coverage systems and related equipment. Maintenance performed in accordance with this code is not considered to be a modification and does not require a construction permit.

907.2.12.2 Fire department communication system. Where a wired communication system is *approved* in lieu of an emergency ~~responder radio~~ communication coverage system in accordance with Section 510, the wired fire department communication system shall be designed and installed in accordance with NFPA 72 and shall operate between a *fire command center* complying with Section 508, elevators, elevator lobbies, emergency and standby power rooms, fire pump rooms, areas of refuge and inside *interior exit stairways*. The fire department communication device shall be provided at each floor level within the *interior exit stairway*.

914.3.6 Emergency ~~responder radio~~ communication coverage. Emergency ~~responder radio~~ communication coverage shall be provided in accordance with Section 510.

1103.2 Emergency ~~responder radio~~ communication coverage in existing buildings. Existing buildings other than Group R-3, that do not have approved ~~radio~~ communication coverage for emergency responders in the building based on existing coverage levels of the public safety communication systems, shall be equipped with such coverage according to one of the following:

1. Where an existing wired communication system cannot be repaired or is being replaced, or where not approved in accordance with Section 510.1, Exception 1.
2. Within a time frame established by the adopting authority.

Exception: Where it is determined by the fire code official that the ~~radio~~ emergency communication coverage system is not needed.

1203.2.3 Emergency ~~responder radio~~ communication coverage systems. Standby power shall be provided for emergency ~~responder radio~~ communication coverage systems as required in Section 510.4.2.3. The standby power supply shall be capable of operating the emergency ~~responder radio~~ communication coverage system for a duration of not less than 24 hours.

2018 International Building Code

Revise as follows:

[F] 403.4.5 Emergency ~~responder radio~~ communication coverage. Emergency ~~responder radio~~ communication coverage shall be provided in accordance with Section 510 of the International Fire Code.

[F] 907.2.12.2 Fire department communication system. Where a wired communication system is *approved* in lieu of an emergency ~~responder radio~~ communication coverage system in accordance with Section 510 of the International Fire Code, the wired fire department communication system shall be designed and installed in accordance with NFPA 72 and shall operate between a fire command center complying with Section 911, elevators, elevator lobbies, emergency and standby power rooms, fire pump rooms, *areas of refuge* and inside *interior exit stairways*. The fire department communication device shall be provided at each floor level within the *interior exit stairway*.

SECTION 918 EMERGENCY RESPONDER RADIO COMMUNICATION COVERAGE

[F] 918.1 General. Emergency ~~responder radio~~ communication coverage shall be provided in all new buildings in accordance with Section 510 of the International Fire Code.

[F] 2702.2.3 Emergency ~~responder radio~~ communication coverage systems. Standby power shall be provided for emergency ~~responder radio~~ communication coverage systems required in Section 918 and the International Fire Code. The standby power supply shall be capable of operating the emergency ~~responder radio~~ communication coverage system for a duration of not less than 24 hours.

communication coverage system for a duration of not less than 12 hours at 100-percent system operation capacity.

Reason:

This proposal is editorial in nature. Section 510 in the 2018 IFC uses several different terms to describe the communication system required. It could be:

1. Emergency responder radio coverage system - Section 510.1
2. Emergency responder communication enhancement - Section 510.4.1
3. Emergency communications enhancement system - Section 510.4.1
4. Public safety communications enhancement system - Section 510.4.2.1
5. Radio enhancement system - Section 510.4.2.8
6. Public safety radio coverage system - Section 510.5

This proposal replaces all of these various terms with "emergency communication coverage system".

This will eliminate confusion and provide consistency in understanding the requirements which will improve consistent application of the requirements.

Other minor editorial revisions occur in Section 510.4.2.4 Item 6, Section 510.5.3 Item 8 and Section 510.4.6.1 Item 4.

References to the emergency communication system requirements are correlated in other sections of the IFC and IBC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is editorial and will not change application of the requirements.

IFC: 202 (New), 510.1, 510.1.1 (New), 510.2 (New), 510.2.2 (New), 510.2.3 (New), 510.2.4 (New), 510.2.5 (New), 510.4.1.1, 510.4.1.2, 510.4.1.3, 510.4.2.2, 510.5.1, 510.5.2, 510.5.4, 510.6.4, 1103.2

Proponent: Mark Chubb, Telgian Corp., representing Telgian Corp. (mchubb@telgian.com)

2018 International Fire Code

Add new definition as follows:

FIRE SERVICE ACCESS POINT.

A location inside or outside a building that is protected from conditions considered immediately dangerous to life and health from which firefighters have access to a reliable water supply for firefighting and other resources necessary to engage in firefighting or rescue operations. Such locations outside a building include a place not less than 100 sq ft in area and not less than 10-ft nor more than 30-ft from an exterior door opening that is adjacent to a fire apparatus access road. Such locations inside buildings include stairway landings in smokeproof enclosures located one level below a fire-involved floor and areas of refuge equipped with standpipe outlets.

CHAPTER 5 FIRE SERVICE FEATURES

510 EMERGENCY RESPONDER RADIO COVERAGE

510.1 Where required. Emergency responder radio coverage systems shall be installed in new and existing buildings where required by this section.

Add new text as follows:

510.1.1 New buildings. Emergency responder radio coverage systems satisfying the technical criteria specified in 510.4.1 shall be provided in all new high-rise buildings, buildings in which portions of the floor area are located more than 250-ft from the nearest fire service access point measured along the normal route of travel, and buildings in which areas of refuge are provided for occupants that require a defend-in-place strategy or rescue assistance due to age, infirmity, involuntary confinement or supervision.

Revise as follows:

~~**510.2 510.1.2 Emergency responder radio coverage in existing Existing buildings.** Existing high-rise buildings and underground buildings in which any portion of the floor area is located more than 250-ft from the nearest fire service access point when measured along the normal route of travel shall be provided with approved radio coverage for emergency responders as required in Chapter 11.~~

Add new text as follows:

510.2 Where not required. Emergency responder radio coverage systems are not required in the buildings or circumstances listed in this section and where determined by the fire code official that such systems are not needed.

Revise as follows:

~~**510.1 510.2.1 Emergency responder radio coverage in new buildings. Two-way firefighter communication systems.**~~

~~New buildings shall have approved radio coverage for emergency responders within the building based on the existing coverage levels of the public safety communication systems utilized by the jurisdiction, measured at the exterior of the building. This section shall not require improvement of the existing public safety communication systems.~~

Exceptions:

- ~~1. Where approved by the building official and the fire code official, a wired communication system in accordance with Section 907.2.12.2 shall be permitted to be installed or maintained instead of an approved radio coverage system.~~
- ~~2. Where it is determined by the fire code official that the radio coverage system is not needed.~~
- ~~3. In facilities where emergency responder radio coverage is required and such systems, components or equipment required could have a negative impact on the normal operations of that facility, the fire code official shall have the authority to accept an automatically activated~~

emergency responder radio coverage system.

Add new text as follows:

510.2.2 Inadequate public safety radio network coverage. Where the existing public safety radio network provides incomplete, inconsistent or inadequate radio coverage outside a building, the building owner shall not be required to install an emergency responder radio coverage system or invest in other improvements to the public safety communication system. For purposes of this section, a transmitted or received signal strength of less than -75 dBm to and from the nearest fixed transmitter or repeater and a handheld portable radio located at a point outside the building consistent with the location of an incident command post shall constitute inadequate radio system coverage. In addition, an adequate signal shall provide a Delivered Audio Quality (DAQ) of 3.0 or an equivalent Signal-to-Interference-plus-Noise-Ratio (SINR) applicable to the technology for either analog or digital signals.

510.2.3 Cellular voice and data service access not required. This section does not require building owners to provide access to cellular telephone or mobile data services to public safety agencies or the general public, including services on Band 14 of the Evolved Universal Mobile Telecommunications System Terrestrial Radio Access (E-UTRA or LTE) spectrum.

510.2.4 Alternative means of compliance. Where fixed or mobile repeaters operated and maintained by the responding public safety agencies are provided or added to improve mobile and portable radio coverage.

510.2.5 Unacceptable interference. In facilities where emergency responder radio coverage is required and such systems, components or equipment could have a negative impact on the normal operations of that facility, the fire code official shall have the authority to accept an automatically activated emergency responder radio coverage system.

510.3 Permit required. A construction permit for the installation of or modification to emergency responder radio coverage systems and related equipment is required as specified in Section 105.7.6. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

510.4 Technical requirements. Systems, components and equipment required to provide the emergency responder radio coverage system shall comply with Sections 510.4.1 through 510.4.2.8.

510.4.1 Emergency responder communication enhancement system signal strength. The building shall be considered to have acceptable emergency responder communications enhancement system coverage when signal strength measurements in 95 percent of all areas on each floor of the building meet the signal strength requirements in Sections 510.4.1.1 through 510.4.1.3.

Revise as follows:

510.4.1.1 Minimum signal strength into the building. ~~The minimum inbound signal strength shall be sufficient to provide usable voice communications throughout the coverage area as specified by the fire code official, measured from a point outside the building consistent with the location of an incident command post using a portable transmitter operating in simplex mode having a power output not greater than that of a handheld radio of the type used by the public safety agency to points inside the building consistent with the method described in Section 510.5.3.~~ The inbound signal level shall be sufficient to provide not less than a Delivered Audio Quality (DAQ) of 3.0 or an equivalent Signal-to-Interference-Plus-Noise Ratio (SINR) applicable to the technology for either analog or digital signals.

510.4.1.2 Minimum signal strength out of the building. ~~The minimum outbound signal strength shall be sufficient to provide usable voice communications throughout the coverage area as specified by the fire code official, measured from points inside the building as specified in Section 510.5.3 to a point outside the building consistent with the location of an incident command post using a portable transmitter operating in simplex mode having a power output not greater than that of a handheld radio of the type used by the public safety agency.~~ The outbound signal level shall be sufficient to provide not less than a DAQ of 3.0 or an equivalent SINR applicable to the technology for either analog or digital signals.

Delete without substitution:

~~**510.4.1.3 System performance.** Signal strength shall be sufficient to meet the audibility and intelligibility requirements of the applications being utilized by public safety for emergency operations through the coverage area as specified by the fire code official in Section 510.4.2.2.~~

510.4.2 System design. The emergency responder radio coverage system shall be designed in accordance with Sections 510.4.2.1 through 510.4.2.8 and NFPA 1221.

510.4.2.1 Amplification systems and components. Buildings and structures that cannot support the required level of radio coverage shall be equipped with systems and components to enhance the public safety radio signals and achieve the required level of radio coverage specified in Sections 510.4.1 through 510.4.1.3. Public safety communications enhancement systems utilizing radio-frequency-emitting devices and cabling shall be approved by the *fire code official*. Prior to installation, all RF-emitting devices shall have the certification of the radio licensing authority and be suitable for public safety use.

Revise as follows:

510.4.2.2 Technical criteria. The *fire code official* shall maintain a document providing the specific technical information and requirements for the emergency responder communications coverage system. This document shall contain, but not be limited to, the various frequencies required, the location of radio sites, the effective radiated power of radio sites, the maximum propagation delay in microseconds, the ~~applications-modes being used, incident-ground communication practices, including accountability, situation reporting, and mayday procedures, as well as other~~ supporting technical information necessary for system design.

510.4.2.3 Standby power. Emergency responder radio coverage systems shall be provided with dedicated standby batteries or provided with 2-hour standby batteries and connected to the facility generator power system in accordance with Section 1203. The standby power supply shall be capable of operating the emergency responder radio coverage system at 100-percent system capacity for a duration of not less than 12 hours.

510.4.2.4 Signal booster requirements. If used, signal boosters shall meet the following requirements:

1. All signal booster components shall be contained in a National Electrical Manufacturer's Association (NEMA) 4-type waterproof cabinet.
2. Battery systems used for the emergency power source shall be contained in a NEMA 3R or higher-rated cabinet.
3. Equipment shall have FCC or other radio licensing authority certification and be suitable for public safety use prior to installation.
4. Where a donor antenna exists, isolation shall be maintained between the donor antenna and all inside antennas to not less than 20dB greater than the system gain under all operating conditions.
5. Bi-Directional Amplifiers (BDAs) used in emergency responder radio coverage systems shall have oscillation prevention circuitry.
6. The installation of amplification systems or systems that operate on or provide the means to cause interference on any emergency responder radio coverage networks shall be coordinated and approved by the *fire code official*.

510.4.2.5 System monitoring. The emergency responder radio enhancement system shall be monitored by a listed *fire alarm control unit*, or where approved by the *fire code official*, shall sound an audible signal at a constantly attended on-site location. Automatic supervisory signals shall include the following:

1. Loss of normal AC power supply.
2. System battery charger(s) failure.
3. Malfunction of the donor antenna(s).
4. Failure of active RF-emitting device(s).
5. Low-battery capacity at 70-percent reduction of operating capacity.
6. Failure of critical system components.
7. The communications link between the *fire alarm system* and the emergency responder radio enhancement system.

510.4.2.6 Additional frequencies and change of frequencies. The emergency responder radio coverage system shall be capable of modification or expansion in the event frequency changes are required by the FCC or other radio licensing authority, or additional frequencies are made available by the FCC or other radio licensing authority.

510.4.2.7 Design documents. The *fire code official* shall have the authority to require "as-built" design documents

and specifications for emergency responder communications coverage systems. The documents shall be in a format acceptable to the *fire code official*.

510.4.2.8 Radio communication antenna density. Systems shall be engineered to minimize the near-far effect. Radio enhancement system designs shall include sufficient antenna density to address reduced gain conditions.

Exceptions:

1. Class A narrow band signal booster devices with independent AGC/ALC circuits per channel.
2. Systems where all portable devices within the same band use active power control features.

510.5 Installation requirements. The installation of the public safety radio coverage system shall be in accordance with NFPA 1221 and Sections 510.5.1 through 510.5.4.

510.5.1 Approval prior to installation. Amplification systems capable of operating on frequencies licensed to any public safety agency by the FCC or other radio licensing authority shall not be installed without prior coordination and approval of the ~~fire code official~~licensee.

510.5.2 Minimum qualifications of personnel. The ~~minimum qualifications of the system designer and lead installation personnel shall include both of the following:~~

- ~~1. A valid FCC issued general radio operators license.~~
- ~~2. Certification of in building system training issued by an approved organization or approved school, or a certificate issued by the manufacturer of the equipment being installed.~~

~~These qualifications shall not be required where demonstration of adequate skills and experience satisfactory to the fire code official is provided.~~ possess valid Type PG General Radiotelephone Operator licenses issued by the FCC.

510.5.3 Acceptance test procedure. Where an emergency responder radio coverage system is required, and upon completion of installation, the building *owner* shall have the radio system tested to verify that two-way coverage on each floor of the building is not less than 95 percent. The test procedure shall be conducted as follows:

1. Each floor of the building shall be divided into a grid of 20 approximately equal test areas.
2. The test shall be conducted using a calibrated portable radio of the latest brand and model used by the agency talking through the agency's radio communications system or equipment approved by the fire code official.
3. Failure of more than one test area shall result in failure of the test.
4. In the event that two of the test areas fail the test, in order to be more statistically accurate, the floor shall be permitted to be divided into 40 equal test areas. Failure of not more than two nonadjacent test areas shall not result in failure of the test. If the system fails the 40-area test, the system shall be altered to meet the 95-percent coverage requirement.
5. A test location approximately in the center of each test area shall be selected for the test, with the radio enabled to verify two-way communications to and from the outside of the building through the public agency's radio communications system. Once the test location has been selected, that location shall represent the entire test area. Failure in the selected test location shall be considered to be a failure of that test area. Additional test locations shall not be permitted.
6. The gain values of all amplifiers shall be measured and the test measurement results shall be kept on file with the building *owner* so that the measurements can be verified during annual tests. In the event that the measurement results become lost, the building *owner* shall be required to rerun the acceptance test to reestablish the gain values.
7. As part of the installation, a spectrum analyzer or other suitable test equipment shall be utilized to ensure spurious oscillations are not being generated by the subject signal booster. This test shall be conducted at the time of installation and at subsequent annual inspections.
8. Systems incorporating Class B signal-booster devices or Class B broadband fiber remote devices shall be tested using two portable radios simultaneously conducting subjective voice quality checks. One portable radio shall be positioned not greater than 10 feet (3048 mm) from the indoor antenna. The second portable radio shall be positioned at a distance that represents the farthest distance from any indoor antenna. With both portable radios simultaneously keyed up on different frequencies within the same band, subjective audio testing shall be conducted and comply with DAQ levels as specified in Sections 510.4.1.1 and 510.4.1.2.

510.5.4 FCC compliance. The emergency responder radio coverage system installation and components shall comply with all applicable federal regulations, including, but not limited to, FCC 47 CFR Part 90.219.

510.6 Maintenance. The emergency responder radio coverage system shall be maintained operational at all times in accordance with Sections 510.6.1 through 510.6.4.

510.6.1 Testing and proof of compliance. The owner of the building or owner's authorized agent shall have the emergency responder radio coverage system shall be inspected and tested annually or where structural changes occur including additions or remodels that could materially change the original field performance tests. Testing shall consist of the following:

1. In-building coverage test as described in Section 510.5.3.
2. Signal boosters shall be tested to verify that the gain is the same as it was upon initial installation and acceptance or set to optimize the performance of the system.
3. Backup batteries and power supplies shall be tested under load of a period of 1 hour to verify that they will properly operate during an actual power outage. If within the 1-hour test period the battery exhibits symptoms of failure, the test shall be extended for additional 1-hour periods until the integrity of the battery can be determined.
4. Other active components shall be checked to verify operation within the manufacturer's specifications.
5. At the conclusion of the testing, a report, which shall verify compliance with Section 510.5.3, shall be submitted to the *fire code official*.

510.6.2 Additional frequencies. The building owner shall modify or expand the emergency responder radio coverage system at his or her expense in the event frequency changes are required by the FCC or other radio licensing authority, or additional frequencies are made available by the FCC or other radio licensing authority. Prior approval of a public safety radio coverage system on previous frequencies does not exempt this section.

510.6.3 Nonpublic safety system. Where other nonpublic safety amplification systems installed in buildings reduce the performance or cause interference with the emergency responder communications coverage system, the nonpublic safety amplification system shall be corrected or removed.

Delete without substitution:

~~**510.6.4 Field testing.** Agency personnel shall have the right to enter onto the property at any reasonable time to conduct field testing to verify the required level of radio coverage.~~

Revise as follows:

1103.2 Emergency responder radio coverage in existing buildings. Existing high-rise buildings, underground buildings, institutional buildings in which all or part of the occupant load requires a defined-in-place strategy, and buildings in which any portion of the floor area is located more than 250-ft from the nearest fire service access opening when measured along the normal route of travel. Existing high-rise buildings and buildings other than Group R-3 that do not have approved radio coverage for emergency responders in the building based on existing coverage levels of the public safety communication systems, shall be equipped with such coverage according to one of the following:

1. Where an existing wired communication system cannot be repaired or is being replaced, or where not approved in accordance with Section 510.1, Exception 1.
2. Within a time frame established by the adopting authority.

Exception: Where it is determined by the fire code official that the radio coverage system is not needed.

Reason:

The scope of existing requirements to install emergency responder radio coverage systems in new buildings introduces an unacceptable degree of uncertainty in the design and construction process. Radio signal propagation in proposed buildings cannot be predicted accurately due to uncertainties regarding the influence of construction, building contents, and operating features [8]. As such, tests to determine whether radio coverage meets jurisdictional requirements must occur late in the construction process, often days before completion and intended occupancy. Failure to achieve the coverage requirements specified in Section 510 can result in unexpected additional costs of tens to hundreds of thousands of dollars at the very end of a construction program [1,7].

Many, if not most, fire and emergency services agencies report routine difficulties communicating from handheld portable radios inside buildings. In many, if not most of the instances in which such problems occur, operators are attempting to transmit signals to fixed repeaters that rebroadcast their messages to other users on the public safety radio network. Although such difficulties are unfortunate and may be distressing to public safety users, they are also inconsistent with the design of most public safety radio systems. Very few public radio systems are designed, specified, installed, operated, and maintained to ensure consistent coverage inside buildings.

Reliance on the use of handheld radios by firefighters has expanded considerably in recent years, often with little or no regard to the added demands such users place on the radio systems hosting these transceivers. The reliance on handheld radios operating in multiplex mode through remote repeaters is not recommended as a primary much less sole means of ensuring fireground communications and accountability for firefighters operating in immediately dangerous to life and health environments. The use of simplex communication between incident commanders and firefighters operating inside buildings provides greater reliability.

The introduction of Section 510 requirements in 2009 recognized the inherent dangers faced by firefighters operating in high-rise buildings and similarly complex structures. In the past, the code required two-way firefighters' phone systems in such premises. In many, if not most cases, improved radio coverage provides a more reliable and cost-effective approach to ensuring firefighter communication and safety in such circumstances.

As currently presented, Section 510's requirements apply to a wide range of buildings not previously considered candidates for firefighter communication systems. As such, the requirements have come to be applied to situations in which reliable firefighter communications seems to be more of an end itself than a means to other ends.

Although software for modeling radio propagation does exist, it does not yield reliable results when attempting to predict public safety radio system coverage inside buildings. These programs do provide a means of designing such systems efficiently and reliably when it is clear that they are required.

Clearly, firefighters require reliable and efficient means of communication in buildings where they must operate for extended periods of time in locations remote from support resources and rapid-intervention teams, where they must support the protection, relocation, or evacuation of defend-in-place occupants, or where escape or evacuation during firefighting is unusually difficult, confusing, or time-consuming.

The proposed change introduces greater certainty into the application of these requirements by specifying building heights and travel distances related to firefighter access and safety. New exclusions clarify the intent by ensuring not only that the requirements are not applied to require the jurisdiction to improve public safety radio coverage outside new buildings, but also ensures that building owners do not bear undue cost burdens to correct deficiencies in the design, operation or maintenance of existing public safety radio systems. A new section recognizing alternative means of compliance through fixed or mobile repeaters is added to afford fire code officials, public safety agencies, and owners of large building complexes or campuses an opportunity to negotiate cost-effective remedies to providing enhanced radio coverage in multiple similarly situated buildings.

Provisions clarifying performance and test parameters are added to recognize that portable handheld radios do not provide reliable means of transmitting signals to public safety network repeaters in many, if not most, circumstances. Best-practice incident ground operating procedures employ simplex communication between firefighters and rescuers entering environments immediately dangerous to life and health and those outside the environment responsible for their safety, extrication, or rescue under exigent circumstances.

Reports from the investigation of firefighter line-of-duty deaths indicate communication failures contribute to but do not cause most serious injuries and deaths, and rarely if ever involve propagation failures. The most common communication failures reported in firefighter casualty investigations involve

1. Not reporting situations of difficulty or distress,
2. Not conveying conditions, actions, and intentions,
3. Inaccurately or incorrectly reporting positions or locations,
4. Missing critical messages due to distractions or interference (in the recipient's environment), and
5. Incorrect operation of equipment, such as using the wrong channel or talkgroup.

No firefighter line of duty death has been reported in a fully-sprinklered building.[3]

In addition to rescoping the provisions to improve certainty of application and intentions related to firefighter and rescuer operations, the proposed change also limits the application of these requirements to radiotelephone communication systems by clearly and unambiguously stating that the provisions do not require improvements to facilitate cellular voice and data service access, including Band 14 of the E-UTRA/LTE spectrum. This band has been designated for public safety broadband data services, which do not include emergency voice communications [5]. (No current or proposed public safety devices or applications that use broadband service have been identified that directly facilitate emergency responder safety while operating in an environment considered immediately dangerous to

life and health [6]. Radio-over-IP [RoIP] and push-to-talk [PTT] applications are not currently recognized or accepted for use in high-risk environments.)

Requirements for designers and installers of emergency responder radio coverage systems beyond those specified by the Federal Communications Commission are deleted in accordance with the pre-emption doctrine [10].

Likewise, the authority of the fire code official to authorize installations and operation on specific frequencies is amended to conform to federal regulations requiring the explicit authorization of licensees to operate in-building radio systems on existing public safety frequencies [11]. (It should be noted that the fire code official may or may not be employed by the same jurisdiction or agency licensed to operate radios and repeaters on public safety radio frequencies installed.)

Right of entry is already afforded by the administrative provisions of the code, and reiteration of that authority here is unnecessary. Language in the section authorizing agency personnel to conduct field testing to verify the required level of radio coverage suggest these personnel possess the equipment and experience necessary to perform such tests, which is rarely the case. Even in those rare instances where personnel possess such qualifications and equipment, the authority to conduct tests is already afforded by the administrative provisions of the code.

In summary, the proposed changes recognize the primary responsibility for firefighter safety and health during emergency response operations rests on emergency services. Reliable communication is but one means of ensuring firefighter safety during firefighting and rescue operations. Effective communication under such circumstances requires much more than a reliable communication path. It also requires carefully-written and well-practiced procedures for operating in environments considered immediately dangerous to life and health, which includes incident-ground communication procedures and robust equipment maintenance.

Cost Impact

The code change proposal will decrease the cost of construction .

The unnecessary or inappropriate application of emergency responder radio coverage system requirements to new and existing buildings adds tens to hundreds of thousands of dollars in costs to construction of individual buildings. Benefits from reducing preventable injuries or deaths to emergency responders can save hundreds of thousands to millions of dollars.

A single firefighter line-of-duty results in direct and indirect costs to the public to pay death benefits; hire, train and equip [13] a replacement firefighter; and conduct a thorough investigation into the circumstances surrounding the incident. These costs could be estimated as follows:

1. Death benefits paid to survivor(s): \$2.6 million (based on annual compensation at median firefighter salary [9] adjusted for inflation over 35-year life expectancy [2] beyond median firefighter age at time of death [3])
2. Succession costs: \$250,000
3. Investigation costs: \$150,000

Experienced installers of bi-directional amplifiers and distributed antenna systems (BDA/DAS) for emergency responder radio coverage systems estimate costs varying between \$0.50 to \$5.00 per square foot of occupied floor area depending upon construction type, building configuration, and power output [1,7]. At a median cost per square foot of floor area of \$2.75 per square foot, a floor area of approximately 11,000,000 sq ft could be protected. This is comparable to approximately 10 new single-story supermarkets or retail stores of the typical footprint.

Emergency responder injuries and deaths in such occupancies are exceedingly rare events. In a typical year, less than five firefighter line-of-duty deaths occur during interior operations in occupancies other than one or two family dwellings [3]. Studies of such incidents by the National Institutes of Occupational Safety and Health [4] and the U.S. Fire Administration major fires investigation program [12] do not suggest communication failures due to signal propagation are a proximate cause of these deaths.

Communication failures contributing to serious injuries and deaths during firefighting operations typically involve failure to develop, implement, and adhere to standard operating practices governing operations in conditions immediately dangerous to life and health.

The rate of serious injuries is not known, but could be conservatively estimated not to exceed 25 serious injuries requiring hospitalization and lost work time per reported death.

At these rates, the existing requirements have a significant negative benefit-to-cost ratio. The proposed code change reduces but does not eliminate the negative benefit-to-cost ratio related to the application of these requirements to new and existing buildings.

Based on this analysis, the deployment of mobile public safety repeaters to incidents by fire and emergency services would be a far more economical and efficient method of ensuring reliable communication in many if not most situations.

F47-18

IFC: 510.1.1 (New), 510.1.1.1 (New)

Proponent: Adria Reinertson, Riverside County Fire Department, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)

2018 International Fire Code

Add new text as follows:

510.1.1 Building conduit and pathway survivability. All new buildings shall be constructed with not less than a two-inch (2") dedicated conduit raceway or other method approved by the fire code official for future expandability, or the installation of an Emergency Responder Radio Coverage System. The raceway shall meet pathway survivability requirements in NFPA 1221 and shall be installed from the lowest floor level to the roof.

510.1.1.1 Identification. The raceway and junction boxes shall be labeled "Emergency Responder Radio Coverage System use only".

Reason:

Communications are key to a successful response to an emergency incident. When emergency responder radio coverage systems are installed in a new building they are tested and approved for the conditions present at the time. Often times, as additional buildings and infrastructure are built in the immediate and adjacent vicinity, the original radio coverage system will no longer function as approved due to interference, etc. This proposal requires a dedicated raceway to be installed at time of construction to allow for future expandability and/ or the installation of a radio coverage system. This proposal would allow for easy expansion and/or installations without the additional cost of invasive retrofits to the original system.

Cost Impact

The code change proposal will increase the cost of construction .

This code change will increase the cost of construction due the requirement to install conduit for future use, however, it will greatly reduce the cost of future installations and/or retrofits for expandability.

IFC: 510.4, 80

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Fire Code

Revise as follows:

510.4 Technical requirements. Equipment required to provide emergency responder radio coverage shall be listed in accordance with UL 2524. Systems, components and equipment required to provide the emergency responder radio coverage system shall comply with Sections 510.4.1 through 510.4.2.8.

Add new standard(s) follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

UL 2524 -2018:

Outline of Investigation for In-building 2-Way Emergency Radio Communication Enhancement Systems

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal adds a requirement to test and list equipment installed to enhance emergency responder radio coverage in buildings to ensure fire and shock safety and compliance with the performance requirements specified in IFC Section 510 and NFPA 1221.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

The requirement to test and list equipment will add to the cost for required equipment installed in new or existing buildings. The cost to test and certify safe equipment should not add more than 1/2% to the total cost of this equipment.

Internal ID: 377

F49-18

IFC: 202 (New), 510.4.1

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Fire Code

Add new definition as follows:

CRITICAL AREAS. Areas that are designated for emergency responder radio coverage including exit stairs, exit passageways, elevator lobbies, fire protection equipment room and control valve locations, fire command centers and other areas identified by the fire code official.

Revise as follows:

510.4.1 Emergency responder communication enhancement system signal strength. The building shall be considered to have acceptable emergency responder communications enhancement system coverage when signal strength measurements in 95 percent of all areas and 99 percent in critical areas on each floor of the building meet the signal strength requirements in Sections 510.4.1.1 through 510.4.1.3.

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal clarifies existing requirements within the 2018 edition of Section 510 through a reference to NFPA 1221 by placing the language related to 99% in critical areas within the technical provisions of 510.4.1. Covering critical areas of a building is vital to the operations of public safety responders. A definition for "critical areas" has been included to clarify what is intended by that term. As the definition notes critical areas include such areas as exit stairways, elevator lobbies, fire pump rooms, etc.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is already required in NFPA 1221. Section 510.4.2 requires compliance with NFPA 1221.

Internal ID: 967

F50-18

IFC: 510.4.1.1

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

510.4.1.1 Minimum signal strength into the building. The minimum inbound signal strength shall be sufficient to provide usable voice communications throughout the coverage area as specified by the *fire code official*. The inbound signal level shall be a minimum of -95dBm throughout the coverage area and sufficient to provide not less than a Delivered Audio Quality (DAQ) of 3.0 or an equivalent Signal-to-Interference-Plus-Noise Ratio (SINR) applicable to the technology for either analog or digital signals.

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is intended to put the minimum design criteria of -95dBm back into the code for the inbound signal also know as the downlink and clarify it is intended to apply throughout the coverage area while at the same time providing a DAQ of 3.0. dBm is an abbreviation for the power ratio in decibels (dB) of the measured power referenced to one milliwatt (mW). It is used in radio, microwave and fiber-optical communication networks as a convenient measure of absolute power because of its capability to express both very large and very small values in a short form. Specifying the minimum design criteria for the downlink provides a benchmark for system designers to utilize when designing a system and the DAQ 3.0 provision provides testing criteria.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Industry practice is to utilize a design parameter somewhere around -95dBm to determine if their design will work properly therefore this is simply a clarification..

Internal ID: 968

F51-18

IFC: 510.4.2.2

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

510.4.2.2 Technical criteria. The *fire code official* shall maintain a document available to approved system designers, providing the specific technical information and requirements for the emergency responder communications coverage system. This document shall contain, but not be limited to, the various frequencies required, the location of radio sites, the effective radiated power of radio sites, the maximum propagation delay in microseconds, the applications being used and other supporting technical information necessary for system design.

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is intended to clarify that the technical criteria listed within this code section shall be shared with industry in-building public safety communications system designers. Some code officials have expressed concern about sharing information related to their organizations public safety communications system with industry designers. However, without the information listed within this code section, a designer cannot properly design a system.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The intention of this section is to provide this information to designers but this has not always been understood. This clarifies who this information needs to be provided to and that it needs to be made available. This is simply a clarification of that intent.

Internal ID: 970

F52-18

IFC: 510.4.2.4

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

510.4.2.4 Signal booster requirements. If used, signal boosters shall meet the following requirements:

1. All signal booster components shall be contained in a National Electrical Manufacturer's Association (NEMA) 4-type waterproof cabinet.
2. Battery systems used for the emergency power source shall be contained in a NEMA 3R or higher-rated cabinet.
3. Equipment shall have FCC or other radio licensing authority certification and be suitable for public safety use prior to installation.
4. Where a donor antenna exists, isolation shall be maintained between the donor antenna and all inside antennas to not less than 20dB greater than the system gain under all operating conditions.
5. ~~Bi-Directional Amplifiers (BDAs)~~ Active RF emitting devices used in emergency responder radio coverage systems shall have ~~oscillation prevention~~ built-in oscillation detection and control circuitry.
6. The installation of amplification systems or systems that operate on or provide the means to cause interference on any emergency responder radio coverage networks shall be coordinated and approved by the *fire code official*.

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is intended to clarify that only active RF emitting devices utilized in emergency responder radio coverage systems shall have circuitry built into their design that both detects and controls oscillation. When oscillation occurs it can create significant interference on public safety radio frequencies rendering them inoperable. Therefore, it is not sufficient to just detect oscillation is occurring but that the equipment have the capability to control it when it occurs by reducing the gain or shutting itself down also known as self-healing.

A separate code proposal for Section 510 being submitted will require that public safety in-building communications equipment be listed and tested to perform their intended function. Oscillation detection and control is a factor in that process. Additionally, the ability to detect and control oscillation is an industry best-practice by the majority of manufacturers.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not increase construction cost as the requirement was already within the code. This proposal clarifies that it applies to active RF emitting devices.

Internal ID: 971

F53-18

IFC: 510.4.2.5

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

510.4.2.5 System monitoring. The emergency responder radio enhancement system shall be monitored by a listed *fire alarm control unit*, or where approved by the *fire code official*, shall sound an audible signal at a constantly attended on-site location. Automatic supervisory signals shall include the following:

1. Loss of normal AC power supply.
2. System battery charger(s) failure.
3. Malfunction of the donor antenna(s).
4. Failure of active RF-emitting device(s).
5. Low-battery capacity at 70-percent reduction of operating capacity.
6. Failure of critical system components.
7. The communications link between the *fire alarm system* and the emergency responder radio enhancement system.
8. Oscillation of active RF-emitting device(s)

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

IFC Section 510.4.2.4 requires that active RF emitting public safety in-building communications equipment detect and control oscillation because it can impact the public safety radio system operations. As such, public safety in-building communications systems should monitor when oscillation has or is occurring in order to provide detailed documentation of system stability and necessary data for system performance evaluation. Detailed data related to system performance is vital when troubleshooting system issues. Additionally, it can assist jurisdictions in identifying public safety radio system interference.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal may increase the cost of construction if the building owner chooses equipment that does not already provide sufficient dry contacts for system monitoring. Many system components produced by industry have the ability to monitor the functions required by the code.

F54-18

IFC: 510.4.2.8

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

510.4.2.8 Radio communication antenna density. Systems shall be engineered to minimize the near-far effect. Radio enhancement system designs shall include sufficient antenna density to address reduced gain conditions.

~~Exceptions-Exception:~~

- ~~1: Class A narrow band signal booster devices with independent AGC/ALC circuits per channel.~~
- ~~2: Systems where all portable devices within the same band use active power control features.~~

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Antenna density is critical to the design and functionality of public safety in-building communications systems. As Exception 1 is currently worded, some might perceive that if a Channelized Bi-Directional Amplifier (BDA) installed at the headend was feeding a fiber Distributed Antenna System (DAS) that they have met the intent of the code. While utilizing a Channelized BDA feeding a fiber DAS is not as bad as a Class B feeding a passive DAS, the fact is that near-far can still occur unless a fiber remote also has Class A capabilities. Near-far prohibits a second responder such as an EMS or fire crew working in another area of the structure communicating on a different talk group from being able to transmit on their radios thereby creating a life safety issue. Therefore, it is recommended that Exception 1 be deleted and require that system designers address near-far conditions regardless of equipment type.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

To properly design a public safety in-building communications system, antenna density must be considered because the potential for overdriving the uplink amplifiers is basically a given. Therefore, this code change proposal does not in and of itself increase construction cost.

Internal ID: 969

F55-18

IFC: 510.5, 510.5.1 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

510.5 Installation requirements. The installation of the public safety radio coverage system shall be in accordance with NFPA 1221 and Sections 510.5.1 through ~~510.5.4-510.5.5.~~

Add new text as follows:

510.5.1 Mounting of the donor antenna(s). To maintain proper alignment with the system designed donor site, donor antennas shall be permanently affixed on the building or where approved, mounted on a movable sled with a clearly visible sign stating "Movement or repositioning of this antenna is prohibited without approval from the fire code official". The antenna installation shall be in accordance with the applicable requirements in the International Building Code for weather protection of the building envelope.

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The location and direction the donor antenna is positioned is critical to the successful operation of a public safety in-building communications system. There are two basic methods of mounting donor antennas, either fixed or on an antenna sled held down by weights. Mounting the donor antenna in a fixed position limits the amount of movement that may occur. Although antenna sleds are common practice for mounting various types of antennas on a roof, for those utilized for public safety in-building communications systems they should be approved by the fire code official. Adding signage about the public safety use alerts others such as roofers, HVAC repair personnel to their importance and the need to make notification prior to moving them and rendering the public safety in-building communications system inoperable.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not add any new requirements to what is already required for the components of these systems. This proposal simply clarifies the location of installed donor antennas must be static to ensure system performance and reliability.

Internal ID: 975

F56-18

IFC: 510.5.3

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

510.5.3 Acceptance test procedure. Where an emergency responder radio coverage system is required, and upon completion of installation, the building *owner* shall have the radio system tested to verify that two-way coverage on each floor of the building is not less than 95 percent. The test procedure shall be conducted as follows:

1. Each floor of the building shall be divided into a grid of 20 approximately equal test areas.
2. The test shall be conducted using a calibrated portable radio of the latest brand and model used by the agency talking through the agency's radio communications system or equipment approved by the fire code official.
3. Failure of more than one test area shall result in failure of the test.
4. In the event that two of the test areas fail the test, in order to be more statistically accurate, the floor shall be permitted to be divided into 40 equal test areas. Failure of not more than two nonadjacent test areas shall not result in failure of the test. If the system fails the 40-area test, the system shall be altered to meet the 95-percent coverage requirement.
5. A test location approximately in the center of each test area shall be selected for the test, with the radio enabled to verify two-way communications to and from the outside of the building through the public agency's radio communications system. Once the test location has been selected, that location shall represent the entire test area. Failure in the selected test location shall be considered to be a failure of that test area. Additional test locations shall not be permitted.
6. The gain values of all amplifiers shall be measured and the test measurement results shall be kept on file with the building *owner* so that the measurements can be verified during annual tests. In the event that the measurement results become lost, the building *owner* shall be required to rerun the acceptance test to reestablish the gain values.
7. As part of the installation, a spectrum analyzer or other suitable test equipment shall be utilized to ensure spurious oscillations are not being generated by the subject signal booster. This test shall be conducted at the time of installation and at subsequent annual inspections.
8. ~~Systems incorporating Class B signal booster devices or Class B broadband fiber remote devices~~ shall be tested using two portable radios simultaneously conducting subjective voice quality checks. One portable radio shall be positioned not greater than 10 feet (3048 mm) from the indoor antenna. The second portable radio shall be positioned at a distance that represents the farthest distance from any indoor antenna. With both portable radios simultaneously keyed up on different frequencies within the same band, subjective audio testing shall be conducted and comply with DAQ levels as specified in Sections 510.4.1.1 and 510.4.1.2.

Reason:

This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Removing the code language "incorporating Class B signal-booster devices or Class B broadband fiber remote devices" is intended to clarify that the near-far effect should be a factor when testing each in-building public safety communications system. As currently worded, some might perceive that if using a channelized BDA (Bi-Directional Amplifier) at the headend feeding a fiber DAS (Distributed Antenna System), then they have met code. While

channelized feeding a fiber DAS is not as bad as class B feeding a passive DAS, the fact is that near-far is still a problem unless the fiber remote also has class A and the system should be tested.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

As the reason statement noted it might be perceive that if using a channelized BDA (Bi-Directional Amplifier) at the head-end feeding a fiber DAS (Distributed Antenna System), then they have met code. While channelized feeding a fiber DAS is not as bad as class B feeding a passive DAS, the fact is that near-far is still a problem unless the fiber remote also has class A and the system should be tested. Therefore this is simply clarifying what is intended by this section by removing this language therefore the cost should not be increased.

IFC: SECTION 601, SECTION 602, 603, 604, 605, 606, 607, 608, SECTION 609

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

SECTION 601 GENERAL

SECTION 602 DEFINITIONS

Revise as follows:

SECTION ~~604~~603 ELECTRICAL EQUIPMENT, WIRING AND HAZARDSSYSTEMS

SECTION ~~606~~ ~~604~~ ELEVATOR OPERATION, MAINTENANCE AND FIRE SERVICE KEYS ~~ELEVATORS~~

SECTION ~~603~~605 FUEL-FIRED APPLIANCES AND SYSTEMS

SECTION ~~607~~606 COMMERCIAL KITCHEN HOODS COOKING EQUIPMENT AND SYSTEMS

SECTION ~~608~~607 COMMERCIAL KITCHEN COOKING COOKING OIL STORAGE

SECTION ~~605~~608 MECHANICAL REFRIGERATION

SECTION 609 HYPERBARIC FACILITIES

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The Sections are reorganized within the Chapter to follow a more logical sequence addressing building systems and their construction and/or installation, operation, inspection and maintenance requirements and associated hazard mitigation requirements.

The order of requirements within each section are reorganized as part of the "technical" changes for each section through separate code proposals. The goal is to have a "general" or "scope" subsection followed by hazard mitigation requirements, as these requirements are most important to the fire code official. The construction, inspection, testing, operation, and maintenance requirements should follow a logical order for each respective system. In addition to creating a more logical order within both this Chapter and each section, the titles for individual sections are revised to more accurately reflect what is covered within each section.

Electrical equipment, wiring and systems - Hazards are covered in all sections, and is not needed in the title. This section not only includes equipment and wiring, but also full systems.

Elevators - Operation and maintenance are covered in all sections, and is part of the overall scope of the entire Chapter. Fire service keys are one of several components of elevators, and is not necessary to be included in the title.

Fuel-fired appliances and systems - This section not only includes appliances, but also full systems, including chimneys, vents, fuel piping, and fuel storage.

Commercial cooking equipment and systems - This section not only includes hoods, but also grease filters, cooking appliances, and grease ducts.

Commercial cooking oil storage - The storage of cooking oil is not limited to the kitchen area.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No technical changes are proposed. This proposal reorders Chapter 6, and the changes to titles clarifies the contents of each section.

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

601.1 Scope. The provisions of this chapter shall apply to the installation, operation and maintenance of ~~fuel of the~~ following building services and systems:

1. Electrical systems, equipment and wiring;
2. Information technology server rooms;
3. Elevator systems, emergency operation and recall;
4. Fuel-fired appliances and heating systems, electrical systems and equipment, mechanical refrigeration systems, elevator recall and commercial kitchen equipment, chimneys and fuel oil storage;
5. Commercial cooking equipment and systems;
6. Commercial cooking oil storage;
7. Mechanical refrigeration systems; and
8. Hyperbaric facilities.

Add new text as follows:

601.3 Hazard abatement. Operations or conditions deemed unsafe or hazardous by the fire code official shall be abated. Equipment, appliances, materials, and systems that are modified or damaged and constitutes an electrical shock or fire hazard shall not be used.

601.3.1 Correction of unsafe conditions. The fire code official shall be authorized to require the owner, the owner's authorized agent, operator or occupant of a building or premises to abate or cause to be abated or corrected such unsafe operations or conditions either by repair, rehabilitation, demolition or other approved corrective action in compliance with this code.

Revise as follows:

602.1 Definitions. The following terms are defined in Chapter 2:

COMMERCIAL COOKING APPLIANCES.

~~CRITICAL CIRCUIT.~~

HOOD.

- **Type I.**
- ~~Type II.~~
-

REFRIGERANT .

REFRIGERATING (REFRIGERATION) SYSTEM.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

Section 601.1 is expanded, and presented in a numbered format, to clarify what building services and systems are covered by Chapter 6. Electrical systems also include wiring. Information technology server rooms are proposed in a separate proposal to address the unique requirements. Besides elevator recall, systems and emergency operations are covered. Besides fuel-fired appliances and systems, chimneys and fuel oil storage are covered. The section for commercial kitchens also includes requirements for the exhaust system and the cooking equipment.

A new section is added to address general abatement of hazards and unsafe conditions for all building services and systems. The new Section 601.3 is based on the existing Section 604.1. The new Section 601.3.1 is based on the existing Section 110.4. The purpose of these sections is to establish the fire code official's authority, to identify who is doing the correction of the unsafe conditions, and to establish what criteria is to be followed for the corrections.

The terms "critical circuit" and "Hood Type II" are proposed to be removed from Section 602 because these terms were removed from Chapter 6 in the 2018 code edition.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal provides clarity regarding the scope of Chapter 6, and removes definitions of terms not used in the Chapter. This proposal provides clarity on hazard abatement and addressing unsafe conditions.

2018 International Fire Code

Delete without substitution:

~~**601.2 Permits.** Permits shall be obtained for refrigeration systems, battery systems and solar photovoltaic power systems as set forth in Sections 105.6 and 105.7.~~

Add new text as follows:

605.2 Permits. Permits shall be obtained for refrigeration systems as set forth in Sections 105.6 and 105.7.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The requirements for battery systems and solar photovoltaic power systems were relocated to a new Chapter 12 in the last code cycle. The only remaining requirement for specific operational and construction permits are for refrigeration systems. Those requirements for refrigeration system permits are proposed to be relocated into the mechanical refrigeration Section 605.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There are no changes to the requirements for permits. The requirements are simply relocated to the sections that apply.

2018 International Fire Code

Revise as follows:

603.1 Installation-General. ~~The design, construction, installation, operation, alteration, repair, and maintenance of nonportable gas-fired appliances and systems shall comply with the provisions of this section and the International Fuel Gas Code. The design, construction, installation of nonportable liquid fuel-fired, operation, alteration, repair, and maintenance of nonportable solid-fuel-fired and oil-fired appliances and systems shall comply with the provisions of this section and the International Mechanical Code. The installation of all other construction and use of portable fuel-fired appliances, other than portable internal combustion engines, oil lamps and other portable devices not connected to a fixed fuel piping system, such as blow torches, melting pots and weed burners, shall comply with this section and the International Mechanical Code section.~~

603.1.1 Manufacturer's instructions-Installation of nonportable fuel-fired appliances. ~~The installation of nonportable fuel-fired appliances shall be made in accordance with the manufacturer's installation instructions and applicable federal, state and local rules and regulations. Where it becomes necessary to change, modify or alter a manufacturer's instructions in any way, written approval shall first be obtained from the manufacturer.~~

Delete without substitution:

603.1.2 Approval. ~~The design, construction and installation of fuel-fired appliances shall be in accordance with the International Fuel Gas Code and the International Mechanical Code.~~

Revise as follows:

~~603.1.3~~ **603.1.2 Electrical wiring and equipment.** Electrical wiring and equipment used in connection with ~~oil fuel-burning-fired appliances and~~ equipment shall be installed and maintained in accordance with Section 604 and NFPA 70.

~~603.1.4~~ **603.1.3 Fuel oil.** The grade of fuel oil used in ~~a~~ an oil burner shall be that for which the oil burner is *approved* and as stipulated by the oil burner manufacturer's instructions. Oil containing gasoline shall not be used. Waste crankcase oil shall be an acceptable fuel in Group F, M and S occupancies where utilized in equipment *listed and labeled* for use with waste oil and where such equipment is installed in accordance with the manufacturer's instructions and the terms of its listing.

~~603.1.5~~ **603.1.4 Access.** The installation of fuel fired equipment shall be provided with access to equipment for cleaning hot surfaces; removing burners; replacing motors, controls, air filters, chimney and vent connectors, draft regulators and other working parts; and for adjusting, cleaning and lubricating parts.

~~603.1.6~~ **603.1.5 Testing, diagrams and instructions.** After installation of the ~~oil fuel-burning-fired~~ equipment, operation and combustion performance tests shall be conducted to determine that the burner equipment is in proper operating condition and that all accessory equipment, controls, and safety devices function properly.

~~603.1.6.1~~ **603.1.5.1 Diagrams.** Contractors installing industrial oil-burning systems shall furnish not less than two copies of diagrams showing the main oil lines and controlling valves, one copy of which shall be posted at the oil-burning equipment and another at an *approved* location that will be available in case of emergency.

~~603.1.6.2~~ **603.1.5.2 Instructions-Operating instructions.** After completing the installation, the installer shall instruct the *owner* or operator in the proper operation of the equipment. The installer shall furnish the *owner* or operator with the ~~name and telephone number of persons to contact for technical information or assistance and routine or emergency services~~ manufacturer's operating instructions.

~~603.1.7~~ **603.1.6 Clearances.** Working clearances between ~~oil~~ fuel-fired appliances and electrical panelboards and equipment shall be in accordance with NFPA 70. Clearances between oil-fired equipment and oil supply tanks shall be in accordance with NFPA 31.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The following changes are proposed:

1. Scoping and general installation requirements - Provides a general scoping section, aligning the scoping of the International Fuel Gas Code and international Mechanical Code with the Fire Code. The scope is expanded to include operation, repairs, and maintenance, besides the existing installation requirements. The scope of the section is expanded to include solid-fuel-fired appliances (only gas-fired and oil-fired appliances are covered in the existing code)
2. Installation instructions - Approval is from the fire code official, not the manufacturer.
3. Approval - Delete existing Section 603.1.2 because this is a repeat of Section 603.1.
4. Electrical wiring and equipment, access, testing diagrams and instructions and clearances expanded to also apply to solid-fuel fired and gas-fired appliances and equipment. These general requirements apply to all types of fuel-fired appliances and equipment, not just oil-fired.
5. Instructions (604.1.6.2) - the installer should be leaving the operating instructions for the owner or operator of the equipment.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal aligns the provisions of this section with already existing requirements in other codes, and provides clarity on the scope of this section.

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

~~603.7~~ **603.2 Discontinuing operation-Abatement of unsafe heating appliances-conditions.** The *fire code official* is authorized to order that measures be taken to prevent the operation of any existing stove, oven, furnace, incinerator, boiler or any other heat-producing device or appliance found to be defective or in violation of code requirements for existing appliances after giving notice to this effect to any person, *owner*, firm or agent or operator in charge of the same. The *fire code official* is authorized to take measures to prevent the operation of any device or appliance without notice when inspection shows the existence of an immediate fire hazard or when imperiling human life. The defective device shall remain withdrawn from service until all necessary repairs or *alterations* have been made or replaced in accordance with Section 603.1.

~~603.6~~ **603.2.1 Chimneys and appliances.** Chimneys, vents, incinerators, smokestacks or similar devices for conveying smoke or hot gases to the outer air and the appliances, such as stoves, furnaces, fireboxes or boilers to which such devices are connected, shall be maintained so as not to create a fire hazard.

~~603.6.1~~ **603.2.1.1 Masonry chimneys.** Masonry chimneys that, upon inspection, are found to be without a flue liner and that have open mortar joints which will permit smoke or gases to be discharged into the building, or which are cracked as to be dangerous, shall be repaired or relined with a *listed* chimney liner system installed in accordance with the manufacturer's instructions and the International Mechanical Code, or a flue lining system installed in accordance with the requirements of the International Building Code and appropriate for the intended class of chimney service.

~~603.6.2~~ **603.2.1.2 Metal chimneys.** Metal chimneys that are corroded or improperly supported shall be repaired or replaced in accordance with the International Mechanical Code.

~~603.6.3~~ **603.2.1.3 Decorative shrouds.** Decorative shrouds installed at the termination of factory-built chimneys or vents shall be removed except where such shrouds are *listed* and *labeled* for use with the specific factory-built chimney system and are installed in accordance with the chimney or vent manufacturer's instructions and the International Mechanical Code or International Fuel Gas Code.

~~603.6.4~~ **603.2.1.4 Factory-built chimneys-chimneys and vent systems.** Existing factory-built chimneys and vent systems that are damaged, corroded or improperly supported shall be repaired or replaced in accordance with the International Mechanical Code.

~~603.6.5~~ **603.2.1.5 Connectors.** Existing chimney and vent connectors that are damaged, corroded or improperly supported shall be repaired or replaced in accordance with the International Mechanical Code.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The existing sections for Discontinuing operation of unsafe heating appliances (Section 603.7) and Chimneys and appliances (Section 603.6) are relocated to directly follow the general installation requirements in Section 603.1, to provide a logical order for enforcement of the code. The requirements in Chimneys and appliances (Section 603.6) are relocated as subsections to the section on unsafe conditions, because these requirements are about recognizing and abating specific unsafe conditions. These requirements are expanded to include vent systems, and to direct the repairs in accordance with the IMC and the IFGC.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire->

code-action-committee-fcac/

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No technical changes to already existing requirements.

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

603.3 Fuel oil storage systems. Fuel oil storage systems for building heating systems shall be installed and maintained in accordance with this code. ~~Fuel tanks and fuel-oil piping systems~~ shall be installed in accordance with Chapter 13 of the International Mechanical Code.

603.3.1 Fuel oil storage in outside, above-ground tanks. Where connected to a fuel-oil piping system, the maximum amount of fuel oil storage allowed outside above ground without additional protection shall be 660 gallons (2498 L). The storage of fuel oil above ground in quantities exceeding 660 gallons (2498 L) shall comply with NFPA 31.

Add new text as follows:

603.3.1.1 Approval. Outside Fuel oil storage tanks shall be in accordance with UL142 or UL 2085.

Revise as follows:

603.3.2 Fuel oil storage inside buildings. Fuel oil storage inside buildings shall comply with Sections 603.3.2.1 through 603.3.2.5 or Chapter 57: of this code.

Add new text as follows:

603.3.2.1 Approval. Inside Fuel oil storage tanks shall be in accordance with UL 80, UL 142, UL 443, or UL 2085.

Revise as follows:

~~603.3.2.1~~ **603.3.2.2 Quantity limits.** One or more fuel oil storage tanks containing Class II or III *combustible liquid* shall be permitted in a building. The aggregate capacity of all tanks shall not exceed the following:

1. 660 gallons (2498 L) in unsprinklered buildings, where stored in a tank complying with UL 80, UL 142, UL 443, or UL 2085.
2. 1,320 gallons (4996 L) in buildings equipped with an *automatic sprinkler* system in accordance with Section 903.3.1.1, where stored in a tank complying with UL 142.
3. 3,000 gallons (11 356 L) in buildings equipped with an automatic sprinkler system in accordance with Section 903.3.1.1, where stored in protected above-ground tanks complying with UL 2085 and Section 5704.2.9.7 ~~and the room is protected by an automatic sprinkler system in accordance with Section 903.3.1.1. of this code.~~

603.3.2.2 Restricted use and connection. Tanks installed in accordance with Section 603.3.2 shall be used only to supply fuel oil to fuel-burning equipment, generators or fire pumps installed in accordance with Section 603.3.2.4. Connections between tanks and equipment supplied by such tanks shall be made using closed piping ~~systems~~ systems in accordance with the International Mechanical Code.

603.3.2.3 Applicability of maximum allowable quantity and control area requirements. The quantity of *combustible liquid* stored in tanks complying with Section 603.3.2 shall not be counted towards the maximum allowable quantity set forth in Table 5003.1.1(1), and such tanks shall not be required to be located in a *control area*.

603.3.2.4 Installation. Tanks and piping systems shall be installed in accordance with Section 915 and Chapter 13, both of the International Mechanical Code, as applicable.

603.3.2.5 Separation. Rooms containing fuel oil tanks for internal combustion engines shall be separated from the remainder of the building by *fire barriers, horizontal assemblies*, or both, with a minimum 1-hour fire-resistance rating with 1-hour fire-protection-rated *opening protectives* constructed in accordance with the International Building Code.

Exception: Rooms containing protected above-ground tanks complying with Section 5704.2.9.7 of this code shall

not be required to be separated from surrounding areas.

603.3.2.6 Spill containment. Tanks exceeding ~~55-60~~ gallon (~~208-227~~ L) capacity or an aggregate capacity of 1,000 gallons (3785 L) that are not provided with integral secondary containment shall be provided with spill containment sized to contain a release from the largest tank.

603.3.2.7 Tanks in basements. Tanks in *basements* shall be in accordance with UL 80 and shall be located not more than two stories below grade plane.

603.3.3 ~~Underground storage of fuel oil.~~ Fuel oil storage in underground tanks. The storage of fuel oil in underground storage tanks shall comply with UL 58 or UL 1316 and installed in accordance with NFPA 31.

Add new standard(s) follows:

Northbrook IL 60062

443-06:

Steel Auxiliary Tanks for Oil-Burner Fuel (with revisions through March 8, 2013)

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal provides the following clarity:

1. The scope of these sections is for fuel oil storage systems for building heating systems, not for generators or fire pumps.
2. These sections cover both installation and maintenance.
3. Both tanks and fuel oil piping systems are covered in Chapter 13 of the IMC.
4. Identifies what standards that the fuel oil storage tanks located outside, inside, and underground are required to comply.
5. Adds UL 443, UL 58, and UL 1316 as additional alternative standards for tanks to comply.
6. Correlates in Section 603.3.2.6 the technical requirements with the definitions of containers (a vessel of 60 gallons or less) and tanks (a vessel more than 60 gallons).

CONTAINER. A vessel of 60 gallons (227 L) or less in capacity used for transporting or storing hazardous materials. Pipes, piping systems, engines and engine fuel tanks are not considered to be containers.

TANK. A vessel containing more than 60 gallons (227 L).

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarifies existing requirements, and provides additional alternative compliance paths for the tanks.

Analysis: A review of the standard proposed for inclusion in the code, UL 443-06 with revisions through March 8, 2013, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 409

F64-18

IFC: 603.3.2.1

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

603.3.2.1 Quantity limits. One or more fuel oil storage tanks containing Class II or III *combustible liquid* shall be permitted in a building. The aggregate capacity of all tanks shall not exceed the following:

1. 660 gallons (2498 L) in unsprinklered buildings, where stored in a tank complying with UL 80, UL 142 or UL 2085.
2. 1,320 gallons (4996 L) in buildings equipped with an *automatic sprinkler* system in accordance with Section 903.3.1.1, where stored in a tank complying with UL 142- as a listed secondary containment tank. Secondary containment shall be monitored visually or automatically.
3. 3,000 gallons (11 356 L) where stored in protected above-ground tanks complying with UL 2085 and Section 5704.2.9.7 and the room is protected by an *automatic sprinkler system* in accordance with Section 903.3.1.1. Secondary containment shall be monitored visually or automatically.

Reason:

The current allowance of 1,320 gallons in a single wall tank in a non-Group H occupancy area is simply not consistent with historical practice for such installations and is not equivalent to what is required in Chapter 50 relative to maximum allowable quantities, which would normally only allow up to 240 gallons in a fully sprinklered non-Group H occupancy in a use-closed system.

Additionally, the vast majority of these tanks presently installed inside and outside buildings are of the double-wall type for permanent installations.

Primary concern is the exposure of 1,320 gallons of spilled diesel (fuel oil - Class II combustible liquid) inside a building, resulting in much greater involvement in a fire condition than in the vented interstitial space of a double-wall tank.

The double-wall tank provides an added layer of protection at a reasonable cost and is common industry practice currently, especially when located inside a building.

Cost Impact

The code change proposal will increase the cost of construction .

The vast majority of fuel tanks associated with generators and fire pumps are of the double-wall type presently; however, being that the code currently allows these to be of the single wall type for the maximum 1,320 gallon designated quantity, the requirement of double-wall would be an increase in the cost of construction as a result.

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

603.4 Portable unvented heaters. Portable unvented fuel-fired heating equipment shall be prohibited in occupancies in Groups A, E, I, R-1, R-2, R-3 and R-4 and ambulatory care facilities.

Exceptions:

1. ~~In one- and two-family dwellings portable~~ Portable unvented fuel-fired heaters, ~~where approved and listed in accordance with UL 647~~ are permitted to be used in one- and two-family dwellings, where operated and maintained in accordance with the manufacturer's instructions.
2. Portable outdoor gas-fired heating appliances in accordance with Section 603.4.2.

Revise as follows:

603.4.2.1 Location. Portable outdoor gas-fired heating appliances shall be used and located in accordance with Sections 603.4.2.1.1 through 603.4.2.1.4.

603.4.2.1.1 Prohibited locations. The storage or use of portable outdoor gas-fired heating appliances is prohibited in any of the following locations:

1. Inside of any occupancy where connected to the fuel gas container.
2. Inside of tents, canopies and membrane structures.
3. On exterior balconies.

Exception: ~~As allowed permitted in Section 6.22 of NFPA 58 Chapter 61 of this code.~~

603.4.2.2 Installation Use and operation. Portable outdoor gas-fired heating appliances shall be ~~installed~~ used and operated in accordance with Sections 603.4.2.2.1 through 603.4.2.2.4.

603.4.2.2.1 Listing and approval. Only *listed* and *approved* portable outdoor gas-fired heating appliances utilizing a fuel gas container that is integral to the appliance shall be used. Portable outdoor gas-fired heating appliances shall be listed and labeled in accordance with ANSI Z83.26/CSA 2.37 or ANSI Z21.58/CSA 1.6.

603.4.2.2.2 Installation Use and maintenance. Portable outdoor gas-fired heating appliances shall be ~~installed~~ used and maintained in accordance with the manufacturer's instructions.

Delete without substitution:

~~**603.4.2.2.3 Tip-over switch.** Portable outdoor gas-fired heating appliances shall be equipped with a tilt or tip-over switch that automatically shuts off the flow of gas if the appliance is tilted more than 15 degrees (0.26 rad) from the vertical.~~

~~**603.4.2.2.4 Guard against contact.** The heating element or combustion chamber of portable outdoor gas-fired heating appliances shall be permanently guarded so as to prevent accidental contact by persons or material.~~

Add new standard(s) follows:

ANSI Z83.26/CSA 2.37-2014:

Gas-Fired Outdoor Infrared Patio Heaters

ANSI Z21.58/CSA 1.6-2015:

Outdoor Cooking Gas Appliances

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal addresses the following for portable unvented heaters and outdoor gas-fired heating appliances:

1. Replaces "installed" with "used", because these are portable products.
2. For listed portable unvented heaters in one- and two-family dwellings, the fire code official will not be present to approve the use. The requirements have been expanded to also require these heaters to be operated and maintained in accordance with the manufacturer's instructions, which are part of the listing of the heater.
3. Adds specific standards for the portable outdoor gas-fired heating appliances.
4. Removes the tip-over switch requirement (Section 603.4.2.2.3) because this is already a requirement in ANSI Z83.26/CSA 2.37 (Section 5.19). The listing standard includes a performance test to determine.
5. Removes the guard requirement (Section 603.4.2.2.4) because this is already a requirement in ANSI Z83.26/CSA 2.37 (Section 5.14). The listing standard includes requirements addressing accessibility to any heated surface (Section 5.14).

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarifies already existing requirements.

Analysis: A review of the standards proposed for inclusion in the code, ANSI Z83.26/CSA 2.37-2014 and ANSI Z21.58/CSA 1.6-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

791-06:

Residential Incinerators - with revisions through November 2014

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This aligns with the International Mechanical Code, which requires, in Section 907.1, listing for residential incinerators to UL 791.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Aligns the Fire code with already existing requirements in the IMC.

Internal ID: 509

F67-18

IFC: 603.10 (New), 603.10.1 (New), 603.10.2 (New)

Proponent: Richard Boisvert, Brighton Area Fire Authority, representing Michigan Fire Inspector's Society
(rboisvert@brightonareafire.com)

2018 International Fire Code

Add new text as follows:

603.10 Clothes dryer exhaust ducts. Clothes dryer exhaust ducts shall be in accordance with Sections 603.10.1 and 603.10.2.

603.10.1 Installation. Clothes dryer vent ducts shall be installed and maintained in accordance with the International Mechanical Code and the manufacturer's installation instructions.

603.10.2 Maintenance. The lint trap, mechanical and heating components, and the exhaust duct system of a clothes dryer shall be maintained to prevent the accumulation of lint or debris that prevents the exhaust of air, products of combustion or that creates a fire hazard.

Reason:

Th IFC does not specifically address clothes dryer exhaust duct system installation and maintenance. The addition of this section creates a clear code path to ensure these duct systems are maintained to prevent fires.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change will not affect the cost of construction, however, it will require additional maintenance costs to maintain them following installation.

IFC: 604.1 (New), , 604.7

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

604.1 General. Electrical equipment, wiring and systems required by this code or the International Building Code shall be installed, used and maintained in accordance with NFPA 70 and Sections 604.2 through 604.11.

Revise as follows:

~~**604.7604.1.1 Equipment and fixtures-wiring.** Electrical equipment and fixtures~~ All electrical equipment, wiring, devices, and appliances shall be tested and listed by an approved agency and labeled, and installed, used and maintained in accordance with NFPA 70 and all instructions included as part of such listing.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal provides scoping for the section for electrical equipment, wiring and systems, which are installed, used, and maintained in accordance with NFPA 70 and this section. The installation and listing of electrical equipment and wiring is relocated to the beginning of this section. The terms for all electrical products to be listed are updated to the current terms used and defined in NFPA 70.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal clarifies the scoping of this section. No technical requirements are added.

Internal ID: 464

F69-18

IFC: 604.1.1 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Add new text as follows:

604.1.1 Healthcare facilities. In Group I-2 facilities, ambulatory care facilities and outpatient clinics, the electrical systems and equipment shall be maintained and tested in accordance with NFPA 99.

Reason:

In order to meet federal conditions of participation health care facilities must comply with the electrical systems and equipment maintenance and testing requirements listed in NFPA 99, Health Care Facilities Code (K913). This change will align the electrical systems maintenance and testing requirements for Outpatient Clinics, Group B Ambulatory Care and Group I-2 facilities.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is an operational change regarding maintenance and testing. This will not increase the cost of construction on the healthcare industry.

Internal ID: 694

F70-18

IFC: 604.1, 604.2.1 (New), 604.6

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new definition as follows:

CURRENT TAP An electrical device that, where connected to a permanently installed receptacle outlet, provides multiple receptacle outlet configurations.

RELOCATABLE POWER TAP A relocatable electrical enclosure that provides one or more receptacle outlets and that is provided with an attached power supply cord and attachment plug for connection to a permanently installed receptacle outlet (also called a "multiplug adaptor").

Revise as follows:

~~**604.4 Multiplug adapters, Relocatable power taps and current taps.** Multiplug adapters, such as cube adapters, unfused plug strips or any other device not complying with NFPA 70 shall be prohibited. The construction and use of current taps and relocatable taps shall be in accordance with NFPA 70 and this code.~~

~~**604.4.1 Power tap design, Listing.** Relocatable power taps shall be of the polarized or grounded type, equipped with overcurrent protection, and shall be listed in accordance with UL 1363. Current taps shall be listed and labeled in accordance with UL 498A~~

~~**604.4.2 Power supply, Application and use.** Relocatable power taps and current taps shall be directly connected to a permanently installed receptacle.~~

Exceptions:

1. Where used in a meeting room in a Group B Occupancy, no more than five relocatable power taps shall be permitted to be connected together for temporary use to supply power to electronic equipment.
2. Current taps and relocatable power taps shall not be required to connect directly to a permanently installed receptacle outlet where used for 90 days or less for the purpose of testing the performance of such devices.

~~**604.4.3 Installation.** Relocatable power tap cords shall not extend through walls, ceilings, floors, under doors or floor coverings, or be subject to environmental or physical damage.~~

Add new text as follows:

~~**604.4.4 Maintenance.** Relocatable power taps and current taps shall be maintained in a safe condition without splices, deterioration or damage~~

~~**604.4.5 Grounding.** Relocatable power taps and current taps shall be grounded where serving grounded portable appliances.~~

Add new standard(s) follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

498A-08:

Current Taps and Adapters - with revisions thru June 10, 2016

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal addresses the following:

1. Uses the correct industry terms for these devices - relocatable power taps and current taps - and provides definitions.
2. Adds the proper standard for current taps, UL 498A..
3. Removes the prescriptive construction requirements for relocatable power taps, which are already included in the required standard, UL 1363.
4. Permits the use of connecting multiple relocatable power taps together for temporary use in conference rooms with specific limitations. Expands the allowance of current taps and relocatable power taps to be used in temporary situations, with specific limitations, in accordance with the National Electrical Code, NFPA 70.
5. Adds maintenance and grounding requirements that are the same as the requirements for extension cords.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarifies already existing requirements, and uses current terminology. Provides for more flexible use of relocatable power taps.

Analysis: A review of the standard proposed for inclusion in the code, UL 498A-08, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 410

F73-18

IFC: 604.4.1.1 (New), Chapter 80

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

604.4.1.1 Listing in Group I-2 occupancies and ambulatory care facilities. . In Group I-2 occupancies and ambulatory care facilities, relocatable power taps shall be listed in accordance with UL 1363 except under the following conditions.

1. In Group I-2, Condition 2 occupancies, relocatable power taps providing power to patient care-related electrical equipment in the patient care vicinity as defined by NFPA 99 shall be listed in accordance with UL 1363A or UL 60601-1.
2. In Group I-2, Condition 1 facilities, in care recipient rooms using line-operated patientcare-related electrical equipment, relocatable power taps in the patient care vicinity as defined by NFPA 99 shall be listed in accordance with UL 1363A or UL 60601-1.
3. In ambulatory care facilities, relocatable power taps providing power to patient care-related electrical equipment in the patient care vicinity as defined by NFPA 99 shall be listed in accordance with UL 1363A or UL 60601-1.

Add new standard(s) follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

1363A-2014:

Standard for Relocatable Power Taps

60601-2003:

Medical Electrical Equipment, Part i: General Requirements for Safety

Reason:

Due to the potential for electrical shock to patients and care recipients the need for a higher standard for relocatable power taps within the patient care vicinity and resident rooms using line-operating patientcare related electrical equipment is needed (K920).

Patient care vicinity is defined in NFPA 99 as an area that is a 6'-0" space around a care recipient exam or treatment location.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is an operational change regarding the use of relocatable power taps and will not increase the cost of construction in the healthcare industry.

Analysis: A review of the standards proposed for inclusion in the code, UL 1363A-2014 and UL 60601-2003, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 696

F74-18

IFC: 604.5, 604.5.1

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

604.5 Extension cords. Extension cords ~~and flexible cords~~ shall not be a substitute for permanent wiring and shall be listed and labeled in accordance with UL 817. Extension cords and flexible cords shall not be affixed to structures, extended through walls, ceilings or floors, or under doors or floor coverings, nor shall such cords be subject to environmental damage or physical impact. Extension cords shall be used only with portable appliances. Extension cords marked for indoor use shall not be used outdoors.

604.5.1 ~~Power supply.~~ Application and use. Extension cords shall be plugged directly into an *approved* receptacle, relocatable power tap or multiplug adapter current tap, and, except for *approved* multiplug extension cords, shall serve only one portable appliance.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The National Electrical Code (NFPA 70) permits in Article 400 the use of flexible cords for permanent wiring in a variety of conditions, including wiring of luminaires, elevators, cranes and hoists, connection of utilization equipment to facilitate frequent interchange, to prevent the transmission of noise or vibration. UL 817 is used for listing extension cords, but not for listing flexible cords.

The terms "relocatable power tap" and "current tap" are more current than the term "multiplug adapter".

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The requirements in NFPA 70 are not changed, which establish the requirements for use of flexible cords. This proposal removes a conflict with NFPA 70.

Internal ID: 411

F75-18

IFC: 604.9, 604.9.1

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

604.9 Temporary wiring. ~~Temporary~~ ~~The use of temporary~~ wiring for electrical power and lighting installations is ~~allowed for~~ shall not exceed a period ~~not to exceed of~~ 90 days. Temporary wiring methods shall meet the applicable provisions of NFPA 70.

Exception: Temporary wiring for electrical power and lighting installations ~~is allowed~~ complying with the applicable provisions of NFPA 70 is permitted during periods of construction, remodeling, repair or demolition of buildings, structures, equipment or similar activities.

604.9.1 Attachment to structures. Temporary wiring attached to a structure shall be ~~attached in an approved~~ manner protected from physical damage and supported on insulators spaced not more than 10 ft. (3.0 m) apart

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal aligns the requirements for temporary wiring with NFPA 70, and provides specific criteria regarding the attachment of temporary wiring to structures.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarifies existing requirements for temporary wiring and is will not affect construction cost.

IFC: 605.1.2, Chapter 80

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

605.1.2 Ammonia refrigeration. Refrigeration systems using ammonia refrigerant and the buildings in which such systems are installed shall comply with IIAR-2 for system design and installation, IIAR 6 for maintenance and inspection, and IIAR-7 for operating procedures. Decommissioning of ammonia refrigeration systems shall comply with IIAR-8.

Update standard(s) as follows:

IIAR

International Institute of Ammonia
Refrigeration
1001 N. Fairfax Street, Suite 503
Alexandria VA 22314
US

IIAR - 2-2014:

Safe Design of Closed-circuit Ammonia ~~Refrigerating~~ Refrigeration Systems

IIAR - 8-2015:

Decommissioning of Closed-circuit Ammonia ~~Refrigerating~~ Refrigeration Systems

IIAR 6-2018:

Standard for Inspection, Testing, and Maintenance of Closed-Circuit Ammonia Refrigeration Systems

Reason:

IIAR 6 is a newly developed standard, being produced in accordance with ANSI requirements. It will provide comprehensive model regulations for maintenance and inspection of ammonia refrigeration systems and is part of a comprehensive set of IIAR standards for such systems that have been adopted by the IFC, IMC and other model codes. The first public comment period for this document has been completed, and it is anticipated that the document will be finished in time for adoption by the ICC membership in 2018.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

IIAR 6 is a maintenance and inspection standard for existing ammonia refrigeration systems.

Analysis: A review of the standard proposed for inclusion in the code, IIAR 6—2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IMC COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows:

REFRIGERANT DETECTOR. A device that is capable of sensing the presence of refrigerant vapor.

CHAPTER 6 BUILDING SERVICES AND SYSTEMS

SECTION 605 MECHANICAL REFRIGERATION

[M] 605.1 Scope. Refrigeration systems shall be installed in accordance with the International Mechanical Code.

605.5 Access. Access to refrigeration systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 or 30 pounds (14 kg) of any other group refrigerant shall be provided for the fire department at all times as required by the *fire code official*.

605.6 Testing of equipment. Refrigeration equipment and systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 or 30 pounds (14 kg) of any other group refrigerant shall be subject to periodic testing in accordance with Section 605.6.1. Records of tests shall be maintained. Tests of emergency devices or systems required by this chapter shall be conducted by persons trained and qualified in refrigeration systems.

605.6.1 Periodic testing. The following emergency devices or systems shall be periodically tested in accordance with the manufacturer's instructions and as required by the *fire code official*.

1. Treatment and flaring systems.
2. Valves and appurtenances necessary to the operation of emergency refrigeration control boxes.
3. Fans and associated equipment intended to operate emergency ventilation systems.
4. Detection and alarm systems.

Revise as follows:

605.8 Refrigerant detection. Machinery rooms shall be provided with ~~a refrigerant detector~~ one or more refrigerant detectors capable of detecting the specific refrigerant(s) utilized in the machinery room, with an audible and visible alarm. Where ammonia is used as the refrigerant, detection shall comply with IIAR 2. For refrigerants other than ammonia, refrigerant detection shall comply with Section 605.8.1.

605.8.1 Refrigerants other than ammonia.

A detector, or a sampling tube that draws air to a detector, shall be provided at ~~an one or more approved location~~ locations where refrigerant from a leak is expected to accumulate. ~~The system shall be designed to initiate audible and visible alarms inside of and outside each entrance to the refrigerating machinery room and transmit a signal to an approved location where the concentration of refrigerant detected exceeds the lesser of the following:~~

1. ~~The corresponding TLV-TWA values shown in the International Mechanical Code for the refrigerant classification.~~
2. ~~Twenty five percent of the lower flammable limit (LFL).~~

~~Detection of a refrigerant concentration exceeding the upper detection limit or 25 percent of the lower flammable limit (LFL), whichever is lower, shall stop refrigerant equipment in the machinery room in accordance with Section 605.9.1.~~ detection, signaling and control circuits shall be supervised. The detection system shall be designed in

accordance with Sections 605.8.1.1 and 605.8.1.2.

Add new text as follows:

605.8.1.1 Low level response. The system shall be designed to perform the following actions when the concentration of refrigerant detected exceeds the smallest value of Occupational Exposure Limit (OEL) and does not exceed the smallest value of Refrigerant Concentration Level (RCL), as listed in the International Mechanical Code for any refrigerant utilized in the machinery room:

1. Initiate audible and visible alarms inside of and outside each entrance to the refrigerating machinery room and transmit a signal to an approved location.
2. The ventilation system shall provide a flow rate not less than the highest of the following values for any refrigerant utilized in the machinery room: for Group A1 and B1 refrigerants 100% of the normal ventilation quantity, and for Group A2L, A2, A3, B2L, B2, and B3 refrigerants, 50% of the emergency conditions quantity, as required by the International Mechanical Code.
3. After initiation of alarms and ventilation system, it is permissible to utilize automatic reset of alarms and ventilation system after the refrigerant concentration has reduced below the OEL and maintained below the OEL for a minimum of 15 minutes.

605.8.1.2 High level response. The system shall be designed to perform the following actions when the concentration of refrigerant detected exceeds the refrigerant concentration limit (RCL), or 25 percent of the lower flammable limit (LFL), or upper detection limit of the detector, whichever is lower, for any refrigerant utilized in the machinery room:

1. Initiate audible and visible alarms inside of and outside each entrance to the refrigerating machinery room and transmit a signal to an approved location.
2. The ventilation system shall provide a flow rate not less than 100% of the emergency conditions quantity required by the International Mechanical Code.
3. For Group A2L, A2, A3, B2L, B2, and B3 refrigerants, stop refrigerant equipment in the machinery room in accordance with Section 605.9.1.
4. After initiation, alarms and ventilation system shall continue until manually reset at a location within the machinery room.

Delete without substitution:

605.17.1 Refrigerant detection system. ~~The machinery room shall be provided with a refrigerant detection system. The refrigerant detection system shall be in accordance with Section 605.8 and all of the following:~~

- ~~1. The detectors shall activate at or below a refrigerant concentration of 25 percent of the LFL.~~
- ~~2. Upon activation, the detection system shall activate the emergency ventilation system in Section 605.17.3.~~
- ~~3. The detection, signaling and control circuits shall be supervised.~~

2018 International Mechanical Code

Delete and substitute as follows:

[F] 1106.5.1 Refrigerant detection system. ~~The machinery room shall be provided with a refrigerant detection system. The refrigerant detection system shall be in accordance with Section 605.8 of the International Fire Code and all of the following:~~

- ~~1. The detectors shall activate at or below a refrigerant concentration of 25% of the LFL.~~
- ~~2. Upon activation, the detection system shall activate the emergency ventilation system required by Section 1106.5.2.~~
- ~~3. The detection, signaling and control circuits shall be supervised.~~

[F] 1106.5.1 Refrigerant detection system. The machinery room shall be provided with a refrigerant detection system. The refrigerant detection system shall be in accordance with Section 605.8 of the International Fire Code.

F79-18 Part II

IFC: [M]605.16, [M]605.17, [M]605.17.2, TABLE [M] 605.17.2, [M]605.17.3; IMC: 202(New), 1103.1, TABLE 1103.1, 1106.4, 1106.5.2, TABLE 1106.5.2

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Fire Code

Revise as follows:

[M] 605.16 Electrical equipment. Where *refrigerant* of Groups A2L, A2, A3, B2L, B2 and B3, as defined in the International Mechanical Code, are used, refrigeration machinery rooms shall conform to the Class I, Division 2 hazardous location classification requirements of NFPA 70.

Exceptions:

1. Ammonia machinery rooms that are provided with ventilation in accordance with Section 1106.3 of the International Mechanical Code.
2. Machinery rooms for systems containing Group A2L *refrigerants* that are provided with ventilation in accordance with Section 605.17, or Group B2L refrigerants that are provided with ventilation in accordance with Section 605.17. Sections 605.12.3 and Section 1106.3 of the International Mechanical Code.

[M] 605.17 Special requirements for Group A2L refrigerant machinery rooms. Machinery rooms with systems containing Group A2L refrigerants shall comply with Sections 605.17.1 through 605.17.3. Section 1106.4 of the International Mechanical Code.

Exception: Machinery rooms conforming to the Class 1, Division 2 hazardous location classification requirements of NFPA 70.

Delete without substitution:

~~**[M] 605.17.2 Emergency ventilation system.** An emergency ventilation system shall be provided at the minimum exhaust rate specified in ASHRAE 15 or Table 605.17.2. Shut down of the emergency ventilation system shall be by manual means.~~

**TABLE [M] 605.17.2
MINIMUM EXHAUST RATE**

REFRIGERANT	Q (m ³ /sec)	Q (cfm)
R32	15.4	32,600

R1234ze(E)	5.92	12,600

~~**[M] 605.17.3 Emergency ventilation system discharge.** The point of discharge to the atmosphere shall be located outside of the structure at not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or exit.~~

2018 International Mechanical Code

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

Delete and substitute as follows:

~~**FLAMMABILITY CLASSIFICATION.** Refrigerants shall be assigned to one of the three classes—1, 2 or 3—in accordance with ASHRAE 34. For Classes 2 and 3, the heat of *combustion* shall be calculated assuming that *combustion* products are in the gas phase and in their most stable state.~~

~~**Class 1.** Refrigerants that do not show flame propagation when tested in air at 14.7 psia (101 kPa) and 140°F (60°C).~~

~~**Class 2.** Refrigerants having a lower flammability limit (LFL) of more than 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) and a heat of combustion of less than 8169 Btu/lb (19 000 kJ/kg).~~

~~**Class 3.** Refrigerants that are highly flammable, having a LFL of less than or equal to 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) or a heat of combustion greater than or equal to 8169 Btu/lb (19 000 kJ/kg).~~

~~**FLAMMABILITY CLASSIFICATION (REFRIGERANT).** The alphabetical/numerical designation used to identify the flammability of refrigerants. Class 1 indicates a refrigerant with no flame propagation. Class 2L indicates a refrigerant with lower flammability and lower burning velocity. Class 2 indicates a refrigerant with lower flammability. Class 3 indicates a refrigerant with higher flammability.~~

Add new definition as follows:

~~**REFRIGERANT CONCENTRATION LIMIT (REFRIGERANT) (RCL)** The refrigerant concentration limit, in air, intended to reduce the risks of acute toxicity, asphyxiation, and flammability hazards in normally occupied, enclosed spaces.~~

Delete and substitute as follows:

~~**REFRIGERANT SAFETY CLASSIFICATIONS.** Groupings that indicate the toxicity and flammability classes in accordance with Section 1103.1. The classification group is made up of a letter (A or B) that indicates the toxicity class, followed by a number (1, 2 or 3) that indicates the flammability class. Refrigerant blends are similarly classified, based on the compositions at their worst cases of fractionation, as separately determined for toxicity and flammability. In some cases, the worst case of fractionation is the original formulation.~~

~~**Flammability.** See “Flammability classification.”~~

~~**Toxicity.** See “Toxicity classification.”~~

REFRIGERANT SAFETY GROUP CLASSIFICATION. The alphabetical/numerical designation that indicates both toxicity and flammability classifications of refrigerants.

Toxicity. See "Toxicity classification (Refrigerant)."

Flammability. See "Flammability classification (Refrigerant)."

~~**TOXICITY CLASSIFICATION.** Refrigerants shall be classified for toxicity in one of two classes in accordance with ASHRAE 34:~~

~~**Class A.** Refrigerants that have an occupational exposure limit (OEL) of 400 parts per million (ppm) or greater.~~

~~**Class B.** Refrigerants that have an OEL of less than 400 ppm.~~

TOXICITY CLASSIFICATION (REFRIGERANT). An alphabetical designation used to identify the toxicity of refrigerants. Class A indicates a refrigerant with lower toxicity. Class B indicates a refrigerant with higher toxicity.

CHAPTER 11 REFRIGERATION

SECTION 1103 REFRIGERATION SYSTEM CLASSIFICATION

Revise as follows:

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Each refrigerant shall be assigned to one of the following refrigerant safety group classifications: A1, A2L, A2, A3, B1, B2L, B2, or B3. For refrigerants that do not have values in Table 1103.1, the safety group, RCL value, and OEL value shall be determined in accordance with ASHRAE 34 and approved by the code official.

TABLE 1103.1

REFRIGERANT CLASSIFICATION, AMOUNT AND OEL

CHEMICAL REFRIGERANT	FORMULA	CHEMICAL NAME OF BLEND	REFRIGERANT SAFETY GROUP CLASSIFICATION	AMOUNT OF REFRIGERANT PER OCCUPIED SPACE				[F] DEGREES OF HAZARD ^a
				RCL			OEL ^c	
				lb per 1,000 ft ³ Pounds per 1,000 cubic feet	ppm	g/m ³	ppm

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. For installations that are entirely outdoors, use 3-1-0.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.
- f. ~~The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~

1106.4 Flammable refrigerants. Where refrigerants of Groups A2L, A2, A3, B2L, B2 and B3 are used in one or more refrigerating systems, the *machinery room* shall conform to the Class 1, Division 2, *hazardous location* classification requirements of NFPA 70.

Exceptions:

1. Ammonia *machinery rooms* that are provided with *ventilation* in accordance with Section 1106.3.
2. Machinery rooms for systems containing in which the refrigerating system(s) that contain(s) flammable refrigerants utilize only Group A2L refrigerants that refrigerant(s), and are in accordance with Section 1106.5.

1106.5.2 Emergency ventilation system. An emergency ventilation system shall be provided at the minimum exhaust rate specified in ASHRAE ~~15 or Table 1106.5.2-15~~. Shutdown of the emergency ventilation system shall be by manual means.

Delete without substitution:

**TABLE 1106.5.2

R1234yf	7.80	16,600
R1234ze(E)	5.92	12,600

Reason:

The proposed code changes include technical content based on ASHRAE Standard 34-2016 with Addendum G and ASHRAE Standard 15-2016 with Addendum H. The revisions in these two ASHRAE addenda are dependent and must be correlated as shown in this code change proposal. Upon publication, these addenda will be incorporated into the 2019 editions of ASHRAE 34 and ASHRAE 15.

There was a considerable amount of industry research into the use of flammable refrigerants that occurred in 2016 and 2017, following the announcement in June 2016 of a collaborative research effort between ASHRAE, AHRI, and US DOE. ASHRAE SSPC15 relied upon this body of knowledge, extended upon prior ASHRAE research from 2012, in drafting the addenda to the 2016 edition of Standard 15.

The refrigerant safety group classification is an alphabetical/numerical designation that is used to identify both the toxicity and flammability classifications of a given refrigerant. There are two new safety group classifications added to ASHRAE 34: A2L and B2L. Previously 2L was a sub-class of class 2 as an interim measure to implement changes to refrigerant flammability classification into ASHRAE 34 prior to making associated changes to a future edition of ASHRAE 15; but now 2L is a separate class and safety requirements must be revised to distinguish between class 2 and class 2L.

The current definitions of “flammability classification” and “toxicity classification” are improper since both contain mandatory code requirements. The definitions should only define the term, not contain code requirements with the use of the word “shall.” The current definition of refrigerant safety classifications is incorrect due to revisions to ASHRAE 34. The attempt to define the technical requirements of flammability are not correct. ASHRAE 34 goes into extensive requirements as to how to test and classify a refrigerant regarding flammability. The code should leave the technical requirements to ASHRAE 34 which is accomplished in Section 1103.1. The definition only has to identify the meanings of the classification categories. These terms used are found in the body of ASHRAE 34. The addition of “refrigerant” to the term “flammability classification” and “toxicity classification” clarify that the definitions only apply to refrigerants. Flammability and toxicity are terms also used in the ventilation sections of the code. These definitions do not apply to the use of those terms in Chapter 5.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal addresses a new safety group of refrigerants, with no precedent on the construction costs.

F80-18

IFC: 605.10

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

605.10 Emergency pressure control system. Permanently installed refrigeration systems in machinery rooms containing more than 6.6 pounds (3 kg) of flammable, toxic or highly toxic refrigerant or ammonia shall be provided with an emergency pressure control system in accordance with Sections 605.10.1 and 605.10.2.

Reason:

The original concept of emergency pressure control systems (EPCS) was as a substitute for cross-over valves in manual emergency control boxes. Emergency control boxes were previously required, only by the UFC, with an expectation that ammonia could be transferred to another pressure zone or released to a water tank, treatment system or atmosphere to reduce system pressure in the event of a building fire that exposed the system to high temperatures. Whatever risk may occur is limited to large equipment that would be found in a machinery room, and this is recognized by the IMC, which limits EPCS requirements to machinery rooms in Section 1105.9 (Section 1105 is machinery rooms). This proposal correlates the IFC requirement with the IMC and appropriately recognizes that the risk of a major fire exposure to outdoor ammonia refrigeration equipment isn't sufficient to warrant the need for an EPCS. Such systems are already provided with normal operation pressure limits, overpressure sensors on compressors to stop compressors in the event of continued overpressure, and relief vents to maintain systems in a safe operating pressure range, and the EPCS is an unnecessary fourth-level safety feature for outdoor systems.

Cost Impact

The code change proposal will decrease the cost of construction .

Additional requirement to provide EPCS for outdoor equipment, and associated cost, would no longer be required.

Internal ID: 2104

F81-18

IFC: 605.12.2, 605.12.2.1 (New), 605.12.4

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (JBEngineer@aol.com)

2018 International Fire Code

Revise as follows:

605.12.2 Flammable refrigerants. Systems containing more than 6.6 pounds (3 kg) of ~~flammable Group A2, A3, B2, or B3~~ refrigerants having a density equal to or greater than the density of air shall discharge vapor to the atmosphere only through an *approved* treatment system in accordance with Section 605.12.5 or a flaring system in accordance with Section 605.12.6. Systems containing more than 6.6 pounds (3 kg) of ~~flammable Group A2, A3, B2, or B3~~ refrigerants having a density less than the density of air shall be permitted to discharge vapor to the atmosphere provided that the point of discharge is located outside of the structure at not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or *exit*.

Add new text as follows:

605.12.2.1 Group A2L refrigerant. Systems containing more than 6.6 pounds (3 kg) of Group A2L refrigerant shall discharge vapor directly to atmosphere where the fire code official determines, on review of an engineering analysis prepared in accordance with Section 104.7.2, that a fire hazard would not result from atmospheric discharge of Group A2L refrigerant.

Revise as follows:

605.12.4 Ammonia and Group B2L refrigerant. Systems containing more than 6.6 pounds (3 kg) of ammonia or Group B2L refrigerant shall discharge vapor to the atmosphere in accordance with one of the following methods:

1. Directly to atmosphere where the *fire code official* determines, on review of an engineering analysis prepared in accordance with Section 104.7.2, that a fire, health or environmental hazard would not result from atmospheric discharge of ammonia or B2L refrigerant.
2. Through an *approved* treatment system in accordance with Section 605.12.5.
3. Through a flaring system in accordance with Section 605.12.6.
4. ~~Through~~ For ammonia, through an *approved* ammonia diffusion system in accordance with Section 605.12.7.
5. By other *approved* means.

Exception: Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.

Reason:

ASHRAE 34 changed the grouping of refrigerants adding two new categories, A2L and B2L. These refrigerants are lower flammable refrigerants. The refrigerants do not readily ignite and do not pose the same hazard as A2, A3, B2, and B3 refrigerants. With the addition of these new refrigerants, revisions are necessary to these section. Ammonia is a Group B2L refrigerant, hence, there are already special requirements. The modification will allow other B2L refrigerants to meet the same requirements.

A2L refrigerants have similar flammability characteristics to ammonia. Hence, allowance for the evaluation of ignition should apply similar to ammonia. The text in Section 606.12.3.1 is similar to item 1 in Section 606.12.5. Item 1 of Section 606.12.5 also includes an evaluation of the health or environmental hazard which would not apply to A2L refrigerants.

Cost Impact

The code change proposal will decrease the cost of construction .

Group A2L refrigerants will be treated similar to ammonia regarding the flammability.

Internal ID: 1317

F82-18

IFC: 605.12.4

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

605.12.4 Ammonia refrigerant. Systems containing more than 6.6 pounds (3 kg) of ammonia refrigerant shall discharge vapor to the atmosphere in accordance with one of the following methods:

1. Directly to atmosphere where the *fire code official* determines, on review of an ~~engineering~~ analysis prepared in accordance with Section 104.7.2, that a ~~fire, health or environmental~~ hazard would not result from atmospheric discharge of ammonia.
2. Through an *approved* treatment system in accordance with Section 605.12.5.
3. Through a flaring system in accordance with Section 605.12.6.
4. Through an *approved* ammonia diffusion system in accordance with Section 605.12.7.
5. By other *approved* means.

Exception: Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.

Reason:

Although an engineer may perform release modeling and analysis associated with 605.12.4 Item 1, that's not always the case. Individuals with expertise in dispersion modeling may or may not be engineers. Inclusion of the word "engineering" in this provision suggests that an engineer is necessary to perform the analysis, which seems to preclude selection of a qualified individual as specified in Section 104.7.2 and to supersede state engineering practice acts, which may or may not require an engineer for this work.

Elimination of the fire and environmental analysis is based on experience with this section indicating that neither will result from an emergency relief vent installed and located in accordance with code requirements. Ammonia's lower flammability limit is in the range of 160,000 ppm (16% in air), and it becomes too rich to burn in the range of 250,000 ppm (25% in air). Achieving a stable mix of these concentrations in open air from a vent release isn't reasonably possible, and the difficulty of ammonia ignition in an outdoor environment is recognized by UN/DOT, which does not classify ammonia as flammable for shipping purposes. I'm only aware of rare cases of outdoor ignitions when large liquid spills have occurred outside, and this section is specifically scoped to vapor-only releases. With respect to the environmental analysis, ammonia is a natural refrigerant consisting of nitrogen and hydrogen, which are readily dissipated into the atmosphere upon release. While the release may be noxious, ammonia vapor released into open air will not cause an environmental risk.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposed change will provide additional options with respect to selecting a suitable design professional and will eliminate the need to perform some aspects of release analysis where the results are known before the analysis is performed.

F83-18 Part I

IFC: 605.17.1; IMC: [F] 1106.5.1)

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IMC COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

Revise as follows:

605.17.1 Refrigerant detection system. Ventilation system activation. ~~The machinery room Ventilation shall be provided with a refrigerant detection system. The refrigerant detection system activated by the refrigerant detection system in the machinery room.~~ Refrigerant detection shall be in accordance with Section 605.8 and all of the following:

1. The detectors shall activate at or below a refrigerant concentration of 25 percent of the LFL.
2. Upon activation, the detection system shall activate the emergency ventilation system in Section 605.17.3.
3. The detection, signaling and control circuits shall be supervised.

2018 International Mechanical Code

Revise as follows:

[F] 1106.5.1 Refrigerant detection system. Ventilation system activation. ~~The machinery room Ventilation shall be provided with a refrigerant detection system. The refrigerant detection system activated by the refrigerant detection system in the machinery room.~~ Refrigerant detection shall be in accordance with Section 605.8 of the International Fire Code and all of the following:

1. The detectors shall activate at or below a refrigerant concentration of 25% of the LFL.
2. Upon activation, the detection system shall activate the emergency ventilation system required by Section 1106.5.2.
3. The detection, signaling and control circuits shall be supervised.

Internal ID: 2024

F83-18 Part II

IMC: 1106.4, 1106.5; IFC: [M]605.17

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Mechanical Code

Revise as follows:

1106.4 Flammable refrigerants. Where refrigerants of Groups A2, A3, B2 and B3 are used, the *machinery room* shall conform to the Class 1, Division 2, *hazardous location* classification requirements of NFPA 70.

Exceptions:

1. Ammonia *machinery rooms* that are provided with *ventilation* in accordance with Section 1106.3.
2. *Machinery rooms* for systems containing Group A2L *refrigerants* that are provided with ventilation in accordance with Section 1106.5.

1106.5 Special requirements for Group A2L refrigerant machinery rooms. Machinery rooms ~~for with~~ systems containing Group A2L refrigerants ~~shall comply with Sections 1106.5.1 through 1106.5.3.~~ **Exception:** ~~Machinery rooms conforming to the Class 1 that do not conform with the Class I, Division 2, hazardous location classification electrical requirements of NFPA 70 are not required to, as permitted by Section 1106.4 Exception 2, shall comply with Sections 1106.5.1 and 1106.5.2 through 1106.5.3.~~

2018 International Fire Code

Revise as follows:

[M] 605.17 Special requirements for Group A2L refrigerant machinery rooms. Machinery rooms with systems containing Group A2L refrigerants ~~shall comply with Sections 605.17.1 through 605.17.3.~~ **Exception:** ~~Machinery rooms conforming to the Class 1 that do not conform with the Class I, Division 2 hazardous location classification electrical requirements of NFPA 70, as permitted by Section 605.16 Exception 2, shall comply with Sections 605.17.1 through 605.17.3.~~

Reason:

Editorial clarification. The current exception format of IFC Section 605.17 gives this section the appearance of being a circular requirement with Section 605.16 (IMC section are similarly structured). No technical change is intended by this proposal. The revision to Section 605.17.1 is for correlation with Section 605.16 Exception 2, which references Section 605.17 as a "ventilation" requirement only. Leak detection is already required, and the purpose of 605.17.1 is to specify activation of ventilation by the detection system, not to create another requirement to have a detection system. IMC changes are proposed to make the sections consistent. For disclosure, I represent IAR, which has an interest in the refrigeration industry, but this proposal is not being submitted on IAR's behalf. I am submitting the proposal based on my personal interest and expertise in the refrigeration industry and my interest in clarity of refrigeration related requirements as a consultant to the ASHRAE 15 Committee.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Editorial clarification.

F84-18

IFC: 606.1 (New), 606.2, 606.3, 606.3.1, 606.3.2, 606.3.3, 606.3.4, 606.4, 606.5 (New), 606.5.1, 606.5.2, 606.5.3, 606.6 (New), 606.6.1, 606.6.2, 606.6.2.1, 606.6.2.2, 606.6.2.3, 606.6.2.4

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

606.1 General. Elevators and conveying systems required by this code or the International Building Code shall comply with Chapter 30 of the International Building Code and Sections 606.2 through 606.6

Revise as follows:

~~606.1~~**606.2 Emergency operation.** Existing elevators with a travel distance of 25 feet (7620 mm) or more shall comply with the requirements in Chapter 11 ~~of this code.~~ New elevators shall be provided with Phase I emergency recall operation and Phase II emergency in-car operation in accordance with ASME A17.1/CSA B44.

~~606.2~~**606.3 Standby power.** In buildings and structures where standby power is required or furnished to operate an elevator, standby power shall be provided in accordance with Section 1203 ~~of this code.~~ Operation of the system shall be in accordance with Sections ~~606.2.1~~**606.3.1** through ~~606.2.4~~ **606.3.4**.

~~606.2.1~~**606.3.1 Manual transfer.** Standby power shall be manually transferable to all elevators in each bank.

~~606.2.2~~**606.3.2 One elevator.** Where only one elevator is installed, the elevator shall automatically transfer to standby power within 60 seconds after failure of normal power.

~~606.2.3~~**606.3.3 Two or more elevators.** Where two or more elevators are controlled by a common operating system, all elevators shall automatically transfer to standby power within 60 seconds after failure of normal power where the standby power source is of sufficient capacity to operate all elevators at the same time. Where the standby power source is not of sufficient capacity to operate all elevators at the same time, all elevators shall transfer to standby power in sequence, return to the designated landing and disconnect from the standby power source. After all elevators have been returned to the designated level, not less than one elevator shall remain operable from the standby power source.

~~606.2.4~~**606.3.4 Machine room ventilation.** Where standby power is connected to elevators, the machine room ventilation or air conditioning shall be connected to the standby power source.

[BE] 606.3~~606.4~~ **Emergency signs.** An *approved* pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the exit stairways and not to use the elevators in case of fire. The sign shall read: IN FIRE EMERGENCY, DO NOT USE ELEVATOR. USE EXIT STAIRS.

Exceptions:

1. The emergency sign shall not be required for elevators that are part of an accessible *means of egress* complying with Section 1009.4.
2. The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008 of the International Building Code.

Add new text as follows:

606.5 Maintenance of elevators. Elevator features and lobbies required by Section 3006 of the International Building Code shall be maintained and in accordance with Sections 606.5.1 thru 606.5.3

Revise as follows:

~~606.4~~**606.5.1 Fire service access elevator elevators and lobbies.** Where fire service access elevators are required by Section 3007 of the International Building Code, the fire service access elevator fire protection and safety features required by Section 3007 of the International Building Code shall be maintained and lobbies shall be maintained free of storage and furniture.

~~606.5~~**606.5.2 Occupant evacuation elevator elevators and lobbies.** Where occupant evacuation elevators

are provided in accordance with Section 3008 of the International Building Code, the occupant evacuation elevator fire protection and safety features and lobbies required by Section 3008 of the International Building Code shall be maintained and maintained free of storage and furniture.

~~606.6~~606.5.3 Water protection of hoistway enclosures. Methods to prevent water from infiltrating into a hoistway enclosure required by Section 3007.3 and Section 3008.3 of the International Building Code shall be maintained.

Add new text as follows:

606.6 Elevator keys. All elevators shall be provided with elevator car door and fire-fighter service keys in accordance with Sections 606.6.1 thru 606.6.2.4

Revise as follows:

~~606.7~~606.6.1 Elevator key location. Keys for the elevator car doors and fire-fighter service keys shall be kept in an *approved* location for immediate use by the fire department.

~~606.8~~606.6.2 Standardized fire service elevator keys. Buildings with elevators equipped with Phase I emergency recall, Phase II emergency in-car operation, or a fire service access elevator shall be equipped to operate with a standardized fire service elevator key approved by the *fire code official*.

Exception: The owner shall be permitted to place the building's nonstandardized fire service elevator keys in a key box installed in accordance with Section 506.1.2.

~~606.8.1~~606.6.2.1 Requirements for standardized fire service elevator keys. Standardized fire service elevator keys shall comply with all of the following:

1. All fire service elevator keys within the jurisdiction shall be uniform and specific for the jurisdiction. Keys shall be cut to a uniform key code.
2. Fire service elevator keys shall be of a patent-protected design to prevent unauthorized duplication.
3. Fire service elevator keys shall be factory restricted by the manufacturer to prevent the unauthorized distribution of key blanks. Uncut key blanks shall not be permitted to leave the factory.
4. Fire service elevator keys subject to these rules shall be engraved with the words "~~DO NOT~~ DO NOT DUPLICATE."

~~606.8.2~~606.6.2.2 Access to standardized fire service keys. Access to standardized fire service elevator keys shall be restricted to the following:

1. Elevator owners or their authorized agents.
2. Elevator contractors.
3. Elevator inspectors of the jurisdiction.
4. *Fire code officials* of the jurisdiction.
5. The fire department and other emergency response agencies designated by the *fire code official*.

~~606.8.3~~606.6.2.3 Duplication or distribution of keys. A person shall not duplicate a standardized fire service elevator key or issue, give, or sell a duplicated key unless in accordance with this code.

~~606.8.4~~606.6.2.4 Responsibility to provide keys. The building owner shall provide up to three standardized fire service elevator keys where required by the *fire code official*, upon installation of a standardized fire service key switch or switches in the building.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The new scoping section for elevators correlates Section 606 with Chapter 30 of the International Building Code.

Clarity is provided regarding the maintenance of not only the elevator lobbies, but also the fire protection and safety features of the elevator. Clarity is also provided in grouping together the sections for maintenance of elevators and lobbies (the new Section 606.5) and the sections for elevator keys (the new Section 606.6)

It is the intention of F-CAC that this proposal correlate with the B-CAC Proposal being heard by the IBC-E Technical Committee to match the elevator signage requirements for standard and occupant evacuation elevators in both IBC Chapter 30 and IFC Chapter 6.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies already existing requirements.

2018 International Fire Code

Add new text as follows:

606.6 Storage within elevator lobbies. Where hoistway opening protection is required by Section 3006.2 of the International Building code, elevator lobbies shall be maintained free of storage.

Reason:

There are existing provisions to prohibit storage of furniture and combustibles in fire service and occupant evacuation elevators. This proposal addresses combustible storage in other elevator lobbies requiring hoistway protection.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies that storage is not permitted in any protected hoistway and does not have an impact on construction costs.

Internal ID: 979

F86-18

IFC: 606.8, 606.8.1

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org)

2018 International Fire Code

Revise as follows:

606.8 Standardized fire service elevator keys. Buildings with elevators equipped with Phase I emergency recall, Phase II emergency in-car operation, or a fire service access elevator shall be equipped to operate with a standardized fire service elevator key approved by the *fire code official* or a standardized key in accordance with ASME A17.1/CSA B44.

Exception: The owner shall be permitted to place the building's nonstandardized fire service elevator keys in a key box installed in accordance with Section 506.1.2.

606.8.1 Requirements for standardized fire service elevator keys. Standardized fire service elevator keys shall comply with all of the following:

1. All fire service elevator keys within the jurisdiction shall be uniform and ~~specific for the jurisdiction.~~ approved in accordance with Section 606.8. Keys shall be cut to a uniform key code.
2. Fire service elevator keys shall be of a patent-protected design to prevent unauthorized duplication.
3. Fire service elevator keys shall be factory restricted by the manufacturer to prevent the unauthorized distribution of key blanks. Uncut key blanks shall not be permitted to leave the factory.
4. Fire service elevator keys subject to these rules shall be engraved with the words "DO NOT DUPLICATE."

Reason:

To eliminate a potential conflict with ASME A17.1/CSA B44 and all jurisdictions more flexibility in selection of a standardized keys.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change will not impact cost since it allows more options and eliminates a potential conflict.

Internal ID: 1443

F87-18

IFC: 606.8.5 (New), 315.3.3

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

606.8.5 Storage. Furniture, materials or combustible waste shall not be stored in elevator cars or elevator machine rooms.

Exception: Blankets used for protection of elevator cab walls during construction or renovation.

Revise as follows:

315.3.3 Equipment rooms. Combustible material shall not be stored in boiler rooms, mechanical rooms, elevator machine rooms, electrical equipment rooms or in *fire command centers* as specified in Section 508.1.5.

Reason:

This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

These changes will clarify that elevator cars and machine rooms are not to be used for storage. An exception is provided for blankets that are used for protecting the elevator cab walls.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These areas are currently not permitted to be used for storage purposes.

Internal ID: 408

F88-18

IFC: 701.6

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Fire Code

Revise as follows:

701.6 Owner's responsibility. The owner shall maintain an inventory of all required *fire-resistance-rated* construction, construction installed to resist the passage of smoke and the construction included in Sections 703 through 707 and Sections 602.4.1 and 602.4.2 of the International Building Code. Such construction shall be visually inspected by the *owner* annually and properly repaired, restored or replaced where damaged, altered, breached or penetrated. Records of inspections and repairs shall be maintained. Where concealed, such elements shall not be required to be visually inspected by the *owner* unless the concealed space is accessible by the removal or movement of a panel, access door, ceiling tile or similar movable entry to the space.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The Ad Hoc Committee has discussed a number of proposals to potentially increase the permitted height and area for Type IV structures, specifically mass timber buildings. One of the basic requirements incorporated into these proposed increased heights and areas is the added active and passive protection features to these structures.

Specific to this code change proposal, in the related code change proposals for Type IV-A and Type IV-B, mass timber walls and ceilings, except where permitted, will be required to meet a fire-resistance performance with a specified amount provided with gypsum board or its equivalent.

The greater permitted heights and areas are being proposed based on the requirement of this added level of passive protection. It would seem obvious that we should incorporate a methodology to insure this passive protection remains in place.

This is not an undue burden to the building owner or management. Section 701.6 of the International Fire Code permits these inspections to be done by current building staff. Local jurisdictions may or may not require the annual inspection to be reported. The managing authority simply must keep a record of such inspections and take steps to correct any deficiencies identified.

Some have suggested that we do not require other types of construction to inspect the gypsum board annually to insure it has not been compromised. Other forms of construction do not contribute to the fuel load in the manner mass timber construction potentially will do. If we are going to permit mass timber construction to greater heights than previously permitted it means we are relying on the performance of active and passive protection to protect the occupants of the building in the event of a fire. We currently require the active protection to be inspected for performance it is time we require the same for the passive.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Internal ID: 962

F89-18

IFC: 703.2 (New), 704.2 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

703.2 Repair of Penetrations. Where damaged, materials used to protect membrane- and through-penetrations shall be replaced or restored with materials or systems that meet or exceed the code requirements applicable at the time when the assembly was constructed, remodeled or altered.

704.2 Repair of Joints and Voids. Where damaged, materials used to protect joints and voids shall be replaced or restored with materials or systems that meet or exceed the code requirements applicable at the time when the assembly was constructed, remodeled or altered.

Reason:

This proposal compliments the work of the Fire Code Action Committee during the 2015-2017 Code Development Cycle on expanding the maintenance requirements in Chapter 7 of the IFC.

While the current language in Section 703.1 of the IFC addresses maintenance of fire-resistance-rated construction, it is not very specific. Clearly, the intent of Section 703.1 is that when protection of penetrations and joints has been damaged, they need to be repaired, not simply "maintained" in a damaged condition. The language proposed here clarifies that requirement.

This proposal recognizes that penetrations and joints that were protected in accordance with previous code editions may not have used the types of tested systems that are mandated by today's building codes. Consequently, the wording proposed here continues the allowance to grandfather installed penetration and joint seals when they are damaged, but requires that they be repaired to meet the requirements that were applicable when the penetration or joint protection was installed.

Conversely, where the current IBC requirements differ from those in effect at the time of construction, the IEBC already provides a procedure for complying with current IBC requirements in Section 803.6.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The assumption of the current code is when damaged, the materials or systems used to protect penetrations and joints will be replaced or restored. This proposal simply clarifies the requirements for replacing or restoring the materials or systems.

Internal ID: 317

F90-18

IFC: 704.1

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2018 International Fire Code

Revise as follows:

704.1 Maintaining protection. Where required when the building was originally constructed, materials and systems used to protect joints and voids in the following locations shall be maintained. The materials and systems shall be securely attached to or bonded to the adjacent construction, without openings visible through the construction.

1. Joints in or between *fire-resistance-rated* walls, floors or floor/ceiling assemblies and roof or roof/ceiling assemblies.
2. Joints in *smoke barriers*.
3. Voids at the intersection of a horizontal floor assembly and an exterior curtain wall.
4. Voids at the intersection of a horizontal smoke barrier and an exterior curtain wall.
5. Voids at the intersection of a nonfire-resistance-rated floor assembly and an exterior curtain wall.
6. Voids at the intersection of a vertical *fire barrier* and an exterior curtain wall.
7. Voids at the intersection of a vertical *fire barrier* and a nonfire-resistance-rated roof assembly.

Unprotected joints and voids do not need to be protected where such joints and voids were not required to be protected when the building was originally constructed. Where the system design number is known, the system shall be inspected to the listing criteria and manufacturer's installation instructions.

Reason:

During the 2018 Code Development Cycle this language was added to the through penetration firestop section but not the section covering fire resistant joint systems. This was apparently was an oversight on our part as the proponent and was not identified during the hearing process. For the same reasons that it is appropriate for through penetration firestop systems, it is appropriate for joint systems. The listing information, where available, allows one to identify the maintenance requirements provided by the manufacturer. Therefore, we've added this to bring consistency to the code sections so that all firestopping, penetrations and joints, have the same requirements.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The fire-resistive joints are to be maintained anyway. Therefore, this should not increase nor decrease the cost of construction.

Internal ID: 2266

F91-18

IFC: SECTION 708 (New), 708.1 (New)

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (billmchugh-jr@att.net)

2018 International Fire Code

Add new text as follows:

SECTION 708 SPRAY FIRE-RESISTIVE MATERIALS AND INTUMESCENT FIRE-RESISTIVE COATINGS

708.1 Maintaining Protection. The fire-resistance ratings of building elements, components or assemblies shall be maintained. The materials shall be securely bonded, not exhibit cracks, voids, spalls, delamination or any exposure to the substrate and be in accordance with the permitted fireproofing thicknesses. The materials shall be maintained in accordance with the listing and manufacturers instructions, where known.

Reason:

We compliment the work of the Fire Code Action Committee and its successful F-113 proposal that resulted in new sections for maintaining assemblies in the IFC Chapter 7, Fire and Smoke Protection Features. There were several needed sections added to the International Fire Code through the F-113 Proposal. However, there was no section submitted at the time by the industry for sprayed fire-resistive materials (SFRM) or intumescent fire-resistive materials (IFRM) Fireproofing. This proposal adds the section to add a section on maintaining protection of building elements, structural members or assemblies receiving SFRM and IFRM Fireproofing.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code proposal does not increase the cost of construction because all Fire and Smoke Protection Features are supposed to be maintained currently.

F92-18 Part I

IFC: Chapter 8, SECTION 801, 801.1, 808 (New), 808.1 (New), 808.2 (New), 808.3 (New), 808.4 (New), 808.5 (New)

Proponent: Ali Fattah, City of San Diego, representing Self

2018 International Fire Code

CHAPTER 8 INTERIOR FINISH, DECORATIVE MATERIALS AND FURNISHINGS

SECTION 801 GENERAL

801.1 Scope. The provisions of this chapter shall govern interior finish, interior trim, furniture, furnishings, decorative materials and decorative vegetation ~~in~~ on the interior and exterior of buildings. Existing buildings shall comply with Sections 803 through 808. New buildings shall comply with Sections 804 through ~~808~~809, and Section 803 of the International Building Code.

808 OUTDOOR ARTIFICIAL DECORATIVE VEGETATION

808.1 General. Artificial decorative vegetation placed outdoors, within 30 feet (9140 mm) of a building, or on an occupied roof of a building shall comply with this section.

808.2 Testing. Artificial decorative vegetation shall meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701. Meeting such criteria shall be documented and certified by the manufacturer in an approved manner. Alternatively, the artificial decorative vegetation shall be tested in accordance with NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

808.3 Electrical fixtures and wiring. The use of unlisted electrical wiring and lighting on artificial decorative

vegetation shall be prohibited. The use of electrical wiring and lighting on artificial trees constructed entirely of metal shall be prohibited

808.4 Candles and open flames. Candles and open flames shall not be used on or within 5 feet of artificial decorative vegetation.

808.5 Maintenance. Artificial decorative vegetation shall be tested to demonstrate that the flame propagation performance criterion or the heat release criterion from Section 808.2, as appropriate, remains effective for the period for which the artificial decorative vegetation remains in service, as approved by the fire code official. Materials tested to Chapter 16 of NFPA 701 that retain the flame propagation performance shall be deemed acceptable.

Internal ID: 927

F92-18 Part II

IBC: Chapter 8, SECTION 801, 801.1, 802.3, 807 (New), 807.1 (New), 807.2 (New), 807.3 (New), 807.4 (New)

Proponent: Ali Fattah, City of San Diego, representing Self

2018 International Building Code

CHAPTER 8 INTERIOR FINISHES AND DECORATIVE MATERIALS

SECTION 801 SCOPE

801.1 Scope. The provisions of this chapter shall govern the use of materials used as *interior finishes, trim* and *decorative materials*.

[F] 802.3 Decorative materials and trim. *Decorative materials* and *trim* shall be restricted by combustibility, fire performance or flame propagation performance criteria in accordance with Section 806 for the interior of the building and Section 807 for the exterior of the building.

807 ARTIFICIAL DECORATIVE VEGETATION ON BUILDINGS AND IN OUTDOOR OCCUPANCIES

807.1 General. Fixed artificial decorative vegetation placed in outdoor occupancies or on an occupied roof of a building shall comply with this section.

807.2 Testing. Artificial decorative vegetation shall meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701. Meeting such criteria shall be documented and certified by the manufacturer in an approved manner. Alternatively, the artificial decorative vegetation shall be tested in accordance with NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

807.3 Electrical fixtures and wiring. The use of unlisted electrical wiring and lighting on artificial decorative vegetation shall be prohibited. The use of electrical wiring and lighting on artificial trees constructed entirely of metal shall be prohibited.

807.4 Ignition sources and maintenance. Ignition sources and maintenance of outdoor artificial vegetation shall be in accordance with Section 808.4 and 808.5 of the IFC.

Reason:

The proposed code change is in response to the increased use of decorative artificial vegetation on occupied roofs, within interior courts in buildings and outdoor occupancies such as Group A-5 stadiums. In the event that plastics in the decorative combustible vegetation ignites it can spread fire to surrounding buildings and this potential was very visible when artificial palm trees on the pool deck at the Las Vegas Cosmopolitan Hotel ignited in July of 2015. The IBC and IFC presently only specifically regulate decorative artificial vegetation in buildings through the requirements in Section 807.4 that was added in the last code cycle. The hazards are just as important in outdoor occupancies as they are in indoor occupancies.

Occupied roofs typically are classified as Group A-2 or A-3 occupancies and outdoor stadiums are classified as Group A-5 both of which accommodate large numbers of people. Additionally, when placed in close proximity to a building they can spread fire to a building if ignited.

Outdoor use poses weathering problems due to moisture, UV exposure or cleaning chemicals necessary to freshen up the vegetation. As a result, testing is required after weathering conditioning per the requirements of Chapter 16 in NFPA 701. Since there are no specific standards and tests done for this specific type of outdoor plastic compliance with the weathering accelerated weathering testing per ASTM D4329 and ASTM D4587 where fire retardant coating is used is not being required to allow the fire code official flexibility.

Cost Impact

The code change proposal will increase the cost of construction .

Artificial decorative vegetation protected with fire retardants need to be tested for outdoor weathering. This testing which is seen as necessary will increase the cost of these materials.

Internal ID: 2319

F93-18

IFC: 806.1.4 (New), Chapter 80

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Add new text as follows:

806.1.4 Fire retardant treatments for natural cut trees. Fire retardant treatments applied to natural cut trees shall be tested by an approved agency and shall comply with one of the following:

1. Both Test Method 1 and Test Method 2 of ASTM E3082.
2. Exhibit a maximum rate of heat release not exceeding 100 kW when applied in accordance with the manufacturer's recommendations and tested in accordance with section 5.5 of NFPA 289.

Add new standard(s) follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-
2959
US

E3082-17:

Standard Test Methods for Determining the Effectiveness of Fire Retardant Treatments for Natural Christmas Trees

Reason:

It has been found that many treatments are offered for sale that are said to improve the fire performance of natural Christmas trees. The Natural Christmas Tree Association has been very worried for some time about the efficacy of some of these products. It has been found that the use of poorly formulated and untested fire retardant treatments can accelerate the drying out of the Christmas tree and actually worsen the fire danger. The Natural Christmas Tree Association approached both ASTM (committee E05 on fire standards) and individual members off the NFPA Fire Tests committee to develop a test method for assessing whether the treatments offered for sale are actually doing as claimed by manufacturers. The state of California has a fire test that it uses to approve such treatments, based on a small scale fire test, but other states do not.

As a result of these concerns, ASTM has now developed and published ASTM E3082 for that purpose. It contains both a small scale test (Test Method 1) and a full scale test (Test Method 2). In order to comply with the requirements of ASTM E3082 a treatment must comply with both tests, and then it will be said to have "passed" the test. Test Method 1 is similar to the test used by the state of California for its requirements. Test Method 2 is a full scale heat release test largely based on UL Outline of Investigation 2358, "Fire Tests of Pre-Lit Artificial Seasonal Use Trees and Other Seasonal Decorative Items".

NFPA has developed a procedure within NFPA 289 (a heat release test for full scale individual fuel items) to also test Christmas tree treatments. The test in NFPA 289 (section 5.5) is similar (but not identical) to the full scale test in ASTM E3082 (Test Method 2) and does not have pass fail criteria. Therefore the pass fail criteria recommended are those used when testing to NFPA 289 in more than one section of the IFC (807.3, 807.4.1, 807.5.1.1, etc.), which are a heat release rate not exceeding 100 kW.

NFPA statistics show that, between 2011 and 2015, U.S. fire departments responded to an estimated 200 structure fires, per year, caused by Christmas trees resulting in an annual average of 6 deaths, 16 injuries and \$14.8 million in property damage. When comparing Christmas tree fires to other reported home fires, 1 out of every 32 home fires that began with a Christmas tree resulted in a death compared to 1 death out of every 143 reported home fires.

The use of an appropriate fire retardant treatment is a passive means or protection, which adds fire safety to the active means in 806.1.1 and 806.1.3.

Cost Impact

The code change proposal will increase the cost of construction .

This will provide added fire safety but it will require manufacturers of fire retardant treatments to conduct some fire testing to demonstrate the effectiveness of their products.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E3082-17 Standard Test Methods for Determining the Effectiveness of Fire Retardant Treatments for Natural Christmas Trees, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 912

F94-18

IFC: 808.4

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBENGINEER@aol.com)

2018 International Fire Code

Revise as follows:

808.4 Combustible lockers. Where lockers constructed of combustible materials are used, the lockers shall be considered to be interior finish and shall comply with Section 803.

Exception:

Lockers constructed entirely of wood and noncombustible materials shall be permitted to be used wherever interior finish materials are required to meet a Class C classification in accordance with Section 803.1.2.

Reason:

The current section is poorly worded. What is attempting to be required is for combustible lockers to comply with the interior finish requirements of Table 803.3. The proposed change clearly states the requirement.

The exception is not an exception to the requirements, it is simply an additional requirement. The exception would become the second sentence in the section stating the allowance of wood lockers without the need to be subjected to an ASTM E84 test.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change will clarify the requirements in the code.

Internal ID: 1503

F95-18

IFC: 808.4

Proponent: Misty Guard, representing Bradley Corporation (Misty.Guard@bradleycorp.com)

2018 International Fire Code

Revise as follows:

808.4 Combustible lockers. Where lockers constructed of combustible materials are used, the lockers shall be considered to be interior finish and shall comply with ~~Section 803~~Table 803.3.

Exception: Lockers constructed entirely of wood and noncombustible materials shall be permitted to be used wherever interior finish materials are required to meet a Class C classification in accordance with Section 803.1.2.

Reason:

The current requirement references all of Section 803, whereas the intent is to apply Table 803.3 for interior finish. Combustible lockers are made of different materials, including wood, ABS, and HDPE. If the material meets the interior finish requirements of Table 803.3 then they should be permitted.

The current Section 803 would appear to apply different requirements for wood, ABS, and HDPE lockers. The exception to allow any wood to be classified as Class C is acceptable. There is an implication that HDPE would be regulated differently than ABS. Section 803.9 could be incorrectly interpreted as applying to HDPE lockers. However, this section was never intended to apply to lockers. The original change adding this section addressed large areas of HDPE panels as an interior finish. No mention was made in the code change of lockers.

HDPE lockers have been installed for the last 25 years, as have ABS lockers. Many fire stations, schools, and health club like the added benefits of HDPE and ABS lockers. From a cleanliness and sanitation standpoints, HDPE and ABS lockers are superior to many metal lockers.

A study was completed by NFPA Research entitled, "Non-Residential Structure Fires That Originated in Lavatories, Locker Rooms or Coat Check Rooms," dated November 2017, authored by Marty Ahrens. The report shows no fire issue with HDPE or ABS lockers. There are no fire deaths reported from fires originating in a locker room. Hence, the perceived fire hazard does not exist with lockers in commercial building that meet the interior finish requirements of Table 803.3. This change is needed for clarification.

Bibliography:

Ahrens, M. (2017). Non-Residential Structure Fires that Originated in Lavatories, Locker Rooms or Coat Check Rooms. Quincy, MA: NFPA Research.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction.

2018 International Fire Code

Add new text as follows:

808.5 Children's play structures added to existing buildings. Where children's play structures that exceed 10 feet (3048 mm) in height or 150 square feet (14 m²) in area are added inside an existing building they shall comply with Section 424 of the International Building Code.

Reason:

This is simply a pointer from the IFC to the IBC for children's play structures incorporated into existing occupancies. The fire testing that led to its inclusion into the IBC showed that these children's playground structures or play structures can release very large amounts of heat when they burn and need to be regulated.

The IBC (in Section 424) already regulates these structures for new buildings. However, the IBC deals with play structures at the time of construction of the entire building but play structures are often added, into malls or restaurants, after the certificate of occupancy has been granted. This proposal simply sends a pointer. Moreover as play structures age they are often removed and replaced and the IBC would normally not apply. Similarly, the IEBC would also not apply.

This section is both within the scope of the IFC and of its chapter 8, as follows:

IFC: 101.2 Scope. This code establishes regulations affecting or relating to structures, processes, premises and safeguards regarding all of the following:

1. The hazard of fire and explosion arising from the storage, handling or use of structures, materials or devices.
2. Conditions hazardous to life, property or public welfare in the occupancy of structures or premises.
3. Fire hazards in the structure or on the premises from occupancy or operation.
4. Matters related to the construction, extension, repair, alteration or removal of fire suppression or alarm systems.
5. Conditions affecting the safety of fire fighters and emergency responders during emergency operations.

IFC Chapter 8:

About this chapter: Chapter 8 provides requirements for interior finishes, decorative materials and furnishings in new and existing buildings so that they do not significantly add to or create fire hazards in buildings. The provisions tend to focus on occupancies with specific risk characteristics, such as vulnerability of occupants, density of occupants, lack of familiarity with the building and societal expectations of importance. This chapter is consistent with Chapter 8 of the International Building Code, which regulates the interior finishes and decorative materials of new buildings.

Cost Impact

The code change proposal will increase the cost of construction .

This code proposal has the potential effect of applying to children's play structures installed (or renewed) after the building has been occupied. They are potentially excluded from complying with the requirements now.

IFC: 202, 901.1, 901.2, 901.2.1, 901.4, 901.4.1, 901.4.2, 901.4.3 (New) (IBC: 202, [F] 901.1, [F] 901.2, [F] 901.2.1, [F] 901.4, 901.4.1, 901.4.2, 901.4.3 (New))

Proponent: Dave Frable, U.S General Services Administration, representing U.S. General Services Administration (dave.frable@gsa.gov)

2018 International Fire Code

SECTION 901 GENERAL

Revise as follows:

901.1 Scope. The provisions of this chapter shall specify where fire protection and life safety systems are required and shall apply to the design, installation, inspection, operation, testing and maintenance of all *fire protection and life safety systems*.

901.2 Construction documents. The *fire code official* shall have the authority to require *construction documents* and calculations for all *fire protection and life safety systems* and to require permits be issued for the installation, rehabilitation or modification of any *fire protection and life safety system*. *Construction documents for fire protection and life safety systems* shall be submitted for review and approval prior to system installation.

901.2.1 Statement of compliance. Before requesting final approval of the installation, where required by the *fire code official*, the installing contractor shall furnish a written statement to the *fire code official* that the subject *fire protection and life safety system* has been installed in accordance with *approved* plans and has been tested in accordance with the manufacturer's specifications and the appropriate installation standard. Any deviations from the design standards shall be noted and copies of the approvals for such deviations shall be attached to the written statement.

901.3 Permits. Permits shall be required as set forth in Sections 105.6 and 105.7.

Delete and substitute as follows:

~~**901.4 Installation.** *Fire protection systems* shall be maintained in accordance with the original installation standards for that system. Required systems shall be extended, altered or augmented as necessary to maintain and continue protection where the building is altered, remodeled or added to. *Alterations to fire protection systems* shall be done in accordance with applicable standards.~~

901.4 Fire Protection and Life Safety Systems. *Fire protection and life safety systems shall be installed, repaired, operated, and maintained in accordance with this code and the International Building Code.*

Revise as follows:

901.4.1 Required fire protection and life safety systems. *Fire protection and life safety systems required by this code or the International Building Code shall be installed, repaired, operated, tested and maintained in accordance with this code. A fire protection system or life safety system for which a design option, exception or reduction to the provisions of this code or the International Building Code has been granted shall be considered to be a required system.*

901.4.2 Nonrequired fire protection and life safety systems. ~~A *fire protection system*~~ *Fire protection and life safety systems* or portion thereof not required by this code or the International Building Code shall be allowed to be furnished for partial or complete protection provided that such installed system meets the applicable requirements of this code and the International Building Code.

Add new text as follows:

901.4.3 Alterations in Buildings and Structures. For any alteration within a building or structure, the fire protection and life safety systems shall be extended, altered, or augmented to maintain and continue protection within the building or structure. Persons shall not remove or modify any fire protection or life safety system installed or maintained under the provisions of this code or the International Building Code without approval by the fire code official.

Reason:

The intent of this proposal is to address the need to acknowledge “life safety systems” (see Title of Chapter) with a defined term and to reference life safety systems when referencing “fire protection systems”. The subject term is used in the title of IFC Chapter 9, Fire Protection and Life Safety Systems and throughout Chapter 9 but is not defined. The term “fire protection system” is defined; however, “life safety system” is not. In addition, a new Section 901.4.3, Alterations in Buildings and Structures has also been proposed to address alterations in buildings and structures that is currently located within existing Section 901.4, Installation, which we believe is an incorrect location for this subject matter, therefore a new Section was created.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The revisions to this section should not increase or decrease the cost of construction as it is simply to align the text with the title of the chapter and place provisions related to alterations independent of installations.

Internal ID: 1866

F98-18

IFC: 901.1, 901.5, 901.6

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

901.1 Scope. The provisions of this chapter shall specify where fire protection and life safety systems and equipment are required and shall apply to the design, installation, inspection, operation, testing and maintenance of all ~~fire protection systems~~ such systems and equipment.

901.5 Installation acceptance testing. Fire detection and alarm systems, emergency alarm systems, gas detection systems, fire-extinguishing systems, fire hydrant systems, ~~fire~~ standpipe systems, fire pump systems, private fire service mains ~~and all other~~, mechanical smoke exhaust systems, smoke and heat vents, and other fire protection systems and appurtenances thereto shall be subject to acceptance tests as contained in the installation standards and as *approved* by the *fire code official*. The *fire code official* shall be notified before any required acceptance testing.

901.6 Inspection, testing and maintenance. Fire detection and alarm systems, emergency alarm systems, gas detection systems, fire-extinguishing systems, fire hydrant systems, standpipe systems, fire pump systems, private fire service mains, mechanical smoke exhaust systems ~~and~~, smoke and heat vents, and other fire protection systems and appurtenances thereto shall be maintained in an operative condition at all times, and shall be replaced or repaired where defective. Nonrequired *fire protection systems* and equipment shall be inspected, tested and maintained or removed.

Reason:

Cleanup to correlate with systems and equipment covered in Chapter 9 that have been omitted from scoping and ITM sections. And, for 901.6, to 901.5 correlate the text with Section 901.5 and vice versa. These sections should have the same scoping.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Not anticipated as changing how the code is applied.

Internal ID: 2209

F99-18

IFC: 901.2.1

Proponent: Lynn Nielson, representing Self

2018 International Fire Code

901.2 Construction documents. The *fire code official* shall have the authority to require *construction documents* and calculations for all *fire protection systems* and to require permits be issued for the installation, rehabilitation or modification of any *fire protection system*. *Construction documents for fire protection systems* shall be submitted for review and approval prior to system installation.

Add new text as follows:

901.2.1 Fire protection system plans and calculations. Jurisdictions that review construction documents and perform inspections for fire protection systems shall use qualified personnel, approved agencies or individuals as determined by the fire code official.

Revise as follows:

~~901.2.1~~**901.2.2 Statement of compliance.** Before requesting final approval of the installation, where required by the *fire code official*, the installing contractor shall furnish a written statement to the *fire code official* that the subject *fire protection system* has been installed in accordance with *approved* plans and has been tested in accordance with the manufacturer's specifications and the appropriate installation standard. Any deviations from the design standards shall be noted and copies of the approvals for such deviations shall be attached to the written statement.

Reason:

The review and inspection of fire protection systems is essential to ensure these life safety and property protection systems achieve their desired objectives. Requiring staff (or those designated) to be qualified to perform these reviews and inspections helps achieve this goal. ICC is one example of an agency that provides certification for plans examiners and inspectors that allows them to demonstrate professionalism, knowledge and skill with fire protection systems.

At the Fire Service Membership Council's (FSMC) request, in 2014 ICC developed five certification examinations to assess code officials' professional competence in fire alarm and sprinkler system plan review and inspection.

The FSMC is working on co-branding the program with the Society of Fire Protection Engineers, American Fire Sprinkler Association, National Fire Sprinkler Association and Automatic Fire Alarm Association and the National Institute for Certification in Engineering Technologies (NICET), as stated in the FSMC Annual Report 2016-17.

Cost Impact

The code change proposal will increase the cost of construction .

Additional cost of construction could be incurred if the jurisdiction passes on the cost of education, training and certification or if the jurisdiction identifies more construction document and installation deficiencies as a result of using qualified personnel.

Internal ID: 2303

F100-18

IFC: 901.4.4, 901.5, 901.5.1, 901.6, 901.8

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

901.4.4 Additional fire protection systems. In occupancies of a hazardous nature, where special hazards exist in addition to the normal hazards of the occupancy, or where the *fire code official* determines that access for fire apparatus is unduly difficult, the *fire code official* shall have the authority to require additional ~~safeguards~~. ~~Such safeguards include, but shall not be limited to, the following: automatic fire detection systems, fire alarm systems, automatic fire-extinguishing systems, standpipe systems, or portable or fixed extinguishers.~~ Fire protection equipment ~~safeguards and fire protection systems~~. Fire protection systems required under this section shall be installed in accordance with this code and the applicable referenced standards.

901.5 Installation acceptance testing. ~~Fire detection and alarm systems, emergency alarm systems, gas detection systems, fire-extinguishing systems, fire hydrant systems, fire standpipe systems, fire pump systems, private fire service mains and all other fire~~ *Fire protection systems* and appurtenances thereto shall be subject to acceptance tests as contained in the installation standards and as *approved* by the *fire code official*. The *fire code official* shall be notified before any required acceptance testing.

901.5.1 Occupancy. It shall be unlawful to occupy any portion of a building or structure until the required fire ~~detection, alarm and suppression~~ *protection systems* have been tested and *approved*.

901.6 Inspection, testing and maintenance. ~~Fire detection and alarm systems, emergency alarm systems, gas detection systems, fire-extinguishing systems, mechanical smoke exhaust systems and smoke and heat vents~~ *protection systems* shall be maintained in an operative condition at all times, and shall be replaced or repaired where defective. Nonrequired *fire protection systems* and equipment shall be inspected, tested and maintained or removed in accordance with Section 901.8.

901.8 Removal of or tampering with equipment. It shall be unlawful for any person to remove, tamper with or otherwise disturb any fire ~~hydrant, fire detection and alarm system, fire suppression system or other fire appliance~~ *protection system* required by this code except for the purposes of extinguishing fire, training, recharging or making necessary repairs or where *approved* by the *fire code official*.

Reason:

Section 901.1 through 901.4.3 uses "Fire Protection System" and the remainder of 901 uses a list of multiple systems, many times leaving out sprinkler systems and other types of systems.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Language clarifies and encompasses all systems that meet the definition. No cost involved.

Internal ID: 190

F101-18

IFC: 901.7

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

901.7 Systems out of service. Where a required *fire protection system* is out of service, the fire department and the *fire code official* shall be notified immediately and, where required by the *fire code official*, the building shall be either evacuated or an *approved* fire watch shall be provided for all occupants left unprotected by the shutdown until the *fire protection system* has been returned to service.

Where utilized, fire watches shall be provided with not less than one *approved* means for notification of the fire department and their only duty shall be to perform constant patrols of the protected premises and keep watch for fires.

Exception: Facilities with an approved notification and impairment management procedure complying with NFPA 25 or NFPA 72.

Reason:

The primary purpose of the proposed exception is to address the word “immediately.” In addition to periodic maintenance and testing, the extent of construction activity in existing Group I-2 buildings would result in the fire department and fire code official being constantly notified of fire protection systems being placed out of service and then needing to make a determination as to whether a fire watch or building evacuation are required. In many instances, the duration of the system being out of service is relatively short. For example, a dry pipe sprinkler system is impaired at the conclusion of every trip test for the time period necessary to reset the system.

NFPA 25 and NFPA 72 address these situations and allow either 10 hours in a 24 hour period (NFPA 25) or 4 hours in a 24 hour period (NFPA 72) of time before the building is required to be evacuated or a fire watch is implemented. Both documents still require the fire department, code official, and other parties (such as the insurance carrier) to be notified. The NFPA documents also address issues such as:

Designating an impairment coordinator (NFPA 25)

Responsibilities of the impairment coordinator (NFPA 25)

Tagging system (NFPA 25)

Restoring the system to service and the resultant notifications (Both NFPA 25 and NFPA 72)

Supervising station notification requirements (NFPA 72)

Risk mitigation (NFPA 25 and NFPA 72)

Record keeping (NFPA 25 and NFPA 72)

The list of responsibilities in Sections 901.7.4 and 901.7.6 are essentially the same as the lists in NFPA 25. As such, the primary impact of this change is to establish an acceptable time period prior to establishing the requirement for a fire watch or building evacuation. The established time period also results in uniformity and allows for proper planning when a preplanned impairment is anticipated. It also relieves the code official from being required to establish when a fire watch or building evacuation is required.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>.

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes;

reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an operational option with no construction requirements.

Internal ID: 601

F102-18

IFC: 903.2.4, 903.2.4.2 (New) , 903.2.7, 903.2.7.2 (New), 903.2.9, 903.2.9.3 (New) (IBC: [F] 903.2.4, [F]903.2.4.2 (New) , [F]903.2.7, [F]903.2.7.2 (New), [F]903.2.9, [F]903.2.9.3 (New))

Proponent: Michael O'Brian (FCAC@iccsafe.org); Andrew Klein, Self Storage Association (andrew@asklein.com)

2018 International Fire Code

903.1 General. *Automatic sprinkler systems* shall comply with this section.

903.2 Where required. *Approved automatic sprinkler systems* in new buildings and structures shall be provided in the locations described in Sections 903.2.1 through 903.2.12.

Exception: Spaces or areas in telecommunications buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided that those spaces or areas are equipped throughout with an automatic smoke detection system in accordance with Section 907.2 and are separated from the remainder of the building by not less than 1-hour *fire barriers* constructed in accordance with Section 707 of the International Building Code or not less than 2-hour *horizontal assemblies* constructed in accordance with Section 711 of the International Building Code, or both.

Revise as follows:

903.2.4 Group F-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group F-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group F-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. ~~A Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).~~

903.2.4.1 Woodworking operations. An *automatic sprinkler system* shall be provided throughout all Group F-1 occupancy *fire areas* that contain woodworking operations in excess of 2,500 square feet (232 m²) in area that generate finely divided combustible waste or use finely divided combustible materials.

Add new text as follows:

903.2.4.2 Group F-1 upholstered furniture or mattresses. An automatic sprinkler system shall be provided throughout a Group F-1 fire area used for the manufacture of upholstered furniture or mattresses that exceeds 2,500 square feet (232 m²).

Revise as follows:

903.2.7 Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group M *fire area* is located more than three stories above grade plane.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. ~~A Group M occupancy used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m²).~~

Add new text as follows:

903.2.7.2 Group M upholstered furniture or mattresses. An automatic sprinkler system shall be provided throughout a Group M fire area used for the display and sale of upholstered furniture or mattresses that exceeds 5,000 square feet (464 m²).

Revise as follows:

903.2.9 Group S-1. *An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:*

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 *fire area* used for the storage of commercial motor vehicles where the *fire area* exceeds 5,000 square feet (464 m²).
5. ~~A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).~~

Add new text as follows:

903.2.9.3 Group S-1 upholstered furniture and mattresses. An automatic sprinkler system shall be provided throughout a Group S-1 fire area used for the storage of upholstered furniture or mattresses that exceeds 2,500 square feet (232 m²).

Exception: Self-service storage facilities (mini-storage) no greater than one story above grade plane where all storage spaces can be accessed directly from the exterior.

Reason:

This proposal addresses a number of issues dealing with the suppression requirements for spaces containing upholstered furniture or mattresses.

The term Occupancy is replaced with fire area to clarify that the target hazard is the space containing the hazard.

The threshold language has been dropped down to its own subsection to provide for suppression being installed only within the target hazard fire area, not the entire building the fire area may be located within.

An exception has been added to the S-1 trigger for one story self-service storage facilities (mini-storage) where all storage spaces can be accessed from the exterior.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

By limiting the fire suppression requirement to the targeted hazard fire area instead of suppressing the whole building, the cost of construction has been reduced.

F103-18

IFC: 903.1.1, 904.2.1 (IBC: [F]903.1.1, [F]904.2.1)

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

903.1.1 Alternative protection. Alternative automatic fire-extinguishing systems complying with Section 904 shall be permitted instead of automatic sprinkler protection where recognized by the applicable standard and *approved* by the *fire code official*. Where an automatic fire-extinguishing system is provided in lieu of an automatic sprinkler system, the exceptions or reductions allowed for buildings protected throughout with an automatic sprinkler system shall not apply.

904.2.1 Restriction on using automatic sprinkler system exceptions or reductions. ~~Automatic~~ Where an automatic fire-extinguishing systems shall not be considered alternatives for the purposes of system is provided in lieu of an automatic sprinkler system, the exceptions or reductions allowed for *automatic sprinkler systems* or by other requirements of this code buildings protected throughout with an automatic sprinkler system shall not apply.

Reason:

This proposal is intended to correlate these two sections within each code. There is no intended change in code requirements.

The wording in Section 904.2.1 can be confusing, so it is proposed to be revised without any change in application. Essentially, this section states the if an automatic fire-extinguishing is substituted for the fire sprinkler system in a room or area, then the building is not eligible for code modifications based on the building being equipped with a fire sprinkler system. In other words, the building is not considered sprinklered throughout when sprinklers are not provided in all locations where the code and the design standard require sprinklers. Section 903.1.1 is revised to correlate with 904.2.1. This section is revised to clarify application of this section.

Sections 903.1.1 and 904.2 discuss the substitution of alternative fire-extinguishing systems for sprinklers, but the limitation regarding substitution for sprinklers is only found in Section 904.2.1. It is added to Section 903.1.1 so that it is not overlooked.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No cost impact since this is simply clarification and correlation between the codes.

Internal ID: 2023

F104-18

IFC: 903.2.3 (IBC: [F] 903.2.3)

Proponent: Randy Roxson, representing USA Sprinkler Fitters Association (randy@roxsonlaw.com)

2018 International Fire Code

Delete and substitute as follows:

903.2.3 Group E. ~~An automatic sprinkler system shall be provided for Group E occupancies as follows:~~

- ~~1. Throughout all Group E fire areas greater than 12,000 square feet (1115 m²) in area.~~
- ~~2. The Group E fire area is located on a floor other than a level of exit discharge serving such occupancies.~~

~~**Exception:** In buildings where every classroom has not fewer than one exterior exit door at ground level, an automatic sprinkler system is not required in any area below the lowest level of exit discharge serving that area.~~

- ~~3. The Group E fire area has an occupant load of 300 or more.~~

903.2.3 Group E. ~~An automatic sprinkler system shall be provided throughout all buildings with a Group E fire area.~~

Reason:

According to statistics compiled by NFPA, fire departments responded to an average of 4,980 structure fires in educational occupancies each year from 2011 until 2015. These fires caused an average of one civilian death, 70 civilians injured, and \$70 million in direct property loss each of those years sampled. Most occurred in K-12 educational occupancies.

Also, there exists a psychological impact upon students whom are instantly confronted with the sudden loss of important rituals such as sporting events and other extracurricular activities, not to mention a disruption to their education.

The square footage or number of occupants of the building have little relationship to the plethora of adverse impacts to life, property and the mutual distress to students and the community when a fire occurs in a school.

FACT SHEET » RESEARCH

Structure Fires in Educational Properties

U.S. fire departments responded to an estimated average of 4,980 structure fires in educational properties in 2011–2015, annually. These fires caused annual averages of one civilian death, 70 civilian injuries, and \$70 million in direct property damage.

Nearly seven in ten of the fires in educational properties (69%) occurred in nursery, elementary, middle, or high schools. The remaining educational property fires were reported in college classrooms and adult education centers (13%), day care centers (11%), or unclassified or unknown education properties (6%).

Structure Fires in Educational Property Type
2011–2015 Annual Averages

- ▶ In 2011–2015, 38% of structure fires in educational properties involved cooking equipment. These fires resulted in 14% of civilian injuries and 3% of direct property damage.
- ▶ Fires that were set intentionally accounted for 36% of educational property fires. These fires caused 37% of civilian injuries and 31% of direct property damage.
- ▶ Playing with a heat source was responsible for 15% of educational property fires and caused 15% of civilian injuries and 20% of direct property damage.

These estimates are derived from the U.S. Fire Administration National Fire Incident Reporting System (NFIRS) Version 5.0 and NFPA's annual fire department experience survey. Educational property includes preschools through high schools, adult education centers, and day care centers.

© 2017 National Fire Protection Association • September 2017

Cost Impact

The code change proposal will increase the cost of construction .

The cost versus the benefit of protecting our educational facilities are immeasurable. A school having fewer than 300 students or is 12,000 square feet or less, or having direct exits to the exterior is no less vulnerable to fire and the resulting adverse impacts.

F105-18

IFC: 903.2.4, 903.2.7, 903.2.9 (IBC: [F]903.2.4, [F]903.2.7, [F]903.2.9)

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Revise as follows:

903.2.4 Group F-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group F-1 occupancy where one of the following conditions exists:

1. A Group F-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group F-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group F-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group F-1 occupancy ~~used for the manufacture of upholstered furniture or mattresses exceeds that is greater than 2,500 square feet (232 m²)~~ in area and where upholstered furniture or mattresses are manufactured.

903.2.7 Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group M *fire area* is located more than three stories above grade plane.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group M occupancy ~~used for the display and sale of upholstered furniture or mattresses exceeds that is greater than 5,000 square feet (464 m²)~~ in area and that is used for the display or sale of any amount of upholstered furniture or mattresses.

903.2.9 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 *fire area* used for the storage of commercial motor vehicles where the *fire area* exceeds 5,000 square feet (464 m²).
5. A Group S-1 occupancy ~~used for the storage of upholstered furniture or mattresses exceeds that is greater than 2,500 square feet (232 m²)~~ in area and is used for the storage of any amount of upholstered furniture or mattresses.

Reason:

Change proposed simply to clarify the meaning of the existing section. No requirements are being altered but questions have been raised as to how the requirements should be applied.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No change because the code proposal is simply clarification.

2018 International Fire Code

Revise as follows:

903.2.7 Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group M *fire area* is located more than three stories above grade plane.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group M occupancy where the area used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m²).

903.2.9 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 *fire area* used for the storage of commercial motor vehicles where the *fire area* exceeds 5,000 square feet (464 m²).
5. A Group S-1 occupancy where the area used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).

Reason:

In a lot of retail or storage areas there may be as little as a few upholstered furniture for display or storage. These sections imply if the area of the display or storage of upholstered furniture is even 10 sq ft and this display is located in a very large room/building, that the entire room/building needs to be sprinklered. We do not believe this was the intent of this section.

Cost Impact

The code change proposal will decrease the cost of construction .

This is intended to clarify that the area of the upholstered display or storage and not the entire room needs to be considered. A lot of businesses having small number of upholstered furniture will not longer be "lumped" together with facilities that are of actual concern.

F107-18

IFC: 903.2.9 (IBC: [F] 903.2.9)

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

903.2.9 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 *fire area* used for the storage of commercial motor vehicles where the *fire area* exceeds 5,000 square feet (464 m²).
5. A Group S-1 ~~occupancy~~ *fire area* used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).
6. A Group S-1 *fire area* used as a public- or self-storage facility exceeds 2,500 square feet (232 m²).

Reason:

Correction proposed for consistency of requirements relative to occupancy vs fire area. Additional requirement proposed to sprinkler public- and self-storage facilities, which regularly store a multitude of different commodities, not the least concerning of which is upholstered furniture. The fire area criteria allows for fire barriers to be utilized to separate the different spaces up to the aggregate 24,000sq. ft.

Cost Impact

The code change proposal will increase the cost of construction .

The requirement for sprinkler protection of such occupancies or the provision of fire barriers to avoid such requirement will increase the cost of construction.

2018 International Fire Code

Add new text as follows:

903.2.9 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 *fire area* used for the storage of commercial motor vehicles where the *fire area* exceeds 5,000 square feet (464 m²).
5. A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).

Exception: Self-service storage facilities.

Reason:

The proposed code change was intended for occupancies dedicated to storage of upholstered furniture and mattresses and this will reduce the need to sprinkler occupancies not intended.

Cost Impact

The code change proposal will decrease the cost of construction .

This code exception is intended exclude the application of 2500 sq ft as a sprinkler threshold in self storage areas that are not specifically dedicated for storage of upholstered furniture,.

Internal ID: 1783

F109-18

IFC: 903.2.9 (IBC: [F]903.2.9)

Proponent: Mark Chubb, representing Telgian Corp. (mchubb@telgian.com)

2018 International Fire Code

Revise as follows:

903.2.9 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 *fire area* used for the storage of commercial motor vehicles where the *fire area* exceeds 5,000 square feet (464 m²); ~~excluding noncombustible canopies and open structures.~~
5. A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).

Reason:

The proponent has recently encountered jurisdictions requiring the installation of automatic sprinkler systems under canopies and open structures protecting motor fuel dispensing operations with five or more dispensing islands (10 vehicle bays). Existing safeguards for motor fuel dispensing operations prescribed by Chapter 23 adequately address this hazard.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change recognizes the efficacy of existing safeguards prescribed by Chapter 23.

Internal ID: 425

F110-18

IFC: 903.2.10, 903.2.11.3 (IBC: [F]903.2.10, [F]903.2.11.3)

Proponent: Jeffrey Shapiro, representing National Fire Sprinkler Association (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

903.2.10 Group S-2 enclosed parking garages. An automatic sprinkler system shall be provided throughout buildings classified as enclosed parking garages ~~in accordance with Section 406.6 of the International Building Code where either~~ where any of the following conditions exists:

1. Where the fire area of the enclosed parking garage in accordance with Section 406.6 of the International Building Code exceeds 12,000 square feet (1115 m²).
2. Where the enclosed parking garage in accordance with Section 406.6 of the International Building Code is located beneath other groups.

Exception: Enclosed parking garages located beneath Group R-3 occupancies.

3. Where the fire area of the open parking garage in accordance with Section 406.5 of the International Building Code exceeds 48,000 square feet (4460 m²).

903.2.11.3 Buildings 55 feet or more in height. An automatic sprinkler system shall be installed throughout buildings that have one or more stories with an occupant load of 30 or more located 55 feet (16 764 mm) or more above the lowest level of fire department vehicle access, measured to the finished floor.

Exception:Exceptions:

1. Open parking structures.
2. Occupancies in Group F-2.

Reason:

Historically, open parking garages have been considered to have a very low fire risk, which has led to dozens of special allowances for reduced code requirements in these occupancies. Fire tests run decades ago offered some support for this perspective. However, it is common knowledge that much of what makes up a vehicle today is combustible, and bodies and interior components that may previously have been of steel are now primarily plastic, rubber, fiberglass and lightweight metals, facilitating vehicle-to-vehicle fire spread and production of dense combustible smoke layers. Stored energy systems in electric vehicles also increase the fuel load. Nevertheless, the wisdom of exempting open parking garages from many code requirements that would otherwise apply has tended to go unchallenged, lacking sufficient evidence to demonstrate the existence of a problem. That has now changed.

An open parking garage fire in Liverpool UK on January 1, 2018 demonstrated the fire risk associated with the new world order of vehicle construction. The concrete building and 1,400 cars were destroyed by a fire that reportedly started in a single vehicle's engine compartment.

The thought that allowing smoke to escape from an open parking garage perimeter will entirely mitigate fire risk is certainly debunked by this incident, and this proposal seeks to recognize that these structures and their contents can present significant challenges to the fire service and result in catastrophic fire losses. The recommended sprinkler threshold based on building height is consistent with the threshold that was established years ago for most occupancies, and the reason for exempting open parking garages is no longer evident. The proposal also provides for an area based threshold, which is very generous compared to other occupancies that might be argued as having similar, or even lesser, fire loads. The recommended value is four times larger than what is applicable to enclosed garages, recognizing that, while there may be some benefit to perimeter openings, the fire service will ultimately be relied on to control these fires if sprinklers are not provided. Therefore, it is appropriate to limit the size of a fire area in these building so that there is a reasonable ability of the fire service to access and extinguish a fire before it becomes uncontrollable.

Cost Impact

The code change proposal will increase the cost of construction .

Yes, there is a cost increase due to lowering the thresholds for requiring an automatic sprinkler system in larger and taller open parking garages.

F111-18

IFC: 903.2.11, 903.2.11.7 (New) (IBC: [F]903.2.11, [F] 903.2.11.7 (New))

Proponent: Thomas Daly, The Hospitality Security Consulting Group, LLC, representing The Hospitality Security Consulting Group, LLC (Thomas.Daly@myhscg.com)

2018 International Fire Code

Revise as follows:

903.2.11 Specific buildings areas and hazards. In all occupancies other than Group U, an *automatic sprinkler system* shall be installed for building design or hazards in the locations set forth in Sections 903.2.11.1 through ~~903.2.11.6~~ 903.2.11.7.

Add new text as follows:

903.2.11.7 Exposure protection. Newly constructed buildings of Type III, IV & V construction in 'High' or 'Extreme' wildfire hazard zones, as defined in Section 502.1 of the International Wildland Urban Interface Code, that are otherwise required to have an automatic sprinkler system installed throughout, shall be provided with exposure sprinklers at the exterior perimeter of the building in accordance with the applicable installation standard.

Reason:

Dozens of otherwise fully sprinklered buildings burned to the ground in the October 2017 Napa and Sonoma County, California wildfires as the direct result of exposure to wildfires.

NFPA 13, see Sections 7.7; 8.3.4.3 and 11.3.2 provides sufficient guidance on the design parameters for exposure sprinkler system design which will mitigate the effect of exposure fires on such buildings.

Bibliography:

See NFPA 13-2016 edition for references to exposure sprinkler protection.

Cost Impact

The code change proposal will increase the cost of construction .

This proposed code change will marginally increase the cost of construction but only for newly constructed buildings otherwise requiring sprinkler systems and then only for Type III, IV & V construction types when located within High or Extreme wildfire hazard zones. The number of such buildings will be small but the protection afforded will mitigate the potential for destruction from exposure fires.

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

[A] 101.2 Scope. This code establishes regulations affecting or relating to structures, processes, premises and safeguards regarding all of the following:

1. The hazard of fire and explosion arising from the storage, handling or use of structures, materials or devices.
2. Conditions hazardous to life, property or public welfare in the occupancy of structures or premises.
3. Fire hazards in the structure or on the premises from occupancy or operation.
4. Matters related to the construction, extension, repair, alteration or removal of fire ~~suppression or alarm~~ protection systems.
5. Conditions affecting the safety of fire fighters and emergency responders during emergency operations.

SUPERVISORY SERVICE. The service required to monitor performance of guard tours and the operative condition of ~~fixed suppression~~ fire protection systems or other systems for the protection of life and property.

SUPERVISORY SIGNAL. A signal indicating the need of action in connection with the supervision of guard tours, the fire ~~suppression~~ protection systems or equipment, or the maintenance features of related systems.

SUPERVISORY SIGNAL-INITIATING DEVICE. An initiating device such as a valve supervisory switch, water level indicator, or low-air pressure switch on a dry-pipe sprinkler system whose change of state signals an off-normal condition and its restoration to normal of a fire protection or life safety system; or a need for action in connection with guard tours, fire ~~suppression~~ protection systems or equipment, or maintenance features of related systems.

311.2.2 Fire protection. Fire ~~alarm, sprinkler and stand pipe~~ protection systems shall be maintained in an operable condition at all times.

Exceptions:

1. Where the premises have been cleared of all combustible materials and debris and, in the opinion of the *fire code official*, the type of construction, *fire separation distance* and security of the premises do not create a fire hazard.
2. Where *approved* by the *fire code official*, buildings that will not be heated and where *fire protection systems* will be exposed to freezing temperatures, fire alarm and automatic sprinkler systems are permitted to be placed out of service and standpipes are permitted to be maintained as dry systems (without an automatic water supply), provided that the building does not have contents or storage, and windows, doors and other openings are secured to prohibit entry by unauthorized persons.
3. Where *approved* by the *fire code official*, fire alarm and automatic sprinkler systems are permitted to be placed out of service in seasonally occupied buildings: that will not be heated; where fire protection systems will be exposed to freezing temperatures; where *fire areas* do not exceed 12,000 square feet (1115 m²); and that do not store motor vehicles or hazardous materials.

509.1 Identification. Fire protection equipment shall be identified in an *approved* manner. Rooms containing controls for air-conditioning systems, ~~sprinkler risers and valves, or other fire detection, suppression or control elements~~ fire protection systems shall be identified for the use of the fire department. *Approved* signs required to identify fire protection system equipment and equipment location shall be constructed of durable materials, permanently installed and readily visible.

509.2 Equipment access. *Approved* access shall be provided and maintained for all fire protection system equipment to permit immediate safe operation and maintenance of such equipment. Storage, trash and other materials or objects shall not be placed or kept in such a manner that would prevent such equipment from being readily

accessible.

903.2.11.6 Other required ~~suppression fire protection systems~~. In addition to the requirements of Section 903.2, the provisions indicated in Table 903.2.11.6 require the installation of a fire ~~suppression protection system~~ for certain buildings and areas.

**TABLE 903.2.11.6

6004.2.2.6	Gas rooms for highly toxic and toxic gas
6004.3.3	Outdoor storage for highly toxic and toxic gas
6504.1.1	Pyroxylin plastic storage cabinets
6504.1.3	Pyroxylin plastic storage vaults
6504.2	Pyroxylin plastic storage and manufacturing

For SI: 1 cubic foot = 0.023 m³.

907.6.4.2 High-rise buildings. In high-rise buildings, a separate zone by floor shall be provided for each of the following types of alarm-initiating devices where provided:

1. Smoke detectors.
2. Sprinkler waterflow devices.
3. Manual fire alarm boxes.
4. Other *approved* types of automatic fire ~~detection devices or suppression protection systems.~~

914.2.4 Fire department access to equipment. Rooms or areas containing controls for air-conditioning systems, ~~automatic fire-extinguishing systems, automatic sprinkler systems or other detection, suppression or control elements or fire protection systems~~ shall be identified for use by the fire department.

1205.12 Fire suppression protection. ~~Fire suppression protection systems~~ for stationary fuel cell power system installations shall be provided in accordance with NFPA ~~853-853.~~

3201.3 Construction documents. At the time of building permit application for new structures designed to accommodate high-piled storage or for requesting a change of occupancy/use, and at the time of application for a storage permit, plans and specifications shall be submitted for review and approval. In addition to the information required by the International Building Code, the storage permit submittal shall include the information specified in this section. The construction documents shall include all of the following:

1. Floor plan of the building showing locations and dimensions of *high-piled storage areas*.
2. Usable storage height for each storage area.
3. Number of tiers within each rack, if applicable.
4. Commodity clearance between top of storage and the sprinkler deflector for each storage arrangement.
5. Aisle dimensions between each storage array.
6. Maximum pile volume for each storage array.
7. Location and classification of commodities in accordance with Section ~~3203-3203.~~
8. Location of commodities that are banded or encapsulated.
9. Location of required fire department access doors.
10. Type of fire ~~suppression and fire detection protection~~ systems.
11. Location of valves controlling the water supply of ceiling and in-rack sprinklers.
12. Type, location and specifications of smoke removal and curtain board systems.
13. Dimension and location of transverse and longitudinal flue spaces.
14. Additional information regarding required design features, commodities, storage arrangement and fire protection features within the *high-piled storage area* shall be provided at the time of permit, where required by the *fire code official*.

3504.3.1 Pre-hot-work check. A pre-hot-work check shall be conducted prior to work to ensure that all equipment is safe and hazards are recognized and protected. A report of the check shall be kept at the work site during the work and available upon request. The pre-hot-work check shall determine all of the following:

1. *Hot work equipment* to be used shall be in satisfactory operating condition and in good repair.
2. *Hot work* site is clear of combustibles or combustibles are protected.
3. Exposed construction is of noncombustible materials or, if combustible, then protected.
4. Openings are protected.
5. Floors are kept clean.
6. Exposed combustibles are not located on the opposite side of partitions, walls, ceilings or floors.
7. Fire watches, where required, are assigned.
8. *Approved* actions have been taken to prevent accidental activation of ~~suppression and detection~~

fire protection system equipment in accordance with Sections 3504.1.8 and ~~3504.1.9~~3504.1.9.

9. Fire extinguishers and fire hoses (where provided) are operable and available.

Revise as follows:

5005.1.8 Fire ~~extinguishing~~ protection systems. Indoor rooms or areas in which hazardous materials are dispensed or used shall be protected by an automatic sprinkler system or automatic fire-extinguishing system in accordance with Chapter 9. Sprinkler system design shall be not less than that required for Ordinary Hazard, Group 2, with a minimum design area of 3,000 square feet (279 m²). Where the materials or storage arrangement are required by other regulations to be provided with a higher level of sprinkler system protection, the higher level of sprinkler system protection shall be provided.

5704.3.5.1 Basement storage. Class I liquids shall be allowed to be stored in *basements* in amounts not exceeding the *maximum allowable quantity per control area* for use-open systems in Table 5003.1.1(1), provided that ~~automatic suppression and other fire protection systems~~ are provided in accordance with Chapter ~~9-9~~. Class II and IIIA liquids shall be allowed to be stored in *basements*, provided that automatic suppression and other fire protection are provided in accordance with Chapter ~~9-9~~.

5704.3.7.5.1 Fire ~~extinguishing~~ protection systems. Liquid storage rooms shall be protected by *automatic sprinkler systems* installed in accordance with Chapter 9 and Tables 5704.3.6.3(4) through 5704.3.6.3(7) and Table 5704.3.7.5.1. In-rack sprinklers shall also comply with NFPA 13. Automatic foam-water systems and automatic aqueous film-forming foam (AFFF) water sprinkler systems shall not be used except where *approved*.

Protection criteria developed from fire modeling or full-scale fire testing conducted at an *approved* testing laboratory are allowed in lieu of the protection as shown in Tables 5704.3.6.3(2) through 5704.3.6.3(7) and Table 5704.3.7.5.1 where *approved*.

2018 International Building Code

[F] 402.7.5 Fire department access to equipment. Rooms or areas containing controls for air-conditioning systems, ~~automatic fire extinguishing systems, automatic sprinkler systems or other detection, suppression or control elements or fire protection systems~~ shall be identified for use by the fire department.

Reason:

The term suppression is used in several ways throughout the IFC. Suppression is not a defined term, but it means to extinguish the fire or is commonly used as a fire department response term. The IFC uses suppression in ways that are not related to fire extinguishment or fire department response. This proposal adjusts lists, and charging sections to hone in to the intent of the section and replaces with a more exclusive and defined term of fire protection system. A fire protection system is a sprinkler system, an alarm system, a standpipe system and on and on. It is a better term.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

Using defined terms in the code will save on mis-interpretation and mis-application of the code.

IFC: 903.3.1.1.1 (IBC: [F] 903.3.1.1.1)

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

903.3.1.1.1 Exempt locations. Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an *approved* automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from a room merely because it is damp, of fire-resistance-rated construction or contains electrical equipment.

1. A room where the application of water, or flame and water, constitutes a serious life or fire hazard.
2. A room or space where sprinklers are considered undesirable because of the nature of the contents, where *approved* by the *fire code official*.
3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a *fire-resistance rating* of not less than 2 hours.
4. Rooms or areas that are of noncombustible construction with wholly noncombustible contents.
5. ~~Fire service access~~ All elevator machine rooms and machinery spaces.
6. ~~Machine rooms, machinery spaces, control rooms and control spaces associated with occupant evacuation elevators designed in accordance with Section 3008 of the International Building Code, control spaces, and hoistways, other than pits.~~

Reason:

It is time to eliminate the shunt trip requirement. NFPA 13 is finally moving in this direction, all be it quite slowly. This is currently only addressed for FSAE and OE elevators. The Fire Department regularly utilizes the elevators in multi-story buildings for emergency operations and subjecting the elevator to shunt trip puts them at risk. Also, if sprinklers are not needed for FSAE and OE equipment areas, etc., why are they needed for other elevators?

Cost Impact

The code change proposal will decrease the cost of construction .

Elimination of the sprinkler requirement from such spaces resulting in the elimination of shunt trip is a cost savings to construction of multi-story buildings.

2018 International Fire Code

Revise as follows:

903.3.1.1.1 Exempt locations. Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an *approved* automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from a room merely because it is damp, of fire-resistance-rated construction or contains electrical equipment.

1. A room where the application of water, or flame and water, constitutes a serious life or fire hazard.
2. A room or space where sprinklers are considered undesirable because of the nature of the contents, where *approved* by the *fire code official*.
3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a *fire-resistance rating* of not less than 2 hours.
4. Rooms or areas that are of noncombustible construction with wholly noncombustible contents.
5. Fire service access elevator machine rooms and machinery spaces.
6. Machine rooms, machinery spaces, control rooms and control spaces associated with occupant evacuation elevators designed in accordance with Section 3008 of the International Building Code.
7. Spaces or areas of buildings having molten material present. Such non-sprinklered spaces or areas shall be separated from the remainder of the sprinklered building by walls and floor/ceiling or roof/ceiling assemblies having a fire-resistance rating of not less than 2 hours.

Reason:

OSHA has fined facilities for having fire sprinkler systems in areas having molten material: <https://www.osha.gov/news/newsreleases/region2/08022006>

Although it could be stated that number 1. in the list of sprinkler exemptions addresses this issue, molten material poses such a severe threat to life safety with the provision of fire sprinkler systems overhead, it needs to be specifically addressed here and not subject to interpretation, such as with water reactive materials.

This matter is not well understood in the fire protection industry and is not well addressed by NFPA 13, which only discusses the matter relative to the Standard on Ovens and Furnaces (Section 22.16) and that only requires shielding from sprinkler water and could also be interpreted as only applying to the interior of such appliances.

Guidance is needed for fire sprinkler designers and AHJ's to ensure that this potential life safety threat is avoided.

Bibliography:

1. U.S. Department of Labor: Region 2 News Release: 06-1271-NEW/BOS 2006-213 Wednesday, August 2, 2006 Contact: Ted Fitzgerald Phone: (617) 565-2074
2. NFPA 13 (2016 edition) Section 22.16

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Although a savings would be incurred from the exemption of the fire sprinkler system from the space/area in question, additional expense would result from the required 2 hour fire separation from the rest of the building. It is not known if this would result in an overall savings or cost increase as a result - will depend upon size of space/area in question and need of separation from surrounding area.

2018 International Fire Code

903.3.1.1.1 Exempt locations. Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an *approved* automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from a room merely because it is damp, of fire-resistance-rated construction or contains electrical equipment.

1. A room where the application of water, or flame and water, constitutes a serious life or fire hazard.
2. A room or space where sprinklers are considered undesirable because of the nature of the contents, where *approved* by the *fire code official*.
3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a *fire-resistance rating* of not less than 2 hours.
4. Rooms or areas that are of noncombustible construction with wholly noncombustible contents.
5. Fire service access elevator machine rooms and machinery spaces.
6. Machine rooms, machinery spaces, control rooms and control spaces associated with occupant evacuation elevators designed in accordance with Section 3008 of the International Building Code.
7. Concealed spaces in accordance with NFPA 13, Section 8.15.1.2.

Reason:

This is a clarification needed to ensure the requirements in NFPA 13 are used for buildings constructed under the building code. NFPA recognizes that sprinklers are not necessary in all concealed spaces. Section 8.15.1.2 has the requirements for when sprinklers are not needed.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal better explains exemption already allowed in the code.

Proponent: Frank Savino, representing UNITED Fire Protection Corporation (fsavino@ufpco.com)

2018 International Fire Code

Revise as follows:

903.3.1.1.1 Exempt locations. Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an *approved* automatic fire suppression system with a compatible alternative fire suppression agent, actuated by an *approved* fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from a room merely because it is damp, of fire-resistance-rated construction or contains electrical equipment.

1. A room where the application of water, or flame and water, constitutes a serious life or fire hazard.
2. A room or space where sprinklers are considered undesirable because of the nature of the contents, where *approved* by the *fire code official*.
3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a *fire-resistance rating* of not less than 2 hours.
4. Rooms or areas that are of noncombustible construction with wholly noncombustible contents.
5. Fire service access elevator machine rooms and machinery spaces.
6. Machine rooms, machinery spaces, control rooms and control spaces associated with occupant evacuation elevators designed in accordance with Section 3008 of the International Building Code.

Reason:

903.3.1.1.1 of the IBC allows exemption from automatic sprinkler protection for certain locations in buildings that are required to be equipped throughout with an automatic sprinkler system. Exempt locations include generator, transformer, elevator machine rooms and machinery spaces, and control rooms and control spaces associated with occupant evacuation.

The general rationale for the exemption is the incompatibility of water sprinkler discharge with the contents of the room. All of these exempt rooms represent significant risk in terms of probability of fire as well as the consequences from fire.

Simply because one of many possible fire suppression alternatives is not compatible with a hazard should not be a reason to exempt needed protection when many other cost effective alternative agent options are available. These options include water mist, clean waterless agent, aerosol, foam, dry chemical, and carbon dioxide.

In cases where it is the intention of the Code to protect buildings with automatic fire suppression throughout, there should be no exceptions when compatible suppression agent systems are available. The code should require protection with a compatible alternative.

Cost Impact

The code change proposal will increase the cost of construction .

Cost impact is highly dependent on the nature of the protected locations and the chosen alternatives. The additional cost of alternative systems should only be a small fraction of the overall fire protection cost for the entire building.

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov)

2018 International Fire Code

Revise as follows:

903.3.1.2 NFPA 13R sprinkler systems. *Automatic sprinkler systems* in Group R occupancies ~~up to and including four stories in height in buildings not exceeding 60 feet (18 288 mm) in height above grade plane~~ shall be permitted to be installed throughout in accordance with NFPA ~~13R~~13R ~~where the Group R occupancy meets all of the following conditions:~~

1. Four stories or less above grade plane.
2. The floor level of the highest story is 30 feet (9114 mm) or less above the lowest level of fire department vehicle access.
3. The floor level of the lowest story is 30 feet (9114 mm) or less below the lowest level of fire department vehicle access.

~~The number of stories of Group R occupancies constructed in accordance with Sections 510.2 and 510.4 of the International Building Code shall be measured from the horizontal assembly creating separate buildings grade plane.~~

Reason:

The recent fires in Group R occupancies, both occupied and under construction, requires revisiting the applicable code requirements.

One major concern is the affect of the recent advent of podium-style buildings, and how the code has changed to allow NFPA 13R sprinkler systems to heights that exceed the original scope of NFPA 13R. The scope of NFPA 13R, 2007 edition, reads "This standard shall cover the design and installation of automatic sprinkler systems for protection against fire hazards in residential occupancies up to and including 4 stories in height". In 2013, the scope of NFPA 13R was changed to read "This standard shall cover the design and installation of automatic sprinkler systems for protection against fire in residential occupancies up to and including four stories in height in buildings not exceeding 60 feet (18 m) in height above grade plane."

This followed a change in the 2009 IBC that greatly expanded the use of the podium concept. After the expansion of the podium concept, the increase in height for NFPA 13R systems was permitted, leading us to where we are today. Today, 5 and 6 story height buildings can be created, where the separate podium building is one or two stories (measured from grade plane) and the other separate building, atop the podium building, is 4 stories as measured from the podium, all protected with NFPA 13R fire sprinklers.

There is a big difference in the protection provided between NFPA 13R and NFPA 13 systems, in the required design density and areas covered by fire sprinklers. Allowing the NFPA 13R sprinkler system for these taller podium style buildings leads to a significant decrease in the protection being provided by automatic fire sprinklers, versus what was required prior to the code changes referenced above.

When determining a suitable trigger for height to propose for this code section, a review of other parts of the code led to the requirements for when standpipe systems are required per Section 905.3.1. Philosophically, standpipe systems would be required where travel distance by responding fire fighters is long enough that hose lines fed directly from fire engines may not reach the fire, so that fire hose would need to be carried into the building, for connection to an outlet that is closer to the fire. The decision to trigger the requirement for a standpipe would represent a recognition of an increased building hazard, which in this can be adapted as a means to determine the break point between allowing a NFPA 13R sprinkler system, and requiring a NFPA 13 sprinkler system.

Cost-wise, the infrastructure, such as main pipe sizes, required to install a standpipe system, would ease the impact of requiring the sprinkler system to be NFPA 13, rather than NFPA 13R. While there would be significant argument that the pipe sizes would all have to be increased in order to change from NFPA 13R to NFPA 13, which would clearly increase costs, this increase is tempered by the fact that the pipe sizes required to comply with the standpipe system are so large that the NFPA 13 sprinkler design can very easily be accommodated with little to no increase in pipe sizing. In other words, by using the same requirement for when a standpipe system is required, the impact of requiring a NFPA 13 system, versus 13R, is substantially reduced.

For this reason, the proposal is to use the trigger for installation of a standpipe system, per existing Section 905.3.1, as the upper limit for permitting the installation of NFPA 13R systems, and by default creating the trigger for switching the sprinkler system to a NFPA 13 sprinkler system in Group R occupancies.

In summary, this proposal intends to address the recent fire history in Group R occupancies, especially those built with the podium concept, and seeks to increase the protection required in these buildings. The proposal utilizes the same trigger for requiring a standpipe system, for the point where the sprinkler system would have to change from NFPA 13R design, to NFPA 13 design. While there is still an increase in cost, this increase is greatly minimized due to the already existing requirement for standpipe systems.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase construction costs by requiring NFPA 13 sprinkler systems in some situations where NFPA 13R sprinkler systems are currently permitted. There is no doubt that, due to the difference in water flow required, additional sprinkler requirements, and other requirements in the NFPA standards, that the cost of NFPA 13 sprinkler systems is higher than the cost of NFPA 13R sprinkler systems. Some of this cost is mitigated by aligning the new requirement to the requirement for installing a standpipe system, which already would represent greater flow capacity for the building, ostensibly requiring larger diameter mains already; however, even with this mitigating factor, there is little doubt that this code change would represent an increase in overall construction costs.

IBC: 903.3.1.2 (IBC: [F]903.3.1.2)

Proponent: William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Jason Thompson, representing Masonry Alliance for Codes and Standards (jthompson@ncma.org)

2018 International Fire Code

Revise as follows:

903.3.1.2 NFPA 13R sprinkler systems. *Automatic sprinkler systems* in Group R occupancies up to and including four stories in height in buildings not exceeding 60 feet (18 288 mm) in height above grade plane shall be permitted to be installed throughout in accordance with NFPA 13R.

The number of stories of Group R occupancies constructed in accordance with Sections 510.2 and 510.4 of the International Building Code shall be measured from ~~the horizontal assembly creating separate buildings-grade plane.~~

Reason:

This proposal will restrict the use of NFPA13R to residential structures with a maximum of 4 stories including the podium. Last cycle this issue was somewhat addressed by inserting requirements instructing the user to protect the attic if the highest pitched roof is over 55 ft. at the eaves. However, what if a lower pitched roof is located higher? All of these requirements then would not apply. While these measures increase fire safety in the attic, they do not mitigate the other issues of trying to use a standard out of its scope and the fact remains that combustible concealed areas are still abundant throughout other parts of the building if any of the options are chosen. The Edgewater fire in New Jersey began in a combustible concealed space by workers. Numerous issues such as pressure, volume, height of operations for outside attack become apparent when sorting out the details of how to use the low rise NFPA13R standard for attic protection. Heads in the attic require more water pressure and volume demand than the residential heads within the dwelling units and often may need a fire pump to serve an adequate pressure or volume. NFPA 13R Systems were never designed for property protection and sprinkler protection in the attic is property protection and out of the scope of this standard.

The new sections that were added last cycle are not removed by this proposal. They will still pertain to buildings using the NFPA 13R standard where the building have attics that are greater than 55 ft. to the highest pitch roof, presuming they don't use loophole described above.

Historically our codes have measured to grade plane and podium buildings should be no different. The increased height, possible inset design where the building sits on the podium and modest fire fighting access can make these buildings much tougher to fight if ignition occurs in a concealed area. NFPA 13 systems are the choice to reduce risk and provide life safety and property protection for its residents as well neighboring buildings

Cost Impact

The code change proposal will increase the cost of construction .

While this is the most obvious choice, I cannot say what the cost difference is between modifying NFPA 13R to add sprinklers in the attic and providing a NFPA13 system or using one of the ignition resistant options. It could be less costly but either way, the added cost will be low.

F119-18

IFC: 903.3.1.2.2 (IBC: [F] 903.3.1.2.2)

Proponent: Jeffrey Shapiro, Lake Travis Fire Rescue, representing Lake Travis Fire Rescue (jshapiro@ltfr.org)

2018 International Fire Code

Revise as follows:

903.3.1.2.2 ~~Open-ended corridors~~ Corridors and balconies in the means of egress. Sprinkler protection shall be provided in corridors and for balconies in the means of egress where any of the following conditions apply:

1. Corridors with combustible floor or walls.
2. Corridors with an interior change of direction exceeding 45 degrees (0.79 rad).
3. Corridors that are less than 50 percent open to the outside atmosphere at the ends.
4. Open-ended corridors and associated exterior stairways and ramps as specified in Section 1027.6, Exception 3.
5. Egress balconies not complying with Sections 1021.2 and 1021.3.

Reason:

NFPA 13R has migrated to a place where great liberties are being allowed to exempt corridors in multifamily occupancies from sprinkler requirements, going far beyond what is intended under the IBC. The current text in 13R allows any "open corridor" to be unsprinklered in a 13R protected building, and the NFPA Residential Sprinkler Handbook commentary on Page 296 of the 2016 edition interprets "open" to mean any corridor that is open to outside temperature (regardless of how small the opening may be). Carried to the extreme, an enclosed, unconditioned corridor with an air vent would be permitted by 13R to be an unsprinklered space based on the Handbook and appendix guidance. In contrast, the original allowance by model codes for open corridors to be unsprinklered was associated with breezeway style units that were essentially fully open on one end or both, where the corridor connects to the stairs. In these cases, smoke accumulation in the corridor was inhibited by the large opening.

Recognizing that buildings protected by 13R sprinkler systems gain a variety of sprinkler incentives, for example the IBC allows an exception to providing means of escape openings in 13R protected buildings, the code needs to be put back to a place where the application is better reflective of the original intent. Having been intimately involved in the integration of 13R recognition in the IBC, I can state with absolute certainty that the 13R provisions and guidance are not being interpreted by NFPA in a manner consistent with what the IBC expected.

Although I have prepared a TIA for submittal to 13R hoping to address the issue there as well, I believe that it is essential for the IBC to establish minimum requirements for corridor and balcony protection associated with 13R protected buildings. The text suggested in this proposal is my attempt to get the code back to where it should have been all along.

It is also worth noting that the IBC added requirements for balconies and decks to have sprinkler protection several years ago, based in part on the fire loss history associated with fires originating in these locations. The original loss data associated with NFPA 13R's protection scheme (NFPA 13R Table A.1.2) shows hallways and corridors (recommended for protection by this proposal) as a more frequent area of ignition for fatal fires than exterior balconies and open porches.

For disclosure, I represent the National Fire Sprinkler Association and Tyco Fire Products as a consultant, but I am not representing either on this proposal. I came across this issue in my role as a fire code official, and the proposal is submitted on behalf of my fire department.

Cost Impact

The code change proposal will increase the cost of construction .

Additional sprinklers in corridors and for protection of balconies will add cost.

Internal ID: 1187

F120-18

IFC: 903.3.1.2.3 (IBC: [F]903.3.1.2.3)

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

903.3.1.2.3 Attics. Attic protection shall be provided as follows:

1. Attics that are used or intended for living purposes or storage shall be protected by an *automatic sprinkler system*.
2. Where fuel-fired equipment is installed in an unsprinklered attic, not fewer than one quick-response intermediate temperature sprinkler shall be installed above the equipment.
3. Where located in a building of Type III, Type IV or Type V construction designed in accordance with Section 510.2 or 510.4 of the International Building Code, attics not required by Item 1 to have sprinklers shall comply with one of the following if the roof assembly is located more than 55 feet (16 764 mm) above the lowest level of ~~required~~ fire department vehicle access needed to meet the provisions in Section 503:
 - 3.1. Provide *automatic sprinkler system* protection.
 - 3.2. Construct the attic using noncombustible materials.
 - 3.3. Construct the attic using fire-retardant-treated wood complying with Section 2303.2 of the International Building Code.
 - 3.4. Fill the attic with noncombustible insulation.

The height of the roof assembly shall be determined by measuring the distance from the lowest required fire vehicle access road surface adjacent to the building to the eave of the highest pitched roof, the intersection of the highest roof to the exterior wall, or the top of the highest parapet, whichever yields the greatest distance. For the purpose of this measurement, required fire vehicle access roads shall include only those roads that are necessary for compliance with Section 503.
4. Group R-4, Condition 2 occupancy attics not required by Item 1 to have sprinklers shall comply with one of the following:
 - 4.1. Provide *automatic sprinkler system* protection.
 - 4.2. Provide a heat detection system throughout the attic that is arranged to activate the building fire alarm system.
 - 4.3. Construct the attic using noncombustible materials.
 - 4.4. Construct the attic using fire-retardant-treated wood complying with Section 2303.2 of the International Building Code.
 - 4.5. Fill the attic with noncombustible insulation.

Reason:

When this section was added last cycle, there was some concern about the word "required" when it came to jurisdictions that do not have legal authority to enforce fire code requirements for fire apparatus access roads. Rather than risk possible rejection of the overall requirement, it was agreed that the text would be adjusted in the 2021 cycle to address this concern. While subtle, the intent of this change is to differentiate between access that may be legally required versus access that meets the technical provisions set forth in Section 503.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal would only impact jurisdictions that are not enforcing IFC requirements for apparatus access in Section 503, and requiring that a building meet the IFC requirement, regardless of local authority, does not technically constitute a cost increase from ICC's perspective since it relates to local application and enforcement of the code.

Internal ID: 2172

F121-18

IFC: 903.3.1.2.3 (LBC: [F] 903.3.1.2.3)

Proponent: Robert J Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

903.3.1.2.3 Attics. Attic protection shall be provided as follows:

1. Attics that are used or intended for living purposes or storage shall be protected by an *automatic sprinkler system*.
2. Where fuel-fired equipment is installed in an unsprinklered attic, not fewer than one quick-response intermediate temperature sprinkler shall be installed above the equipment.
3. Where located in a building of Type III, Type IV or Type V construction ~~designed in accordance with Section 510.2 or 510.4 of the International Building Code~~, attics not required by Item 1 to have sprinklers shall comply with one of the following if the roof assembly is located more than 55 feet (16 764 mm) above the ~~lowest level of required fire department vehicle access grade plane~~:
 - 3.1. Provide *automatic sprinkler system* protection.
 - 3.2. Construct the attic using noncombustible materials.
 - 3.3. Construct the attic using fire-retardant-treated wood complying with Section 2303.2 of the International Building Code.
 - 3.4. Fill the attic with noncombustible insulation.

The height of the roof assembly shall be determined by measuring the distance from the ~~lowest required fire vehicle access road surface adjacent to the building grade plane~~ to the eave of the highest pitched roof, the intersection of the highest roof to the exterior wall, or the top of the highest parapet, whichever yields the greatest distance. ~~For the purpose of this measurement, required fire vehicle access roads shall include only those roads that are necessary for compliance with Section 503.~~

4. Group R-4, Condition 2 occupancy attics not required by Item 1 to have sprinklers shall comply with one of the following:
 - 4.1. Provide *automatic sprinkler system* protection.
 - 4.2. Provide a heat detection system throughout the attic that is arranged to activate the building fire alarm system.
 - 4.3. Construct the attic using noncombustible materials.
 - 4.4. Construct the attic using fire-retardant-treated wood complying with Section 2303.2 of the International Building Code.
 - 4.5. Fill the attic with noncombustible insulation.

Reason:

The purpose of this proposal is to eliminate two triggers contained within the code from last cycles proposal that severely limits application of the necessary improvement to the code requirements dealing with Type III, Type IV or Type V construction building protected by NFPA 13R sprinkler systems. The F172-16 proposal from last cycle's reason statement states:

"This proposal is recommended as a response to fire-service concerns about suppressing a fire involving a tall pedestal building attic. Such attic or attics will be required to have increased fire protection. The proposed threshold is modeled after a combination of two existing code sections, Appendix D Section 105.1 (which establishes requirements for aerial ladder access based on attic height) and Section 903.2.11.3 (which uses 55 feet as a building height threshold related to sprinklers)."

The initial statement is incorrect in that the problem identified, (NFPA 13R protected buildings with concealed combustible space attics being destroyed once a fire reaches the attic), is not limited to tall pedestal buildings. The problem includes buildings not utilizing the pedestal design option. From a fire protection standpoint there is no difference in the fire potential for rapid spread and destruction of the building when a fire reaches an attic 55 feet above the lowest level of fire department access whether or not the building sits upon a pedestal, the fire is still at

that 55 foot level.

The proponent indicates the proposal was developed by combining the concepts found within two code sections, one of those being Section D105.1 which applies to the need for aerial ladder fire apparatus access roads:

"D105.1 Where required. Where the vertical distance between the grade plane and the highest roof surface exceeds 30 feet (9144mm), approved aerial fire apparatus access roads shall be provided. For purposes of this section, the highest roof surface shall be determined by measurement to the eave of a pitched roof, the intersection of the roof to the exterior wall, or the top of parapet walls, whichever is greater."

Note that in Section D105.1 the height is measured from grade plane, (not from a fire apparatus access road), this is important because it is tied to the ability to deploy ground ladders and hand hose streams to combat a fire; and Section D105.1 uses a height of 30 feet which is a concept long contained within the code when assessing the ability to effectively use ground ladders and hand hose lines to combat fire as a trigger for standpipe installations.

This core concept involving the impact of height on the ability to effectively deploy ground ladders and hand hose lines to combat fire do not change based upon the existence of a pedestal. If anything, many pedestal designs negatively impact ground ladder placement where the portion of the building is recessed to the edge of the pedestal. Ground ladders are negatively impacted from placement at a proper climbing angle when placed at grade while simultaneously there may not be sufficient width of the exposed podium from the building face to edge of the podium for ground ladder placement at that level.

This proposal eliminates the reference to pedestal building construction, "designed in accordance with Section 510.2 or Section 510.4 of the International Building Code"; 55 feet above grade is 55 feet above grade regardless of whether or not there is an intervening pedestal. The rapidly spreading fire is 55 feet high and out of reach of effective ground ladder hose stream application.

The proposal also eliminates any reference to a fire vehicle access road. Whether or not there is a "required" fire apparatus access road does not change the impact of the height above grade plane for ground ladder placement.

The reference to "required fire vehicle access roads" was an intentionally restrictive trigger which ensured that the protection, already severely impacted by only applying to pedestal buildings, also only applied to sites with "required fire vehicle access roads". No required access roads, no application of this requirement. Whether or not there is a "required" fire apparatus access road does not change the impact of the height above grade plane for ground ladder placement. In addition, many fire departments are not part of the site design and approval process and do not have authority to require "designated fire apparatus access roads" on an approved site, they must rely on whatever paved areas that have been provided for routine motor vehicle traffic and parking.

Eliminating the two restrictive triggers will ensure that the "solution" added to the code will apply to any building utilizing Type III, Type IV or Type V construction once the height of the roof assembly reaches the 55 foot level above grade plane creating a concealed combustible space attic.

Note: Even with these suggested changes the resulting language will use a height trigger 15 feet higher than the historically recognized 30 feet above grade plane contained within the code dealing with the concept of height versus application of hand hose streams.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase the cost of construction for a portion of buildings that take advantage of pedestal construction combined with wood frame construction measures. This increased is outweighed by the cost of the destruction of buildings constructed in this manner when a fire event reaches the unprotected attic and destroys the entire building.

Internal ID: 2333

F122-18 Part I

IFC: 903.3.2 (IBC: [F] 903.3.2); IFGC: 303.3.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IFGC COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

Revise as follows:

903.3.2 Quick-response and residential sprinklers. Where *automatic sprinkler systems* are required by this code, quick-response or residential automatic sprinklers shall be installed in all of the following areas in accordance with Section 903.3.1 and their listings:

1. Throughout all spaces within a smoke compartment containing care recipient *sleeping units* in Group I-2 in accordance with the International Building Code.
2. ~~Throughout all spaces within a smoke compartment containing gas fireplace appliances and decorative gas appliances in Group I-2 in accordance with the International Building Code.~~
3. Throughout all spaces within a smoke compartment containing treatment rooms in ambulatory care facilities.
4. *Dwelling units* and *sleeping units* in Group I-1 and R occupancies.
5. Light-hazard occupancies as defined in NFPA 13.

Internal ID: 635

F122-18 Part II

IFGC: 303.3.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fuel Gas Code

Revise as follows:

303.3.1 Fireplaces and decorative appliances in Group I-2, Condition 2 occupancies. ~~Gas in Group I-2, Condition 2 occupancies, gas fireplace appliances and decorative gas appliances shall be prohibited in Group I-2, Condition 2 occupancies except where such appliances are direct-vent appliances installed in public lobby and waiting areas that are not within smoke compartments containing patient sleeping areas. The In Group I-2, Condition 1 occupancies, gas fireplace appliances and decorative gas appliances shall be prohibited in patient sleeping rooms. In Group I-2 occupancies, the appliance controls shall be located where they can be accessed only by facility staff. Such fireplaces shall comply with Sections 501.2 and 604.1 of this code and Section 915 of the International Fire Code.~~

Reason:

This change adds a requirement for quick response sprinkler heads within the smoke compartment where gas fireplace appliances and decorative gas appliances are installed in all Group I-2 facilities (K524). The second part of this change adds the prohibition of installing gas fireplace appliances and decorative gas appliances in nursing home patient rooms. Due to the defend-in-place practice within these building types prohibiting gas fireplace appliances and decorative gas appliances in nursing home patient rooms and requiring quick response sprinklers in the smoke compartment where a gas fireplace appliances and decorative gas appliances is installed will provide the necessary protection for patients, staff and visitors.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The cost will not be impacted because in new construction since all Group I-2 facilities are required to be fully sprinklered.

Internal ID: 3505

F123-18

IFC: 903.4, 903.4.1 (IBC: [F]903.4, [F]903.4.1); IEBC: 803.2.4

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

903.4 Sprinkler system supervision and alarms. Valves controlling the water supply for *automatic sprinkler systems*, pumps, tanks, water levels and temperatures, critical air pressures and waterflow switches on all sprinkler systems shall be electrically supervised by a *listed* fire alarm control unit.

Exceptions:

1. *Automatic sprinkler systems* protecting one- and two-family *dwelling*s.
2. Limited area sprinkler systems in accordance with Section 903.3.8.
3. *Automatic sprinkler systems* installed in accordance with NFPA 13R where a common supply main is used to supply both domestic water and the *automatic sprinkler system*, and a separate shutoff valve for the *automatic sprinkler system* is not provided.
4. Jockey pump control valves that are sealed or locked in the open position.
5. Control valves to commercial kitchen hoods, paint spray booths or dip tanks that are sealed or locked in the open position.
6. Valves controlling the fuel supply to fire pump engines that are sealed or locked in the open position.
7. Trim valves to pressure switches in dry, preaction and deluge sprinkler systems that are sealed or locked in the open position.
8. Underground key or hub gate valves in roadway boxes.

903.4.1 Monitoring. Alarm, supervisory and trouble signals shall be distinctly different and shall be automatically transmitted to an *approved* supervising station or, where *approved* by the *fire code official*, shall sound an audible signal at a constantly attended location.

Exceptions ~~Exception~~:

- ~~1. Underground key or hub valves in roadway boxes provided by the municipality or public utility are not required to be monitored.~~
- ~~2.1~~ Backflow prevention device test valves located in limited area sprinkler system supply piping shall be locked in the open position. In occupancies required to be equipped with a fire alarm system, the backflow preventer valves shall be electrically supervised by a tamper switch installed in accordance with NFPA 72 and separately annunciated.

2018 International Existing Building Code

Revise as follows:

803.2.4 Supervision. Fire sprinkler systems required by this section shall be supervised by one of the following methods:

1. *Approved* central station system in accordance with NFPA 72.
2. *Approved* proprietary system in accordance with NFPA 72.
3. *Approved* remote station system of the jurisdiction in accordance with NFPA 72.
4. Where *approved* by the *code official*, *approved* local alarm service that will cause the sounding of an alarm in accordance with NFPA 72.

Exception: Supervision is not required for the following:

1. Underground ~~gate valve with~~ key or hub gate valves in roadway boxes.
2. Halogenated extinguishing systems.
3. Carbon dioxide extinguishing systems.

4. Dry- and wet-chemical extinguishing systems.
5. Automatic sprinkler systems installed in accordance with NFPA 13R where a common supply main is used to supply both domestic and automatic sprinkler systems and a separate shutoff valve for the automatic sprinkler system is not provided.

Reason:

This change correlates the underground gate valves of fire protection systems in the IBC, IFC, and IEBC. It removes the monitoring requirement to private underground gate valves and places it in the supervision exceptions. The result: underground gate valves with specials keys are not required to be supervised or monitored. Per 2015 IFC Commentary for 903.4.1: "Exception 1 recognizes that underground key or hub valves in roadway boxes are not normally supervised or required to be supervised by this section or NFPA 13."

These requirements have been in the IBC since the first edition in 2000 and it appears to come from the earlier editions of the BOCA code. A strict reading of Section 903.4 appears that a private roadbox would be required to be supervised because the specific language says it has to be monitored, however, the actual code path and information contained in the IBC, IFC, the commentary, NFPA 13, NFPA 24 and NFPA 25 suggests a different intent. The IFC references NFPA 24 (via IFC 507.2.1) for installation of private service mains. In NFPA 24, Section 6.7.3, does not require supervision of underground roadway gate valves, regardless of ownership. If there is no supervision, there certainly cannot be monitoring of a missing device. Furthermore, an informal survey of code officials and supervision device manufacturers reveal no enforcement of this section as it is written and the market lacks devices available to achieve this requirement.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code is unenforceable as written.

Internal ID: 184

F124-18

IFC: 904.14 (IBC: [F]904.14), 904.14.1

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

~~904.14~~ ~~904.12~~ **Aerosol fire-extinguishing systems.** Aerosol fire-extinguishing systems shall be installed, maintained, periodically inspected ~~, and tested and maintained~~ in accordance with ~~Sections 901 and 904.4~~, NFPA 2010, and ~~in accordance with their listing.~~

Such devices and appurtenances shall be listed and installed in compliance with manufacturer's instructions.

~~904.14.1~~ ~~904.12.1~~ **Maintenance.** Not less than semiannually, an inspection shall be conducted by a trained person to assess whether the system is in working order. Not less than annually, a certified fire suppression contractor having knowledge of and training in the installation, operation and maintenance of the specific fire-extinguishing system shall inspect, test, service and maintain such system in accordance with this section and the manufacturer's specifications and servicing manuals. Records of inspections and testing shall be maintained.

Reason:

Section 904.14 for aerosol fire-extinguishing systems is relocated so that it is located with the other alternative fire-extinguishing systems. Then the requirements for Commercial Cooking Systems are moved to 904.13. This provides for proper formatting and sequencing of code requirements.

The references to Sections 901 and 904.4 are deleted. This reference is redundant since all fire-extinguishing systems must already comply with both Section 901 and Section 904.4.

Section 904.12.1 is revised to specify that inspection and testing records must be maintained. This correlates with the global revisions for record maintenance that occurred in code change ADM43-13.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an editorial change with no impact on enforcement or application.

Internal ID: 2025

F125-18

IFC: 905.11 (IBC: [F]905.11)

Proponent: David Kerr, Knox Corporation, representing Knox Corporation

2018 International Fire Code

Revise as follows:

905.11 Locking standpipe outlet caps. The *fire code official* is authorized to require locking caps on the outlets on ~~dry~~ standpipes where the responding fire department carries key wrenches for the removal that are compatible with locking FDC connection caps.

Reason:

Wet pipe standpipe systems are subject to vandalism. It has been reported that caps have been removed and valves opened allowing water to flow into stairwells causing flooding to buildings. Removing the word "dry" allows the Fire Department to require or allow the building owner to install locking caps on an as needed bases clarifying the intent of the existing code. If caps are missing, debris can enter the outlet and if not properly cleared, it will clog the fire fighter nozzle.

Cost Impact

The code change proposal will increase the cost of construction .

The cost of the cap is \$250.

Internal ID: 1242

F126-18

IFC: 905.3.1 (IBC: [F] 905.3.1)

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

905.3.1 Height. Class III standpipe systems shall be installed throughout buildings where any of the following conditions exist:

1. Four or more stories are above or below grade plane.
2. The floor level of the highest story is located more than 30 feet (9144 mm) above the lowest level of the fire department vehicle access.
3. The floor level of the lowest story is located more than 30 feet (9144 mm) below the highest level of fire department vehicle access.

Exceptions:

1. Class I standpipes are allowed in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Class I standpipes are allowed in Group B and E occupancies.
3. Class I ~~manual~~ standpipes are allowed in ~~open parking garages where the highest floor is located not more than 150 feet (45 720 mm) above the lowest level of fire department vehicle access.~~ parking garages.
4. ~~Class I manual~~ Semi-automatic dry standpipes are allowed in open parking garages that are subject to freezing temperatures, ~~provided that the hose connections are located as required for Class II standpipes in accordance with Section 905.5.~~ temperatures.

Reason:

The purpose of this change is to modify the two exceptions addressing standpipe system installed in open parking garages. The exceptions have been in the IFC/IBC unchanged since the 2000 editions of the codes while the materials in vehicles has changed to add more combustible synthetic material, thinner/lighter metals and a growing increase of alternative fueled vehicles, GH2, CNG, LPG and Lithium-Ion batteries. Electric Vehicle charging stations have been installed within parking garages to encourage their use.

Basically, the current requirements for parking garages, open or closed, in the codes are based on old vehicle concepts and studies.

Multi-vehicle large fires can occur and have occurred. As in any multi-story building, effective firefighting actions to protect life and property involved being able to quickly apply water to the fire. The type of fire and danger presented by that fire has increased as the use of alternative fueled vehicles has increased.

This proposal deletes the options for manual standpipes which as a rule require extra effort on the part of the fire service to get water to upper stories and attempt extinguishment of the fire. In place is allowance for Class I standpipes to be installed in any parking garage. The standpipes are there for firefighter use, in the rare occurrence a parking garage opts to have trained personnel they can add the necessary outlet reducer and hose line.

The proposal also calls for semi-automatic dry systems where subject to freezing temperatures. As part of that change the Class II location requirement was eliminated.

NFPA 14 2016 edition

3.3.17.6 Semiautomatic Dry Standpipe System. A standpipe system permanently attached to a water supply that is capable of supplying the system demand at all times arranged through the use of a device such as a deluge valve and that requires activation of a remote control device to provide water at hose connections.

Neither the height of the story the fire is located on or the temperature of the atmosphere impacts the size of the fire and amount of water needed to be rapidly applied. The standpipe systems should meet all the requirements for a semi-automatic dry system which will provide for a more rapid water supply availability.

The fuel loads have changed significantly in parking garages due to modern manufacturing methods and the increased use of alternative fuels. Improvement in the requirements of the codes is necessary to address those changes.

Background material.

<http://www.urbanfiretraining.com/parking-garages.html>

<http://www.firerescuemagazine.com/articles/print/volume-7/issue-2/strategy-and-tactics/fighting-vehicle-fires-in-parking-garages.html>

<http://www.fireengineering.com/ap-news/2018/01/01/parking-garage-fire-destroys-hundreds-of-cars-in-uk.html>

<https://www.youtube.com/watch?v=KVx6avRTNCA>

<https://www.youtube.com/watch?v=HK0U-PKJ1NE>

Cost Impact

The code change proposal will increase the cost of construction .

This proposal will increase costs but is balanced with allowance for Class I standpipes in all parking garages and by eliminating the Class II outlet location requirements. The nature of the fuel load has changed within parking structures and fire protection systems need to be improved to deal with the potential fires.

Internal ID: 2174

F127-18

IFC: 905.4 (IBC: [F]905.4)

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

905.4 Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1. In every required ~~interior~~ exit stairway, a hose connection shall be provided for each story above and below grade plane. Hose connections shall be located at the main floor landing unless otherwise approved by the fire code official.
Exception: A single hose connection shall be permitted to be installed in the open corridor or open breezeway between open stairs that are not greater than 75 feet (22 860 mm) apart.
■
Exception: Where floor areas adjacent to a horizontal exit are reachable from an interior exit stairway hose connection by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30 480 mm) of hose, a hose connection shall not be required at the horizontal exit.
■
3. In every exit passageway, at the entrance from the exit passageway to other areas of a building.
Exception: Where floor areas adjacent to an exit passageway are reachable from an interior exit stairway hose connection by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30 480 mm) of hose, a hose connection shall not be required at the entrance from the exit passageway to other areas of the building.
■
4. In covered mall buildings, adjacent to each exterior public entrance to the mall and adjacent to each entrance from an exit passageway or exit corridor to the mall. In open mall buildings, adjacent to each public entrance to the mall at the perimeter line and adjacent to each entrance from an exit passageway or exit corridor to the mall.
5. Where the roof has a slope less than four units vertical in 12 units horizontal (33.3-percent slope), a hose connection shall be located to serve the roof or at the highest landing of an interior exit stairway with access to the roof provided in accordance with Section 1011.12.
6. Where the most remote portion of a nonsprinklered floor or story is more than 150 feet (45 720 mm) from a hose connection or the most remote portion of a sprinklered floor or story is more than 200 feet (60 960 mm) from a hose connection, the fire code official is authorized to require that additional hose connections be provided in approved locations.

Reason:

This proposal is designed to fill a gap in standpipe hose connection requirements. If a standpipe is required, and the required exit stairs are exterior, there is no criteria on location of standpipe hose connections.

For example, IBC Section 406.5.8 requires open parking garages to be provided with a standpipe system when required by Section 905.3. Section 905.3 requires a Class III standpipe system in buildings where the floor level is 30 feet or more above or below the level of fire department vehicle access. So, when a parking garage is required to be provided with a standpipe, the user then refers to Section 905.4 which specifies where the hose connections are to be located. Section 905.4 requires a Class I hose connections at:

1. On each landing of an interior exit stairway – while stairways are provided, they most likely are not interior exit stairways.
2. On each side of horizontal exit – most likely not provided in an open parking garage.
3. In each exit passageway – most likely not provided in an open parking garage.
4. This item is specific to covered malls.
5. On the roof – possibly could be interpreted that the top tier is a roof...
6. This item requires additional connections, beyond the connections listed in Items 1 through 5

The question then arises, where are Class I hose connections required? Therefore, Item 1 is revised to include ALL required stairways.

Section 1027 allows exterior exit stairways in buildings up to six stories in height. A standpipe is required at 4 stories in height, so this building must have a standpipe, but Section 905.4 does not specify anything for exterior exit stairways.

The revision to Item 1 would now include both interior and exterior exit stairways. The exception to Item 3 is revised to correlate with the revision in Item 1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarifies application of section.

Internal ID: 2321

F128-18

IFC: 905.9 (IBC: [F] 905.9)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

905.9 Valve supervision. Valves controlling water supplies shall be supervised in the open position so that a change in the normal position of the valve will generate a supervisory signal at the supervising station required by Section 903.4. Where a fire alarm system is provided, a signal shall be transmitted to the control unit.

Exceptions:

1. Valves to underground key or hub valves in roadway boxes ~~provided by the municipality or public utility~~ do not require supervision.
2. Valves locked in the normal position and inspected as provided in this code in buildings not equipped with a fire alarm system.
3. Control valves and isolation valves for dry manual standpipes are permitted to be locked in the open position.

Reason:

In Exception 1, the removal of the supervision requirement for municipal or public utility roadboxes correlates to a similar proposal made to IFC/IBC 903.4. NFPA 24, referenced by the IFC does not require supervision of private main roadboxes. By removing this text, it would apply to be public and private mains.

In Exception 3, the fire department is the water supply for dry manual standpipe systems. Section 5.6.1 of NFPA 14 specifically states electrical supervision for the control valve in a dry manual standpipe system is not required. This may seem to contradict Section 6.3.7.1 of NFPA 14, but a dry manual standpipe system is not connected to an automatic system water supply. Dry manual standpipes are supplied by the fire department and the valve position is controlled by the fire department. Locking the control valve (if provided) for the dry manual system in the open position insures uninterrupted operation when the system is pressurized.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal clarifies which valves are required to be electrically supervised and which valves are permitted to be locked. This will provide consistency in the market and eliminate alternate interpretations of the code.

Internal ID: 189

F129-18

IFC: 906.1 (IBC: [F] 906.1)

Proponent: Daniel E Nichols, MTA Metro-North Railroad- New York, NY, representing MTA Metro-North Railroad (dnichols@mnr.org)

2018 International Fire Code

Revise as follows:

906.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

1. In new and existing buildings containing Group A, B, E, F, H, I, M, R-1, R-2, R-4 ~~and or~~ S occupancies.

Exceptions:

1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
2. Within 30 feet (9144 mm) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Reason:

The term "occupancy" is not a defined term to cover the actual area when fire extinguisher coverage is required. It is assumed that it is within a building, but could be confused as an outdoor space where the occupant load is calculated for appropriate exiting features or to provide accessible accommodations. Examples would be outdoor patio spaces, passenger train platforms, and outdoor storage areas with weather coverings. This change clarifies the intent of the use of the word "occupancy" as it applies to spaces within buildings.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification to ensure the application of fire extinguisher installation meets the intent of the existing language. No change in application is intended by this change.

Internal ID: 938

F130-18

IFC: 906.1 (IBC:[F] 906.1)

Proponent: Dave Frable, U.S. General Services Administration, representing U.S. General Services Administration

2018 International Fire Code

Revise as follows:

906.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exceptions:

1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
3. In Group B occupancies protected throughout by an automatic sprinkler system designed and installed in accordance Section 903.3.1.1 utilizing quick-response sprinklers, portable fire extinguishers shall be required only in locations specified in Items 2 through 6.
2. Within 30 feet (9144 mm) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Reason:

The intent of this code change is to permit a building owner to be exempt from installing portable fire extinguishers in common areas as well as tenant spaces in new and existing Group B occupancies if the Group B occupancy is protected throughout with an automatic sprinkler system designed and installed in accordance with NFPA 13 that utilizes quick response sprinklers. The faster acting sprinklers and the lower fuel load associated with Group B occupancies alleviate the need for portable fire extinguishers to be installed throughout non-hazardous areas within this occupancy.

Please note that the typical evacuation strategy for Group B occupancies is for building occupants to evacuate the building or relocate to a safe area within the building in lieu of delaying evacuation/relocation and having occupants attempt to utilize a portable fire extinguisher to try to extinguish a fire.

It should be noted that the requirements in the IFC do not require building occupants to be assigned firefighting duties and be trained to know the locations and proper use of portable fire extinguishers. The IFC (Section 406.3.3) only requires the building owner's employees assigned firefighting responsibilities to be trained to know the locations and proper use of portable fire extinguishers and does not apply to the occupants of the building.

In addition, fire department personnel typically will not use the portable fire extinguishers which have been installed within a building due to the uncertainty they have regarding the subject extinguisher operating when needed. Therefore, the installation of this type of manual extinguishing equipment throughout a Group B occupancy protected by an operational sprinkler system utilizing quick-response sprinklers is questionable and not justifiable.

It should also be noted that the Occupational Safety and Health Administration (OSHA), 29 CFR 1910.157(g)(1), also addresses portable fire extinguishers by specifically stating: "Where the employer has provided portable fire extinguishers **for employee use** in the workplace, the employer shall also provide an educational program to familiarize employees with the general principles of fire extinguisher use and the hazards involved with incipient stage firefighting." Therefore, if portable fire extinguishers have been installed in a building and have been designated for occupant use and incorporated into the building's fire safety plan, training would be required. However, if this protocol

for occupants using portable fire extinguishers is not incorporated in the building's fire safety plan, no training would be required. Hence, the occupants will not be properly trained to use the subject portable fire.

Fire is a rare event; however, should a fire occur in this occupancy, the probability that occupants are knowledgeable and have been trained proficiently in the use of portable fire extinguishers to effectively extinguish a fire is low. We also believe the cost associated with the installation of portable fire extinguishers in these occupancies is unjustified, taking into consideration maintaining the subject fire extinguishers for the life of the building. We also believe these costs savings would be better expended active fire detection and suppression systems.

Some opponents of this code change may argue that fire extinguishers are still the first line of defense in many situations and therefore should not be removed in Group B occupancies since occupants should be able to use them if they choose to do so. However, if this is the case, the installation of portable fire extinguishers in Group B occupancies should be a choice and not a requirement. We believe that when a fire does occur in an office building, evacuation of the building should be the first action of the occupants; in lieu of delaying evacuation/relocation and having untrained occupants attempt to utilize a portable fire extinguisher to try to extinguish a fire.

Lastly, it should be noted that this exception was deleted from the Code in 2012 based on the concerns from fire code officials that it was inappropriate to place complete reliance on automatic fire sprinkler systems for the protection of Group A (Assembly) occupancies (not Group B occupancies) and a National Institute of Standards and Technology (NIST) investigation report of the Station Nightclub fire. In addition, the proposed exception for Group B occupancies does not eliminate portable fire extinguishers where the fire risk is a concern (e.g., special hazard areas, areas where flammable and combustible liquids are stored, used, dispensed, etc.). Therefore, we do not believe that the proposed exception for Group B occupancies will present an increased hazard to the safety of the occupants - evacuation of the building should be the first action of the occupants, not fighting the fire.

Therefore, we believe the installation of this type of manual extinguishing equipment throughout a Group B occupancy equipped with an operational sprinkler system utilizing quick-response sprinklers is questionable and not warranted or cost effective (e.g., installation costs, maintenance costs, etc.) over the life of a building.

Cost Impact

The code change proposal will decrease the cost of construction .

This exception will decrease the initial costs of construction (installation of portable fire extinguisher cabinets and portable fire extinguishers) as well as decreasing the maintenance costs over the life of the building.

Internal ID: 1508

F131-18

IFC: 906.1 (IBC: [F]906.1)

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

906.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exceptions:

1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
3. In storage areas of Group S Occupancies where forklift, powered industrial truck or cart operators are the primary occupants, fixed extinguishers, as specified in NFPA 10, shall not be required where in accordance with all of the following:
 - 3.1. Use of vehicle mounted extinguishers shall be approved by the fire code official.
 - 3.2. Each vehicle shall be equipped with a 10-pound, 40A:80B:C extinguisher affixed to the vehicle using a mounting bracket approved by the extinguisher manufacturer or the fire code official for vehicular use.
 - 3.3. Not less than two spare extinguishers of equal or greater rating shall be available onsite to replace a discharged extinguisher.
 - 3.4. Vehicle operators shall be trained in the proper operation, use and inspection of extinguishers.
 - 3.5. Inspections of vehicle mounted extinguishers shall be performed daily.
2. Within 30 feet (9144 mm) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Reason:

A similar allowance to what is proposed for Exception 3 has been permitted by NFPA 1 since 2006 and was the result of a collaborative effort between the me and the Fire Equipment Manufacturers Association representative at the time. In large storage warehouses where the occupants are primarily riding on powered industrial trucks, it makes more sense to provide the operator with a suitable extinguisher on the truck, with the operator, vs. distributing them around the facility. They are more readily accessible to the operator, improving the speed of deployment, and this proposal requires daily inspections, operator training and the availability of spare extinguishers to improve reliability of fire extinguisher use.

Cost Impact

The code change proposal will decrease the cost of construction .

This proposal may reduce the number of fire extinguishers required in storage areas of Group S occupancies, where permitted by the fire code official.

F132-18

IFC: 906.1 (IBC: [F] 906.1)

Proponent: Richard Kluge, Ericsson Inc., representing Alliance for Telecommunications Industry Solutions (richard.kluge@ericsson.com)

2018 International Fire Code

Revise as follows:

906.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exceptions:

1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
2. Within 30 feet (9144 mm) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Exception: Portable fire extinguishers are not required at normally unmanned buildings or structures where a portable fire extinguisher suitable to the hazard of the location is provided on the vehicle of visiting personnel.

Reason:

The IFC section 906 Commentary repeatedly discusses the use of Portable Fire Extinguishers for incipient fire control to allow for increased time for evacuation, but these benefits are not applicable to unmanned locations.

US telecommunication carriers operate a large number of small unmanned equipment facilities. It is not practical to install and maintain Portable Fire Extinguishers in accordance with NFPA 10 at normally unmanned locations as explained below.

Backup generators at remote telecommunications locations provide telecommunications services when commercial ac power fails. These sites may have diesel fuel or liquified propane gas (LPG) stored either indoors or outdoors. Fuel oil, when used, is typically less than 660 gallons in capacity. The sites are normally unmanned. Technicians will travel to the sites only when needed for repairs or maintenance activities. These sites are considered Utility and Miscellaneous Group U occupancies under the IBC. Adherence to the current Section 906 of the IFC requires keeping an extinguisher at the site in compliance with NFPA 10. This requires monthly inspections. For rarely visited remote locations, compliance to NFPA 10 entails a monthly visit for the sole purpose of inspecting the extinguisher, which while possible, is not reasonable. Certain remote and isolated locations are not accessible or impractical to visit during winter months as access is blocked by snow. Furthermore, if there were a fire, the vast majority of the time, there is no one on site to use the extinguisher as the site is not manned. Having a Portable Fire Extinguisher on the technician's vehicle when servicing the site is a more effective alternative to a fixed site-mounted extinguisher. The Portable Fire Extinguisher carried on the vehicle can be inspected and maintained per NFPA 10 and ready for use if necessary.

From the International Building Code Commentary

Per IBC Section 312, Utility and Miscellaneous Group U Commentary: "Structures housing accessory equipment that is part of a utility or communications system are often classified as Group U occupancies when there is no intent that these structures be occupied except for serving and maintaining the equipment within the structure." This language supports an exemption to clearly state the Portable Fire Extinguishers are not required in unmanned or unoccupied

Group U structures when visiting personnel have extinguishers available.

Related content from NFPA 76, Standard for Fire Protection of Telecommunications Facilities

NFPA 76, Chapter 11, “Small Unoccupied Structures” applies to small normally unoccupied telecommunications sites including on-grade walk-in cabinets, on-grade huts, cell huts, and controlled environmental vaults. Section 11.2.3 clearly states that portable fire extinguishers shall not be required in these facilities.

Related content from CFR, Subchapter N, Artificial Islands and Fixed Structures on the Outer Continental Shelf

Code of Federal Regulations of the United States of America, Subchapter N, Artificial Islands and Fixed Structures on the Outer Continental Shelf, Part 145 Fire-Fighting Equipment also supports the position that fire extinguishers in unmanned locations are not required. Per the CFR, Subchapter N, Artificial Islands and Fixed Structures on the Outer Continental Shelf, Part 14, fire extinguishers are only required when crews will be working at the site on a 24-hour basis. Continual deployment of Portable Fire Extinguishers at unmanned locations provides no value and is not practical.

Cost Impact

The code change proposal will decrease the cost of construction .

The cost of code compliance will decrease if portable fire extinguishers will not be required to be installed and maintained at unmanned locations.

Internal ID: 1614

F133-18

IFC 906.2; IBC: [F] 906.2

Proponent: Daniel E Nichols, MTA Metro-North Railroad- New York, NY, representing MTA Metro-North Railroad (dnichols@mnr.org)

2018 International Fire Code

Revise as follows:

906.2 General requirements. Portable fire extinguishers shall be selected, installed and maintained in accordance with this section and NFPA 10.

Exceptions:

1. The distance of travel to reach an extinguisher shall not apply to the spectator seating portions of Group A-5 occupancies.
2. The distance of travel to reach an extinguisher shall not apply to portions of buildings where a fire safety plan, developed in accordance with Chapter 4, states that only trained employees shall utilize portable fire extinguishers and all others immediately evacuate.
3. Thirty-day inspections shall not be required and maintenance shall be allowed to be once every 3 years for dry-chemical or halogenated agent portable fire extinguishers that are supervised by a *listed* and *approved* electronic monitoring device, provided that all of the following conditions are met:
 - ~~2.1.3.1.~~ Electronic monitoring shall confirm that extinguishers are properly positioned, properly charged and unobstructed.
 - ~~2.2.3.2.~~ Loss of power or circuit continuity to the electronic monitoring device shall initiate a trouble signal.
 - ~~2.3.3.3.~~ The extinguishers shall be installed inside of a building or cabinet in a noncorrosive environment.
 - ~~2.4.3.4.~~ Electronic monitoring devices and supervisory circuits shall be tested every 3 years when extinguisher maintenance is performed.
 - ~~2.5.3.5.~~ A written log of required hydrostatic test dates for extinguishers shall be maintained by the *owner* to verify that hydrostatic tests are conducted at the frequency required by NFPA 10.
- ~~3.4.~~ In Group I-3, portable fire extinguishers shall be permitted to be located at staff locations.

2018 International Building Code

Revise as follows:

[F] 906.2 General requirements. Portable fire extinguishers shall be selected and installed in accordance with this section and NFPA 10.

Exceptions:

1. The distance of travel to reach an extinguisher shall not apply to the spectator seating portions of Group A-5 occupancies.
2. The distance of travel to reach an extinguisher shall not apply to portions of buildings where a fire safety plan, developed in accordance with Chapter 4, states that only trained employees shall utilize portable fire extinguishers and all others immediately evacuate.
3. In Group I-3, portable fire extinguishers shall be permitted to be located at staff locations.

Reason:

The purpose of this proposal is to permit latitude in the locations of portable fire extinguishers within buildings that have a fire safety plan which focuses on prompt evacuation rather than fire extinguisher use.

For those areas covered by the worker protection requirements of OSHA, the removal of the distribution requirements of portable fire extinguishers is addressed in 49 CFR 1910.157(b)(2), which states:

"Where the employer has an emergency action plan meeting the requirements of 1910.38 which designates certain employees to be the only employees authorized to use the available portable fire extinguishers, and which requires all other employees in the fire area to immediately evacuate the affected work area upon the sounding of the fire alarm, the employer is exempt from the distribution requirements in paragraph (d) of this section"

For areas that aren't regulated by OSHA like public access assembly spaces and residential units, training on the use of fire extinguishers is minimal at best. All instructions that are given in public areas and provided on manufacturer's installation instructions for residential smoke alarms is to immediately evacuate when an alarm sounds.

To utilize this exception, one of two processes would need to occur. For most buildings, a fire safety plan required by Section 403 would need to be submitted to the Fire Code Official for approval. Since portable fire extinguishers are a required item of the plan, the layout and specific location of extinguishers would need to be approved. For all other buildings, a fire safety plan would need to be created and be approved by the Fire Code Official even though it isn't required by Chapter 403 (mainly for smaller buildings). Either way, the fire code official approves the modified distribution plan.

In locations where fire extinguishers could be sourced as a potential security issue, the coordination of the fire safety plan and the security priorities of the building ensure both fire protection and security are maintained. By having the ability to move fire extinguishers to areas that are still accessible by trained personnel while lessening a security threat, this promotes maintaining good fire protection while having the fire code official as an integral part of the all-hazards emergency action plan for the building.

As a final note, the intent of this proposal is to maintain the requirement for fire extinguishers in buildings and is not to be construed as a method to remove fire extinguishers completely from buildings. As a point of information, the complete removal is permitted by 1910.157 (b)(1) for workplaces regulated by OSHA; but this proposal is based on the requirements of 1910.157 (b)(2) only.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost impact to construction as this is to provide latitude in the distribution of the portable fire extinguishers.

Internal ID: 940

F134-18

IBC: 907.2 (IBC: [F] 907.2)

Proponent: Ryan Wyse, Hebron Fire Department, representing Hebron Fire Department (ryan.wyse@hebronfd.org)

2018 International Fire Code

Revise as follows:

907.2 Where required—new buildings and structures. An *approved* fire alarm and detection system installed in accordance with the provisions of this code and NFPA 72 shall be provided in new buildings and structures in accordance with Sections 907.2.1 through 907.2.23 and provide occupant notification in accordance with Section 907.5, unless other requirements are provided by another section of this code.

Not fewer than one manual fire alarm box shall be provided in an *approved* location to initiate a fire alarm signal for fire alarm systems employing automatic fire detectors or waterflow detection devices. Where other sections of this code allow elimination of fire alarm boxes due to sprinklers, a single fire alarm box shall be installed.

Exceptions:

1. The manual fire alarm box is not required for fire alarm systems dedicated to elevator recall control and supervisory service.
2. The manual fire alarm box is not required for Group R-2 occupancies unless required by the *fire code official* to provide a means for fire watch personnel to initiate an alarm during a sprinkler system impairment event. Where provided, the manual fire alarm box shall not be located in an area that is open to the public.

Reason:

It is my belief that the intent of the code was to require a fire alarm system capable of: receiving notification of a fire, whether automatically or manually; notify the occupants; and notify the fire department within every building applicable to this code for the following reasons:

- All of the group exceptions use the term "manual fire alarm system" or "manual fire alarm box". If the intent of an exception was to eliminate the requirement of the fire alarm system completely, there would be no reason to specifically say "manual". Using the term manual implies that there must also be an automatic available.

- The definition of "fire alarm system" in 902.1 defines it as a system that monitors and annunciates the status of a fire alarm and initiates the appropriate response. Well, if my building is unsprinklered and an exception to requiring the manual pull station applies to me, what else would my approved fire alarm system that "shall be provided" monitor other than detectors?

The specific occupancy classifications and their exceptions listed in 2.1 through 2.23 only provide permission to omit the required manual pull stations and do not imply the permission to omit the fire alarm system completely. Unfortunately, this is how every fire & building code official I have met has interpreted this. My building code official right now is not requiring a fire alarm system in a tire & repair shop, because they don't have an occupancy load of 500 or more, and so on, per Section 907.2.2. There is a significantly large portion of the code enforcement community that believe that a fire alarm system with detectors is not required when they meet an exception for the manual fire alarm box or the building is unsprinklered.

By adding "and detection" to 907.2, it is my hope that others will have an easier time identifying that an alarm system is still required, even though it may not require the manual pull station. My intent of this code change is not to simply change the wording, but correct the problem. So, if you feel that other wording is more appropriate to achieve this goal, please do so.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed change will increase the cost of construction, since they will now have to pay for a fire alarm system that the code official mistakenly waved. However, it also will not increase the costs, because the alarm system has always been required. It just hasn't been enforced properly.

There would also be a cost impact to the insurance industry, because the proper enforcement of the code would mean that the fire department will be notified faster than waiting for someone to call it in when flames are through the roof.

F135-18

IFC: 907.2.1, 907.2.1.1, 907.2.1.2, 907.5.2.2, 907.5.2.2.4, 907.5.2.2.5; IBC: [F] 907.2.1.1 , 1108.2.7.3

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Fire Code

907.2.1 Group A. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group A occupancies where the occupant load due to the assembly occupancy is 300 or more, or where the Group A occupant load is more than 100 persons above or below the *lowest level of exit discharge*. Group A occupancies not separated from one another in accordance with Section 707.3.10 of the International Building Code shall be considered as a single occupancy for the purposes of applying this section. Portions of Group E occupancies occupied for assembly purposes shall be provided with a fire alarm system as required for the Group E occupancy.

Exception: Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

Revise as follows:

907.2.1.1 System initiation in Group A occupancies with an occupant load of 1,000 or more. Activation of the fire alarm in Group A occupancies with an *occupant load* of 1,000 or more shall initiate a signal using an emergency voice/alarm communications system in accordance with Section 907.5.2.2.

~~Exception-Exceptions:~~

1. Where *approved*, the prerecorded announcement is allowed to be manually deactivated for a period of time, not to exceed 3 minutes, for the sole purpose of allowing a live voice announcement from an *approved*, constantly attended location.
2. An emergency voice/alarm communication system is not required for open air assembly bleacher seating with an occupant load of less than 15,000 in accordance with ICC 300.

907.2.1.2 Emergency voice/alarm communication system captions. Stadiums, arenas and grandstands required to caption audible public announcements shall be in accordance with Section 907.5.2.2.4.

907.5.2.2 Emergency voice/alarm communication systems. Emergency voice/alarm communication systems required by this code shall be designed and installed in accordance with NFPA 72. The operation of any automatic fire detector, sprinkler waterflow device or manual fire alarm box shall automatically sound an alert tone followed by voice instructions giving *approved* information and directions for a general or staged evacuation in accordance with the building's fire safety and evacuation plans required by Section 404. In high-rise buildings, the system shall operate on at least the alarming floor, the floor above and the floor below. Speakers shall be provided throughout the building by paging zones. At a minimum, paging zones shall be provided as follows:

1. Elevator groups.
2. *Interior exit stairways*.
3. Each floor.
4. *Areas of refuge* as defined in Chapter 2.

Exception: In Group I-1 and I-2 occupancies, the alarm shall sound in a constantly attended area and a general occupant notification shall be broadcast over the overhead page.

907.5.2.2.4 Emergency voice/alarm communication captions. Where stadiums, arenas and grandstands have 15,000 fixed seats or more and provide audible public announcements, the emergency/voice alarm communication system shall provide pre-recorded or real-time captions. Prerecorded or live emergency captions shall be from an *approved* location constantly attended by personnel trained to respond to an emergency.

907.5.2.2.5 Emergency power. Emergency voice/ alarm communications systems shall be provided with emergency power in accordance with Section 1203. The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.

2018 International Building Code

1108.2.7.3 Public address systems. Where stadiums, arenas and *grandstands* have 15,000 fixed seats or more and provide audible public announcements, they shall also provide prerecorded or real-time captions of those audible public announcements.

Reason:

The ICC 300 Section 309 provides for situations where a emergency voice alarm system is not required. The intent of this proposal is for coordination between those allowances. Typically a more restrictive requirement in the code would over ride an allowance in the standard. For outdoor bleacher systems, the ICC 300 has appropriate thresholds that should be allowed.

SECTION 309

FIRE PROTECTION

309.1 Fire protection. Fire protection systems shall be provided where required by the building code.

Exceptions:

1. An emergency voice/alarm system is not required for outdoor bleacher-type seating provided all of the following are met:

1.1. The bleacher-type seating has an occupant load of less than 15,000;

1.2. A public address system with standby power is provided;

1.3. Enclosed spaces attached or immediately adjacent to the bleacher-type seating comprise, in the aggregate, 10% or less of the overall area of the bleacher-type seating or 1,000 square feet (92.9 square meters), whichever is less.

1.4. Spaces under the bleacher-type seating shall be separated from the bleacher-type seating in accordance with Section 1029.1.1.1 of the International Building Code

1.5. All means of egress from the bleacher-type seating are open to the outside.

2. An emergency voice/alarm system is not required for outdoor bleacher-type seating with an occupant load of 300 or less.

3. An emergency voice/alarm system is not required for temporary outdoor bleacher-type seating providing all of the following are met:

3.1. There are no enclosed spaces under or attached to the bleacher-type seating;

3.2. The bleacher-type seating is erected for a period of less than 180 days;

3.3. Evacuation of the bleacher-type seating is included in an approved fire safety plan.

Cost Impact

The code change proposal will decrease the cost of construction .

If this is allowed, this could be a reduction in requirements for alarms for outdoor bleachers.

Internal ID: 738

F136-18

IFC: 907.2.2 (IBC: [F] 907.2.2)

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Fire Code

Revise as follows:

907.2.2 Group B. A manual fire alarm system, that activates the occupant notification system in accordance with Section 907.5, shall be installed in Group B occupancies where one of the following conditions exists:

1. The combined Group B *occupant load* of all floors is 500 or more.
2. The Group B *occupant load* is more than 100 persons above or below the lowest *level of exit discharge*.
3. The *fire area* contains an ambulatory care facility.

Exception: Manual fire alarm boxes are not required where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

Reason:

All the other sections in 907.2 include similar phrasing that clearly states that an occupant notification system is a part of the design. The language seeks to clarify the intent and provide consistency among the similar code sections.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change is clarification only.

Internal ID: 1130

F137-18

IFC: 907.2.22 (IBC: [F] 907.2.22)

Proponent: Richard Kluge, representing Alliance for Telecommunications Industry Solutions
(richard.kluge@ericsson.com)

2018 International Fire Code

Revise as follows:

907.2.22 Battery rooms. An automatic smoke detection system shall be installed in areas containing stationary storage battery systems as required in Section 1206.2.

Exception: Normally unoccupied, stand-alone telecommunications structures with a gross floor area of less than 1500 ft² (140 m²) shall not be required to have an automatic smoke detection system.

Reason:

There is little value to installing a fire or smoke detection system in a small normally unoccupied, stand-alone telecommunications structure. These facilities are categorized as USe Group U facilities under the IBC. There is no intent that these structures be occupied except for servicing and maintaining the equipment they house. The recommended text is consistent with NFPA 1 chapter 52 on Energy Storage Systems as well as pending changes to NFPA 76 on Telecommunications facilities.

Cost Impact

The code change proposal will decrease the cost of construction .

Not requiring detection in these sites will decrease the cost of code compliance in initial construction, as well as ongoing operations, testing, maintenance.

2018 International Fire Code

Delete and substitute as follows:

~~**907.2.3 Group E.** A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. Where *automatic sprinkler systems* or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.~~

Exceptions:

- ~~1. A manual fire alarm system is not required in Group E occupancies with an *occupant load* of 50 or less.~~
- ~~2. Emergency voice/alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual fire alarm system initiates an *approved* occupant notification signal in accordance with Section 907.5.~~
- ~~3. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
 - ~~3.1. Interior *corridors* are protected by smoke detectors.~~
 - ~~3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by *heat detectors* or other *approved* detection devices.~~
 - ~~3.3. Shops and laboratories involving dusts or vapors are protected by *heat detectors* or other *approved* detection devices.~~~~
- ~~4. Manual fire alarm boxes shall not be required in Group E occupancies where all of the following apply:
 - ~~4.1. The building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.~~
 - ~~4.2. The emergency voice/alarm communication system will activate on sprinkler water flow.~~
 - ~~4.3. Manual activation is provided from a normally occupied location.~~~~

907.2.3 Group E. A manual fire alarm system shall be installed in Group E occupancies with an occupant load greater than 50. Where an automatic sprinkler system or a smoke detector system is installed, such systems shall be connected to the building fire alarm system.

Add new text as follows:

907.2.3.1 Manual fire alarm boxes. Manual fire alarm boxes shall be provided unless either of the following applies:

1. Interior corridors are protected by smoke detectors; auditoriums, cafeterias, gymnasiums and similar areas are protected by heat detectors or other approved detection devices; and shops and laboratories involving dusts or vapors are protected by heat detectors or other approved detection devices.
2. The building is equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, and occupant notification will activate upon sprinkler waterflow, with manual activation provided at a normally occupied location.

907.2.3.2 Occupant notification. Where the occupant load of the Group E occupancy is greater than 100, the fire alarm system shall initiate one of the following:

1. An occupant notification signal utilizing an emergency voice/alarm communications system complying with Sections 907.5.2.2 and 907.6.
2. An occupant notification signal complying with Section 907.5 and an interconnected in-building mass

notification system complying with Sections 907.5.2.2 and installed in accordance with Section 907.6, and NFPA 72.

Reason:

Changes proposed for 907.2.3 are intended to:

- a) improve code language clarity by eliminating complex lists of exceptions;
- b) permit listed mass notification systems in conjunction with fire alarm systems as an alternative to EVAC for occupant notification.

In North America, the risk of death and serious injury in schools has shifted from fire incidences towards incidences of violence through a combination of reduction of fire deaths and an increase of violence. NFPA 72 2010 formally introduced listed (UL 2572) mass notification systems as an enforceable class of emergency communication system (ECS). Mass notification often utilizes both voice and textual notification and is intended to communicate information about emergencies including but not limited to: fire, human caused events (accidental and intentional), other dangerous situations, accidents, and natural disasters.

As threats to children in schools evolve, in-building mass notification systems (MNS) have and are being professionally developed specifically for educational occupancies. MNS are designed to support multiple situations including: environmental, active shooter, hostage, and weather. MNS may include automatic responses such as: lockdown, partial lockdown with partial evacuation, lockdown acknowledgment and tracking, lockout, reverse evacuation, covert monitoring, and others. EVAC systems do not require a risk analysis because the risk of fire in schools is generally well understood. But MNS (as per NFPA 72) does require formal consideration of the risks above by requiring a specific risk analysis be developed for each school.

This proposal provides an option for listed mass notification systems in combination with fire alarm systems as an alternative to EVAC systems in schools. The relationship between fire alarm and in-building mass notification is well-developed in NFPA 72. Some schools are budget limited and cannot support the purchase of both EVAC and MNS. This proposal is intended to provide choice for jurisdictions considering MNS as an option.

The proposed code includes safeguards to ensure the level of protection of the school is not reduced as compared with EVAC. References to NFPA 72 ensure that MNS systems are listed to UL 2572 or UL 864. Both NFPA 72 and UL 2572 require that listed MNS systems are manufactured to common core F.A. standards including: secondary power, monitoring for integrity, supervisory, trouble, emergency control functions, notification and control circuits, annunciation and zoning, pathway class designation, monitoring for integrity and circuit performance, audible characteristics, system performance and integrity, performance of initiating device circuits (IDCs), notification appliance circuits (NACs), and signaling line circuits (SLCs).

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost impact, because the proposal presents MNS/fire alarm as an option, not a requirement. The restructuring of the paragraph maintains the current requirements so there is no additional cost associated with these changes.

When MNS/fire alarm is chosen, there is the additional cost of the MNS system, but also cost reductions from changing EVAC to manual fire alarm and the elimination of P.A. systems that are normally installed in schools.

Internal ID: 481

F139-18

IFC: 907.2.3 (IBC:[F] 907.2.3)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

907.2.3 Group E. A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. Where *automatic sprinkler systems* or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an *occupant load* of 50 or less.
2. Emergency voice/alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual fire alarm system initiates an *approved* occupant notification signal in accordance with Section 907.5.
3. Manual fire alarm boxes ~~are~~ shall not be required in Group E occupancies where all of the following apply:
 - 3.1. Interior *corridors* are protected by smoke detectors.
 - 3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by *heat detectors* or other *approved* detection devices.
 - 3.3. Shops and laboratories involving dusts or vapors are protected by *heat detectors* or other *approved* detection devices.
 - 3.4. Manual activation is provided from a normally occupied location.
4. Manual fire alarm boxes shall not be required in Group E occupancies where all of the following apply:
 - 4.1. The building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
 - 4.2. The emergency voice/alarm communication system will activate on sprinkler water flow.
 - 4.3. Manual activation is provided from a normally occupied location.

Reason:

As currently written, exception #3 allows the elimination of all manual notification means if smoke or heat detection is provided in interior corridors, high occupancy areas and hazardous areas within the school. No detection is required in offices, classrooms, storage rooms, or similar areas. Under the existing exception a fire occurring in one of these areas will be allowed to grow significantly before heat or products of combustion will activate an automatic detector. With no means of manual activation, occupant notification and notification of emergency services will be significantly delayed.

3.4 provides a manual means to alert occupants and notify emergency services and in the event that a fire is discovered in an area without required detection. The provision is identical to that in exception 4 (4.3).

See Proposal 481 from FCAC, if successful this change needs to be correlated with that revised language.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There should be no increase in construction cost for this provision. School are typically designed with the Fire Alarm Control Panels located in the normally occupied office area. FACPs typically provide a means for manual fire alarm activation.

Internal ID: 1405

F140-18

IFC: 907.2.8.1 (IBC: [F] 907.2.8.1)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Thomas Daly (Thomas.Daly@myhscg.com); Richard Roberts, representing Honeywell (richard.roberts@systemsensor.com); Jason Webb, representing Automatic Fire Alarm Association Codes & Standards Committee (jwebb608@gmail.com)

2018 International Fire Code

Revise as follows:

907.2.8.1 Manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group R-1 occupancies.

Exceptions:

1. A manual fire alarm system is not required in buildings not more than two stories in height or having 20 units or less where all individual *sleeping units* and contiguous attic and crawl spaces to those units are separated from each other and public or common areas by not less than 1-hour *fire partitions* and each individual *sleeping unit* has an *exit* directly to a *public way, egress court* or yard.
2. Manual fire alarm boxes are not required throughout the building where all of the following conditions are met:
 - 2.1. The building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.
 - 2.2. The notification appliances will activate upon sprinkler water flow.
 - 2.3. Not fewer than one manual fire alarm box is installed at an *approved* location.

Reason:

For new construction this change would continue the exemption for two-story or less Group R—1 occupancies from having a fire alarm system as such occupancies require sprinkler protection (with quick response sprinklers) but would limit that exception to those having 20 rooms or less. Sprinkler systems employ an alarm notification appliance (typically a water motor gong or electric bell per the IFC Sec. 903.4.2) which will provide an audible alarm in a small (20 rooms or less) occupancy. Beyond 20 rooms the effectiveness of that audible alarm is questionable

Such fires in two-story motels without automatic sprinkler systems occurred on January 4, 2010 in South Birmingham, AL (4 fatalities on the second floor), on December 14, 2013 in Wausau, WI (20 injuries) and in Point Pleasant Beach, NJ on March 21, 2014 (four fatalities on the second floor).

One additional example of a multiple life-loss fire was the Newport, OR City Center Motel on August 5, 2016, 4 civilian fire deaths and 3 civilian fire injuries. Fire deaths occurred on both the ground floor and the 2nd floor. The fire started on the ground floor. No sprinklers and no reports of a fire alarm system sounding.

These fires resulted in fatalities, as second floor occupants could not escape due to the means of egress being blocked by smoke and flames. In fires resulting in fatalities, no fire alarm system was in place to provide early warning to occupants.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

This change will impact the cost of construction in a limited number of newly constructed hotels. First some hotel chains are doing this on their own. When you need to add notification (horns and strobes) to these buildings, the cost would be about \$350.00 a device installed.

F141-18

IFC: 907.2.10 (New) (IBC: [F] 907.2.10 (New))

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Add new text as follows:

907.2.10 Group S. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be

installed in Group S public- and self-storage occupancies for interior corridors and common areas.

Exception: Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1, and the occupant notification appliances will activate throughout the notification zones upon sprinkler water flow.

Reason:

We have adopted this amendment in the North Texas region for several years, due to the lack of familiarity of the occupants with the subject building, which may be multi-story in many cases where having interior corridors or common areas.

Cost Impact

The code change proposal will increase the cost of construction .

The requirement for a fire alarm system will increase the cost of construction of such facilities.

Internal ID: 1290

F142-18

IFC: 907.2.10.1, 907.2.10.2 (IBC: [F] 907.2.10.1, [F]907.2.10.2)

Proponent: Frances Bengtsson, representing self (flbengtsson@gmail.com)

2018 International Fire Code

907.2.10 Single- and multiple-station smoke alarms. *Listed* single- and multiple-station smoke alarms complying with UL 217 shall be installed in accordance with Sections 907.2.10.1 through 907.2.10.7 and NFPA 72.

Revise as follows:

907.2.10.1 Group R-1. Single- or multiple-station smoke alarms shall be installed in all of the following locations in Group R-1:

1. In sleeping areas.
2. In every room in the path of the *means of egress* from the sleeping area to the door leading from the *sleeping unit*.
3. In each story within the *sleeping unit*, including *basements*. For *sleeping units* with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full story below the upper level.
4. In each combustible attic space located above dwelling units or sleeping units.

Exception: Smoke detectors located in sleeping areas shall be permitted to be interconnected with an approved automatic heat detector or other approved initiating device in the attic areas in accordance with manufacturers instructions. Attic spaces protected throughout by an automatic sprinkler system in accordance with Section 903.3.1.1 are not required to have an initiating device provided sprinkler flow initiates an alarm audible in all sleeping areas.

907.2.10.2 Groups R-2, R-3, R-4 and I-1. Single or multiple-station smoke alarms shall be installed and maintained in Groups R-2, R-3, R-4 and I-1 regardless of *occupant load* at all of the following locations:

1. On the ceiling or wall outside of each separate sleeping area in the immediate vicinity of bedrooms.
2. In each room used for sleeping purposes.
3. In each story within a *dwelling unit*, including *basements* but not including crawl spaces and uninhabitable attics. In *dwelling units* or *dwelling units* with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full story below the upper level.
4. In each combustible attic space located above dwelling units or sleeping units.

Exception: Smoke detectors located in sleeping areas shall be permitted to be interconnected with an approved automatic heat detector or other approved initiating device in the attic areas in accordance with manufacturers instructions. Attic spaces protected throughout by an automatic sprinkler system in accordance with Section 903.3.1.1 are not required to have an initiating device provided sprinkler flow initiates an alarm audible in all sleeping areas.

Reason:

When a fire on the outside of the structure enters the attic space through vents either by blowing embers or direct flames, a family sleeping on the inside of the structure may not be aware of the fire in the attic until it breaks through the ceiling into the unit and activates smoke detectors. By that time it may be too late for escape or escape may be more difficult. Both situations have been the case in recent fires.

Even if the building is equipped with NFPA 13 D or 13 R sprinkler systems, those systems are not required to have sprinkler heads in the attic. A fire growing undetected in the attic will overwhelm such systems and possibly take it out of service as the attic collapses.

Some have suggested this is a Wildland Urban Interface issue only however embers have been documented to travel in wind and ignite buildings several miles away from WUI areas. Buildings in non WUI areas do not have vents designed to prevent embers from getting into the attic thus those structures are more susceptible to this type of event. Even a single residence with a fire started by a cigarette deposited in leaves or from a trash bin can cause this type of tragedy. This code change will also be submitted into the IRC process in Group B.

IFC: 907.3.1 (IBC: [F]907.3.1); IMC: [F]606.4.1

Proponent: Ryan Wyse, representing Hebron Fire Department (ryan.wyse@hebronfd.org)

2018 International Fire Code

Revise as follows:

907.3.1 Duct smoke detectors. Smoke detectors installed in ducts shall be *listed* for the air velocity, temperature and humidity present in the duct. Duct smoke detectors shall be connected to the building's fire alarm control unit where a fire alarm system is required by Section 907.2. Activation of a duct smoke detector shall initiate a visible and audible supervisory signal at a *constantly attended location* and shall perform the intended fire safety function in accordance with this code and the International Mechanical Code. In facilities that are required to be monitored by a supervising station, duct smoke detectors shall report only as a supervisory signal and not as a fire alarm. They Duct smoke detectors installed in new construction shall not be used as a substitute for required open area detection.

Exceptions:

1. The supervisory signal at a constantly attended location is not required where duct smoke detectors activate the building's alarm notification appliances.
2. In occupancies not required to be equipped with a fire alarm system, actuation of a smoke detector shall activate a visible and an audible signal in an *approved* location. Smoke detector trouble conditions shall activate a visible or audible signal in an *approved* location and shall be identified as air duct detector trouble.
3. Unless an alternate means of smoke detection is present in the area being served, duct smoke detectors in existing structures, previously approved as a substitute for required open area detection, shall continue to perform the functions as designed.

2018 International Mechanical Code

Revise as follows:

[F] 606.4.1 Supervision. The duct smoke detectors shall be connected to a fire alarm system where a fire alarm system is required by Section 907.2 of the International Fire Code. The actuation of a duct smoke detector shall activate a visible and audible supervisory signal at a constantly attended location. In facilities that are required to be monitored by a supervising station, duct smoke detectors shall report only as a supervisory signal, not as a fire alarm. Duct smoke detectors installed in new construction shall not be used as a substitute for required open area detection.

Exceptions:

1. The supervisory signal at a constantly attended location is not required where the duct smoke detector activates the building's alarm-indicating appliances.
2. In occupancies not required to be equipped with a fire alarm system, actuation of a smoke detector shall activate a visible and audible signal in an *approved* location. Duct smoke detector trouble conditions shall activate a visible or audible signal in an *approved* location and shall be identified as air duct detector trouble.
3. Unless an alternate means of smoke detection is present in the area being served, duct smoke detectors in existing structures, previously approved as a substitute for required open area detection, shall continue to perform the functions as designed.

Reason:

The purpose of this change is to permit the application of this code to new construction only. Many buildings utilize duct smoke detectors as a means of detecting smoke in open areas. If a building owner is required to change the activation transmission from an alarm to a supervisory, what will then take the place of the open area protection that was once provided by the duct smoke detectors.

One could say that they would be required to install other devices (smoke heads, heat detectors, etc.) to replace this function. However, can we require the installation of new detectors in a building that was previously approved? If we are, then a code official should have no trouble being able to require the installation of tamper switches on sprinkler valves that were also previously approved, but we cannot.

If this code is enforced and the building owner is not required to replace the open area smoke detection function with

another means that transmits its activation as an alarm and not as a supervisory signal, then we will be reducing the fire protection of the building. I feel that it is best that this code be applicable to new construction only and not be enforceable in existing structures unless the open area that it is protecting already has other detectors already in place.

Cost Impact

The code change proposal will increase the cost of construction .

Requiring that all duct smoke detectors, which are presently being used as a means of open area smoke detection, only be permitted to transmit activation as a supervisory signal will require the installation of other detectors, such as smoke heads or heat detectors, to take the place of this alarm function. This change will cost the building owner, because they will be required to hire a qualified alarm installer to install these detectors. Furthermore, they will be required to pay for an architect to draw up plans showing this since they are altering the design of the system.

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

907.4 Initiating devices. ~~Where manual or automatic alarm initiation is required as part of a fire alarm system, the initiating a fire alarm system is required by another section of this code, occupant notification in accordance with Section 907.5 shall be initiated by one or more of the following. Initiating devices shall be installed in accordance with Sections 907.4.1 through 907.4.3.1.~~

1. Manual fire alarm boxes.
2. Automatic fire detectors.
3. Automatic sprinkler system waterflow devices.
4. Automatic fire-extinguishing systems.

907.5 Occupant notification systems, notification. ~~A fire alarm system shall annunciate at the fire alarm control unit and shall initiate occupant notification upon activation. Occupant notification by fire alarms shall be in accordance with Sections 907.5.1 through 907.5.2.3.3. Where a fire alarm system is required by another section of this code, it shall be activated by:~~

1. ~~Automatic fire detectors.~~
2. ~~Automatic sprinkler system waterflow devices.~~
3. ~~Manual fire alarm boxes.~~
4. ~~Automatic fire-extinguishing systems.~~

Exception: ~~Where notification systems are allowed elsewhere in Section 907 to annunciate at a constantly attended location.~~

907.5.2.3.3. Occupant notification by smoke alarms in Groups R-1 and R-2 Occupancies shall comply with Section 907.5.2.1.3.2.

Add new text as follows:

907.5.1 Alarm activation and annunciation. Upon activation, fire alarm systems shall initiate occupant notification and shall annunciate at the fire alarm control unit, or where allowed elsewhere in Section 907, at a constantly attended location.

~~**907.5.1.1 Presignal feature.** A presignal feature shall not only be installed unless provided where approved by the fire code official. Where a presignal feature is provided, a signal approved. The presignal shall be annunciated at an approved at a constantly attended location approved by the fire code official, so that occupant notification can be activated in having the capability to activate the occupant notification system in the event of fire or other emergency.~~

907.5.2.1.3 Audible signal frequency in Groups R-1 and R-2 sleeping rooms. Audible signal frequency in Groups R-1 and R-2 occupancies shall be in accordance with Sections 907.5.2.1.3.1 and 907.2.1.3.2.

907.5.2.1.3.1 Fire alarm system signal. In sleeping rooms of Groups R-1 and R-2 Occupancies, the audible alarm activated by a fire alarm system shall be a 520 Hz low-frequency signal complying NFPA 72.

907.5.2.1.3.2 Smoke alarm signal in sleeping rooms. In sleeping rooms of Groups R-1 and R-2 Occupancies that are required by Sections 907.2.8 or 907.2.9 to have a fire alarm system, the audible alarm signal activated by single- or multiple-station smoke alarms in the dwelling unit or sleeping unit shall be a 520 Hz signal complying NFPA 72.

Where a sleeping room smoke alarm is unable to produce a 520 Hz signal, the 520 Hz alarm signal shall be provided by a listed notification appliance or a smoke detector with an integral 520 Hz sounder.

Reason:

This Proposal seeks to enhance the waking effectiveness of high risk segments of the population in the International Fire Code (IFC) by requiring a consistent use of the 520 Hz low frequency audible fire alarm signal in new Group R-1 and R-2 occupancies that are required to have a fire alarm system.

This approach is an interim option to get the low frequency signal in buildings where the technology is commercially available and avoids requiring the low frequency signal in buildings where the technology is not currently available in the stream of commerce. The proposal has taken careful consideration to not require the low frequency technology in buildings without a fire alarm system because there are no smoke alarms currently available with an integral sounder capable of producing the low frequency signal. However, it does not prohibit their installation if the product becomes available in the future. The reason the proposal does require the low frequency signal in sleeping areas of buildings with a fire alarm system because there are numerous manufacturers of system connected smoke detectors with an integral sounder that produces the 520 Hz low frequency signal.

Peer-reviewed research has concluded the 520 Hz low frequency is six times more effective than the standard 3 KHz signal at waking high risk segments of the population (people over 65, people who are hard of hearing, school age children and people who are alcohol impaired). The standard 3 KHz audible alarm signal has been used in the majority of fire alarm horns and smoke alarms for the past 30 years.

The reason this Proposal is necessary is because NFPA 72 stipulates both the 520 Hz and 3 KHz signal in the sleeping rooms of hotels, dormitories and apartment building bedrooms when smoke alarms are installed in the sleeping room. Specifically, Chapter 18 of NFPA 72 requires audible notification appliances (horns, speakers or smoke detectors with an integral sounder bases) to produce the 520 HZ low frequency signal in all sleeping rooms of buildings with a protected premises fire alarm system. Whereas Chapter 29 of NFPA 72 only requires smoke alarms to produce the 520 Hz low frequency signal for people with hearing loss or provided voluntarily for those with hearing loss.

The different requirements within NFPA 72 present a life safety issue because the waking effectiveness of the 520 Hz low frequency is superior to 3 KHz audible alarm signal awakening high risk segments of the population. The low frequency signal needs to be provided in areas intended for sleeping for people over 65, people who are hard of hearing, school age children and people who are alcohol impaired.

There are several product solutions currently available in the market capable of providing the 520 Hz low frequency signal.

1. Fire alarm system horns and horn/strobes
2. Smoke detectors with integral sounder bases
3. Speakers connected to an Emergency Voice Alarm Communication (EVAC) system

Peer-Reviewed Research:

Ian R. Thomas and Dorothy Bruck, Waking Effectiveness of Alarms for Adults Who Are Hard of Hearing (Melbourne, Australia: Victoria University), National Fire Protection Association, 2007

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

The code change proposal will increase the cost of construction. The total installation cost will only increase in new R-1 and R-2 occupancies where a fire alarm system is required by Section 907 by requiring the use of the 520 Hz low frequency audible fire alarm signal.

In accordance with the included cost analysis the estimated price increase is \$57 per sleeping room for occupancies that are not required to utilize an emergency voice alarm communication (EVAC) system for occupant notification and approximately \$107 per sleeping room for occupancies that are required to utilize an (EVAC) system for occupant notification.

For non-EVAC systems, the solution utilizes a currently available smoke detector with an integral low frequency sounder base instead of installing a smoke alarm and low frequency horn. For EVAC systems, the solution utilizes a currently available fire alarm system speaker and a smoke detector with an integral low frequency sounder base.

R-1 and R-2 Occupancy with a Non-ULC Fire Alarm System

R-1 and R-2 Occupancy with an ULC Fire Alarm

	Option A		Option B
	Smoke Alarm (220VAC/Battery)	Low Frequency Horns and Additional Power Supplies	Smoke Detector with Low Frequency Sounder Base, Additional Power Supplies and Additional Control Unit Programming
Contractor purchase price of fire alarm equipment	25.00	45.00	115.00
Contract, wire, labor and labor (labor at \$75 per hr)	75.00	240.00	225.00
25% Contractor Overhead/Profit	25.00	46.25	45.00
Total installed (complete) Device per Room	125.00	246.25	425.00

	Option A	
	Smoke Alarm (110VAC/Battery)	Additional Power Supplies and Additional Control
Contractor purchase price of fire alarm equipment	25.00	75.00
Contract, wire, labor and labor (labor at \$75 per hr)	75.00	240.00
25% Contractor Overhead/Profit	25.00	46.25
Total installed (complete) Device per Room	125.00	361.25

Notes:
 Option A: Application meets the current NFPA 72 requirements. The total installed cost of a smoke alarm and a low frequency horn is \$125.00.
 Option B: Requires the low frequency where the technology is commercially available. The total installed cost of the smoke detector w/low frequency sounder base is \$425.00.
 Percent Increase per room: 25.2%
 Dollar Increase per room: \$61.25

Notes:
 Option A: Meets the current NFPA 72 requirements. Total installed cost of a smoke alarm and a low frequency horn is \$361.25.
 Option B: Requires the low frequency where the technology is commercially available. Total installed cost of the smoke detector and a speaker is \$361.25.
 Percent Increase per room: 25.2%
 Dollar Increase per room: \$61.25

2018 International Fire Code

Revise as follows:

907.4 Initiating devices. ~~Where manual or automatic alarm initiation is required as part of a fire alarm system, the initiating a fire alarm system is required by another section of this code, occupant notification in accordance with Section 907.5 shall be initiated by one or more of the following. Initiating devices shall be installed in accordance with Sections 907.4.1 through 907.4.3.1.~~

1. Manual fire alarm boxes.
2. Automatic fire detectors.
3. Automatic sprinkler waterflow devices.
4. Automatic fire-extinguishing systems.

907.5 Occupant notification systems. ~~A fire alarm system shall annunciate at the fire alarm control unit and shall initiate occupant notification upon activation. Occupant notification shall be in accordance with Sections 907.5.1 through 907.5.2.3.3. Where a fire alarm system is required by another section of this code, it shall be activated by:~~

- ~~1. Automatic fire detectors.~~
- ~~2. Automatic sprinkler system waterflow devices.~~
- ~~3. Manual fire alarm boxes.~~
- ~~4. Automatic fire-extinguishing systems.~~

~~**Exception:** Where notification systems are allowed elsewhere in Section 907 to annunciate at a constantly attended location.~~

Add new text as follows:

907.5.1 General. Occupant notification by fire alarms shall comply with 907.5.2 through 907.5.2.3.3. Occupant notification by smoke alarms in Groups R-1 and R-2 Occupancies shall comply with Section 907.5.2.1.4.2. Upon activation, fire alarm systems shall initiate occupant notification and shall annunciate at the fire alarm control unit, or where allowed elsewhere in Section 907, at a constantly attended location.

Revise as follows:

~~**907.5.1 907.5.1.1 Presignal feature.** A presignal feature shall not be installed unless approved by the fire code official. Where a presignal feature is provided, a signal only be provided where approved. The presignal shall be annunciated at a constantly attended location approved by the fire code official, so that occupant notification can be activated having the capability to activate the occupant notification system in the event of fire or other emergency.~~

Add new text as follows:

907.5.2.1.3 Sleeping area requirements. In sleeping areas, the minimum sound level at the pillow shall be 75 dBA, or 15 dB above the average ambient sound level, or 5 dB above the maximum sound level having a duration of at least 60 seconds, whichever is greater.

907.5.2.1.4 Audible signal frequency in Groups R-1 and R-2 sleeping rooms. Audible signal frequency in Groups R-1 and R-2 sleeping rooms shall comply with Sections 907.5.2.1.4.1 through 907.5.2.1.4.3.

907.5.2.1.4.1 Fire alarm system signal. In sleeping rooms of Groups R-1 and R-2 Occupancies, the audible alarm activated by a fire alarm system shall be a 520 Hz low-frequency signal complying NFPA 72.

907.5.2.1.4.2 Smoke alarm signal. In sleeping rooms of Groups R-1 and R-2 Occupancies that are required by Sections 907.2.8 or 907.2.9 to have a fire alarm system, the audible alarm signal shall be a 520 Hz low-frequency signal complying NFPA 72 and shall be provided by one of the following:

1. A single- or multiple-station smoke alarm.
2. A 520 Hz alarm notification appliance activated by a single- or multiple-station smoke alarm.
3. A smoke detector with an integral 520 Hz low frequency sounder.

907.5.2.1.4.3 Sound level. The minimum sound level shall be in accordance with 907.5.2.1.3.

Reason:

This Proposal seeks to enhance the waking effectiveness of high risk segments of the population in the International Fire Code (IFC) by requiring the 520 Hz low frequency audible fire alarm signal in new Group R-1 and R-2 occupancies that are required to have a fire alarm system. The proposal does not require the low frequency technology in buildings without a fire alarm system because there are no smoke alarms currently available with an integral sounder capable of producing the low frequency signal. However, it does not prohibit their installation if the product becomes available in the future. The reason the proposal does require the low frequency signal in sleeping areas of Group R-1 and R-2 buildings with a fire alarm system is because there are numerous manufacturers of system connected smoke detectors with an integral sounder that produces the 520 Hz low frequency signal.

The reason this Proposal is necessary is because NFPA 72 stipulates both the 520 Hz and 3 KHz signal in the sleeping rooms of hotels, dormitories and apartment building bedrooms when smoke alarms are installed in the sleeping room. Specifically, Chapter 18 of NFPA 72 requires audible notification appliances (horns, speakers or smoke detectors with an integral sounder bases) to produce the 520 Hz

low frequency signal in all sleeping rooms of buildings with a protected premises fire alarm system. Whereas Chapter 29 of NFPA 72 only requires smoke alarms to produce the 520 Hz low frequency signal for people with hearing loss or provided voluntarily for those with hearing loss.

The different requirements within NFPA 72 present a life safety issue because peer-reviewed research has concluded the waking effectiveness of the 520 Hz low frequency is superior to 3 KHz audible alarm signal awakening high risk segments of the population. Peer-reviewed research has concluded the 520 Hz low frequency is six times more effective than the standard 3 KHz signal at waking high risk segments of the population (people over 65, people who are hard of hearing, school age children and people who are alcohol impaired). The standard 3 KHz audible alarm signal has been used in most fire alarm horns and smoke alarms for the past 30 years. The low frequency signal needs to be provided in areas intended for sleeping to protect people over 65, people who are hard of hearing, school age children and people who are alcohol impaired.

There are several product solutions currently available in the market capable of providing the 520 Hz low frequency signal.

Fire alarm system horns and horn/strobes

Smoke detectors with integral sounder bases

Speakers connected to an in-building fire alarm Emergency Voice Alarm Communication (EVAC) system

Peer-Reviewed Research:

Ian R. Thomas and Dorothy Bruck, Waking Effectiveness of Alarms for Adults Who Are Hard of Hearing (Melbourne, Australia: Victoria University), National Fire Protection Association, 2007

Cost Impact

The code change proposal will increase the cost of construction .

The code change proposal will increase the cost of construction. The code change proposal will increase the cost of construction. The total installation cost will only increase in new R-1 and R-2 occupancies where a fire alarm system is required by Section 907 by requiring the use of the 520 Hz low frequency audible fire alarm signal.

In accordance with the included cost analysis the estimated price increase is \$57 per sleeping room for occupancies that are not required to utilize an emergency voice alarm communication (EVAC) system for occupant notification and approximately \$107 per sleeping room for occupancies that are required to utilize an (EVAC) system for occupant notification.

For non-EVAC systems, the solution utilizes a currently available smoke detector with an integral low frequency sounder base instead of installing a smoke alarm and low frequency horn. For EVAC systems, the solution utilizes a currently available fire alarm system speaker and a smoke detector with an integral low frequency sounder base.

F146-18

IBC: 907.4.2.4 (IBC:[F] 907.4.2.4)

Proponent: Kevin Duerr-Clark, NYSDOS, representing New York State Department of State (kevin.duerr-clark@dos.ny.gov)

2018 International Fire Code

Revise as follows:

907.4.2.4 Signs. Where fire alarm systems are not required to be monitored by a~~an approved~~ supervising station in accordance with Section 907.6.6, an *approved* permanent sign shall be installed adjacent to each manual fire alarm box that reads: WHEN ALARM SOUNDS – CALL FIRE DEPARTMENT.

Exception: Where the manufacturer has permanently provided this information on the manual fire alarm box.

Reason:

This code change proposal is intended to clarify that one cannot simply install a sign to bypass the monitoring requirements of Section 907.6.6. According to the 2015 IBC Commentary for Section 907.4.2.4: "This section has limited application because, as indicated in Section 907.6.6, fire alarm systems generally must be monitored by an approved supervising station. When a system is not monitored, such as possibly a fire alarm system that is not required by code, adequate signage must be displayed to tell occupants what response actions must be taken."

Because Chapter 9 of the IBC is coordinated with Chapter 9 of the IFC, the corresponding change must be made in the IFC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

It is simply a clarification of the code the is already in place.

Internal ID: 1192

F147-18

IFC: 907.5.2.1, 907.5.2.3 (IBC: [F]907.5.2.1, [F]907.5.2.3)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Revise as follows:

907.5.2.1 Audible alarms. Audible alarm notification appliances shall be provided and emit a distinctive sound that is not to be used for any purpose other than that of a fire alarm.

Exceptions:

1. Audible alarm notification appliances are not required in critical care areas of Group I-2, Condition 2 occupancies that are in compliance with Section 907.2.6, Exception 2.
2. A visible alarm notification appliance installed in a nurses' control station or other continuously attended staff location in a Group I-2, Condition 2 suite shall be an acceptable alternative to the installation of audible alarm notification appliances throughout the suite or unit in Group I-2, Condition 2 occupancies that are in compliance with Section 907.2.6, Exception 2.
3. Where provided, audible notification appliances located in each enclosed occupant evacuation elevator lobby in accordance with Section 3008.9.1 of the International Building Code shall be connected to a separate notification zone for manual paging only.

907.5.2.3 Visible alarms. Visible alarm notification appliances shall be provided in accordance with Sections 907.5.2.3.1 through 907.5.2.3.3.

Exceptions:

1. Visible alarm notification appliances are not required in *alterations*, except where an existing fire alarm system is upgraded or replaced, or a new fire alarm system is installed.
2. Visible alarm notification appliances shall not be required in *exits* as defined in Chapter 2.
3. Visible alarm notification appliances shall not be required in elevator cars.
4. Visual alarm notification appliances are not required in critical care areas of Group I-2, Condition 2 occupancies that are in compliance with Section 907.2.6, Exception 2.
5. A visible alarm notification appliance installed in a nurses' control station or other continuously attended staff location in a Group I-2, Condition 2 suite shall be an acceptable alternative to the installation of visible alarm notification appliances throughout the suite or unit in Group I-2, Condition 2 occupancies that are in compliance with Section 907.2.6, Exception 2.

Reason:

There should be an exception for both visible and audible alarms in hospitals. Current text is only audibles. Visible alarms can cause harmful distractions similar to audible distractions when delivering care. For example, delicate surgery such as neurological (brain / spine) surgery, cardiac surgery or any invasive procedure which is adjacent to arteries or veins requires precision. A visual flash or sudden alarm can cause a surgeon to startle, which could have devastating consequences to the patient. To mitigate this situation in the surgery environment, the Circulating or Charge Nurse in the surgical area is responsible for being aware of the alarms of the surgical suite, and is at a continuously monitored control station that serves the unit or suite. This staff is directly involved in the emergency response. The staff then informs the surgical team of the situation in a manner appropriate for the level of care. This eliminates the need for the startling alarms in the operation room, and the team can react to the situation by safely closing the patient.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will decrease the cost of construction .

This is a removal of some of the visual alarms in the rooms to ensure patient safety. Staff will notify doctors and address care recipients protection.

Internal ID: 690

F148-18

IFC: 907.5.2.1.2 (IBC: [F] 907.5.2.1.2)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Richard Roberts, representing Honeywell (richard.roberts@systemsensor.com); Jason Webb, representing Automatic Fire Alarm Association Codes & Standards Committee (jwebb608@gmail.com)

2018 International Fire Code

Revise as follows:

907.5.2.1.2 Maximum sound pressure. ~~The maximum total sound pressure level for audible alarm produced by combining the ambient sound pressure level with all audible notification appliances operating shall be not exceed 110~~ dBA at the minimum hearing distance from the audible appliance. Where the average ambient noise is greater than ~~95~~ 105 dBA, visible alarm notification appliances shall be provided in accordance with NFPA 72 and audible alarm notification appliances shall not be required.

Reason:

This Proposal seeks to align the sound pressure level requirements for audible fire alarm notification appliances in the 2018 edition of the International Fire Code (IFC) with the 2016 edition of the NFPA 72 ®. Section 18.4.1.2 of NFPA 72 stipulates total sound pressure level (produced by combining the ambient sound pressure level with all audible notification appliances operating) shall not exceed 110 dBA. This section includes annex material covering OSHA worker exposure noise levels and an OSHA table for calculating permissible noise exposures.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal provides clarity and alignment with NFPA 72, National Fire Alarm and Signaling Code which is a referenced document.

Internal ID: 268

F149-18

IFC: 907.5.2.2.5 (IBC: [F] 907.5.2.2.5), 1203.2.4; IBC: 2702.2.4

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Jason Webb, representing Automatic Fire Alarm Association Codes & Standards Committee (jwebb608@gmail.com)

2018 International Fire Code

Revise as follows:

907.5.2.2.5 Emergency power. Emergency voice/ alarm communications systems shall be provided with emergency power in accordance with Section 1203. ~~The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.~~

1203.2.4 Emergency voice/alarm communication systems. Emergency power shall be provided for emergency voice/alarm communication systems as required in Section 907.5.2.2.5. ~~The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.~~

2018 International Building Code

Revise as follows:

~~**[F] 2702.2.4 Emergency voice/alarm communication systems.**~~ **Voice Alarm Communication Systems.** Emergency power shall be provided for emergency voice/alarm communication systems as required in Section 907.5.2.2.5. ~~The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.~~

Reason:

This code change is to provide clarification that the standby power for the EVACs system is to be designed to comply with NFPA 72.

We are deleting the reference and code section 1203.2.4. This is causing confusion and the standby power requirements for Fire Alarm systems is clearly outlined in NFPA 72.

This section contradicts itself. NFPA 72 10.6.7.2.1.2 requires secondary power for 24 hours under quiescent load but also requires the secondary power to be capable of operating the system for 15 minutes at maximum load after the 24 hours. Deleting the time and simply referencing the standard insures consistency.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

Depending on interpretation this could reduce the cost of construction. Overall this will provide code clarity and alignment with NFPA 72 and within the IBC-IFC

Internal ID: 295

IFC: 907.5.2.3.3, 907.5.2.3.4 (New), 907.5.2.3.5 (New), 907.5.2.3.6 (New) (IBC [F] 907.5.2.3.3, [F]907.5.2.3.4 (New), [F]907.5.2.3.5 (New), [F]907.5.2.3.6 (New))

Proponent: Jason Webb, Automatic Fire Alarm Association, representing Automatic Fire Alarm Association Codes & Standards Committee

2018 International Fire Code

Revise as follows:

907.5.2.3.3 Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, each story that contains dwelling units and sleeping units shall be provided with the future capability to support visible alarm notification appliances in accordance with Chapter 11 of ICC A117.1. Such capability shall accommodate wired or wireless equipment. ~~The future capability shall include one of the following:~~

- ~~• 1.The interconnection of the building fire alarm system with the unit smoke alarms.~~
- ~~• 2.The replacement of audible appliances with combination audible/visible appliances.~~
- ~~3.The future extension of the existing wiring from the unit smoke alarm locations to required locations for visible appliances.~~

Add new text as follows:

907.5.2.3.4 Documentation. Documentation shall be provided within the fire alarm shop drawings to show that the building fire alarm panel has the power supply to handle expansion of visual notification devices in each living unit

907.5.2.3.5 Pathways and Circuits. The power, pathways and circuits shall be vertically extended in the buildings riser. Pathways and circuits are not required to be run into the dwelling units for future use.

907.5.2.3.6 Future capability. The future capability shall include one of the following:

1. Replacement of smoke alarms with smoke alarms with visible alarm notification appliances.
2. The replacement of audible appliances with combination audible/visible appliances or new visible appliances.

Reason:

This code change will clear up confusion that has been in this section of the code. This is an important section of the code. Group R-1 occupancies have a table to refer too to determine how many hotel rooms need to be designed for hearing impaired. In R-2 occupancies we do not have a table or prescriptive direction on how many apartment/condos to have arranged for hearing impaired to comply with A.117.1. So the practice is when someone moves into a dwelling unit or sleeping that does not have the needed safety items, they need to be provided.

The current code attempts to do this by calling for “capacity and be capable of” is vague and unenforceable language. Many code officials and engineers take the worse case position and say that you need to “pre-wire” to every dwelling unit and bedroom for a possible future visual notification device to be connected to the building fire alarm system. That is costing tens of thousands of dollars extra construction costs that only a very small fraction may be used.

First thing to understand, to our understanding is that the key point in A117.1 is to provide visual notification to the occupants in case of fire. That is the mission. The above code change proposal follows this logic and understanding

New Apartment/ Condo R-2

Each dwelling unit gets smoke alarms installed in each sleeping unit and main hall, all interconnected-one goes off, they all go off in that dwelling unit

The building fire alarm system needs to extend audible notification device into each dwelling unit so the occupants are notified when there is a fire in the building.

The smoke alarms will let them know if there is a fire in their dwelling unit, and the building fire alarm system audible notification device (horn/speaker) will let them know there is a fire in the building.

New Apartment/ Condo R-2 with Hearing Impaired occupant

The building owner would just replace the smoke alarms (110 VAC) with smoke alarms with built-in strobes. One goes off; they all go off, giving the dwelling unit occupant visual notification of a problem in “Their” unit.

The building fire alarm system will need to expand into the dwelling unit with visual notification devices in each bedroom and main living area. You start with the existing horn/speaker change it to a horn/strobe or speaker strobe and extend the circuit within the dwelling unit from the existing notification device to power the new visual devices.

The other key to this is the new code language that requires the fire alarm shop drawings to show the system has the necessary power supplies and circuits to accomplish this task, and that this is extended vertically in the building if it is applicable. So the main extra power will always be in the panel and in the riser as needed, and the work within the dwelling unit will be minimal, but you will only be investing in work that needs to be done to provide safety for an occupant that is there.

Cost Impact

The code change proposal will decrease the cost of construction .

This will REDUCE the cost on construction on most installations going forward as it clarifies the intent of the code, and eliminates costly work that was being done that was not required by the Code. The details are explained in the reason statement.

Internal ID: 1807

F151-18

IFC: 907.5.2.3.3 (IBC: [F] 907.2.3.3)

Proponent: Adria Reinertson, Riverside County Fire Department, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)

2018 International Fire Code

Revise as follows:

907.5.2.3.3 Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, each *story* that contains *dwelling units* and *sleeping units* shall be provided with the ~~future~~ capability to support future visible alarm notification appliances in accordance with Chapter 11 of ICC A117.1. Such capability shall accommodate wired or wireless equipment. The future capability shall include one of the following:

1. ~~The~~ A path to allow for future interconnection of the building fire alarm system with the unit smoke alarms in order to activate and power the required visual signals in accordance with NFPA 72 and in accordance with the manufacturer's instructions.
2. The replacement of audible appliances with combination audible/visible appliances or additional visible appliances as required.
3. ~~The future extension of the existing wiring from the unit smoke alarm locations to required locations for visible appliances.~~ Replace unit smoke alarms with system smoke alarms.

Plans for future design capability shall be submitted with the fire alarm system shop drawings to the fire code official.

Reason:

There is much confusion in the fire alarm industry and with fire code officials on how to interpret this section. Currently, fire alarm designers are proposing from just providing additional power supplies for future expansion to installing additional power supplies and extending the notification circuits to every dwelling unit in an R-2 Occupancy. This proposal clarifies how to provide for future expandability with reference to NFPA 72, National Fire Alarm and Signaling Code for the path (rated wiring above the corridor or wiring in conduit), and the fire alarm system manufacturer's requirements.

Option 1 identifies to provide a path in the initial system design to provide for future interconnect the building fire alarm system, which is 24 volt DC system with the unit smoke alarms, which are 110 volt AC devices. To accomplish this, the fire alarm system designer must follow the prescriptive requirements in NFPA 72. The reference is added to identify this design requirement.

Option 2 is modified to include visible notification appliances, allowing where there are locations where only a visible notification appliance is required, due to adequate evacuation sound decibels in the room.

Option 3 language is deleted due to 110 volt AC smoke alarms do not allow for connecting visible notification appliances to the smoke alarms. The smoke alarms are 110 volt AC devices which cannot control a visible appliance. In its place, the option of replacing building smoke alarms with building system smoke detectors is provided. In this scenario, the building's fire alarm system notification appliances would be used to meet the visible requirement on Section 907.5.2.3.3.

The last sentence is added to clarify the method of future design capability will be identified during system design approval by the Fire Code Official.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Will not increase the cost of construction. The proposal is clarifying the prescriptive installation requirements. There could be additional cost for those companies/designers who were not installing for future expansion, but the requirement is not changing.

Internal ID: 771

F152-18

IFC: 907.5.2.3.3 (IBC: [F]907.5.2.3.3)

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

907.5.2.3.3 Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, each *story* that contains *dwelling units* and *sleeping units* shall be provided with the future capability to support visible alarm notification appliances in accordance with Chapter 11 of ICC A117.1. Such capability shall accommodate wired or wireless equipment. The future capability shall include one of the following:

1. The interconnection of the building fire alarm system with the unit smoke alarms.
2. The replacement of audible appliances with combination audible/visible appliances.
3. The future extension of the existing wiring from the unit smoke alarm locations to required locations for visible appliances.

For wired equipment, the fire alarm power supply and circuits shall have not less than 5% excess capacity to accommodate future addition of visible alarm notification appliances, and access to such circuits shall be available on every story. Such circuits shall not be required to be extended beyond a single access point on a story.

Reason:

Last cycle, F213-16 was approved with the intent of clarifying and standardizing the capability for future additions of alarm equipment to accommodate changes for units that may need to be converted to accommodate hearing impaired occupants. The question of a reasonable percentage for excess capacity of wired equipment was left unresolved, and I committed to bringing something back to address this so that the fire alarm industry would have a standardized basis for designing excess capacity into systems. The proposed text has been prepared based on what I learned in a discussion with an individual who has been instrumental in the development of ANSI A117.1 regarding the intent of the standard and his experience as an accessibility expert with respect to the relatively low frequency of units being retrofitted for hearing impaired occupants.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The requirement for future expansion capability already exists in this section. I am just trying to quantify the provision, so the cost consequence cannot be accurately assessed, since some installations my previously have provided more expansion capability and others less.

Internal ID: 2018

F153-18

IFC: 907.6.5 (IBC: [F] 907.6.5)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Richard Roberts, representing Honeywell (richard.roberts@systemsensor.com); Jason Webb, representing Automatic Fire Alarm Association Codes & Standards Committee (jwebb608@gmail.com)

2018 International Fire Code

Revise as follows:

907.6.5 Access-Access and visibility. Access shall be provided to ~~each fire alarm device and notification appliance for devices, notification appliances, and equipment requiring periodic inspection, maintenance and testing.~~ Where devices, notification appliances and equipment are concealed from view, an approved sign or other means to identify their location shall be provided.

Reason:

One of the causes of "unwanted alarms" is identified as fire alarm devices that get installed but are not accessible to perform routine inspection, testing and maintenance. Duct mounted smoke detectors; detection in elevator shafts and atrium detection are some of the key areas of concern. During construction and initial testing special equipment is provided to reach these spaces, but when the building is in normal operation these special lifts and appliances are not available. Leaving smoke devices not tested or maintained.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

In 95% of all cases there will be no additional cost to install the fire alarm system and devices when properly designed. In some specific cases it may be more expensive to install the device "correctly" but that is the right way to do it.

Internal ID: 276

F154-18

IFC: 907.6.6.1 (IBC: [F]907.6.6.1)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Shane Clary, Bay Alarm Company, representing Automaric Fire Alarm Association, Inc. (smclary@bayalarm.com); Jason Webb, representing Automatic Fire Alarm Association Codes & Standards Committee (jwebb608@gmail.com)

2018 International Fire Code

Revise as follows:

~~**907.6.6.1 Automatic telephone dialing devices.** Automatic telephone dialing devices used to transmit an emergency alarm shall not be connected to any fire department telephone number unless approved by the fire chief.~~**Transmission of alarm signals.** Transmission of alarm signals to a supervising station shall be in accordance with NFPA 72

Reason:

The communications industry has changed more in the last 10 years than the previous one hundred and the rate of technology development is expected to continue escalating over the next 10 years as well. This change has impacted the transmission of alarm, trouble and supervisory signals from the protected premises to the supervising station. The technology used since the late 1980's used private copper telephone lines with power originating at the telephone central office. This technology is becoming a thing of the past because it's unsustainable by the telephone companies. It is estimated that some 70,000 plain old telephone system (POTS) lines are cancelled by consumers every month. Costs of maintaining the copper lines are growing and AT&T recently announced a sunset date of 2018 for POTS.

The automatic dialer devices are not longer used, or approved within NFPA 72. Providing the direct reference to NFPA 72 will cover the advancements in technologies and they move forward.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This provides clarity with NFPA 72 National Fire Alarm and Signaling Code

2018 International Fire Code

Add new text as follows:

907.6.6.2 MIY Monitoring. Direct transmission of alarms associated with Monitor it Yourself (MIY) transmitters to a public safety answering point (PSAP) shall not be permitted unless approved by the fire code official.

907.6.6.2.1 Telephone calls. Requests for emergency service shall only be made via live voice to a public safety answering point (PSAP), unless approved by the fire code official.

Reason:

DIY Do it Yourself Fire Alarm Devices, and MIY Monitor it Yourself technologies practices are here today, and will only grow over the next 10+ years. The Fire Life Safety concern that this language addresses is the potential for a smoke detector/fire alarm system that today can easily communicate with our phones, tablets, watches and laptops; will also be able to contact DIRECTLY the Emergency Communication Center (911) without human interface. This will lead to an increase in unwanted alarm dispatches and place our first responders at risk.

This language will allow the technologies to advance and send information to the devices that a human can interface with, and they can make the determination to call 911.

This language will also allow the fire code official to allow advance technologies if they make that determination.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a code clarification and alignment with NFPA 72 National Fire Alarm and Signaling Code

Internal ID: 367

IFC: 907.8.4, 907.8.4.1

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Jason Webb, representing Automatic Fire Alarm Association Codes & Standards Committee (jwebb608@gmail.com)

2018 International Fire Code

907.8.3 Smoke detector sensitivity. Smoke detector sensitivity shall be checked within one year after installation and every alternate year thereafter. After the second calibration test, where sensitivity tests indicate that the detector has remained within its *listed* and marked sensitivity range (or 4-percent obscuration light gray smoke, if not marked), the length of time between calibration tests shall be permitted to be extended to not more than 5 years. Where the frequency is extended, records of detector-caused nuisance alarms and subsequent trends of these alarms shall be maintained. In zones or areas where nuisance alarms show any increase over the previous year, calibration tests shall be performed.

Delete without substitution:

~~**907.8.4 Sensitivity test method.** To verify that each smoke detector is within its *listed* and marked sensitivity range, it shall be tested using one of the following methods:~~

- ~~1. A calibrated test method.~~
- ~~2. The manufacturer's calibrated sensitivity test instrument.~~
- ~~3. *Listed* control equipment arranged for the purpose.~~
- ~~4. A smoke detector/control unit arrangement whereby the detector causes a signal at the control unit where the detector's sensitivity is outside its acceptable sensitivity range.~~
- ~~5. Another calibrated sensitivity test method acceptable to the *fire code official*.~~

~~Detectors found to have a sensitivity outside the *listed* and marked sensitivity range shall be cleaned and recalibrated or replaced.~~

~~Exceptions:~~

- ~~1. Detectors *listed* as field adjustable shall be permitted to be either adjusted within the *listed* and marked sensitivity range and cleaned and recalibrated or they shall be replaced.~~
- ~~2. This requirement shall not apply to single-station smoke alarms.~~

~~**907.8.4.1 Sensitivity testing device.** Smoke detector sensitivity shall not be tested or measured using a device that administers an unmeasured concentration of smoke or other aerosol into the detector.~~

Revise as follows:

~~**907.8.5**~~**907.8.4 Inspection, testing and maintenance.** The building *owner* shall be responsible to maintain the fire and life safety systems in an operable condition at all times. Service personnel shall meet the qualification requirements of NFPA 72 for inspection, testing and maintenance of such systems. Records of inspection, testing and maintenance shall be maintained.

Reason:

This Proposal seeks just eliminate the redundant language in the IFC that is in NFFA 72. Does NOT change any testing requirements, just points you towards NFPA 72 for the details.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is just eliminating duplicated language that is in NFPA 72, the referenced document.

2018 International Fire Code

Add new text as follows:

907.8.6 Problematic Systems. Where required by the fire code official, fire alarm systems that produce chronic, unwanted alarms shall be monitored with central station service in accordance with NFPA 72 requirements. A copy of the certificate, placard or other documentation issued by the organization that listed the central station, or the prime fire alarm system contractor, shall be made available to the fire code official upon request.

Reason:

This section is intended to address situations where fire alarm systems repeatedly create unwanted alarm signals. The determination of what constitutes chronic unwanted alarms is up to the fire code official to decide based on local policies and practices, such as local false alarm ordinances. By requiring central station service the fire alarm system now will be covered by an audit program administered by the company that listed the central station. Certified central station service has been shown to significantly reduce unwanted alarms.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is an approximate \$100 annual fee for certificates which includes the ongoing third party inspection. To clarify does not increase the cost of construction or installation, but when employed will cost the owner this additional amount for annual service.

IFC: 907.10, 907.10.1 (New)

Proponent: Thomas Daly, representing The Hospitality Security Consulting Group, LLC (Thomas.Daly@myhscg.com)

2018 International Fire Code

Revise as follows:

907.10 Smoke alarm maintenance. Smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions. ~~Smoke alarms shall be replaced when they fail to respond to operability tests, or when they exceed 10 years from the date of manufacture, unless an earlier replacement is specified in the manufacturer's published instructions.~~

Add new text as follows:

907.10.1 Replacement. Newly installed smoke alarms shall be replaced, deemed construction, when they fail to respond to operability tests, or when they exceed 10 years from the date of manufacture, unless an earlier replacement is specified in the manufacturer's published instructions.

Reason:

The proposed changes will clarify the intent of the language by differentiating between maintenance (testing, cleaning, etc) and replacement (construction) and apply the replacement obligation to newly installed smoke alarms, as there is no corresponding language in Chapter 11 making this replacement obligation applicable to existing installations.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal will likely decrease the cost of operations. If this code change approved, the cost of operations would decrease as only smoke alarms installed on and after the adoption of the 2021 code, would be covered by the obligation for replacement at 10 years. Existing smoke alarms would not as there is no corresponding language in Chapter 11 (now or proposed) for existing construction. There are multiple occupancies affected and I cannot speak for all of them, but for lodging the decrease in costs we estimate at \$25 million per year, every year

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov)

2018 International Fire Code

Add new text as follows:

908.3 Fire alarm system interface. Where an emergency alarm system is interfaced with a building's fire alarm system, the signal produced at the fire alarm control unit shall be a supervisory signal.

Reason:

The code is silent about how to interface an emergency alarm system with a fire alarm system. The emergency alarm system may or may not require evacuation, but should not activate the fire alarm system. It is important to ensure the integrity of the fire alarm system, and to ensure that the fire alarm signal be reserved for fire emergencies. Where interface between different alarm systems is desired, such as may occur when providing off-site monitoring services, it is important to ensure that unwanted activations of the fire alarm system are avoided. By requiring the supervisory signal, the code clarifies what is intended when systems are interfaced, and provides an appropriate level of signal to monitoring facilities to ensure that corrective action is taken.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will not change the cost of system installation, as it only addresses the internal programming of a fire alarm system when interfaced with an emergency alarm system.

IFC: 909.12.1 (IBC[F] 909.12.1); IMC: 513.12.1

Proponent: John Kampmeyer, representing Self (jkamppe@gmail.com)

2018 International Fire Code

Revise as follows:

909.12.1 Verification. Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override and the presence of power downstream of all disconnects. A preprogrammed weekly test sequence shall report abnormal conditions audibly, visually and by printed report. The preprogrammed weekly test shall operate all devices, equipment, and components used for smoke control.

Exception: Where verification of individual components tested through the preprogrammed weekly testing sequence will interfere with, and produce unwanted effects to, normal building operation, such individual components are permitted to be bypassed from the preprogrammed weekly testing, where *approved* by the *fire code official* and in accordance with both of the following:

1. Where the operation of components is bypassed from the preprogrammed weekly test, presence of power downstream of all disconnects shall be verified ~~weekly~~ continuously by a listed control unit that monitors all of the functions of the smoke control system.
2. Testing of all components bypassed from the preprogrammed weekly test shall be in accordance with Section 909.20.6.

2018 International Mechanical Code

Revise as follows:

[F] 513.12.1 Verification. Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override and the presence of power downstream of all disconnects. A preprogrammed weekly test sequence shall report abnormal conditions audibly, visually and by printed report. The preprogrammed weekly test shall operate all devices, equipment and components used for smoke control.

Exception: Where verification of individual components tested through the preprogrammed weekly testing sequence will interfere with, and produce unwanted effects to, normal building operation, such individual components are permitted to be bypassed from the preprogrammed weekly testing, where *approved* by the building official and in accordance with both of the following:

1. Where the operation of components is bypassed from the preprogrammed weekly test, presence of power downstream of all disconnects shall be verified ~~weekly~~ continuously by a listed control ~~unit.~~ unit that monitors all of the functions of the smoke control system.
2. Testing of all components bypassed from the preprogrammed weekly test shall be in accordance with Section 909.20.6 of the International Fire Code.

Reason:

The weekly automatic test of dedicated smoke control systems (atrium exhaust, stair pressurization, etc) is detrimental to building in cold climates. Building owners are reluctant to introduce unconditioned air into the buildings.

By monitoring the smoke control system components and functions on a listed control panel connected to power supplies, end switches, disconnect switches, airflow switches, etc, the failure of any item will immediately register a fault condition on the smoke control panel and initiate a supervisory alarm on the fire alarm panel.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not affect the cost of smoke control systems since the monitoring required by this exception will be the same cost whether continuously or weekly. It also eliminates the need for a printer which is often not provided on smaller building systems which contain atria.

F161-18

IFC 909.17 (IBC: [F] 909.17)

Proponent: Douglas Evans, DHE FPE LLC, representing DHE FPE LLC (dhefpe@gmail.com)

2018 International Fire Code

Revise as follows:

909.17 System response time. Smoke-control system activation shall be initiated immediately after receipt of an appropriate automatic or manual activation command. Smoke control systems shall activate individual components (such as dampers and fans) in the sequence necessary to prevent physical damage to the fans, dampers, ducts and other equipment. For purposes of smoke control, the fire ~~fighter's~~fighter's control panel response time shall be the same for automatic or manual smoke control action initiated from any other building control point. The total response time, including that necessary for detection, shutdown of operating equipment and smoke control system startup, shall allow for full operational mode to be achieved before the conditions in the space exceed the design smoke condition. Upon receipt of an alarm condition at the fire alarm control panel, fans, dampers and automatic doors shall have achieved their proper operating state and final status shall be indicated at the smoke control panel within 90 seconds. The system response time for each component and their sequential relationships shall be detailed in the required rational analysis and verification of their installed condition reported in the required final report.

Reason:

The code does not presently specify a time frame in which the smoke control system is required to configure and be fully operational. This decision is left open for debate. At times, designers have argued that fire department response times should dictate the duration in which the smoke control system should configure, which can be expected to take several minutes. As specified in the third sentence of 909.17, the time limitation also applies to manual activation from the fire-fighter's control panel. As such, a reasonable time frame for the smoke control system to be fully operational from either manual or automatic initiation should be specified in the code.

There are a number of time delays that are inherent in activation of smoke control systems. There is the delay between when the initiating device activates and when the panel registers an alarm condition. These delays can be inherent in the components or even programmed into the system. Sprinkler systems are allowed to have a delay up to 90 seconds to compensate for surges in the piping network.

The 90 second delay proposed herein is: after the fire alarm control panel indicates an alarm condition, the smoke control system is expected to be fully operational. This 90 second delay is based on the time it takes smoke dampers to configure and annunciate their status (open/closed). Section 8.1 of UL 555S, which governs smoke dampers, requires them to fully configure (open or close) within 75 seconds. The additional time (15 seconds for a total of 90 seconds) allows for delays in data transfer and confirmation, as well as ample time for all other components to be fully operational (e.g. fans).

With 90 seconds stipulated in the code, there is no confusion, or debate, as to what's expected. This time constraint for smoke control systems to configure and report proper status has been used throughout Southern Nevada, including the Las Vegas Strip, for almost 25 years and has not been shown to be a hardship.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

All components of a smoke control system can easily configure and report back to the smoke control panel within the allotted 90 seconds.

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Add new text as follows:

[BF] 909.20 Smokeproof enclosures. Where required by Section 1023.11, a smokeproof enclosure shall be constructed in accordance with this section. A smokeproof enclosure shall consist of an interior exit stairway or ramp that is enclosed in accordance with the applicable provisions of Section 1023 and an open exterior balcony or ventilated vestibule meeting the requirements of this section. Where access to the roof is required, such access shall be from the smokeproof enclosure where a smokeproof enclosure is required.

[BF] 909.20.1 Access. Access to the stairway or ramp shall be by way of a vestibule or an open exterior balcony. The minimum dimension of the vestibule shall be not less than the required width of the corridor leading to the vestibule but shall not have a width of less than 44 inches (1118 mm) and shall not have a length of less than 72 inches (1829 mm) in the direction of egress travel.

[BF] 909.20.2 Construction. The smokeproof enclosure shall be separated from the remainder of the building by not less than 2-hour fire barriers constructed in accordance with Section 707 of the International Building Code or horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both. Openings are not permitted other than the required means of egress doors. The vestibule shall be separated from the stairway or ramp by not less than 2-hour fire barriers constructed in accordance with Section 707 of the International Building Code or horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both. The open exterior balcony shall be constructed in accordance with the fire-resistance rating requirements for floor assemblies.

[BF] 909.20.2.1 Door closers. Doors in a smokeproof enclosure shall be self- or automatic closing by actuation of a smoke detector in accordance with Section 716.5.9.3 of the International Building Code and shall be installed at the floor-side entrance to the smokeproof enclosure. The actuation of the smoke detector on any door shall activate the closing devices on all doors in the smokeproof enclosure at all levels. Smoke detectors shall be installed in accordance with Section 907.3.

[BF] 909.20.3 Natural ventilation alternative. The provisions of Sections 909.20.3.1 through 909.20.3.3 shall apply to ventilation of smokeproof enclosures by natural means.

[BF] 909.20.3.1 Balcony doors. Where access to the stairway or ramp is by way of an open exterior balcony, the door assembly into the enclosure shall be a fire door assembly in accordance with Section 716 of the International Building Code.

[BF] 909.20.3.2 Vestibule doors. Where access to the stairway or ramp is by way of a vestibule, the door assembly into the vestibule shall be a fire door assembly complying with Section 716 of the International Building Code. The door assembly from the vestibule to the stairway shall have not less than a 20-minute fire protection rating complying with Section 716 of the International Building Code.

[BF] 909.20.3.3 Vestibule ventilation. Each vestibule shall have a minimum net area of 16 square feet (1.5 m²) of opening in a wall facing an outer court, yard or public way that is not less than 20 feet (6096 mm) in width.

[BF] 909.20.4 Mechanical ventilation alternative. The provisions of Sections 909.20.4.1 through 909.20.4.4 shall apply to ventilation of smokeproof enclosures by mechanical means.

[BF] 909.20.4.1 Vestibule doors. The door assembly from the building into the vestibule shall be a fire door assembly complying with Section 716.5.3 of the International Building Code. The door assembly from the vestibule to the stairway or ramp shall not have less than a 20-minute fire protection rating and shall meet the requirements for a smoke door assembly in accordance with Section 716.5.3 of the International Building Code. The door shall be installed

in accordance with NFPA 105.

[BF] 909.20.4.2 Vestibule ventilation. The vestibule shall be supplied with not less than one air change per minute and the exhaust shall be not less than 150 percent of supply. Supply air shall enter and exhaust air shall discharge from the vestibule through separate, tightly constructed ducts used only for that purpose. Supply air shall enter the vestibule within 6 inches (152 mm) of the floor level. The top of the exhaust register shall be located at the top of the smoke trap but not more than 6 inches (152 mm) down from the top of the trap, and shall be entirely within the smoke trap area. Doors in the open position shall not obstruct duct openings. Duct openings with controlling dampers are permitted where necessary to meet the design requirements, but dampers are not otherwise required.

[BF] 909.20.4.2.1 Engineered ventilation system. Where a specially engineered system is used, the system shall exhaust a quantity of air equal to not less than 90 air changes per hour from any vestibule in the emergency operation mode and shall be sized to handle three vestibules simultaneously. Smoke detectors shall be located at the floor-side entrance to each vestibule and shall activate the system for the affected vestibule. Smoke detectors shall be installed in accordance with Section 907.3.

[BF] 909.20.4.3 Smoke trap. The vestibule ceiling shall be not less than 20 inches (508 mm) higher than the door opening into the vestibule to serve as a smoke and heat trap and to provide an upward-moving air column. The height shall not be decreased unless approved and justified by design and test.

[BF] 909.20.4.4 Stairway or ramp shaft air movement system. The stairway or ramp shaft shall be provided with a dampered relief opening and supplied with sufficient air to maintain a minimum positive pressure of 0.10 inch of water (25 Pa) in the shaft relative to the vestibule with all doors closed.

[BF] 909.20.5 Stairway and ramp pressurization alternative. Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the vestibule is not required, provided that each interior exit stairway or ramp is pressurized to not less than 0.10 inch of water (25 Pa) and not more than 0.35 inches of water (87 Pa) in the shaft relative to the building measured with all interior exit stairway and ramp doors closed under maximum anticipated conditions of stack effect and wind effect.

[BF] 909.20.6 Ventilating equipment. The activation of ventilating equipment required by the alternatives in Sections 909.20.4 and 909.20.5 shall be by smoke detectors installed at each floor level at an approved location at the entrance to the smokeproof enclosure. When the closing device for the stairway and ramp shaft and vestibule doors is activated by smoke detection or power failure, the mechanical equipment shall activate and operate at the required performance levels. Smoke detectors shall be installed in accordance with Section 907.3.

[BF] 909.20.6.1 Ventilation systems. Smokeproof enclosure ventilation systems shall be independent of other building ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or connected to the smokeproof enclosure by ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with Section 707 of the International Building Code or horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both.
2. Equipment, control wiring, power wiring and ductwork shall be located within the smokeproof enclosure with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with Section 707 of the International Building Code or horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both.
3. Equipment, control wiring, power wiring and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour fire barriers constructed in accordance with Section 707 of the International Building Code or horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both.

Exceptions: Control wiring and power wiring located outside of a 2-hour fire barrier construction shall be protected using any one of the following methods:

1. Cables used for survivability of required critical circuits shall be listed in accordance with UL 2196 and shall have a fire-resistance rating of not less than 2 hours.

2. Where encased with not less than 2 inches (51 mm) of concrete.
3. Electrical circuit protective systems shall have a fire-resistance rating of not less than 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

[BF] 909.20.6.2 Standby power. Mechanical vestibule and stairway and ramp shaft ventilation systems and automatic fire detection systems shall be provided with standby power in accordance with Section 604.

[BF] 909.20.6.3 Acceptance and testing. Before the mechanical equipment is approved, the system shall be tested in the presence of the building official to confirm that the system is operating in compliance with these requirements.

Revise as follows:

~~909.20.909.22~~ **Maintenance.** Smoke control systems shall be maintained to ensure to a reasonable degree that the system is capable of controlling smoke for the duration required. The system shall be maintained in accordance with the manufacturer's instructions and Sections ~~909.20.1~~ 909.22.1 through ~~909.20.6~~ 909.22.6.

~~909.20.1~~ 909.22.1 **Schedule.** A routine maintenance and operational testing program shall be initiated immediately after the smoke control system has passed the acceptance tests. A written schedule for routine maintenance and operational testing shall be established.

~~909.20.2~~ 909.22.2 **Records.** Records of smoke control system testing and maintenance shall be maintained. The record shall include the date of the maintenance, identification of the servicing personnel and notification of any unsatisfactory condition and the corrective action taken, including parts replaced.

~~909.20.3~~ 909.22.3 **Testing.** Operational testing of the smoke control system shall include all equipment such as initiating devices, fans, dampers, controls, doors and windows.

~~909.20.4~~ 909.22.4 **Dedicated smoke control systems.** Dedicated smoke control systems shall be operated for each control sequence semiannually. The system shall be tested under standby power conditions.

~~909.20.5~~ 909.22.5 **Nondedicated smoke control systems.** Nondedicated smoke control systems shall be operated for each control sequence annually. The system shall be tested under standby power conditions.

~~909.20.6~~ 909.22.6 **Components bypassing weekly test.** Where components of the smoke control system are bypassed by the preprogrammed weekly test required by Section 909.12.1, such components shall be tested semiannually. The system shall be tested under standby power conditions.

909.6.3 Pressurized stairways and elevator hoistways. Where stairways or elevator hoistways are pressurized, such pressurization systems shall comply with Section 909 as smoke control systems, in addition to the requirements of ~~Section 909.21 of this code and Section 909.20 of the International Building Code.~~ Sections 909.20 and 909.21.

909.12.1 Verification. Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override and the presence of power downstream of all disconnects. A preprogrammed weekly test sequence shall report abnormal conditions audibly, visually and by printed report. The preprogrammed weekly test shall operate all devices, equipment, and components used for smoke control.

Exception: Where verification of individual components tested through the preprogrammed weekly testing sequence will interfere with, and produce unwanted effects to, normal building operation, such individual components are permitted to be bypassed from the preprogrammed weekly testing, where *approved* by the *fire code official* and in accordance with both of the following:

1. Where the operation of components is bypassed from the preprogrammed weekly test, presence of power downstream of all disconnects shall be verified weekly by a listed control unit.
2. Testing of all components bypassed from the preprogrammed weekly test shall be in accordance with Section ~~909.20.6~~ 909.22.6.

909.19 System acceptance. Buildings, or portions thereof, required by this code to comply with this section shall not be issued a certificate of occupancy until such time that the *fire code official* determines that the provisions of this

section have been fully complied with and that the fire department has received satisfactory instruction on the operation, both automatic and manual, of the system and a written maintenance program complying with the requirements of Section ~~909.20.1~~ 909.22.1 has been submitted and *approved* by the *fire code official*.

Exception: In buildings of phased construction, a temporary certificate of occupancy, as *approved* by the *fire code official*, shall be allowed, provided that those portions of the building to be occupied meet the requirements of this section and that the remainder does not pose a significant hazard to the safety of the proposed occupants or adjacent buildings.

[BE] 1023.3.1 Extension. Where *interior exit stairways* and *ramps* are extended to an *exit discharge* or a *public way* by an *exit passageway*, the *interior exit stairway* and *ramp* shall be separated from the *exit passageway* by a *fire barrier* constructed in accordance with Section 707 of the International Building Code or a horizontal assembly constructed in accordance with Section 711 of the International Building Code, or both. The *fire-resistance rating* shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door* assembly complying with Section 716 of the International Building Code shall be installed in the *fire barrier* to provide a *means of egress* from the *interior exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door* assembly are prohibited. Penetrations of the *fire barrier* are prohibited.

Exceptions:

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.
2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.
3. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where the *interior exit stairway* and the *exit passageway* extension are pressurized in accordance with Section 909.20.5 of the International Building Code.

[BE] 1023.11 Smokeproof enclosures. Where required by Building Code, *interior exit stairways* and *ramps* shall be smokeproof enclosures in accordance with Section 909.20 of the International Building Code .

[BE] 1023.11.2 Enclosure access. Access to the *stairway* or *ramp* within a *smokeproof enclosure* shall be by way of a vestibule or an open exterior balcony.

Exception: Access is not required by way of a vestibule or exterior balcony for *stairways* and *ramps* using the pressurization alternative complying with Section 909.20.5 of the International Building Code.

Reason:

Section 909.20 does not exist in the 2018 IFC, although, these sections have been in the IBC for several editions. It is generally considered that Chapter 9 in the IFC is the same as Chapter 9 in the IBC.

Adding this text into the IFC provides correlation with the IBC and enhances consistent application, interpretation, and enforcement. The is no substantive change in the code language.

The IFC sections referencing these items are revised to refer to the new sections in the IFC.

The IBC sections referencing IFC sections are revised to refer to the new sections in the IFC.

The [BF] symbol is added for each section since amendments to these provisions are processed through the IBC Fire Safety Code Development Committee.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a format change and does not affect application of the code requirements.

IFC: 909.6.3, 909.22 (New), 909.22.1 (New), 909.22.1.1 (New), 909.22.1.2 (New), 909.22.1.3 (New), 909.22.1.3.1 (New), 909.22.1.3.2 (New), 909.22.1.3.3 (New), 909.22.2 (New), 909.22.3 (New), 909.22.4 (New), 909.22.5 (New), 909.22.6 (New), 909.22.7 (New); IBC: 909.6.3

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

909.6.3 Pressurized stairways and elevator hoistways. Where stairways and ramps or elevator hoistways are pressurized, such pressurization systems shall comply with Section 909 as smoke control systems, in addition to the requirements of ~~Section Sections~~ 909.21 ~~of this code and Section 909.20 of the International Building Code and 909.22,~~ as applicable.

Add new text as follows:

909.22 Stairway and Ramp Pressurization Alternative.

Where the stairway and ramp pressurization alternative is chosen for compliance with Building Code requirements for a smokeproof enclosure, interior exit stairways and ramps shall be pressurized to a minimum of 0.10 inches of water (25 Pa) and a maximum of 0.35 inches of water (87 Pa) in the shaft relative to the building measured with all interior exit stairway and ramp doors closed under maximum anticipated conditions of stack effect and wind effect. Such pressurization systems shall also comply with Sections 909.22.1 through 909.22.7.

909.22.1 Ventilating equipment. The activation of ventilating equipment for the stair and ramp pressurization system shall be by smoke detectors installed at each floor level at an approved location at the entrance to the smokeproof enclosure. When the closing device for the stairway and ramp shaft and vestibule doors is activated by smoke detection or power failure, the mechanical equipment shall activate and operate at the required performance levels. Smoke detectors shall be installed in accordance with Section 907.3.

909.22.1.1 Ventilation Systems. Smokeproof enclosure ventilation systems shall be independent of other building ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or connected to the smokeproof enclosure by ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with Section 707 of the Building Code or horizontal assemblies constructed in accordance with Section 711 of the Building Code, or both.
2. Equipment, control wiring, power wiring and ductwork shall be located within the smokeproof enclosure with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour barriers constructed in accordance with Section 707 of the Building Code or horizontal assemblies constructed in accordance with Section 711 of the Building Code, or both.
3. Equipment, control wiring, power wiring and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour fire barriers constructed in accordance with Section 707 of the Building Code or horizontal assemblies constructed in accordance with Section 711 of the Building Code, or both
Exceptions:
 1. Control wiring and power wiring utilizing a 2-hour rated cable or cable system.
 2. Where encased with not less than 2 inches (51 mm) of concrete.
 3. Control wiring and power wiring protected by a listed electrical circuit protective systems with a fire-resistance rating of not less than 2 hours.

909.22.1.2 Ducts for system. Any duct system that is part of the pressurization system shall be protected with the same fire-resistance rating as required for the smokeproof enclosure.

909.22.1.3 Fan system. The fan system provided for the pressurization system shall be as required by Sections 909.22.1.3.1 through 909.22.1.3.3.

909.22.1.3.1 Fire resistance. Where located within the building, the fan system that provides the pressurization shall be protected with the same fire-resistance rating required for the smokeproof enclosure.

909.22.1.3.2 Smoke detection. The fan system shall be equipped with a smoke detector that will automatically shut down the fan system when smoke is detected within the system.

909.22.1.3.3 Separate systems. A separate fan system shall be used for each smokeproof enclosure.

909.22.2 Standby power. The pressurization system shall be provided with standby power in accordance with Section 1203.

909.22.3 Testing. Testing for performance shall be required in accordance with Section 909.18.8. System acceptance shall be in accordance with Section 909.19.

909.22.4 Marking and identification. Detection and control systems shall be marked in accordance with Section 909.14.

909.22.5 Control diagrams. Control diagrams shall be provided in accordance with Section 909.15.

909.22.6 Control panel. A control panel complying with Section 909.16 shall be provided.

909.22.7 System response time. Stairway and ramp pressurization systems shall comply with the requirements for smoke control system response time in Section 909.17.

2018 International Building Code

Revise as follows:

[F] 909.6.3 Pressurized stairways and elevator hoistways. Where stairways and ramps or elevator hoistways are pressurized, such pressurization systems shall comply with Section 909 as smoke control systems, in addition to the requirements of Sections 909.20 of this code and 909.21 and 909.22, as applicable, of the International Fire Code.

Reason:

The intent with this change is to simply duplicate the requirements for a stairway and ramp pressurization systems from the Building Code to the Fire Code. This change is not intended to make substantive changes to the requirements, but rather to provide the fire code official with the requirements for such systems in the Fire Code for enforcement purposes relative to the Smoke Control Permit required for such systems and 909.6.3, both of which were introduced to the code in the 2015 edition. The elevator pressurization requirements were duplicated in a similar fashion in the 2015 edition of the code, but the stairway pressurization requirements were not, resulting in some confusion.

The change was previously proposed to the 2018 edition of the IFC to no avail, so I am attempting one last time to get this put into the IFC because it doesn't make sense to have elevator pressurization requirements in the IFC and not stairway pressurization requirements when a smoke control permit is clearly required for such systems. The proposal has been arranged to more closely match the arrangement of the elevator pressurization requirements in hopes of satisfying the committee's past concerns.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is simply a duplication of the requirements from the Building Code into the Fire Code, so there should be no increase in the cost of construction, as such.

Internal ID: 1048

F164-18

IFC: 910.2.2 (IBC: [F] 910.2.2)

Proponent: Mark Chubb, Telgian Corp., representing Telgian Corp. (mchubb@telgian.com)

2018 International Fire Code

Revise as follows:

910.2.2 High-piled combustible storage. Smoke and heat removal required by Table 3206.2 for buildings and portions thereof containing high-piled combustible storage shall be installed in accordance with Section 910.3 in un-sprinklered buildings. In buildings and portions thereof containing high-piled combustible storage equipped throughout with an *automatic sprinkler system* using standard-spray or control mode density-area (CMDA) sprinklers in accordance with Section 903.3.1.1, a smoke and heat removal system shall be installed in accordance with Section 910.3 or 910.4. Smoke and heat removal systems shall not be required in buildings equipped throughout with an automatic sprinkler system using Early-Suppression Fast-Response (ESFR) or Control-Mode Specific-Application (CMSA) sprinklers in accordance with Section 903.3.1.1. In occupied portions of a building equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 where the upper surface of the story is not a roof assembly, a mechanical smoke removal system in accordance with Section 910.4 shall be installed.

Reason:

The proposed change is consistent with Table 3206.1, Note h., which exempts high-piled storage protected by ESFR or CMSA sprinklers from smoke and heat removal requirements. Adding this language to section 910.2.2 seeks to improve consistency in application and interpretation of these code requirements.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change recognizes the existing exception for smoke and heat venting in Table 3206.1, Note h. in buildings protected by ESFR or CMSA sprinklers.

Internal ID: 150

F165-18

IBC: 910.3.4 (New) (IBC: [F] 910.3.4 (New))

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

910.3.4 Vent Operation. Smoke and heat vents shall be capable of being operated by approved automatic and manual means.

Reason:

Several code changes have revised the smoke and heat vent requirements over the past several cycles. Most recently, F195-13 removed much of the requirements in the IFC/IBC regarding smoke and heat vents and replaced them with a requirement for compliance with UL 793 or FM 4430 and a reference to NFPA 204 for maintenance, along with a significant change to the number of smoke and heat vents and mechanical smoke removal requirements.

One of the requirements that is no longer found in the IFC is the requirement that smoke and heat vents be capable of both automatic and manual operation. While this requirement is found in Section 5.3.5 of NFPA 204 Smoke and Heat Venting, the standard is not referenced for installation. But even if it was referenced for installation, this requirement would likely still be missed since the UL test standard does not require a manual release. The UL standard states that **IF** a manual release is provided, it will be tested. But the reality is that you can find UL listed smoke and heat vents with, or without, a manual release.

Placing this requirement into the code brings it to the attention of the designer, plan reviewer, and inspector

The manual release is critical since the smoke and heat vent most likely will not open automatically in a sprinklered building, if the sprinkler system is adequately cooling the ceiling temperatures. Therefore, the firefighters must have the ability to open the smoke and heat vents manually.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is standard for NFPA 2014 installations and was inadvertently removed in the sweeping changes made to Section 910 in 2015.

Internal ID: 277

F166-18

IFC: 910.3.4 (New) (IBC: [F] 910.3.4 (New))

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov)

2018 International Fire Code

Add new text as follows:

910.3.4 Fusible link temperature rating. Where vents are installed in areas provided with automatic fire sprinklers and the vents operate by fusible link, the fusible link shall have a temperature rating of 360° F (182° C).

Reason:

There have been studies that show that draft curtains and smoke and heat vents can have negative consequence on fire sprinkler performance in storage buildings. One item that is not addressed within the IFC is related to the acceptable temperature rating of fusible links used to operate smoke and heat vents. At least one legacy code (UFC) required this link rating to be between 350° F and 400° F, and FM guidance indicates 360° F is an appropriate temperature rating. The proposal here is to use the 360° F temperature rating, in order to ensure that the fire sprinklers activate prior to opening of the smoke and heat vents.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal may increase costs of construction in order to accommodate the costs with changing fusible links to meet this proposed requirement.

Internal ID: 1069

F167-18

IFC: 910.4.3.1 (IBC: [F] 910.4.3.1)

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

910.4.3.1 Makeup air. Makeup air openings shall be provided within 6 feet (1829 mm) of the floor level. Operation of makeup air openings shall be ~~manual or~~ automatic. The minimum gross area of makeup air inlets shall be 8 square feet per 1,000 cubic feet per minute (0.74 m² per 0.4719 m³/s) of smoke exhaust.

Reason:

Allowing makeup air to be manually activated results in additional personnel being required to accommodate running around the building to open doors, louvers, etc., as well as a knowledge as to the number and location of which doors to open to accommodate the makeup air needs of the exhaust system. Automatically activating the makeup air saves significant time for responders to be able to immediately activate the system and have it function properly. It is understood that many believe these systems are only utilized in post-fire scenarios, but that is not always the case.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal would eliminate the option of manually activating makeup air, i.e. manually opening doors around the building, in favor of requiring automatically activated makeup air when the mechanical smoke exhaust system is activated.

2018 International Fire Code

Revise as follows:

911.1 General. Explosion control shall be provided in the following locations:

1. Where a structure, room or space is occupied for purposes involving explosion hazards as identified in Table 911.1.
2. Where quantities of hazardous materials specified in Table 911.1 exceed the maximum allowable quantities in Table 5003.1.1(1).

Such areas shall be provided with explosion (*deflagration*) venting, explosion (*deflagration*) prevention systems or *barricades* in accordance with this section and NFPA 68, NFPA 69, or NFPA 495 as applicable. *Deflagration* venting shall not be utilized as a means to protect buildings from *detonation* hazards.

Add new text as follows:

911.4 Deflagration venting. Deflagration venting shall be of an approved type and installed in accordance with the provisions of this code and NFPA 68.

Revise as follows:

**TABLE 911.1

- h. Explosion venting is not required for Group H-5 fabrication areas complying with Section 415.11.1 and the International Fire Code-
- i. Where explosion control is required in Section 1206.

Add new standard(s) follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

68-13:

Standard on Explosion Protection by Deflagration Venting

Reason:

Lithium-ion battery explosions have been occurring on a regular basis with a variety of products. These events are likely attributed to the release of flammable gases from batteries cells that vent flammable gases during thermal runaway and other off-normal conditions. This proposal provides correlation with a rewrite of Section 1206 ESS requirements. Specifically new ESS explosion control requirements in Table 1206.6 and Section 1206.6.4 in the International Fire Code and [F] Table 414.5.1 of the International Building Code. The proposal also adds appropriate references to the NFPA 68 Standard on Explosion Protection by Deflagration Venting to add additional requirements and guidance on the installation of deflagration venting.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

The cost of construction will increase if explosion control is required, but that increase is not triggered by this proposal, but by the proposal that rewrites Section 1206.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 68—13, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Where explosion hazards exist ^f	Detonation	Required	Not Permitted
	Deflagration	Not Required	Required

- a. See Section 414.1.3.
- b. See the International Fire Code.
- c. ~~As generated during manufacturing or processing.~~ Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.7.2. See definition of "Combustible dust" in Chapter 2.
- d. Storage or use.
- e. In open use or dispensing.
- f. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.
- g. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.
- h. Explosion venting is not required for Group H-5 fabrication areas complying with Section 415.11.1 and the International Fire Code.

Reason:

This footnote is intended for areas where combustible dust is generated or manufactured where actual explosion potential could exist, such as H-2 Occupancies. The way it is written, it can be misleading into requiring explosion control for any area (e.g. small woodworking shps in schools etc.) where combustible dust is manufactured or generated.

Cost Impact

The code change proposal will decrease the cost of construction .

There is no cost associated with this since it is clarifying the intent of the code. It will reduce the cost of construction if it is being misapplied.

IFC: 913.1 (IBC: [F] 913.1)

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

913.1 General. Where provided, fire pumps for fire protection systems, other than automatic sprinkler systems designed in accordance with Section 903.3.1.3, shall be installed in accordance with this section and NFPA 20.

Reason:

Neither IRC Section P2904 nor NFPA 13D require fire pumps or any pumps to comply with NFPA 20. Pumps used in 1- and 2- family dwellings are not required to be listed for fire protection. Since “fire pumps” are not defined, it could be interpreted to follow NFPA 20 for these systems. This change uses the defined term of fire protection systems as it applies to several water based systems which are required to follow NFPA 20, such as NFPA 13, NFPA 13R, NFPA 14, NFPA 750, etc.

Cost Impact

The code change proposal will decrease the cost of construction .

This will result in cost decrease if jurisdictions were requiring listed fire pumps in dwellings.

Internal ID: 2044

F172-18

IFC: 913.1 (IBC:[F] 913.1)

Proponent: Michael O'Brian, representing National Fire Sprinkler Association (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

913.1 General. Where provided, fire pumps, for fire protection systems, shall be installed in accordance with this section and NFPA ~~20-20~~.

Exception: Pumps for automatic sprinkler systems installed in accordance with Section 903.3.1.3 or Section P2904 of the International Residential Code.

Reason:

NFPA 13D does not require fire pumps or any pumps to follow NFPA 20. Pumps used in NFPA 13D systems are not required to be listed for fire protection. Since “fire pumps” are not defined, it could be interpreted to follow NFPA 20 for NFPA 13D systems. This change uses the defined term of fire protection systems as it applies to several water based systems which are required to follow NFPA 20, such as NFPA 13, NFPA 13R, NFPA 14, NFPA 750, etc.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification of the NFPA 13D standard and code.

Internal ID: 73

F173-18

IFC: 913.2.2 (IBC: [F] 913.2.2)

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

913.2.2 Circuits supplying fire pumps. Cables used for survivability of circuits supplying fire pumps shall be protected using one of the following methods:

Exception: Cables, or portions of cables, located within a fire pump room or generator room which is separated from the remainder of the occupancy with fire-resistance-rated construction.

1. Cables used for survivability of required critical circuits shall be *listed* in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than ~~1-hour~~ 2 hours.
2. Electrical circuit protective systems shall have a fire-resistance rating of not less than ~~1-hour~~ 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.
3. Construction having a *fire-resistance rating* of not less than ~~1-hour~~ 2 hours.
4. The cable or raceway is encased in a minimum of 2 inches (50 mm) of concrete.

Reason:

Protecting the fire pump power supply is essential, but more critical when the pump is located within the building.

Section 695.6(A)(2)(d) of NFPA 70 requires that the power supply for fire pumps be protected for a minimum of 2 hours when it is routed through the building. The revisions to Items 1, 2 and 3 will correlate this requirement with the National Electrical Code.

The exception is added to clarify that cables located within the fire pump room are not required to be protected, and cables located with the generator room are not required to be protected. The fire-resistance rating is not specified since it could be either 1-hour or 2-hour based on other code sections.

- IBC Section 901.8 requires that the fire pump room be separated by either 1-hour or 2-hour construction depending on whether the building is high-rise or not.
- IFC/IBC Section 903.3.1.1 allows the elimination of sprinklers in the generator room if the generator room is of 2-hour construction and provided with a fire detection system.

Based on the above sections the separation could be 1-hour or 2-hour. It should also be noted that the 2-hour separation for the generator is not required, but rather an option. If the 2-hour separation and detection is not provided, then the room is provided with sprinklers. Additionally, the proposed exception in 913.2.2 would not apply since there is no fire-resistance-rated separation.

Cost Impact

The code change proposal will increase the cost of construction .

This may increase the cost of construction if listed cables are used and now must be 2-hour rated. However, Item 4 allows embedding the cables in concrete which would not require 2-hour listed cables.

Internal ID: 2048

F174-18

IFC: 913.2.2 (IBC: [F] 913.2.2)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

913.2.2 Circuits supplying fire pumps. Cables used for survivability of circuits supplying fire pumps shall be protected using one of the following methods:

1. Cables used for survivability of required critical circuits shall be *listed* in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 1 hour.
2. Electrical circuit protective systems shall have a fire-resistance rating of not less than 1 hour. Electrical circuit protective systems shall be installed in accordance with their listing requirements.
3. Construction having a *fire-resistance rating* of not less than 1 hour.
4. The cable or raceway is encased in a minimum of 2 inches (50 mm) of concrete.

Exception: This section shall not apply to cables, or portions of cables, located within a fire pump room or generator room which is separated from the remainder of the occupancy with fire-resistance-rated construction.

Reason:

Protecting the fire pump power supply is essential, but more critical when the pump is located within the building.

Section 695.6(A)(2)(d) of NFPA 70, the National Electrical Code, requires that the power supply for fire pumps be protected for a minimum of 2 hours when it is routed through the building. These revisions will correlate this requirement with the National Electrical Code.

The exception is added to clarify that where the cables are located within the fire pump room are not required to be protected, and cables located with the generator room are not required to be protected. The fire-resistance rating is not specified since it could be either 1-hour or 2-hour based on other code sections.

IBC Section 901.8 requires that the fire pump room be separated by either 1-hour or 2-hour construction depending on whether the building is high-rise or not.

IFC/IBC Section 903.3.1.1 allows the elimination of sprinklers in the generator room if the generator room is of 2-hour construction and provided with a fire detection system.

Based on the above sections the separation could be 1-hour or 2-hour. It should also be noted that the 2-hour separation for the generator is not required, but rather an option. If the 2-hour separation and detection is not provided, then the room is provided with sprinklers. Additionally, the proposed exception in 913.2.2 would not apply since there is no fire-resistance-rated separation.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Correlates with the NEC so is simply a clarification.

Internal ID: 278

F175-18

IFC: 914.3.2; IBC: 403.3.3

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

2018 International Fire Code

Revise as follows:

914.3.2 Secondary water supply. An automatic secondary on-site water supply having a capacity not less than the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings assigned to Seismic Design Category C, D, E or F as determined by the International Building Code. An additional fire pump shall not be required for the secondary water supply unless needed to provide the minimum design intake pressure at the suction side of the fire pump supplying the *automatic sprinkler system*. The secondary water supply shall have a duration of not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.

Exception: Existing buildings.

2018 International Building Code

Revise as follows:

[F] 403.3.3 Secondary water supply. An automatic secondary on-site water supply having a capacity not less than the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for *high-rise buildings* assigned to Seismic Design Category C, D, E or F as determined by Section 1613. An additional fire pump shall not be required for the secondary water supply unless needed to provide the minimum design intake pressure at the suction side of the fire pump supplying the *automatic sprinkler system*. The secondary water supply shall have a duration of not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.

Reason:

Code change F139-13 was approved as modified by public comment (AMPC). It's original intent was to relocate Section 903.3.5.2 of the IBC to the High-rise building provisions of Chapter 4. However, the full text of the 2012 Section 903.3.5.2 was not included. The final phrase of the requirement as well as the exception were not shown in the proposal (nor in the public comment.) The public comment established parallel text in the IFC. That 'parallel' text is as follows:

IFC 914.3.2 Secondary water supply. An automatic secondary on-site water supply having a capacity not less than the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings assigned to Seismic Design Category C, D, E or F as determined by the International Building Code. An additional fire pump shall not be required for the secondary water supply unless needed to provide the minimum design intake pressure at the suction side of the fire pump supplying the automatic sprinkler system. The secondary water supply shall have a duration of not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.

Exception: Existing buildings.

As you can see, the parallel text isn't the same as the IFC contains the additional phrase and exception. To have the sections in agreement, the proposed changes are appropriate. The FCAC may wish to note that the 2015 code also saw the elimination of the Existing buildings chapter (Ch 34) from the IBC. This was in part to concentrate existing building provisions in the IEBC. Since both Section 403 and Chapter 9 deal with new construction the existing building exception is not necessary.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The intent of these provisions remain the same and Section 914.3.2 should be duplicate to Section 403.3.3. The exception for existing buildings is unnecessary as these chapters pertain to new construction.

Internal ID: 281

F176-18

IFC: 914.3.8 (New), 914.3.8.1 (New)

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov)

2018 International Fire Code

Add new text as follows:

914.3.8 Smoke removal. To facilitate smoke removal in post-fire salvage and overhaul operations, buildings and structures shall be equipped with natural or mechanical ventilation for removal of products or combustion in accordance with one of the following:

1. Easily identifiable, manually operable windows or panels shall be distributed around the perimeter of each floor at not more than 50-foot (15 240 mm) intervals. The area of operable windows or panels shall be not less than 40 square feet (3.7 m²) per 50 linear feet (15 240 mm) of perimeter.

Exceptions:

1. In Group R-1 occupancies, each sleeping unit or suite having an exterior wall shall be permitted to be provided with 2 square feet (0.19 m²) of venting area in lieu of the area specified in Item 1.
2. Windows shall be permitted to be fixed provided that glazing can be cleared by fire fighters.
2. Mechanical air-handling equipment providing one exhaust air change every 15 minutes for the area involved. Return and exhaust air shall be moved directly to the outside without recirculation to other portions of the building.
3. Any other approved design that will produce equivalent results.

914.3.8.1 Maintenance. Smoke removal systems shall be maintained in accordance with the manufacturer's instructions to ensure continued system performance. A written schedule for routine maintenance and testing shall be established, and records of such maintenance and testing shall be kept. Operational testing of the smoke removal system shall include all equipment such as initiating means, fans, dampers, controls, doors and windows.

Exception: Fixed windows shall not require operational testing where such windows are routinely maintained and visually inspected.

Reason:

Smoke removal is a requirement for high-rise buildings set forth in Section 403.4.7 of the International Building Code (IBC). While many features of high-rise buildings from the IBC are referenced in Section 914.3 of the International Fire Code (IFC), the smoke removal system is not included in this section. Due to the nature of the system as an aid to fire fighters, it would be appropriate to add the requirement for this system to the IFC as well. This proposal seeks to copy the smoke removal provisions from the IBC, and add them to Section 914 of the IFC.

In addition to adding this section, an additional section regarding maintenance is proposed. As the IFC is often seen as a maintenance code, it is appropriate to add maintenance provisions into the IFC when including the smoke removal system requirements. The proposal is to add the maintenance requirements only to the IFC, and to leave the smoke removal provisions in the IBC untouched. There is precedent for having maintenance requirements appear only in the Fire Code; specifically related to smoke control systems, Section 909.20 of the IFC addresses maintenance of smoke control systems, and maintenance requirements are not included in the IBC (IBC Section 909.20 is smokeproof enclosures).

The language for maintenance that is proposed for smoke removal, is borrowed heavily from the existing maintenance requirements of IFC Section 909.20. As the smoke removal system utilizes similar equipment as is utilized by smoke control systems, Section 909.20 is a natural starting point for creating a maintenance section for smoke removal systems. While the proposal for maintenance of smoke removal systems is not as encompassing as those maintenance provisions that exist for smoke control systems, they are viewed as appropriate as the smoke removal system would typically be less complicated than a smoke control system.

Cost Impact

The code change proposal will increase the cost of construction .

While the cost of construction is not impacted, as the proposal simply copies existing construction requirements from the IBC into the IFC, the cost of operations for the user is increased, if no maintenance or testing of the smoke removal

system was undertaken previously.

Analysis: This proposal is partially trying to repeat language from Section 403.4.7 in the IFC section 914 as new section 914.3.8 that contains duplicate language related to fire protection systems from Chapter 4 of the IFC. Section 914.3.8.1 is new.

Internal ID: 1073

F177-18

IFC: 915.7 (New) (IBC: [F] 915.7 (New))

Proponent: Richard Soltis, Lawrence Township, N.J., representing Self (rsoltis@lawrencetwp.com)

2018 International Fire Code

Add new text as follows:

915.7 Mechanical system connection. Where there is a carbon monoxide detection system, connection to the mechanical system shall be provided for shutdown upon activation of a carbon monoxide detector.

Reason:

When there is a Carbon Monoxide event, along with notifying the occupants, the air distribution system should be shut down to avoid the spread of the hazard. Whether it is caused by the air handling unit itself or another fuel burning appliance within the structure. N.F.P.A. 720 recommends consideration of having carbon monoxide detection perform shutdown of HVAC systems to avoid the spread of carbon monoxide through the structure.

Bibliography:

N.F.P.A. 720, section 5.8.5.4, 2015ed., Carbon Monoxide Detectors for Control of Carbon Monoxide Spread.

Section 5.8.8.4.1, System designers shall consider the spread of carbon monoxide through an occupancy through the HVAC system.

Section 5.8.5.4.2, Interaction with smoke control systems, if such is provided, shall be considered.

Cost Impact

The code change proposal will increase the cost of construction .

The cost incurred would be due to interfacing the Carbon Monoxide detection system with the air handlers to cause shutdown. Even if the Carbon Monoxide detectors are connected to a fire alarm in the structure, there would be the cost incurred when interfacing with the air handlers for shutdown.

Internal ID: 888

F178-18

IFC: 1031.2

Proponent: Ken Brouillette, Seattle Fire Department, representing Seattle Fire Department
(ken.brouillette@seattle.gov)

2018 International Fire Code

Revise as follows:

1031.2 Reliability. Required *exit accesses, exits* and *exit discharges* shall be continuously maintained free from obstructions or impediments to full instant use in the case of fire or other emergency where the building area served by the *means of egress* is occupied. An ~~exit or~~ *exit passageway or corridor* shall not be used for any purpose that interferes with a *means of egress*.

Reason:

The discussion needs to continue regarding what is acceptable to be placed or stored in the egress system. It is not my intention to prohibit the occasional delivery but to give the fire code official the ability to regulate ongoing obstructions to the egress system that could cause delay in evacuations and make it more difficult for emergency personnel to access areas of a building.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is directed to existing buildings and does not affect construction.

Internal ID: 1376

F179-18

IFC: 1031.2.1.1 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

1031.2.1.1 Fire escapes. Security enclosures, fences, or screening for fire escape stairways shall be approved by the fire code official and shall be constructed such that they do not impede egress to the public way. Means shall be provided for access to the fire escape stair by emergency personnel from the exterior of the enclosure.

Reason:

Often as a result of owner concerns regarding unlawful access to private property, the retrofitting of security devices at the termination of a fire escape can sometimes be placed or installed in a manner which then prevents their immediate use by emergency personnel.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This specific maintenance provision would clarify the need for such access at the termination of the fire escape, It is not intended to increase the cost of compliance.

Internal ID: 534

F180-18

IFC: 1031.3.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Revise as follows:

1031.3.1 Group I-2. In Group I-2, the required clear width for *aisles, corridors* and *ramps* that are part of the required *means of egress* shall comply with Section 407.4.3 of the International Building Code and Section 1020.2. ~~The facility shall have a plan to maintain the required clear width during emergency situations.~~

Exception: In areas required for bed movement, equipment shall be permitted in the required width where all of the following provisions are met:

1. The equipment is low hazard and wheeled.
2. The facility shall have a plan to remove wheeled equipment in order to maintain the required clear width during emergency situations.
3. The equipment does not reduce the effective clear width for the *means of egress* to less than 5 feet (1525 mm).
4. The equipment is limited to:
 - 4.1. Equipment and carts in use.
 - 4.2. Medical emergency equipment.
 - 4.3. Infection control carts.
 - 4.4. Patient lift and transportation equipment.
5. Medical emergency equipment and patient lift and transportation equipment, when not in use, are required to be located on one side of the corridor.
6. The equipment is limited in number to not more than one per patient sleeping room or patient care room within each smoke compartment.

Reason:

This clarification of language is required in order to conform with Federal Standards and CMS enforcement rules (K211). The reference to Section 407.4.3 is to point to the fixed furniture requirements for hospitals and nursing homes. This relocated language gives the AHJ enforcement language to ensure that all wheeled equipment that may be occasionally found in hallways, must be included in the facility's emergency plan and must be moved out of the required egress width in the event of an emergency situation. Items that are often found in corridors include crash carts and infection control carts, which are needed to be near the point of use and readily available in typical circumstances, but must be moved out of the corridor during emergencies.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed language is operational clarification.

Internal ID: 580

F181-18

IFC: 1031.7; IPMC: [F]702.4

Proponent: Ed Kullik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

1031.7 Emergency escape and rescue openings. Required *emergency escape and rescue openings* shall be maintained in accordance with the ~~that was~~ code in effect at the time of construction, and both of the following:

1. Required *emergency escape and rescue openings* shall be operational from the inside of the room without the use of keys or tools.
2. Bars, grilles, grates or similar devices are ~~allowed~~ permitted to be placed over *emergency escape and rescue openings* provided that the minimum net clear opening size complies with the code that was in effect at the time of construction and such the unit is equipped with smoke alarms installed in accordance with Section 907.2.11 of the International Building Code. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the *emergency escape and rescue opening*.

2018 International Property Maintenance Code

Revise as follows:

[F] 702.4 Emergency escape ~~openings and rescue openings.~~ Required emergency escape and rescue openings shall be maintained in accordance with the code in effect at the time of construction, and ~~the following.~~ both of the following:

1. Required emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools.
2. Bars, grilles, grates or similar devices are permitted to be placed over emergency escape and rescue openings provided that the minimum net clear opening size complies with the code that was in effect at the time of construction and such the unit is equipped with smoke alarms installed in accordance with Section 907.2.11 of the International Building Code. Such devices shall be releasable or removable from the inside without the use of a key, tool or force greater than that which is required for normal operation of the escape and rescue opening.

Reason:

This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the I-codes. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IFC and IPMC will be proposed in Group A and the proposals for IEC will be proposed in Group B.

The IPMC should be revised to follow the format in the IFC, with a slight editorial change in language. To address situations where someone added these grills without a permit and for consistency with IEBC, add a requirement for smoke detectors.

There will be a coordinating proposal to the IEBC Section 505.4 and 701.4 as part of Group B.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were proposed changes. Related documentation and reports are posted on the FCAC website at: FCAC.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is an existing requirement in the IEBC. To add this to IFC and IPMC is just reminding someone what the requirements are, so there is no change to requirements where someone wants to add grills.

F182-18

IFC: 105.6.47 (New), 202 (New), 1001.3 (New), 1031.11 (New), 1031.11.1 (New), 1031.11.2 (New)

Proponent: Michael O'Brian, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

105.6.47 Valet trash collection. An operational permit is required to use a valet trash collection service in a Group R-2 Occupancy.

Add new definition as follows:

VALET TRASH COLLECTION A service that collects occupant-generated combustible trash or recyclable materials from dwelling units, where the trash is left outside of dwelling units for scheduled pickup.

Add new text as follows:

1001.3 Permits. Permits shall be required as forth in Section 105.6 for the activities regulated in 1031.11.

1031.11 Combustible trash in means of egress. Combustible trash or recyclable materials shall not be placed in exits, in enclosures for stairways or ramps, in corridors, in elevator lobbies or on egress balconies except as permitted by one of the following:

1. Combustible trash or recyclable materials associated with construction, demolition, remodeling, or alterations in accordance with Section 3311.3.
2. Combustible trash or recyclable materials in corridors or on egress balconies of Group R-2 Occupancies that is awaiting scheduled valet trash collection in accordance with Sections 1031.11.1 and 1031.11.2.

1031.11.1 Valet Trash collection. Trash or recyclable materials awaiting valet trash collection shall only be placed in a corridor or on an egress balcony within 18 hours of scheduled pickup and shall not obstruct the minimum egress width required by Section 1020.2.

Trash or recyclable materials awaiting valet trash collection shall be placed completely inside of one or more containers with a closed lid that complies with Section 1031.11.2. Additional trash or recyclable material placed outside of compliant containers are prohibited in a corridor or egress balcony.

1031.11.2 Valet trash collection containers. Containers used for valet trash collection shall not exceed a capacity of 2.0 cubic feet (15 gallons, 0.06 cubic meters) and shall be provided with tight-fitting or self-closing lids. Containers and lids shall comply with one of the following:

1. Containers and lids located in an area protected by fire sprinklers shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. The automatic sprinkler system supplying the sprinklers shall be permitted to comply with Section 903.3.1.1 or 903.3.1.2.
2. Containers and lids located in an area that is not protected by fire sprinklers in accordance with Item 1 shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 150 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. Wall and ceiling finishes in the area where valet trash collection containers are placed for pickup shall be noncombustible or shall comply with the requirements of Section 803 for Class B interior finish materials.

Reason:

Valet trash collection services have become common in many R-2 occupancies. Occupants receiving this service place trash and recyclables in the corridors outside of their apartments to be picked up by a collection service, which

typically comes by on a regular scheduled basis.

Currently, there are no provisions in the IFC that specifically prohibit or regulate the placement of combustible trash or recyclables in common egress areas for pickup by others. Without regulation, the hazard of excessive fire loading or exit obstruction is significant. This proposal seeks to establish reasonable safety precautions to allow this process to be offered, based on:1. An operational permit is required, ensuring that the Fire Code Official is aware that the service is being provided and encouraging code compliance.2. Requires that trash containers not obstruct the minimum required clear width of the means of egress.3. Clarifies that, in general, trash is not allowed to be accumulated in exits, corridors or egress balconies.4. Regulates trash containers and interior finish of the container placement area based on whether fire sprinklers are provided.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: FCAC

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not affect construction costs but may increase cost of compliance with the fire code depending upon how the provisions are enforced. However enforcement of these provisions will reduce the risk of fires.

R = The building is required to comply.

- a. Existing buildings shall comply with the sections identified as "Required" (R) based on occupancy classification or use, or both, whichever is applicable.
- ~~b. Only applies to Group I-2, Condition 2 occupancies as established by the adopting ordinance or legislation of the jurisdiction.~~
- ~~e. b.~~ Only applies to Group A-2 occupancies where alcoholic beverages are consumed.

Reason:

This proposal relocates the requirement for sprinklers in existing Group I-2, Condition 2 occupancies to Section 1105.9. Section 1105 deals specifically with Group I-2 occupancies so the code user will most likely be using that section for requirements.

Additionally, Section 1103.5.2 already references Section 1105.9 for all Group I-2 occupancies. So rather than this requirement being lost and hard to find it is proposed to locate it with the other sprinkler requirements for Group I-2 in Section 1105.9.

The statement to comply with the adopting is removed from this requirement. This statement was redundant to Section 1101.4 so it is unnecessary and creates an additional step in the adopting ordinance process. Section 1104 already stipulates time frames and is applicable to all sections in Chapter 11. All the requirements in Chapter 11 are retroactive and applicable to existing buildings. As such, all Chapter 11 requirements also fall under the requirements of Section 1101.4, which states that a time frame for construction documents and completion of the project. The application of Section 1101.4 allows for judgement on the part of the fire code official as to the appropriate time frame for specific projects. Some retrofit projects can be accomplished in a month or two, while others won't even be able to obtain approved construction drawings and a permit in that length of time.

There is no reason for this section to be any different and there are circumstances where completion by a predetermined date may not be appropriate. A review of Table 1103.1 which identifies which sections in Chapter 11 apply to Group I-2 occupancies, identifies that there are many potential retroactive requirements which apply to a Group I-2. It is more appropriate to evaluate the building, establish a complete list of retroactive requirements, then determine the date for completion.

Table 1103.1 is revised to show the deletion of Section 1103.5.3.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no change in requirements, just a relocation of sections.

Proponent: Jeffrey Shapiro, representing National Fire Sprinkler Association (jeff.shapiro@intlcodeconsultants.com); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

1103.5 Sprinkler systems. An *automatic sprinkler system* shall be provided in existing buildings in accordance with Sections 1103.5.1 through 1103.5.4.

1103.5.1 Group A-2. Where alcoholic beverages are consumed in a Group A-2 occupancy having an occupant load of 300 or more, the fire area containing the Group A-2 occupancy shall be equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

1103.5.2 Group I-2. In Group I-2, an *automatic sprinkler system* shall be provided in accordance with Section 1105.9.

1103.5.3 Group I-2, Condition 2. In addition to the requirements of Section 1103.5.2, existing buildings of Group I-2, Condition 2 occupancy shall be equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1. The *automatic sprinkler system* shall be installed as established by the adopting ordinance. [DATE BY WHICH SPRINKLER SYSTEM MUST BE INSTALLED].

Add new text as follows:

1103.5.4 High-rise buildings. Where Appendix M has not been adopted, existing high-rise buildings that do not have a previously approved fire sprinkler system shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 when any of the following conditions apply:

1. The high-rise building has an occupied floor located more than 120 feet above the lowest level of fire department vehicle access.
2. The high-rise building has occupied floors located more than 75 feet and not more than 120 feet above the lowest level of fire department vehicle access and the building does not have at least two interior exit stairways complying with Section 1104.10 that are separated from the building interior by fire assemblies having a fire-resistance rating of not less than 2-hours with opening protection in accordance with Table 716.1(2).
3. The high-rise building has occupied floors located more than 75 feet and not more than 120 feet above the lowest level of fire department vehicle access and the building does not have a fire alarm system that includes smoke detection in mechanical equipment, electrical, transformer, telephone equipment and similar rooms; corridors; elevator lobbies; and at doors penetrating interior exit stairway enclosures.

Building owners shall file a compliance schedule with the fire code official not later than 365 days after receipt of a written notice. The compliance schedule shall not exceed 12 years for completion of the automatic sprinkler system retrofit.

Revise as follows:

~~1103.5.4~~1103.5.5 Pyroxylin plastics. An *automatic sprinkler system* shall be provided throughout existing buildings where cellulose nitrate film or pyroxylin plastics are manufactured, stored or handled in quantities exceeding 100 pounds (45 kg). Vaults located within buildings for the storage of raw pyroxylin shall be protected with an *approved automatic sprinkler system* capable of discharging 1.66 gallons per minute per square foot (68 L/min/m²) over the area of the vault.

Reason:

Unsprinklered high-rise buildings represent a significant risk to occupants and emergency responders, and the risk increases as a function of building height and when a building has an insufficient means of egress and inadequate fire detection systems. These risks have been well documented over time in the news media and NFPA reports (<https://www.nfpa.org/News-and-Research/Fire-statistics-and-reports/Fire-statistics/Fires-by-property-type/High-Rise-Building-Fires>), and while catastrophic fires may be infrequent, Grenfell Tower provided another grim reminder of the potential consequences.

The intent of this proposal is to compliment Appendix M, which is an optional appendix that requires all high-rise

buildings to be retrofitted with sprinklers if adopted by a jurisdiction. For jurisdictions not adopting Appendix M, this proposal will provide an less stringent retrofit requirement that offers an incremental step between retrofitting all high-rise buildings with sprinklers versus none at all. High-rise buildings meeting one of three specified conditions would be impacted.

1) Buildings having occupied floors located more than 120 feet above the lowest level of fire department access were selected because these buildings are well beyond the capability of most fire departments to handle with an exterior attack, represent an extreme difficulty with respect to mustering resources on upper floors for interior fire attack, and are difficult to evacuate, particularly when mobility challenged occupants are involved. The 120 foot threshold correlates with IFC Section 907.2.12.3, which requires multiple-channel voice evacuation systems for buildings, and IBC Section 403.6.1, which requires fire service access elevators, in both cases for buildings with an occupied floor more than 120 feet above the lowest level of fire department vehicle access.

2) Any unsprinklered high-rise buildings that does not have at least two exit stairs enclosed by a two-hour fire-rated assembly should be retrofitted with sprinklers. The challenge of occupant evacuation with the counter-flow of emergency responders taking equipment to the fire floor, particularly when mobility challenged occupants must be brought down stairs, is sufficient to justify the need for sprinklers. And, if the stairs are compromised and charged with smoke, occupants cannot be evacuated and firefighter access is further hampered by low visibility and the need to use SCBA while climbing to a fire floor. The 2-hour rating is justified as a minimum requirement because firefighters may need to perform an extended attack in an unsprinklered building, as has been demonstrated in fires such as the First Interstate Bank Fire in Los Angeles.

3) Any unsprinklered high-rise building that does not have a reasonable level of automatic fire detection in common areas to detect a fire, warn occupants and contact emergency responders should be retrofitted with sprinklers. Fires grow at an exponential rate, and delayed detection, alarm and emergency response significantly increases the risk to occupants and emergency responders. It is simply common sense that unsprinklered high-rise buildings should have a reasonable level of automatic fire detection.

The proposal recognizes that some jurisdictions adopting the IFC may have already implemented a high-rise retrofit program in accordance with Appendix M, and where that is the case, this section would not apply. Likewise, some jurisdictions, such as the State of Nevada, implemented high-rise retrofit programs that did not require sprinkler systems to fully comply with NFPA 13. This proposal would not apply to buildings that completed a previously approved retrofit, even if the sprinkler system is not compliant with NFPA 13.

In summary, this proposal should not be read as a suggestion that any high-rise building is sufficiently safe without a fire sprinkler system. However, recognizing that the risk of catastrophic outcomes associated with high-rise fires are a function of building height and other safety features, this proposal advances the idea of incremental progress towards a goal as opposed to no progress at all.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal pertains to existing buildings and does not impact the cost of new building construction. There will be an associated cost of retrofitting fire safety equipment in some existing buildings.

Internal ID: 1353

F185-18

IFC: 1103.7.5.1

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Jason Webb, Automatic Fire Alarm Association Codes & Standards Committee, representing Automatic Fire Alarm Association Codes & Standards Committee; Richard Roberts, representing Honeywell (richard.roberts@systemsensor.com)

2018 International Fire Code

Revise as follows:

1103.7.5.1 Group R-1 hotel and motel manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in existing the following:

1. Existing Group R-1 hotels and motels more than three stories ~~or~~ in height.
2. Existing Group R-1 hotels and motels with more than 20 sleeping units.
3. Existing unsprinklered Group R-1 hotels and motels more than one story in height.

Exceptions:

1. Buildings less than two stories in height where all *sleeping units*, attics and crawl spaces are separated by 1-hour fire-resistance-rated construction and each *sleeping unit* has direct access to a *public way, egress court* or yard.
2. Manual fire alarm boxes are not required throughout the building where the following conditions are met:
 - 2.1. The building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.
 - 2.2. The notification appliances will activate upon sprinkler water flow.
 - 2.3. Not less than one manual fire alarm box is installed at an *approved* location.

Reason:

For existing unsprinklered Group R-1 occupancies a fire alarm system would be required if the building is more than one story or has more than 20 sleeping units.

Fires in some older multiple story unsprinklered hotels without fire alarm systems, as was allowed in the IBC/IFC up to 2003, have resulted in multiple fire fatalities and fire injuries, where a fire in on the first-floor envelopes the second story means of egress.

Such fires in two-story motels without automatic sprinkler systems occurred on January 4, 2010 in South Birmingham, AL (4 fatalities on the second floor), on December 14, 2013 in Wausau, WI (20 injuries) and in Point Pleasant Beach, NJ on March 21, 2014 (four fatalities on the second floor).

One additional example of a multiple life-loss fire was the Newport, OR City Center Motel on August 5, 2016, 4 civilian fire deaths and 3 civilian fire injuries. Fire deaths occurred on both the ground floor and the 2nd floor. The fire started on the ground floor. No sprinklers and no reports of a fire alarm system sounding.

These fires resulted in fatalities, as second floor occupants could not escape due to the means of egress being blocked by smoke and flames. In these fires resulting in fatalities, no fire alarm system was in place to provide early warning to occupants.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire->

Cost Impact

The code change proposal will increase the cost of construction .

This change will impact the cost of construction or operation of a smaller number existing hotels. When you need to add notification (horns and strobes) to these buildings, the cost would be about 350.00 a device installed.

Internal ID: 364

F186-18

IFC: 1103.9

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

1103.9 Carbon monoxide ~~alarms-detection~~. Carbon monoxide ~~alarms-detection~~ shall be installed in existing ~~dwelling units and sleeping units~~ Group I-1, I-2, I-4 and R occupancies and in classrooms in Group E occupancies where those units include any of the conditions identified in Sections 915.1.2 through 915.1.6. The carbon monoxide alarms shall be installed in the locations specified in Section 915.2 and the installation shall be in accordance with Section 915.4.

Exceptions:

1. Carbon monoxide alarms are permitted to be solely battery operated where the code that was in effect at the time of construction did not require carbon monoxide detectors to be provided.
2. Carbon monoxide alarms are permitted to be solely battery operated in dwelling units that are not served from a commercial power source.
3. A carbon monoxide detection system in accordance with Section 915.5 shall be an acceptable alternative to carbon monoxide alarms.

Reason:

This proposal accomplishes two things, first it correlates the occupancies in existing buildings for which carbon monoxide detection is required with the occupancies in new buildings which required carbon monoxide detection. It also changes references from "carbon monoxide alarms" to "carbon monoxide detection". This change in terminology will not preclude carbon monoxide alarms from being provided in applications for which they are listed, but better reflects terminology used in Section 915.

Carbon monoxide poisoning incidents have occurred in the occupancies included in this proposal, and in many cases these incidents have resulted in legislative and regulatory solutions that addressed this problem. The proposed revisions provide a consistent method for providing CO detection, but only in installations where a potential source of CO is present, as described in Section 915.1 through 915.1.6.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

The proposal will increase the cost of construction. The increased cost will be in instances where the new occupancies covered by this proposal do not have carbon monoxide detection.

Group I-4	NR	NR	20	20	200	250 _i
Group M	75	100 _i	50	50	200	250 _{i, i}
Group R-1	75	75 _{l, k}	50	50	200	250 _{l, k}
Group R-2	75	125 _{l, k}	50	50	200	250 _{l, k}
Group R-3	NR	NR	NR	NR	NR	NR
Group R-4	NR	NR	NR	NR	NR	NR
Group U	75 ^g	100 _i	20	50	300	400 _j

NR = No Requirements.

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. See Section 1029.9.5 for dead-end aisles in Group A occupancies.
- b. This dimension is for the total travel distance, assuming incremental portions have fully utilized their allowable maximums. For travel distance within the room, and from the room exit access door to the exit, see the appropriate occupancy chapter.
- c. See Section 412.7 of the International Building Code for special requirements on spacing of doors in aircraft hangars.
- d. Separation of exit access doors within a care recipient sleeping room, or any suite that includes care recipient sleeping rooms, shall comply with Section 1105.5.6.
- e. In smoke compartments containing care recipient sleeping rooms and treatment rooms, dead-end corridors shall comply with Section 1105.5.5.
- f. In Group I-2, Condition 2, care recipient sleeping rooms or any suite that includes care recipient sleeping rooms shall comply with Section 1105.6.
- g. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet.
- h. Where the building, or portion of the building, is limited to one story and the height from the finished floor to the bottom of the ceiling or roof slab or deck is 24 feet or more, the exit access travel distance is increased to 400 feet.
- i. For covered and open malls, the exit access travel distance is increased to 400 feet.
- j. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1
- k. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2
- l. Group H occupancies equipped throughout with an automatic sprinkler system in accordance with Section 903.2.5

Reason:

This IFC table has no link to sprinkler system standards or sections. This proposal correlates to the three corresponding tables and the required sprinkler system increases in the IBC. The column for common path of egress travel limit correlates to IBC Table 1006.2.1, dead-end column to IBC 1020.4 and the egress access travel distance column to IBC Table 1017.2. Each table has a sprinklered and nonsprinklered column. Without the new footnotes j., k. or l. the user may attribute an increased distance without the appropriate sprinkler system.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Correlates IFC table to the three IBC tables.

Internal ID: 857

F188-18

IFC: 1105.5.4.2.2, 1105.5.4.2.4, 1105.5.4.2.5 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Revise as follows:

1105.5.4.2.2 Corridor doors. Doors in *corridor* walls shall limit the transfer of smoke by complying with the following:

1. Doors shall be constructed of not less than 1³/₄ inch-thick (44 mm) solid bonded-core wood or capable of resisting fire not less than 1/3 hour.
Exception: Corridor doors in buildings equipped throughout with an automatic sprinkler system.
2. Frames for side-hinged swinging doors shall have stops on the sides and top to limit transfer of smoke.
3. Where provided, vision panels in doors shall be a fixed glass window assembly installed to limit the passage of smoke. Existing wired glass panels with steel frames shall be permitted to remain in place.
4. ~~Door undercuts~~ The clearance between the bottom of the door and floor shall not exceed 1 inch (25 mm).
5. Doors shall be positive latching with devices that resist not less than 5 pounds (22.2 N). Roller latches are prohibited.
6. Mail slots or similar openings shall be permitted in accordance with Section 1105.5.4.3.

1105.5.4.2.3 Dutch doors. Where provided, dutch doors shall comply with Section 1105.5.4.2.2. In addition, dutch doors shall be equipped with latching devices on either the top or bottom leaf to allow leaves to latch together. The space between the leaves shall be protected with devices such as astragals to limit the passage of smoke.

1105.5.4.2.4 Self- or automatic-closing doors. Where self- or automatic-closing doors are required, closers shall be maintained in operational condition. Hold open devices on doors shall be capable of manual release.

Add new text as follows:

1105.5.4.2.5 Protective plates. Protective plates installed on corridor doors shall not be limited in size.

Reason:

This change has three components dealing with corridor doors in an existing Group I-2 occupancy (K363). The first proposed change is to Section 1105.5.4.2.2, Item 4 it is specific to remove industry terminology that often has multiple understandings of the term and be more specific as to how the opening clearance is to be measured and removing subjectivity.

Next, is the addition of the last sentence to Section 1105.5.4.2.4. Previously the language didn't address the operation of hold open devices often used on corridor doors. This proposed new sentence accomplishes that and states clearly that hold open devices need to be capable of being released manually and not just release via an electrical or mechanical system operation.

Last, is the addition of new Section 1105.5.4.2.5. This provides direction that protective plates attached to doors to protect the viability of a door are not limited in the size. Previously there was no language to address this common attachment to doors in corridors.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The addition of these provisions are addressing gaps within the existing language to address components often found on or used in conjunction with corridor doors or how to actually measure a maximum clearance.

Internal ID: 603

F189-18

IFC: 1105.6.1 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Add new text as follows:

1105.6.1 Two means of egress. A means of egress shall be provided from each smoke compartment created by smoke barriers without having to return through the smoke compartment from which means of egress originated. Smoke compartments that do not contain an exit shall be provided with direct access to not less than two adjacent smoke compartments.

Reason:

This aligns the requirement for exits within Group I-2 smoke compartments within the fire code with the requirements within the building code allowing this to be applied to existing smoke compartments. Repeating of the language establishes the criteria preferred for existing facilities as an independent requirement from new construction. If the requirement changes in the future for new construction, this requirement would remain for existing buildings.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will increase the cost of construction .

This could have significant cost increase for historical/existing facilities that do not have two independent exits from a smoke compartment. Due to the defend in place practice in Group I-2 facilities a second exit becomes necessary to avoid a dead-end situation if horizontal evacuation is used. This additional safety requirement is needed and justifies the cost increase.

Internal ID: 597

F190-18

IFC: 1201.1, 1201.3

Proponent: Charles Foster, self, representing Energy Storage Association (chuck@crfenergy.com)

2018 International Fire Code

Revise as follows:

1201.1 Scope. The provisions of this chapter shall apply to the installation, operation, ~~and maintenance, repair, commissioning and decommissioning~~ of energy systems used for generating or storing energy. It shall not apply to equipment associated with the generation, control, transformation, transmission, or distribution of energy installations that is under the exclusive control of an electric utility or lawfully designated agency.

1201.3 Mixed system installation. Where approved, the aggregate nameplate kWh energy of all energy storage systems in a fire area shall not exceed the maximum quantity specified for any of the energy systems in this chapter. Where required by the *fire code official*, a hazard mitigation analysis shall be provided and approved in accordance with Section 104.7.2 to evaluate any potential adverse interaction between the various energy systems and technologies.

Reason:

This proposal expands the current definition to include other typical activities associated with ESS.

The proposal also clarifies the threshold quantity to be based on nameplate rating.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only adds clarity - does not add or remove requirements, therefore it will neither increase or decrease the cost of construction.

Internal ID: 794

F191-18

IFC: 1201.2

Proponent: Joseph Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (JoeCainPE@gmail.com)

2018 International Fire Code

Revise as follows:

1201.2 Electrical wiring and equipment. Electrical wiring and equipment used in connection with energy systems shall be installed and maintained in accordance with Chapter 12, Section 604 and NFPA 70.

Reason:

Section 1201.2 appropriately references NFPA 70 and the electrical provisions specific to energy systems that were relocated to IFC Chapter 12 and expanded during the 2018 development cycle. However, some electrical requirements relevant to electrical equipment, wiring and hazards remain in IFC Section 604. This proposal simply adds a pointer to IFC Section 604, such that the reader will find electrical requirements relevant to energy systems that are not specific to energy systems.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal includes addition of a pointer only, and does not change technical requirements.

Internal ID: 2000

F192-18

IFC: 1203.4.1, 1203.5.1

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Revise as follows:

1203.4.1 Group I-2 and ambulatory care facilities. In Group I-2 occupancies and ambulatory care facilities, emergency and standby power systems shall be maintained in accordance with NFPA 99.

1203.5.1 Group I-2 and ambulatory care facilities. In Group I-2 occupancies and ambulatory care facilities, emergency and standby power systems shall be inspected and tested under load in accordance with NFPA 99.

Reason:

In addition to meeting the previous codes and standards referenced in this section in order to meet federal conditions of participation health care facilities must comply with the inspection and testing requirements of emergency and standby power systems listed in NFPA 99, Health Care Facilities Code (K918). This change will align the inspection and testing requirements of emergency and standby power systems for ambulatory care facilities.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is an operational change regarding inspection and testing and will not increase the cost of construction on the healthcare industry.

Internal ID: 695

F193-18

IFC: 202 (New), TABLE 906.1 (IBC: [F] TABLE 906.1), 1202.1, SECTION 1204 (New), 3106.6.2, 3107.16, SECTION 3307 (New), UL (New), Chapter 80

Proponent: Andrew King, International Association of Fire Chiefs, Fire & Life Safety Section, representing International Association of Fire Chiefs, Fire & Life Safety Section (andyk@franklintn.gov)

2018 International Fire Code

Add new definition as follows:

PORTABLE GENERATOR. A mobile internal combustion engine-driven device that provides electrical power.

Revise as follows:

**TABLE 906.1
ADDITIONAL REQUIRED PORTABLE FIRE EXTINGUISHERS**

SECTION	SUBJECT
303.5	Asphalt kettles
307.5	Open burning

1202.1 Definitions. The following terms are defined in Chapter 2:

BATTERY SYSTEM, STATIONARY STORAGE.

BATTERY TYPES.

Lead-acid battery.

CAPACITOR ARRAY.

CAPACITOR ENERGY STORAGE SYSTEM.

CRITICAL CIRCUIT.

EMERGENCY POWER SYSTEM.

ENERGY MANAGEMENT SYSTEMS.

FUEL CELL POWER SYSTEM, STATIONARY.

PORTABLE GENERATOR.

STANDBY POWER SYSTEM.

STATIONARY BATTERY ARRAY.

Add new text as follows:

SECTION 1204 PORTABLE GENERATORS

1204.1 Portable generators. The use, operation, and maintenance of portable generators shall comply with this section.

1204.2 Carbon monoxide mitigation. Portable generators shall be listed and labeled in accordance with the UL 2201 carbon monoxide mitigation requirements.

1204.3 Operation and maintenance. Portable generators shall be operated and maintained in accordance with the manufacturer's instructions.

1204.4 Grounding. Portable generators shall be grounded in accordance with NFPA 70.

1204.5 Operating locations. Portable generators shall be only operated outdoors a minimum of 10 ft. (1524 m) from any building openings such as windows and doors or air intakes. Portable generators shall not be operated within buildings or enclosed areas. Additional separation shall be provided for tents, membrane structures and outdoor assembly events as specified in Chapter 31 of this Code.

1204.6 Cords and wiring. Extension cords and temporary wiring used to connect portable generators shall be in accordance with Section 604 of this code and shall be provided with GFCI protection.

1204.7 Connections to premise wiring. Connections to a premise wiring system shall comply with all of the following:

1. Power shall not be provided in a manner that "back feeds" receptacles or the premise wiring system.
2. Connection to a premise served by commercial power shall be made through a listed transfer switch installed, used and maintained in accordance with NFPA 70.
3. Connections to buildings not served by commercial power shall comply with NFPA 70.

1204.8 Refueling. Portable generators shall not be refueled while operating.

1204.9 Storage and repair. Storage and repair of fuel fired portable generators shall comply with Section 313.

1204.10 Fire extinguisher. One portable fire extinguisher shall be provided in accordance with Section 906 for an Ordinary (Moderate) hazard Class B and Class C fire hazard, and placed in an approved location.

Revise as follows:

3106.6.2 Generators-Portable generators.. ~~Generators-Portable generators~~ shall comply with Section 1204. Portable generators shall be installed not less than 10 feet (3048 mm) from combustible materials, and shall be isolated from the public by physical guard, fence or enclosure installed not less than 3 feet (914 mm) away from the internal combustion power source.

3107.16 Separation of generators-Portable generator separation.. ~~Generators-Portable generators~~ and other internal combustion power sources shall be separated from tents or membrane structures by not less than 20 feet (6096 mm) and shall be isolated from contact with the public by fencing, enclosure or other *approved* means.

Add new text as follows:

SECTION 3307 PORTABLE GENERATORS

3307.1 General. Portable generators used at construction and demolition sites shall comply with Section 1204.

Add new standard(s) follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

UL 2201-18:

Standard for Tests for Determining Carbon Monoxide (CO) Emission Rate of Portable Generators

Reason:

The use of portable generators is unregulated in the IFC, except for Section 313 storage, use and repair requirements and some Chapter 31 setback requirements. These products are frequently used to provide power at special outdoor events, construction sites, and during power outages, which often occur during and following natural disasters. A 2016 Consumer Product Safety Commission (CPSC) staff report https://www.cpsc.gov/s3fs-public/PGMAsummitCPSCstaffpresentation_2.pdf?utm_source=rss&utm_medium=rss&utm_campaign=Portable%20Generator%20Technical%20Reports indicated that in the 9 year period of 2004 through 2012, there were 8,703 CO injuries and 666 fatalities associated with the use of portable generators. The report also indicated that a typical engine powering a 5 kW portable generator emits a weighted average CO rate of nominally 1500 g/hr, compared to an idling mid-size late 1990's vintage cars that emit 2.4 - 5.4 g/hr of CO.

ut

This proposal provides basic safety requirements for the use of portable generators, including the following:

1. 1204.2 requires portable generators to be listed and labeled in accordance with UL 2201 carbon monoxide mitigation requirements, which (1) limit the amount of CO produced by a portable generator, and (2) require the portable generator to shutoff in elevated CO environments. These requirements were developed based on an analysis of the CPSC CO incident data, and are complementary, addressing both indoor misuse and outdoor use incidents. In accordance with UL 2201, the CO emission rate shall not exceed 150 g/h, and the generator shall shutoff at any time when there is a peak 400 ppm CO concentration, or the average CO concentration is greater than 150 ppm during a rolling 600 seconds during the test.
2. 1204.5 includes restrictions on locations where portable generators can be operated to minimize the chance of carbon monoxide poisoning and fires.
3. 1204.7 provides guidance on how power from portable generators can be provided to premise wiring systems. Back feeding receptacles is an unsafe practice which can bypass premise overcurrent protection and create a dangerous situation when local commercial power comes back online. It can also endanger utility workers while they repairing power lines, when they are not expecting any power.
4. 1204.10 requires a portable fire extinguisher be provided where portable generators are used. The sizing and rating complies with NFPA 10 for the hazard classification associated with portable generators fueled with a flammable liquid (gasoline). This is consistent with current portable fire extinguisher requirements for mitigation of potential fire hazards.

Cost Impact

The code change proposal will increase the cost of construction .

There could be additional expense for providing portable extinguishers, providing grounding per NFPA 70, providing NFPA 70 compliant connections, and UL 2201 compliant portable generators.

Analysis: A review of the standard proposed for inclusion in the code, UL 2201-18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 707

F194-18

IFC: 1204.1, 1204.2.1

Proponent: Joseph Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (JoeCainPE@gmail.com)

2018 International Fire Code

Revise as follows:

1204.1 General. Solar photovoltaic (PV) systems shall be installed in accordance with Sections 1204.2 through 1204.5, and the International Building Code or International Residential Code. The electrical portion of solar PV systems shall be installed in accordance with NFPA 70.

1204.2.1 ~~Solar photovoltaic~~ Photovoltaic (PV) panel systems for Group R-3 buildings. ~~Solar photovoltaic Photovoltaic (PV) panel~~ systems for Group R-3 buildings shall comply with Sections 1204.2.1.1 through ~~1204.2.1.3, 1204.2.2,~~

Exceptions:

1. These requirements shall not apply to structures designed and constructed in accordance with the International Residential Code.
2. These requirements shall not apply to roofs with slopes of 2 units vertical in 12 units horizontal or less.

Reason:

The editorial change to Section 1204.1 serves to more-formally introduce the abbreviation "PV" into this section.

The editorial changes to Section 1204.2.1 incorporate the defined term "photovoltaic panel systems," along with the "PV" abbreviation.

The range of applicable sections for Group R-3 is expanded to include up through Section 1204.2.2, Emergency escape and rescue openings.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Changes are editorial only, and do not change technical requirements.

Internal ID: 2001

F195-18

IFC: 1204.1, 1204.4, 1204.4.1 (New), 1204.4.2 (New)

Proponent: John Terry, self, representing self (John.Terry@dca.nj.gov)

2018 International Fire Code

Revise as follows:

1204.1 General. ~~Solar-Building-mounted solar~~ photovoltaic systems shall be installed in accordance with Sections 1204.2 through 1204.3 and Section 1204.5, and the International Building Code or International Residential Code. The electrical portion of solar PV systems shall be installed in accordance with NFPA 70. Ground-mounted solar photovoltaic systems shall comply with Section 1204.4.

1204.4 Ground-mounted photovoltaic panel systems. ~~Ground-mounted photovoltaic panel systems shall comply be installed in accordance with Section 1204.1 and this section. Setback requirements shall not apply to ground-mounted, free-standing photovoltaic arrays. A clear, brush-free area of 10 feet (3048 mm) shall be required for ground-mounted photovoltaic arrays. this section and the International Building Code. The electrical portion of solar PV systems shall be installed in accordance with NFPA 70.~~

Add new text as follows:

1204.4.1 Vegetation control. A clear, brush-free area of 10 feet (3048 mm) shall be required around the perimeter of the ground-mounted photovoltaic arrays. A non-combustible base of gravel or a maintained vegetative surface approved by the fire code official shall be installed and maintained under the photovoltaic arrays and associated electrical equipment installations.

1204.4.2 Security. Ground-mounted photovoltaic arrays shall be secured against unauthorized access and safeguarded in an approved manner.

Reason:

When the PV code language was added to the 2012 IFC, Section 604.11.1 dealt with marking of wiring that entered a building and Section 604.11.2 dealt with locations of conductors run within a building. As a result, then Section 604.11.4 for ground mounted systems pointed to these sections for additional requirements. It then had a clear statement that setback requirements, (referred to as access and pathways), did not apply. All of the access and pathway requirements are for the purpose of roof ventilation and access to roof skylights and heat vents.

Going into the 2015 edition of the IFC, the PV requirements were updated including deletion of the wiring requirements because they were relocated to the NEC. As a result the current language in 1204.4 pointing to Section 1204.1 generally does not pick up any additional requirements other than reference to the IBC and NFPA 70.

This has caused a loop for some enforcers and there are code officials now assuming that some portion of access and pathways must apply due to the pointer, such as the 150 by 150 array size limitation which clearly states it is for roof ventilation opportunities.

This proposal eliminates any confusion by breaking the linkage between Sections 1204.1 and 1204.4. The proposal also adds to the vegetation control requirements under the installation and adds security requirements to protect unauthorized persons and animals. As indicated in the appendix of Section 11.12.3.2 of NFPA 1 Fire Code on this topic, though dirt with minor growth is not considered noncombustible, the fire code official might approve dirt bases as long as any growth is maintained under and around the installation to reduce the risk of ignition from the electrical system. An example would be regular mowing to keep the grass or other growth low eliminating an exposure hazard to the installation.

Currently the IBC at Section 1607.13.5.3 requires the area under the structure to be restricted in some manner to keep the public away from the array. Unfortunately, that is buried under the load carrying requirements of the IBC and frequently missed. Adding the language here will coordinate the IFC with the IBC and provide for improved enforcement.

Bibliography:

2015 NFPA 1 Fire Code

11.12.3.2* Noncombustible Base. A gravel base or other noncombustible base acceptable to the AHJ shall be installed and maintained under and around the installation.

A.11.12.3.2 Though dirt with minor growth is not considered noncombustible, the AHJ might approve dirt bases as long as any growth is maintained under and around the installation to reduce the risk of ignition from the electrical system.

This could be a serious consideration for large ground-mounted photovoltaic systems. Not only should the base be considered under the systems, but also around the systems to the point that the risk of fire from growth or other ignition sources will be reduced.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies the intent of existing code requirements, therefore, it has no impact on the cost of construction.

Revise as follows:

[F] 403.4.8.2 Fuel line piping protection. Fuel lines supplying a generator set inside a building shall be separated from areas of the building other than the room the generator is located in by ~~an approved method or one of the~~ following methods:

1. A fire-resistant pipe-protection system that has been tested in accordance with UL 1489. The system shall be installed as tested and in accordance with the manufacturer's installation instructions, and shall have a rating of not less than 2 hours. Where the building is protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1, the required rating shall be reduced to 1 hour.
2. An assembly that has a fire-resistance rating of not less than 2 hours. Where the building is protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1, the required fire-resistance rating shall be reduced to 1 hour.
3. Other approved methods.

[F] 2702.1.2 Fuel-line piping protection. Fuel lines supplying a generator set inside a *high-rise building* shall be separated from areas of the *building* other than the room the generator is located in by ~~an approved method, or an~~ one of the following methods:

1. A fire-resistant pipe-protection system that has been tested in accordance with UL 1489. The system shall be installed as tested and in accordance with the manufacturer's installation instructions, and shall have a rating of not less than 2 hours. Where the building is protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1, the required rating shall be reduced to 1 hour.
2. An assembly that has a fire-resistance rating of not less than 2 hours. Where the building is

protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1, the required fire-resistance rating shall be reduced to 1 hour.

3. Other approved methods.

Add new standard(s) follows:

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096

1489-2016:

Fire Resistant Pipe Protection Systems Carrying Combustible Liquids

Reason:

This proposal is intended to provide a third option for protecting fuel lines supplying a generator set inside a high-rise building. The third option is through the use of a fire-resistant pipe-protection system tested to UL 1489, "Fire Resistant Pipe Protection Systems Carrying Combustible Liquids". The system shall be installed as tested and in accordance with the manufacturer's installation instructions.

UL 1489 addresses the fire-resistive performance of fuel lines protected for an hourly rating. UL 1489 compliments the two standards currently referenced in the International Fire Code for establishing fire-resistance ratings: ASTM E119 and UL 263. The standard describes the same test equipment and same time-temperature fire exposure as ASTM E119 and UL 263. However, the sample testing configuration specifically addresses pipe-protection systems. The Conditions of Acceptance follow the intent of ASTM E119 and UL 263, but specifically address the performance requirements for fire-resistant pipe-protection systems. Specifically, the Conditions of Acceptance requires 1) resistance to the fire and hose stream exposure without developing openings in the pipe, and 2) preventing a temperature increase exceeding 325°F at any single point or 250°F at any cross section along the pipe.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Fuel lines supplying stationary generators already require protection in accordance with this section. This proposal simply provides an additional option for protecting the fuel lines.

Analysis: A review of the standard proposed for inclusion in the code, UL 1489-2016 Fire Resistant Pipe Protection Systems Carrying Combustible Liquids, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 226

F197-18

IFC: 1204.2

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

1204.2 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections 1204.2.1 through 1204.3.3. Pathways shall be over areas capable of supporting fire fighters accessing the roof. Pathways shall be located in areas with minimal obstructions, such as vent pipes, conduit or mechanical equipment.

Exceptions:

1. Detached, nonhabitable Group U structures including, but not limited to, detached garages serving Group R-3 buildings, parking shade structures, carports, solar trellises and similar structures.
2. Roof access, pathways and spacing requirements need not be provided where the *fire code official* has determined that rooftop operations will not be employed.
3. Designated pathways are not required for building integrated photovoltaic (BIPV) systems where the BIPV systems are approved, integrated into the finished roof surface and are listed in accordance with a national test standard developed to address Section 690.12(B)(2) of NFPA 70. The removal or cutting away of portions of the system during specific firefighting operations shall not expose a firefighter to slipping hazards, fall hazards, or electrical shock hazards that are not common to similar traditional roofing systems.

Reason:

The technology of solar roofs has been advancing with new materials and methods, particularly in the area of BIPV. Unlike conventional PV panel systems mounted above the roof surface, BIPV systems are integrated into the finished roof surface, and do not present significant trip hazards or physical obstacles to equipment such as ladders that typically exist with other systems. Portions of these systems, and soon the entire roof system, may be listed to meet the NEC safety thresholds for firefighters upon rapid shutdown activation. There are BIPV systems available today that have been shown through testing to not present electrical hazards to firefighters even when cutting into them during ventilation operations. In order to build confidence in the safety features and performance of these systems an evaluation by a NRTL should be required.

These systems eliminate the hazard to firefighters for large portions of the roof, or in some cases the entire roof where BIPV is installed, eliminating the need to provide for access and pathways.

This proposal is intended to provide recognition of those safety levels by adding exceptions to the access and pathways portion of the IFC PV requirements.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change is intended to address an emerging technology that will be optional for a design professional and/or contractor to use. If approved it will simply pave the way for a potentially safer and more aesthetically pleasing solar PV option. Other technologies that are currently existing may still be used and the mass production of this technology should make it a viable option. This code change will not mandate the use of the new technology but will allow additional options.

Internal ID: 1905

F198-18

IFC: 1204.2

Proponent: Jason Fisher, Tesla Inc., representing Tesla Inc.

2018 International Fire Code

Revise as follows:

1204.2 Access and pathways. Roof access, pathways, and spacing requirements shall be provided in accordance with Sections 1204.2.1 through 1204.3.3. Pathways shall be over areas capable of supporting fire fighters accessing the roof. Pathways shall be located in areas with minimal obstructions, such as vent pipes, conduit or mechanical equipment.

Exceptions:

1. Detached, nonhabitable Group U structures including, but not limited to, detached garages serving Group R-3 buildings, parking shade structures, carports, solar trellises and similar structures.
2. Roof access, pathways and spacing requirements need not be provided where the *fire code official* has determined that rooftop operations will not be employed.
3. BIPV systems integrated into the finished roof surface, listed in accordance with Section 690.12(B)(2) of NFPA 70, where the removal or cutting away of portions of the system during specific firefighting operations have been determined to not expose a firefighter to electrical shock hazards.

Reason:

The technology of solar roofs has been advancing with new materials and methods, particularly in the area of BIPV. Unlike conventional PV panel systems mounted above the roof surface, BIPV systems are integrated into the finished roof surface, and do not present significant trip hazards or physical obstacles to equipment such as ladders that typically exist with other systems. These systems can be listed to meet the NEC safety thresholds for firefighters upon rapid shutdown activation. There are BIPV systems available today that have been shown through testing to not present electrical hazards to firefighters even when cutting into them during ventilation operations. In order to build confidence in the safety features and performance of these systems an evaluation by a NRTL should be required.

Since listed and tested systems meeting these exception requirements would reduce shock hazards to firefighters performing rooftop operations, including vertical ventilation activities, and since the PV portion of the roof is integrated into the finished roof surface, thus not presenting a physical barrier to firefighters needing access to these areas, these types of systems should not be required to restrict the locations of the PV portions of the roof around perimeter pathways, since the entire roof would provide firefighter access.

This proposal is intended to provide recognition of these improved safety levels by adding exceptions to the access and pathways portion of the IFC PV requirements.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change does not mandate the installation of BIPV systems that include these safety features. Existing BIPV systems and other types of PV systems are not impacted by this proposal.

Internal ID: 2014

F199-18

IFC: 1204.2.2

Proponent: Joseph Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (JoeCainPE@gmail.com)

2018 International Fire Code

Revise as follows:

1204.2.2 Emergency escape and rescue openings. ~~Panels and modules installed on Group R-3 buildings~~ Photovoltaic (PV) panel systems shall not be placed on the portion of a roof that is below an emergency escape and rescue opening. A pathway of not less than 36 inches (914 mm) wide shall be provided to ~~the~~ not fewer than one emergency escape and rescue ~~opening~~ opening for each sleeping room.

Reason:

Section 1204.2.2 was new in the 2018 IFC, as a result of Proposal F-87 Part 1.

"Panels and modules" is a non-specific reference to solar photovoltaic (PV) systems. This incomplete language does not correlate to terms defined in the IBC. "Photovoltaic panel system" is a term defined in the IBC and IRC.

As written in the 2018 IFC, this provision applies only to Group R-3 occupancies. However, IBC and IFC Section 1030.1 also require emergency escape and rescue openings for Group R-2 and Group R-4 occupancies, in certain cases. By removing the R-3 buildings, the access pathway requirement is expanding to any occupancy where emergency escape and rescue openings are required. In those cases where a sleeping room has more than one opening that meets the dimensional criteria for an emergency escape and rescue opening, an access pathway is required to not fewer than one emergency escape and rescue opening for each sleeping room. The language "not fewer than one" is consistent with language found in IBC/IFC Section 1030.1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal clarifies that access pathways are required to emergency escape and rescue openings in any residential occupancy where they are required by IFC Section 1030 and IBC Section 1030. This will neither increase nor decrease the cost of construction.

Internal ID: 1607

F200-18

IFC: 1204.2.3 (New)

Proponent: Kevin Reinertson, Riverside County Fire Department, representing Riverside County Fire Department
(kevin.reinertson@fire.ca.gov)

2018 International Fire Code

Add new text as follows:

1204.2.3 Building Integrated Photovoltaic (BIPV) systems. Where building integrated photovoltaic (BIPV) systems are installed in a manner that creates areas with electrical hazards to be hidden from view, markings shall be provided to identify the hazardous areas to avoid. The markings shall be reflective and be visible from grade.

Reason:

When Building Integrated Photovoltaic (BIPV) Systems are installed upon roofs, the areas containing electrical hazards can be hidden from view of firefighters and other responders seeking to access the roof for emergency operations. With at least one manufacturer the entire roof surface has the same appearance, photovoltaic and non-photovoltaic tiles have the same finish, preventing any awareness of where the system is located.

The purpose of this proposal to require markings warning firefighters and others that access the roof of where the areas are they must avoid for safety purposes. The marking must be readily visible day and night and visible from grade to avoid ground ladder placement at an area with an electrical hazard.

Cost Impact

The code change proposal will increase the cost of construction .

The increase of construction is specific to BIPV systems and only includes additional marking or labeling.

Internal ID: 2281

F201-18

IFC: 1204.3.3

Proponent: Joseph Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (JoeCainPE@gmail.com); Kevin Reinertson, Riverside County Fire Department, representing Riverside County Fire Department (kevin.reinertson@fire.ca.gov)

2018 International Fire Code

1204.3.3 Smoke ventilation. The solar installation shall be designed to meet the following requirements:

1. Where nongravity-operated smoke and heat vents occur, a pathway not less than 4 feet (1219 mm) wide shall be provided bordering all sides.
2. ~~Smoke ventilation options between array sections shall be one of the following:~~
 - ~~2.1. A pathway not less than 8 feet (2438 mm) wide.~~
 - ~~2.2.~~
3. Smoke ventilation options between array sections shall be one of the following:
 - 3.1. A pathway not less than 8 feet (2438 mm) wide.
 - 3.2. A pathway not less than 4 feet (1219 mm) wide bordering 4-foot by 8-foot (1219 mm by 2438 mm) venting cutouts every 20 feet (6096 mm) on alternating sides of the pathway.

Reason:

Section 1204.3.3 is modified to clarify the original intent that fire fighter access is required to all smoke and heat vents, whether they are nongravity-operated or gravity-operated dropout smoke and heat vents. As in the original intent, access is required to all sides of nongravity-operated smoke and heat vents, and on not fewer than one side of gravity-operated dropout smoke and heat vents.

Two options remain for access pathways between array sections.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Language is modified to clarify the original intent that access is required to all smoke & heat vents.

F202-18

IFC: SECTION 1205, 1205.1, 1205.5, 1205.14 (New)

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA
(rjd@davidsoncodeconcepts.com)

2018 International Fire Code

SECTION 1205 STATIONARY FUEL CELL POWER SYSTEMS

Revise as follows:

1205.1 General. *Stationary fuel cell power systems* in new and existing occupancies shall comply with this section.

Exception: The temporary use of a fuel cell powered electric vehicle to power a Group R-3 or R-4 building while parked shall comply with Section 1205.14.

1205.5 Residential use. *Stationary fuel cell power systems* shall not be installed in Group R-3 and R-4 buildings, or dwelling units associated with Group R-2 buildings unless they are specifically listed for residential use.

Exception: The temporary use of a fuel cell powered electric vehicle to power a Group R-3 or R-4 building while parked shall comply with Section 1205.14.

Add new text as follows:

1205.14 Group R-3 and R-4 Fuel Cell Vehicle ESS Use. The temporary use of the dwelling unit owner or occupant's fuel cell powered electric vehicle to power a Group R-3 or R-4 dwelling while parked in an attached or detached garage or outside shall comply with the vehicle manufacturer's instructions and NFPA 70.

Reason:

This proposal is intended to provide correlation with proposals updating the energy storage system provisions in Section 1206 and work being done with the initial NFPA 855 Energy Storage Systems Standard.

Both the current draft of NFPA 855 and an updated proposal to Section 1206 will provide exceptions from the ESS language for temporary use of electric vehicles, (a fuel cell powered vehicle is an electric vehicle), to power R-3 or R-4 dwellings. The NFPA 855 language would also include IRC one- and two-family homes and townhouses.

The conditions are that the vehicles belong to an owner or occupant of the unit, not a third party. Third party applications of mobile ESS is proposed to be separately regulated by NFPA 855 and the IFC.

Additionally the use must comply with the vehicle manufacturer's instructions and NFPA 70 to provide for an appropriate level of safety. The vehicle manufacturer's information covers the approved electric connection on the vehicle itself in accordance with federal standards and NFPA 70 covers the necessary requirements for the electrical connections to the dwelling.

Vehicles capable of being used in this manner already have been marketed. It is more than a convenience issue, in times of natural disasters with associated power outages the ability to utilize the energy provided by the owner/occupants personal vehicle could be critical.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The added language will not change the cost of construction. Use of personal vehicles in this manner are optional and any necessary electrical equipment would be required regardless of what standby power method was utilized to power a building.

BATTERY TYPES.

Flow battery. A type of storage battery that includes chemical components dissolved in two different liquids. Ion exchange, which provides the flow of electrical current, occurs through the membrane while both liquids circulate in their respective spaces.

Lead-acid battery. A storage battery that is comprised of lead electrodes immersed in sulphuric acid electrolyte.

Lithium-ion battery. A storage battery with lithium ions serving as the charge carriers of the battery. The electrolyte is a polymer mixture of carbonates with an inorganic salt and can be in a liquid or a gelled polymer form. Lithiated metal oxide is typically a cathode and forms of carbon or graphite typically form the anode.

Nickel-cadmium (Ni-Cd) battery. An alkaline storage battery in which the positive active material is nickel oxide, the negative contains cadmium and the electrolyte is potassium hydroxide. ~~Preengineered stationary storage battery system.~~

~~**Nickel metal hydride (Ni-MH)** An energy storage system consisting of batteries, a battery management system, components and modules that are produced in a factory, designed to comprise the system when assembled on the job site.~~

~~**Prepackaged stationary storage battery system.** An energy storage system consisting of batteries, a battery management system, components and modules that is factory assembled and shipped as a complete unit for installation at the job site.~~

~~**Sodium beta storage battery.** A storage battery, also referred to as a Na beta battery or NBB, which uses a solid beta alumina electrolyte membrane that selectively allows sodium ion transport between a positive electrode such as metal halide and a negative sodium electrode.~~

Delete without substitution:

~~**CAPACITOR ARRAY.** An arrangement of individual capacitor modules in close proximity to each other, mounted on storage racks or in cabinets or other enclosures.~~

CAPACITOR ENERGY STORAGE SYSTEM. A stationary, rechargeable energy storage system consisting of capacitors, chargers, controls and associated electrical equipment designed to provide electrical power to a building or facility. The system is typically used to provide standby or emergency power, an uninterruptable power supply, load shedding, load sharing or similar capabilities.

~~**Preengineered capacitor energy storage system.** A capacitor energy storage system consisting of capacitors, an energy management system, components and modules that are produced in a factory, designed to comprise the system when assembled on the job site.~~

~~**Prepackaged capacitor energy storage system.** A capacitor energy storage system consisting of capacitors, an energy management system, components and modules that is factory assembled and then shipped as a complete unit for installation at the job site.~~

ENERGY STORAGE MANAGEMENT SYSTEMS. An electronic system that protects ~~stationary energy storage batteries systems~~ from operating outside their safe operating parameters, and ~~generates an alarm and trouble signal for off normal conditions~~ disconnects electrical power to the ESS or places it in a safe condition if potentially hazardous temperatures or other conditions are detected.

ENERGY STORAGE SYSTEM (ESS).

One or more devices, assembled together, capable of storing energy in order to supply electrical energy at a future time.

Add new text as follows:

ENERGY STORAGE SYSTEM CABINET. A cabinet containing components of the energy storage system that is included

in the UL 9540 listing for the system. Personnel are not able to enter the enclosure, other than reaching in to access components for maintenance purposes.

ENERGY STORAGE SYSTEM COMMISSIONING.

A systematic process that provides documented confirmation that an energy storage system functions according to the intended design criteria and complies with applicable code requirements.

ENERGY STORAGE SYSTEM DECOMMISSIONING.

A systematic process that provides documentation and procedures that allow an energy storage system to be safely de-energized, disassembled, readied for shipment or storage, and removed from the premise in accordance with applicable code requirements.

ENERGY STORAGE SYSTEM, ELECTROCHEMICAL.

An energy storage system that stores energy and produces electricity using chemical reactions. It includes, among others, battery ESS and capacitor ESS.

ENERGY STORAGE SYSTEM, MOBILE.

An energy storage system capable of being moved and utilized for temporary energy storage applications, and not installed as fixed or stationary electrical equipment. The system can include integral wheels for transportation, or be loaded on a trailer and unloaded for charging, storage and deployment.

ENERGY STORAGE SYSTEM, STATIONARY.

An energy storage system installed as fixed or stationary electrical equipment in a permanent location.

ENERGY STORAGE SYSTEM, WALK-IN UNIT.

A pre-fabricated building that contains energy storage systems. It includes doors that provide walk-in access for personnel to maintain, test and service the equipment, and is typically used in outdoor and mobile ESS applications.

Delete without substitution:

~~**STATIONARY BATTERY ARRAY.** An arrangement of individual stationary storage batteries in close proximity to each other, mounted on storage racks or in modules, battery cabinets or other enclosures.~~

Add new text as follows:

105.6.14 Energy storage systems, mobile. An operational permit is required for mobile energy storage systems regulated by Section 1206.

Delete without substitution:

~~**[A] 105.7.2 Battery systems.** A construction permit is required to install stationary storage battery systems regulated by Section 1206.2.~~

ENERGY STORAGE SYSTEM DECOMMISSIONING.

ENERGY STORAGE SYSTEM, ELECTROCHEMICAL.

ENERGY STORAGE SYSTEM, MOBILE.

ENERGY STORAGE SYSTEM, WALK-IN UNIT.

FUEL CELL POWER SYSTEM, STATIONARY.

STANDBY POWER SYSTEM.~~STATIONARY BATTERY ARRAY.~~

Add new text as follows:

1203.2.5 Exhaust ventilation. Standby power shall be provided for mechanical exhaust ventilation systems as required in Section 1206.6.1.2.1. The system shall be capable of powering the required load for a duration of not less than two hours.

1203.2.6 Gas detection systems. Emergency power shall be provided for gas detection systems where required by Sections 1203.2.9 and ~~1203.2.16~~-1203.2.16. Standby power shall be provided for gas detection systems where required by ~~Section 916.5~~Sections 916.5 and 1206.6.2.2.4.

SECTION 1206 ELECTRICAL ENERGY STORAGE SYSTEMS (ESS)

1206.1 General. The provisions in this section are applicable to stationary and mobile electrical energy storage

systems (ESS).

1206.1.1 Scope. ESS having capacities exceeding the values shown in Table 1206.1 shall comply with this section.

1206.1.2 Permits. Permits shall be obtained for ESS as follows:

1. Construction permits shall be obtained for stationary ESS installations and for mobile ESS charging and storage installations covered by 1206.10.1. Permits shall be obtained in accordance with Sections 105.7.7.
2. Operational permits shall be obtained for mobile ESS deployment operations covered by Section 1206.10.3. Permits shall be obtained in accordance with Sections 105.6.14.

TABLE 1206.1
ENERGY STORAGE SYSTEM (ESS) THRESHOLD QUANTITIES

TECHNOLOGY	ENERGY CAPACITY^a
Lead acid batteries, all types	70 KWh (252 Megajoules) ^c
Nickel cadmium batteries (Ni-Cd)	70 KWh (252 Megajoules)
Nickel metal hydride (Ni-MH)	70 KWh (252 Megajoules)
Lithium-ion batteries	20 KWh (72 Megajoules)
Flow batteries ^b	20 KWh (72 Megajoules)
Other battery technologies	10 KWh (36 Megajoules)
Capacitor ESS	3 KWh (10.8 Mega joules)
Other electrochemical ESS technologies	3 KWh (10.8 Mega joules)

a. Energy capacity is the total energy capable of being stored (nameplate rating), not the usable energy rating. For units rated in Amp-Hours, KWh shall equal rated voltage times amp-hour rating divided by 1000.

b. Shall include vanadium, zinc-bromine, polysulfide-bromide, and other flowing electrolyte type technologies.

c. 50 gallons of lead acid battery electrolyte shall be considered equivalent to 70 KWh.

1206.1.3 Construction documents. The following information shall be provided with the permit application:

1. Location and layout diagram of the room or area in which the ESS is to be installed.
2. Details on the hourly fire-resistance ratings of assemblies enclosing the ESS.
3. The quantities and types of ESS to be installed.
4. Manufacturer's specifications, ratings and listings of each ESS.
5. Description of energy (battery) management systems and their operation.
6. Location and content of required signage.
7. Details on fire suppression, smoke or fire detection, thermal management, ventilation, exhaust and deflagration venting systems, if provided.
8. Support arrangement associated with the installation, including any required seismic restraint.
9. A commissioning plan complying with 1206.2.1.
10. A decommissioning plan complying with 1206.2.3.

1206.1.4 Hazard mitigation analysis. A failure modes and effects analysis (FMEA) or other approved hazard mitigation analysis shall be provided in accordance with Section 104.7.2 under any of the following conditions:

1. Where ESS technologies not specifically identified in Table 1206.1 are provided.
2. More than one ESS technology is provided in a room or enclosed area where there is a potential for adverse interaction between technologies.
3. Where allowed as a basis for increasing maximum allowable quantities. See Section 1206.5.2.

1206.1.4.1 Fault condition. The hazard mitigation analysis shall evaluate the consequences of the following failure modes. Only single failure modes shall be considered.

1. A thermal runaway condition in a single ESS rack, module or unit.
2. Failure of any battery (energy) management system.
3. Failure of any required ventilation or exhaust system.
4. Voltage surges on the primary electric supply.
5. Short circuits on the load side of the ESS.
6. Failure of the smoke detection, fire detection, fire suppression, or gas detection system.
7. Required spill neutralization not being provided or failure of a required secondary containment system.

1206.1.4.2 Analysis approval. The fire code official is authorized to approve the hazardous mitigation analysis provided the consequences of the hazard mitigation analysis demonstrate:

1. Fires will be contained within unoccupied ESS rooms or areas for the minimum duration of the fire-resistance rated separations identified in Section 1206.7.4.
2. Fires in occupied work centers will be detected in time to allow occupants within the room or area to safely evacuate.
3. Toxic and highly toxic gases released during fires will not reach concentrations in excess of IDLH level in the building or adjacent means of egress routes during the time deemed necessary to evacuate occupants from any affected area.
4. Flammable gases released from ESS during charging, discharging and normal operation will not exceed 25 percent of their lower flammability limit (LFL).
5. Flammable gases released from ESS during fire, overcharging and other abnormal conditions will be controlled through the use of ventilation of the gases preventing accumulation or by deflagration

venting.

1206.1.4.3 Additional protection measures. Construction, equipment and systems that are required for the ESS to comply with the hazardous mitigation analysis, including but not limited to those specifically described in Section 1206 shall be installed, maintained and tested in accordance with nationally recognized standards and specified design parameters.

1206.1.5 Large scale fire test. Where required elsewhere in Section 1206, large scale fire testing shall be conducted on a representative ESS in accordance with UL 9540A. The testing shall be conducted or witnessed and reported by an approved testing laboratory and show that a fire involving one ESS will not propagate to an adjacent ESS, and where installed within buildings, enclosed areas and walk-in units will be contained within the room, enclosed area or walk-in unit for a duration equal to the fire resistance rating of the room separation specified in Section 1206.7.4. The test report shall be provided to the fire code official for review and approval in accordance with Section 104.7.2.

1206.1.6 Fire remediation. Where a fire or other event has damaged the ESS and ignition or re-ignition of the ESS is possible, the system owner, agent, or lessee shall take the following actions, at their expense, to mitigate the hazard or remove damaged equipment from the premises to a safe location.

1206.1.6.1 Fire mitigation personnel. Where, in the opinion of the fire code official, it is essential for public safety that trained personnel be on site to respond to possible ignition or re-ignition of a damaged ESS, the system owner, agent or lessee shall immediately dispatch one or more fire mitigation personnel to the premise, as required and approved, at their expense. These personnel shall remain on duty continuously after the fire department leaves the premise until the damaged energy storage equipment is removed from the premises, or earlier if the fire code official indicates the public safety hazard has been abated.

1206.1.6.2 Duties. On-duty fire mitigation personnel shall have the following responsibilities:

1. Keep diligent watch for fires, obstructions to means of egress and other hazards.
2. Immediately contact the fire department if their assistance is needed to mitigate any hazards or extinguish fires.
3. Take prompt measures for remediation of hazards in accordance with the decommissioning plan in Section 1206.2.3.
4. Take prompt measures to assist in the evacuation of the public from the structures.

1206.2 Commissioning, decommissioning, operation and maintenance. Commissioning, decommissioning, operation and maintenance shall be conducted in accordance with this section.

1206.2.1 Commissioning. Commissioning of newly installed ESS, and existing ESS that have been retrofitted, replaced or previously decommissioned and are returning to service shall be conducted prior to the ESS being placed in service in accordance with a commissioning plan that has been approved prior to initiating commissioning. The commissioning plan shall include the following:

1. A narrative description of the activities that will be accomplished during each phase of commissioning including the personnel intended to accomplish each of the activities.
2. A listing of the specific ESS and associated components, controls and safety related devices to be tested, a description of the tests to be performed and the functions to be tested.
3. Conditions under which all testing will be performed, which are representative of the conditions during normal operation of the system.
4. Documentation of the owner's project requirements and the basis of design necessary to understand the installation and operation of the ESS.
5. Verification that required equipment and systems are installed in accordance with the approved plans and specifications.
6. Integrated testing for all fire and safety systems.
7. Testing for any required thermal management, ventilation or exhaust systems associated with the ESS installation.
8. Preparation and delivery of operation and maintenance documentation.
9. Training of facility operating and maintenance staff.

10. Identification and documentation of the requirements for maintaining system performance to meet the original design intent during the operation phase.
11. Identification and documentation of personnel who are qualified to service, maintain and decommission the ESS, and respond to incidents involving the ESS, including documentation that such service has been contracted for.
12. A decommissioning plan for removing the ESS from service, and from the facility in which it is located. The plan shall include details on providing a safe, orderly shutdown of energy storage and safety systems with notification to the code officials prior to the actual decommissioning of the system. The decommissioning plan shall include contingencies for removing an intact operational ESS from service, and for removing an ESS from service that has been damaged by a fire or other event.

Exception: Commissioning shall not be required for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC. However a decommissioning plan shall be provided and maintained whenever required by the fire code official.

1206.2.1.1 Initial acceptance testing. During the commissioning process an ESS shall be evaluated for proper operation in accordance with the manufacturer's instructions and the commissioning plan prior to final approval.

1206.2.1.2 Commissioning report. A report describing the results of the system commissioning and including the results of the initial acceptance testing required in Section 1206.2.1.1 shall be provided to code official prior to final inspection and approval and maintained at an approved on-site location.

1206.2.2 Operation and maintenance. An operating and maintenance manual shall be provided to both the ESS owner or their authorized agent and the ESS operator before the ESS is put into operation and shall include the following:

1. Manufacturer's operation manuals and maintenance manuals for the entire ESS or for each component of the system requiring maintenance, that clearly identify the required routine maintenance actions.
2. Name, address and phone number of a service agency that has been contracted to service the ESS and its associated safety systems.
3. Maintenance and calibration information, including wiring diagrams, control drawings, schematics, system programming instructions and control sequence descriptions, for all energy storage control systems.
4. Desired or field-determined control set points that are permanently recorded on control drawings at control devices or, for digital control systems, in system programming instructions.
5. A schedule for inspecting and recalibrating all ESS controls.
6. A service record log form that lists the schedule for all required servicing and maintenance actions and space for logging such actions that are completed over time and retained on site.

The ESS shall be operated and maintained in accordance with the manual and a copy of the manual shall be retained at an approved onsite location.

1206.2.2.1 Ongoing inspection and testing. Systems that monitor and protect the ESS installation shall be inspected and tested in accordance with the manufacturer's instructions and the operating and maintenance manual. Inspection and testing records shall be maintained in the operation and maintenance manual.

1206.2.3 Decommissioning. The code official shall be notified prior to decommissioning of an ESS. Decommissioning shall be performed in accordance with the decommissioning plan that includes the following:

1. A narrative description of the activities to be accomplished for removing the ESS from service, and from the facility in which it is located.
2. A listing of any contingencies for removing an intact operational ESS from service, and for removing an ESS from service that has been damaged by a fire or other event.

1206.3 Equipment. ESS equipment shall be in accordance with Sections 1206.3.1 through 1206.3.9

1206.3.1 Energy storage system listings. ESS shall be listed in accordance with UL 9540.

Exception: Lead-acid and nickel cadmium battery systems installed in facilities under the exclusive control of

communications utilities, and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76 are not required to be listed.

1206.3.2 Equipment listing. Chargers, inverters, energy storage management systems shall be covered as part of the UL 9540 listing or shall be listed separately.

1206.3.3 Utility interactive systems. Inverters shall be listed and labeled in accordance with UL 1741. Only inverters listed and labeled for utility interactive system use and identified as interactive shall be allowed to operate in parallel with the electric utility power system to supply power to common loads.

1206.3.4 Energy storage management system. Where required by the ESS listing an approved energy storage management system shall be provided that monitors and balances cell voltages, currents and temperatures within the manufacturer's specifications. The system shall disconnect electrical connections to the ESS or otherwise place it in a safe condition if potentially hazardous temperatures or other conditions such as short circuits, over voltage or under voltage are detected.

1206.3.5 Enclosures. Enclosures of ESS shall be of noncombustible construction.

1206.3.6 Repairs. Repairs of ESS shall only be done by qualified personnel. Repairs with other than identical parts shall be considered retrofitting and comply with Section 1206.3.7. Repairs shall be documented in the service records log.

1206.3.7 Retrofits. Retrofitting of an existing ESS shall comply with the following:

1. A construction permit shall be obtained in accordance with Section 105.7.7.
2. New batteries, battery modules, capacitors and similar ESS components shall be listed in accordance with UL 1973.
3. Battery management and other monitoring systems shall be connected and installed in accordance with the manufacturer's instructions.
4. The overall installation shall continue to comply with UL 9540 listing requirements, where applicable.
5. Systems that have been retrofitted shall be commissioned in accordance with Section 1206.2.1.
6. Retrofits shall be documented in the service records log.

1206.3.7.1 Retrofitting Lead Acid and Nickel Cadmium. Section 1206.3.7 shall not apply to retrofitting of lead acid and nickel cadmium batteries with other lead acid and nickel cadmium batteries at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC.

1206.3.8 Replacements. Replacements of ESS shall be considered new ESS installations and shall comply with the provisions of Section 1206 as applicable to new ESS. The ESS being replaced shall be decommissioned in accordance with Section 1206.2.3.

1206.3.9 Reused and repurposed equipment. Equipment and materials shall only be reused or reinstalled as permitted in Section 104.7.1. Storage batteries previously used in other applications, such as electric vehicle propulsion, shall not be reused in applications regulated by Chapter 12, unless (1) approved by the fire code official and (2) the equipment is refurbished by a battery refurbishing company approved in accordance with UL 1974.

1206.4 General installations requirements. Stationary and mobile ESS shall comply with the requirements of section 1206.4.1 through 1206.4.12.

1206.4.1 Electrical disconnects. Where the ESS disconnecting means is not within sight of the main electrical service disconnecting means, placards or directories shall be installed at the location of the main electrical service disconnecting means indicating the location of stationary storage battery system disconnecting means in accordance with NFPA 70.

Exception: Electrical disconnects for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities and operating at less than 50 VAC and 60 VDC shall be permitted to have electrical disconnects signage in accordance with NFPA 76.

1206.4.2 Working clearances. Access and working space shall be provided and maintained about all electrical equipment to permit ready and safe operation and maintenance of such equipment in accordance with NFPA 70 and the manufacturer's instructions.

1206.4.3 Fire-resistance rated separations. Rooms and other indoor areas containing ESS shall be separated from other areas of the building in accordance with Section 1206.7.4. ESS shall be permitted to be in the same room with the equipment they support.

1206.4.4 Seismic and structural design. Stationary ESS shall comply with the seismic design requirements in Chapter 16 of the International Building Code, and shall not exceed the floor loading limitation of the building.

1206.4.5 Vehicle impact protection. Where ESS are subject to impact by a motor vehicle, including fork lifts, vehicle impact protection shall be provided in accordance with Section 312.

1206.4.6 Combustible storage. Combustible materials shall not be stored in ESS rooms, areas, or walk-in units. Combustible materials in occupied work centers covered by Section 1206.4.10 shall be stored at least 3 feet (914 mm) from ESS cabinets.

1206.4.7 Toxic and highly toxic gases. ESS that have the potential to release toxic and highly toxic gas during charging, discharging and normal use conditions shall be provided with a hazardous exhaust system in accordance with Section 502.8 of the International Mechanical Code.

1206.4.8 Signage. Approved signs shall be provided on or adjacent to all entry doors for ESS rooms or areas and on enclosures of ESS cabinets and walk-in units located outdoors, on rooftops or in open parking garages. Signs designed to meet both the requirements of this section and NFPA 70 shall be permitted. The signage shall include the following or equivalent.

1. "Energy Storage System", "Battery Storage System", "Capacitor Energy Storage System", or the equivalent.
2. The identification of the electrochemical ESS technology present.
3. "Energized electrical circuits"
4. If water reactive electrochemical ESS are present the signage shall include "APPLY NO WATER"
5. Current contact information, including phone number, for personnel authorized to service the equipment and for fire mitigation personnel required by Section 1206.1.6.1.

Exception: Existing electrochemical ESS shall be permitted to include the signage required at the time they were installed.

1206.4.9 Security of installations. Rooms, areas and walk-in units in which electrochemical ESS are located shall be secured against unauthorized entry and safeguarded in an approved manner. Security barriers, fences, landscaping, and other enclosures shall not inhibit the required air flow to or exhaust from the electrochemical ESS and its components.

1206.4.10 Occupied work centers. Electrochemical ESS located in rooms or areas occupied by personnel not directly involved with maintenance, service and testing of the systems shall comply with the following.

1. Electrochemical ESS located in occupied work centers shall be housed in locked noncombustible cabinets or other enclosures to prevent access by unauthorized personnel.
2. Where electrochemical ESS are contained in cabinets in occupied work centers, the cabinets shall be located within 10 feet (3048 mm) of the equipment that they support.
3. Cabinets shall include signage complying with Section 1206.4.8.

1206.4.11 Open rack installations. Where electrochemical ESS are installed in a separate equipment room and only authorized personnel have access to the room, they shall be permitted to be installed on an open rack for ease of maintenance.

1206.4.12 Walk-in units. Walk-in units shall only be entered for inspection, maintenance and repair of ESS units and ancillary equipment, and shall not be occupied for other purposes.

1206.5 Electrochemical ESS Protection. The protection of electrochemical ESS shall be in accordance with Sections 1206.5.1 through 1206.5.8 where required by Section 1206.7 through 1206.10.

1206.5.1 Size and separation. Electrochemical ESS shall be segregated into groups not exceeding 50 KWh (180 Mega joules). Each group shall be separated a minimum three feet (914 mm) from other groups and from walls in the

storage room or area. The storage arrangements shall comply with Chapter 10.

Exceptions:

1. Lead acid and nickel cadmium battery systems in facilities under the exclusive control of communications utilities and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76.
2. The fire code official is authorized to approve larger capacities or smaller separation distances based on large scale fire testing complying with Section 1206.1.5.

1206.5.2 Maximum allowable quantities. Fire areas within rooms, areas and walk-in units containing electrochemical ESS shall not exceed the maximum allowable quantities in Table 1206.5.

Exceptions:

1. Where approved by the fire code official, rooms, areas and walk-in units containing electrochemical ESS that exceed the amounts in Table 1206.5 shall be permitted based on a hazardous mitigation analysis in accordance with Section 1206.1.4 and large scale fire testing complying with Section 1206.1.5.
2. Lead-acid and nickel cadmium battery systems installed in facilities under the exclusive control of communications utilities, and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76.
3. Dedicated use buildings in compliance with Section 1206.7.1.

1206.5.2.1 Mixed electrochemical energy systems. Where rooms, areas and walk-in units contain different types of electrochemical energy technologies, the total aggregate quantities of the systems shall be determined based on the sum of percentages of each technology type quantity divided by the maximum allowable quantity of each technology type. The sum of the percentages shall not exceed 100 percent of the maximum allowable quantity.

**TABLE 1206.5
MAXIMUM ALLOWABLE QUANTITIES OF ELECTROCHEMICAL ESS**

TECHNOLOGY	MAXIMUM ALLOWABLE QUANTITIES ^a
STORAGE BATTERIES	
Lead acid, all types	Unlimited
Nickel cadmium (Ni-Cd)	Unlimited
Nickel metal hydride (Ni-MH)	Unlimited
Lithium-ion	600 KWh
Flow batteries ^b	600 KWh
Other battery technologies	200 KWh
CAPACITORS	
All types	20 KWh
OTHER ELECTROCHEMICAL ESS	
All types	20 KWh

a. For electrochemical ESS units rated in Amp-Hours, KWh shall equal rated voltage times the Amp-hour rating divided by 1000

b. Shall include vanadium, zinc-bromine, polysulfide-bromide, and other flowing electrolyte type technologies

1206.5.3 Elevation. Electrochemical ESS shall not be located in the following areas:

1. Where the floor is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, or
2. Where the floor is located below the lowest level of exit discharge.

Exceptions:

1. Lead acid and Nickel cadmium battery systems less than 50 VAC and 60 VDC installed in facilities under the exclusive control of communications utilities in accordance with NFPA 76.
2. Where approved, installations shall be permitted in underground vaults complying with NFPA 70, Article 450, Part III.
3. Where approved by the fire code official, installations shall be permitted on higher and lower floors.

1206.5.4 Fire detection. An approved automatic smoke detection system or radiant energy-sensing fire detection system complying with Section 907.2 shall be installed in rooms, indoor areas, and walk-in units containing electrochemical ESS. An approved radiant energy-sensing fire detection system shall be installed to protect open parking garage and rooftop installations. Alarm signals from detection systems shall be transmitted to a central station, proprietary or remote station service in accordance with NFPA 72, or where approved to a constantly attended location.

1206.5.4.1 System status. Where required by the fire code official, visible annunciation shall be provided on cabinet exteriors or in other approved locations to indicate that potentially hazardous conditions associated with the ESS exist.

1206.5.5 Fire suppression systems. Rooms and areas within buildings and walk-in units containing electrochemical ESS shall be protected by an automatic fire suppression system designed and installed in accordance with one of the following:

1. An automatic sprinkler systems designed and installed in accordance with Section 903.3.1.1 with a minimum density of 0.3 gpm/ft.² based on the fire area or 2,500 ft.² design area, whichever is smaller.
2. Where approved, an automatic sprinkler system designed and installed in accordance with Section 903.3.1.1 with a sprinkler hazard classification based on large scale fire testing complying with Section 1206.1.5.
3. The following alternate automatic fire extinguishing systems designed and installed in accordance with Section 904, provided the installation is approved by the fire code official based on large scale fire testing complying with Section 1206.1.5

- NFPA 12, Standard on Carbon Dioxide Extinguishing Systems
- NFPA 15, Standard for Water Spray Fixed Systems for Fire Protection
- NFPA 750, Standard on Water Mist Fire Protection Systems
- NFPA 2001, Standard on Clean Agent Fire Extinguishing Systems
- NFPA 2010, Standard for Fixed Aerosol Fire-Extinguishing Systems

Exception: Fire suppression systems for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities that operate at less than 50 VAC and 60 VDC shall be provided where required by NFPA 76.

1206.5.5.1 Water reactive systems. Electrochemical ESS that utilize water reactive materials shall be protected by an approved alternative automatic fire-extinguishing system in accordance with Section 904, where the installation is approved by the fire code official based on large scale fire testing complying with Section 1206.1.5.

1206.5.6 Maximum enclosure size. Outdoor walk-in units housing ESS shall not exceed 53 feet by 8 feet by 9.5 feet high. Walk-in units that exceed these dimensions shall be considered indoor installations and comply with the requirements in Section 1206.7.

1206.5.7 Vegetation control. Areas within 10 feet (3 m) on each side of outdoor ESS shall be cleared of combustible vegetation and other combustible growth. Single specimens of trees, shrubbery, or cultivated ground cover such as green grass, ivy, succulents, or similar plants used as ground covers shall be permitted to be exempt provided that they do not form a means of readily transmitting fire.

1206.5.8 Means of egress separation. ESS located outdoors and in open parking garages shall be separated from any means of egress as required by the fire code official to ensure safe egress under fire conditions, but in no case less than 10 feet (3048 mm).

Exception: The fire code official is authorized to approve a reduced separation distance if large scale fire testing complying with Section 1206.1.5 is provided that shows that a fire involving the ESS will not adversely impact occupant egress.

1206.6 Electrochemical ESS technology specific protection. Electrochemical ESS installations shall comply with the requirements of this section in accordance with the applicable requirements of Table 1206.6.

**TABLE 1206.6
ELECTROCHEMICAL ESS TECHNOLOGY SPECIFIC REQUIREMENTS**

<u>COMPLIANCE REQUIRED</u> ^b	<u>BATTERY TECHNOLOGY</u>				<u>OTHER ESS AND BATTERY TECHNOLOGIES</u> ^b	<u>CAPACITOR ESS</u> ^b
	<u>Lead-acid</u>	<u>Ni-Cad and Ni-MH</u>	<u>Lithium-ion</u>	<u>Flow</u>		
<u>1206.6.1 Exhaust ventilation</u>	<u>Yes</u>	<u>Yes</u>	<u>No</u>	<u>Yes</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.6.2 Spill control and neutralization</u>	<u>Yes</u> ^c	<u>Yes</u> ^c	<u>No</u>	<u>Yes</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.6.3Explosion control</u>	<u>Yes</u> ^a	<u>Yes</u> ^a	<u>Yes</u>	<u>No</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.6.4 Safety caps</u>	<u>Yes</u>	<u>Yes</u>	<u>No</u>	<u>No</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.6.5 Thermal runaway</u>	<u>Yes</u>	<u>Yes</u>	<u>Yes</u> ^d	<u>No</u>	<u>Yes</u> ^d	<u>Yes</u>

a. Not required for lead-acid and nickel cadmium batteries at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC.

b. Protection shall be provided unless documentation acceptable to the fire code official is provided in accordance with Section 104.7.2 that provides justification why the protection is not necessary based on the technology used.

c. Applicable to vented (i.e. flooded) type nickel cadmium and lead acid batteries.

d. The thermal runaway protection is permitted to be part of a battery management system that has been evaluated with the battery as part of the evaluation to UL 1973.

1206.6.1 Exhaust ventilation. Where required by Table 1206.6 or elsewhere in this code, exhaust ventilation of rooms, areas, and walk-in units containing electrochemical ESS shall be provided in accordance with the International Mechanical Code and Section 1206.6.1.1 or 1206.6.1.2.

1206.6.1.1 Ventilation based upon LFL. The exhaust ventilation system shall be designed to limit the maximum concentration of flammable gas to 25 percent of the lower flammable limit (LFL) of the total volume of the room, area, or walk-in unit during the worst-case event of simultaneous charging of batteries at the maximum charge rate, in accordance with nationally recognized standards.

1206.6.1.2 Ventilation based upon exhaust rate. Mechanical exhaust ventilation shall be provided at a rate of not less than $1 \text{ ft}^3/\text{min}/\text{ft}^2$ ($5.1 \text{ L}/\text{sec}/\text{m}^2$) of floor area of the room, area, or walk-in unit. The ventilation shall be either continuous or shall be activated by a gas detection system in accordance with Section 1206.6.1.2.4.

1206.6.1.2.1 Standby power. Mechanical exhaust ventilation shall be provided with a minimum of two hours of standby power in accordance with Section 1203.2.5.

1206.6.1.2.2 Installation instructions. Required mechanical exhaust ventilation systems shall be installed in accordance with the manufacturer's installation instructions and the International Mechanical Code.

1206.6.1.2.3 Supervision. Required mechanical exhaust ventilation systems shall be supervised by an approved central station, proprietary or remote station service in accordance with NFPA 72, or shall initiate an audible and visible signal at an approved constantly attended on-site location.

1206.6.1.2.4 Gas detection system. Where required by Section 1206.6.1.2, rooms, areas, and walk-in units containing ESS shall be protected by an approved continuous gas detection system that complies with Section 916 and with the following:

1. The gas detection system shall be designed to activate the mechanical ventilation system when the level of flammable gas in the room, area, or walk-in unit exceeds 25 percent of the LFL.
2. The mechanical ventilation system shall remain on until the flammable gas detected is less than 25 percent of the LFL.
3. The gas detection system shall be provided with a minimum of 2 hours of standby power in accordance with Section 1203.2.6.
4. Failure of the gas detection system shall annunciate a trouble signal at an approved central station, proprietary or remote station service in accordance with NFPA 72, or shall initiate an audible and visible trouble signal at an approved constantly attended on-site location.

1206.6.2 Spill control and neutralization. Where required by Table 1206.6 or elsewhere in this code, areas containing free-flowing liquid electrolyte or hazardous materials shall be provided with spill control and neutralization in accordance with this section.

1206.6.2.1 Spill control. Spill control shall be provided to prevent the flow of liquid electrolyte or hazardous materials to adjoining rooms or areas. The method shall be capable of containing a spill from the single largest battery or vessel.

1206.6.2.2 Neutralization. An approved method to neutralize spilled liquid electrolyte shall be provided that is capable of neutralizing a spill from the largest battery or vessel to a pH between 5.0 and 9.0.

1206.6.3 Explosion control. Where required by Table 1206.6 or elsewhere in this code, explosion control complying

with Section 911 shall be provided for rooms, areas or walk-in units containing electrochemical ESS technologies.

Exceptions:

1. Where approved, explosion control is permitted to be waived by the fire code official based on large scale fire testing complying with Section 1206.1.5 which demonstrates that flammable gases are not liberated from electrochemical ESS cells or modules where tested in accordance with UL 9540A.
2. Where approved, explosion control is permitted to be waived by the fire code official based on documentation provided in accordance with Section 104.7 that demonstrates that the electrochemical ESS technology to be used does not have the potential to release flammable gas concentrations in excess of 25 percent of the LFL anywhere in the room, area, walk-in unit or structure under thermal runaway or other fault conditions.

1206.6.4 Safety caps. Where required by Table 1206.6 or elsewhere in this code, vented batteries and other ESS shall be provided with flame-arresting safety caps.

1206.6.5 Thermal runaway. Where required by Table 1206.6 or elsewhere in this code, batteries and other ESS shall be provided with a listed device or other approved method to prevent, detect and minimize the impact of thermal runaway.

1206.7 Indoor installations. Indoor ESS installations shall be in accordance with Sections 1206.7.1 through 1206.7.4.

1206.7.1 Dedicated use buildings. For the purpose of Table 1206.7 dedicated use ESS buildings shall be classified as Group F-1 occupancies and comply with all the following:

1. The building shall only be used for ESS, electrical energy generation, and other electrical grid related operations.
2. Occupants in the rooms and areas containing ESS are limited to personnel that operate, maintain, service, test and repair the ESS and other energy systems.
3. No other occupancy types shall be permitted in the building.
4. Administrative and support personnel shall be permitted in areas within the buildings that do not contain ESS, provided:
 - 4.1 The areas do not occupy more than 10 percent of the building area of the story in which they are located.
 - 4.2 A means of egress is provided from the incidental use areas to the public way that does not require occupants to traverse through areas containing ESS or other energy system equipment.

1206.7.2 Non-dedicated use buildings. For the purpose of Table 1206.7 non-dedicated use buildings include all buildings that contain ESS and do not comply with Section 1206.7.2 dedicated use building requirements.

**TABLE 1206.7
INDOOR ESS INSTALLATIONS**

<u>COMPLIANCE REQUIRED</u>	<u>DEDICATED USE BUILDINGS^a</u>	<u>NON-DEDICATED USE BUILDINGS^b</u>
<u>1206.4 General installation requirements</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.1 Size and separation</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.2 Maximum allowable quantities</u>	<u>No</u>	<u>Yes</u>
<u>1206.5.3 Elevation</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.4 Smoke and automatic fire detection</u>	<u>Yes^c</u>	<u>Yes</u>
<u>1206.5.5 Fire suppression systems</u>	<u>Yes^d</u>	<u>Yes</u>
<u>1206.7.3 Dwelling units and sleeping units</u>	<u>NA</u>	<u>Yes</u>
<u>1206.7.4 Fire-resistance rated separations</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.6 Technology specific protection</u>	<u>Yes</u>	<u>Yes</u>

NA = Not allowed.

a. See Section 1206.7.1.

b. See Section 1206.7.2.

c. Where approved by the fire code official, alarm signals are not required to be transmitted to a central station, proprietary or remote station service in accordance with NFPA 72, or a constantly attended location where local fire alarm annunciation is provided and trained personnel are always present.

d. Where approved by the fire code official, fire suppression systems are permitted to be omitted in dedicated use buildings located more than 100 feet (30.5 M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards.

1206.7.3 Dwelling units and sleeping units. ESS shall not be installed in sleeping units or in habitable spaces of dwelling units.

1206.7.4 Fire-resistance rated separations. Rooms and areas containing ESS shall include fire-resistance rated separations as follows:

1. In dedicated use buildings, rooms and areas containing ESS shall be separated from areas in which administrative and support personnel are located.
2. In non-dedicated use buildings, rooms and areas containing ESS shall be separated from other areas in the building.

Separation shall be provided by 2 hour rated fire barriers constructed in accordance with Section 707 of the International Building Code and 2 hour rated horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate.

1206.8 Outdoor installations. Outdoor installations shall be in accordance with Sections 1206.8.1 through 1206.8.3.

1206.8.1 Remote outdoor installations. For the purpose of Table 1206.8, remote outdoor installations include ESS located more than 100 feet (30.5 M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards.

1206.8.2 Installations near exposures. For the purpose of Table 1206.8, installations near exposures include all outdoor ESS installations that do not comply with Section 1206.8.1 remote outdoor location requirements.

**TABLE 1206.8
OUTDOOR ESS INSTALLATIONS^a**

<u>COMPLIANCE REQUIRED</u>	<u>REMOTE INSTALLATIONS^a</u>	<u>INSTALLATIONS NEAR EXPOSURES^b</u>
<u>1206.4 All ESS installations</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.1 Size and separation</u>	<u>No</u>	<u>Yes^c</u>
<u>1206.5.2 Maximum allowable quantities</u>	<u>No</u>	<u>Yes</u>
<u>1206.5.4 Smoke and automatic fire detection</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.5 Fire suppression systems</u>	<u>Yes^d</u>	<u>Yes</u>
<u>1206.5.6 Maximum enclosure size</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.7 Vegetation control</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.8 Means of egress separation</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.8.3 Clearance to exposures</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.6 Technology specific protection</u>	<u>Yes</u>	<u>Yes</u>

a. See Section 1206.8.1.

b. See Section 1206.8.2.

c. In outdoor walk-in units, spacing is not required between ESS units and the walls of the enclosure.

d. Where approved by the fire code official, fire suppression systems are permitted to be omitted.

1206.8.3 Clearance to exposures. ESS located outdoors shall be separated by a minimum ten feet (3048 mm) from the following exposures:

1. Lot lines
2. Public ways
3. Buildings
4. Stored combustible materials
5. Hazardous materials
6. High-piled stock
7. Other exposure hazards

Exceptions:

1. Clearances are permitted to be reduced to 3 feet (914 mm) where a 1-hour free standing fire barrier, suitable for exterior use, and extending 5 feet (1.5 m) above and extending 5 feet (1.5 m) beyond the physical boundary of the ESS installation is provided to protect the exposure.
2. Clearances to buildings are permitted to be reduced to 3 feet (914 mm) where noncombustible exterior walls with no openings or combustible overhangs are provided on the wall adjacent to the ESS and the fire-resistance rating of the exterior wall is a minimum 2 hours.
3. Clearances to buildings are permitted to be reduced to 3 feet (914.4 mm) where a weatherproof enclosure constructed of noncombustible materials is provided over the ESS, and it has been demonstrated that a fire within the enclosure will not ignite combustible materials outside the enclosure based on large scale fire testing complying with Section 1206.1.5.

1206.9 Special installations. Rooftop and open parking garage ESS installations shall comply with Sections 1206.9.1 through 1206.9.6.

1206.9.1 Rooftop installations. For the purpose of Table 1206.9, rooftop ESS installations are those located on the roofs of buildings.

1206.9.2 Open parking garage installations. For the purpose of Table 1206.9, open parking garage ESS installations are those located in a structure or portion of a structure that complies with Section 406.5 of the International Building Code.

**TABLE 1206.9
SPECIAL ESS INSTALLATIONS**

<u>COMPLIANCE REQUIRED</u>	<u>ROOFTOPS</u> ^a	<u>OPEN PARKING GARAGES</u> ^b
<u>1206.4 All ESS installations</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.1 Size and separation</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.2 Maximum allowable quantities</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.4 Smoke and automatic fire detection</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.6 Maximum enclosure size</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.8 Means of egress separation</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.9.3 Clearance to exposures</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.9.4 Fire suppression systems</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.9.5 Rooftop installations</u>	<u>Yes</u>	No
<u>1206.9.6 Open parking garage installations</u>	No	<u>Yes</u>
<u>1206.6 Technology specific protection</u>	<u>Yes</u>	<u>Yes</u>

a. See Section 1206.9.1.

b. See Section 1206.9.2.

1206.9.3 Clearance to exposures. ESS located on rooftops and in open parking garages shall be separated by a minimum ten feet (3048 mm) from the following exposures:

1. Buildings, except the building on which rooftop ESS is mounted
2. Any portion of the building on which a rooftop system is mounted that is elevated above the rooftop on which the system is installed
3. Lot lines
4. Public ways
5. Stored combustible materials
6. Locations where motor vehicles can be parked
7. Hazardous materials
8. Other exposure hazards

Exceptions:

1. Clearances are permitted to be reduced to 3 feet (914 mm) where a 1-hour free standing fire barrier, suitable for exterior use, and extending 5 feet (1.5 m) above and extending 5 feet (1.5 m) beyond the physical boundary of the ESS installation is provided to protect the exposure.
2. Clearances are permitted to be reduced to 3 feet (914.4 mm) where a weatherproof enclosure constructed of noncombustible materials is provided over the ESS and it has been demonstrated that a fire within the enclosure will not ignite combustible materials outside the enclosure based on large scale fire testing complying with Section 1206.1.5.

1206.9.4 Fire suppression systems. ESS located in walk-in units on rooftops or in walk-in units in open parking garages shall be provided with automatic fire suppression systems within the ESS enclosure in accordance with Section 1206.5.5. Areas containing ESS other than walk-in units in open parking structures on levels not open above to the sky shall be provided with an automatic fire suppression system complying with Section 1206.5.5. Exception: A fire suppression system is not required in open parking garages if large scale fire testing complying with Section 1206.1.5 is provided that shows that a fire will not impact the exposures in Section 1206.9.3.

1206.9.5 Rooftop installations. ESS and associated equipment that are located on rooftops and not enclosed by building construction shall comply with the following:

1. Stairway access to the roof for emergency response and fire department personnel shall be provided either through a bulkhead from the interior of the building or a stairway on the exterior of the building.
2. Service walkways at least 5 feet (1524 mm) in width shall be provided for service and emergency personnel from the point of access to the roof to the system.
3. ESS and associated equipment shall be located from the edge of the roof a distance equal to at least the height of the system, equipment, or component but not less than 5 feet (1.5 m).
4. The roofing materials under and within 5 feet (1524 mm) horizontally from an ESS or associated equipment shall be noncombustible or shall have a Class A rating when tested in accordance with ASTM E108 or UL 790.
5. A Class I standpipe outlet shall be installed at an approved location on the roof level of the building or in the stairway bulkhead at the top level.
6. The ESS shall be the minimum of 10 feet from the fire service access point on the roof top.

1206.9.6 Open parking garages. ESS and associated equipment that are located in open parking garages shall comply with all of the following:

1. ESS shall not be located within 50 feet (15,240 mm) of air inlets for building HVAC systems.

Exception: This distance shall be permitted to be reduced to 25 feet (7,620 mm) if the automatic fire alarm system

monitoring the radiant-energy sensing detectors de-energizes the ventilation system connected to the air intakes upon detection of fire.

2. ESS shall not be located within 25 feet (7620 mm) of exits leading from the attached building where located on a covered level of the parking structure not directly open to the sky above.
3. 3. An approved fence with a locked gate or other approved barrier shall be provided to keep the general public at least five feet (1024 mm) from the outer enclosure of the ESS.

1206.10 Mobile ESS equipment and operations. Mobile ESS equipment and operations shall comply with Sections 1206.10.1 through 1206.10.7.7.

1206.10.1 Charging and storage. For the purpose of Section 1206.10, charging and storage covers the operation where mobile ESS are charged and stored so they are ready for deployment to another site, and where they are charged and stored after a deployment.

1206.10.2 Deployment. For the purpose of Section 1206.10, deployment covers operations where mobile ESS are located at a site other than the charging and storage site and are being used to provide power.

1206.10.3 Permits. Construction and operational permits shall be provided for charging and storage of mobile ESS and operational permits shall be provided for deployment of mobile ESS as required by Section 1206.1.2.

1206.10.4 Construction documents. Construction documents complying with Section 1206.3 shall be provided with the construction permit application for mobile ESS charging and storage locations.

1206.10.4.1 Deployment documents. The following information shall be provided with the operation permit applications for mobile ESS deployments:

1. Relevant information for the mobile ESS equipment and protection measures in the construction documents required by Section 1206.1.3.
2. Location and layout diagram of the area in which the mobile ESS is to be deployed, including a scale diagram of all nearby exposures.
3. Location and content of signage, including no smoking signs.
4. Description of fencing to be provided around the ESS, including locking methods.
5. Details on fire suppression, smoke and automatic fire detection, system monitoring, thermal management, exhaust ventilation, and explosion control, if provided.
6. For deployment, the intended duration of operation, including anticipated connection and disconnection times and dates.
7. Location and description of local staging stops during transit to the deployment site. See Section 1206.10.8.5.
8. Description of the temporary wiring, including connection methods, conductor type and size, and circuit overcurrent protection to be provided.
9. Description of how fire suppression system connections to water supplies or extinguishing agents are to be provided.
10. Contact information for personnel who are responsible for maintaining and servicing the equipment, and responding to emergencies as required by Section 1206.1.6.1.

1206.10.5 Approved locations. Locations where mobile ESS are charged, stored and deployed shall be restricted to the locations established on the construction and operational permits.

1206.10.6 Charging and storage. Installations where mobile ESS are charged and stored shall be treated as permanent ESS indoor or outdoor installations, and shall comply with the following sections, as applicable:

1. Indoor charging and storage shall comply with Section 1206.7.
2. Outdoor charging and storage shall comply with Section 1206.8.
3. Charging and storage on rooftops and in open parking garages shall comply with Section 1206.9.

Exceptions:

1. Electrical connections shall be permitted to be made using temporary wiring complying with the manufacturer's instructions, the UL 9540 listing, and NFPA 70.
2. Fire suppression system connections to the water supply shall be permitted to use approved temporary connections.

1206.10.7 Deployed mobile ESS requirements. Deployed mobile ESS equipment and operations shall comply with this section and Table 1206.10.

1206.10.7.1 Duration. The duration of mobile ESS deployment shall not exceed 30 days.

Exceptions:

1. Mobile ESS deployments that provide power for durations longer than 30 days shall comply with Section 1206.10.7.
2. Mobile ESS deployments shall not exceed 180 days unless additional operational permits are obtained.

1206.10.7.2 Restricted locations. Deployed mobile ESS operations shall not be located indoors, in covered parking garages, on rooftops, below grade, or under building overhangs.

1206.10.7.3 Clearance to exposures. Deployed mobile ESS shall be separated by a minimum 10 feet (3048 mm) from the following exposures:

1. Public ways
2. Buildings
3. Stored combustible materials
4. Hazardous materials
5. High-piled stock
6. Other exposure hazards

Deployed mobile ESS shall be separated by a minimum 50 feet (15.3 M) from public seating areas and from tents, canopies and membrane structures with an occupant load of 30 or more.

1206.10.7.4 Electrical connections. Electrical connections shall be made in accordance with the manufacturer's instructions and the UL 9540 listing. Temporary wiring for electrical power connections shall comply with NFPA 70. Fixed electrical wiring shall not be provided.

1206.10.7.5 Local staging. Mobile ESS in transit from the charging and storage location to the deployment location and back shall not be parked within 100 feet (30,480 mm) of an occupied building for more than one hour during transit, unless specifically approved by the fire code official when the permit is issued.

1206.10.7.6 Fencing. An approved fence with a locked gate or other approved barrier shall be provided to keep the general public at least five feet (1024 mm) from the outer enclosure of a deployed mobile ESS.

**TABLE 1206.10
MOBILE ENERGY STORAGE SYSTEMS (ESS)**

<u>COMPLIANCE REQUIRED</u>	<u>DEPLOYMENT</u> ^a
<u>1206.4 All ESS installations</u>	Yes ^b
<u>1206.5.1 Size and separation</u>	Yes ^c
<u>1206.5.2 Maximum allowable quantities</u>	Yes
<u>1206.5.4 Smoke and automatic fire detection</u>	Yes ^e
<u>1206.5.5 Fire suppression systems</u>	Yes ^d
<u>1206.5.6 Maximum enclosure size</u>	Yes
<u>1206.5.7 Vegetation control</u>	Yes
<u>1206.5.8 Means of egress separation</u>	Yes
<u>1206.6 Technology specific protection</u>	Yes

a. See Section 1206.10.2.

b. Mobile operations on wheeled vehicle or trailers shall not be required to comply with Section 1206.4.4 seismic and structural load requirements.

c. In walk-in units, spacing is not required between ESS units and the walls of the enclosure.

d. Fire suppression system connections to the water supply shall be permitted to use approved temporary connections.

e. Alarm signals are not required to be transmitted to an approved location for mobile ESS deployed 30 days or less.

1206.10.7.7 Smoking. Smoking shall be prohibited within 10 feet (3048 mm) of mobile ESS. Signs shall be posted in accordance with Section 310.

Delete without substitution:

~~**1206.1 Scope.** The provisions in this section are applicable to energy storage systems designed to provide electrical power to a building or facility. These systems are used to provide standby or emergency power, an uninterruptable power supply, load shedding, load sharing or similar capabilities.~~

~~**1206.2 Stationary storage battery systems.** Stationary storage battery systems having capacities exceeding the values shown in Table 1206.2 shall comply with Section 1206.2.1 through 1206.2.12.6, as applicable.~~

TABLE 1206.2
BATTERY STORAGE SYSTEM THRESHOLD QUANTITIES.

BATTERY TECHNOLOGY	CAPACITY^a
Flow batteries ^b	20 kWh
Lead acid, all types	70 kWh
Lithium, all types	20 kWh
Nickel cadmium (Ni-Cd)	70 kWh
Sodium, all types	20 kWh ^c
Other battery technologies	10 kWh

For SI: 1 kilowatt hour = 3.6 megajoules.

- a. For batteries rated in amp hours, kWh shall equal rated voltage times amp hour rating divided by 1000.
- b. Shall include vanadium, zinc bromine, polysulfide bromide, and other flowing electrolyte type technologies.
- c. 70 kWh for sodium ion technologies.

1206.2.1 Permits. Permits shall be obtained for the installation and operation of stationary storage battery systems in accordance with Section 105.7.2.

1206.2.2 Construction documents. The following information shall be provided with the permit application:

1. Location and layout diagram of the room in which the stationary storage battery system is to be installed.
2. Details on hourly fire-resistance-rated assemblies provided.
3. Quantities and types of storage batteries and battery systems.
4. Manufacturer's specifications, ratings and listings of storage batteries and battery systems.
5. Details on energy management systems.
6. Location and content of signage.
7. Details on fire-extinguishing, smoke detection and ventilation systems.
8. Rack storage arrangement, including seismic support criteria.

1206.2.3 Hazard mitigation analysis. A failure modes and effects analysis (FMEA) or other approved hazard mitigation analysis shall be provided in accordance with Section 104.7.2 under any of the following conditions:

1. Battery technologies not specifically identified in Table 1206.2 are provided.
2. More than one stationary storage battery technology is provided in a room or indoor area where there is a potential for adverse interaction between technologies.
3. Where allowed as a basis for increasing maximum allowable quantities in accordance with Section 1206.2.9.

1206.2.3.1 Fault condition. The hazard mitigation analysis shall evaluate the consequences of the following failure modes, and others deemed necessary by the *fire code official*. Only single failure modes shall be considered:

1. Thermal runaway condition in a single battery storage rack, module or array.
2. Failure of any energy management system.
3. Failure of any required ventilation system.
4. Voltage surges on the primary electric supply.
5. Short circuits on the load side of the stationary battery storage system.
6. Failure of the smoke detection, fire extinguishing or gas detection system.
7. Spill neutralization not being provided or failure of the secondary containment system.

1206.2.3.2 Analysis approval. The *fire code official* is authorized to approve the hazardous mitigation analysis provided that the hazard mitigation analysis demonstrates all of the following:

1. Fires or explosions will be contained within unoccupied battery storage rooms for the minimum duration of the fire resistance rated walls identified in Table 509.1 of the International Building Code.
2. Fires and explosions in battery cabinets in occupied work centers will be detected in time to allow occupants within the room to evacuate safely.
3. Toxic and highly toxic gases released during fires and other fault conditions shall not reach concentrations in excess of Immediately Dangerous to Life or Health (IDLH) levels in the building or adjacent means of egress routes during the time deemed necessary to evacuate from that area.
4. Flammable gases released from batteries during charging, discharging and normal operation shall

not exceed 25 percent of their lower flammability limit (LFL).

5. Flammable gases released from batteries during fire, overcharging and other abnormal conditions shall not create an explosion hazard that will injure occupants or emergency responders.

1206.2.3.3 Additional protection measures. Construction, equipment and systems that are required for the stationary storage battery system to comply with the hazardous mitigation analysis, including but not limited to those specifically described in Section 1206.2, shall be installed, maintained and tested in accordance with nationally recognized standards and specified design parameters.

1206.2.4 Seismic and structural design. Stationary storage battery systems shall comply with the seismic design requirements in Chapter 16 of the International Building Code, and shall not exceed the floor loading limitation of the building.

1206.2.5 Vehicle impact protection. Where stationary storage battery systems are subject to impact by a motor vehicle, including fork lifts, vehicle impact protection shall be provided in accordance with Section 312.

1206.2.6 Combustible storage. Combustible materials not related to the stationary storage battery system shall not be stored in battery rooms, cabinets or enclosures. Combustible materials in occupied work centers covered by Section 1206.2.8.5 shall not be stored less than 3 feet (915 mm) from battery cabinets.

1206.2.7 Testing, maintenance and repair. Storage batteries and associated equipment and systems shall be tested and maintained in accordance with the manufacturer's instructions. Any storage batteries or system components used to replace existing units shall be compatible with the battery charger, energy management systems, other storage batteries and other safety systems. Introducing other types of storage batteries into the stationary storage battery system or other types of electrolytes into flow battery systems shall be treated as a new installation and require approval by the *fire code official* before the replacements are introduced into service.

1206.2.8 Location and construction. Rooms and areas containing stationary storage battery systems shall be designed, located and constructed in accordance with Sections 1206.2.8.1 through 1206.2.8.7.4.

1206.2.8.1 Location. Stationary storage battery systems shall not be located in areas where the floor is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, or where the floor level is more than 30 feet (9144 mm) below the finished floor of the lowest level of exit discharge.

Exceptions:

1. Lead acid and nickel cadmium stationary storage battery systems.
2. Installations on noncombustible rooftops of buildings exceeding 75 feet (22 860 mm) in height that do not obstruct fire department rooftop operations, where *approved by the fire code official*.

1206.2.8.2 Separation. Rooms containing stationary storage battery systems shall be separated from other areas of the building in accordance with Section 509.1 of the International Building Code. Battery systems shall be allowed to be in the same room with the equipment they support.

1206.2.8.3 Stationary battery arrays. Storage batteries, prepackaged stationary storage battery systems and preengineered stationary storage battery systems shall be segregated into stationary battery arrays not exceeding 50 kWh (180 megajoules) each. Each stationary battery array shall be spaced not less than 3 feet (914 mm) from other stationary battery arrays and from walls in the storage room or area. The storage arrangements shall comply with Chapter 10.

Exceptions:

1. Lead acid and nickel cadmium storage battery arrays.
2. Listed preengineered stationary storage battery systems and prepackaged stationary storage battery systems shall not exceed 250 kWh (900 megajoules) each.
3. The fire code official is authorized to approve listed, preengineered and prepackaged battery arrays with larger capacities or smaller battery array spacing if large scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving one array will not propagate to an adjacent array, and be contained within the room for a duration equal to the fire-resistance rating of the room separation specified in Table 509 of the International Building Code.

1206.2.8.4 Separate rooms. Where stationary batteries are installed in a separate equipment room that can be accessed only by authorized personnel, they shall be permitted to be installed on an open rack for ease of maintenance.

1206.2.8.5 Occupied work centers. Where stationary storage batteries are located in an occupied work center, they shall be housed in a noncombustible cabinet or other enclosure to prevent access by unauthorized personnel.

1206.2.8.5.1 Cabinets. Where stationary batteries are contained in cabinets in occupied work centers, the cabinet enclosures shall be located within 10 feet (3048 mm) of the equipment that they support.

1206.2.8.6 Signage. Approved signs shall be provided on doors or in locations near entrances to stationary storage battery system rooms and shall include the following or equivalent:

1. The room contains energized battery systems.
2. The room contains energized electrical circuits.
3. The additional markings required in Section 1206.2.12 for the types of storage batteries contained within the room.

Exception: Existing stationary storage battery systems shall be permitted to include the signage required at the time it was installed.

1206.2.8.6.1 Electrical disconnects. Where the stationary storage battery system disconnecting means is not within sight of the main service disconnecting means, placards or directories shall be installed at the location of the main service disconnecting means indicating the location of stationary storage battery system disconnecting means in accordance with NFPA 70.

1206.2.8.6.2 Cabinet signage. Battery storage cabinets provided in occupied work centers in accordance with Section 1206.2.8.5 shall have exterior labels that identify the manufacturer and model number of the system and electrical rating (voltage and current) of the contained battery system. There shall be signs within the cabinet that indicate the relevant electrical and chemical hazards, as required by Section 1206.2.12.

1206.2.8.7 Outdoor installations. Stationary storage battery systems located outdoors shall comply with Sections 1206.2.8.7 through 1206.2.8.7.4, in addition to all applicable requirements of Section 1206.2. Installations in outdoor enclosures or containers that can be occupied for servicing, testing, maintenance and other functions shall be treated as battery storage rooms.

Exception: Stationary battery arrays in noncombustible containers shall not be required to be spaced 3 feet (914 mm) from the container walls.

1206.2.8.7.1 Separation. Stationary storage battery systems located outdoors shall be separated by a minimum 5 feet (1524 mm) from the following:

1. Lot lines.
2. Public ways.
3. Buildings.
4. Stored combustible materials.
5. Hazardous materials.
6. High-piled stock.
7. Other exposure hazards.

Exception: The fire code official is authorized to approve smaller separation distances if large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the system will not adversely impact occupant egress from adjacent buildings, or adversely impact adjacent stored materials or structures.

1206.2.8.7.2 Means of egress. Stationary storage battery systems located outdoors shall be separated from any means of egress as required by the fire code official to ensure safe egress under fire conditions, but not less than 10 feet (3048 mm).

Exception: The fire code official is authorized to approve lesser separation distances if large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the system will not adversely impact occupant egress.

~~1206.2.8.7.3 Security of outdoor areas.~~ Outdoor areas in which stationary storage battery systems are located shall be secured against unauthorized entry and safeguarded in an approved manner.

~~1206.2.8.7.4 Walk-in units.~~ Where a stationary storage battery system includes an outer enclosure, the unit shall only be entered for inspection, maintenance and repair of batteries and electronics, and shall not be occupied for other purposes.

~~1206.2.9 Maximum allowable quantities.~~ *Fire areas* within buildings containing stationary storage battery systems exceeding the maximum allowable quantities in Table 1206.2.9 shall comply with all applicable Group H occupancy requirements in this code and the International Building Code.

~~Exception:~~ Where approved by the *fire code official*, areas containing stationary storage batteries that exceed the amounts in Table 1206.2.9 shall be treated as incidental use areas and not Group H occupancies based on a hazardous mitigation analysis in accordance with Section 1206.2.3 and large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory.

**TABLE 1206.2.9
MAXIMUM ALLOWABLE BATTERY QUANTITIES**

BATTERY TECHNOLOGY	MAXIMUM ALLOWABLE QUANTITIES^a	GROUP H OCCUPANCY
Flow batteries ^b	600 kWh	Group H-2
Lead acid, all types	Unlimited	Not Applicable
Lithium, all types	600 kWh	Group H-2
Nickel cadmium (Ni-Cd)	Unlimited	Not Applicable
Sodium, all types	600 kWh	Group H-2
Other battery technologies	200 kWh	Group H-2 ^c

For SI: 1 kilowatt hour = 3.6 megajoules.

- a. For batteries rated in amp-hours, kilowatt-hours (kWh) shall equal rated battery voltage times the amp-hour rating divided by 1,000.
- b. Shall include vanadium, zinc-bromine, polysulfide-bromide, and other flowing electrolyte-type technologies.
- c. Shall be a Group H-4 occupancy if the fire code official determines that a fire or thermal runaway involving the battery technology does not represent a significant fire hazard.

1206.2.9.1 Mixed battery systems. Where areas within buildings contain different types of storage battery technologies, the total aggregate quantities of batteries shall be determined based on the sum of percentages of each battery type quantity divided by the maximum allowable quantity of each battery type. If the sum of the percentages exceeds 100 percent, the area shall be treated as a Group H occupancy in accordance with Table 1206.2.9.

1206.2.10 Storage batteries and equipment. The design and installation of storage batteries and related equipment shall comply with Sections 1206.2.10.1 through 1206.2.10.8.

1206.2.10.1 Listings. Storage batteries and battery storage systems shall comply with the following:

1. Storage batteries shall be listed in accordance with UL 1973.
2. Prepackaged and preengineered stationary storage battery systems shall be listed in accordance with UL 9540.

Exception: Lead-acid batteries are not required to be listed.

1206.2.10.2 Prepackaged and preengineered systems. Prepackaged and preengineered stationary storage battery systems shall be installed in accordance with their listing and the manufacturer's instructions.

1206.2.10.3 Energy management system. An approved energy management system shall be provided for battery technologies other than lead-acid and nickel-cadmium for monitoring and balancing cell voltages, currents and temperatures within the manufacturer's specifications. The system shall transmit an alarm signal to an approved location if potentially hazardous temperatures or other conditions such as short circuits, over-voltage or under-voltage are detected.

1206.2.10.4 Battery chargers. Battery chargers shall be compatible with the battery chemistry and the manufacturer's electrical ratings and charging specifications. Battery chargers shall be listed and labeled in accordance with UL 1564 or provided as part of a listed preengineered or prepackaged stationary storage battery system.

1206.2.10.5 Inverters. Inverters shall be listed and labeled in accordance with UL 1741. Only inverters listed and labeled for utility interactive system use and identified as interactive shall be allowed to operate in parallel with the electric utility power system to supply power to common loads.

1206.2.10.6 Safety caps. Vented batteries shall be provided with flame-arresting safety caps.

1206.2.10.7 Thermal runaway. Where required by Section 1206.2.12, storage batteries shall be provided with a listed device or other approved method to prevent, detect and control thermal runaway.

1206.2.10.8 Toxic and highly toxic gas. Stationary storage battery systems that have the potential to release toxic and highly toxic gas during charging, discharging and normal use conditions shall comply with Chapter 60.

1206.2.11 Fire-extinguishing and detection systems. Fire-extinguishing and detection systems shall be provided in accordance with Sections 1206.2.11.1 through 1206.2.11.5.

1206.2.11.1 Fire-extinguishing systems. Rooms containing stationary storage battery systems shall be equipped with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1. Commodity classifications for specific technologies of storage batteries shall be in accordance with Chapter 5 of NFPA 13. If the storage battery types are not addressed in Chapter 5 of NFPA 13, the *fire code official* is authorized to approve the fire-extinguishing system based on full-scale fire and fault condition testing conducted or witnessed and reported by an *approved laboratory*.

Exception: Spaces or areas containing stationary storage battery systems used exclusively for telecommunications equipment in accordance with Section 903.2.

1206.2.11.1.1 Alternative fire-extinguishing systems. Battery systems that utilize water-reactive materials shall be protected by an approved alternative automatic fire-extinguishing system in accordance with Section 904. The system shall be listed for protecting the type, arrangement and quantities of storage batteries in the room. The fire code official shall be permitted to approve the alternative fire-extinguishing system based on full-scale fire and fault condition testing conducted or witnessed and reported by an approved laboratory.

1206.2.11.2 Smoke detection system. An approved automatic smoke detection system shall be installed in rooms containing stationary storage battery systems in accordance with Section 907.2.

1206.2.11.3 Ventilation. Where required by Section 1206.2.3 or 1206.2.12, ventilation of rooms containing stationary storage battery systems shall be provided in accordance with the International Mechanical Code and one of the following:

1. The ventilation system shall be designed to limit the maximum concentration of flammable gas to 25 percent of the lower flammability limit, or for hydrogen, 1.0 percent of the total volume of the room.
2. Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute (cfm) per square foot [$0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2)$] of floor area, but not less than 150 cfm ($4 \text{ m}^3/\text{min}$).

The exhaust system shall be designed to provide air movement across all parts of the floor for gases having a vapor density greater than air and across all parts of the vault ceiling for gases having a vapor density less than air.

1206.2.11.3.1 Cabinet ventilation. Where cabinets located in occupied spaces contain storage batteries that are required by Section 1206.2.3 or 1206.2.12 to be provided with ventilation, the cabinet shall be provided with ventilation in accordance with Section 1206.2.11.3.

1206.2.11.3.2 Supervision. Required mechanical ventilation systems for rooms and cabinets containing storage batteries shall be supervised by an approved central station, proprietary or remote station service or shall initiate an audible and visual signal at an approved constantly attended on-site location.

1206.2.11.4 Gas detection system. Where required by Section 1206.2.3 or 1206.2.12, rooms containing stationary storage battery systems shall be protected by a gas detection system complying with Section 916. The gas detection system shall be designed to activate where the level of flammable gas exceeds 25 percent of the lower flammable limit (LFL), or where the level of toxic or highly toxic gas exceeds one-half of the IDLH.

1206.2.11.4.1 System activation. Activation of the gas detection system shall result in all the following:

1. Initiation of distinct audible and visible alarms in the battery storage room.
2. Transmission of an alarm to an approved location.
3. De-energizing of the battery charger.
4. Activation of the mechanical ventilation system, where the system is interlocked with the gas detection system.

Exception: Lead-acid and nickel-cadmium stationary storage battery systems shall not be required to comply with Items 1, 2 and 3.

1206.2.11.5 Spill control and neutralization. Where required by Section 1206.2.12, approved methods and materials shall be provided for the control and neutralization of spills of electrolyte or other hazardous materials in areas containing stationary storage batteries as follows:

1. For batteries with free-flowing electrolyte, the method and materials shall be capable of neutralizing a spill of the total capacity from the largest cell or block to a pH between 5.0 and 9.0.
2. For batteries with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.

1206.2.12 Specific battery-type requirements. This section includes requirements applicable to specific types of storage batteries. Stationary storage battery systems with more than one type of storage battery shall comply with requirements applicable to each battery type.

1206.2.12.1 Lead-acid storage batteries. Stationary storage battery systems utilizing lead-acid storage batteries shall comply with the following:

1. ~~Ventilation shall be provided in accordance with Section 1206.2.11.3.~~
2. ~~Spill control and neutralization shall be in accordance with Section 1206.2.11.5.~~
3. ~~Thermal runaway protection shall be provided for valve-regulated lead acid (VRLA) storage batteries in accordance with Section 1206.2.10.7.~~
4. ~~The signage in Section 1206.2.8.6 shall indicate the room contains lead-acid batteries.~~

~~**1206.3.5.1 Fire-extinguishing systems.** Rooms containing capacitor energy storage systems shall be equipped with an automatic sprinkler system installed in accordance with Section 903.3.1.1. Commodity classifications for specific capacitor technologies shall be in accordance with Chapter 5 of NFPA 13. If the capacitor types are not addressed in Chapter 5 of NFPA 13, the fire code official is authorized to approve the automatic sprinkler system based on full-scale fire and fault condition testing conducted by an approved laboratory.~~

~~**1206.2.12.2 Nickel-cadmium (Ni-Cd) storage batteries.** Stationary storage battery systems utilizing nickel-cadmium (Ni-Cd) storage batteries shall comply with the following:~~

1. ~~Ventilation shall be provided in accordance with Section 1206.2.11.3.~~
2. ~~Spill control and neutralization shall be in accordance with Section 1206.2.11.5.~~
3. ~~Thermal runaway protection shall be provided for valve-regulated sealed nickel-cadmium storage batteries in accordance with Section 1206.2.10.7.~~
4. ~~The signage in Section 1206.2.8.6 shall indicate the room contains nickel-cadmium batteries.~~

~~**1206.2.12.3 Lithium-ion storage batteries.** The signage in Section 1206.2.8.6 shall indicate the type of lithium batteries contained in the room.~~

~~**1206.3.2.5 Electrical disconnects.** Where the capacitor energy storage system disconnecting means is not within sight of the main service disconnecting means, placards or directories shall be installed at the location of the main service disconnecting means identifying the location of the capacitor energy storage system disconnecting means in accordance with NFPA 70.~~

~~**1206.2.12.4 Sodium-beta storage batteries.** Stationary storage battery systems utilizing sodium-beta storage batteries shall comply with the following:~~

1. ~~Ventilation shall be provided in accordance with Section 1206.2.11.3.~~
2. ~~The signage in Section 1206.2.8.6 shall indicate the type of sodium batteries in the room and include the instructions, "APPLY NO WATER."~~

~~**1206.3.2.6 Outdoor installation.** Capacitor energy systems located outdoors shall comply with Sections 1206.3.2.6 through 1206.3.2.6.4 in addition to all applicable requirements of Section 1206.3. Installations in outdoor enclosures or containers that can be occupied for servicing, testing, maintenance and other functions shall be treated as capacitor storage rooms.~~

~~**Exception:** Capacitor arrays in noncombustible containers shall not be required to be spaced 3 feet (914 mm) from the container walls.~~

~~**1206.3.2.6.1 Separation.** Capacitor energy systems located outdoors shall be not less than 5 feet (1524 mm) from the following:~~

1. ~~Lot lines.~~
2. ~~Public ways.~~
3. ~~Buildings.~~
4. ~~Stored combustible materials.~~
5. ~~Hazardous materials.~~
6. ~~High-piled stock.~~
7. ~~Other exposure hazards.~~

~~**Exception:** The fire code official is authorized to approve lesser separation distances if large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the system will not adversely impact occupant egress from adjacent buildings, or adversely impact adjacent stored materials or structures.~~

1206.2.12.5 Flow storage batteries. Stationary storage battery systems utilizing flow storage batteries shall comply with the following:

1. Ventilation shall be provided in accordance with Section 1206.2.11.3.
2. Spill control and neutralization shall be in accordance with Section 1206.2.11.5.
3. The signage required in Section 1206.2.8.6 shall indicate the type of flow batteries in the room.

1206.3.2.6.3 Security of outdoor areas. Outdoor areas in which capacitor energy storage systems are located shall be secured against unauthorized entry and safeguarded in an approved manner.

1206.3.2.1 Location. Capacitor energy storage systems shall not be located in areas where the floor is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, or where the floor level is more than 30 feet (9144 mm) below the finished floor of the lowest level of exit discharge.

1206.3.4.4 Capacitor chargers. Capacitor chargers shall be compatible with the capacitor manufacturer's electrical ratings and charging specifications. Capacitor chargers shall be listed and labeled in accordance with UL 1564 or provided as part of a listed preengineered or prepackaged capacitor energy storage system.

1206.2.12.6 Other battery technologies. Stationary storage battery systems utilizing battery technologies other than those described in Sections 1206.2.12.1 through 1206.2.12.5 shall comply with the following:

1. Gas detection systems complying with Section 916 shall be provided in accordance with Section 1206.2.11.4 where the batteries have the potential to produce toxic or highly toxic gas in the storage room or cabinet in excess of the permissible exposure limits (PEL) during charging, discharging and normal system operation.
2. Mechanical ventilation shall be provided in accordance with Section 1206.2.11.3.
3. Spill control and neutralization shall be in accordance with Section 1206.2.11.5.
4. In addition to the signage required in Section 1206.2.8.6, the marking shall identify the type of batteries present, describe the potential hazards associated with the battery type, and indicate that the room contains energized electrical circuits.

1206.3.2.2 Separation. Rooms containing capacitor energy storage systems shall be separated from the following occupancies by fire barriers or horizontal assemblies, or both, constructed in accordance with the International Building Code:

1. Group B, F, M, S and U occupancies by 1-hour fire resistance-rated construction.
2. Group A, E, I and R occupancies by 2-hour fire resistance-rated construction.

1206.3.2.6.4 Walk-in units. Where a capacitor energy storage system includes an outer enclosure, the unit shall only be entered for inspection, maintenance and repair of batteries and electronics, and shall not be occupied for other purposes.

1206.3.4.1 Listing. Capacitors and capacitor energy storage systems shall comply with the following:

1. Capacitors shall be listed in accordance with UL 1973.
2. Prepackaged and preengineered stationary capacitor energy storage systems shall be listed in accordance with UL 9540.

1206.3.4.5 Toxic and highly toxic gas. Capacitor energy storage systems that have the potential to release toxic and highly toxic materials during charging, discharging and normal use conditions shall comply with Chapter 60.

1206.3.5.1.1 Alternative fire-extinguishing systems. Capacitor energy storage systems that utilize water-reactive materials shall be protected by an approved alternative automatic fire-extinguishing system in accordance with Section 904. The system shall be listed for protecting the type, arrangement and quantities of capacitors in the room. The fire code official shall be permitted to approve the system based on full-scale fire and fault condition testing conducted by an approved laboratory.

1206.3 Capacitor energy storage systems. Capacitor energy storage systems having capacities exceeding 3 kWh (10.8 megajoules) shall comply with Sections 1206.3 through 1206.3.2.6.1.

~~**Exception:** Capacitors regulated by NFPA 70, Chapter 460, and capacitors included as a component part of other listed electrical equipment are not required to comply with this section.~~

~~**1206.3.2.3 Capacitor arrays.** Capacitor energy storage systems shall be segregated into capacitor arrays not exceeding 50 kWh (180 megajoules) each. Each array shall be spaced not less than 3 feet (914 mm) from other arrays and from walls in the storage room or area. The storage arrangements shall comply with Chapter 10.~~

~~**Exception:** Capacitor energy storage systems in noncombustible containers located outdoors shall not be required to be spaced 3 feet (914 mm) from the container walls.~~

~~**1206.3.3 Maximum allowable quantities.** Fire areas within buildings containing capacitor energy storage systems that exceed 600 kWh of energy capacity shall comply with all applicable Group H occupancy requirements in this code and the International Building Code.~~

~~**1206.3.4.2 Prepackaged and preengineered systems.** In addition to other applicable requirements of this code, prepackaged and preengineered capacitor energy storage systems shall be installed in accordance with their listing and the manufacturer's instructions.~~

~~**1206.3.5.3 Ventilation.** Where capacitors release flammable gases during normal operating conditions, ventilation of rooms containing capacitor energy storage systems shall be provided in accordance with the International Mechanical Code and one of the following:~~

- ~~1. The ventilation system shall be designed to limit the maximum concentration of flammable gas to 25 percent of the lower flammability limit.~~
- ~~2. Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute (cfm) per square foot [$0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2)$] of floor area, but not less than 150 cfm (4 m^3/min).~~

~~The exhaust system shall be designed to provide air movement across all parts of the floor for gases having a vapor density greater than air and across all parts of the ceiling for gases having a vapor density less than air.~~

~~**1206.3.5.3.1 Supervision.** Required mechanical ventilation systems for rooms containing capacitor energy storage systems shall be supervised by an approved central station, proprietary or remote station service, or shall initiate an audible and visible signal at an approved, constantly attended on-site location.~~

~~**1206.3.1 Permits.** Permits shall be obtained for the installation of capacitor energy storage systems in accordance with Section 105.7.3.~~

~~**1206.3.2.4 Signage.** Approved signs shall be provided on doors or in locations adjacent to the entrances to capacitor energy storage system rooms and shall include the following or equivalent verbiage and information:~~

- ~~1. "CAPACITOR ENERGY STORAGE ROOM."~~
- ~~2. "THIS ROOM CONTAINS ENERGIZED ELECTRICAL CIRCUITS."~~
- ~~3. An identification of the type of capacitors present and the potential hazards associated with the capacitor type.~~

~~**1206.3.4.3 Energy management system.** An approved energy management system shall be provided for monitoring and balancing capacitor voltages, currents and temperatures within the manufacturer's specifications. The system shall transmit an alarm signal to an approved location if potentially hazardous temperatures or other conditions such as short circuits, over voltage or under voltage are detected.~~

~~**1206.3.5.2 Smoke detection system.** An approved automatic smoke detection system shall be installed in rooms containing capacitor energy storage systems in accordance with Section 907.2.~~

~~**1206.3.5.4 Spill control and neutralization.** Where capacitors contain liquid electrolyte, approved methods and materials shall be provided for the control and neutralization of spills of electrolyte or other hazardous materials in areas containing capacitors as follows:~~

- ~~1. For capacitors with free flowing electrolyte, the method and materials shall be capable of neutralizing a spill of the total capacity from the largest cell or block to a pH between 5.0 and 9.0.~~
- ~~2. For capacitors with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.~~

~~**1206.3.2.6.2 Means of egress.** Capacitor energy storage systems located outdoors shall be separated from any means of egress as required by the fire code official to ensure safe egress under fire conditions, but not less than 10 feet (3048 mm).~~

~~**Exception:** The fire code official is authorized to approve lesser separation distances if large scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the system will not adversely impact occupant egress.~~

~~**1206.3.6 Testing, maintenance and repair.** Capacitors and associated equipment and systems shall be tested and maintained in accordance with the manufacturer's instructions. Any capacitors or system components used to replace existing units shall be compatible with the capacitor charger, energy management systems, other capacitors, and other safety systems. Introducing different capacitor technologies into the capacitor energy storage system shall be treated as a new installation and require approval by the fire code official before the replacements are introduced into service.~~

~~**1206.3.2 Location and construction.** Rooms and areas containing capacitor energy storage systems shall be designed, located and constructed in accordance with Sections 1206.3.2 through 1206.3.2.5.~~

~~**1206.3.4 Capacitors and equipment.** The design and installation of capacitor energy storage systems and related equipment shall comply with Sections 1206.3.4.1 through 1206.3.4.5.~~

~~**1206.3.5 Fire-extinguishing and detection systems.** Fire-extinguishing and smoke detection systems shall be provided in capacitor energy storage system rooms in accordance with Sections 1206.3.5.1 through 1206.3.5.2.~~

**[F] TABLE 414.5.1
EXPLOSION CONTROL REQUIREMENTS^{a, h}**

MATERIAL	CLASS	EXPLOSION CONTROL METHODS	
		Barricade construction	Explosion (deflagration) venting or explosion (deflagration) prevention systems ^b
HAZARD CATEGORY			
Combustible dusts ^c	-	Not Required	Required
Cryogenic flammables	-	Not Required	Required
Explosives	Division 1.1	Required	Not Required
	Division 1.2	Required	Not Required
	Division 1.3	Not Required	Required
	Division 1.4	Not Required	Required
	Division 1.5	Required	Not Required
	Division 1.6	Required	Not Required
Flammable gas	Gaseous	Not Required	Required
	Liquefied	Not Required	Required
Flammable liquid	IA ^d	Not Required	Required
	IB ^e	Not Required	Required
Organic peroxides	U	Required	Not Permitted
	I	Required	Not Permitted
Oxidizer liquids and solids	4	Required	Not Permitted
Pyrophoric gas	-	Not Required	Required
Unstable (reactive)	4	Required	Not Permitted
	3 Detonable	Required	Not Permitted
	3 Nondetonable	Not Required	Required
Water-reactive liquids and solids	3	Not Required	Required
	2 ^g	Not Required	Required
SPECIAL USES			
Acetylene generator rooms	-	Not Required	Required
<u>Electrochemical energy storage systems^l</u>	---	<u>Not Required</u>	<u>Required</u>
Grain processing	-	Not Required	Required
Liquefied petroleum gas-distribution facilities	-	Not Required	Required
Where explosion hazards exist ^f	Detonation	Required	Not Permitted
	Deflagration	Not Required	Required

- a. See Section 414.1.3.
- b. See the International Fire Code.
- c. As generated during manufacturing or processing.
- d. Storage or use.
- e. In open use or dispensing.
- f. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.
- g. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.
- h. Explosion venting is not required for Group H-5 fabrication areas complying with Section 415.11.1 and the International Fire Code.
- i. Where explosion control is required in Section 1206.6 of the International Fire Code.

Reason:

The addition of energy storage system (ESS) requirements into the 2018 code was an initial effort to address safety hazards associated with the increased use of lithium-ion batteries, capacitors and other modern energy storage system (ESS) technologies for an expanded number of grid related energy storage applications. The new requirements were a huge step toward addressing modern ESS technologies and grid based applications. However as written the requirements made it difficult to apply appropriate safety requirements for different installations, each with their own risks and exposures. Case in point, a lead acid battery ESS installation in an unmanned rural telecommunications repeater doesn't present the same risks and exposures as a lithium-ion battery ESS installation in a mixed occupancy high rise in an urban area.

Since the 2018 ESS requirements were developed there has been a lot of work done by private and government stakeholders to enhance ESS installation requirements, including the initial drafting of the NFPA 855 Energy Storage System standard. The Fire Code Action Committee's ESS work group, which includes 45+ code officials, manufacturers, users and industry experts identified several areas in the 2018 code that needed to be addressed to provide requirements that better address the hazards and exposures associated with various types of ESS installations, technologies and operations.

This section rewrite retains many of the basic protection concepts in the 2018 code, but also provide customized requirements for different types of installations and different types of ESS technologies in use today. We chose to replace the section in its entirety, rather than trying to edit existing text. Explanations of some of the more significant changes are included below.

Mobile ESS operations, consisting of lithium-ion batteries on trailers or skids are being deployed to locations to provide a temporary source of power. An operational permit is required for the mobile operations.

Section 1206.1 includes general requirements for all ESS. No significant changes were made to the Construction Document and Hazard Mitigation Analysis requirements.

Section 1206.1.5 - The 2018 code allowed certain variances be allowed based on large scale fire and fault condition testing, but the criteria for conducting such testing was undefined. The UL 9540A Test Method was specifically developed to cover this testing.

Section 1206.1.6 - This section was developed to address fire events involving lithium-ion battery systems, since lithium-ion battery fires have the potential to re-ignite hours or even days after initial extinguishment by the fire department, who cannot remain on scene indefinitely until the fire damaged ESS is safely removed from the premises. The fire remediation requirements, similar to fire watch requirements, make the owner responsible for sending mitigation personnel to the scene take over the remediation process.

Section 1206.2 covers commissioning, decommissioning, maintenance and testing requirements, which are important considerations for providing a safe, code compliant installation.

Section 1206.3 covers the ESS equipment itself, and much of these requirements are unchanged from the 2018 code. New section on repairs, retrofits and replacements were added to address practices to be followed when systems need to be upgraded or serviced.

Section 1206.3.8 allows code officials to regulate installations of repurposed electric vehicle batteries that are converted for ESS use in buildings.

Section 1206.4 includes requirements that need to be met by all ESS installations, and much of these are unchanged from the 2018 requirements. The Walk-in units section, with associated definition, is new and recognizes that ISO type

shipping containers are being used to house ESS in various outdoor and mobile applications.

Section 1206.5 describes ESS protection requirements that are only applicable for certain type of installations, such as indoor dedicated use ESS installations, outdoor ESS installations in remote locations, and rooftop installations. Section 1206.5 tells you how to provide a particular type of protection, and tables in Sections 1206.7 through 1206.10 tell you when this protection is required.

1206.5.2 The size and separation protection concept (formerly “arrays”) was introduced in the 2018 code. The term array was confusing and has been replaced. A maximum ESS unit size of 50 KWh previously only applied to unlisted ESS, but now all ESS are required to be listed due to the significant fire event that can be produced by 50 KWh of some ESS technologies.

1206.5.3 MAQs amounts are essentially the same as 2018 values. Due to introductions of facilities such as dedicated use ESS (utility size) requirements, and exemptions for increases based on large scale fire testing, it is no longer necessary to reference Group H-2 occupancies.

1206.5.4 Elevation requirements are similar to those in the 2018 IFC, but now restrict below grade installations except in underground vaults or when specifically approved by the code official. This is due to concerns raised by the fire service about responding to ESS fires in below grade locations.

1206.5.5 The previous smoke detection requirements have been modified to allow radiant energy-sensing fire detection as an option.

1206.5.6 The fire suppression requirements in the 2018 code only allowed NFPA 13 systems to be provided to protect ESS, but it was difficult or impossible to determine required design density. These requirements have been updated to specify a minimum 0.3 gpm/ft.² design density, with options for lower densities based on large scale fire testing per UL 9540A. Also an option for providing alternate fire suppression systems has been added, provided they have successfully passed UL 9540A fire testing.

1206.5.7 A maximum enclosure size for walk-in units, corresponding to the largest ISO type containers used for these installations, was established to provide differentiation between a walk-in unit and an inside installation.

1206.5.9 Separation from outdoor means of egress pathways leading to a public way were in the 2018 code.

Section 1206.6 includes electrochemical ESS technology specific protection, in a new table format. Table 1206.6 identifies which technologies need technology specific protection, which may include exhaust ventilation, spill control and neutralization, explosion control, safety caps and thermal runaway.

Section 1206.6.4 (explosion control) addresses a potentially significant hazard. Lithium-ion battery systems and other electrochemical ESS technologies have the potential to rapidly build up potentially explosive atmospheres in the battery or electrochemical ESS room or enclosure under thermal runaway and other conditions which could result in a catastrophic fire and or explosion. To protect against these hazards explosion control in accordance with IFC Section 911 is required for certain battery technologies.

Section 1206.7 covers indoor locations, and identifies two types of indoor installations, dedicated use installations (typical of utility grid related facilities) and non-dedicated use installations (typical of ESS in mixed use buildings or incidental use areas of occupancies). Protection for each installation is commensurate with the related risk and exposures.

Similarly Section 1206.8 covers two types of outdoor installations, remote outdoor installations (more than 100 feet from exposures, and installations near exposures (<100 ft.) more typical of an urban environment.

Section 1206.9 covers two special installations, rooftop ESS and open parking garage ESS.

Section 1206.10 covers two types of mobile ESS installations/operations, charging and storage of the mobile ESS at its home facility when it is not deployed to an event or facility, and deployment of the mobile ESS for temporary energy storage applications, such as providing power at an electric vehicle event. Mobile ESS charging and storage locations are treated the same as a stationary indoor or outdoor installation in accordance with Section 1206.7 or 1206.8, but can include temporary electrical and fire suppression system connections. This provides an acceptable level of protection based on the exposures at the facility, and prevents parties from using an ESS on wheels as a permanent ESS with less than effective protection.

Section 1206.10 also includes requirements for deploying mobile ESS to a facility or event for providing up to 30 days of temporary power (with some exceptions). An operational permit is required for each mobile ESS deployment.

The proposal also eliminated references to providing ESS in incidental use areas. Modern load leveling and peak shaving ESS applications make the 10% floor area limitations of incidental use areas impractical for anticipated installations. However the additional protection in this section, including equivalent Section 1206.7.5 fire-resistance rated separations, should effectively mitigate hazards with providing ESS on floor areas greater than 10% of the total floor area.

To summarize this proposal, developed by a large industry and code official work group, more effectively protects ESS installations based on knowledge gained since last code cycle. It provides protection customized for the types of installations that are being deployed today, instead of using the “one size fits all” type of protection in the 2018 code.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Some of the requirements in this proposal have the potential to increase the cost of providing ESS installations. However some of the provisions in this proposal better address risks and owner/user needs in dedicated use (utility) buildings and outdoor remote installations, and will probably decrease the cost of those installations as compared to installations installed using the 2018 IFC requirements.

Analysis: A review of the standards proposed for inclusion in the code, UL 1974 -17, UL 9540A-17 and NFPA 76-16 , with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 253

F204-18

IFC: 1206.2.1, 1206.2.1.1 (New), 80

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

1206.2.1 Permits. ~~Permits shall be obtained for the installation and operation of stationary storage battery systems in accordance with Section 105.7.2.ESS as follows:~~

1. Construction permits shall be obtained for stationary ESS installations and for mobile ESS charging and storage installations. Permits shall be obtained in accordance with Sections 105.7.7.
2. Operational permits shall be obtained for all stationary and mobile ESS installations and operations. Permits shall be obtained in accordance with Sections 105.6.14.

Add new text as follows:

1206.2.1.1 Communication utilities. Operational permits shall not be required for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC.

Add new standard(s) follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

76-16:

Standard for the Fire Protection of Telecommunications Facilities

Reason:

Energy storage systems have a significant amount of ongoing maintenance, testing and servicing that requires supervision by the fire code official to ensure the system operates safely and doesn't present a hazard to occupants and emergency responders. This proposal is intended to supplement the significant FCAC rewrite of Section 1206. If both proposals are accepted the intent is that the wording in this proposal will replace Section 1206.1.2 of the other proposal and add a new section 1206.1.2.1.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

However it has the potential to increase local permit fees.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 76 -16 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 264

F205-18

IFC: 1206.2.1

Proponent: Richard Kluge, representing Alliance for Telecommunications Industry Solutions
(richard.kluge@ericsson.com)

2018 International Fire Code

Revise as follows:

1206.2.1 Permits. Permits shall be obtained for the installation ~~and operation~~ of stationary storage battery systems in accordance with Section 105.7.2.

Reason:

The reference to a permit for the operation of a stationary storage battery system should be removed as such permits are not required by Section 105.7.2. Only construction permits are required for a stationary storage battery system per Section 105.7.2.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The change is a clarification of the required permit type and will not change code implementation or cost of construction.

Internal ID: 1875

F206-18

IFC: 1206.2.3.2, 1206.2.8.3, 1206.2.11.1, Chapter 80

Proponent: Charles Foster, self, representing Energy Storage Association (chuck@crfenergy.com)

2018 International Fire Code

Revise as follows:

1206.2.3.2 Analysis approval. The *fire code official* is authorized to approve the hazardous mitigation analysis provided that the hazard mitigation analysis demonstrates all of the following:

1. Fires or explosions will be contained within unoccupied battery storage rooms for the minimum duration of the fire-resistance-rated walls identified in Table 509.1 of the International Building Code.
2. Fires ~~and explosions~~ in battery cabinets in occupied work centers will be detected in time to allow occupants within the room to evacuate safely.
3. Toxic and highly toxic gases released during fires and other fault conditions shall not reach concentrations in excess of Immediately Dangerous to Life or Health (IDLH) levels in the building or adjacent means of egress routes during the time deemed necessary to evacuate from that area.
4. Flammable gases released from batteries during charging, discharging and normal operation shall not exceed 25 percent of their lower flammability limit (LFL).
5. Flammable gases released from batteries during fire, overcharging and other abnormal conditions shall not create an explosion hazard that will injure occupants or emergency responders.

1206.2.8.3 Stationary battery arrays. Storage batteries, prepackaged stationary storage battery systems and preengineered stationary storage battery systems shall be segregated into stationary battery arrays not exceeding 50 kWh (180 megajoules) each. Each stationary battery array shall be spaced not less than 3 feet (914 mm) from other stationary battery arrays and from walls in the storage room or area. The storage arrangements shall comply with Chapter 10.

Exceptions:

1. Lead acid and nickel cadmium storage battery arrays.
2. Listed preengineered stationary storage battery systems and prepackaged stationary storage battery systems shall not exceed 250 kWh (900 megajoules) each.
3. ~~The fire code official is authorized to approve listed, preengineered and prepackaged battery arrays with larger capacities larger maximum battery capacities and/or smaller battery array spacing if based on the results of large scale fire testing performed in accordance with UL 9540A, and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving one array will not propagate to an adjacent array, and be contained within the room for a duration equal to the fire resistance rating of the room separation specified in Table 509 of the International Building Code.~~

1206.2.11.1 Fire-extinguishing systems. Rooms containing stationary storage battery systems shall be equipped with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1. Commodity classifications for specific technologies of storage batteries shall be in accordance with Chapter 5 of NFPA 13. If the storage battery types are not addressed in Chapter 5 of NFPA 13, the *fire code official* is authorized to approve the fire-extinguishing system based on full-scale fire and fault condition testing conducted or witnessed and reported by an *approved* laboratory.

Exception:

1. Spaces or areas containing stationary storage battery systems used exclusively for telecommunications equipment in accordance with Section 903.2.
2. Unoccupied, non-combustible containers located outdoors, meeting the clearances found in Section 1206.2.8.7.1, and housing only ESS equipment.

UL

9540A-17:

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

UL Standard for Safety Test Method for Evaluating Thermal Runaway Fire Propagation in Battery Energy Storage Systems

Reason:

This proposal addresses 3 sections as described below.

1. It removes the words "and explosion" in section 1206.2.3.2(2). This provision deals with early detection to allow for evacuation and seems impossible for an explosion.
2. It restates the existing exception found in section 1206.2.8.3(3) to specifically identify the reference to UL 9540A.
3. It adds to the exception found at 1206.2.11.1 to include non-combustible containers located outdoors and meeting the clearances found at housing only ESS equipment. Since the non-combustible ESS container is unoccupied, outdoors, and away from combustibles, sprinkling would not have a significant impact on life safety or minimizing property damage.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal removes the requirement to sprinkle unoccupied, non-combustible buildings located outside away combustibles and reduces the cost of construction.

Internal ID: 2090

F207-18

IFC: 1206.2.10.4

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Fire Code

Revise as follows:

1206.2.10.4 Battery chargers. Battery chargers shall be compatible with the battery chemistry and the manufacturer's electrical ratings and charging specifications. Battery chargers shall be listed and labeled in accordance with UL ~~1564~~1741 or provided as part of a listed preengineered or prepackaged stationary storage battery system.

Reason:

UL 1741 is the correct standard to be used in listing battery chargers. The scope of UL 1741 includes inverters, converters, charge controllers, and interconnection system equipment (ISE) intended for use in stand-alone (not grid-connected) or utility-interactive (grid-connected) power systems.

UL 1564 covers battery chargers intended for use with industrial storage batteries, which provide power for material-handling trucks, tractors, personnel carriers, and similar motive equipment.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Manufacturers already have their battery chargers used with energy storage systems properly listed for this use in accordance with UL 1741.

Internal ID: 230

F208-18

IFC: 1206.2.11.2

Proponent: Richard Kluge, Ericsson Inc., representing Alliance for Telecommunications Industry Solutions (richard.kluge@ericsson.com)

2018 International Fire Code

Revise as follows:

1206.2.11.2 Smoke detection system. An *approved automatic smoke detection system* shall be installed in rooms containing *stationary storage battery systems* in accordance with Section 907.2.

Exception: Normally unoccupied, stand-alone telecommunications structures with a gross floor area of less than 1500 ft² (140 m²) shall not be required to have an *approved automatic smoke detection system*.

Reason:

There is little value to installing a fire or smoke detection system in a small normally unoccupied, stand-alone telecommunications structure. These facilities are categorized as Use Group U facilities under the IBC. There is no intent that these structures be occupied except for servicing and maintaining the equipment they house. The recommended text is consistent with NFPA 1 chapter 52 on Energy Storage Systems as well as pending changes to NFPA 76 on Telecommunications facilities.

Cost Impact

The code change proposal will decrease the cost of construction .

Not requiring detection in these sites will decrease the cost of code compliance in initial construction, as well as ongoing operations, testing, maintenance.

Internal ID: 1946

F209-18

IFC: 1206.2.11.5

Proponent: Jeffrey Betz, AT&T Corporation, representing AT&T Corporation (jbetz@att.com)

2018 International Fire Code

Revise as follows:

1206.2.11.5 Spill control and neutralization. Where required by Section 1206.2.12, approved methods and materials shall be provided for the control and neutralization of spills of electrolyte or other hazardous materials in areas containing stationary storage batteries as follows:

1. For batteries with free-flowing electrolyte, ~~the a~~ method and materials shall be capable of ~~neutralizing of~~:
 - 1.1. Providing spill control to prevent the flow of electrolyte to adjoining areas when rooms or areas are used for the storage of free-flowing electrolyte in individual vessels having a capacity of more than 55 gallons (208 L), or in which the aggregate capacity of multiple vessels exceeds 1,000 gallons (3785 L)
 - 1.2. Neutralizing a spill of the total capacity from the largest individual cell or block to a pH between 5.0 and 9.0.
2. For batteries with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.

Reason:

This proposal incorporates and clarifies the code industry's basic quantity requirements for spill control. It further provides the specific requirements of this chapter (12 formerly Section 608) related to vessel and aggregate thresholds currently addressed in the 2015 IFC Section 608 Commentary (2018 IFC 1206.2.11.5 Spill containment and neutralization) and 2015 IFC Code and Commentary Chapter 50 Hazardous Materials Section 5004.2.1 Spill control for hazardous materials liquids. 2015 IFC Commentary - Section 608.5 Batteries that contain a free-flowing liquid electrolyte pose the same containment problems as any other corrosive liquid hazardous material, but the containment and neutralization provisions in this section are performance based and neither specifically require spill control in the form of containment nor a specific method of neutralization. The quantity of neutralization material required to be available would be greater for these less-viscous electrolytes, however, because of their mobility and the rapidity with which they can spread and the potential scope of the spread. See the commentary to Section 5004.2.1 for further discussion of spill control strategies. The exception recognizes the reduced spill control hazard of sealed batteries that contain a higher-viscosity electrolyte. 2015 IFC Commentary - Chapter 50 Hazardous Materials 5004.2.1 Spill control for hazardous material liquids The requirement for spill control in a room or area is based on two items. The first is that the storage container(s) have a capacity of more than 55 gallons (208 L). The second is that the aggregate capacity of multiple vessels be more than 1,000 gallons (3785 L). The area, once determined to require spill control, must be protected so that the containment area will handle the release from the largest container in the area.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No additional cost impact, as this clarifies intent of current code.

Internal ID: 2241

F210-18

IFC: 1206.1.1(New),1206.6.4 (New), Chapter 80

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Tesla, USA
(rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Add new text as follows:

1206.4 Exterior wall installations. ESS shall be permitted to be installed outdoors on exterior walls of buildings when all of the following conditions are met:

1. The maximum energy capacity of individual ESS units shall not exceed 20 KWh.
2. The ESS shall comply with applicable requirements in Sections 1206.
3. The ESS shall be installed in accordance with the manufacturer's instructions and their listing.
4. Individual ESS units shall be separated from each other by at least three feet (914 mm).
5. The ESS shall be separated from doors, windows, operable openings into buildings, or HVAC inlets by at least five feet (1524 mm).

Exception: Where approved smaller separation distances in items 4 and 5 shall be permitted based on large scale fire testing complying with Section 1206.1.1.

1206.1.1 Large scale test. Where required elsewhere in Section 1206, large scale fire testing shall be conducted on a representative ESS in accordance with UL 9540A. The testing shall be conducted or witnessed and reported by an approved testing laboratory and show that a fire involving one ESS will not propagate to an adjacent ESS, and where installed within buildings, enclosed areas and walk-in units will be contained within the room, enclosed area or walk-in unit for a duration equal to the fire resistance rating of the room separation specified in Section 1206.2.8.2. The test report shall be provided to the fire code official for review and approval in accordance with Section 104.7.2.

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

9540A-17:

Standard for Safety Test Method for Evaluating Thermal Runaway Fire Propagation in Battery Energy Storage Systems

Reason:

This proposal is intended to complement the comprehensive FCAC rewrite of Section 1206, and fit in with the proposed numbering system. However since it is a separate proposal it has been written to fit with the numbering in current Section 1206. It is the intent that if the proposal which rewrites Section 1206 should pass this section should be numbered 1206.8.5. Also new section 1206.1.1 is to be consistent with Section 1206.1.5 proposed in the rewrite of Section 1206.

The new section provides requirements for wall mounted ESS that are being sold and installed on an increasing basis for those users not requiring the larger systems. Without this proposal the code will not allow installation of small ESS Units on the outside walls of buildings.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal actually provides a cost effective alternative for providing ESS in facilities with limited indoor and outdoor areas for installation and lower energy needs in comparison to current code provisions.

Analysis: A review of the standard proposed for inclusion in the code, UL 9540A-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 1532

2018 International Fire Code

CHAPTER 12 ENERGY SYSTEMS

SECTION 1206 ELECTRICAL ENERGY STORAGE SYSTEMS

Revise as follows:

1206.1 Scope. The provisions in this section are applicable to energy storage systems designed to provide electrical power to a building or facility. These systems are used to provide standby or emergency power, an uninterruptable power supply, load shedding, load sharing or similar capabilities.

Exception: ESS in Group R-3 and R-4 occupancies shall comply with Section 1206.11.

1206.1.1 Large scale test. Where required elsewhere in Section 1206, large scale fire testing shall be conducted on a representative ESS in accordance with UL 9540A. The testing shall be conducted or witnessed and reported by an approved testing laboratory and show that a fire involving one ESS will not propagate to an adjacent ESS, and where installed within buildings, enclosed areas and walk-in units will be contained within the room, enclosed area or walk-in unit for a duration equal to the fire resistance rating of the room separation specified in Section 1206.2.8.2. The test report shall be provided to the fire code official for review and approval in accordance with Section 104.7.2

Add new text as follows:

1206.4 Group R-3 and R-4 occupancies ESS. ESS installed for Group R-3 or Group R-4 occupancies shall comply with the provisions of sections 1206.4.1 through 1206.4.9.

Exception: The use of an electric powered vehicle to power the dwelling while parked shall comply with Section 1206.4.10.

1206.4.1 Equipment listings. ESS shall be listed and labeled for residential use in accordance with UL 9540.

Exceptions:

1. Where approved, repurposed unlisted battery systems from electric vehicles are allowed to be installed outdoors or in detached dedicated cabinets located not less than 5 feet (1524 mm) from exterior walls, property lines and public ways.
2. ESS less than 1 kWh (3.6 megajoules).

1206.4.2 Installation. ESS shall be installed in accordance with the manufacturer's instructions and their listing.

1206.4.2.1 Spacing. Individual units shall be separated from each other by at least three feet of spacing unless smaller separation distances are documented to be adequate based on large scale fire testing complying with Section 1206.1.1.

1206.4.3 Location. ESS shall only be installed in the following locations:

1. Detached garages and detached accessory structures.
2. Attached garages separated from the dwelling unit living space and sleeping units in accordance with Section 406.3.2 of the International Building Code.
3. Outdoors on exterior walls located a minimum 3 ft. from doors and windows.
4. Utility closets and storage or utility spaces within dwelling units and sleeping units.

1206.4.4 Energy ratings. Individual ESS units shall have a maximum rating of 20 KWh. The aggregate rating structure shall not exceed:

1. 40 KWh within utility closets and storage or utility spaces.
2. 80 KWh in attached or detached garages and detached accessory structures.
3. 80 kWh on exterior walls.
4. 80 kWh outdoors on the ground.

1206.4.5 Electrical installation. ESS shall be installed in accordance with NFPA 70. Inverters shall be listed and labeled in accordance with UL 1741 or provided as part of the UL 9540 listing. Systems connected to the utility grid shall use inverters listed for utility interaction.

1206.4.6 Fire detection. Rooms and areas within dwellings units, sleeping units and attached garages in which ESS are installed shall be protected by smoke alarms in accordance with Section 907.2.10. A heat detector listed and interconnected to the smoke alarms shall be installed in locations within dwelling units, sleeping units and attached garages where smoke alarms cannot be installed based on their listing.

1206.4.7 Protection from impact. Stationary storage battery systems installed in a location subject to vehicle damage shall be protected by approved barriers. Appliances in garages shall also be installed in accordance with Section 304.3 of the International Mechanical Code.

1206.4.8 Ventilation. Indoor installations of ESS that include batteries that produce hydrogen or other flammable gases during charging shall be provided with ventilation in accordance with Section 1206.2.11.3.

1206.4.9 Toxic and highly toxic gas. ESS that have the potential to release toxic or highly toxic gas during charging, discharging and normal use conditions shall not be installed within Group R-3 or R-4 occupancies.

1206.4.10 Electric vehicle use. The use of owner or occupant's electric powered vehicle to power a dwelling unit or sleeping unit while parked in an attached or detached garage or outside shall comply with the vehicle manufacturer's instructions and NFPA 70.

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

[IRC] LIVING SPACE.

Space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes.

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

9540A-17:

Standard for Safety Test Method for Evaluating Thermal Runaway Fire Propagation in Battery Energy Storage Systems

Reason:

This proposal includes requirements ESS installations in Group R-3 and R-4 occupancies. Currently the commercial level of requirements found in the IFC would be applicable. The intent is to provide a level of protection that is equivalent to ESS requirements in the 2018 IRC. However, additional detail is being provided to enhance safety.

Generally the proposal is based upon the 2018 numbering but if the ESS rewrite should also pass the intent is that this section be numbered 1206.11. Note that the intent of the reference in Section 1206.11.1.2 to new section 1206.1.1 is to be consistent with Section 1206.1.5. in the ESS rewrite proposal.

A definition for dwelling unit living space from the IRC is being duplicated in this Code.

An exception is being provided to the scope of Section 1206 to clarify that R-3 and R-4 ESS are only required to comply with Section 1206.11, and not the other sections of 1206.

Section 1206.4.3 - This section provides the locations where ESS can be installed.

Section 1206.4.4 - The 2018 IRC allowed ESS to be installed in closets, storage and utility rooms in dwelling units with no additional protection. This proposal allows ESS to be installed in those rooms and areas, but requires them to comply with the same fire-resistance rated separation as required between an attached garage and the dwelling unit in IRC Section R302.6.

Section 1206.4.5 provides limits on the maximum energy provided for a single ESS unit, and the aggregate. Units up to 20 kWh are commercially available and limiting the installation to an aggregate 40 kWh limits the potential heat release rate to an acceptable level within the dwelling unit. Allowing 80 kWh in attached garages, detached structures and outdoors allows additional ESS to be provided to help meet the energy needs of the residence. The increased aggregate amount recognizes that electric vehicles with 85 kWh to 10 kWh are already parked in attached garages and adjacent to dwellings.

ESS installations in excess of 80 kWh are required to comply with all applicable IFC requirements. It also prevents parties from installing a commercial/grid type ESS installations on residential property without meeting applicable safety requirements.

Section 1206.4.6 requires smoke detection to be provided in rooms or garages in which ESS are located, in order to provide early warning in case of an incident involving the ESS. Since smoke alarms are not listed for use in garages or unconditioned spaces, an interconnected heat alarm can be used to provide the early warning.

Note that the intent of the reference in Section 1206.4.1.2 to a new section 1206.1.1 is to be consistent with Section 1206.1.5. in the ESS rewrite proposal. The language is the same and should be correlated if both proposals should pass.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

When applying IFC requirements to Group R-3 and R-4 installations, this proposal will decrease the cost of construction since it exempts many of the requirements in Section 1206.1 through 1206.9.

Internal ID: 308

F212-18

IFC: Chapter 22, 202 (New)

Proponent: Ellie Klausbruckner, representing Klausbruckner & Associates, Inc. (ek@klausbruckner.com); Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

CHAPTER 22 COMBUSTIBLE DUST-PRODUCING OPERATIONS

SECTION 2201 GENERAL

Delete without substitution:

~~**2201.1 Scope.** The equipment, processes and operations involving dust explosion hazards shall comply with the provisions of this code and NFPA 652.~~

~~**2201.2 Permits.** Permits shall be required for *combustible dust* producing operations as set forth in Section 105.6.~~

SECTION 2202 DEFINITION

~~**2202.1 Definition.** The following term is defined in Chapter 2:~~

~~**COMBUSTIBLE DUST.**~~

SECTION 2203 PRECAUTIONS

~~**2203.1 Owner responsibility.** The owner or operator of a facility with operations that manufacture, process, blend, convey, repackage, generate or handle potentially combustible dust or combustible particulate solids shall be responsible for compliance with the provisions of this code and NFPA 652.652.~~

~~**2203.2 Dust hazard analysis (DHA).** The requirements of NFPA 652 apply to all new and existing facilities and operations with combustible dust hazard. Existing facilities shall have a dust hazard analysis (DHA) completed in accordance with Section 7.1.2 of NFPA 652.652.
The fire code official shall be authorized to order a dust hazard analysis to occur sooner if a combustible dust hazard has been identified in a facility that has not previously performed an analysis.~~

~~**2203.3 Sources of ignition.** Smoking, the use of heating or other devices employing an open flame, or the use of spark-producing equipment is prohibited in areas where *combustible dust* is generated, stored, manufactured, processed or handled.~~

~~**2203.4 Housekeeping.** Accumulation of *combustible dust* shall be kept to a minimum in the interior of buildings. Accumulated *combustible dust* shall be collected by vacuum cleaning or other means that will not place *combustible dust* into suspension in air. Forced air or similar methods shall not be used to remove dust from surfaces.~~

SECTION 2204 ADDITIONAL REQUIREMENTS

~~**2204.1 Specific hazards standards.** The industry or commodity specific codes and standards listed in Table 2204.1 shall be complied with based on the identification and evaluation of the specific fire and deflagration hazards that exist at a facility.~~

**TABLE 2204.1
SPECIFIC HAZARDS STANDARDS**

STANDARD	SUBJECT
NFPA 61	Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities
NFPA 69	Standard on Explosion Prevention Systems
NFPA 70	National Electrical Code
NFPA 85	Boiler and Combustion System Hazards Code
NFPA 120	Standard for Fire Prevention and Control in Coal Mines
NFPA 484	Standard for Combustible Metals
NFPA 654	Standard for Prevention of Fire and Dust Explosions from the Manufacturing, Processing and Handling of Combustible Particulate Solids
NFPA 655	Standard for the Prevention of Sulfur Fires and Explosions
NFPA 664	Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities

Add new text as follows:

2201.1 Scope. The equipment, processes and operations involving dust explosion hazards and use or handling of combustible dust shall comply with the provisions of this chapter

Exceptions:

1. In an unsprinklered building, dust production or use, including use-open and use-closed systems, where the quantity does not exceed 5 pounds (2.3 kg) or 0.7 cu ft. (0.019822 m³)
2. In a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, dust production or use, including use-open and use-closed systems, where the quantity does not exceed 10 pounds (4.5 kg) or 1.4 cu ft. (0.039644 m³)

3. Storage and use of consumer materials in Group B or R occupancies.
4. Storage and use of commercially packaged materials in Group M occupancies.
5. Materials displayed in original packaging in Group M occupancies and intended as building materials or for personal or household use.
6. Storage of sealed containers of combustible dust at facilities not associated with an operation that uses, handles or generates combustible dust.
7. Materials stored or used in farm buildings or similar occupancies intended for on-premises agricultural purposes.

2201.2 Permits. Permits shall be required for combustible dust-producing operations as set forth in Section 105.6.

2202 DEFINITIONS

2202.1 Definitions. The following terms are defined in Chapter 2:

Dust Collection System

Combustible Dust

2203 DUST EXPLOSION PREVENTION

2203.1 Critical Depth Layer.

The maximum dust layer on all surfaces, including but not limited to walls, ceilings, beams, equipment, furniture, pipes and ducts, shall not exceed the Critical Depth Layer specified in Table 2203.1. The critical depth layer depth is permitted to be adjusted for explosion hazard further evaluated in accordance with one of the following:

1. Section 6.1.1.3 of NFPA 654.
2. Section 4.2.2 of NFPA 664 for wood flour.

Accumulated combustible dust shall be collected by one of the methods listed in 2203.5.

Table 2203.1
Critical Depth Layer

<u>Type of Dust</u>	<u>Critical Depth Layer (Inches)</u>
<u>Wood Flour</u>	<u>1/8</u>
<u>All Other Dusts</u>	<u>1/32</u>

For SI: 1 inch = 25.4 mm

2203.2 Dust Producing and Dust Handling Equipment. Dust producing equipment and dust handling equipment, including but not limited to vacuums, dust collection systems, dryers, mixers, blenders, separators, conveyors, storage containers, silos or other similar devices shall be listed and shall be maintained in accordance with the manufacturer's recommended standards.

2203.2.1 Signages and Markings. Signages and markings shall be provided in accordance with Section 2203.2.1.1 through 2203.2.1.3.

2203.2.1.1 Deflagration Vent Discharge Area Markings. Where dust collection systems and other equipment, systems, or systems components are provided with deflagration vents, the area within the deflagration vent's discharge area shall be marked in an approved manner.

2203.2.1.2 Caution Signs.

Signs shall be posted near the dust containing equipment with deflagration vents that reads as follows:

CAUTION: THIS EQUIPMENT CAN CONTAIN EXPLOSIVE DUST.

KEEP OUTSIDE THE MARKED AREA WHILE EQUIPMENT IS OPERATING.

2203.2.1.3 Warning Signs. Where dust collection systems and other equipment, systems, or systems components are provided with deflagration vents, vent closures shall be clearly marked as follows:

WARNING: EXPLOSION RELIEF DEVICE. STAY CLEAR.

2203.3 Dust Collection and Conveying Systems. Dust collection and conveying systems shall be in accordance with Sections 2203.3.1 through 2203.3.3.

2203.3.1 Dust Collection Systems. Dust collection systems shall be designed to collect dust emissions from dust producing equipment at the point of generation. Dust collection systems shall be in accordance with Section 511 of the International Mechanical Code.

Exception: Closed systems using listed equipment and designed in accordance with manufacturer's recommendations and specifications, where cleanouts are provided in accordance with Section 2203.3.3.

Heating, ventilation, and air conditioning (HVAC) systems shall not be used as the means to collect dusts from localized sources.

2203.3.1.1 Location. Dust collectors shall be located outside of buildings.

Exceptions:

1. Dust collectors inside of buildings complying with Section 511 of the International Mechanical Code.
2. Wet-type dust collectors when specifically listed for the type of dust conveyed shall be permitted inside of buildings where in accordance with the manufacturer's instructions and specifications.
3. Dust collectors designed to specific NFPA standards listed in Table 2204.1 for the specific type of dust conveyed.

2203.3.1.2 Minimum Conveying Velocities. The minimum velocities within ducts used as part of the dust collection system shall be in accordance with Table 2203.3.1.2.

Table 2203.3.1.2
Minimum Conveying Velocities

Type of Product	Feet Per Minute
Fine light dust, such as cotton, lint, and wood flour (100 mesh and under)	2000 (10 m/s)
Dry dust such as fine rubber molding powder	2500 (13 m/s)
Average dust such as sawdust, grinding dust, coal dust	3500 (18 m/s)
Heavy dust such as metal turnings, including aluminum and magnesium powder	4000 (20 m/s)

2203.3.2 Plastic Ducts and Conveying Systems. Plastic, fiberglass, other nonconductive ducts, duct liners or pipes shall not be used as part of ducts and conveying systems. Ductwork utilizing a combustible lining shall be permitted only in high impact areas and where approved. Flexible hose shall be permitted if designed and installed in accordance with the following requirements:

1. Manufactured of static dissipative construction.
2. Used only for connections and isolation purposes.
3. Limited to 18 inches (457 mm) in length.
4. Properly grounded.

2203.3.3 Cleanouts. Openings shall be provided in enclosed equipment and conveyors to allow access to all parts of the equipment and conveyors to permit inspection, cleaning, maintenance, and the effective use of portable extinguishers or hose streams. Cleanouts for ducts used as part of the dust collection system shall be in accordance with the International Mechanical Code.

2203.4 Sources of Ignition. Sources of Ignition shall be controlled in accordance with Sections 2203.4.1 through 2203.4.9.5.

2203.4.1 Classified Electrical. Classified electrical shall be in accordance with NFPA 70. Electrical motors and electrical components of the equipment shall not be installed in the dust laden air stream unless listed for Class II, Division 1 locations.

2203.4.2 Static Electricity. Bonding and grounding is required to minimize accumulation of static electric charge in the following locations:

1. Dust producing equipment
2. Dust collection system.
3. Pneumatic dust conveying systems conveying combustible dust from one location to another, combustible dust conveyors, piping and conductive components. Conveying systems include transport modes such as railcars, hopper cars, boxcars, tank cars and trucks into which or from which commodities or products are pneumatically conveyed.

4. Conveying systems using metallic piping.

2203.4.3 Hot Works. Hot work and similar spark producing operations shall not be conducted in or adjacent to combustible dust producing areas unless precautions have been taken to provide safety. Hot work shall be permitted only in safe, designated areas in accordance with Chapter 35. Hot work is prohibited on equipment that is operating.

2203.4.3.1 Signs. Conspicuous signs with the following warning shall be posted in the vicinity of combustible dust producing areas or in the vicinity of combustible dust use:

NO WELDING. THE USE OF WELDING OR CUTTING EQUIPMENT IN OR NEAR THIS AREA IS DANGEROUS BECAUSE OF FIRE AND EXPLOSION HAZARDS. WELDING AND CUTTING SHALL BE DONE ONLY UNDER THE SUPERVISION OF THE PERSON IN CHARGE.

2203.4.4 Hot Surfaces and Hot Equipment. In areas where a dust explosion hazard or dust flash fire hazard exists, the temperature of external surfaces, shall be maintained below 80 percent (in degrees Celsius) of the lower of the dust surface ignition temperature or the dust-cloud ignition temperature for worst-case dusts. External surfaces shall include but not limited to:

1. Compressors.
2. Steam, water or process piping.
3. Ducts.
4. Conveyors.
5. Process equipment.

Where steam pipes or hot surfaces occur in dust producing or dust handling areas, accumulation of dust on the surfaces shall be minimized by an approved method.

Exception: Drying apparatus listed for the intended use and installed in accordance with the manufacturer's instructions.

2203.4.5 Powered Industrial Trucks. Powered industrial trucks used in electrically classified areas shall be listed for such use.

2203.4.6 Smoking Prohibited. Smoking shall be prohibited in or adjacent to dust producing or dust handling areas. "No Smoking" signs complying with Section 310 shall be conspicuously posted in such areas. Smoking shall be permitted only in designated areas.

2203.4.7 Spark Producing Devices. Spark-producing devices shall not be located within 20 feet (6096 mm) of areas requiring classified electrical unless separated by a permanent partition.

2203.4.8 Self-heating materials. Materials in silos and other large storage piles of particulates prone to self-heating shall be in accordance with Section 8.5.11 of NFPA 652.

2203.4.9 Open Flames and Fuel Fired Equipment. Open flames and fuel fired equipment shall be in accordance with Section 2203.4.9.1 through 2203.4.9.5.

2203.4.9.1 Release or Airborne Combustible Dust. Production, maintenance or repair activities that have the potential to release or force combustible dust to become airborne shall not be conducted within 35 feet (11 m) of an open flame or pilot flame.

2203.4.9.2 Space Heaters. Fuel-fired space heaters drawing local ambient air shall not be located within electrically classified areas. Space heating appliances in dust producing or dust handling areas shall be located where not subject to accumulation of deposits of combustible dust.

2203.4.9.3 Equipment Listing. Fuel-fired process equipment shall be listed for its intended use and shall be operated and maintained in accordance with the manufacturer's instructions.

2203.4.9.4 Inspection and Preventative Maintenance. Inspection and maintenance of fuel-fired process equipment shall include verification that significant combustible dust accumulations do not exist within or around the equipment.

2203.4.9.5 Sources of Combustion Air. In Class II electrically classified locations, heating units shall be provided with a source of combustion air ducted directly from the building exterior or from an unclassified location.

2203.5 Housekeeping. Accumulation of combustible dust on surfaces inside buildings shall be maintained below the critical depth layer in Section 2203.1. Pressurized air or similar methods shall not be used to remove dust from surfaces. Accumulated combustible dust shall be collected by one of the following methods:

1. Portable vacuum cleaners listed for use in Class II, Group G, Division 1 atmospheres as defined in NFPA 70.
2. Dust collection systems.
3. Other approved means that will not place combustible dust into suspension in air.

2203.6 Standard Operational Procedures. Dust producing equipment and all associated equipment including dust collection equipment shall be maintained in accordance with the manufacturer's instructions and specifications and applicable codes. The inspection, testing and maintenance program shall include the following, as applicable:

1. Fire and explosion protection and prevention equipment, as applicable, in accordance with the applicable NFPA standards.
2. Dust control equipment.
3. Control of potential ignition sources.
4. Electrical, process and mechanical equipment, including applicable process interlocks.
5. Lubrication of bearings for dust collection, dust handling and dust producing equipment.
6. Additional maintenance in accordance with the manufacturer's instructions and specifications for dust collection, dust handling and dust producing equipment.

Records shall be kept of maintenance and repairs performed. The standard operating procedures shall be submitted to the fire code official for review and approval. The written standard operating procedures shall be signed by the person responsible for facility operations.

2203.7 Emergency Response Plan. A written emergency response plan shall be developed for preventing, preparing for and responding to work-related emergencies including but not limited to fire and explosion. The following information shall be developed into the plan:

1. Identification of dust hazards.
2. Identification and location of all utilities to affected areas.
3. Site plans or floor plans locating utility shut-off controls including water, gas and power.
4. Identify the potential for explosion.
5. Identify the location of fire extinguishing equipment compatible with the hazards present.
6. Any additional information required by the fire code official.

2203.8 Training. The plans and procedures required in Sections 2203.5, 2203.6 and 2203.7 shall be approved by the fire code official, The plans and procedures shall be reviewed annually and updated as required by process changes. Initial and annual refresher training shall be provided to employees who are involved in operating, maintaining and supervising facilities that handle combustible dust. Initial and annual refresher training shall include:

1. Workplace hazards.
2. General orientation, plant diagrams and plant safety rules.
3. Process description or flowchart.
4. Equipment operation, safe startup and shutdown, and response to hazard conditions or an incident.
5. The location and use of all related fire and explosion protection and prevention systems.
6. Equipment maintenance requirements and practices, including visual inspections of conveyors and ducts.
7. Housekeeping requirements, including the maintenance of the critical depth layer in Section 2203.1.
8. Emergency response plans as required in Section 2203.7.

The employer shall maintain records of initial and annually training and review.

2204 DUST EXPLOSION SCREENING TESTS

2204.1 Combustibility and Explosivity Tests. Where combustibility or explosivity screening tests are required to analyze the combustible dust as part of compliance with Section 414.1.3 of the International Building Code and Section 104.7 of the this code, it shall be in accordance with Section 5.4 of NFPA 652.

2204.2 Samples. Representative samples for the screening test shall be obtained in accordance with Section 5.5 of NFPA 652.

2205 STANDARDS

2205.1 Specific Hazards Standards. The fire code official is authorized to enforce additional industry or material specific provisions of the codes and standards listed in Table 2205.1 as applicable to prevent and control dust explosions.

**Table 2205.1
Explosion Protection Standards**

<u>Standard</u>	<u>Subject</u>
<u>NFPA 61</u>	<u>Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities</u>
<u>NFPA 69</u>	<u>Standard on Explosion Prevention Systems</u>
<u>NFPA 70</u>	<u>National Electrical Code</u>
<u>NFPA 77</u>	<u>Recommended Practice on Static Electricity</u>
<u>NFPA 85</u>	<u>Boiler and Combustion System Hazards Code</u>
<u>NFPA 120</u>	<u>Standard for Fire Prevention and Control in Coal Mines</u>
<u>NFPA 484</u>	<u>Standard for Combustible Metals</u>
<u>NFPA 652</u>	<u>Standard on the Fundamentals of Combustible Dust</u>
<u>NFPA 654</u>	<u>Standard for Prevention of Fire and Dust Explosions from the Manufacturing, Processing and Handling of Combustible Particulate Solids</u>
<u>NFPA 655</u>	<u>Standard for the Prevention of Sulfur Fires and Explosions</u>
<u>NFPA 664</u>	<u>Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities</u>

2205.1.1 Dust Hazard Analysis. If a dust hazard analysis (DHA) is required by the fire code official to new or existing facilities and operations, it shall be in accordance with NFPA 652. The DHA for existing facilities shall be in accordance with Section 7.1.2 of NFPA 652.

DUST COLLECTION SYSTEM. A combination of equipment designed to contain, capture and collect airborne combustible dusts.

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

13—16:

Standard for the Installation of Sprinkler Systems

13D—16:

Standard for the Installation of Sprinkler Systems in One- and Two-family Dwellings and Manufactured Homes

70—17:

National Electrical Code

72—16:

National Fire Alarm and Signaling Code

77-14:

Recommended Practice on Static Electricity

Reason:

Combustible dust continues to be an issue of concern with AHJs. While references to NFPA for unique dust hazards can be useful, the entire protection cannot just evolve around ten different NFPA Standards. It is simply impractical to apply standards and only standards without any additional guidance for code users, especially fire inspectors in their daily work. One of the premises in the IFC development has been that the code should contain information for use in the field, while items for plan review can be referenced to other standards since plan review is normally conducted in the office where the information in the standards is accessible. In the field, the inspector needs information to apply to situation in front of him or her.

Similar concerns arise from application of Flammable Finishes that involve spraying and/or dipping operations using flammable liquids. Except for unique applications, it has not been necessary to analyze the size of the flammable liquids droplets/vapors, flammability of materials, etc. Providing appropriate hazard mitigations, including sources of ignition, exhaust, etc. Chapter 24 addresses concerns for a wide range of flammable liquids without the need for inspectors to delve into 10 different standards. This proposed new chapter 22 takes a similar approach. This code

change does not deter from the current Chapter, in that those standards are still imbedded in this new proposed chapter, as appropriate. But the code change provides additional guidelines on how to mitigate dust accumulation and sources of ignition. It also provides guidelines on housekeeping, employee training, operational procedures.

If fire plan reviewer or inspector has additional concerns, it still leaves the door open to requiring additional NFPA Standards and Dust Hazard Analysis. That option is still available with this proposed revision under Section 2205.

Section 2201.1: Exception 1 allows 5 lbs. to address small laboratory type use. Additionally combustible dust has a fire hazard rating of 2 and in some rare cases 3. When comparing to MAQs of other materials with fire hazard rating of 2 typical basic MAQs for these materials are 25 lbs and other materials with fire hazard rating of 3 have typical basic MAQs of 10 lbs. Doubling for a sprinklered building, in Exception 2, also puts things in line with other hazardous materials allowances. The remaining exceptions are listed based on similar exceptions in standards due to lack of major incidences in commonly encountered storage and uses.

Section 2203.1: Collection of accumulated dust is the single most critical method of dust explosion prevention. It is one of the simpler methods of evaluating and addressing prevention. The critical depth layer in Table 2203.1 provides a very general approach for fire inspectors, while Section 2203.1 allows for more complicated analysis by adjusting the critical layer depth and/or determining explosion hazard found in NFPA 654 & 664.

Section 2203.2: It is difficult for an inspector to determine if the equipment is inherently safe and/or the associated electrical has been designed properly unless the equipment is listed. This section also requires maintenance in accordance with manufacturer's instructions. Subsections on markings and signs are provided to avoid injury to personnel if vent panels are dislodged or in the event of an incident.

Section 2203.3.1: Dust collection systems need to draw at the point of generation for maximum efficiency. The exception is included since closed system use of combustible dust where dust is not open to the environment of the room does not need a dust collector. References to mechanical code is provided for location of dust collection system.

Section 2203.3.1.1: The general requirement is to located the dust collector outside of buildings. Exceptions are added to address 1) IMC allowances, 2) wet-type dust collectors which when designed and installed per manufacturer's cut sheets do not pose an explosion hazard since the dust is wetted and therefore is inherently safer inside the building, and 3) references to the different NFPA standards for specific dusts when the dust and the dust collection is detailed and specific to a particular NFPA standard for mitigation of dust explosion.

Section 2203.3.1.2: Source is from California Mechanical Code Table 505.2. These velocities have been used for decades and provide a minimum velocity to move the various particles. Particles of different types and weights require different velocities to properly move the particles.

Section 2203.3.2: Grounding and bonding is required for ducts and conveyors. Added precautions are used for types of ducts and piping that will be difficult to dissipate static electricity.

Section 2203.3.3: In addition to the cleanouts proposed for the dust collection in the International Mechanical Code, a method is needed to access all parts of a conveying system for cleaning and inspection. Lack of cleanouts was one of issues that resulted in the explosion in the Imperial Sugar Company, Port Wentworth GA.

Section 2203.4.1: Although these requirements already apply, sending the code user, who may otherwise be unfamiliar to the National Electric Code is appropriate.

Section 2203.4.2: To avoid sources of ignition from static discharge, grounding and bonding is required for equipment that come in contact with combustible dust.

Section 2203.4.3: Similar language is used in IFC Section 2403.2.7 for Flammable Finishes. Limiting hot works to designated area is critical to avoid additional sources of ignition within areas where combustible dust is used.

Section 2203.4.4: Avoiding heated surfaces in areas subject to explosion hazard is very important aspect of controlling sources of ignition. Some of the language is from IFC Section 2404.6.1.2 for Flammable Finishes and some is from other standards.

Section 2203.4.5: Similar language in IFC 2403.2.8 for Flammable Finishes.

Section 2203.4.6: Similar language in IFC Section 2403.2.6 for Flammable Finishes.

Section 2203.4.7: Similar language in IFC Section 2403.2.2 for Flammable Finishes.

Section 2203.4.8: This section is derived from and references NFPA 652. It addresses unique and very hazardous condition for self-heating materials.

Section 2203.4.9: Basic safety requirements need to be maintained in the event that open flame or fuel fired equipment is needed as part of the processes. These sections provide guidelines on how to safely use these equipment and reduce the probability of an incident.

Section 2203.5: Basic housekeeping is required to limit the accumulation of dust specified in Section 2203.1.

Section 2203.6: Standard Operational Procedures is the business owner's commitment to maintaining the operations safe and equipment in good working condition.

Section 2203.7: Emergency response plan is important for facilities where the a potential dust explosion exists.

Section 2203.8: Training is important for facilities with potential dust explosion hazards to encourage employees into maintaining safe conditions within the facility. Educating employees in understanding that maintenance and housekeeping are key life safety aspects in a facility is important.

Section 2204: Dust explosion screening tests may be necessary for specific types of dust. This section allows the AHJ to require and sends the user to the appropriate NFPA standard and section.

Section 2205: If unique hazards that are not covered by this chapter come up [e.g. design of large dryers in large agricultural and food processing facilities], this section allows fire code official to use these NFPA Standards for specific hazards. Similar language is existing in the current code.

Dust Collection System: New definition is provided in Chapter 2.

Bibliography:

International Fire Code, ICC, Chapter 24.

Also the following referenced NFPA Standards:

NFPA 61: Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities

NFPA 69: Standard on Explosion Prevention Systems

NFPA 77: Recommended Practice on Static Electricity

NFPA 85: Boiler and Combustion System Hazards Code

NFPA 120: Standard for Fire Prevention and Control in Coal Mines

NFPA 484: Standard for Combustible Metals

NFPA 652: Standard on the Fundamentals of Combustible Dust

NFPA 654: Standard for Prevention of Fire and Dust Explosions from the Manufacturing, Processing and Handling of Combustible Particulate Solids

NFPA 655: Standard for the Prevention of Sulfur Fires and Explosions

NFPA 664: Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Please note that the proposal may increase or decrease the cost impact to construction. It highly depends on the type and scale of combustible dust use. In most cases, we believe not applying NFPA 652 for all cases will reduce the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 77-14 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 197

F213-18

IFC: 2203.4

Proponent: Matthew Hunter, American Wood Council, representing American Wood Council (mhunter@awc.org)

2018 International Fire Code

Revise as follows:

2203.4 Housekeeping. Accumulation of *combustible dust* shall be kept to a minimum in the interior of buildings. Accumulated *combustible dust* shall be collected by vacuum cleaning or other means that will not place *combustible dust* into suspension in air. Forced air or similar methods shall not be used to remove dust from surfaces.

Exception: Forced air or similar methods shall be permitted to remove dust per NFPA 652, NFPA 654, or NFPA 664.

Reason:

The NFPA standards governing facilities that produce combustible dust as part of the manufacturing process have comprehensive housekeeping requirements. Although the International Fire Code prohibits the use of forced air to clean hard to reach areas in the manufacturing equipment, the NFPA standards permit its use for housekeeping under certain conditions. The safe use of compressed air in accordance with these standards is common practice in the industry. This proposal will bring consistency and uniformity within the standards listed, which are referenced in Table 2204.1.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed language may facilitate a slight cost savings as a broader flexibility of approved housekeeping methods will be available to the plant operator to choose from to reduce or eliminate combustible dust from plant infrastructure.

F214-18

IFC: 2303.1, 2304.2.4

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov); Lynn Nielson, representing Self

2018 International Fire Code

Revise as follows:

2303.1 Location of dispensing devices. Dispensing devices shall be located as follows:

1. Ten feet (3048 mm) or more from *lot lines*.
2. Ten feet (3048 mm) or more from buildings having combustible exterior wall surfaces or buildings having noncombustible exterior wall surfaces that are not part of a 1-hour fire-resistance-rated assembly or buildings having combustible overhangs.
Exception: Canopies constructed in accordance with the International Building Code providing weather protection for the fuel islands.
3. Such that all portions of the vehicle being fueled will be on the premises of the motor fuel-dispensing facility.
4. Such that the nozzle, where the hose is fully extended, will not reach within 5 feet (1524 mm) of building openings.
5. Twenty feet (6096 mm) or more from fixed sources of ignition.
6. Such that fuel dispensing is in view of the attendant at attended self-service motor fuel-dispensing facilities, as required by Section 2304.2.4.

2304.2.4 Obstructions to view. ~~Dispensing devices shall be in clear view of the attendant.~~ The attendant shall have a direct line of sight to observe fuel dispensing operations at all times. Obstructions shall not be placed between the dispensing area and the attendant.

Exception: Video monitoring systems shall be permitted to supplement direct line of sight supervision where approved by the fire code official.

Reason:

Newer fueling stations are typically accompanied by convenience stores. As stores become larger and more elaborate, the design is changing such that attendants operate more as cashiers, and are frequently oriented towards the convenience store merchandise area, and not towards the dispensers. Further, larger fueling stations have multiple dispensing islands that are often set at angles where all of the dispensers can not be viewed by an attendant. Convenience store marketing using posters, signs and or displays further obstruct direct view of dispensing areas for the attendant.

Commentary to ICC code has referred to the use of video cameras for viewing dispensing areas, but the code has not explicitly permitted video cameras to supplement direct view of dispensing areas. This proposal intends to clarify that, subject to approval by the fire code official, it is permissible to supplement direct view of dispensers by the addition of video monitoring. This will allow for better viewing of dispensing areas, than is possible with some newer designs of fueling stations. Video monitoring will enhance the ability for the attendant to view, supervise and control the dispensing of fuel.

Cost Impact

The code change proposal will increase the cost of construction .

While the use of video monitoring is optional as proposed, where the option to supplement direct view is employed, it is expected that there may be some additional costs. It is expected that some of these fueling stations may already have video monitoring for security purposes, and even if additional cameras are required by this requirement, much of the costs will likely already be mitigated.

Internal ID: 1780

F215-18

IFC: 2308.1, 2308.2, 2308.2.3 (New), 2308.2.4. (New), Chapter 80

Proponent: Ted Williams, American Gas Association, representing American Gas Association (twilliams@aga.org)

2018 International Fire Code

Revise as follows:

2308.1 General. Motor fuel-dispensing facilities for compressed natural gas (CNG) fuel shall be in accordance with this section, ~~and Chapter 53 and International Fuel Gas Code Section 413.~~

2308.2 Approvals. Storage vessels and equipment used for the storage, compression or dispensing of CNG shall be *approved* or *listed* in accordance with Sections 2308.2.1 ~~and 2308.2.2~~ through 2308.2.4.

Add new text as follows:

2308.2.3 Residential fueling appliance (RFA). Residential fueling appliances shall be listed to CSA/ANSI NGV 5.1 and installed in accordance with installation requirements of CSA/ANSI NGV 5.1, manufacturer installation instructions, and the International Fuel Gas Code Section 413. The capacity of an RFA shall not exceed 5 standard cubic feet per minute (0.14 standard cubic meter/min) of natural gas.

2308.2.4 Vehicle fueling appliance (VFA). Non-residential fueling appliances shall be listed as VFAs to CSA/ANSI NGV 5.2 and installed in accordance with installation requirements of CSA/ANSI NGV 5.2, manufacturer installation instructions, and requirements of the International Fuel Gas Code Section 413 for VFAs. The capacity of VFA shall not exceed 10 standard cubic feet per minute (0.28 standard cubic meter/min) of natural gas.

Add new standard(s) follows:

ANSI

American National Standards
Institute
25 West 43rd Street, 4th Floor
New York NY 10036

CSA/ANSI NGV 5.2—2017:

Vehicle Fueling Appliances (VFA)

CSA/ANSI NGV 5.1-2016:

Residential Fueling Appliances

Reason:

This proposal adopts “residential fueling appliance” (RFA) and light-commercial “vehicle fueling appliance” (VFA) coverage for listed appliances from ANSI-recognized standards CSA/ANSI NGV 5.1 and CSA/ANSI NGV 5.2, respectively, and applies installation requirements from those standards, manufacturer installation instructions, and proposed parallel requirements to go into the International Fuel Gas Code, Section 413. Requirements in the two CSA standards cover design, installation, labeling, and other requirements for these two classes of listed appliances and differentiate fueling appliances based on input flow rates and other requirements applicable to residential occupancies in the case of NGV 5.1 and light-commercial occupancies in the case of NGV 5.2. RFA coverage is already found in IFGC Section 413; VFA coverage is proposed as new coverage in the IFGC and IFC.

NFPA 52-2016 already defines and differentiates RFAs and VFAs based on limitations on input flow capacities: 5 SCFM for RFAs and 10 SCFM for VFAs for which coverage is now proposed for both the IFGC and IFC. Parallel coverage RFAs and VFAs is proposed to a new edition of NFPA 52 (2019 edition); however, final action on those proposals has not been taken at the time of the submission of this proposal.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal addresses appliance requirements, including installation requirements, unrelated to facility construction.

Analysis: A review of the standards proposed for inclusion in the code, CSA/ANSI NGV 5.2—2017 and CSA/ANSI NGV 5.1-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

2018 International Fire Code

2309.1 General. Hydrogen motor fuel-dispensing and generation facilities shall be in accordance with this section, ~~and Chapter 58,~~ and NFPA 2. Where a fuel-dispensing facility includes a repair garage, the repair operation shall comply with Section 2311.

Reason:

Adding a reference to NFPA 2 Hydrogen Technologies Code to the general requirements for dispensing and generation will provide additional coordination with the detailed requirements for hydrogen dispensing and generating systems developed by the Hydrogen Technologies Code Technical Committee.

Bibliography:

<http://www.nfpa.org/codes-and-standards/all-codes-and-standards/list-of-codes-and-standards/detail?code=2>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The requirements in NFPA 2 are standard for the hydrogen industry and are already implemented at dispensing and generating facilities.

Proponent: Spencer Quong, representing Toyota Motor North America (squong@yahoo.com); Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA (RJD@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

2309.2.2 Listed or approved equipment. Hoses, hose connections, compressors, hydrogen generators, dispensers, motor-fueling connections and electrical equipment used for hydrogen shall be *listed or approved for use with hydrogen*. ~~Hydrogen motor-fueling connections shall be *listed and labeled* or *approved* for use with hydrogen.~~

2309.4 Dispensing into motor vehicles at self-service hydrogen motor fuel-dispensing facilities. Self-service hydrogen motor fuel-dispensing systems, including key, code and card lock dispensing systems, shall be limited to the filling of permanently mounted fuel containers on hydrogen-powered vehicles.

In addition to the requirements in Section 2311, the *owner* of a self-service hydrogen motor fuel-dispensing facility shall provide for the safe operation of the system by complying with this code and the fueling protocols in NFPA 2 and through the institution of a fire safety plan submitted in accordance with Section 404, the training of employees and operators who use and maintain the system in accordance with Section 406, and provisions for hazard communication in accordance with Section 407.

Reason:

The proposed makes two simple modifications.

Section 2309.2.2 is restructured. By pulling "motor-fueling connections into the first sentence there is no need for the second sentence.

Section 2309.4 is modified by adding a pointer to fueling protocols that are in NFPA 2. These protocols need to be referenced to provide for the "safe operation of the system".

Bibliography:

<http://www.nfpa.org/codes-and-standards/all-codes-and-standards/list-of-codes-and-standards/detail?code=2>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Requirements in NFPA2 are already used by manufacturers of hydrogen dispensing and generating facilities.

Internal ID: 1336

F218-18

IFC: 2309.4

Proponent: Spencer Quong, representing Toyota Motor North America (squong@yahoo.com); Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA (RJD@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

2309.4 Dispensing into motor vehicles at self-service hydrogen motor fuel-dispensing facilities. ~~Self-service hydrogen~~ Hydrogen motor fuel-dispensing systems, including key, code and card lock dispensing systems, shall be limited to the filling of permanently mounted fuel containers on hydrogen-powered vehicles.

In addition to the requirements in Section 2311, the *owner* of a ~~self-service~~ hydrogen motor fuel-dispensing facility shall provide for the safe operation of the system through the institution of a fire safety plan submitted in accordance with Section 404, the training of employees and operators who use and maintain the system in accordance with Section 406, and provisions for hazard communication in accordance with Section 407.

Reason:

When the requirements for hydrogen motor-fueling were added to the code dispensing stations were experimental and use of the systems to fuel motor vehicle was restricted and controlled. The safety requirements for hydrogen motor-fuel dispensing has matured over the years and as a result there are over 30 public hydrogen motor-fuel stations installed in California alone with public and private hydrogen motor-fuel stations located in other states, and the numbers will increase. Some stations are self service and others are not. The requirements in 2309.4 should be for all hydrogen stations whether they are self-service or filling is done by an attendant.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Both self service and full service hydrogen stations adopt the requirements in 2309, so there should not be an impact to cost.

Internal ID: 1337

F219-18

IFC: 202 (New), 2309.4, 2311.8.11, 2311.8

Proponent: Spencer Quong, representing Toyota Motor North America (squong@yahoo.com)

2018 International Fire Code

Add new definition as follows:

TANK, MOTOR VEHICLE FUEL A tank permanently mounted on a motor vehicle to store a gas or liquid fuel which is used for propulsion.

Revise as follows:

2309.4 Dispensing into motor vehicles at self-service hydrogen motor fuel-dispensing facilities. Self-service hydrogen motor fuel-dispensing systems, including key, code and card lock dispensing systems, shall be limited to the filling of permanently mounted motor vehicle fuel containers tanks on hydrogen-powered vehicles.

In addition to the requirements in Section 2311, the *owner* of a self-service hydrogen motor fuel-dispensing facility shall provide for the safe operation of the system through the institution of a fire safety plan submitted in accordance with Section 404, the training of employees and operators who use and maintain the system in accordance with Section 406, and provisions for hazard communication in accordance with Section 407.

2311.8 Repair garages for vehicles fueled by lighter-than-air fuels. The room, motor vehicle repair booth or motor vehicle repair space containing repair garage activities for the conversion or repair of vehicles that use CNG, LNG, hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.8 through 2311.8.11 in addition to the other requirements of Section 2311. Repair garages for the repair of vehicles that use hydrogen fuel shall be in accordance with this code and NFPA 2.

Exceptions:

1. Repair garages where work is conducted only on vehicles that have been defueled and their systems purged with nitrogen gas, and where standard operating procedures to document and maintain the fueling status throughout repair operations are approved.
2. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance not requiring open flame or welding on the CNG-, LNG-, hydrogen- or other lighter-than-air-fueled motor vehicle.
3. Repair garages for hydrogen-fueled vehicles where work is not performed on the ~~hydrogen storage tank~~ motor vehicle fuel tank and is limited to the exchange of parts and maintenance not requiring open flame or welding on the hydrogen-fueled vehicle. During the work, the entire hydrogen fuel system shall contain less than 200 cubic feet (5.6 m³) of hydrogen.
4. Repair garages for natural-gas-fueled vehicles where work is not being performed on the motor vehicle fuel storage tank, and is limited to the exchange of parts and maintenance not requiring open flame or welding on the natural-gas-fueled vehicle. During the work, the natural gas, in the motor vehicle fuel tank shall contain a pressure of not more than 250 psi at 70°F (1724 kPa at 21°C).

2311.8.11 Defueling equipment required at vehicle maintenance and repair facilities. Facilities for repairing or replacing hydrogen fuel tanks on hydrogen-fueled vehicles shall have equipment to defuel vehicle storage tanks. Where work must be performed on a vehicle's motor vehicle fuel storage tank for the purpose of maintenance, repair or cylinder certification, defueling and purging shall be conducted in accordance with Section 2309.6 and NFPA 2.

Reason:

The addition of "motor vehicle fuel tank" definition helps clarify the difference between a fuel 'tank' in a car and other containers and tanks which are currently defined in the IFC as having volumes that do not match the volume of motor fuel 'tanks'.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal is a clarifying definition and has no impact on cost

Internal ID: 1639

F220-18

IFC: 2309.4

Proponent: Spencer Quong, representing Toyota Motor North America (squong@yahoo.com); Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA (RJD@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

2309.4 Dispensing into motor vehicles at self-service hydrogen motor fuel-dispensing facilities. Self-service hydrogen motor fuel-dispensing systems, including key, code and card lock dispensing systems, shall be limited to the filling of permanently mounted fuel containers on hydrogen-powered vehicles.

In addition to the requirements in Section 2311, the *owner* of a self-service hydrogen motor fuel-dispensing facility shall provide for the safe operation of the system through the institution of a fire safety plan submitted in accordance with Section 404, the training of employees and operators who use and maintain the system in accordance with Section 406, and provisions for hazard communication in accordance with Section 407.

Exception: Filling of non-permanently mounted storage containers or tanks for motor fuel-dispensing system testing purposes is permitted.

Reason:

Hydrogen dispensing facilities require testing which uses tanks which may not be permanently mounted on a hydrogen fueled vehicle. This testing is important to ensure the proper function of the stations. The exception allows testing to occur.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed text allows for testing at the station and does not affect the cost.

Internal ID: 1338

IFC: 2310.4.1, 2310.4.2

Proponent: Andrew Klein, representing Lakeside Fueling (andrew@asklein.com)

2018 International Fire Code

Revise as follows:

~~2310.4.2~~**2310.4.1 Class I, II or III liquid fuels.** Fueling of floating marine craft with Class I, II or III fuels at other than a marine motor fuel-dispensing facility shall be in accordance with all of the following:

1. The premises and operations shall be *approved* by the *fire code official*.
2. ~~Tank vehicles and fueling operations~~ Fueling operations from tank vehicles shall comply with Section 5706.6.
3. The dispensing nozzle shall be of the *listed* automatic-closing type ~~without~~ with a latch-open device. A listed break-away device shall be provided at the nozzle.
4. Nighttime deliveries shall only be made in lighted areas.
5. ~~The tank vehicle flasher~~ Flasher lights shall be in operation on the marine fueling vehicle while dispensing.
6. Fuel expansion space shall be left in each fuel tank to prevent overflow in the event of temperature increase.

~~2310.4.1~~**2310.4.2 Additional requirements for Class I liquid fuels.** Fueling of floating marine craft with Class I fuels at other than a marine motor fuel-dispensing facility ~~is prohibited~~ shall be in accordance with all of the following:

1. Marine fueling shall not take place within 25 feet (7620 mm) of buildings or combustible storage.
2. Smoking, open flames, and other sources of ignition shall be prohibited within 25 feet (7620 mm) of fuel dispensing activities.
3. The fuel delivery vehicle shall have an approved grounding system that is employed prior to and throughout fueling activities.
4. An approved portable fire extinguisher complying with Section 906 with a minimum rating of 4A-80-B:C shall be provided on the marine fueling vehicle with signage clearly indicating its location.
5. Pumps, meters and hose assemblies shall be listed and approved.

Reason:

The current code regulations that permit the fueling of marine vehicles at other than approved marine service stations was added into the 2000 edition of the IFC (Code Change Proposal F600-99) due to the need to refuel commercial fishing boats that came to dock along coastal and waterway areas where there were no marine service stations. At the time, those boats operated on diesel (Class II liquid), and there was no need for refueling with gasoline (Class I liquid).

There is now both a need and a demand for gasoline delivery to marine vehicles in areas where marine service stations are not available and for the fueling of racing boats at events. Current code language prohibits such fueling simply because specific requirements were never developed. This proposal provides requirements to address the additional hazards presented by Class I liquids should such fueling be approved by the fire code official.

The modifications made to the existing language take into consideration the different types of fueling vehicles, which are not all tank vehicles. The requirement that nozzles have a latch-open device brings this section into consistency with other fueling sections of the code and recognizes the operational and safety benefits of such a nozzle.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal provides the requirements to safely perform a previously prohibited operation, when approved by the fire code official.

IFC: 2311.8

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA (rjd@davidsoncodeconcepts.com); Spencer Quong, representing Toyota Motor North America (squong@yahoo.com)

2018 International Fire Code

Revise as follows:

2311.8 Repair garages for vehicles fueled by lighter-than-air fuels. The room, motor vehicle repair booth or motor vehicle repair space containing repair garage activities for the conversion or repair of vehicles that use CNG, LNG, hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.8 through 2311.8.11 in addition to the other requirements of Section 2311. Repair garages for the repair of vehicles that use hydrogen fuel shall be in accordance with this code and NFPA 2.

Exceptions:

1. Repair garages where work is conducted only on vehicles that the motor fuel tank and system have been defueled and ~~their systems~~ the motor fuel tank have been purged with nitrogen gas, and where standard operating procedures to document and maintain the fueling status throughout repair operations are approved.
2. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance not requiring open flame or welding on the CNG-, LNG-, hydrogen- or other lighter-than-air-fueled motor vehicle.
3. Repair garages for hydrogen-fueled vehicles where work is not performed on the hydrogen storage tank and is limited to the exchange of parts and maintenance not requiring open flame or welding on the hydrogen-fueled vehicle. During the work, the entire hydrogen fuel system shall contain less than 200 cubic feet (5.6 m³) of hydrogen.
4. Repair garages for natural-gas-fueled vehicles where work is not being performed on the fuel storage tank, and is limited to the exchange of parts and maintenance not requiring open flame or welding on the natural-gas-fueled vehicle. During the work, the natural gas, in the vehicle fuel tank shall contain a pressure of not more than 250 psi at 70°F (1724 kPa at 21°C).

Reason:

The purpose of this proposal is to modify the language to require the motor fuel tank and system to be defueled, but only the fuel tank to be purged with nitrogen rather than the entire "system".

The small diameter fuel line running from the motor fuel tank to the engine compartment contains a de minimus amount of gaseous fuel that does not pose a risk to the repair facility. The majority of this gaseous fuel is during the defueling process making nitrogen purging of this portion of the system unnecessary.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This language does not impact construction and will have no impact on construction costs, however, it can reduce operational expenses by eliminating an unnecessary step.

Internal ID: 1657

F224-18

IFC: 2311.8

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA (rjd@davidsoncodeconcepts.com); Spencer Quong, representing Toyota Motor North America (squong@yahoo.com)

2018 International Fire Code

Revise as follows:

2311.8 Repair garages for vehicles fueled by lighter-than-air fuels. The room, motor vehicle repair booth or motor vehicle repair space containing repair garage activities for the conversion or repair of vehicles that use CNG, LNG, hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.8 through 2311.8.11 in addition to the other requirements of Section 2311. Repair garages for the repair of vehicles that use hydrogen fuel shall be in accordance with this code and NFPA 2.

Exceptions:

1. Repair garages where work is conducted only on vehicles that have been defueled and their systems purged with nitrogen gas, and where standard operating procedures to document and maintain the fueling status throughout repair operations are approved.
2. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance not requiring open flame or welding on the CNG-, LNG-, hydrogen- or other lighter-than-air-fueled motor vehicle. Movement of a subassembly upon which the motor fuel tank remains mounted to allow access to other parts of the vehicle that are not a portion of the fuel system shall be permitted.
3. Repair garages for hydrogen-fueled vehicles where work is not performed on the hydrogen storage tank and is limited to the exchange of parts and maintenance not requiring open flame or welding on the hydrogen-fueled vehicle. During the work, the entire hydrogen fuel system shall contain less than 200 cubic feet (5.6 m³) of hydrogen.
4. Repair garages for natural-gas-fueled vehicles where work is not being performed on the fuel storage tank, and is limited to the exchange of parts and maintenance not requiring open flame or welding on the natural-gas-fueled vehicle. During the work, the natural gas, in the vehicle fuel tank shall contain a pressure of not more than 250 psi at 70°F (1724 kPa at 21°C).

Reason:

With motor vehicles today it is common to be required to move a subassembly to access the part needing repair or replacement. At times this includes the subassembly the motor fuel tank is mounted to.

There are varying opinions on the part on fire code officials on whether or not this can be done without defueling and nitrogen purging the fuel tank. Some consider that repair work "on the motor fuel tank and system" other do not.

The added language is intended to firmly state that movement of the subassembly the motor fuel tank is permitted under this exception which is limited to the exchange of parts and no use of open flame or welding. The tank remains firmly mounted to its mounting chassis and is not free to drop, roll or otherwise move during this process and as such does not present any additional safety concerns.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not impact the cost of construction. It can reduce the operational costs in those locations where defueling and purging has been required.

Internal ID: 1676

F225-18

IFC: 2311.8

Proponent: Spencer Quong, representing Toyota Motor North America (squong@yahoo.com)

2018 International Fire Code

Revise as follows:

2311.8 Repair garages for vehicles fueled by lighter-than-air fuels. The room, motor vehicle repair booth or motor vehicle repair space containing repair garage activities for the conversion or repair of vehicles that use CNG, LNG, hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.8 through 2311.8.11 in addition to the other requirements of Section 2311. Repair garages for the repair of vehicles that use hydrogen fuel shall be in accordance with this code and NFPA 2.

Exceptions:

1. Repair garages where work is conducted only on vehicles that have been defueled and their systems purged with nitrogen gas, and where standard operating procedures to document and maintain the fueling status throughout repair operations are approved.
2. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance not requiring open flame or welding on the CNG-, LNG-, hydrogen- or other lighter-than-air-fueled motor vehicle.
3. Repair garages for hydrogen-fueled vehicles where work is not performed on the hydrogen storage tank and is limited to the exchange of parts and maintenance not requiring open flame or welding on the hydrogen-fueled vehicle. During the work, the entire hydrogen fuel system shall contain less than ~~200-400~~ cubic feet (~~5.6-11.2~~ m³) of hydrogen.
4. Repair garages for natural-gas-fueled vehicles where work is not being performed on the fuel storage tank, and is limited to the exchange of parts and maintenance not requiring open flame or welding on the natural-gas-fueled vehicle. During the work, the natural gas, in the vehicle fuel tank shall contain a pressure of not more than 250 psi at 70°F (1724 kPa at 21°C).

Reason:

Exception 3 of Section 2311.7 is intended to allow work on the fuel system, except for the hydrogen storage tank without having to install additional ventilation and gas detection systems in the repair garage. The vehicle's shutoff valve must be securely closed on the fuel storage container so that it is a closed system and no gas can escape during maintenance operations. This proposal is increasing the allowable amount of hydrogen in the sealed fuel tank from 200 to 400 cubic feet (NTP).

Although each hydrogen passenger vehicle is different, typically their storage containers hold between 5000-50000 cubic feet (NTP) of hydrogen at high pressure (5000-10000 psi). However, the hydrogen leaving the storage container is regulated to a lower pressure, typically less than 250 psi and less than 10 cubic feet (NTP) of hydrogen.

Any release of hazardous material can pose a problem. However, this proposal addresses the issues in two ways. First, it requires that the shutoff valve on the fuel storage container to be securely closed. Hydrogen vehicles are required to have a manual valve that can be shut off for maintenance¹. In most vehicles, the shutoff valve fails shut, so the standard operating procedure to ensure that the valve is closed is to disconnect the 12V battery. For manual valves, it can be tagged and locked in the off position. Since almost all of the hydrogen is in the fuel storage container, this requirement will ensure only a minimal amount of hydrogen is left in the remainder of the fuel system.

Second, in the event that the fuel storage container is opened during repairs and all of the hydrogen is allowed to escape, this proposal requires that the entire fuel system be defueled to less than 400 cubic feet (NTP). This is less than 40% of the Maximum Allowable Quantity (MAQ) per control area listed in Table 5003.1.1(1) through 5003.1.1(4).

With more and more hydrogen vehicles on the road, there is a need to be able to work on the low pressure side of the fuel system at any repair garage without adding additional ventilation and gas detection systems. This proposal allows for this work as long as two requirements are met: the fuel storage container is closed and the amount of hydrogen is less than the existing IFC limitations for hazardous materials, and flammable gases. Already, repair garages have industrial cylinders of acetylene and other flammable gases without additional ventilation and detection equipment. Even if the repair garages meet the requirements in this exception, they will still need to be in accordance with Sections 5001 and 5003.

Bibliography:

"Standard for Fuel Systems in Fuel Cell and Other Hydrogen Vehicles." Society of Automotive Engineers. 2013.

http://standards.sae.org/j2579_201303/

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal clarifies the quantity of hydrogen which is allowed in the tank before upgrades are required, but does not impact the type or cost of upgrades.

Internal ID: 1335

F226-18

IFC: 2311.8

Proponent: Spencer Quong, representing Toyota Motor North America (squong@yahoo.com); Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA (RJD@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

2311.8 Repair garages for vehicles fueled by lighter-than-air fuels. The room, motor vehicle repair booth or motor vehicle repair space containing repair garage activities for the conversion or repair of vehicles that use CNG, LNG, hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.8 through 2311.8.11 in addition to the other requirements of Section 2311. Repair garages for the repair of vehicles that use hydrogen fuel shall be in accordance with this code and NFPA 2.

Exceptions:

1. Repair garages where work is conducted only on vehicles that have been defueled and their systems purged with nitrogen gas, and where standard operating procedures to document and maintain the fueling status throughout repair operations are approved.
2. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance not requiring open flame or welding on the CNG-, LNG-, hydrogen- or other lighter-than-air-fueled motor vehicle.
3. Repair garages for hydrogen-fueled vehicles where work is not performed on the hydrogen storage tank and is limited to the exchange of parts and maintenance not requiring open flame or welding on the hydrogen-fueled vehicle. During the work, the entire hydrogen fuel system shall contain less than 200 cubic feet (5.6 m³) of hydrogen.
4. Repair garages for natural-gas-fueled vehicles where work is not being performed on the fuel storage tank, and is limited to the exchange of parts and maintenance not requiring open flame or welding on the natural-gas-fueled vehicle. During the work, the natural gas, in the vehicle fuel tank shall contain a pressure of not more than 250 psi at 70°F (1724 kPa at 21°C).
5. Where approved by the fire code official, repair garages for hydrogen-fueled vehicles where an analysis has been submitted documenting that a flammable mixture in air will not occur in the room or space if the hydrogen is released from the motor fuel tank..

Reason:

The purpose of this proposal is to eliminate the extra protection features for hydrogen motor vehicle repair garages in those cases where an analysis has been performed and submitted documenting that flammable mixture of the hydrogen and air will not occur if the hydrogen is released from its tank.

The application of this exception would be conditioned upon the approval of the fire code official since the necessary analysis, including computer modeling, would be facility specific including the dimensions of the room or space.

Cost Impact

The code change proposal will decrease the cost of construction .

This change would decrease the cost of construction in those cases where the application of the analysis exception is approved.

F227-18

IFC: 2311.8, Chapter 80

Proponent: Ted Williams, American Gas Association, representing American Gas Association (twilliams@aga.org)

2018 International Fire Code

Revise as follows:

2311.8 Repair garages for vehicles fueled by lighter-than-air fuels. The room, motor vehicle repair booth or motor vehicle repair space containing repair garage activities for the conversion or repair of vehicles that use CNG, LNG, hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.8 through 2311.8.11 in addition to the other requirements of Section 2311. Repair garages for the repair of vehicles that use hydrogen fuel shall be in accordance with this code and NFPA 2.

Exceptions:

1. Repair garages where work is conducted only on vehicles that have been defueled and their systems purged with nitrogen gas, and where standard operating procedures to document and maintain the fueling status throughout repair operations are approved.
2. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance not requiring open flame or welding on the CNG-, LNG-, hydrogen- or other lighter-than-air-fueled motor vehicle.
3. Repair garages for hydrogen-fueled vehicles where work is not performed on the hydrogen storage tank and is limited to the exchange of parts and maintenance not requiring open flame or welding on the hydrogen-fueled vehicle. During the work, the entire hydrogen fuel system shall contain less than 200 cubic feet (5.6 m³) of hydrogen.
4. Repair garages for natural-gas-fueled vehicles where work is not being performed on the fuel storage tank, and is limited to the exchange of parts and maintenance not requiring open flame or welding on the natural-gas-fueled vehicle. During the work, the natural gas, in the vehicle fuel tank shall contain a pressure of not more than 250 psi at 70°F (1724 kPa at 21°C).
5. Repair garages for natural-gas-fueled vehicles where garage design and systems meet the requirements of CSA B401.

Add new standard(s) follows:

CSA B401-2018 Natural Gas Vehicle (NGV) Maintenance Facilities Code

Reason:

CSA B401-2019, "NGV Maintenance Facilities Code," will serve as the Canadian code for maintenance facilities for CNG and LNG vehicles. Inclusion of B401 for design of NGV repair garages as an option in the IFC (by exception) provides an opportunity for greater harmonization of requirements across North America. Public review and comment resolution on B401 will conclude prior to the IFC Public Comments deadline. B401 requirements are also being proposed for revision of NFPA 30A-2021, which has a deadline for Public Input in June 2018. Under other timetables, it would be preferred to first pursue adoption of B401 requirements in NFPA 30A and then use NFPA 30A as the basis for IFC proposals. However, final action on NFPA 30A-2021 in April 2020 makes it impractical for planning U. S. adoption of B401 requirements in this way until the 2024 IFC code cycle.

A major benefit in adding B401 as an option for NGV repair garages is the implementation of requirements for classifications of "repair areas" within the repair garages rather than beginning with the presumption that all areas of the garages have to meet the same requirements for "NGV repair garages." Applying all requirements uniformly works well for new-built NGV repair garages but has been shown to be impractical for existing repair garages where NGV maintenance operations are phased in to maintenance operations over time. The 2018 edition of the IFC provides some remedy for this situation by providing distinctions of "major repair" and "minor repair" space requirements (Section 2311.8, including the current exceptions) and separate requirements for "repair booths" (IFC Section 2311.8.4) and "repair spaces" (IFC Section 2311.8.5). In contrast, however, B401 starts with area classification for facilities and, thus, presents a clearer basis for enforcing authorities to apply different requirements for different areas of the facility. As some examples of repair area classification criteria, B401 uses a refinement of "major" and "minor" repairs as the IFC does, along with the IFC on-board CNG fuel pressure threshold of 250 psig as a criterion for repair area classification in CNG repair areas. Requirements are differentiated for roofs, ceilings, walls, partitions, door and penetrations, pits, floors and drains, means of egress, electrical classification, gas detection, purge ventilation, HVAC,

and hot work and presence of other ignition sources. Overall, design criteria are consistent between existing IFC requirements and B401. General facility requirements cover facility requirements for gas and fire detection, alarms, fire suppression, safety and security, and signage. In a number of these areas, B401 provides clearer requirements than the current edition of NFPA 30A and, in some places, greater detail than the IFC does currently.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change proposal will not increase or decrease the cost of construction across the population of repair garages for NGVs. However, construction costs for retrofitting existing NGV repair garages are likely to be reduced by limiting the extent of coverage of systems intended to address natural gas releases and oversizing of systems and equipment.

Analysis: A review of the standard proposed for inclusion in the code, CSA B401-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 2236

F228-18

IFC: 2404.3.3.6

Proponent: Geoffrey Raifsnider, Global Finishing Solutions, representing Self

2018 International Fire Code

Revise as follows:

2404.3.3.6 Size. The aggregate area of spray booths in a building shall not exceed the lesser of 10 percent of the area of any floor of a building or the basic area allowed for a Group H-2 occupancy without area increases, as set forth in the International Building Code. ~~The area of an individual spray booth in a building shall not exceed the lesser of the aggregate size limit or 1,500 square feet (139 m²).~~

Exception: One individual booth not exceeding 500 square feet (46 m²).

Reason:

This section does not take into account that regardless of the footprint of the spray booth the safety ventilation increases as the amount of material sprayed increases in order to meet the requirements of 2404.7.3. In addition, the amount of paint stored within a spray booth does not increase with size. Therefore size should not be a factor in determining the hazard level. A spray booth, regardless of size, that meets the requirements of Chapter 24 provides a safe and reliable piece of equipment. This requirement puts a financial burden on the purchaser who requires a single larger enclosed spray area for their process. NFPA 33 does not have a size limitation. The proposed change brings this section in alignment with current edition of NFPA 33.

Cost Impact

The code change proposal will decrease the cost of construction .

This change will allow use of spray booth construction which is less expensive than fire rated construction.

Internal ID: 2300

F229-18

IFC: 2404.3.4 (New)

Proponent: Geoffrey Raifsnider, Global Finishing Solutions, representing Self

2018 International Fire Code

Add new text as follows:

2404.3.4 Limited Finishing Workstations. A limited finishing workstation shall comply with the applicable provisions of NFPA 33 and Sections 2404.4 through 2404.8.2.

Reason:

This proposed addition addresses a common type of spray application enclosure used in the finishing industry that is not currently addressed by the code. NFPA 33 includes definitions and the minimum safety requirements for this type of equipment.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no cost impact due to this change. Equipment is currently built to meet the requirements of NFPA 33.

Internal ID: 2325

F230-18

IFC: 2404.4, 2404.5.2

Proponent: Jeffrey Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

2018 International Fire Code

Revise as follows:

2404.4 Fire protection. Spray booths and spray rooms shall be protected by an automatic sprinkler system or approved automatic fire-extinguishing system complying with Chapter 9. Protection shall extend to exhaust plenums, exhaust ducts and both sides of dry filters where such filters are used.

2404.5.2 Protection of sprinklers. Automatic sprinklers installed in *flammable vapor areas* shall be protected from the accumulation of residue from spraying operations in an *approved* manner. Bags used as a protective covering shall be 0.003-inch-thick (0.076 mm) ~~polyethylene or~~ cellophane or shall be thin paper. Automatic sprinklers contaminated by overspray particles shall be replaced with new automatic sprinklers.

Reason:

IFC Chapter 24 allows automatic sprinkler systems to protect spray operations. This defined term in added to 2404.4 to specify which fire protection systems can be installed. An approved fire-extinguishing system is permitted, but to leave the code with just this term in confusing as other areas allows sprinklers.

Poly bags were eliminated by NFPA 13 in the 2013 edition to protect sprinklers. Cellophane and thin paper are permitted and the fire code should not allow a material that voids the listing of the sprinkler.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Poly, cellophane and paper bags are similar in cost, but poly bags prove in tests and post-fires to delay and obstruct sprinkler flow.

Internal ID: 811

F231-18

IFC: 2404.8.2, 2404.8.2.1 (New), 2404.8.2.2 (New), 2404.8.2.3 (New)

Proponent: Geoffrey Raifsnider, Global Finishing Solutions, representing Self

2018 International Fire Code

Revise as follows:

~~**2404.8.2 Ventilation interlock prohibited.** Air makeup and flammable vapor area exhaust systems shall not be interlocked with the fire alarm system and shall remain in operation during a fire alarm condition.~~

~~**Exception:** Where the type of fire extinguishing system used requires such ventilation to be discontinued, air makeup and exhaust systems shall shut down and dampers shall close.~~

The interlocking of ventilation with fire alarm systems shall be in accordance with Sections 2404.8.2.1 through 2404.8.2.3.

Add new text as follows:

2404.8.2.1 Interlock. Air makeup and flammable vapor area exhaust systems shall not be interlocked with the fire alarm system and shall remain in operation during a fire alarm condition.

2404.8.2.2 Recirculation. Where flammable vapor area exhaust is recirculated, the recirculation system shall shut down during any fire alarm condition.

Exception: Unless it can be demonstrated that shutting down the recirculation system would create a more hazardous condition.

2404.8.2.3 Shutdown. Where the type of fire-extinguishing system used requires such ventilation to be discontinued, air makeup, recirculation and exhaust systems shall shut down and dampers shall close.

Reason:

Addresses the operation of the recirculation portion of a spray booth or spray room during a fire alarm condition. Shutting down the recirculation prevents smoke from a fire within the spray area from being recirculated.

Cost Impact

The code change proposal will increase the cost of construction .

This code change may increase the cost of construction due to additional design features or mechanical equipment needed to shut down a recirculation system in a spray booth while keeping the supply and exhaust systems operational.

Internal ID: 2317

F232-18

	Class 2	0.25	0.025	
	Class 1	Not Limited	Not Limited	
HEALTH-HAZARD MATERIALS				
Corrosives		Not Limited	Not Limited	Not Limited
Highly toxic		Not Limited	Not Limited	Note d
Toxics		Not Limited	Not Limited	Note d

For SI: 1 pound per square foot = 4.882 kg/m², 1 gallon per square foot = 40.7 L/m², 1 cubic foot @ NTP/square foot = 0.305 m³ @ NTP/m², 1 cubic foot = 0.02832 m³.

- a. Hazardous materials within piping shall not be included in the calculated quantities.
- b. Quantity of hazardous materials in a single fabrication shall not exceed the maximum allowable quantities per control area in Tables 307.1(1) and 307.1(2).
- c. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.
- d. The aggregate quantity of flammable, pyrophoric, toxic and highly toxic gases shall not exceed the greater of 0.2 cubic feet at NTP/square foot or 9,000 cubic feet at NTP.
- e. The aggregate quantity of pyrophoric gases in the building shall not exceed the amounts set forth in Table 415.6.2.
- f. Quantity of Class 3 water reactive solids in a single tool shall not exceed 1 pound.

Reason:

As technological advances continue to be made an important and widespread process now being used is Metal Organic Chemical Vapor Deposition (MOCVD). This technology deposits multiple thin films on a semiconductor wafer using a metal-organic vapor. The tools that employ this technology have on-board ampoules of solid metal organics (e.g. trimethylaluminum, trimethylgallium) that are pyrophoric and Class 3 water-reactives. This proposal is to revise the total quantity of Class 3 water reactive solids allowed in a single H5 fabrication area from 1 lb. (aggregate) to 0.01 lb/sq.ft. while also limiting the maximum quantity of Class 3 water reactive solids on-board a single tool to 1 pound. This is an overall increase in an H5 occupancy that aligns with the quantity currently allowed for Class 3 water reactive liquids in a single fabrication area. The MOCVD process is considered a closed use system utilizing sealed ampoules or "bubblers" to prevent contact with water, UV/IR detection, fail-safe shut-offs and compliance with all other aspects of Chapter 27.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal only affects the quantity of Class 3 water reactive solids allowed in a single H5 fabrication area.

Internal ID: 2155

F233-18

IFC: 2808.3, 2808.3.1 (New), 2808.4

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

2808.3 Size of piles or stacks. Piles shall not exceed 25 feet (7620 mm) in height, 150 feet (45 720 mm) in width and 250 feet (76 200 mm) in length.

Exception: ~~The fire code official is authorized to allow the pile size to be increased where a fire protection plan is provided for approval that includes, but is not limited to, the following:~~

- ~~1. Storage yard areas and materials-handling equipment selection, design and arrangement shall be based on sound fire prevention and protection principles.~~
- ~~2. Factors that lead to spontaneous heating shall be identified in the plan, and control of the various factors shall be identified and implemented, including provisions for monitoring the internal condition of the pile.~~
- ~~3. The plan shall include means for early fire detection and reporting to the public fire department; and facilities needed by the fire department for fire extinguishment including a water supply and fire hydrants.~~
- ~~4. Fire apparatus access roads around the piles and access roads to the top of the piles shall be established, identified and maintained.~~
- ~~5. Regular yard inspections by trained personnel shall be included as part of an effective fire prevention maintenance program.~~

~~Additional fire protection called for in the plan shall be provided and shall be installed in accordance with this code. The increase of the pile size shall be based on the capabilities of the installed fire protection systems and features. Stackable products shall not be stacked in excess of 25 feet in height, 80 feet in width and 250 feet in length.~~

Add new text as follows:

2808.3.1 Increase in Pile or Stack size. Piles or stackable products are permitted to be increased beyond the dimensions in Section 2808.3 provided a written fire protection plan is approved by the fire code official. The fire protection plan shall include, but not be limited to, the following:

1. Contact information for after-hours response by facility personnel.
2. Storage yard areas and material-handling equipment selection, pile design and arrangement shall be based upon sound safety and fire protection principles.
3. Fire apparatus access roads around the piles or stacks and access roads to the top of piles if applicable shall be established, identified, and maintained.
4. The potential for spontaneous heating shall be evaluated and provisions made to control the temperature of the piles. Methods for monitoring the internal temperature of the pile shall be provided.
5. Routine yard inspections shall be conducted by trained personnel.
6. A means for early fire detection and reporting to the public fire department shall be provided.
7. Facilities and equipment needed by the fire department for fire extinguishment shall be provided, including a water supply in compliance with section 507 and heavy equipment necessary to move material.
8. A de-inventory plan shall be utilized to remove alternating piles or stacked products in a manner to increase the separation distances between the remaining piles or stacks.
9. The increased pile size shall be based upon the capabilities of the installed fire protection systems and features.
10. A controlled burn area shall be provided on the site for smoldering or damaged product.

Revise as follows:

2808.4 Pile separation. Piles or stacked product shall be separated from buildings, property lines and adjacent piles ~~by approved fire apparatus access roads~~, or stacks by a distance of not less than 1-1/2 times the height of the pile or stack. The distance between rows shall be a minimum of 30 feet . Approved fire apparatus access roads shall be provided within the separation space in accordance with Section 503.

Reason:

The code never anticipated stacked bales of biomass being used in an agro-industrialized fashion. The difference between piles and stacks was not clearly defined. Restrictions on pile sizes are established for good and practical reasons. When the piles are made low and narrow, fire extinguishment is enhanced and firefighter safety improved. When the piles are extremely high and wide, fire extinguishment is hampered and arrangements must be made for fire-fighting service. This section provides tools and guidance for fire code officials when proposals to increase pile size are submitted. The fire code official must realize these storage sites are not permanent and storage amounts are based upon when the product is harvested. Biomass fuels are likely to have larger storage sites in the fall and winter with declining inventory throughout the rest of the year as product is used.

In order to slow the spread of fire from pile to pile, as well as to provide the fire department with tactical access to all parts of the pile storage area, piles must be subdivided by fire apparatus access roads at least 20 feet in clear width at the base of the piles, in accordance with section 503.2.1. This proposal also protects firefighters who may be operating equipment between the stack rows of aging product. The UL test burns showed large sections of bales falling nearly 20 feet to the ground when fire burnt through the twine. Establishing a collapse zone around these structures is similar to building collapse zones for apparatus parking. Distance separation is based on firefighter safety and equipment operation. Future data may be available to revisit radiant heat as it relates to adjacent stacks.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

The product of Biomass fuels (baled switch grass or corn stover) is already being stacked. If there is a cost impact it may be related to storage site leases. Many companies lease land in fields to store biomass. The current 2018 code limits the size of piles to 250 feet in length. Many storage sites are several hundred feet in length with rows separated by as little as 15 feet. The proposal to increase the length of piles (stacks) can be approved if all the criteria are met listed in 2808.3.1. If extended, it may reduce the amount of land needed to be leased since the exceptions call for increased size of piles but added fire safety features to prevent conflagrations of stover piles.

For SI: 1 foot = 304.8 mm.

SECTION 2810 OUTDOOR STORAGE OF PALLETS AT PALLET MANUFACTURING AND RECYCLING FACILITIES

2810.1 General. The outside storage of wood pallets and wood composite pallets on the same site as a pallet manufacturing or pallet recycling facility shall comply with Sections 2810.2 through 2810.11.

2810.2 Site plan. Each site shall maintain a current site ~~plan that includes a general description of the property, the boundaries of the lot, the size and location of buildings,~~ plan. The site plan be submitted to the fire code official and approval and all of the following:

1. Lot Lines
2. Utilities.
3. Type, Size, location, and type of construction and presence of sprinkler protection for other of the buildings on the site, property
4. Presence of fire protection systems
5. Water supply sources for fire-fighting purposes.
6. Location of hazardous material storage areas.
7. Location of pallet storage.
8. Equipment protected with a dust collection system.
9. *Fire apparatus access roads.*
10. Designated smoking areas.
11. Location of fire alarm control panels.

2810.3 Fire prevention plan. The *owner* or *owner's* authorized representative shall ~~prepare an approved~~ submit a fire prevention plan for review and approval by the fire code official that includes all of the following:

1. Frequency of walk-through inspections to verify compliance with the plan.
2. Hot work permit program in accordance with Chapter 35.
3. Preventive maintenance program for equipment associated with pallet activities.
4. Inspection, testing and maintenance of *fire protection systems* in accordance with Chapter 9.

2810.4 Fire safety and ~~emergency evacuation~~ plan. The *owner* or *owner's* authorized representative shall prepare and train employees in an *approved* fire safety and ~~emergency~~ evacuation plan in accordance with Chapter 4.

2810.5 Security management plan. The *owner* or *owner's* authorized representative shall prepare a security management plan based on a security risk assessment and shall make the plan and assessment available to the *fire code official* upon request.

2810.6 Clearance to property line. Stacks of pallets shall not be stored within 0.75 times the stack height or 8 feet (2438 mm) of the property line, whichever is greater, or shall comply with Section 2810.11.

2810.7 Clearance to important buildings. Stacks of pallets shall not be stored within 0.75 times the stack height of any important building on site, or shall comply with Section 2810.11.

2810.8 Height. Pallet stacks shall not exceed 20 feet (6096 mm) in height.

2810.9 Fire flow. Fire-flow requirements for the site shall be determined by the *fire code official*.

2810.10 Portable fire extinguishers. Portable fire extinguishers shall be ~~provided within 75 feet (22 860 mm) of any pallet stack selected,~~ installed and maintained in accordance with Section 906.

2810.11 Alternative approach. Where *approved* by the *fire code official*, pallet stacks are permitted to be located closer to a property line or structure than as required by Sections 2810.6 and 2810.7 ~~shall be provided with,~~ where additional fire protection is provided, including, but not limited to, the following:

1. The storage yard areas and materials-handling equipment selection, design, and arrangement are

based on an *approved* risk assessment.

2. Automatic fire detection that transmits an alarm to a supervising station in accordance with NFPA 72.
3. *Fire apparatus access roads* around all storage areas.

Reason:

This pallet proposal is to address two items from the previous cycle. The first part of the proposal is to address an issue that happened when the original proposal was submitted into cdpACCESS and a couple of numbers were reversed. This proposal will correct this mistake. The second part of the proposal contains some necessary edits to the language and provides better language flow and to provide more appropriate code format. Both of these revisions were promised to the previous committee that if the proposal passed we would bring these changes and corrections back to the next hearing. This code change meets fulfills that promise.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This fixes incorrect distances and provides clarification to the section overall and will likely make compliance less expensive.

Internal ID: 371

F235-18

IFC: 2810.4

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

2810.4 Fire safety and ~~emergency evacuation plan~~. The *owner* or *owner's* authorized representative shall prepare and train employees in an *approved* fire safety and ~~emergency~~ evacuation plan in accordance with Chapter 4.

Reason:

This is a revision to correlate the terminology in this section with the referenced plan in Chapter 4. Section 403.2 through 403.11.5 require "fire safety and evacuation plans".

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Correlation of terminology; there is no change on requirements.

Proponent: Ellie Klausbruckner, Klausbruckner & Associates Inc., representing Klausbruckner & Associates, Inc. (ek@klausbruckner.com)

2018 International Fire Code

Revise as follows:

3006.1 Required protection. Class A and B ovens that contain, or are utilized for the processing of, combustible materials shall be protected by an *approved automatic fire-extinguishing system* complying with Chapter 9.

Exceptions:

1. Small tabletop ovens used in laboratory facilities.
2. Non walk-in ovens that are less than 4 feet (1.22 m) in length and width.

Reason:

The section is intended for large furnaces, but based on the definitions of Class A and B ovens, sprinklers are required inside smaller and portable ovens. The 4 ft dimension is in line with NFPA 13 requirements for sprinklering below obstructions and can be used as a relative size above which sprinklers would be required.

Cost Impact

The code change proposal will decrease the cost of construction .

The proposal allows exceptions for sprinklered smaller ovens and therefore reduces cost to construction.

Internal ID: 1622

F237-18

IFC: 3103.3.1

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

3103.3.1 Special amusement building. Tents and other membrane structures erected as a special amusement building shall be equipped with an *automatic sprinkler system* in accordance with Section ~~411.3 of the International Building Code~~ 914.7.1.

Reason:

The current language refers back to Section 411.3 in the IBC. IBC Section 411.34 is copied from the IFC and the exact same language can be found in IFC Section 914.7.1. In fact, the IBC section shows “[F]” at the start of the section.

This proposal is to simply refer to the original text for the requirement, which is IFC Section 914.7.1.

There is no change in application or enforcement, however, it eliminates the potential confusion about whether the IBC language applies to the temporary special amusement building.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

There is no change in application or enforcement of the requirements.

- a. Duration of Occupancy except installation and/or removal unless on the same day.
- b. Minimum design wind speed for ASCE 7 wind pressure for Occupancy Category II.
- c. Wind speed 3 second gust at 33ft elevation for Exposure C.
- d. Anchorage plan by Owner, Agent or Installer, based on; Manufacturer's or Registered Design Professional documentation or use 10 lbs per square foot ground surface uplift divided equally between anchor points.
- e. Anchorage plan by Owner, Agent or Installer based on Manufacturer's or Registered Design Professional documentation for Exposure C.
- f. Site specific analysis and anchorage plan from a Registered Design Professional.
- g. For occupancies A-1 to A-4, B, E, M & S-1 to S-2 for aggregate of either occupant load or floor area.

Delete without substitution:

~~**3103.9.2 Tents and membrane structures greater than 7,500 square feet.** *Tents and membrane structures greater than 7,500 square feet (697 m²) shall be designed and constructed to comply with Sections 1606 through 1609 of the International Building Code.*~~

~~**3103.9.3 Tents and membrane structures with an occupant load greater than 1,000.** *Tents and membrane structures with an occupant capacity greater than 1,000 persons shall be designed and constructed to comply with Sections 1606 through 1609 of the International Building Code.*~~

Add new standard(s) follows:

CHAPTER 80 REFERENCED STANDARDS

Update standard(s) as follows:

ASCE/SEI

American Society of Civil Engineers
Structural Engineering Institute
Reston VA 20191-4400

ASCE 7-16:

Minimum Design Load and Associated Criteria for Buildings and Other Structures

Reason:

Overview

In recent years a number of accidents involving temporary tents have resulted in injuries and deaths. Some tents had no wind "ratings" and therefore had no documentation, others were "rated" yet installed improperly. These accidents generally involved failure of the anchoring caused by wind loads leading to the accident. Previous code changes suggested a simple all or nothing approach, however some of these accidents would have still occurred with this approach and the cost to other events would have exceeded their capacity to fund with little actual gain in public safety since equipment being used already had documentation.

Design Wind Speed

The design wind speed in ASCE 7 for permanent structures is based on a 50 year return period. The commentary of ASCE 7 contains the formula that defines the probability that the design wind speed will be exceeded during a specific time period:

$$P_n = 1 - (1 - P_a)^n \text{ (C26.5-7)}$$

Apply this for n = 50 years, the result is a probability of 0.64 for the design wind speed to be exceeded during a 50 year return period.

It is common in current engineering practice to use the same probability for shorter exposure periods, to determine a reduced design wind speed for structures that are temporary in nature. Because there is no standard defining what values to use, the values currently used depend upon the engineer's and the code officials' judgement. The goal with the proposed table is to define a common set of numbers that everyone uses.

In the current practice the wind speed is reduced to equate a return period generally between 2 to 5 years, depending on judgement. The reasons that longer periods are chosen compared to the actual exposure for a tent, are as follows:

1. Tents are installed multiple times so it is reasonable to use a longer exposure period than just the installation

period for one single event or project.

2. For short exposure periods, the resulting design wind speed would be too low to make sense from an evacuation and public safety standpoint.

In the same commentary in ASCE 7 there is a formula to convert the 50 year return period to other return periods:

$$VT/V50 = (0.36 + 0.1 \ln(12T)) \quad (C26.5-2)$$

The following are the design wind speeds for the different return periods based on this formula:

As example: for a 2 year return period this formula results in a ratio of 0.6778 or a design wind speed of $0.6778 \times 115 \text{ mph} = 78 \text{ mph}$.

<u>Period</u>	<u>MPH</u>	<u>Period</u>	<u>MPH</u>
6 month	62	2.5 year	81
1 year	70	3 year	83
1.5 year	75	5 year	89
2 year	78	10 year	96

The probability for a design wind speed to be exceeded during a specific period is based on what society accepts as risk and as acceptable balance between the need for public safety and the cost associated with requiring higher levels of safety. Given the acceptable risk for permanent structures which is well established, it is rational to accept a similar concept for temporary structures.

Comparing the proposed Table 3103.9.1 with the return wind speeds above one notices that the 2 year period was chosen as the middle number in the table, 8 - 30 days and the middle row, 300- 999 occupancy/ 5,001 - 15,000 sq ft size. The other values in the middle column (8-30 days) are chosen to decrease the return period on smaller and increase on larger occupancies and sizes.

The smallest tent for the shortest exposure period has a minimum design wind speed of 57 mph, while the largest tent with the longest exposure is 89 mph, equivalent to a 10 year return period.

Tents exceeding one story are subject to higher design wind speeds in the proposed tables because a failure of a floor level exposes occupants to additional risks both on spaces below and above compared to a tent that is only a roof.

For larger tents, the proposed table will result in higher wind design requirements vs the current practice for the largest tents and longer period of exposure. Many large tent currently meet the 78 mph / 2 year return period.

For smaller tents, the proposed table will for the first time establish minimum design wind speed requirements, and as such is a major commitment of the tent manufacturing and rental industry to public safety.

While we recognize that the table creates a level of complexity not currently in the IFC, we believe it is justifiable because it will allow enforcement of a set of rules that are, though challenging, obtainable for the tent industry and for users of temporary tents in general.

Documentation Requirements

The documentation requirements associated with the proposal are based on 3 different levels, whereby the requirements become more stringent for larger occupancies / sizes. The reason for basing it both on occupancy and size is that there are applications for temporary tents where there is little to no occupancy but where a reasonable level of safety is still needed in the public interest.

The lowest level is footnote 4: it requires an anchoring plan that is either based on a generic wind load documentation from a manufacturer or registered design professional or based on a generally conservative formula requiring resistance against 10 psf uplift equally divided over all anchor points.

Footnote 5: anchorage based on generic engineering documentation provided by the manufacturer or a registered design professional. This requires design wind speed documentation in a category where currently most tents have no wind speed or anchoring load information.

The highest level is Footnote 6: site specific engineering documentation by a registered design professional, which takes into account the specific circumstances of the site: wind exposure, hill, exact length, and anchoring at the site.

Similar as for the design wind speed, we believe it is rational to have a graduated series of documentation requirements to find a balance between public safety and expenses that are reasonable compared to the economics of the project as opposed to a none or all approach.

Occupancies

The minimum wind design requirements in Table 3103.9.1 are based on certain occupant categories. Ones that need

greater oversight, like Group H, would require a registered design professional and code official review, even for temporary use. These are a minority of installations, but the hazards of Group H extend well beyond the structure or Groups I & R for the difficulty in evacuation.

Exceptions in 3103.9.1

Exception 1: Tents and membrane structures that are installed for more than 180 days are subject to the full wind load criteria found in the IBC Section 1609 based on this exception. IBC Sections 1601 thru 1609 are also imposed.

Exception 2: Special Event structures regulated in 3105 should be exempted from this compliance structure. They are not exempt from any compliance, rather they are to conform to the ANSI E1.21 standard as required in 3105. These structures, their usage, designs and load vary far more than temporary tents. They have staff on site, and can design outdoor structures with wind mitigation, where most tent installations, provided by rental companies, have no personnel on site during use.

Summary

No standard or code can prevent all accidents. If this code change were being enforced during recent occurrences a number of accidents would have been prevented. The table establishes minimums that should be used by event promoters, owner and agents for Operational Management Plans including High Wind Action Plans.

With the goal of increasing public safety with reasonable and enforceable requirements and methods, the proposed code changes with inclusion of Table 3103.9.1 will accomplish this. Although costs of equipment, permits and installations will rise, by using a tiered approach, a level of safety will be achieved at all occupancy and tents sizes for events with achievable level of documentation and cost.

Cost Impact

The code change proposal will increase the cost of construction .

Cost increases will include manufacturers or design professional documentation for tents currently without any. Owners or installers will have to prepare anchoring plans for permit submissions based on the tent site's soil conditions, not currently done for most installations. However, the use of generic plans for similar soil conditions will be acceptable.

Internal ID: 530

F239-18

IFC: 3103.9.1, 3103.9.2, 3103.9.3

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance (rnix@zoomtown.com)

2018 International Fire Code

Revise as follows:

3103.9.1 Tents and membrane structures greater than one story. Tents and membrane structures exceeding one story shall be designed and constructed to comply with Sections ~~1606-1603~~ through 1609 of the International Building Code.

3103.9.2 Tents and membrane structures greater than 7,500 square feet. *Tents and membrane structures* greater than 7,500 square feet (697 m²) shall be designed and constructed to comply with Sections ~~1606-1603~~ through 1609 of the International Building Code.

3103.9.3 Tents and membrane structures with an occupant load greater than 1,000. *Tents and membrane structures* with an occupant capacity greater than 1,000 persons shall be designed and constructed to comply with Sections ~~1606-1603~~ through 1609 of the International Building Code.

Reason:

This change proposal captures the complete design requirements necessary for an appropriate structural review, and further enhances the IFC submittal document requirements by ensuring proper information is included for the benefit of pre-construction permit review and for any onsite inspections that also may be required, after construction permit approval.

Adding the reference to 1603 correlates with the construction document requirements of the IFC, and ensures wind design data is included in the construction documents. This information is necessary for structural design of the main wind force resisting system.

Adding the reference to 1604 clarifies the necessary design requirements, including risk categories, etc. but even more important, it specifically includes anchorage requirements essential to design of temporary structures.

Reference to 1605 clarifies the necessary design load combinations that should be considered for all structures, but especially for temporary structures where weather-related events can be most destructive.

Special events using structures of any type create special considerations for life-safety requirements due to the event duration. Structural considerations have been commonly overlooked, and code officials often ask for better or more direct links to the building code with respects to structural safety for temporary structures. This proposal addresses those requests.

Failure in the lateral force resisting system is a primary cause of temporary structure failure, but failures also occur as a result of improper ballasting/anchorage to resist uplift and overturning. For temporary structures, these failures are typically caused by weather-related events, usually wind. It is not acceptable to the entertainment and special event production industry that there are no clearly established structural requirements for temporary structures in the codes, especially since time and time again we are reminded how dangerous wind events can be in the context of temporary structures at special events. It is necessary to know the structure's capacity, particularly for wind loads, when used outdoors for temporary special events, so that mitigation actions and/or evacuation actions can be performed at wind speeds below the structure's capacity, and at wind speeds low enough to permit safe crowd movement during evacuation times.

Requiring that this information be included for temporary structures whenever IBC Chapter 16 is referenced, and whenever construction documents are required, helps ensure a) that proper design analysis has been done, b) that critical information about lateral force resisting systems and for anchorage systems are available during the permit review process, and c) that such information is available to on-site inspectors when inspections are required in addition to the pre-event construction permit submittal process.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change will result in no change to construction costs because the structural analysis requirements already exist. Adding these (3) sections of IBC Chapter 16 clarifies the requirements, and ensures that complete information is provided for the construction permit submittal and review. Because inspections (when required) rely on information provided on the construction documents, this change may decrease the cost of construction by helping to alleviate

confusion during inspections by ensuring that complete information essential to the inspection process is provided well in advance of the actual inspection.

Internal ID: 1633

F240-18

IFC: 3103.9.2, 3103.9.3

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance (rnix@zoomtown.com)

2018 International Fire Code

Delete without substitution:

~~**3103.9.2 Tents and membrane structures greater than 7,500 square feet.** *Tents and membrane structures greater than 7,500 square feet (697 m²) shall be designed and constructed to comply with Sections 1606 through 1609 of the International Building Code.*~~

~~**3103.9.3 Tents and membrane structures with an occupant load greater than 1,000.** *Tents and membrane structures with an occupant capacity greater than 1,000 persons shall be designed and constructed to comply with Sections 1606 through 1609 of the International Building Code.*~~

Reason:

Section 3103.6 **Construction documents** already includes structural analysis as part of construction document requirements for tents and membrane structures having an occupant load of 50 or more persons. This code change proposal alleviates confusion regarding potentially conflicting requirements.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Construction documents and structural analysis are already required by other sections of this Chapter, so eliminating a redundant requirement has no effect on construction costs.

Internal ID: 1635

F241-18

IFC: 3103.10.2, Chapter 80

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance

2018 International Fire Code

Revise as follows:

3103.10.2 Fabric envelope design and construction. ~~Air-supported and air-inflated structures shall have the design and construction of the fabric envelope and the method of anchoring in accordance with Architectural Fabric Structures Institute FSAAS.~~ be designed in accordance with ASCE/SEI 55-16.

Add new standard(s) follows:

ASCE/SEI

American Society of Civil Engineers
Structural Engineering Institute
Reston VA 20191-4400

ASCE/SEI 55-16:

Tensile Membrane Structures

Reason:

This code change proposal replaces outdated or obsolete references with an approved consensus-based reference standard, and removes redundant requirements already addressed in other sections.

These structures are within the scope of ASCE 55-16, which also addresses fabric structures regardless if the fabric is dependent or independent of a frame of any type. Anchorage requirements for all tent and membrane structures are already addressed as part of construction document requirements of Section 3103.6 and the structural stability/anchorage requirements of Section 3103.9.

A scope overview of ASCE/SEI 55-16 can be viewed online, at this web address:
<http://www.asce.org/templates/publications-book-detail.aspx?id=22498>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The requirement to provide appropriate design already exists, so replacing obsolete documents with new standards improves and clarifies design requirements without increasing cost of construction.

Analysis: ASCE 55 is already referenced in the IBC. This is simply a new occurrence of the reference in the I-Codes

Internal ID: 1638

F242-18

IFC: 3104.2

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Fire Code

Revise as follows:

3104.2 Flame propagation performance ~~treatment, testing and certification.~~ Before a permit is granted, the *owner* or agent shall file with the *fire code official* a certificate ~~executed~~issued by an *approved* testing laboratory. The certificate shall indicate that the floor coverings, tents, membrane structures and their appurtenances, which include sidewalls, drops and tarpaulins, are composed of materials meeting the flame propagation performance of Test Method 2 of NFPA 701. Additionally, it shall indicate that the bunting and combustible decorative materials and effects are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2 of NFPA 701, as applicable. Alternatively, the materials shall be treated with a flame retardant in an *approved* manner and meet the flame propagation performance criteria of the applicable test method of NFPA 701. The certificate shall indicate compliance with the testing requirements of Chapter 16 of NFPA 701. The flame propagation performance criteria shall be effective for the period specified by the permit.

Reason:

This proposal is a minor change to correct the requirements for testing and certification to NFPA 701 for weathering. Tents are typically used outdoors and therefore exposed to weather, especially rain. NFPA 701 has a chapter 16, entitled "Cleaning and Water Leaching Procedures", which contains procedures for accelerated dry cleaning, accelerated laundering and accelerated water leaching procedure when they have been conducted. This new requirement simply gives the fire code official the information needed to ensure compliance with the necessary testing procedures.

At present, the IFC does not require that the label indicate the materials tested for flame propagation performance where condition for outdoor use as covered in NFPA Chapter 16 for accelerated dry cleaning, accelerated laundering and accelerated water leaching procedures when they have been conducted. This new requirement simply gives the fire code official the information needed to ensure compliance with the necessary testing procedures.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is a clarification proposal that ensure the weather testing requirements in NFPA 701 are performed on all tents intended for outdoor use. This requirement is already in the 2018 IFC.

Internal ID: 256

F243-18

IFC: 3104.2, 3104.3, 3104.4

Proponent: Thomas Markel, representing Industrial Fabrics Association International - Tent Rental Division; Paul Armstrong, representing IFAI (paul@paulandvauna.com)

2018 International Fire Code

Revise as follows:

3104.2 Flame propagation performance treatment. Before a permit is granted, the *owner* or agent shall file with the *fire code official* a certificate executed by the product manufacturer certifying the materials have been tested by an approved testing laboratory. The certificate shall indicate that the floor coverings, tents, membrane structures and their appurtenances, which include sidewalls, drops and tarpaulins, are composed of materials meeting the flame propagation performance of Test Method 2 of NFPA 701. Additionally, it shall indicate that the bunting and combustible decorative materials and effects are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2 of NFPA 701, as applicable. Alternatively, the materials shall be treated with a flame retardant in an *approved* manner and meet the flame propagation performance criteria of the applicable test method of NFPA 701. The flame propagation performance criteria shall be effective for the period specified by the permit.

3104.3 Label. Membrane structures or tents shall have a permanently affixed label bearing the identification of size and fabric or material ~~type~~ in addition to information required in Section 3104.4 of this Chapter.

3104.4 Certification. An affidavit or affirmation shall be submitted to the *fire code official* and either a copy retained on the premises on which the tent or air-supported structure is located, located or label affixed to the tent or air supported structure. The affidavit shall attest ~~to all of the~~ following information relative to the flame propagation performance criteria of the fabric:

1. Names and address of the ~~owners~~ manufacturers of the tent or air-supported structure.
2. ~~Date~~ Either with the date the fabric was last treated with flame-retardant ~~solution~~ solution, the
3. ~~trade~~ Trade name or kind of chemical used in ~~treatment~~ treatment,
4. ~~name~~ Name of person or firm treating the ~~material~~ material and
5. ~~name~~ Name of testing agency and test standard by which the fabric was ~~tested~~ tested, or
3. The material meets NFPA 701 test Method 1 or 2 without treatment.

Reason:

Tents and membrane structures have been labeled and certifications provided for decades since the Hartford circus fire. At the time of the fire tent material was a natural fiber and waterproofing was accomplished with a flammable mixture. After the fire a external flame retardant was required to be applied to retard flame spread. The topical application was subject to weather and cleaning and would degrade over time and exposure. Retreatment and retesting was needed for compliance.

With the availability of polyester or PVC based material, that has flame retardant integrated into the raw material before extrusion, external treatment of material is not required. The flame retardant is capable of performing for the life of the material and cannot be washed or weathered away. Also, "field testing" (NFPA 705) the tent or membrane structure by cutting out sections for testing, damages the membrane and degrades the structural integrity of the material increasing the danger to the public for a structural failure.

This code proposal changes three parts of the flame propagation requirement that are interrelated.

Flame propagation (3104.2): Testing agencies have never issue the label or certification of the assembled product, rather they test and document the materials used in assembly. The affixed label and certification provided for permitting have **always** been provided by the manufacturer (see attachments). This change to flame propagation corrects the code to what has been the acceptable practice for generations. Further it would be impossible and impractical to enforce the current code; for testing agencies are not capable of producing the label and certification documentation for every tent and sidewall produced by a manufacturer, nor are they able to trace the chain of custody of the materials as the manufacturer's have been doing as evident in both the certifications and labels (see attachments). Therefore this change only brings the code in line with what has been acceptable practice.

Labeling (3104.3): The code is very general and viewing the attached labels, the information presented varies widely. By tying the information required for the label to "match" the certification documentation aids the fire code official to insure the installation matches the permit documents.

Certification (3104.4): This change brings the code requirements of documentation up-to-date with modern tent and membrane structure manufacturing. Rarely is a natural fiber used in new product manufacturing. However, use of older tents made from natural fibers still occurs. The change in certification reflects the modern use of polyester and PVC material (new #3) whose flame retardant is now integrated in the raw polyester or PVC before extruded into material, and therefore cannot be washed or weathered away as the topical application method used on natural fibers.

Certification is hereby made that: (Check "a" or "b")

a) The articles described below this Certificate have been treated with a flame-retardant chemical approved and registered by the State Fire Marshal and that the application of said chemical was done in conformance with the laws of the State of California and the Rules and Regulations of the State Fire Marshal.

Name of chemical used _____ Chem. Reg. No. _____

Method of application _____

(b) The articles described below are made from a flame-resistant fabric or material registered and approved by the State Fire Marshal for such use.

NFPA-701 (large scale)

Trade name of flame-resistant fabric or material used Blockout White 1610

Reg. No. 140.01

The Flame-Retardant Process Used WILL NOT Be Removed By Washing

Fred's Studio Tents & Canopies, Inc.

Plant Supervisor

Product Description 40x100 Series SE Pole Tent Customer Invoice # 17713

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

No additional cost as this is the current practice.

Internal ID: 2005

F244-18

IFC: 3104.3, 3104.4

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Revise as follows:

3104.3 Label. Membrane structures or tents shall have a permanently affixed label bearing the identification of size and fabric or material type. The label shall also indicate that the tent fabric has complied with the requirements of NFPA 701 in accordance with Section 3104.2.

Delete without substitution:

~~**3104.4 Certification.** An affidavit or affirmation shall be submitted to the *fire code official* and a copy retained on the premises on which the tent or air supported structure is located. The affidavit shall attest to all of the following information relative to the flame propagation performance criteria of the fabric:~~

- ~~1. Names and address of the *owners* of the tent or air supported structure.~~
- ~~2. Date the fabric was last treated with flame retardant solution.~~
- ~~3. Trade name or kind of chemical used in treatment.~~
- ~~4. Name of person or firm treating the material.~~
- ~~5. Name of testing agency and test standard by which the fabric was tested.~~

Reason:

The certification information is excessive and unnecessary and increases costs. It does not increase safety. The only key information needed is whether the tent material passes the fire test requirements. A proposed change to the section on fire testing (submitted by ICC FCAC) requires an indication that the tent materials also meet the weathering portion of the fire test.

Cost Impact

The code change proposal will decrease the cost of construction .

This will decrease cost for new tents because they will not need to present unnecessary certificates every time they set up a tent.

2018 International Fire Code

Add new text as follows:

105.6 Inflatable Amusement Device. Inflatable Amusement Device. The fire code official is authorized to require an operational permit to operate an inflatable amusement device.

Exception: Operation on private property for an event not open to the public.

Add new definition as follows:

INFLATABLE AMUSEMENT DEVICE. A device made of flexible fabric or other combustible materials that is inflated by one or more air-blowers providing internal air pressure to maintain its shape. Such a device is designed for recreational activities that allow occupants to bounce, climb, slide, negotiate an obstacle course or participate in interactive play.

Revise as follows:

3101.1 Scope. Tents, temporary special event structures and *membrane structures* shall comply with this chapter. The provisions of Section 3103 are applicable only to temporary tents and membrane structures. The provisions of Sections 3104 and 3106 are applicable to temporary and permanent tents and membrane structures. The provisions of Section 3105 are applicable to temporary special event structures. The provisions of Section 3106 are applicable to inflatable amusement devices. The provisions of Section 3107 are applicable to outdoor assembly events. Other temporary structures shall comply with the International Building Code.

Add new text as follows:

SECTION 3106 INFLATABLE AMUSEMENT DEVICES

3106.1 Scope. Inflatable amusement devices shall comply with Sections 3106.2 through 3106.10.1.

3106.2 General. Inflatable amusement devices shall be designed, anchored, operated and maintained in accordance with the manufacturer's instructions. A complete copy of the manufacturer's instructions shall be filed with the operational permit and, where required, available at the site of operation for review.

3106.3 Permit required. Where required by the fire code official, the operation of an inflatable amusement device shall require a permit as set forth in Section 105.6

3106.4 Use period. Inflatable amusement devices shall not be operated for a period of more than 14 consecutive days at a single location.

3106.5 Combustible materials. The fabrics, textiles, containment netting and combustible small mesh materials used in the construction of the inflatable amusement device shall meet the flame propagation criteria of Test Method 2 of NFPA 701.

3106.6 Operation. Inflatable amusement devices shall be operated within the environmental conditions specified in the manufacturer's installation and operating instructions for wind and weather. Operators shall be familiar with the weather and wind conditions that exceed manufacturer's operating limits for an inflatable amusement device. Operators shall evacuate and deflate the device and not resume operations until conditions are within the manufacturer's operating limits.

3106.7 Permanent safety label. Every inflatable amusement device shall display one or more permanent labels demonstrating compliance with the requirements in this section.

3106.8 Required operators. The minimum number of approved operators to safely supervise operation of the

device, as required by the manufacturer's instructions for each inflatable amusement device, shall be present at all times when the inflatable amusement device is in use.

3106.9 Electrical equipment and wiring. Electrical equipment, blower motors and temporary wiring for electrical power or lighting shall comply with the applicable provisions of NFPA 70. Extension cords and flexible cords shall be listed and labeled in accordance with UL 817. Electrical equipment, blower-motors and wiring utilized outdoors shall be listed and labeled for outdoor use.

3106.10 Portable generators. Portable generators shall comply with the applicable provisions of NFPA 70 and with the portable generator requirements of this code.

3106.10.1 Portable fire extinguishers. Each generator shall be provided with an approved portable fire extinguisher complying with Section 906 and placed in an approved location.

Reason:

This proposal has been prepared through discussions with code officials, industry representatives and other stakeholders. Past events were analyzed related to outdoor “bounce houses” that were uplifted by wind gusts while occupied thereby resulting in injury to children and/or adults that were trapped inside. These new code requirements are simple and intended to improve the authority of code officials to ensure public safety when inflatable amusement devices are used for public gatherings or events.

This proposal introduces basic safety requirements for inflatable amusement devices also known as “bounce houses”. There have been numerous reported incidents of accidents and injuries involving these devices caused by weather events such as sustained or wind gusts and/or improper set-up, anchorage or use where the “bounce house” is uplifted, carried away and/or overturned with children or adults inside.

Chapter Scoping section modified to reference proposed new section.

This new section adds an “optional” operational permit requirement intended to cover public events and excludes operation on private (residential) property.

This section adds basic fire and electrical safety requirements for the construction, placement and operation of portable inflatable amusement devices. The section addresses safety requirements for both outdoor and indoor use of these devices.

A definition for inflatable amusement devices is also included to correlate the type of devices covered by these new IFC code requirements.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal adds requirements for inflatable amusement devices. This use of these devices and the requirements proposed have no relation to building construction or building construction costs.

Internal ID: 260

IFC: 3106.4.1, 3106.4.1.1 (New), 3106.4.1.2 (New)

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance (rnix@zoomtown.com)

2018 International Fire Code

3106.4.1 Public safety plan for gatherings. A public safety plan shall be prepared where required by Section 403.12.2. The public safety plan shall be submitted to the *fire code official* with the application for an operational permit as required by Section 3106.2.2.

Add new text as follows:

3106.4.1.1 Event designated responsible person. Outdoor assembly events shall have a designated person responsible for the temporary outdoor assembly event structures on the site. The designated person shall have sufficient knowledge of the construction documents, manufacturer's recommendations and operations plan to make judgments regarding the event's safety and to coordinate with the fire code official when necessary.

3106.4.1.2 Operations plan. An event operations plan shall be required for outdoor assembly events. It shall contain the event's operational guidelines, procedures for environmental monitoring and actions to be taken under specified conditions consistent with the permit and the construction documents. It shall include the public safety plan if required by Section 403.12.2.

Reason:

This proposed change both supports and enhances the current public safety plan requirements of Chapter 4, with specific consideration given to outdoor assembly events. This proposed change also responds to industry and code administration discussions about incorporating more of ANSI E1.21's Operations Management Plan ("OMP") concepts into Chapter 31, for a broader scope of coverage relative to outdoor assembly events, and relative to structures not specifically covered in the scope of ANSI E1.21, but which are explicitly covered under the scope of Chapter 31. These concepts are considered beneficial and directly attributable to enhancing event safety.

The basic premise of ANSI E1.21's OMP requirements is to establish a general plan and hierarchy responsibilities to facilitate execution of the plan's requirements, particularly with regard to aspects of safety. For example, to enhance structural safety, the OMP contains the structural capacity for the event structure(s), which are in turn used to establish operational controls and thresholds, such as triggering thresholds for event evacuation, and structural safety zone perimeters. These are in turn used in conjunction with any mitigating actions that must be taken when triggered, such as event evacuation due to inclement weather or high winds. The OMP also requires a designated responsible person, thus reinforcing the current code requirements in Section 403, wherein the code official must determine if a weather monitoring person is a necessary consideration for the public safety plan. For structures within the scope of E1.21, this is not an optional suggestion - it is a requirement, and yet those structures represent no more or less significant risk than other temporary structures used for special events purposes.

The change regarding operations plans satisfies any question about what information is required. The change regarding a designated person in responsible charge enhances the current public safety plan consideration for a weather monitoring person. In fact and practice these roles and responsibilities can be met by the same person.

Additional discussion:

Several recent and historical incidents occurring during special events have resulting in injury or death, as a result of structural collapse due to high winds. These tragedies can also be directly attributed to the absence of an operations management plan, or the failure to implement the steps required by such a plan if it did exist. Bringing these topics into the code adds irrefutably clear and significant enhancement to outdoor assembly event safety, first by validating the importance of having the safety plan and personnel requirements for outdoor assembly events documented, and second by increasing awareness for event safety at the event planning and initial permitting approval stages.

In 2011 the stage roof system at the Indianapolis State Fair collapsed due to high winds, killing 12 people and injuring many others. In many ways that tragedy influenced significant changes in the 2015 code.

In 2015, three tent collapses causing deaths and injuries (NH, Wood Dale, St Louis) occurred as a result of high winds. In at least two of those cases, injury and death could have been prevented had evacuation occurred in a timely manner, directing people to an appropriate safe haven. These tragedies have also contributed to increased concern and awareness such that the changes made by the 2015 code were again enhanced, and a new section for outdoor assembly events was added to the 2018 code. The topic of event safety - how to improve it, how to manage it, and how to enforce it - is ever-present in code administration, in standards development activities and in the special

events industry at large.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed change has no impact to cost of construction, because its requirements for documentation of essential information are already directly related to the code official's assessment of the public safety plan's essential requirements. The event production industry already implements these concepts, in principle through documents such as the Event Safety Guide and ANSI E1.21-2013, and in practice through voluntary compliance with those approved consensus standards and industry guidelines documents.

Internal ID: 1164

F247-18

IFC: 3106.4.2, 3106.4.2.1 (New)

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance
(rnix@zoomtown.com)

2018 International Fire Code

3106.4.2 Weather monitoring person. Where required by the *fire code official*, the event operator or agent shall designate one qualified individual to continuously monitor local weather reports, forecasts and conditions. Said person shall be responsible for initiating weather-related event mitigation activities, ordering the suspension or cancellation of the outdoor assembly event and issuing the evacuation signal in accordance with the *approved* public safety plan.

Add new text as follows:

3106.4.2.1 Mandatory weather evacuation. Temporary outdoor assembly events shall be evacuated when wind speeds reach the threshold stated in the public safety plan. Where structures are erected on the event site, mandatory evacuation of the structures' safety zone perimeter shall occur when wind speeds exceed 35 miles per hour (3-second gust), unless other limiting safety criteria designates to the contrary. The public safety plan shall include all other conditions in which evacuations are necessary, including any mitigating actions required to occur prior to evacuation.

Reason:

Deadly incidents continue to occur as a direct result of failure to evacuate during severe weather. For outdoor temporary structures, the single most common cause of structural collapse is high winds creating forces in excess of the structure's capacity, and usually resulting in a failure of the structure's lateral (main wind) force resisting system.

This proposed change introduces a mandatory evacuation threshold in order to enhance safety for the event, prevent injury or death which may result from structural collapse during high-wind events by ensuring there is an approved plan to evacuate prior to wind speeds becoming dangerous. An ancillary yet critically important by-product of this proposal is that the structures' wind capacity thresholds must be determined in order to establish the operation limits under which the structure may be used.

Justification for why the 35 mph threshold has been determined is as follows:

- The National Weather Service defines "Severe Thunderstorm" as, ...A thunderstorm that produces a tornado, **winds of at least 58 mph** (50 knots or ~93 km/h), and/or **hail at least 1" in diameter**. Structural wind damage may imply the occurrence of a severe thunderstorm. A thunderstorm wind equal to or greater than 40 mph (35 knots or ~64 km/h) and/or hail of at least ½" is defined as approaching severe.
- Just after Hurricane Harvey, the Weather Channel advises the public that ...the winds have died down to about 35 MPH, but stay out of the wind because 35 MPH is still considered dangerous.
- Just prior to Hurricane Irma, Government agencies and first responders advise that, once wind speeds reach 45 MPH, they will cease response activities.
- According to the production personnel who participated in the drafting of the original ANSI E1.21 document, 40 MPH is considered the threshold at which working in wind surpasses uncomfortable, and becomes potentially dangerous. This threshold is still considered appropriate today.
- 29 CFR 1926.968 Subpart V provides this note to the definition of "high wind": The Occupational Safety and Health Administration normally considers winds exceeding 64.4 kilometers per hour (40 miles per hour), or 48.3 kilometers per hour (30 miles per hour) if the work involves material handling, as meeting this criteria, unless the employer takes precautions to protect employees from the hazardous effects of the wind.
- ALL weather-related information services address weather-related risks in context of outdoor assembly events.
- <https://weather.com/storms/severe/news/outdoor-festivals-severe-weather-plan>

In summary:

- 58 MPH – wind speed at which the NWS classifies a "Severe Thunderstorm"
- 45 MPH – wind speed at which first responders cease to respond to emergencies.
- 40 MPH – wind speed at which the NWS classifies as "approaching severe"
- 40 MPH – wind speed at which OSHA classifies as "High Wind"
- 40 MPH – the sustained wind speed at which the NWS issues a "High Wind Warning"

34-40 MPH - Beaufort Wind Scale Force 8 = Gale force winds, twigs breaking off trees, generally impedes progress

30 MPH - wind speed at which OSHA classifies as "high wind" for material handling

Therefore, 35 MPH is a reasonable high-wind threshold for mandatory evacuation, but this proposal also allows consideration of other criteria.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Regardless if an evacuation is necessary or not, this proposed change has no impact to the cost of construction because any necessary preparations to effect the action - the public safety plan itself, the necessity for a weather monitoring person, the need for trained crowd managers - are already required by Chapter 4.

Internal ID: 1174

F248-18

IFC: 3106.4.3

Proponent: Richard Nix, representing Entertainment Services & Technology Association/Event Safety Alliance (rnix@zoomtown.com)

2018 International Fire Code

Revise as follows:

3106.4.3 Crowd managers. Where events involve a gathering of more than ~~1,000~~500 people, trained crowd managers shall be provided in accordance with Section 403.12.3.

Reason:

The basic threshold of 500 persons, triggering the requirement for trained crowd managers, is established by 403.12.3, and the minimum number of crowd managers required per number of occupants is established by the charging statement of 403.12.3.1. However, 403.12.3.1 exception 1 permits the triggering threshold to be raised for outdoor assembly events. When a weather monitoring person is required by the code official, this exception potentially places a tremendous burden on that designated weather monitoring person, when - without the exception - 2 to 3 crowd managers would otherwise be required and be available to support the potentially critical life safety responsibilities of the designated weather monitoring person. This proposed change supports the primary triggering threshold of 500 persons set by 403.12.3, and supports the minimum number of trained crowd managers required by 403.12.3.1.

In accordance with the public safety plan requirements of 403.12.2, if the FCO determines a designated weather monitoring person is necessary, then that person has one of the most important tasks potentially occurring at an outdoor assembly event: evacuation in accordance with the public safety plan.

Recent event tragedies in the US and around the world (Wood Dale Festival tent collapse; New Hampshire circus tent collapse; Brazil EDM festival, and others) have demonstrated the importance of weather monitoring in conjunction with the support staff to facilitate and execute an evacuation plan when necessary.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposed change has no impact on cost of construction. This proposed change has minimal cost impact to operational staffing requirements compared to overall event production costs.

Internal ID: 1163

F249-18

IFC: 3107.15.1

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

3107.15.1 Batteries. Batteries shall be disconnected ~~in an appropriate manner.~~ except where the fire code official requires that the batteries remain connected to maintain safety features.

Reason:

This section is revised to correlate with changes to the 2018 IFC which allow batteries to remain connected in some situations.

Many alternative-fuel vehicles have safety features built-in to the vehicle that monitor hazards. When the battery is disconnected, those safety features are lost.

This revision correlates with Section 314.4, Item 1 and provides an increased level of safety for alternative-fuel vehicles.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal does not affect construction.

Internal ID: 2099

F250-18

IFC: 3203.1

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows:

3203.1 Classification of commodities. Commodities shall be classified as Class I, II, III, IV or high hazard in accordance with Sections 3203.2 through 3203.10.3. Materials listed within each commodity classification are assumed to be unmodified for improved combustibility characteristics. Use of flame-retarding modifiers or the physical form of the material could change the classification.

Where a specific commodity cannot be identified, such as a speculative warehouse building, the required fire protection system and life safety features shall be installed assuming Class IV commodities as a minimum criteria, to the maximum pile height, based on available clear height in the building.

Reason:

The intent is to address the multitude of speculative warehouse buildings constructed without due regard to the future tenants. This provision simply provides guidance as to how to design per Chapter 32 based on a conservative assumption, so as to accommodate the majority of future tenants without significantly changing the fire protection features in the building retroactively.

Cost Impact

The code change proposal will increase the cost of construction .

The potential is there to increase the cost of construction if the speculative warehouse is designed based on an assumption of commodity classification that is less than Class IV. It is likely that many would argue that Group A plastics is a more appropriate classification for speculative buildings simply based on the majority of warehousing operations.

IFC: TABLE 3203.8

Proponent: Michael O'Brian, representing FCAC (fcac@iccsafe.org); Robert Davidson, Davidson Code Concepts, LLC, representing Tesla, USA (rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

**TABLE 3203.8
EXAMPLES OF COMMODITY CLASSIFICATION**

PRODUCT CATEGORY	PRODUCT	CLASSIFICATION
Aerosols	Level 1	Class III (See Chapter 51)
	Level 2	Class IV (See Chapter 51)
	Level 3	High-hazard (See Chapter 51)
Batteries	Dry cells (excludes lithium, lithium-ion and other similar exotic metals or combustible electrolyte); without blister packing (if blister packed, refer to the commodity classification definitions)	Class I
	Dry cells (nonlithium or similar exotic metals); in blister packing; cartoned	Class II
	Vehicle; any size (for example, automobile or truck); empty plastic casing	High-hazard (Group A unexpanded)
	Vehicle; large (in other words, truck or larger); dry or wet cells (excludes lithium-ion and other cells containing combustible electrolytes)	High-hazard (Group A unexpanded)
	Vehicle; small (for example, automobile); wet cells (excludes lithium-ion and other cells containing combustible electrolytes)	Class I
	<u>Lithium-ion</u>	<u>High-hazard</u>
Biomass	Circular baled corn stover	Class IV
	Rectangular baled corn stover	Class III
	Rectangular baled switchgrass	High-hazard
Empty containers	Noncombustible	Class I
	PET	Class IV
	Rigid plastic (not including PET)	High-hazard (Group A unexpanded)
	Wood; solid sided (such as crates, boxes)	Class II
Film rolls, including photographic	Polypropylene, polyester, polyethylene; rolled on any reel type	High-hazard (Group A unexpanded)
	35 mm metal film cartridges in polyethylene cans; cartoned	Class III
	Motion picture or bulk rolls in polycarbonate, polyethylene or in metal cans; polyethylene bagged; cartoned	Class II
	Rolls in polycarbonate plastic cassettes; cartoned	Class IV
	Photographic paper; sheets; bagged in polyethylene; cartoned	Class III
Flammable and combustible liquids	Glycol in combustible containers (50 percent or greater)	High-hazard
	Lacquers, which dry by solvent evaporation, in metal cans or cartons	High-hazard
	Lighters; butane; blister-packed; cartoned	High-hazard (Group A unexpanded)
	Over 20- and up to 50-percent alcohol (such as alcoholic beverages, hair spray); up to 1-gallon glass bottles or jars; in racks; cartoned	Class III
	Over 20- and up to 50-percent alcohol (such as alcoholic beverages, hair spray); up to 1-gallon glass bottles or jars; palletized; cartoned	Class IV
	Over 20- and up to 50-percent alcohol (such as alcoholic beverages, hair spray); up to 1-gallon plastic bottles or jars; cartoned	Class IV
	Up to 20-percent alcohol (such as alcoholic beverages, flavoring extracts); greater than 5-gallon plastic containers with wall thickness greater than 0.25 inch	High-hazard (Group A unexpanded)

	Up to 20-percent alcohol (such as alcoholic beverages, flavoring extracts); metal, glass or ceramic containers	Class I
	Up to 20-percent alcohol (such as alcoholic beverages, flavoring extracts); plastic containers greater than 5 gallons and wall thickness up to 1/4 inch	Class II
	Up to 20-percent alcohol (such as alcoholic beverages, flavoring extracts); up to 5-gallon plastic bottles or jars	Class I
	Up to 20-percent alcohol (such as alcoholic beverages, flavoring extracts); wood containers	Class II
	Lubricating or hydraulic fluid in plastic containers	High-hazard
	Nail polish; up to 2-ounce glass bottles or jars; cartoned	Class IV
	Nail polish; up to 2-ounce plastic bottles or jars; cartoned	High-hazard (Group A unexpanded)
Flammable solids	Except solid combustible metals	High-hazard
Food products, frozen	In nonwaxed or nonplastic packaging	Class I
	In plastic trays	Class III
	In waxed or plastic-coated paper packaging	Class II
Food products, nonfrozen	Butter (stick or whipped spread) or margarine (up to 50-percent oil)	Class III
	Butter; whipped spread	Class III
	Dry foods (such as baked goods, candy, cereals, cheese, chocolate, cocoa, coffee, grains, granular sugar, nuts); bagged or cartoned	Class III
	Foods (such as coffee, fish products, fruit, meat products, nuts, poultry); metal cans	Class I
	Fruits and vegetables (noncombustible semiliquid); crushed; plastic containers up to 5 gallons	Class I
	Fruits and vegetables; fresh; wood spacers, nonplastic trays or containers	Class I
	Margarine; over 50- and up to 80-percent oil	High-hazard (Group A unexpanded)
	Meat; fresh; no plastic packaging; uncartoned	Class I
	Meat; fresh; no plastic packaging; cartoned	Class II
	Meat; fresh; plastic tray	Class III
	Milk; any container; stored in solid plastic crates	High-hazard (Group A unexpanded)
	Milk; paper containers, or plastic bottles or jars up to 5 gallons	Class I
	Salt; bagged	Class I
	Salt; cartoned	Class II
	Snack foods (such as potato chips); plasticized aluminum bags; cartoned	High-hazard (Group A unexpanded)
Syrup; wooden container	Class II	
Furniture and bedding	Box spring; standard (minimal plastic materials)	Class III
	Box spring; wrapped in plastic cover	Class IV
	Furniture and bedding; with foam cushioning	High-hazard (Group A expanded)
	Furniture; metal (such as file cabinets or desks with minimal plastic trim); cartoned	Class I
	Furniture; wood (such as doors, windows, cabinets); no plastic coverings or foam cushioning	Class III
	Furniture; wood; plastic coverings; nonexpanded plastic trim	Class IV
	Mattress; foam (in finished form)	High-hazard (Group A expanded)

	Pillows, foam rubber and foam plastics	High-hazard (Group A expanded)
Housing materials and appliances	Appliances; major (for example, stoves, refrigerators); no appreciable plastic interior or exterior trim; cartoned	Class II
	Appliances; major (for example, stoves, refrigerators); no appreciable plastic interior or exterior trim; uncartoned	Class I
	Appliances; no appreciable plastic exterior trim (interior of unit can have appreciable plastic)	Class III
	Carpet tiles; cartoned	High-hazard (Group A unexpanded)
	Fiberglass insulation; paper-backed rolls; bagged or unbagged	Class IV
	Floor coverings; vinyl, stacked tiles	Class IV
	Floor coverings; vinyl; rolled	High-hazard (Group A unexpanded)
	Gypsum board	Class I
	Housing materials (such as sinks, countertops); noncombustible, cartoned or crated	Class II
	Light fixtures; nonplastic; cartoned	Class II
	Paint; oil-based; friction-top metal containers; cartoned	Class IV
	Paint; water-based (latex); friction-top metal containers; cartoned	Class I
	Paper; asphalt; rolled, horizontal or vertical storage	High-hazard
	Roofing shingles; asphalt-coated fiberglass	Class III
	Roofing shingles; asphalt-impregnated felt	Class IV
	Miscellaneous	Ammunition; small arms and shotgun; cartoned
Charcoal; mineral-spirit impregnated; bagged		High-hazard (Group A expanded)
Charcoal; standard (nonmineral-spirit impregnated); bagged		Class III
Fertilizers; nitrates; bagged		Class II
Fertilizers; phosphates; bagged		Class I
Leather hides; baled		Class II
Leather; finished products (such as shoes, jackets, gloves, bags, luggage, belts)		Class III
Motors; electric		Class I
Pallets and flats that are idle; combustible		High-hazard
Shock absorbers; metal dust cover		Class II
Shock absorbers; plastic dust cover		Class III
Skis; wood		Class III
Skis; composite materials (such as plastic, fiberglass, foam)		Class IV
Tobacco products; cartoned		Class III
Toys; stuffed; foam or synthetic		High-hazard (Group A expanded)
Transformer; dry or empty (in other words, void of oil)		Class I
Noncombustible liquids	Liquids or semiliquids; PET containers greater than 5 gallons having a nominal wall thickness greater than 1/4 inch	Class IV
	Liquids or semiliquids; PET containers up to 5 gallons having a nominal wall thickness less than 1/4 inch	Class I
	Liquids or semiliquids (such as crushed fruits and vegetables); plastic containers up to 5-gallon capacity	Class I

	Liquids or semiliquids; plastic (except PET) containers greater than 5-gallon capacity having a nominal wall thickness greater than 1/4 inch	High-hazard (Group A unexpanded)
	Liquids or semiliquids; plastic (except PET) containers greater than 5-gallon capacity having a nominal wall thickness up to 1/4 inch	Class II
	Liquids; cardboard drink boxes, plastic coated, wax coated, and/or aluminum lined; uncartoned or on corrugated carton trays with plastic sheeting	Class I
	Liquids; cardboard drink boxes, plastic coated, wax coated, and/or aluminum lined; stored in plastic containers	High-hazard (Group A unexpanded)
	Liquids; glass bottles or jars; cartoned	Class I
	Liquids; less than 5-gallon plastic containers	Class I
	Liquids; pharmaceuticals (nonflammable); glass bottles or jars; cartoned	Class II
	Liquids; plastic bottles or jars; stored in open or solid plastic crates	High-hazard (Group A unexpanded)
Paper products	Book signatures (paper part of book without hard cover)	Class II
	Cartons (such as cardboard flats); corrugated; partially assembled	Class IV
	Cartons (such as cardboard flats); corrugated; unassembled in neat piles	Class III
	Cartons; wax coated, single-walled corrugated	High-hazard (Group A unexpanded)
	Cellulosic paper products; nonwax coated (such as books, cardboard games, cartoned tissue products, magazines, newspapers, paper cups, paper plates, paper towels, plastic-coated paper food containers, stationary)	Class III
	Cellulosic paper products; wax coated (such as paper plates, cups); loosely packed; cartoned	High-hazard (Group A unexpanded)
	Cellulosic paper products; wax coated (such as paper plates, cups); nested; cartoned	Class IV
	Matches; paper-type; cartoned	Class IV
	Matches; wooden; cartoned	High-hazard (Group A unexpanded)
	Rolled; lightweight; in storage racks	Class IV
	Rolled; medium or heavyweight; in storage racks or onsite	Class III
	Rolled; in horizontal storage or vertical storage that is banded or protected with an approved wrap	Class III
	Rolled; in vertical storage that is unbanded or not protected with an approved wrap	High-hazard
	Tissue products; plastic wrapped; cartoned	Class III
	Tissue products; plastic wrapped; uncartoned	High-hazard (Group A unexpanded)
Plastic, rubber	ABS (Acrylonitrile-butadiene-styrene copolymer)	High-hazard (Group A unexpanded)
	Acetal (polyformaldehyde)	High-hazard (Group A unexpanded)
	Acrylic (polymethyl methacrylate)	High-hazard (Group A unexpanded)
	Automobile bumpers and dashboards	High-hazard (Group A expanded)
	Butyl rubber	High-hazard (Group A unexpanded)
	Cellulose acetate	Class IV (Group B plastic)

Cellulose acetate butyrate	High-hazard (Group A unexpanded)
Chloroprene rubber	Class IV (Group B plastic)
Containers; Nonexpanded plastic gridded or solid; collapsed or nested with no air spaces	High-hazard (Group A unexpanded)
ECTFE (ethylene-chlorotrifluoro-ethylene copolymer)	Class IV (Group B plastic)
EPDM (ethylene-propylene rubber)	High-hazard (Group A unexpanded)
ETFE (ethylene-tetrafluoroethylene copolymer)	Class IV (Group B plastic)
Ethyl cellulose	High-hazard (Group A unexpanded)
FEP (fluorinated ethylene-propylene copolymer)	Class IV (Group B plastic)
FRP (fiberglass-reinforced polyester)	High-hazard (Group A unexpanded)
Melamine (melamine formaldehyde)	Class III (Group C plastic)
Nitrile rubber (acrylonitrile-butadiene rubber)	High-hazard (Group A unexpanded)
Nylon (nylon 6, nylon 6/6)	High-hazard (Group A unexpanded)
PCTFE (polychlorotrifluoroethylene)	Class III (Group C plastic)
PET (Polyethylene terephthalate-thermoplastic polyester)	High-hazard (Group A unexpanded)
Phenolic	Class III (Group C plastic)
Plastics; stored in fully closed and solid (no openings) metal containers	Class I
Polybutadiene	High-hazard (Group A unexpanded)
Polycarbonate	High-hazard (Group A unexpanded)
Polyester elastomer	High-hazard (Group A unexpanded)
Polyethylene	High-hazard (Group A unexpanded)
Polypropylene	High-hazard (Group A unexpanded)
Polystyrene; foam products (such as plates, cups)	High-hazard (Group A expanded)
Polystyrene; rigid products	High-hazard (Group A unexpanded)
Polyurethane	High-hazard (Group A expanded)
PTFE (polytetrafluoroethylene)	Class III (Group C plastic)
PVC (polyvinyl chloride) products; plasticizer content 20 percent or less	Class III (Group C plastic)
PVC (polyvinyl chloride) products; plasticizer content greater than 20 percent	High-hazard (Group A unexpanded)
PVC resins; bagged	Class III (Group C plastic)
PVDC (polyvinylidene chloride)	Class III (Group C plastic)
PVDF (polyvinylidene fluoride)	Class III (Group C plastic)
PVF (polyvinyl fluoride)	High-hazard (Group A unexpanded)
Pyroxylin	High-hazard
Rubber; natural in blocks; cartoned	High-hazard (Group A unexpanded)
Rubber; natural; expanded	High-hazard (Group A expanded)
Rubber; natural; Nonexpanded	High-hazard (Group A unexpanded)

	Rubber; synthetic (santoprene)	High-hazard (Group A unexpanded)
	Rubber tires	High-hazard
	SAN (styrene acrylonitrile)	High-hazard (Group A unexpanded)
	SBR (styrene-butadiene rubber)	High-hazard (Group A unexpanded)
	Silicone rubber	Class IV (Group B plastic)
	Urea (urea formaldehyde)	Class III (Group C plastic)
Plastic containers	Bottles or jars greater than 1 gallon containing noncombustible solids	High-hazard (Group A unexpanded)
	Bottles or jars up to 1 gallon containing noncombustible solids	High-hazard (Group A unexpanded)
Powders, pills	Pharmaceutical pills; glass bottles or jars; cartoned	Class II
	Pharmaceuticals pills; plastic bottles or jars; cartoned	Class IV
	Polyvinyl alcohol (PVA) resins; bagged	Class IV
	Powders; combustible (ordinary—such as sugar or flour); free-flowing; bagged	Class II
	Powders; noncombustible free-flowing powdered or granular materials (such as cement, calcium chloride, clay, iron oxide, sodium chloride, sodium silicate); bagged	Class I
	Powders; noncombustible; glass bottles or jars; cartoned	Class I
	Powders; noncombustible; PET bottles or jars	Class II
	Powders; noncombustible; plastic (other than PET) bottles or jars; uncartoned	High-hazard (Group A unexpanded)
	Powders; noncombustible; plastic bottles or jars greater than 1-gallon capacity	High-hazard (Group A unexpanded)
	Powders; noncombustible; plastic bottles or jars up to 1-gallon capacity; cartoned	Class IV
Textile materials and products	Cloth; natural fibers; baled	Class III
	Cloth; synthetic cloth	Class IV
	Clothing; natural fibers (such as wool, cotton) and viscose	Class III
	Cotton; cartoned	Class III
	Diapers; cotton or linen	Class III
	Diapers; plastic or nonwoven fabric; cartoned	Class IV
	Diapers; plastic or nonwoven fabric; plastic-wrapped; uncartoned	High-hazard (Group A unexpanded)
	Fabric; rayon and nylon	Class IV
	Fabric; synthetic (except rayon and nylon); greater than 50/50 blend	High-hazard (Group A unexpanded)
	Fabric; synthetic (except rayon and nylon); up to 50/50 blend	Class III
	Fabric; vinyl-coated (such as tablecloth); cartoned	High-hazard (Group A unexpanded)
	Fibers; rayon and nylon; baled	Class IV
	Fibers; synthetic (except rayon and nylon); baled	High-hazard (Group A unexpanded)
	Thread or yarn; rayon and nylon; wood or paper spools	Class IV
	Thread or yarn; rayon or nylon; plastic spools	High-hazard (Group A unexpanded)
Thread or yarn; synthetic (except rayon and nylon); greater than 50/50 blend; paper or wood spools	Class IV	

	Thread or yarn; synthetic (except rayon and nylon); greater than 50/50 blend; plastic spools	High-hazard (Group A unexpanded)
	Thread or yarn; synthetic (except rayon and nylon); up to 50/50 blend; plastic spools	High-hazard (Group A unexpanded)
	Thread or yarn; synthetic (except rayon and nylon); up to 50/50 blend; wood or paper spools	Class III
Wax products	Candles	High-hazard (Group A expanded)
	Paraffin or petroleum wax; blocks	High-hazard (Group A expanded)
Wire, cable, spools	Spools; plastic; empty	High-hazard (Group A unexpanded)
	Spools; wood; empty	Class III
	Wire or cable; PVC insulated; metal or wood spools	Class II
	Wire or cable; PVC insulated; plastic spools	Class IV
	Wire; bare; metal spools; uncartoned	Class I
	Wire; bare; metal spools; cartoned	Class II
	Wire; bare; plastic spools; cartoned	Class IV
	Wire; bare; plastic spools; uncartoned	High-hazard (Group A unexpanded)
	Wire; bare; wood or cardboard spools	Class II
Wood products	Wood patterns	Class IV
	Wood products (such as fiberboard, lumber, particle board, plywood, pressboard with smooth ends and edges); bundled solid blocks	Class II
	Wood products (such as fiberboard, lumber, particle board, plywood, pressboard with smooth ends and edges); unbundled or nonsolid blocks	Class III
	Wood products (such as toothpicks, clothespins and hangers)	Class III

For SI: 1 inch = 25.4 mm, 1 gallon = 3.8 L, 1 ounce = 29.57 ml.

Reason:

This proposal adds lithium-ion batteries to Table 3203.8 of the IFC. Lithium-ion batteries will burn vigorously and initial laboratory testing has indicated they will present a challenging fire in storage arrangements. Presently the code lacks guidance on the protection levels necessary for the storage of this product. By classifying lithium-ion batteries as a high-hazard commodity, the user now has a clear commodity to apply to Table 3206.2 for general fire protection and life safety systems when lithium-ion batteries are stored.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

With the commodity in the IFC, the designer no longer needs to provide the code official documentation to classify the commodity.

Internal ID: 753

F252-18

IFC: FIGURE 3203.9(1), FIGURE 3203.9(2)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

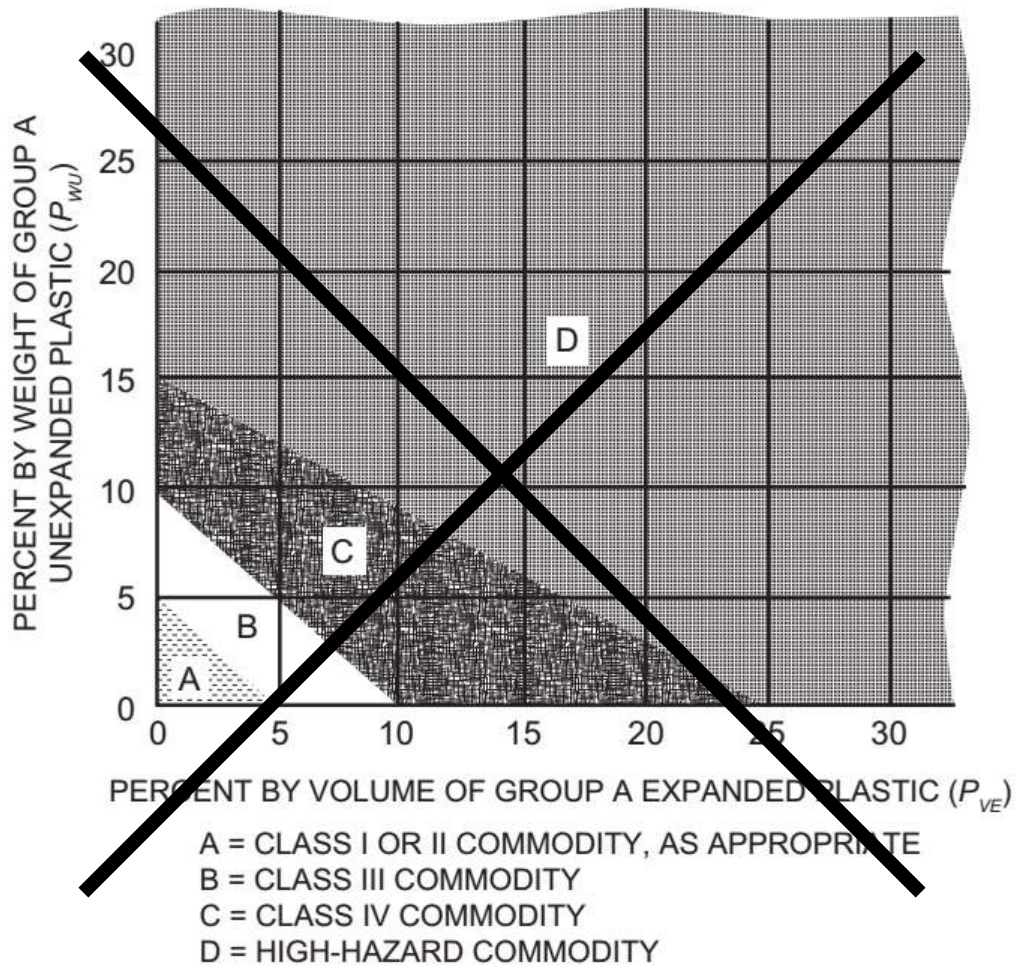

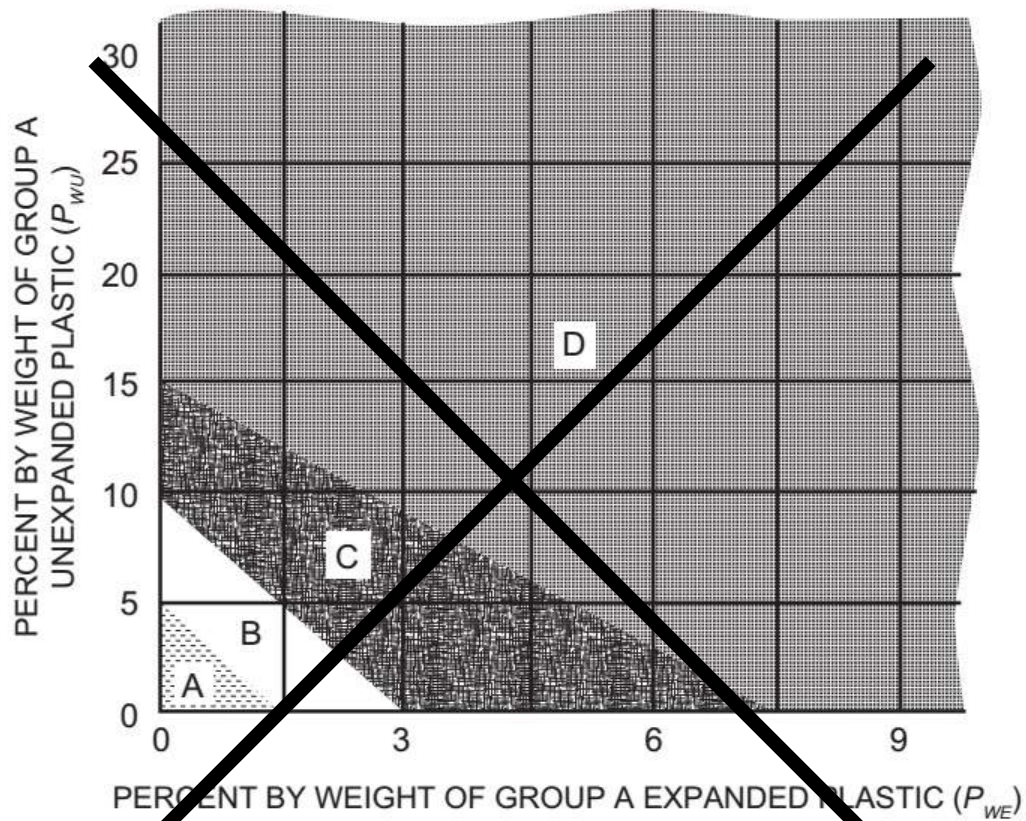

FIGURE 3203.9(1)
EVALUATION BY VOLUME OF GROUP A EXPANDED PLASTICS IN MIXED COMMODITIES^{a, b}

- A = CLASS I OR II COMMODITY, AS APPROPRIATE
- B = CLASS III COMMODITY
- C = CLASS IV COMMODITY
- D = HIGH-HAZARD COMMODITY

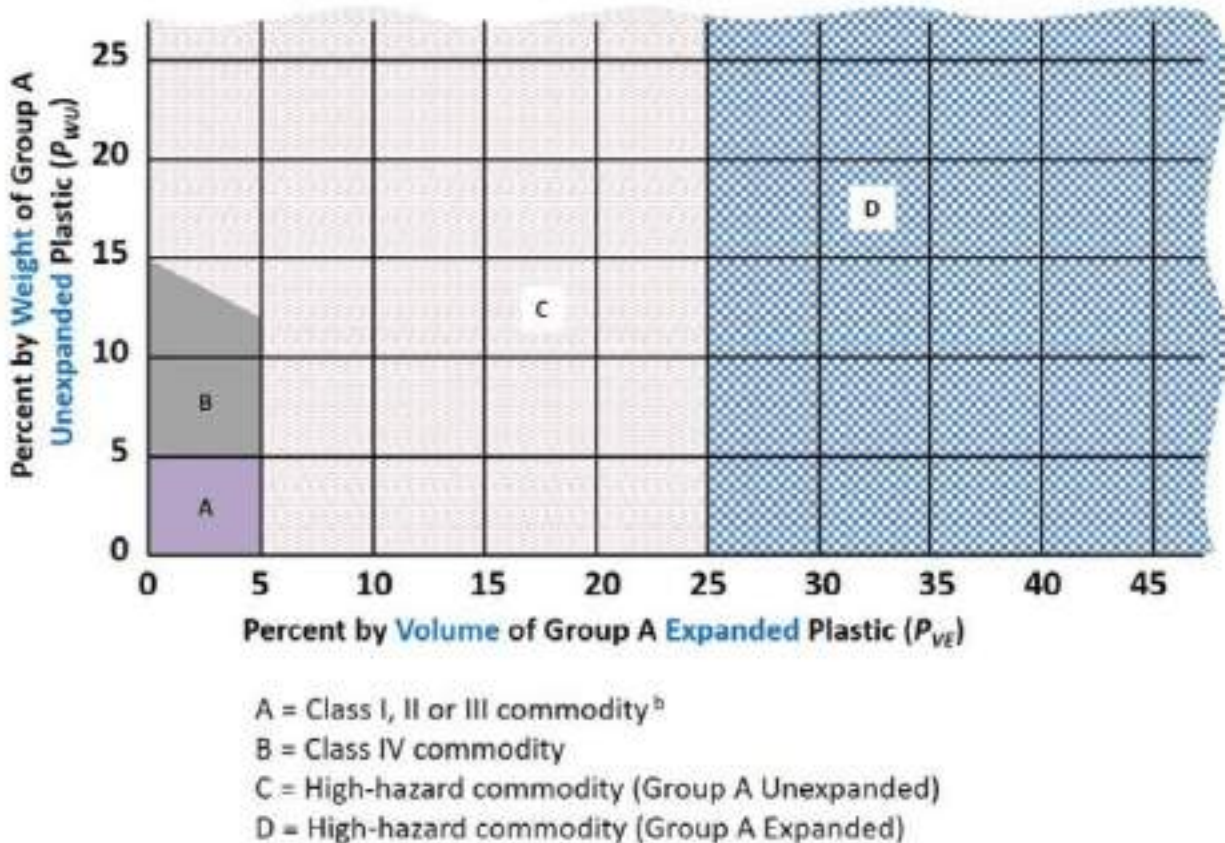

FIGURE 3203.9(2)
EVALUATION BY WEIGHT OF GROUP A EXPANDED PLASTICS IN MIXED COMMODITIES^{a, b, c}

Reason:

During the 2018 IFC code cycle, the FCAC Ch 32 working group submitted changes to these tables that to correlate closer with the 2016 NFPA 13. These changes adjust the tables in the 2021 IFC to match the 2019 edition of NFPA 13. The only difference from the IFC to NFPA 13 are the amounts of plastic in Class I and II plastics. The IFC will permit small amount of plastic in Class I and II commodities whereas NFPA 13 moves any Class I or II commodity with any amount of plastic into a Class III commodity. The FCAC justifies the small amount of plastic in Class I and II commodities to accomodate for existing systems and new systems.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

The IFC will allow small amounts of plastic in Class I and II commodities. This will lower fire protection costs (design, water supply, etc) versus designing to NFPA 13, which classifies any amount of plastic as a Class III commodity.

F253-18

IFC: 3205.1 (New)

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

2018 International Fire Code

Add new text as follows:

3205.1 Storage layout plan maintenance. The approved storage layout shall be verified and evaluated annually in accordance with Section 3201.3.2. Modifications or changes to the provisions of the approved storage layout shall not be made without prior approval of the fire code official.

Reason:

In the 2018 IFC, FCAC included a nine-item list and floor plan placard requirement for high-piled storage in Section 3201.3.2. This proposal correlates this new requirement to the housekeeping and maintenance section in 3205.

The storage layout floor plan in 3201.3.2 includes the following, 1) location and dimension of racks, 2) design storage height, 3) types of commodities, 4) commodity clearances, 5) aisle dimensions, 6) pile volume, 7) location and classification of commodities, 8) location of fire department access doors and 9) location of water supply valves. While these items are on a floor plan installed on new projects, there is essentially no follow up to verify that the floor plan remains or the items contained within are maintained or followed to the degree that this section on housekeeping exists.

This proposal does take the requirements in Section 3205 further by:

1. requiring a annual inspection to verify the floor plan placard still exists and to evaluate the floor plan contents to the actual storage conditions. An annual inspection could correlate with an operational permit, or other annual inspections (that exist throughout the fire code).
2. triggers checking with the fire code official is made prior to any modifications to the floor plan. This is similar to other plans (such as lease plans, door removals, etc.) that adds an additional level of communication between the storage management and the local fire code official.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Correlating. The layout storage plan is expected to be maintained.

Internal ID: 1482

F254-18

IFC: 3205.4

Proponent: Mark Chubb, Telgian Corp., representing Telgian Corp. (mchubb@telgian.com)

2018 International Fire Code

Add new text as follows:

3205.4 Aisle maintenance. When restocking is not being conducted, aisles shall be kept clear of storage, waste material and debris. Fire department access doors, aisles and *exit* doors shall not be obstructed. During restocking operations using manual stocking methods, a minimum unobstructed aisle width of 24 inches (610 mm) shall be maintained in 48-inch (1219 mm) or smaller aisles, and a minimum unobstructed aisle width of one-half of the required aisle width shall be maintained in aisles greater than 48 inches (1219 mm). During mechanical stocking operations, a minimum unobstructed aisle width of 44 inches (1118 mm) shall be maintained in accordance with Section 3206.10.

Exception: In high-piled combustible storage protected by automatic sprinkler systems designed and installed to deliver 0.60 gpm/sq ft over the most remote 2,000 sq ft and not less than 0.70 gpm/sq ft from the four most demanding sprinklers in accordance with 903.3.1.1, displays and wing stacks not exceeding 48-inches in height provided they do not obstruct or reduce the clear width of the aisle to less than 48-inches...

Reason:

The proposed exception recognizes and incorporates language consistent with the provisions of NFPA 13--2016, 20.3.1(13), which represent the most prevalent fire protection design criteria for many big box retail facilities. Extensive large-scale fire testing demonstrates that such displays do not compromise the effectiveness of sprinkler systems to control or extinguish fires in high-piled combustible storage when sprinkler systems satisfy these criteria.

Bibliography:

NFPA 13, Standard for the Installation of Sprinkler Systems, 2016 edition. Quincy, MA: National Fire Protection Association.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Although the proposed change will not increase or decrease the cost of construction, it will facilitate operations that increase retail revenue in facilities that satisfy the specified fire protection design criteria.

Internal ID: 445

F256-18

IFC: TABLE 3206.2

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

**TABLE 3206.2
GENERAL FIRE PROTECTION AND LIFE SAFETY REQUIREMENTS**

COMMODITY CLASS	SIZE OF HIGH-PILED STORAGE AREA ^a (square feet) (see Sections 3206.2 and 3206.3)	ALL STORAGE AREAS (See Sections 3206, 3207 and 3208) ^b				SOLID-PILED STORAGE, SHELF STORAGE AND PALLETIZED STORAGE (see Section 3207.3)		
		Automatic fire-extinguishing system (see Section 3206.4)	Fire detection system (see Section 3206.5)	Fire department access doors (see Section 3206.7)	Smoke and heat removal (see Section 3206.8)	Maximum pile dimension ^c (feet)	Maximum permissible storage height ^d (feet)	Maximum pile volume (cubic feet)

	2,501-12,000 Not open to the public (Option 1)	Yes	Not Required	Not Required ^e	Not Required	120	40	400,000
	2,501-12,000 Not open to the public (Option 2)	Not Required ^e	Yes	Yes	Yes ^{h, i}	120	30 ^e	200,000
	12,001-500,000	Yes	Not Required	Yes	Yes ^{h, i}	120	40	400,000
	Greater than 500,000	Yes	Not Required	Yes	Yes ^{h, i}	120	40	400,000
High hazard	0-500	Not Required ^e	Not Required	Not Required ^e	Not Required	60	Not Required	Not Required
	501-2,500 Open to the public	Yes	Not Required	Not Required ^e	Not Required	60	30	75,000
	501-2,500 Not open to the public (Option 1)	Yes	Not Required	Not Required ^e	Not Required	60	30	75,000
	501-2,500 Not open to the public (Option 2)	Not Required ^e	Yes ^f	Yes	Yes ^{h, i}	60	20	50,000
	2,501-300,000	Yes	Not Required	Yes	Yes ^{h, i}	60	30	75,000
	Greater than 300,000 ^f	Yes	Not Required	Yes	Yes ^{h, i}	60	30	75,000

For SI: 1 foot = 304.8 mm, 1 cubic foot = 0.02832 m³ , 1 square foot = 0.0929 m².

- a. Where automatic sprinklers are required for reasons other than those in Chapter 32, the portion of the sprinkler system protecting the high-piled storage area shall be designed and installed in accordance with Sections 3207 and 3208.
- b. For aisles, see Section 3206.10.
- c. Piles shall be separated by aisles complying with Section 3206.10.
- d. For storage in excess of the height indicated, special fire protection shall be provided in accordance with Note f where required by the fire code official. See Chapters 51 and 57 for special limitations for aerosols and flammable and combustible liquids, respectively.
- e. For storage exceeding 30 feet in height, Option 1 shall be used.
- f. Special fire protection provisions including, but not limited to, fire protection of exposed steel columns; increased sprinkler density; additional in-rack sprinklers, without associated reductions in ceiling sprinkler density; or ~~additional~~ fire department hose connections shall be provided where required by the fire code official.
- g. Not required where an automatic fire-extinguishing system is designed and installed to protect the high-piled storage area in accordance with Sections 3207 and 3208.
- h. Not required where storage areas are protected by either early suppression fast response (ESFR) sprinkler systems or control mode special application sprinklers with a response time index of 50 (m • s)^{1/2} or less that are listed to control a fire in the stored commodities with 12 or fewer sprinklers, installed in accordance with NFPA 13.
- i. Not required in frozen food warehouses used solely for storage of Class I and II commodities where protected by an approved automatic sprinkler system.

Reason:

For high-hazard commodities in large (300,000-500,000 sq. ft.) the code gives the code official broad latitude to require “special fire protection provisions.” The change clarifies that the code official may require approved hose station outlets of any size and in any location he or she feels is necessary in accordance with the stored commodity.

Earlier editions of the International Fire Code included requirements for host stations in rack storage arrays. The existing language: “additional” fire department hose connections implies they may be required and were editorially omitted.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

This change decreases the cost of construction from arbitrarily adding hose connections.

Internal ID: 790

F258-18

IFC: 3206.3.1

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

3206.3.1 Size of high-piled storage area. The size of each *high-piled storage area* shall include the footprint of the actual high-piled storage racks, shelves or piles and the following aisles:

1. Interior aisles within the footprint of the storage area.
2. An aisle around the perimeter of the footprint with a minimum width as required in Section 3206.10.1 or the dimension to a ~~wall~~ or full height wall, whichever is less.

Reason:

This proposal revises Item 2 to specify that the dimension referenced to a full height wall rather than a partial height wall. Even though the section does not state "partial height wall", when it lists "wall or full height wall" it can mistakenly be misapplied to a partial height wall. Removing this term will eliminate the potential confusion.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Clarification with no change in code requirements.

Internal ID: 2351

F259-18

IFC: 3208.1.1 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows:

3208.1.1 Storage Racks. The design and installation of storage racks shall be in accordance with the International Building Code.

Reason:

The change proposal is intended to correlate the IFC to the IBC provisions for steel storage racks. Rack systems installed without considering the design load or anchoring of the structural system can present a collapse hazard to building occupants and emergency responders. Racks without anchors can be overturned, causing collapse of stored pallet loads and the rack structure.

The design, erection and anchoring of steel storage racks constructed from cold-rolled and hot-rolled steel is regulated in Chapters 17 (Special Inspections) and 22 (Steel) of the IBC. Section 2209 requires the design of rack systems comply with Rack Manufacturers Institute MH16.1-08, "Specification for Design, Testing and Utilization of Industrial Steel Racks", an ANSI compliant standard. This standard establishes requirements for the design of the racks to resist gravity loads and external loads such as seismic events. The standard also requires an evaluation of the building foundation to determine it can support the design loads and provide sufficient strength for anchoring. A permanent plaque on each rack is required that indicates the maximum allowable load for each rack tier.

ANSI/MH 16.1 requires the rack owner to maintain the racks in accordance with the approved design and Section 1.4. This section addresses rack loading, proper load placement on the rack, maintaining pallets, and replacement of damaged rack components. The installation of concrete anchors requires a Special Inspection in accordance with IBC Table 1705.3. It is important to recognize that item 4 in IBC Table 1705.3 prescribes that anchors installed in hardened concrete members require evaluation for compliance with American Concrete Institute 335.2, Qualification of Post-Installed Mechanical Anchors in Concrete & Commentary. Compliance is achieved in the IBC when the designer specifies anchors that have been evaluated by and received an evaluation report from ICC Evaluation Services.

The provision provides the Fire Code Official with a mechanism for dealing with rack installations that are installed without a building permit. The provisions in RMI MH16.1 also establishes maximum deflection limits that can be used to determine if a rack is overloaded and establishes requirements mandating the owner maintain the rack in accordance with the standard.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Proposal is meant for correlation between IFC and IBC.

Internal ID: 788

F260-18

IFC: 3209.4, 3209.4.1 (New), 3209.4.2 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

3209.4 Automated rack storage. *High-piled storage areas with greater than 500 square feet (46m²) of automated rack storage shall be provided with a manually activated emergency shutdown switch for use by emergency personnel. The switch shall be clearly identified and shall be in a location approved by the fire code official. and automatic shutdown in accordance with Sections 3209.4.1 and 3209.4.2.*

Add new text as follows:

3209.4.1 Manual Activated Shut Down. A manually activated switch shall be provided to initiate the approved automatic shutdown process. The switch shall be clearly identified and shall be in a location approved by the fire code official.

3209.4.2 Automatic Shut Down. The approved automatic shutdown process shall commence upon any of the following events:

1. Water flow is detected in the automatic sprinkler system, if present.
2. Activation of the fire detection system, if present.

Reason:

This proposal breaks down the charging language into two subsections and adds the option for an automatic shutdown process for automated storage. The approved manual or automatic shutdown process is left to each code official but the term "approved" and "process" here allows for each shutdown to cycle the automated system to a safe place.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will decrease the cost of construction .

Each automated facility has shut down processes. This proposal allows the code official to be involved in the approval of the shutdown process.

Internal ID: 188

For SI: 1 cubic foot = 0.023 m³.

Add new standard(s) follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

232--17:

Standard for the Protection of Records

Reason:

NFPA 232 is a new referenced standard for the IFC. Adding NFPA 232 provides additional criteria for records storage that is not addressed by the IFC. This reference is needed for a path to get to NFPA 232, as it is not a referenced standard through NFPA 13.

Bibliography:

Standard for the Protection of Records, NFPA 232, 2017, www.nfpa.org/232

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Correlation to correct standard.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 232--17 Standard for the Protection of Records, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Internal ID: 799

F262-18 Part I

IFC: Chapter 33

Proponent: Paul Coats, American Wood Council, representing American Wood Council (pcoats@awc.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IBC-G COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

CHAPTER 33 FIRE SAFETY DURING CONSTRUCTION AND DEMOLITION

SECTION 3301 GENERAL

3301.1 Scope. This chapter shall apply to structures in the course of construction, *alteration* or demolition, including those in underground locations. ~~Compliance with NFPA 241 is required for items not specifically addressed herein.~~

3301.2 Purpose. This chapter prescribes minimum safeguards for construction, *alteration* and demolition operations to provide reasonable safety to life and property from fire during such operations.

3302 REQUIREMENTS

3302.1 Requirements. Fire safety during construction and demolition shall be in accordance with Chapter 33 of the International Building Code. Compliance with NFPA 241 is required for items not specifically addressed therein.

Delete without substitution:

Proponent: Paul Coats, American Wood Council, representing American Wood Council (pcoats@awc.org)

2018 International Building Code

Revise as follows:

CHAPTER 33 SAFEGUARDS AND FIRE PREVENTION DURING CONSTRUCTION

SECTION 3301 GENERAL

3301.1 Scope. The provisions of this chapter shall govern safety during construction, alteration, and demolition operations, including structures in underground locations, and the protection of adjacent public and private properties. Compliance with NFPA 241 is required for items not specifically addressed herein.

3301.2 Purpose. This chapter prescribes minimum safeguards for construction, alteration and demolition operations, including minimum safeguards to provide reasonable safety to life and property from fire during such operations.

~~**3301.2**~~**3301.3 Storage and placement.** Construction equipment and materials shall be stored and placed so as not to endanger the public, the workers or adjoining property for the duration of the construction project.

SECTION 3302 CONSTRUCTION SAFEGUARDS

~~**3302.3 Fire safety during construction.** Fire safety during construction shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the International Fire Code.~~

SECTION 3303 DEMOLITION

Delete without substitution:

~~**3303.7 Fire safety during demolition.** Fire safety during demolition shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the International Fire Code.~~

SECTION 3309 TEMPORARY HEATING EQUIPMENT

Add new text as follows:

3309.1 Listed. Temporary heating devices shall be listed and labeled. The installation, maintenance and use of temporary heating devices shall be in accordance with the listing and the manufacturer's instructions.

3309.2 Oil-fired heaters. Oil-fired heaters shall comply with Section 603 of the International Fire Code.

3309.3 LP-gas heaters. Fuel supplies for liquefied-petroleum gas-fired heaters shall comply the International Fuel Gas Code and Chapter 61 of the International Fire Code.

3309.4 Refueling. Refueling operations for liquid-fueled equipment or appliances shall be conducted in accordance with Section 5705 of the International Fire Code. The equipment or appliance shall be allowed to cool prior to refueling.

3309.5 Installation. Clearance to combustibles from temporary heating devices shall be maintained in accordance with the labeled equipment. When in operation, temporary heating devices shall be fixed in place and protected from damage, dislodgement or overturning in accordance with the manufacturer's instructions.

3309.6 Supervision. The use of temporary heating devices shall be supervised and maintained only by competent personnel.

SECTION 3310 PRECAUTIONS AGAINST FIRE

3310.1 Smoking. Smoking shall be prohibited except in areas approved by the fire code official. Signs shall be posted in accordance with Section 310 of the International Fire Code. In areas approved by the fire code official where

smoking is permitted, ashtrays approved by the fire code official shall be provided in accordance with Section 310 of the International Fire Code.

3310.2 Combustible debris, rubbish and waste. Combustible debris, rubbish and waste material shall comply with the requirements of Sections 3310.2.1 through 3310.2.4.

3310.2.1 Combustible waste material accumulation. Combustible debris, rubbish and waste material shall not be accumulated within buildings.

3310.2.2 Combustible waste material removal. Combustible debris, rubbish and waste material shall be removed from buildings at the end of each shift of work.

3310.2.3 Rubbish containers. Where rubbish containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m³) are used for temporary storage of combustible debris, rubbish and waste material, they shall have tightfitting or self-closing lids. Such rubbish containers shall be constructed entirely of materials that comply with either of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation.

3310.2.4 Spontaneous ignition. Materials susceptible to spontaneous ignition, such as oily rags, shall be stored in a listed disposal container.

3310.3 Burning of combustible debris, rubbish and waste. Combustible debris, rubbish and waste material shall not be disposed of by burning on the site unless approved by the fire code official.

3310.4 Open burning. Open burning shall comply with Section 307 of the International Fire Code.

3310.5 Fire watch. Where required by the fire code official or the prefire plan established in accordance with Section 3314.3, a fire watch shall be provided for building demolition and for building construction that is hazardous in nature, such as temporary heating or hot work.

3310.5.1 Fire watch during construction. Where required by the fire code official, a fire watch shall be provided during nonworking hours for new construction that exceeds 40 feet (12 192 mm) in height above the lowest adjacent grade.

3310.5.2 Fire watch personnel. Trained personnel shall be provided to serve as an on-site fire watch. Fire watch personnel shall be provided with not fewer than one means for notification of the fire department which is acceptable to the fire code official, and the sole duty of such personnel shall be to perform constant patrols and watch for the occurrence of fire. The combination of fire watch duties and site security duties is acceptable. Fire watch personnel shall be trained in the use of portable fire extinguishers.

3310.5.3 Fire watch location and records. The fire watch shall include areas specified by the prefire plan established in accordance with Section 3314.3. The fire watch personnel shall keep a record of all time periods of duty, including a log entry each time the site was patrolled and each time a structure under construction was entered and inspected. The records and log entries shall be made available for review by the fire code official upon request.

3310.6 Cutting and welding. Welding, cutting, open torches and other hot work operations and equipment shall comply with Chapter 35 of the International Fire Code.

3310.7 Electrical. Temporary wiring for electrical power and lighting installations used in connection with the construction, alteration or demolition of buildings, structures, equipment or similar activities shall comply with NFPA 70.

3310.8 Cooking. Cooking shall be prohibited except in designated cooking areas approved by the fire code official. Signs with a minimum letter height of 3 inches (76 mm) and a minimum brush stroke of 1/2 inch (13 mm) shall be posted in conspicuous locations in designated cooking areas and state:

DESIGNATED COOKING AREA

COOKING OUTSIDE OF A DESIGNATED COOKING

AREA IS PROHIBITED

SECTION 3311 FLAMMABLE AND COMBUSTIBLE LIQUIDS

3311.1 Storage of flammable and combustible liquids. Storage of flammable and combustible liquids shall be in accordance with Section 5704 of the International Fire Code.

3311.2 Class I and Class II liquids. The storage, use and handling of flammable and combustible liquids at construction sites shall be in accordance with Section 5706.2 of the International Fire Code. Ventilation shall be provided for operations involving the application of materials containing flammable solvents.

3311.3 Housekeeping. Flammable and combustible liquid storage areas shall be maintained clear of combustible vegetation and waste materials. Such storage areas shall not be used for the storage of combustible materials.

3311.4 Precautions against fire. Sources of ignition and smoking shall be prohibited in flammable and combustible liquid storage areas. Signs shall be posted in accordance with Section 310 of the International Fire Code.

3311.5 Handling at point of final use. Class I and II liquids shall be kept in safety containers approved by the fire code official.

3311.6 Leakage and spills. Leaking vessels shall be immediately repaired or taken out of service and spills shall be cleaned up and disposed of properly.

SECTION 3312 FLAMMABLE GASES

3312.1 Storage and handling. The storage, use and handling of flammable gases shall comply with Chapter 58 of the International Fire Code.

3312.2 Cleaning with flammable gas. Flammable gases shall not be used to clean or remove debris from piping open to the atmosphere.

3312.2.1 Pipe cleaning and purging. The cleaning and purging of flammable gas piping systems, including cleaning new or existing piping systems, purging piping systems into service and purging piping systems out of service, shall comply with NFPA 56.

Exceptions:

1. Compressed gas piping systems other than fuel gas piping systems where in accordance with Chapter 53 of the International Fire Code.
2. Piping systems regulated by the International Fuel Gas Code.
3. Liquefied petroleum gas systems in accordance with Chapter 61 of the International Fire Code.

SECTION 3313 EXPLOSIVE MATERIALS

3313.1 Storage and handling. Explosive materials shall be stored, used and handled in accordance with Chapter 56 of the International Fire Code.

3313.2 Supervision. Blasting operations shall be conducted in accordance with Chapter 56 of the International Fire Code.

3313.3 Demolition using explosives. Fire hoses approved by the fire code official for use by demolition personnel shall be maintained at the demolition site wherever explosives are used for demolition. Such fire hoses shall be connected to an water supply approved by the fire code official and shall be capable of being brought to bear on post-detonation fires anywhere on the site of the demolition operation.

SECTION 3314 OWNER'S RESPONSIBILITY FOR FIRE PROTECTION

3314.1 Program development and maintenance. The owner or owner's authorized agent shall be responsible for the development, implementation and maintenance of a written plan establishing a fire prevention program at the project site applicable throughout all phases of the construction, repair, alteration or demolition work. The plan shall address the requirements of this chapter and other applicable portions of this code, the duties of staff, and staff training requirements. The plan shall be made available for review by the fire code official upon request.

3314.2 Program superintendent. The owner shall designate a person to be the fire prevention program

superintendent who shall be responsible for the fire prevention program and ensure that it is carried out through completion of the project. The fire prevention program superintendent shall have the authority to enforce the provisions of this chapter and other provisions as necessary to secure the intent of this chapter. Where guard service is provided in accordance with NFPA 241, the superintendent shall be responsible for the guard service.

3314.3 Prefire plans. The fire prevention program superintendent shall develop and maintain an prefire plan approved by the fire code official and in cooperation with the fire chief. The fire chief and the fire code official shall be notified of changes affecting the utilization of information contained in such prefire plans.

3314.4 Training. Training of responsible personnel in the use of fire protection equipment shall be the responsibility of the fire prevention program superintendent. Records of training shall be kept and made a part of the written plan for the fire prevention program.

3314.5 Fire protection devices. The fire prevention program superintendent shall determine that all fire protection equipment is maintained and serviced in accordance with this code. The quantity and type of fire protection equipment shall be approved by the fire code official. Fire protection equipment shall be inspected in accordance with the fire protection program.

3314.6 Hot work operations. The fire prevention program superintendent shall be responsible for supervising the permit system for hot work operations in accordance with Chapter 35 of the International Fire Code.

3314.7 Impairment of fire protection systems. Impairments to any fire protection system shall be in accordance with Section 901 of the International Fire Code.

3314.7.1 Smoke detectors and smoke alarms. Smoke detectors and smoke alarms located in an area where airborne construction dust is expected shall be covered to prevent exposure to dust or shall be temporarily removed. Smoke detectors and alarms that were removed shall be replaced upon conclusion of dust-producing work. Smoke detectors and smoke alarms that were covered shall be inspected and cleaned, as necessary, upon conclusion of dust-producing work.

3314.8 Temporary covering of fire protection devices. Coverings placed on or over fire protection devices to protect them from damage during construction processes shall be immediately removed upon the completion of the construction processes in the room or area in which the devices are installed.

SECTION 3315 FIRE REPORTING

3315.1 Emergency telephone. Emergency telephone facilities with ready access shall be provided in an a location approved by the fire code official at the construction site, or an equivalent means of communication approved by the fire code official shall be provided. The street address of the construction site and the emergency telephone number of the fire department shall be posted adjacent to the telephone. Alternatively, where an equivalent means of communication has been approved by the fire code official, the site address and fire department emergency telephone number shall be posted at the main entrance to the site, in guard shacks and in the construction site office.

SECTION 3316 ACCESS FOR FIRE FIGHTING

3316.1 Required access. Vehicle access approved by the fire code official for firefighting shall be provided to all construction or demolition sites. Vehicle access shall be provided to within 100 feet (30 480 mm) of temporary or permanent fire department connections. Vehicle access shall be provided by either temporary or permanent roads, capable of supporting vehicle loading under all weather conditions. Vehicle access shall be maintained until permanent fire\ apparatus access roads are available.

3316.2 Key boxes. Key boxes shall be provided as required by Chapter 5 of the International Fire Code.

SECTION 3309-3317 FIRE EXTINGUISHERS

[F] 3309-13317.1 Where required. Structures under construction, alteration or demolition shall be provided with not fewer than one ~~approved~~ portable fire extinguisher in accordance with Section 906, approved by the building official and the fire code official, and sized for not less than ordinary hazard as follows:

1. At each *stairway* on all floor levels where combustible materials have accumulated.
2. In every storage and construction shed.

3. Additional portable fire extinguishers shall be provided where special hazards exist, such as the storage and use of flammable and combustible liquids.

Delete without substitution:

~~[F] 3309.2 Fire hazards.~~ The provisions of this code and the International Fire Code shall be strictly observed to safeguard against all fire hazards attendant upon construction operations.

SECTION 3310-3318 MEANS OF EGRESS

~~3310.13318.1 Stairways required.~~ Where building construction exceeds 40 feet (12 192 mm) in height above the lowest level of fire department vehicle access, a temporary or permanent *stairway* shall be provided. As construction progresses, such *stairway* shall be extended to within one floor of the highest point of construction having secured decking or flooring.

~~[F] 3310.23318.2 Maintenance of means of egress.~~ ~~Means Required~~ *means of egress* and required accessible *means of egress* shall be maintained at all times during construction, demolition, remodeling or *alterations* and *additions* to any building.

Exception: Existing *means of egress* need not be maintained where approved

temporary *means of egress* and temporary accessible means of egress systems and facilities, approved by the building official and the fire code official, are provided.

SECTION 3311-3319 STANDPIPES

~~[F] 3311.13319.1 Where required.~~ In buildings required to have standpipes by Section 905.3.1, not fewer than one standpipe shall be provided for use during construction. Such standpipes shall be installed prior to construction exceeding 40 feet (12 192 mm) in height above the lowest level of fire department vehicle access. Such standpipes shall be provided with fire department hose connections at locations adjacent to *stairways* complying with Section ~~3310.1-3318.1.~~ As construction progresses, such standpipes shall be extended to within one floor of the highest point of construction having secured decking or flooring.

~~[F] 3311.23319.2 Buildings being demolished.~~ Where a building is being demolished and a standpipe exists within such a building, such standpipe shall be maintained in an operable condition so as to be available for use by the fire department. Such standpipe shall be demolished with the building but shall not be demolished more than one floor below the floor being demolished.

~~[F] 3311.33319.3 Detailed requirements.~~ Standpipes shall be installed in accordance with the provisions of Chapter 9.

Exception: Standpipes shall be either temporary or permanent in nature, and with or without a water supply, provided that such standpipes conform to the requirements of Section 905 as to capacity, outlets and materials.

SECTION 3312-3320 AUTOMATIC SPRINKLER SYSTEM

~~[F] 3312.13320.1 Completion before occupancy.~~ In buildings where an *automatic sprinkler system* is required by this code or the International Fire Code, it shall be unlawful to occupy any portion of a building or structure until the *automatic sprinkler system* installation has been tested and approved by the building and fire code official, except as provided in Section ~~111.3-111.3~~ of this code or Section 105.3.4 of the International Fire Code.

~~[F] 3312.23320.2 Operation of valves.~~ Operation of sprinkler control valves shall be permitted only by properly authorized personnel and shall be accompanied by notification of duly designated parties. When the sprinkler protection is being regularly turned off and on to facilitate connection of newly completed segments, the sprinkler control valves shall be checked at the end of each work period to ascertain that protection is in service.

SECTION 3313-3321 WATER SUPPLY FOR FIRE PROTECTION

~~[F] 3313.13321.1 Where required.~~ ~~An~~ ~~A~~ ~~approved~~ water supply for fire protection, either temporary or permanent, shall be approved by the building official and fire code official and made available as soon as combustible material arrives on the site.

SECTION 3314 FIRE WATCH DURING CONSTRUCTION

SECTION 3322 MOTORIZED CONSTRUCTION EQUIPMENT

3322.1 Conditions of use. Internal-combustion-powered construction equipment shall be used in accordance with all of the following conditions:

1. Equipment shall be located so that exhausts do not discharge against combustible material.
2. Exhausts shall be piped to the outside of the building.
3. Equipment shall not be refueled while in operation.
4. Fuel for equipment shall be stored in an area outside of the building which is approved by the fire code official.

SECTION 3323 SAFEGUARDING ROOFING OPERATIONS

3323.1 General. Roofing operations utilizing heat-producing systems or other ignition sources shall be conducted in accordance with Sections 3323.2 and 3323.3 and Chapter 35 of the International Fire Code.

3323.2 Asphalt and tar kettles. Asphalt and tar kettles shall be operated in accordance with Section 303 of the International Fire Code.

3323.3 Fire extinguishers for roofing operations. Fire extinguishers shall comply with Section 906. There shall be not less than one multiple-purpose portable fire extinguisher with a minimum 3-A 40-B:C rating on the roof being covered or repaired.

CHAPTER 35 REFERENCED STANDARDS

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

56--17:

Standard for Fire and Explosion Prevention during Cleaning and Purging of Flammable Gas Piping Systems

241--13:

Standard for Safeguarding Construction, Alteration, and Demolition Operations

Reason:

This change takes the current requirements of Chapter 33 of the IFC and incorporates them into Chapter 33 of the IBC. It makes no changes in technical requirements and retains all requirements of both codes. Explanations of each editorial change is given section by section at the end of this reason statement.

The purview of the fire code committee for sections currently under their purview (indicated by an “[F]” before the appropriate sections), and the authority of the fire code official where the fire code official’s approval is currently required, are preserved. The practice of having key fire safety provisions in the IBC that are maintained by the IFC committee and enforced by the fire code official is already established. Many provisions of Chapter 9 do this.

Requirements for fire safety are currently found in both the IBC and the IFC, with considerable overlap. For instance, requirements for fire extinguishers, means of egress, standpipes, sprinkler systems, and water supply are currently in both codes.

Most significant construction fires are the result of noncompliance with current code requirements. The consolidation of these chapters into the IBC will reduce the likelihood of code violations leading to fire, and will be beneficial for several other reasons. First, there are jurisdictions that do not adopt the IFC and the requirements will be more accessible to them. Second, enforcement activities for key provisions such as fire watches, a fire prevention program superintendent and plan, temporary heating equipment safety, cooking areas, rubbish and debris disposal, hot work precautions, roofing precautions, and access for firefighting—all which appear in the IFC but not the IBC—are less likely to be neglected. Third, problems in correlation of overlapping requirements will be eliminated.

Here is a section-by-section explanation of modifications:

Chapter 33 title: changed to reflect the inclusion of IFC fire safety provisions.

3301.1: General: the scope is expanded to include the current scope of the Chapter 33 of the IFC, including required compliance with NFPA 241 for items not specifically addressed.

3301.2: Purpose: the IBC currently has no Purpose section, this is brought over from the IFC and modified to make it clear that fire safety is one purpose among others.

3301.3 Storage and placement: renumbering only.

3302.3 Fire safety during construction: deleted since requiring compliance with Chapter 33 of the IFC is no longer necessary; all the fire safety provisions of Chapter 33 of the IFC are being added here.

3303.7 Fire safety during demolition: deleted since requiring compliance with Chapter 33 of the IFC is no longer necessary; all the fire safety provisions of Chapter 33 of the IFC are being added here.

3309 TEMPORARY HEATING EQUIPMENT: all subsections 3309.1 through 3309.6 are unchanged from parallel provisions in Section 3303 of the IFC, except to add references to the IFC where appropriate.

3310 PRECAUTIONS AGAINST FIRE: all subsections 3310.1 through 3310.8 are unchanged from parallel provisions in Section 3304 of the IFC, except to add reference to the IFC where appropriate and editorial modifications to preserve the authority of the fire code official in subsections 3310.1, 3310.3, 3310.5.2, and 3310.8.

3311 FLAMMABLE AND COMBUSTIBLE LIQUIDS: all subsections 3311.1 through 3311.6 are unchanged from parallel provisions in Section 3305 of the IFC, except to add references to the IFC where appropriate.

3312 FLAMMABLE GASES: all subsections 3312.1 through 3312.2.1 are unchanged from parallel provisions in Section 3306 of the IFC, except to add references to the IFC where appropriate.

3313 EXPLOSIVE MATERIALS: all subsections 3313.1 through 3313.3 are unchanged from parallel provisions in Section 3307 of the IFC, except to add references to the IFC where appropriate, and editorial modifications to preserve the authority of the fire code official in subsection 3313.3.

3314 OWNER'S RESPONSIBILITY FOR FIRE PROTECTION: all subsections 3314.1 through 3314.8 are unchanged from parallel provisions in Section 3308 of the IFC, except to add references to the IFC where appropriate, and editorial modifications to preserve the authority of the fire code official in subsection 3314.3.

3315 FIRE REPORTING: Subsection 3315.1 is unchanged from parallel provisions in Section 3309 of the IFC except to editorial modification to preserve the authority of the fire code official.

3316 ACCESS FOR FIRE FIGHTING: Subsections 3316.1 AND 3316.2 are unchanged from parallel provisions in Section 3310 of the IFC, except to add a reference to the IFC where appropriate in 3316.2 and an editorial modification to preserve the authority of the fire code official in subsection 3316.1.

3317 FIRE EXTINGUISHERS is current IBC Section 3309, which parallel the current provisions of IFC 3315 Portable Fire Extinguishers. The requirements were identical except for minor editorial wording such as "not less than" vs. "not fewer than," and "including, but not limited to" in one of the items. The wording of the IFC was used, and an editorial change was made to 3317.1 to retain the authority of the fire code official in addition to the building official for enforcement, since the same requirement was found in both codes.

(Current IBC subsection 3309.2 Fire hazards was deleted; it is no longer necessary since all fire safety provisions of Chapter 33 of the IFC are being added.)

3318 MEANS OF EGRESS is current IBC Section 3310, which parallels the current provisions of IFC 3311 Means of Egress.

3318.1 Stairways required: renumbered only.

3318.2 Maintenance of means of egress: the requirements of this subsection were essentially the same as IFC Section 3311.2, but the wording differed, especially for the exception. The word "required" in front of means of egress was brought over from the fire code, and the exception was modified to incorporate accessible means of egress, which appeared in the fire code. The revisions were made to incorporate the intent of both codes, which were thought to be the same. Editorial changes were made to retain the authority of the fire code official for approval since similar provisions for temporary means of egress were found in both codes.

3319 STANDPIPES is current IBC Section 3311, which parallel the current provisions of IFC 3313. Subsections 3319.1, 3319.2, and 3319.3 have been renumbered only.

3320 AUTOMATIC SPRINKLER SYSTEM is current IBC Section 3312, which parallel the current provisions of IFC 3314.

3320.1 Completion before occupancy: editorially modified to retain references to code sections in the IBC and IFC as they appear in their respective codes, and to retain the authority of both the building officials and fire code official from the respective codes.

3320.2 Operation of valves: renumbered only. "Shall be permitted" as used by the IBC was retained instead of "shall be allowed" per the IFC.

3321 WATER SUPPLY FOR FIRE PROTECTION is current IBC Section 3313, which parallel the current provisions of IFC 3312.

3321.1 Where required: editorial changes were made to make it clear that approvals are needed from both the building official and the fire code official, since approval is currently required by each code.

3314 FIRE WATCH DURING CONSTRUCTION was deleted since the identical requirement appears in proposed Section 3310.5.1, brought over from the IFC.

3322 MOTORIZED CONSTRUCTION EQUIPMENT is current section 3316 of the IFC.

3322.1 Conditions of use: an editorial change was made in item 4 to retain the authority of the fire code official.

3323 SAFEGUARDING ROOFING OPERATIONS is current section 3317 the IFC. Editorial changes were made to subsections 3323.1 and 3323.1 to make appropriate reference to the IFC for referenced code sections.

Here are the current IFC sections and their corresponding sections in this proposal:

IFC Section 3301: it remains in the IFC.

IFC Section 3302: deleted as unnecessary to follow IBC convention.

IFC 3303: proposed IBC 3309

IFC 3304: proposed IBC 3310

IFC 3305: proposed IBC 3311

IFC 3306: proposed IBC 3312

IFC 3307: proposed IBC 3313

IFC 3308: proposed IBC 3314

IFC 3309: proposed IBC 3315

IFC 3310: proposed IBC 3316

IFC 3311: proposed IBC 3318

IFC 3312: proposed IBC 3321

IFC 3313: proposed IBC 3319

IFC 3314: proposed IBC 3320

IFC 3315: proposed IBC 3317

IFC 3316: proposed IBC 3322

IFC 3317: proposed IBC 3323

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

Currently the IBC requires that all the fire safety requirements of Chapter 33 of the IFC be enforced (IBC Section 3302.3). Therefore the moving of these provisions into the IBC will have no effect on the cost of construction.

Analysis: NFPA 56 and NFPA 241 are already referenced in the I-codes. Note that there has been erratum that changed the edition of NFPA 241 referenced in the 2018 IFC to the 2013 edition.

Internal ID: 3482

IFC: 3308

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows:

SECTION 3308.3303 OWNER'S RESPONSIBILITY FOR RESPONSIBILITY FOR FIRE PROTECTION

~~3308.1~~**3303.1 Program development and maintenance.** The *owner* or *owner's* authorized agent shall be responsible for the development, implementation and maintenance of a written plan establishing a fire prevention program at the project site applicable throughout all phases of the construction, repair, *alteration* or demolition work. The plan shall address the requirements of this chapter and other applicable portions of this code, the duties of staff, and staff training requirements. The plan shall be made available for review by the *fire code official* upon request.

~~3308.2~~**3303.2 Program superintendent.** The *owner* shall designate a person to be the fire prevention program superintendent who shall be responsible for the fire prevention program and ensure that it is carried out through completion of the project. The fire prevention program superintendent shall have the authority to enforce the provisions of this chapter and other provisions as necessary to secure the intent of this chapter. Where guard service is provided in accordance with NFPA 241, the superintendent shall be responsible for the guard service.

Add new text as follows:

3303.3 Daily fire safety inspection. The fire prevention program superintendent shall be responsible for completion of a daily fire safety inspection at the project site. Each day, all building and outdoor areas shall be inspected to ensure compliance with the inspection list in this section. The results of each inspection shall be documented and maintained on site until a certificate of occupancy has been issued. Documentation shall be immediately available on site for presentation to the fire code official upon request. Failure to properly conduct, document and maintain documentation required by this section shall constitute an unlawful act in accordance with Section 110.1 and shall result in the issuance of a notice of violation in accordance with Section 110.3 to the fire prevention program superintendent. Upon the third offence in any 30-day period, a stop work order shall be issued in accordance with Section 112, and work shall not resume until satisfactory assurances of future compliance have been presented to and approved by the fire code official.

1. Any contractors entering the site to perform hot work each day have been instructed in hot work safety requirements in Chapter 35 and hot work is only performed in areas approved by the fire prevention superintendent.
2. Temporary heating equipment is maintained away from combustible materials in accordance with the equipment manufacturer's instructions.
3. Combustible debris, rubbish and waste material is removed from the building in areas where work is not being performed.
4. Temporary wiring does not have exposed conductors.
5. Flammable liquids and other hazardous materials are stored in locations that have been approved by the fire prevention superintendent when not involved in work that is being performed.
6. Fire apparatus access roads required by Section 3310 are maintained clear of obstructions that reduce the width of the usable roadway to less than 20 feet.
7. Fire hydrants are clearly visible from access roads and are not obstructed.
8. The location of fire department connections to standpipe and in-service sprinkler systems are clearly identifiable from the access road and such connections are not obstructed.
9. Standpipe systems are in service and continuous to the highest work floor, as specified in Section 3313.
10. Portable fire extinguishers are available in locations required by Section 3315 and 3317.3.

~~3308.3~~**3303.4 Prefire plans.** The fire prevention program superintendent shall develop and maintain an *approved* prefire plan in cooperation with the fire chief. The fire chief and the *fire code official* shall be notified of changes affecting the utilization of information contained in such prefire plans.

3308.43303.5 Training. Training of responsible personnel in the use of fire protection equipment shall be the responsibility of the fire prevention program superintendent. Records of training shall be kept and made a part of the written plan for the fire prevention program.

3308.53303.6 Fire protection devices. The fire prevention program superintendent shall determine that all fire protection equipment is maintained and serviced in accordance with this code. The quantity and type of fire protection equipment shall be *approved*. Fire protection equipment shall be inspected in accordance with the fire protection program.

3308.63303.7 Hot work operations. The fire prevention program superintendent shall be responsible for supervising the permit system for hot work operations in accordance with Chapter 35.

3308.73303.8 Impairment of fire protection systems. Impairments to any *fire protection system* shall be in accordance with Section 901.

3308.7.13303.8.1 Smoke detectors and smoke alarms. Smoke detectors and smoke alarms located in an area where airborne construction dust is expected shall be covered to prevent exposure to dust or shall be temporarily removed. Smoke detectors and alarms that were removed shall be replaced upon conclusion of dust-producing work. Smoke detectors and smoke alarms that were covered shall be inspected and cleaned, as necessary, upon conclusion of dust-producing work.

3308.83303.9 Temporary covering of fire protection devices. Coverings placed on or over fire protection devices to protect them from damage during construction processes shall be immediately removed upon the completion of the construction processes in the room or area in which the devices are installed.

Reason:

The number and magnitude of construction fires in the past few years has been well documented in NFPA loss reports and on national news. Many of these fires are not "accidental," but are instead the result of inexcusable carelessness...failing to follow basic fire safety practices. For some reason, it seems that there has been a loss of attention to fire safety at construction sites. Although major construction fires represent a relatively small percentage of the overall population of buildings under construction at any given time, the consequences of these fires is seeming to impact nearby buildings and neighborhoods with increasing frequency and increasing levels of damage.

Contractors are busy trying to stay on schedule. Fire inspectors show up to look at specific inspection tasks, such as sprinkler inspections, without having time to look at construction fire safety concerns. Building inspectors are on tight inspection schedules and may not have time or be trained to look for fire safety concerns. It seems that nobody is focused on construction site fire safety. Ultimately, this responsibility falls on the owner and the fire prevention program superintendent to ensure compliance, and there needs to be a viable way to verify that the responsible parties are doing their code-required jobs.

Hence, this proposal is intended to serve as a hammer to make sure that there is a motivation to pay attention to basic fire safety requirements and to pin this responsibility on the owner and the fire prevention program superintendent. By requiring daily inspections and documentation, any fire or building inspector can simply request to see the checklist when at the site for any reason, and a clear enforcement path is specified when non-compliance is encountered. While it's true that someone could just do the paperwork exercise, the liability associated with fraudulently documenting compliance in the event of an incident would be significant, and presumably, there will be cases where code officials will spot check compliance.

Unfortunately, there is no perfect solution to this issue. But this proposal represents a significant step forward with regard to getting responsible parties to pay attention to a significant and ongoing issue.

This proposal also recommends relocating Section 3308 to Section 3303. This is perhaps the most important part of Chapter 33, and the requirements need to be right up front.

Cost Impact

The code change proposal will increase the cost of construction .

The additional time required for personnel to complete the tasks required by this section will increase the cost of construction.

Internal ID: 2280

IFC: 3304.5, 3304.5.1, 3304.5.2, 3304.5.2.1 (New), 3304.5.2.2 (New), 3304.5.2.3 (New), 3304.5.3, 3308.5.4 (New), 3304.8, 3308.1, 3308.1.1 (New), 3308.2, 3308.3, 3308.4, 3308.5, , 3308.6, 3308.7, 3308.8, 501.3, 501.3.1 (New), 202 (New)

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

3304.5 Fire watch. Where required by the *fire code official* or the ~~pre-fire site safety plan~~ established in accordance with Section ~~3308.3~~3308.1, a fire watch shall be provided for building demolition and for building construction that is hazardous in nature, such as temporary heating or hot work construction.

3304.5.1 Fire watch during construction. Where required by the *fire code official*, ~~a~~ fire watch shall be provided during nonworking hours for new construction that exceeds 40 feet (12 192 mm) in height above the lowest adjacent grade at any point along the building perimeter, any new multi-story construction with an aggregate area exceeding 50,000 sq. ft. per story or as required by the fire code official.

3304.5.2 Fire watch personnel. Trained personnel shall be provided to serve as an on-site fire watch. Fire watch personnel shall be provided ~~with not fewer than one approved means for notification of the fire department, and the sole duty of such personnel shall be to perform constant patrols and watch for the occurrence of fire. The combination of fire watch duties and site security duties is acceptable. Fire watch personnel shall be trained in the use of portable fire extinguishers in accordance with this section.~~

Add new text as follows:

3304.5.2.1 Duties. The primary duty of fire watch personnel shall be to perform constant patrols and watch for the occurrence of fire. The combination of fire watch duties and site security duties is acceptable.

3304.5.2.2 Training. Personnel shall be trained in to serve as an on-site fire watch. Training shall include the use of portable fire extinguishers. Fire extinguishers and fire reporting shall be in accordance with Section 3309.

3304.5.2.3 Means of notification. Fire watch personnel shall be provided with not fewer than one approved means for notifying the fire department.

Revise as follows:

3304.5.3 Fire watch location and records. The fire watch shall include areas specified by the ~~pre-fire site safety plan~~ established in accordance with Section ~~3308.3~~. ~~The fire watch personnel shall keep a record of all time periods of duty, including a log entry each time the site was patrolled and each time a structure under construction was entered and inspected. The records and log entries shall be made available for review by the fire code official upon request.~~3308.

3308.5.4 Fire Watch Records. Fire watch personnel shall keep a record of all time periods of duty, including the log entry each time the site was patrolled, and each time a structure was entered and inspected. Records shall be made available for review by the fire code official upon request.

3304.8 Cooking. Cooking shall be prohibited except in *approved* designated cooking areas separated from combustibile materials by a minimum of ten feet. Signs with a minimum letter height of 3 inches (76 mm) and a minimum brush stroke of 1/2 inch (13 mm) shall be posted in conspicuous locations in designated cooking areas and state:
DESIGNATED COOKING AREA

COOKING OUTSIDE OF A DESIGNATED COOKING AREA IS PROHIBITED

3308.1 Program development and maintenance. The owner or owner's authorized agent shall be responsible for the development, implementation and maintenance of ~~a~~an approved written site safety plan establishing a fire prevention program at the project site applicable throughout all phases of the construction, repair, alteration or demolition work. The plan shall address the requirements of this chapter and other applicable portions of this code, the duties of staff, and staff training requirements. The plan shall be submitted and approved before a building permit is issued. Any changes to the plan shall be made available for review by the fire code official upon request.~~submitted for approval.~~

Add new text as follows:

3308.1.1 Components of Site Safety Plans. Site Safety Plans shall include the following as applicable:

1. Name and contact information of Site Safety Director
2. Documentation of the training of the Site Safety Director and fire watch personnel
3. Procedures for reporting emergencies
4. Fire Department Vehicle Access routes
5. Location of fire protection equipment including portable fire extinguishers, standpipes, fire department connections and fire hydrants.
6. Smoking and cooking policy, designated areas to be used when approved, and signage locations in accordance with 3304.8.
7. Location and safety considerations for temporary heating equipment
8. Hot work permit plan
9. Plans for control of combustible waste material
10. Locations and methods for storage and use of flammable and combustible liquids and other hazardous materials
11. Provisions for site security
12. Changes that affect this plan
13. Other site-specific information required by the Fire Code Official

Revise as follows:

3308.2 ~~Program superintendent.~~Site Safety Director. ~~The owner shall designate a person to be the fire prevention program superintendent who~~ site safety director. ~~The site safety director shall be responsible for the fire prevention program and ensure that it is carried out through completion of the project. The fire prevention program superintendent ensuring compliance with the site safety plan. The site safety director shall have the authority to enforce the provisions of this chapter and other provisions as necessary to secure the intent of this chapter. Where guard service is provided in accordance with NFPA 241, the superintendent~~ site safety director shall be responsible for the guard service.

3308.3 ~~Prefire plans.~~Qualifications. ~~The fire prevention program superintendent shall develop and maintain an approved prefire plan in cooperation with the fire chief. The fire chief and the fire code official shall be notified of changes affecting the utilization of information contained in such prefire plans.~~ Site Safety Director shall acquire training specific to their roles and responsibilities. Upon request, the training and qualifications of the Site Safety Director shall be submitted to the Fire Code Official for approval.

3308.4 Training. ~~Training of fire watch and other responsible personnel in the use of fire protection equipment shall be the responsibility of the fire prevention program superintendent.~~ site safety director. ~~Records of training shall be kept and made a part of the written plan for the fire prevention program.~~ site safety plan.

3308.5 Fire protection devices. ~~The fire prevention program superintendent shall determine~~ Site Safety Director shall ensure that all fire protection equipment is maintained and serviced in accordance with this code. The quantity and type of fire protection equipment shall be approved. Fire protection equipment shall be inspected in accordance with the fire protection program.

3308.5 Fire protection devices. ~~The fire prevention program superintendent shall determine that all fire protection equipment is maintained and serviced in accordance with this code. The quantity and type of fire protection equipment shall be approved. Fire protection equipment shall be inspected in accordance with the fire protection program.~~

3308.6 Hot work operations. ~~The fire prevention program superintendent shall be responsible for supervising the permit system for~~ Site Safety Director shall ensure hot work operations and permit procedures are in accordance with Chapter 35.

3308.7 Impairment of fire protection systems. ~~Impairments~~ The Site Safety Director shall ensure impairments to any fire protection system shall be are in accordance with Section 901.

3308.8 Temporary covering of fire protection devices. Coverings placed on or over fire protection devices to protect them from damage during construction processes shall be immediately removed upon the completion of the construction processes in the room or area in which the devices are installed.

501.3 Construction documents. *Construction documents* for proposed fire apparatus access, location of *fire lanes*, security gates across fire apparatus access roads and *construction documents* and hydraulic calculations for fire hydrant systems shall be submitted to the fire department for review and approval prior to construction.

Add new text as follows:

501.3.1 Site Safety Plan. The owner or owner's authorized agent shall be responsible for the development, implementation and maintenance of an approved written site safety plan in accordance with Section 3308.

SITE SAFETY PLAN

A plan developed to establish a fire prevention program at a construction site.

Reason:

Fires in buildings under construction have, unfortunately, become routine. Fire departments across the United States are being stressed beyond their limits by these fires, and communities are being subjected to all of the negative consequences of losing major projects and draining fire protection resources. Virtually every national organization with a stake in this issue are wrestling with solutions. Part of the solution is to provide on-site safety supervision throughout the construction project. This code change will refine and clarify current requirements, and will require that the site safety plans be submitted with other construction documents in order to inform the building officials of their existence and their requirements. Specifically:

3304.5 This section has been reformatted for clarity.

3304.5.1 Makes a fire watch mandatory for buildings above 40 ft. in height or multi-story construction with an aggregate area exceeding 50,000 sq. ft. These buildings are large enough to create a significant loss to a community, endanger firefighters, and consume resources at an extraordinary rate if the building burns.

3304.5.2.1 maintains the requirement that the primary role of fire watch personnel is to watch for fires, but may also serve as security.

3305.2.2 Maintains current requirements for training fire watch personnel

3304.5.2.3 Requires the fire watch person to have a means to notify the fire department.

3304.8 introduces a requirement for separating the construction site from cooking operations.

3308.1 introduces a new requirement for the site safety plan to be submitted for approval before a building permit is issued. This is intended to highlight the importance of having a plan, and getting it into the hands of the inspectors before the building is actually under construction.

3308.1.1 outlines the content required for a site safety plan.

3308.2 simply changes the nomenclature from "fire prevention program superintendent" to "site safety director".

3308.3 requires the site safety director to be trained in the duties of the job

3308.4 updates the verbiage of the existing requirements

3308.5 updates the language and removes an ambivalent requirement for the "quantity and type of fire protection equipment" to be approved; it also removes language about inspecting the equipment because that is deemed to be redundant language

3308.6 inserts a reference to Chapter 35 for hot work and updates the language.

Section 501.3.1 is updated to require a site safety plan and place responsibility on the owner.

Finally, a definition for site safety plan is added.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will increase the cost of construction .

it's likely that this code change will have a minimal, but increased cost impact. Many construction sites already comply with these provisions; for those that don't, the cost of added security and development of a site safety plan will be additional costs.

Internal ID: 390

F265-18

IFC: 3304.9 (New)

Proponent: Adria Reinertson, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)

2018 International Fire Code

Add new text as follows:

3304.9 Separations between construction areas. Separations used in Type I and Type II construction to separate construction areas from occupied portions of the building, shall be constructed of materials that comply with one of the following:

1. Non-combustible materials
2. Materials that exhibit a flame spread index not exceeding 25 when tested in accordance with ASTM E84 or UL 723
3. Materials exhibiting a heat peak release rate not exceeding 300kW/m² when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation on specimens at the thickness intended for use.

Reason:

These tarpaulins are found frequently in construction zones and need to exhibit some improved fire performance, because they could propagate fire more easily otherwise. The options provided are such that many materials exist that can comply with at least one of the requirements.

Cost Impact

The code change proposal will increase the cost of construction .

Fire retarded tarpaulins can be roughly twice the cost of non-fire-retarded tarpaulins and therefore will increase the cost of separating the areas, but they will increase fire safety.

Internal ID: 608

F266-18

IFC: 3308.4 (New)

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Fire Code

3308.4 Fire safety requirements for buildings of Types IV-A, IV-B, and IV-C construction. Buildings of Types IV-A, IV-B, and IV-C construction designed to be greater than six stories above grade plane shall comply with the following requirements during construction unless otherwise approved by the fire code official.

1. Standpipes shall be provided in accordance with Section 3313.
2. A water supply for fire department operations, as approved by the fire chief.
3. Where building construction exceeds six stories above grade plane, at least one layer of noncombustible protection where required by Section 602.4 of the International Building Code shall be installed on all building elements more than 4 floor levels, including mezzanines, below active mass timber construction before erecting additional floor levels.
4. Where building construction exceeds six stories above grade plane required exterior wall coverings shall be installed on all floor levels more than 4 floor levels, including mezzanines, below active mass timber construction before erecting additional floor level.

Exception: Shafts and vertical exit enclosures.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB has developed a number of proposals to potentially increase the permitted height and area for Type IV structures, specifically mass timber buildings adding additional Types IV-A, IV-B & IV-C. One of the basic requirements incorporated into these proposed increased heights and areas is the added active and passive protection features to these structures.

The goal of this proposal is to provide guidance and requirements for when this combustible building is most vulnerable, while under construction prior to fire protection systems have been installed.

Over the recent years we have experienced a number of fires while combustible buildings have been under construction. It is understood the vast majority of these fires did occur in structures of light-frame structural wood members which present a significant fire hazard when exposed. Even with this fact we cannot simply ignore the potential risk of fire in combustible construction simply due to the size of the timber element and the potentially longer period of time for ignition as the potentially fuel load of a mass timber building can be substantial.

The TWB had a great deal of discussion regarding the proposed requirements regarding water supply to the buildings of combustible construction sites. On one hand, there was a desire to establish a minimum water flow of 250 gpm with a minimum pressure. But the counter discussion identified that these combustible building construction sites may have various degrees of hazards on the site and was not restrictive to just the structure. Mass timber construction typically proceeds with little stored combustible material on the site, mass timber is generally installed as it arrives. Thus, there may be more or fewer site hazards than on a typical construction site utilizing combustible materials. Moreover, protection of the installed material must occur before the project moves above certain specified numbers of levels. This is very different from conventional construction processes.

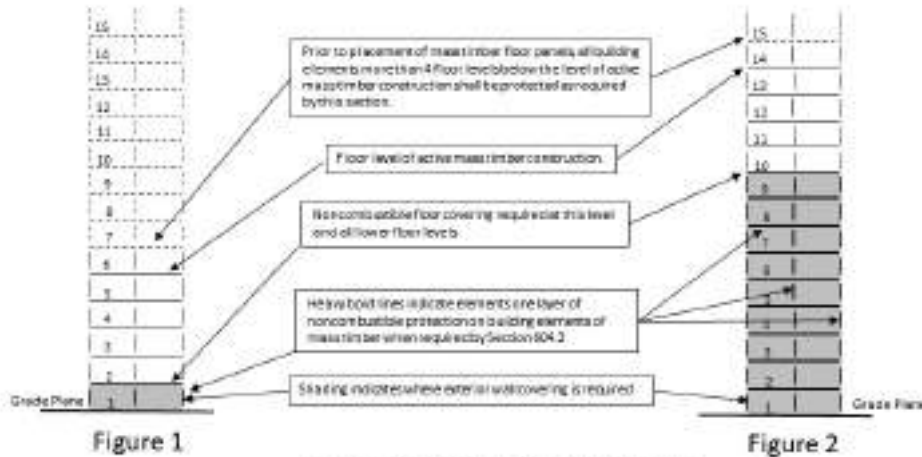

With this understanding, the TWB is proposing project developers meet and confer with the local fire service to establish the fire department's response needs, in terms of water flow and pressure, for the specific building, while under construction, and job site.

While sub-sections 1 and 2 apply to the delivery of water to the job site, and/or structure, sub-sections 3 and 4 are specific to the passive protection related to the structure. Due to the proposed increased heights and areas, the TWB felt it was important to require interior and exterior passive protection as the construction progressed. This would insure the lower portions of the combustible structure had redundant, active and passive, protection as greater heights were added.

Two figures are shown below to illustrate the requirements of sub-sections 3 and 4 of this proposal. Since both buildings will exceed six-stories, protection must be provided during construction. The solid thick lines indicate building

elements that are required to be protected. Solid thin lines indicate elements that are in-place, but are not required to be protected and dashed lines indicate elements that have not yet been placed. Figure 1 is shown to illustrate when protection is first required on a building under construction. When level 6 is the active level of mass timber construction, protection of the building elements and the exterior wall coverings are required before level 7 panels can be placed. In Figure 2, the progress of protection on each successive level is indicated as construction continues. In this example, level 14 is the active level of mass timber construction, so prior to placement of floor panels at level 15, protection is required on level 9.

New paragraph for the reason statement: Two figures are shown below to illustrate the requirements of sub-sections 3 and 4 of this proposal. Since both buildings will exceed six-stories, protection must be provided during construction. The solid thick lines indicate building elements that are required to be protected. Solid lines indicate elements that are in-place, but are not required to be protected and dashed lines indicate elements that have not yet been placed. Figure 1 is shown to indicate when protection is first required to be provided on a building under construction. When level 6 is the active level, protection of the building elements and the exterior wall coverings are required before level 7 panels can be placed. In Figure 2, the progress of protection on each successive level is indicated as construction continues. In this example, level 14 is the active level, so prior to placement of floor panels at level 15, protection is required on level 9.

Examples of Protection During Construction For Mass Timber Buildings Greater Than 6 Stories Above Grade Plane

The TWB strongly feels these code change proposals should be adopted as a whole package. By adopting a few of the code change proposals without the complete package potentially ignores the details required to insure these proposed projects are designed, built and maintained properly now and in the future. **Background information:** The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

2018 International Fire Code

Add new text as follows:

SECTION 3318 PROTECTION OF COMBUSTIBLE CONSTRUCTION

3318.1 Fire safety requirements for buildings of Type III and V construction. Buildings of Types III and V construction designed to be four or more stories above grade plane shall meet the following requirements during construction unless otherwise approved by the fire official.

3318.1.1 Exposed interior combustible framing. Where portions of the building construction exceeds 40-feet in height above fire department vehicle access, exposed interior combustible framing members shall be protected during the construction process by a thermal barrier of 1/2-inch gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275 in accordance with Section 2603.4 of the International Building Code. Concealed spaces shall comply with Section 718 of the International Building Code.

The thermal barrier shall be installed on all exposed interior surfaces of combustible framing members below the 40-feet of height, including mezzanines, so that no more than two floors of combustible framing members for the building are exposed before erecting an additional floor level. When the building construction commences above the 40-feet of height, the thermal barrier shall be installed on all exposed interior combustible framing members, including mezzanines, so that a total of no more than one floor of combustible framing members for the building is exposed on the interior before erecting an additional floor level.

3318.1.2 Exposed exterior combustible framing. Where portions of the building construction exceeds 40-feet above fire department vehicle access, including mezzanines, exposed exterior combustible framing members below the 40-feet of height, shall be covered by a noncombustible material or exterior wall covering in accordance with Section 1404 of the International Building Code so that no more than two floors of exterior combustible framing are exposed before erecting additional floor levels. The noncombustible material or exterior wall covering shall continue to be installed on all exposed exterior combustible framing above the 40-feet of height, including mezzanines, so that a total of no more than one floor of combustible framing members are exposed on the exterior before erecting additional floor levels.

Add new standard(s) follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

275—17:

Standard Method of Fire Tests for the Evaluation of Thermal Barriers

Analysis: A review of the standard proposed for inclusion in the code, NFPA 275-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Analysis: The referenced standard, NFPA 275-17, is currently referenced in other 2018 I-codes.

2018 International Building Code

Add new text as follows:

SECTION 3314 PROTECTION OF COMBUSTIBLE CONSTRUCTION

3314.1 Fire safety requirements for buildings of Type III and V construction. Buildings of Types III and V construction designed to be four or more stories above grade plane shall meet the following requirements during construction unless otherwise approved by the fire official.

3314.1.1 Exposed interior combustible framing. Where portions of the building construction exceeds 40-feet in height above fire department vehicle access, exposed interior combustible framing members shall be protected during the construction process by a thermal barrier of 1/2-inch gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275 in accordance with Section 2603.4. Concealed spaces shall comply with Section 718. The thermal barrier shall be installed on all exposed interior surfaces of combustible framing members below the 40-feet of height, including mezzanines, so that no more than two floors of combustible framing members for the building are exposed before erecting an additional floor level. When the building construction commences above the 40-feet of height, the thermal barrier shall be installed on all exposed interior combustible framing members, including mezzanines, so that a total of no more than one floor of combustible framing members for the building is exposed on the interior before erecting an additional floor level.

3314.1.2 Exposed exterior combustible framing. Where portions of the building construction exceeds 40-feet above fire department vehicle access, including mezzanines, exposed exterior combustible framing members below the 40-feet of height, shall be covered by a noncombustible material or exterior wall covering in accordance with Section 1404 so that no more than two floors of exterior combustible framing are exposed before erecting additional floor levels. The noncombustible material or exterior wall covering shall continue to be installed on all exposed exterior combustible framing above the 40-feet of height, including mezzanines, so that a total of no more than one floor of combustible framing members are exposed on the exterior before erecting additional floor levels.

Reason:

As light wood frame buildings of Type III and V construction continue to be built to large heights and areas as allowed in Tables 504.3, 504.4 and 506.2 of the code, there has been a notable increase in fires, especially for Group R2 Residential Occupancies constructed of combustible framing, while the building is under construction. This has resulted in significant loss of property for the building under construction and nearby properties exposed to the fire in part because important fire safety features such as passive fire protection for the combustible framing is not complete and automatic sprinkler system upon which these larger and taller buildings depend are not operational.

Besides the damage to the building under construction and to nearby properties some of these fires have required major street closures including interstates, and tied up firefighting resources to the extent that other areas of the communities were left under-protected for extended periods. An example is the major fire in Los Angeles with five stories of wood framing over a two-story concrete podium on December 8, 2014 that not only resulted in millions of dollars in damage to the building under construction, but also damaged adjacent buildings. The apartment building known as the DaVinci was a complete loss after the fire that was fueled by the five stories of wood frame construction. More than 250 firefighters were dispatched to the scene. The burning of the structure's wooden frame forced the closure of northbound Harbor Freeway (Hwy 110) and affected local streets causing major traffic disruptions for commuters and to the nearby business and residences. Buildings nearby were damaged by exposure to fire from the radiant heat as well as damage inside because the fire activated sprinklers in these adjacent buildings. It has been reported that the heat also melted or damaged computers and partition cubicles in neighboring buildings as well. The glazing in hundreds of windows of a nearby building was also damaged.

There are numerous examples of other large combustible framed apartment and condominium building that experienced significant fires and damage while the building was under construction that illustrate the fire risk these large buildings pose. The following is a list of six such incidences in 2017. This list is not necessarily inclusive of all similar large combustible building fires in 2017 while under construction.

1. Metropolitan Apartments, Raleigh NC March 17, 2017- 5-story apartments on concrete podium.
2. The Royale at City Place, Overland Park, KS March 20, 2017 - 5-story apartments
3. Fuse 47, College Park, MD April 24, 2017 - 5-story apartments on concrete podium.
4. Treadmark, Boston MA, June 28, 2017 - 6-story condominiums
5. Kelowna, BC, Canada July 8, 2017 - 6-story apartments on concrete podium
6. Edison on the Charles, Waltham, MA July 23, 2017 - 5-story apartments

The goal of this proposal is to provide guidance and requirements for protection when this combustible building is most vulnerable, while under construction and prior to passive and active fire protection being installed. Recently the ICC Tall Wood Building Ad Hoc Committee discussed similar fire protection measures for Mass Timber Buildings under construction. The TWB Committee recognized the risks associated with taller buildings of combustible construction and the hazards they pose for fire department exterior and interior attack tactics

To reduce the risk of these construction fires this proposal will require the exposed combustible framing members be covered with a thermal barrier on the inside of the building and the planned exterior wall covering on the outside. The thermal barrier protection is similar to the requirements for exposed foam plastic insulation (a combustible material) in 2603.4. If combustible framing should be ignited during construction both the thermal barrier and the exterior wall coverings reduce exposure of other combustible materials from the fire incident.

The passive protection should be provided when the construction reaches the 40-foot height above the fire department vehicle access. The 40-foot threshold is consistent with the threshold when standpipes for construction are required by 3311.1. These levels of fire protection are consistent with the fire risks associated with these larger buildings of combustible construction, and upon which the building code provisions are based. Also, like the standpipe requirements, the passive protection must be extended as each floor is added.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal is expected to increase the cost of construction due to the passive fire protection having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

2018 International Fire Code

CHAPTER 33 FIRE SAFETY DURING CONSTRUCTION AND DEMOLITION

SECTION 3312 WATER SUPPLY FOR FIRE PROTECTION

Revise as follows:

3312.1 When required. An approved water supply for fire protection, either temporary or permanent, shall be made available as soon as combustible material-structural elements arrives on the site-site, upon commencement of vertical combustible construction, and upon installation of a standpipe system in buildings under construction, in accordance with Sections 3312.2 through 3312.5.

Exception: The fire code official is authorized to reduce the fire-flow requirements for isolated buildings or a group of buildings in rural areas or small communities where the development of full fire-flow requirements is impractical.

Add new text as follows:

3312.2 Combustible structural elements. When combustible structural elements of the building under construction are delivered to a site, a minimum fire flow of 1,000 gpm shall be provided. The fire hydrant used to provide this fire flow supply shall be within 500 feet of the combustible structural elements, as measured along an approved fire apparatus access lane. Where the site configuration is such that one fire hydrant can not be located within 500 feet of all combustible structural elements, additional fire hydrants shall be required to provide coverage in accordance with this section.

3312.3 Vertical construction of Types III, IV, and V construction. Prior to commencement of vertical construction of Type III, IV, or V buildings that utilize any combustible structural elements, the fire flow required by Sections 3312.3.1 through 3312.3.3 shall be provided, accompanied by fire hydrants in sufficient quantity to deliver the required fire flow and proper coverage.

3312.3.1 Fire separation up to 30 feet. Where a building of Type III, IV, or V construction has a fire separation distance of less than 30 feet from property lot lines, and an adjacent property has an existing structure or otherwise can be constructed upon, the water supply shall provide either a minimum of 1,000 gpm, or the entire fire flow required for the building when constructed, whichever is greater.

3312.3.2 Fire separation of 30 feet up to 60 feet. Where a building of Type III, IV, or V construction has a fire separation distance of 30 feet up to 60 feet from property lot lines, and an adjacent property has an existing structure or otherwise can be constructed upon, the water supply shall provide a minimum of 1,000 gpm, or 50% of the fire flow required for the building when constructed, whichever is greater.

3312.3.3 Fire separation of 60 feet or greater. Where a building of Type III, IV, or V construction has a fire separation of 60 feet or greater from a property lot line, a water supply of 1,000 gpm shall be provided.

3312.4 Vertical Construction, Type I and II construction. If combustible construction materials are delivered to the construction site, water supply in accordance with Section 3312.2 shall be provided. Additional water supply for fire flow is not required prior to commencing vertical construction of Type I and II buildings.

3312.5 Standpipe supply. Regardless of the presence of combustible construction materials, the construction type or the fire separation distance, where a standpipe is required in accordance with Section 3313, a water supply providing a minimum flow of 500 gpm shall be provided. The fire hydrant used for this water supply shall be located

within 100 feet of the Fire Department Connection supplying the standpipe.

2018 International Building Code

SECTION 3313 WATER SUPPLY FOR FIRE PROTECTION

[F] 3313.1 Where required. An approved water supply for fire protection, either temporary or permanent, shall be made available as soon as combustible material arrives on the site, structural elements arrive on the site, upon commencement of vertical combustible construction, and upon installation of a standpipe system in buildings under construction, in accordance with Sections 3312.2 through 3312.5.

Exception: The fire code official is authorized to reduce the fire-flow requirements for isolated buildings or a group of buildings in rural areas or small communities where the development of full fire-flow requirements is impractical.

3313.2 Combustible construction elements. When combustible structural elements of the building under construction are delivered to a site, a minimum fire flow of 1,000 gpm shall be provided. The fire hydrant used to provide this fire flow supply shall be within 500 feet of the combustible structural elements, as measured along an approved fire apparatus access lane. Where the site configuration is such that one fire hydrant can not be located within 500 feet of all combustible structural elements, additional fire hydrants shall be required to provide coverage in accordance with this section.

3313.3 Vertical construction of Types III, IV, and V construction. Prior to commencement of vertical construction of Type III, IV, or V buildings that utilize any combustible structural elements, the fire flow required by Sections 3312.3.1 through 3312.3.3 shall be provided, accompanied by fire hydrants in sufficient quantity to deliver the required fire flow and proper coverage.

3313.3.1 Fire separation up to 30 feet. Where a building of Type III, IV, or V construction has a fire separation distance of less than 30 feet from property lot lines, and an adjacent property has an existing structure or otherwise can be constructed upon, the water supply shall provide either a minimum of 1,000 gpm, or the entire fire flow required for the building when constructed, whichever is greater.

3313.3.2 Fire separation of 30 feet up to 60 feet. Where a building of Type III, IV, or V construction has a fire separation distance of 30 feet up to 60 feet from property lot lines, and an adjacent property has an existing structure or otherwise can be constructed upon, the water supply shall provide a minimum of 1,000 gpm, or 50% of the fire flow required for the building when constructed, whichever is greater.

3313.3.3 Fire separation of 60 feet or greater. Where a building of Type III, IV, or V construction has a fire separation of 60 feet or greater from a property lot line, a water supply of 1,000 gpm shall be provided.

3313.4 Vertical Construction, Type I and II construction. If combustible construction materials are delivered to the construction site, water supply in accordance with Section 3312.2 shall be provided. Additional water supply for fire flow is not required prior to commencing vertical construction of Type I and II buildings.

3313.5 Standpipe supply. Regardless of the presence of combustible construction materials, the construction type or the fire separation distance, where a standpipe is required in accordance with Section 3313, a water supply providing a minimum flow of 500 gpm shall be provided. The fire hydrant used for this water supply shall be located within 100 feet of the Fire Department Connection supplying the standpipe.

2018 International Existing Building Code

SECTION 1509 WATER SUPPLY FOR FIRE PROTECTION

[F] 1509.1 When required. An approved water supply for fire protection, either temporary or permanent, shall be made available as soon as combustible material structural elements arrives on the site, upon commencement of vertical combustible construction, and upon installation of a standpipe system in buildings under construction, in accordance with Sections 3312.2 through 3312.5.

Exception: The fire code official is authorized to reduce the fire-flow requirements for isolated buildings or a group of buildings in rural areas or small communities where the development of full fire-flow requirements is impractical.

1509.2 Combustible structural elements. When combustible structural elements of the building under construction are delivered to a site, a minimum fire flow of 1,000 gpm shall be provided. The fire hydrant used to provide this fire flow supply shall be within 500 feet of the combustible structural elements, as measured along an approved fire apparatus access lane. Where the site configuration is such that one fire hydrant can not be located

within 500 feet of all combustible structural elements, additional fire hydrants shall be required to provide coverage in accordance with this section.

1509.3 Vertical construction of Types III, IV, and V construction. Prior to commencement of vertical construction of Type III, IV, or V buildings that utilize any combustible structural elements, the fire flow required by Sections 3312.3.1 through 3312.3.3 shall be provided, accompanied by fire hydrants in sufficient quantity to deliver the required fire flow and proper coverage.

1509.3.1 Fire separation up to 30 feet. Where a building of Type III, IV, or V construction has a fire separation distance of less than 30 feet from property lot lines, and an adjacent property has an existing structure or otherwise can be constructed upon, the water supply shall provide either a minimum of 1,000 gpm, or the entire fire flow required for the building when constructed, whichever is greater.

1509.3.2 Fire separation of 30 feet up to 60 feet. Where a building of Type III, IV, or V construction has a fire separation distance of 30 feet up to 60 feet from property lot lines, and an adjacent property has an existing structure or otherwise can be constructed upon, the water supply shall provide a minimum of 1,000 gpm, or 50% of the fire flow required for the building when constructed, whichever is greater.

1509.3.3 Fire separation of 60 feet or greater. Where a building of Type III, IV, or V construction has a fire separation of 60 feet or greater from a property lot line, a water supply of 1,000 gpm shall be provided.

1509.4 Vertical Construction, . Type I and II construction. If combustible construction materials are delivered to the construction site, water supply in accordance with Section 3312.2 shall be provided. Additional water supply for fire flow is not required prior to commencing vertical construction of Type I and II buildings.

1509.5 Standpipe supply. Regardless of the presence of combustible construction materials, the construction type or the fire separation distance, where a standpipe is required in accordance with Section 3313, a water supply providing a minimum flow of 500 gpm shall be provided. The fire hydrant used for this water supply shall be located within 100 feet of the Fire Department Connection supplying the standpipe.

Reason:

The current base code provides little guidance with respect to providing water supply during construction. This proposal attempts to provide requirements for providing minimum water supply for fire flow and for standpipe supply during construction.

Construction fires have been a problem recently. These fires have predominately affected combustible construction types III, IV, and V. One of the issues with construction is that water supply infrastructure is not always constructed prior to vertical construction of the building. The lack of a reliable and sufficient water supply has been a cause for many of these construction fires to cause more damage than may otherwise have occurred. The fire service can not fight fire of any significant size without a reliable water supply. It is necessary that we re-examine the way water supply is provided for buildings under construction.

Note that the provisions provided herein are not intended to require any additional water supply that would not already be required by Appendix B. The minimum fire flow that is required to be provided by Appendix B is 1,000 gpm. This proposal does not require any more than 1,000 gpm, unless the actual required fire flow for the specific building is already greater, as dictated by Appendix B. In order to ensure conformance with the fire flow requirement of Appendix B, the same exception allowing reduced fire flow from Appendix B is copied here as well.

What this proposal does is affect the timing of providing fire flow. Rather than allowing construction to start prior to establishing a water supply, as is often the case, this proposal requires that the fire flow, or a portion thereof, be provided as soon as combustible structural elements arrive at the site, and further be provided prior to vertical construction.

One should note that only structural elements are addressed. This proposal is not intended to require fire flow water supply for construction trailers, combustible forms, and the like. It is not the intent to require additional water supply during construction of non-combustible construction buildings merely due to presence of any combustibles, but rather to focus on combustible construction types.

Cost Impact

The code change proposal will increase the cost of construction .

While this proposal does not require any additional water supply that is not already required by code, it does affect the timing of providing this water supply. While the costs are difficult to quantify, affecting timing of improvements will surely have some associated costs that are not currently required without these requirements.

Analysis. The issue of water supply for fire protection at a construction site that appears in the IFC, IBC and IEBC is the responsibility of the IFC Committee. This code change proposes additional requirements for water supply relative to combustible elements and types of construction, but the subject matter remains within the same issue, therefore this code change proposed for the IFC, IBC and IEBC will be heard by the IFC committee.

2018 International Fire Code

Revise as follows:

3313.3 Detailed requirements. Standpipes shall be installed in accordance with the provisions of Section 905.

Exception: Standpipes shall be either temporary or permanent in nature, and with or without a water supply, provided that such standpipes comply with the requirements of Section 905 as to capacity, pressure, outlets and materials.

2018 International Building Code

[F] 3311.3 Detailed requirements. Standpipes shall be installed in accordance with the provisions of Chapter 9.

Exception: Standpipes shall be either temporary or permanent in nature, and with or without a water supply, provided that such standpipes conform to the requirements of Section 905 as to capacity, pressure, outlets and materials.

2018 International Existing Building Code

[F] 1506.3 Detailed requirements. Standpipes shall be installed in accordance with the provisions of Chapter 9 of the International Building Code.

Exception: Standpipes shall be either temporary or permanent in nature, and with or without a water supply, provided that such standpipes conform to the requirements of Section 905 of the International Building Code as to capacity, pressure, outlets and materials.

Reason:

Currently this section has the words capacity, outlets and materials. Capacity is typically is just gmp when we are talking about water supply. in order for fire standpipe work correctly they need capacity but also need pressure. If you have 500 gpm or more at the floor level but very little outlet pressure then the nozzle will not work correctly.

If the Fire Dept apparatus can supply the water capacity and pressure to the required floor height then there is no new code requirement.

however if the Fire Dept apparatus cannot supply the water capacity and pressure to the require floor height then a temporary or permanent pump would be required.

Cost Impact

The code change proposal will increase the cost of construction .

Chapter 33 would allow several type of standpipe system, this would include (automatic wet, automatic dry, manual dry, manual wet and semiautomatic dry) as define in chapter 2 of the IFC.

If the Fire Dept apparatus can supply the water capacity and pressure to the required floor height then there is no cost increase.

However if the Fire Dept apparatus cannot supply the capacity and pressure to the required floor height due the fire pump size then the construction team would need ot work with the Fire Dept to determine the best possible way to fix this. this could include a temporary pump or permanent pump installed. this would then be a cost increase

2018 International Fire Code

Add new text as follows:

3314.1 Completion during construction. Where an automatic sprinkler system is required by this code in buildings of Type III or V construction, and will be 4 or more stories above grade plane, the portion of the building or structure that is more than 40-feet in height above fire department vehicle access shall not begin construction until automatic sprinkler protection, either temporary or permanent, is provided for all stories below. As construction progresses such automatic sprinkler protection shall be extended to within one floor of the highest point of construction having secured decking or flooring.

2018 International Building Code

Add new text as follows:

3312.1 Completion during construction. Where an automatic sprinkler system is required by this code in buildings of Type III or V construction, and will be 4 or more stories above grade plane, the portion of the building or structure that is more than 40-feet in height above fire department vehicle access shall not begin construction until automatic sprinkler protection, either temporary or permanent, is provided for all stories below. As construction progresses such automatic sprinkler protection shall be extended to within one floor of the highest point of construction having secured decking or flooring.

2018 International Existing Building Code

1507.1 Completion during construction. Where an automatic sprinkler system is required by this code in buildings of Type III or V construction, and will be 4 or more stories above grade plane, the portion of the building or structure that is more than 40-feet in height above fire department vehicle access shall not begin construction until automatic sprinkler protection, either temporary or permanent, is provided for all stories below. As construction progresses such automatic sprinkler protection shall be extended to within one floor of the highest point of construction having secured decking or flooring.

Reason:

Automatic sprinkler protection systems continue to be the major factor that permits buildings to be built to larger heights and areas as allowed in Tables 504.3, 504.4 and 506.2 of the code. With these increases there has been a notable increase in fires, especially for Group R2 Residential Occupancies constructed of combustible framing, while the building is under construction. This has resulted significant loss of property for the building under construction and nearby properties exposed to the fire in part because important fire safety features such as passive fire protection for the combustible framing is not complete and automatic sprinkler system upon which these larger and taller buildings depend are not operational.

Besides the damage to the building under construction and to nearby properties some of these fires have required major street closures including interstates, and tied up firefighting resources to the extent that other areas of the communities were left under-protected for extended periods. An example is the major fire in Los Angeles with five stories of wood framing over a two-story concrete podium on December 8, 2014 that not only resulted in millions of dollars in damage to the building under construction, but also damaged adjacent buildings. The apartment building known as the DaVinci was a complete loss after the fire that was fueled by the five stories of wood frame construction. More than 250 firefighters were dispatched to the scene. The burning of the structure's wooden frame forced the closure of northbound Harbor Freeway (Hwy 110) and affected local streets causing major traffic disruptions for commuters and to the nearby business and residences. Buildings nearby were damaged by exposure to fire from the radiant heat as well as damage inside because the fire activated sprinklers in these adjacent buildings. It has been reported that the heat also melted or damaged computers and partition cubicles in neighboring building as well. The glazing in hundreds of windows of a nearby building was also damaged.

There are numerous examples of other large combustible framed apartment and condominium building fires while the building was under construction that illustrate the fire risk these large buildings pose. The following is a list of six such incidences in 2017. This list is not necessarily inclusive of all similar large combustible building fires in 2017.

1. Metropolitan Apartments, Raleigh NC March 17, 2017- 5-story apartment on pedestal
2. The Royale at City Place, Overland Park, KS March 20, 2017 - 5-story apartments
3. Fuse 47, College Park, MD April 24, 2017 - 5-story apartment on pedestal
4. Treadmark, Boston MA, June 28, 2017 - 6-story condominiums
5. Kelowna, BC, Canada July 8, 2017 - 6-story apartments
6. Edison on the Charles, Waltham, MA July 23, 2017 - 5-story apartments

Section 3311.1 of the code requires at least one operational standpipes be in place when portions of buildings requiring standpipes are 40 feet or more above the lowest level of fire department vehicle access. This proposal takes a similar approach to the standpipe requirement for fire safety by requiring sprinkler protection, either temporary or permanent, be provided when the construction reaches the 40-foot height above the fire department vehicle access. This level of fire protection is consistent with the fire risks associated with these larger buildings of combustible construction, and upon which the building code provisions are based. Also, like the standpipe requirements, the sprinkler system must be extended as each floor is provided with decking or flooring.

Cost Impact

The code change proposal will increase the cost of construction .

This proposal is expected to increase the cost of construction due to the sprinkler protection system having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

Analysis: The topic covered in this proposal is scoped to the IFC Code Development committee and therefore have been added to correlate in the duplicated sections within the IBC and IEBC.

IFC: Chapter 38, SECTION 3801, 3801.1, SECTION 3803, 3803.3 (New), 3803.4 (New), 5003.8.3; IBC: 307.1.1, SECTION 407, 407.12 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Revise as follows:

CHAPTER 38 HIGHER EDUCATION AND HOSPITAL CLINICAL LABORATORIES

SECTION 3801 GENERAL

3801.1 Scope. Higher education and Group I-2, Condition 2 clinical laboratories complying with the requirements of this chapter shall be permitted to exceed the maximum allowable quantities of hazardous materials in *control areas* set forth in Chapter 50 without requiring classification as a Group H occupancy. Except as specified in this chapter, such laboratories shall comply with all applicable provisions of this code and the International Building Code.

SECTION 3803 GENERAL SAFETY PROVISIONS

Add new text as follows:

3803.3 Safety showers. Where more than 5 gallons (19 L) of corrosive liquid or flammable liquid are stored, handled or used, suitable facilities with fixed overhead or flexible hand-held showers shall be installed and maintained in accordance with the International Plumbing Code.

3803.4 Neutralizing or absorbing agents. Where more than 5 gallons (19 L) of corrosive liquids are stored, handled or used, a quantity of neutralizing or absorbing agents shall be provided.

Revise as follows:

5003.8.3 Control areas. *Control areas* shall comply with Sections 5003.8.3.1 through 5003.8.3.5.3.

Exception: Higher education and Group I-2, Condition 1 clinical laboratories in accordance with Chapter 38 of this code and Section 428 of the International Building Code.

2018 International Building Code

Revise as follows:

[F] 307.1.1 Uses other than Group H. An occupancy that stores, uses or handles hazardous materials as described in one or more of the following items shall not be classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of Section 416 and the International Fire Code.
2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the International Fire Code.
3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment.
4. Cleaning establishments that utilize combustible liquid solvents having a flash point of 140°F (60°C) or higher in closed systems employing equipment *listed* by an *approved* testing agency, provided that this occupancy is separated from all other areas of the building by 1-hour *fire barriers* constructed in accordance with Section 707 or 1-hour *horizontal assemblies* constructed in accordance with Section 711, or both.
5. Cleaning establishments that utilize a liquid solvent having a flash point at or above 200°F (93°C).
6. Liquor stores and distributors without bulk storage.
7. Refrigeration systems.

8. The storage or utilization of materials for agricultural purposes on the premises.
9. Stationary storage battery systems installed in accordance with the International Fire Code.
10. Corrosive personal or household products in their original packaging used in retail display.
11. Commonly used corrosive building materials.
12. Buildings and structures occupied for aerosol product storage shall be classified as Group S-1, provided that such buildings conform to the requirements of the International Fire Code.
13. Display and storage of nonflammable solid and nonflammable or noncombustible liquid hazardous materials in quantities not exceeding the maximum allowable quantity per *control area* in Group M or S occupancies complying with Section 414.2.5.
14. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the International Fire Code.
15. Stationary fuel cell power systems installed in accordance with the International Fire Code.
16. Capacitor energy storage systems in accordance with the International Fire Code.
17. Group B higher education laboratory occupancies complying with Section 428 and Chapter 38 of the International Fire Code.
18. Group I-2, Condition 2 clinical laboratories complying with Sections 407 and 428 and Chapter 38 of the International Fire Code.

SECTION 407 GROUP I-2

Add new text as follows:

407.12 Clinical laboratories.. In Group I-2, Condition 2 occupancies, clinical laboratories shall be designed and constructed in accordance with Section 428 and Chapter 38 of the International Fire Code and NFPA 45.

Reason:

The reason this code change is being proposed is because hospitals have very similar needs to academic research laboratory in terms of quantity of hazardous material, but are not addressed in the current language of Chapter 38. Understanding that Chapter 38 is intended to be a very narrow focus, expanding to clinical laboratories found in I-2, Condition 2 hospitals only slightly expands the focus of the chapter.

A clinical lab processes tests for the clinical activity of the building, such as blood test and biopsies of body tissue. Handling of biohazardous waste is an issue, which causes many clinical labs to be in basements or sub-basements, as to not traverse the rest of the hospital and provide more direct access to the loading dock for proper specimen disposal per contaminated waste disposal and chain-of-custody procedures. Current IBC and IFC codes consider these spaces High Hazard, although quantities of hazardous material are relatively low. Clinical laboratories were not considered in the Chapter 38 change last cycle, although the quantities are actually less than those described in Chapter 38 for Higher Education labs. This change seeks to add clinical laboratories, because the commonality is that both types are not high-level production (K322).

There are several types of functions of clinical laboratories: chemistry, point-of-care testing, cytology (cell analysis), specimen processing, hematology (blood testing) and anatomical pathology. These make up sections of a clinical lab with specific analyzers. Only anatomical pathology and cytology labs use flammable or hazardous material, and are commonly stored in plastic, liter sized containers. Other labs include irritants and corrosives, in similar containers.

Clinical laboratories in these spaces is limited to one or two lab areas, usually arranged as a suite, which also indicates total size, and the separation requirements are adequate based on Table 3806.2.1 for sprinklered buildings (3804.1.1 for non-sprinklered).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will decrease the cost of construction .

This change decreases the cost of construction, because it eliminates a conflict between the I-codes the federal standard.

F272-18

IFC: 3805.2.1, 3805.2.2, 3805.4, TABLE 3805.4

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

3805.2.1 Restricted materials storage. Where *approved* by the *fire code official*, storage of the following hazardous materials prohibited by Table 5003.1.1(1) in buildings not equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall be allowed within a laboratory *control area* at 25 percent of Table 5003.1.1(1) limits for a building equipped throughout with an *automatic sprinkler system*.

1. ~~Pyrophorics~~-Class 4 Oxidizers.
2. ~~Class 4 Oxidizers~~-Pyrophorics.

The percentage of the maximum allowable quantity per control shown in Table 3805.4 shall be applied to 25 percent of Table 5003.1.1(1) limits for Class 4 Oxidizers or pyrophoric materials.

Additional quantity increases shall be prohibited, and such materials shall be stored in accordance with all of the following:

1. Containers shall be completely sealed and stored in accordance with the manufacturers' recommendations.
2. Storage shall be within *approved* hazardous material storage cabinets in accordance with Section 5003.8.7, or shall be located in an inert atmosphere glove box in accordance with NFPA 45, Section 7.11.
3. The storage cabinet or *glove box* shall not contain any storage of *incompatible materials*.

3805.2.2 Restricted materials use. Where *approved* by the *fire code official*, use of the following hazardous materials prohibited by Table 5003.1.1(1) in buildings not equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, shall be allowed within a laboratory *control area* at 25 percent of Table 5003.1.1(1) limits for buildings equipped throughout with an *automatic sprinkler system*.

1. ~~Pyrophorics~~-Class 4 Oxidizers.
2. ~~Class 4 Oxidizers~~-Pyrophorics.

The percentage of the maximum allowable quantity per control area shown in Table 3805.4 shall be applied to 25 percent of Table 5003.1.1(1) limits for Class 4 Oxidizers or pyrophoric materials.

Additional quantity increases shall be prohibited, and such materials shall be stored in accordance with all of the following:

1. Use shall be within an *approved* chemical fume hood listed in accordance with UL 1805, or in an inert atmosphere glove box in accordance with NFPA 45, Section 7.11, or other *approved* equipment designed for the specific hazard of the material.
2. Combustible materials shall be kept not less than 2 feet (610 mm) away from the work area, except for those items directly related to the research.
3. A portable fire extinguisher appropriate for the specific material shall be provided within 20 feet (6096 mm) of the use in accordance with Section 906.

3805.4 Percentage of maximum allowable quantity per control area. The percentage of *maximum allowable quantities per control area* of hazardous materials shall ~~be permitted to be increased in accordance~~ comply with Table 3805.4.

**TABLE 3805.4
DESIGN AND NUMBER OF CONTROL AREAS IN EXISTING NONSPRINKLERED LABORATORIES**

FLOOR LEVEL		PERCENTAGE OF THE MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA^{a,e}	NUMBER OF CONTROL AREAS PER FLOOR	FIRE-RESISTANCE RATING FOR FIRE BARRIERS IN HOURS^{b, c, d}
Above grade plane	Higher than 9	5	1	2 ^c
	7-9	10	2	2 ^c
	4-6	25	2	2 ^c
	3	75	2	1
	1-2	100	4	1
Below grade plane	1	100	3	1
	2	75	2	1
	Lower than 2	Not Allowed	Not Allowed	Not Allowed

- a. Percentages shall be of the maximum allowable quantity per control area shown in Tables 5003.1.1(1) and 5003.1.1(2), excluding all increases allowed in the footnotes to those tables.
- b. Fire barriers shall include walls, floors and ceilings necessary to provide separation from other portions of the building.
- c. Vertical fire barriers separating control areas from other spaces on the same floor are permitted to be 1-hour fire-resistance rated.
- d. See Section 414.2.4 of the International Building Code for additional requirements.
- e. The percentage of the maximum allowable quantity per control shown in Table 3805.4 shall be applied to 25 percent of Table 5003.1.1(1) limits for Class 4 Oxidizers or pyrophoric materials.

Reason:

It was requested by those who had previously worked on this proposal to revisit the new 2018 IFC Chapter 38. It was felt that portions of the new code chapter were too easy to misapply or misinterpret. After several teleconference meetings, these changes were among those proposed to clarify the intent of the new chapter and to reorder the materials referenced in 3805.2.1 and 3805.2.2 to place them in alphabetical order. The FCAC agreed with these revisions.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed changes should have little to no impact on cost for achieving code compliance. These changes are believed to be needed only to clarify the intent of the current text.

Internal ID: 1886

F273-18

IFC: 3901.2

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

3901.2 Existing buildings or facilities. Existing buildings or facilities used for the processing of plants ~~or~~ shall comply with this chapter. Existing extraction processes where the medium of extraction or solvent is changed shall comply with this chapter.

Reason:

This proposal is a simple revision to clarify the intent of application of Chapter 39 to existing buildings.

As currently written, Section 3901.2 states that the new chapter 39 applies to:

1. Existing buildings and facilities, OR
2. Existing buildings and facilities where the extraction solvent is changed.

It either applies to ALL existing buildings, or not. If the intent was to have this chapter apply to all existing facilities, then it would not matter whether the extraction was changed or not; the existing facility must comply.

The proposed revision clarifies that the requirements apply to existing facilities where or not the extraction solvent is changed.

When those same existing facilities want to change the extraction process, those changes must also comply with this chapter. This application is consistent with Chapter 1 of the IFC which states that the requirements apply to new buildings, facilities, and operations. The change of solvent would mean of change in operations which means that the new operation must comply with the current regulations.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This is editorial and clarifies the application of Chapter 39.

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows:

3904.2 Systems and equipment. ~~Systems or equipment used for the extraction of oils from plant material shall be listed or approved for the specific use. If the system used for extraction of oils and products from plant material is not listed, the system shall be reviewed by a registered design professional. The registered design professional shall review and consider any information provided by the system's designer or manufacturer. For systems and equipment not listed for the specific use, a technical report in accordance with Section 3904.3 shall be prepared and submitted to the fire code official for review and approval. The firm or individual preparing the technical report shall be approved by the fire code official prior to performing the analysis.~~ comply with either Section 3404.2.1 or 3404.2.2.

Add new text as follows:

3904.2.1 Listings. Systems or equipment used for the extraction of oils from plant material shall be listed and labeled in accordance with UL 1389 and installed in accordance with the listing and the manufacturer's installation instructions.

3904.2.2 Approvals. Systems or equipment used for the extraction of oils from plant material shall be approved for the specific use. The system shall be reviewed by a registered design professional. The registered design professional shall review and consider any information provided by the system's designer or manufacturer. A technical report in accordance with Section 3904.2.2.1 shall be prepared and submitted to the fire code official for review and approval. The firm or individual preparing the technical report shall be approved by the fire code official prior to performing the analysis.

Revise as follows:

~~3904.3~~**3904.2.2.1 Technical report.** A technical report, reviewed and approved by the *fire code official* as required by Section ~~3904.2~~3904.2.2, is required prior to the equipment being located or installed at the facility. The report shall be prepared by a *registered design professional* or other professional approved by the *fire code official*.

~~3904.3~~**3904.2.2.2 Report content.** The technical report shall contain all of the following:

1. Manufacturer information.
2. Preparer of record of the technical report.
3. Date of review and report revision history.
4. Signature page, including all of the following:
 - 4.1. Author of the report.
 - 4.2. Date of report.
 - 4.3. Date and signature of *registered design professional* of record performing the design or peer review.
5. Model number of the item evaluated. If the equipment is provided with a serial number, the serial number shall be included for verification at the time of site inspection.
6. Methodology of the design or peer review process used to determine minimum safety requirements. Methodology shall consider the basis of design, and shall include a code analysis and code path to demonstrate whether specific codes or standards are applicable.
7. Equipment description. A list of every component and subassembly, such as fittings, hose, quick disconnects, gauges, site glass, gaskets, valves, pumps, vessels, containers and switches, of the system or equipment, indicating the manufacturer, model number, material and solvent compatibility. Manufacturer's data sheets shall be provided.
8. A general flow schematic or general process flow diagram of the process. Post-processing or winterization shall be included in this diagram. Primary components of the process equipment shall be identified and match the equipment list required in Item 7. Operating temperatures, pressures

and solvent state of matter shall be identified in each primary step or component. A piping and instrumentation diagram (PID or P&ID) shall be provided.

9. Analysis of the vessel(s) if pressurized beyond standard atmospheric pressure. Analysis shall include purchased and fabricated components.
10. Structural analysis for the frame system supporting the equipment.
11. Process safety analysis of the extraction system, from the introduction of raw product to the end of the extraction process.
12. Comprehensive process hazard analysis considering failure modes and points of failure throughout the process. The process hazard analysis shall include a review of emergency procedure information provided by the manufacturer of the equipment or process and not that of the facility, building or room.
13. Review of the assembly instructions, operational and maintenance manuals provided by the manufacturer.
14. List of references used in the analysis.

~~3904.4~~**3904.2.2.3 Site inspection.** Prior to operation of the extraction equipment, where required by the *fire code official*, the engineer of record or *approved* professional, as *approved* in Section ~~3904.2~~**3904.2.2**, shall inspect the site of the extraction process once equipment has been installed for compliance with the technical report and the building analysis. The engineer of record or *approved* professional shall provide a report of findings and observations of the site inspection to the *fire code official* prior to the approval of the extraction process. The field inspection report authored by the engineer of record shall include the serial number of the equipment used in the process and shall confirm that the equipment installed is the same model and type of equipment identified in the technical report.

Add new standard(s) follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

1389—17:

Plant Extraction Units

Reason:

The code currently allows extraction equipment to be either listed or approved. If the equipment is not listed, approval is based on a registered design professional preparing a technical report on the equipment, followed up by a site inspection.

UL 1389 was developed to investigate plant extraction equipment that utilizes flammable solvents. This proposal adopts UL 1389 as the standard used to list extraction equipment, and reformats section 3904 to clarify that the technical report and registered design professional site inspection are only required for extraction systems that are not listed.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposal only identifies the standard used to list extraction equipment, and does not remove the option for non-listed equipment to be provided under certain identified conditions.

Internal ID: 765

F275-18

IFC: SECTION 3905, 3905.1, 3905.1.1, 3905.1.2, 3905.1.3, 3905.1.5, 3905.2

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

SECTION 3905 SAFETY SYSTEMS

Revise as follows:

3905.1 Gas detection. For extraction processes utilizing flammable gases as solvents, a ~~continuous~~ gas detection system ~~complying with Section 916~~ shall be provided. ~~The gas detection threshold shall be not greater than 25 percent of the lower explosive limit/lower flammability limit (LEL/LFL) of the materials.~~

Delete without substitution:

~~**3905.1.1 System design.** The flammable gas detection system shall be *listed* or *approved* and shall be calibrated to the types of fuels or gases used for the extraction process. The gas detection system shall be designed to activate when the level of flammable gas exceeds 25 percent of the LFL.~~

~~**3905.1.2 Gas detection system components.** Gas detection system control units shall be *listed* and *labeled* in accordance with UL 864 or UL 2017. ~~2017.~~ Gas detectors shall be *listed* and *labeled* in accordance with UL 2075 for use with the gases and vapors being detected.~~

Revise as follows:

~~3905.1.~~**3905.1.2 Operation.** Activation of the gas detection system shall result in all the following:

1. Initiation of distinct audible and visual alarm signals in the extraction room.
2. Deactivation of all heating systems located in the extraction room.
3. Activation of the mechanical ventilation system, where the system is interlocked with gas detection.
4. ~~Activation of the gas detection system shall disable all light switches and electrical outlets.~~

~~3905.1.4~~**3905.1.3 Failure of the gas detection system.** Failure of the gas detection system shall result in the deactivation of the heating system; activation of the mechanical ventilation system where the system is interlocked with the gas detection system; and initiation of a trouble signal to sound in an *approved* location.

Delete without substitution:

~~**3905.1.5 Interlocks.** Electrical components within the extraction room shall be interlocked with the gas detection system. Activation of the gas detection system shall disable all light switches and electrical outlets.~~

3905.2 Emergency shutoff. Extraction processes utilizing gaseous hydrocarbon-based solvents shall be provided with emergency shutoff systems in accordance with Section 5803.1.3.

Reason:

Last cycle F75-16 included a comprehensive rewrite of gas detection system requirements. This proposal does not change when and where gas detection is required in Chapter 39, but merely correlates the requirements with the remaining IFC gas detection system requirements. Section 916 includes requirements for the gas detection system and components, and covers the 25% LFL detection threshold.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This correlates this new chapters gas detection systems with F75-16. It should not change the cost or possibly reduce as the gas detction requirements will be more specific to the process being regulated.

2018 International Building Code

Revise as follows:

[F] 307.1.1 Uses other than Group H. An occupancy that stores, uses or handles hazardous materials as described in one or more of the following items shall not be classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of Section 416 and the International Fire Code.
2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the International Fire Code.
3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment.
4. Cleaning establishments that utilize combustible liquid solvents having a flash point of 140°F (60°C) or higher in closed systems employing equipment *listed* by an *approved* testing agency, provided that this occupancy is separated from all other areas of the building by 1-hour *fire barriers* constructed in accordance with Section 707 or 1-hour *horizontal assemblies* constructed in accordance with Section 711, or both.
5. Cleaning establishments that utilize a liquid solvent having a flash point at or above 200°F (93°C).
6. Liquor stores and distributors without bulk storage.
7. Refrigeration systems.
8. The storage or utilization of materials for agricultural purposes on the premises.
9. Stationary storage battery systems installed in accordance with the International Fire Code.
10. Corrosive personal or household products in their original packaging used in retail display.
11. Commonly used corrosive building materials.
12. Buildings and structures occupied for aerosol product storage shall be classified as Group S-1, provided that such buildings conform to the requirements of the International Fire Code.
13. Display and storage of nonflammable solid and nonflammable or noncombustible liquid hazardous materials in quantities not exceeding the maximum allowable quantity per *control area* in Group M or S occupancies complying with Section 414.2.5.
14. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the International Fire Code.
15. Stationary fuel cell power systems installed in accordance with the International Fire Code.
16. Capacitor energy storage systems in accordance with the International Fire Code.
17. Group B higher education laboratory occupancies complying with Section 428 and Chapter 38 of the International Fire Code
18. Distilling or brewing of beverages conforming to the requirements of the International Fire Code.
19. The storage of beer, distilled spirits and wines in barrels and casks conforming to the requirements of the International Fire Code.

311.2 Moderate-hazard storage, Group S-1. Storage Group S-1 occupancies are buildings occupied for storage uses that are not classified as Group S-2, including, but not limited to, storage of the following:

- Aerosol products, Levels 2 and 3

- Aircraft hangar (storage and repair)
- Bags: cloth, burlap and paper
- Bamboos and rattan
- Baskets
- Belting: canvas and leather
- Beverages: over 16-percent alcohol content
- Books and paper in rolls or packs
- Boots and shoes
- Buttons, including cloth covered, pearl or bone
- Cardboard and cardboard boxes
- Clothing, woolen wearing apparel
- Cordage
- Dry boat storage (indoor)
- Furniture
- Furs
- Glues, mucilage, pastes and size
- Grains
- Horns and combs, other than celluloid
- Leather
- Linoleum
- Lumber
- Motor vehicle repair garages complying with the maximum allowable quantities of hazardous materials listed in Table 307.1(1) (see Section 406.8)
- Photo engravings
- Resilient flooring
- Self-service storage facility (mini-storage)
- Silks
- Soaps
- Sugar
- Tires, bulk storage of
- Tobacco, cigars, cigarettes and snuff
- Upholstery and mattresses
- Wax candles

311.3 Low-hazard storage, Group S-2. Storage Group S-2 occupancies include, among others, buildings used for the storage of noncombustible materials such as products on wood pallets or in paper cartons with or without single thickness divisions; or in paper wrappings. Such products are permitted to have a negligible amount of plastic *trim*, such as knobs, handles or film wrapping. Group S-2 storage uses shall include, but not be limited to, storage of the following:

- Asbestos
- Beverages up to and including 16-percent alcohol ~~in metal, glass or ceramic containers~~
- Cement in bags
- Chalk and crayons
- Dairy products in nonwaxed coated paper containers
- Dry cell batteries
- Electrical coils

- Electrical motors
- Empty cans
- Food products
- Foods in noncombustible containers
- Fresh fruits and vegetables in nonplastic trays or containers
- Frozen foods
- Glass
- Glass bottles, empty or filled with noncombustible liquids
- Gypsum board
- Inert pigments
- Ivory
- Meats
- Metal cabinets
- Metal desks with plastic tops and *trim*
- Metal parts
- Metals
- Mirrors
- Oil-filled and other types of distribution transformers
- Parking garages, open or enclosed
- Porcelain and pottery
- Stoves
- Talc and soapstones
- Washers and dryers

2018 International Fire Code

Add new text as follows:

903.2.4.2 Group F-1 Distilled Spirits. An automatic sprinkler system shall be provided throughout a Group F-1 fire area used for the manufacture of distilled spirits.

903.2.9.3 Group S-1 Distilled spirits or wine. An automatic sprinkler system shall be provided throughout a Group S-1 fire area used for the bulk storage of distilled spirits or wine.

CHAPTER 40 STORAGE OF DISTILLED SPIRITS AND WINES

SECTION 4001 GENERAL

4001.1 General. The storage of distilled spirits and wines in barrels and casks shall comply with this chapter in addition to other applicable requirements of this code.

4001.1.1 Nonapplicability. Chapter 50 and Chapter 57 of this code are not applicable to the storage of distilled spirits and wines in barrels and casks as identified in Section 5001.1, Exception 10, and Section 5701.2, Item 10.

SECTION 4002 DEFINITIONS

4002.1 Terms defined in Chapter 2. Words and terms used in this chapter and defined in Chapter 2 shall have the meanings ascribed to them as defined therein.

4003 PRECAUTIONS AGAINST FIRE

4003.1 Spill Control. Drainage or containment systems shall be provided by means of curbs, scuppers, special drains, or other suitable means to prevent the flow of spills throughout the building.

4003.2 Ventilation. Ventilation shall be provided for rooms and spaces where distilled spirits and wines in barrels and casks are stored in accordance with the International Mechanical Code and one of the following:

1. The rooms and spaces shall be ventilated at a rate sufficient to maintain the concentration of vapors within the area at or below 25% of the LFL . This shall be confirmed by sampling of the actual vapor concentration under normal operating conditions. The sampling shall be conducted throughout the enclosed storage area extending to or toward the bottom and the top of the enclosed storage area. The vapor concentration used to determine the required ventilation rate shall be the highest measured concentration during the sampling procedure. The sampling shall be conducted manually or by installation of a continuously monitoring flammable vapor detection system.
2. The rooms and spaces shall be provided exhaust ventilation at a rate of not less than 1 cfm/ft² (0.3 m³/min) of solid floor area. The exhaust ventilation shall be accomplished by natural or mechanical means, with discharge of the exhaust to a safe location outside the building.

4003.3 Sources of ignition.. Sources of ignition shall be controlled in accordance with Sections 4003.3.1 through 4003.4.

4003.3.1 Smoking. Smoking shall be prohibited and "No Smoking" signs provided as follows:

1. In rooms or areas where hazardous materials are stored or dispensed or used in open systems in amounts requiring a permit in accordance with Section 105.6 and 105.7
2. Within 25 feet (7620mm) of outdoor storage, dispensing or open use areas.
3. Facility or areas within facilities that have been designated as totally "no smoking" shall have "No Smoking" signs placed at all entrances to the facility or area. Designated areas within such facilities where smoking is permitted either permanently or temporarily shall be identified with signs designating that smoking is permitted in these areas only.
4. In rooms or areas where flammable or combustible hazardous materials are stored, dispensed or used.

Signs required by this section shall be in English as a primary language or in symbols allowed by this code and shall comply with Section 310.

4003.3.2 Open Flame. Open flames and high-temperature devices shall not be used in a manner that creates a hazardous condition and shall be listed for use with the hazardous materials stored or used.

4003.3.3 Industrial trucks. Powered industrial trucks used in areas designated as hazardous (classified) locations in accordance with NFPA 70 shall be listed and labeled for use in the environment intended in accordance with NFPA 505.

4003.3.4 Electrical. Electrical wiring and equipment shall be installed and maintained in accordance with Section 605 and NFPA 70.

4003.4 Lightning. Structures containing barrel storage should be protected from lightning. The lightning protection equipment shall be installed in accordance with NFPA 780 and NFPA 70.

SECTION 4004 STORAGE

4004.1 Storage. Storage shall be in accordance with this section and Section 315.

4004.2 Empty containers. The storage of empty containers previously used for the storage of flammable or combustible liquids, unless free from explosive vapors, shall be stored as required for filled containers.

4004.3 Basement storage. Class I liquids shall be allowed to be stored in basements in amounts not exceeding the maximum allowable quantity over control area for use-open systems in Table 5003.1.1(1), provided that automatic suppression and other fire protection are provided in accordance with Chapter 9. Class II and IIIA liquids shall also be allowed to be stored in basements, provided that automatic suppression and other fire protection are provided in accordance with Chapter 9.

4004.4 Bulk beverage storage areas. There shall be no storage of combustible materials in the bulk beverage storage areas not related to the beverage storage activities.

SECTION 4005 FIRE PROTECTION

4005.1 Automatic sprinkler system. The storage of distilled spirits and wines shall be protected by an approved automatic sprinkler system as required by Chapter 9.

4005.2 Portable Fire Extinguishers. Approved portable fire extinguishers shall be provided in accordance with Section 906.

SECTION 4006 SIGNAGE

4006.1 Hazard identification signs. Unless otherwise exempted by the fire code official, visible hazard identification signs as specified in NFPA 704 for the specific material contained shall be placed on stationary containers and above ground tanks and at entrances to locations where hazardous materials are stored, dispensed, used or handled in quantities requiring a permit and at specific entrances and locations designated by the fire code official.

4006.1.1 Maintenance and style. Signs and markings required by Section 4006.1 shall not be obscured or removed, shall be in English as a primary language or in symbols allowed by this code, shall be durable, and the size, color, and lettering shall be approved.

Revise as follows:

5001.1 Scope. Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials shall be in accordance with this chapter.

This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that where specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.

Exceptions:

1. In retail or wholesale sales occupancies, the quantities of medicines, foodstuff or consumer products and cosmetics containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solutions not being flammable shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).
2. Quantities of alcoholic beverages in retail or wholesale sales occupancies shall not be limited providing the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
3. Application and release of pesticide and agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications where applied in accordance with the manufacturers' instructions and label directions.
4. The off-site transportation of hazardous materials where in accordance with Department of Transportation (DOTn) regulations.
5. Building materials not otherwise regulated by this code.
6. Refrigeration systems (see Section 605).
7. Stationary storage battery systems regulated by Section 1206.2.
8. The display, storage, sale or use of fireworks and *explosives* in accordance with Chapter 56.
9. *Corrosives* utilized in personal and household products in the manufacturers' original consumer packaging in Group M occupancies.
10. The storage of beer, distilled spirits and wines in ~~wooden~~ barrels and casks.
11. The use of wall-mounted dispensers containing alcohol-based hand rubs classified as Class I or II liquids where in accordance with Section 5705.5.

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

1. Specific provisions for flammable liquids in motor fuel-dispensing facilities, repair garages, airports and marinas in Chapter 23.
2. Medicines, foodstuffs, cosmetics and commercial or institutional products containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solution not being

flammable, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).

3. Quantities of alcoholic beverages in retail or wholesale sales or storage occupancies, provided that the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
4. Storage and use of fuel oil in tanks and containers connected to oil-burning equipment. Such storage and use shall be in accordance with Section 603. For abandonment of fuel oil tanks, this chapter applies.
5. Refrigerant liquids and oils in refrigeration systems (see Section 605).
6. Storage and display of aerosol products complying with Chapter 51.
7. Storage and use of liquids that do not have a fire point when tested in accordance with ASTM D92.
8. Liquids with a *flash point* greater than 95°F (35°C) in a water-miscible solution or dispersion with a water and inert (noncombustible) solids content of more than 80 percent by weight, which do not sustain combustion.
9. Liquids without *flash points* that can be flammable under some conditions, such as certain halogenated hydrocarbons and mixtures containing halogenated hydrocarbons.
10. The storage of ~~beer~~, distilled spirits and wines in ~~wooden~~ barrels and casks.
11. Commercial cooking oil storage tank systems located within a building and designed and installed in accordance with Section 608 and NFPA 30.

2018 International Mechanical Code

Revise as follows:

[F] 502.9.5 Flammable and combustible liquids. Exhaust ventilation systems shall be provided as required by Sections 502.9.5.1 through 502.9.5.5 for the storage, use, dispensing, mixing and handling of flammable and combustible liquids. Unless otherwise specified, this section shall apply to any quantity of flammable and combustible liquids.

~~Exception~~ **Exceptions:**

1. This section shall not apply to flammable and combustible liquids that are exempt from the International Fire Code.
2. The storage of beer, distilled spirits and wines in barrels and casks conforming to the requirements of the International Fire Code.

Reason:

Currently, due to changes over several code change cycles, there is confusion on how to treat distilled spirits and wines as a Group in the International Building Code and for applicable safety requirements of the International Fire Code. Coordination between the codes on this subject is important because distilled spirits still have the properties of flammable liquids and proper safeguards must be provided for the occupancies housing such activities.

[F] COMBUSTIBLE LIQUID. A liquid having a closed cup flash point at or above 100°F (38°C). Combustible liquids shall be subdivided as follows:

Class II. Liquids having a closed cup flash point at or above 100°F (38°C) and below 140°F (60°C).

Class IIIA. Liquids having a closed cup flash point at or above 140°F (60°C) and below 200°F (93°C).

Class IIIB. Liquids having a closed cup flash point at or above 200°F (93°C).

The category of combustible liquids does not include compressed gases or cryogenic fluids.

[F] FLAMMABLE LIQUID. A liquid having a closed cup flash point below 100°F (38°C). Flammable liquids are further categorized into a group known as Class I liquids. The Class I category is subdivided as follows:

Class IA. Liquids having a flash point below 73°F (23°C) and a boiling point below 100°F (38°C).

Class IB. Liquids having a flash point below 73°F (23°C) and a boiling point at or above 100°F (38°C).

Class IC. Liquids having a flash point at or above 73°F (23°C) and below 100°F (38°C). The category of flammable liquids does not include compressed gases or cryogenic fluids.

Image-1-Alcohol-Levels

Image-2-Alcohol-Levels

The International Building Code classifies the various activities into Groups. The manufacturing of beverages with over 16 percent alcohol is classified as an F-1 and the manufacturing of beverages 16 percent alcohol or less is classified as an F-2:

306.2 Moderate-hazard factory industrial, Group F-1. Factory industrial uses that are not classified as Factory Industrial F-2 Low Hazard shall be classified as F-1 Moderate Hazard and shall include, but not be limited to, the following:

Beverages: over 16-percent alcohol content

306.3 Low-hazard factory industrial, Group F-2. Factory industrial uses that involve the fabrication or manufacturing of noncombustible materials that during finishing, packing or processing do not involve a significant fire hazard shall be classified as F-2 occupancies and shall include, but not be limited to, the following:

Beverages: up to and including 16-percent alcohol content

The storage of beverages with up to and including 16-percent alcohol in metal, glass or ceramic containers is classified as an S-2:

311.3 Low -hazard storage, Group S-2. Storage Group S-2 occupancies include, among others, buildings used for the storage of noncombustible materials such as products on wood pallets or in paper cartons with or without single thickness divisions; or in paper wrappings. Such products are permitted to have a negligible amount of plastic trim, such as knobs, handles or film wrapping. Group S-2 storage uses shall include, but not be limited to, storage of the following:

Beverages up to and including 16-percent alcohol in metal, glass or ceramic containers

However, there is no Group S classification listed for storage of beverages with over 16 percent alcohol and there are no listed "Uses other than Group H" for distilling activities or bulk storage of distilled spirits in Section 307 High Hazard Group H.

311.2 Moderate-hazard storage, Group S-1. Storage Group S-1 occupancies are buildings occupied for storage uses that are not classified as Group S-2, including, but not limited to, storage of the following:

???

[F] 307.1.1 Uses other than Group H. An occupancy that stores, uses or handles hazardous materials as described in one or more of the following items shall not be classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the International Fire Code.

6. Liquor stores and distributors without bulk storage.

The lack of a S-1 Group designation for storage activities for beverages over 16-percent alcohol or any bulk storage recognition and the lack of recognition under "Uses other than Group H" causes disputes between code officials as to application of a Group H to storage of the finished product after it leaves the Factory group process.

In the International Fire Code there is confusion about the applicability of Chapter 50 Hazardous Materials-General Provisions and Chapter 57 Flammable and Combustible Liquids provisions to distilled spirits because of the exception for distilled spirits and wines stored in wooden barrels and casks in IFC Chapters 50 and 57. The issue is arising because of the growing popularity of "boutique" or "craft" distillers.

A review of the International Fire Code Commentary concerning the distilled spirits in wooden barrels exception finds the following statement which highlights the conflict between the codes:

5001.1 Scope.

Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials shall be in accordance with this chapter.

This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that where specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.

Exceptions:

10. The storage of distilled spirits and wines in wooden barrels and casks.

IFC Commentary:

"Exception 10 covers the storage of distilled spirits and wines in wooden barrels and casks. This statement may appear to exempt all requirements for these products from being a Group H occupancy. However, the IBC will still classify the storage area as a Group H occupancy if the amounts exceed the maximum allowable quantities (MAQs) per control area listed in Table 307.1(1) of that code for flammable or combustible liquids. All requirements for a Group H occupancy in the IBC are still applicable; however, any requirements from the code (fire code) are not."

5701.1 Scope and application. Prevention, control and mitigation of dangerous conditions related to storage, use,

dispensing, mixing and handling of flammable and combustible liquids shall be in accordance with Chapter 50 and this chapter.

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

10. The storage of distilled spirits and wines in wooden barrels and casks.

IFC Commentary:

“Item 10 makes the storage of distilled spirits and wines in wooden barrels and casks exempt from this chapter. Although their contents are classified as flammable liquids, the containers do not pose the rupture hazard that other containers do. Barrels and casks will leak their contents and contribute to the fire as the metal bands that secure the staves expand and loosen. Even this hazard feature is generally mitigated by the operation of automatic sprinklers that prevent the fire from progressing to the point where the metal bands get hot enough to expand. A similar exception also appears in Section 5001.1.”

In summary, when you manufacture distilled spirits you are an F-1 occupancy. When you manufacture wine or beer you are an F-2 occupancy. When you store wine and beer you are an S-2 occupancy. When you store distilled spirits in retail packaging you are not an H occupancy but there is no clarifying entry under S-1. If you store any beverage with over 16% alcohol in bulk, (includes some wines), you have an H occupancy. As far as risk goes, manufacturing has a higher risk than storage for an event, yet manufacturing of distilled spirits is an F-1 regardless of amount but an H if stored in bulk. This makes no sense. To top it off, when you go to the IFC, if you store your distilled spirits in bulk in wooden barrels Chapter 50 and 57 do not apply so there are no code requirements.

This proposal attempts to address this confusion recognizing the main safety issues are the need for automatic fire suppression, the need for mechanical ventilation and need for containment of spills. In 2005 the Distilled Spirits Council of The United States (DISCUS) released recommended guidelines for these facilities which addressed fire protection, ventilation and secondary containment requirements. Those guidelines were consulted in drafting the new chapter proposed for the International Fire Code.

It is proposed to make the following Group designation changes to the International Building Code:

Add a classification under S-1 for storage of beverages over 16% alcohol whether in bulk or retail packaging.

Modify the classification under S-2 to apply to all beverages up to and including 16-percent alcohol regardless of container type.

Modify Section [F] 307.1.1 “Uses other than Group H” to add classifications for distilling, brewing or storage of these materials.

In the International Fire Code, it is proposed to strike the word “wooden” and addition of the “word beer” in the exceptions in Chapters 50 and 57:

10. The storage of beer, distilled spirits and wines in ~~wooden~~ barrels and casks.

In the International Mechanical Code it is proposed to strike the word “wooden” from Section [F] 502.9.5 “Flammable and combustible liquids”.

In conjunction with the Group classification cleanup and striking the word wooden in both the IFC and IMC, protection features will be addressed by establishing new sprinkler thresholds for the manufacture of distilled spirits or bulk storage of distilled spirits regardless of square footage along with the creation of a new chapter in the International Fire Code for the Storage of Distilled Spirits and Wines.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Building Code Action Committee (BCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>. BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Bibliography:

Recommended Fire Protection Practices for Distilled Spirits Beverage Facilities, Third Edition

Prepared Under the Auspices of The Distilled Spirits Council of the United States, Inc.

<http://www.discus.org/policy/fireprotection/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This proposal will likely break even on the cost of construction by clarifying what the appropriate Group designation is, elimination of the unnecessary H classifications, and clarifying what protection levels are necessary.

2018 International Fire Code

Add new definition as follows:

ANIMAL HOUSING FACILITY Area of a building or structure, including interior and adjacent exterior spaces, where animals are fed, rested, worked, exercised, treated, exhibited, or used for production.

Add new text as follows:

CHAPTER 40 ANIMAL HOUSING FACILITIES

4001 GENERAL

4001.1 Scope. Fire protection for animal housing facilities, including agricultural buildings where livestock and poultry are housed, shall comply with the provisions of this chapter.

4002 DEFINITION

4002.1 Definitions. The following term is defined in Chapter 2:
ANIMAL HOUSING FACILITY

4003 PRECAUTIONS

4003.1 Sources of Ignition. Smoking or the use of heating or other devices employing an open flame, or the use of spark-producing equipment is prohibited in all areas of an animal housing facility, including agricultural buildings housing livestock or poultry.

4003.2 Waste Removal and Housekeeping. A procedure to ensure cleanliness and orderliness, including the removal of animal waste, shall be maintained. Permanent storage shall be prohibited in aisles, hallways, or other types of corridors.

4004 FIRE PROTECTION AND LIFE SAFETY

4004.1 Standards. Animal housing facilities shall be in accordance with the applicable provisions of the standards referenced in Table 4004.1..

Table 4004.1
Fire and Life Safety Standards for Animal Housing

Standard	Subject
NFPA 101	The Life Safety Code
NFPA 150	Standard on Fire and Life Safety in Animal Housing Facilities

Add new standard(s) follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

150-16:

Standard on Fire and Life Safety in Animal Housing Facilities

Reason:

Currently, the IFC does not recognize this special type of occupancy. While housing for poultry and livestock in agricultural buildings is addressed, non-agricultural facilities where animals are housed and attended to by humans are not addressed. This proposed chapter would address the fire protection and life safety concerns in all types of animal housing, including agricultural buildings that house poultry and livestock. It is important for the IFC to recognize the special operations that take place in these unique facilities, where a secondary population is wholly reliant on a primary population for the necessary, prompt attention required during a fire emergency. This language will allow the IFC to correlate with NFPA 1 and NFPA 101, which both address this special occupancy, and will provide a vital directional path from the IFC to the only standard in our industry that addresses the specific requirements for fire protection and life safety in an animal housing facility, namely NFPA 150. Such correlation and recognition by the IFC would be vital in advancing the work of property protection and life safety in this important sector of our industry.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

These facilities already exist but are simply not yet addressed in the IFC. This would not affect the cost of construction as these facilities should already be complying with the referenced standards. Also in some cases the requirements of this chapter are operational and not related to construction.

2018 International Fire Code

Revise as follows:

5001.1 Scope. Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials shall be in accordance with this chapter.

This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that where specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.

Exceptions:

1. ~~In retail or wholesale sales occupancies, the quantities of medicines, foodstuff, cosmetics and commercial or consumer institutional products and cosmetics containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solutions not being flammable shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).~~
2. ~~Quantities of alcoholic beverages in retail or wholesale sales occupancies shall not be limited providing~~
provided that the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
3. Application and release of pesticide and agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications where applied in accordance with the manufacturers' instructions and label directions.
4. The off-site transportation of hazardous materials where in accordance with Department of Transportation (DOTn) regulations.
5. Building materials not otherwise regulated by this code.
6. Refrigerant liquids and oils in refrigeration systems (see Section 605).
7. Stationary storage battery systems regulated by Section 1206.2.
8. The display, storage, sale or use of fireworks and *explosives* in accordance with Chapter 56.
9. *Corrosives* utilized in personal and household products in the manufacturers' original consumer packaging in Group M occupancies.
10. The storage of distilled spirits and wines in wooden barrels and casks.
11. The use of wall-mounted dispensers containing alcohol-based hand rubs classified as Class I or II liquids where in accordance with Section 5705.5.
12. Flammable liquids in motor fuel-dispensing facilities, repair garages, airports and marinas in Chapter 23.
13. Storage and use of fuel oil in tanks and containers connected to oil-burning equipment. Such storage and use shall be in accordance with Section 603. For abandonment of fuel oil tanks, Chapter 57 applies.
14. Storage and display of aerosol products complying with Chapter 51.
15. Storage and use of flammable or combustible liquids that do not have a fire point when tested in accordance with ASTM D92, not otherwise regulated by this code.
16. Flammable or combustible liquids with a flash point greater than 95°F (35°C) in a water-miscible solution or dispersion with a water and inert (noncombustible) solids content of more than 80 percent by weight, which do not sustain combustion, not otherwise regulated by this code.
17. Commercial cooking oil storage tank systems located within a building and designed and installed in accordance with Section 608 and NFPA 30.

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

1. ~~Specific provisions for~~ Flammable liquids in motor fuel-dispensing facilities, repair garages, airports and marinas in Chapter 23.
2. Medicines, foodstuffs, cosmetics and commercial or institutional products containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solution not being flammable, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).
3. Quantities of alcoholic beverages in retail or wholesale sales or storage occupancies, provided that the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
4. Storage and use of fuel oil in tanks and containers connected to oil-burning equipment. Such storage and use shall be in accordance with Section 603. For abandonment of fuel oil tanks, this chapter applies.
5. Refrigerant liquids and oils in refrigeration systems (see Section 605).
6. Storage and display of aerosol products complying with Chapter 51.
7. Storage and use of liquids that do not have a fire point when tested in accordance with ASTM D92.
8. Liquids with a *flash point* greater than 95°F (35°C) in a water-miscible solution or dispersion with a water and inert (noncombustible) solids content of more than 80 percent by weight, which do not sustain combustion.
9. Liquids without *flash points* that can be flammable under some conditions, such as certain halogenated hydrocarbons and mixtures containing halogenated hydrocarbons.
10. The storage of distilled spirits and wines in wooden barrels and casks.
11. Commercial cooking oil storage tank systems located within a building and designed and installed in accordance with Section 608 and NFPA 30.
12. Application and release of pesticide and agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications where applied in accordance with the manufacturers' instructions and label directions.
13. The off-site transportation of flammable or combustible liquids where in accordance with Department of Transportation (DOTn) regulation.

COMBUSTIBLE LIQUID.

FLAMMABLE LIQUID.

Reason:

The intent of this code change is to match language in the exceptions under applicability in Chapters 50 and 57 as much as possible. For example there is an exception for motor fuel dispensing and repair garages in Chapter 57. We believe it was intended to be exempt out of both Chapter 50 and 57. Otherwise the quantities of fuels would have to be applied against the MAQs in Chapter 50.

With some of the exceptions (for example Exceptions 15 in Chapter 50) additional language was added to clarify that if (for example) you have a flammable liquid with no fire point, but if that liquid is also a toxic, that this liquid is not exempted. Therefore "not otherwise regulated by this code" was added to the language.

The definition of flammable and combustible liquids (Chapter 57) have been changed to exclude liquids without a fire point. The **fire point** of a liquid is the lowest temperature at which the vapour of that fuel will continue to burn for at least 5 seconds after ignition by an open flame. At the flash point, a lower temperature, a substance will ignite briefly, but the vapors cannot sustain the fire if the liquid does not have a fire point. This is why liquids with no fire point have always been excluded out of the Chapter 57 (under applicability) with the intention of not classifying these liquids as flammable or combustible. For example most beers contain 4%-12% ethanol may have a flashpoint, but in most cases do not have a fire point when tested. However, this is not reflected in Chapter 50 where the MAQs are assessed, nor in the definitions. It is only added to the exceptions in Chapter 57.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change is providing consistency to the language. It is not intended to increase or decrease the cost to construction, but to provide clarification on what should have been applied all along.

IFC: 5001.1, 6001.1

Proponent: Ellie Klausbruckner, Klausbruckner & Associates, Inc, representing Klausbruckner & Associates, Inc. (ek@klausbruckner.com)

2018 International Fire Code

5001.1 Scope. Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials shall be in accordance with this chapter.

This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that where specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.

Exceptions:

1. In retail or wholesale sales occupancies, the quantities of medicines, foodstuff or consumer products and cosmetics containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solutions not being flammable shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).
2. Quantities of alcoholic beverages in retail or wholesale sales occupancies shall not be limited providing the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
3. Application and release of pesticide and agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications where applied in accordance with the manufacturers' instructions and label directions as follows:
 - 3.1 Application or release of liquids and solids indoors
 - 3.2 Application or release of liquids, solids and gases outdoors
 - 3.3 Application or release of gases indoors in an approved manner.
4. The off-site transportation of hazardous materials where in accordance with Department of Transportation (DOTn) regulations.
5. Building materials not otherwise regulated by this code.
6. Refrigeration systems (see Section 605).
7. Stationary storage battery systems regulated by Section 1206.2.
8. The display, storage, sale or use of fireworks and *explosives* in accordance with Chapter 56.
9. *Corrosives* utilized in personal and household products in the manufacturers' original consumer packaging in Group M occupancies.
10. The storage of distilled spirits and wines in wooden barrels and casks.

Revise as follows:

6001.1 Scope. The storage and use of highly toxic and toxic materials shall comply with this chapter. *Compressed gases* shall also comply with Chapter 53.

Exceptions:

1. Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.
2. Conditions involving pesticides or agricultural products as follows:
 - 2.1. Application and release of pesticide, agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications when applied in accordance with the manufacturer's instruction and label directions as follows:
 - 2.1.1. Application or release of liquids and solids indoors,
 - 2.1.2. Application or release of liquids, solids and gases outdoors,
 - 2.1.3. Application or release of gases indoors in an approved manner

- 2.2. Transportation of pesticides in compliance with the Federal Hazardous Materials Transportation Act and regulations thereunder.

Reason:

More and more indoor marijuana growing facilities are heating sulfur to produce sulfur dioxide, a highly toxic gas. Sulfur dioxide is used as a form of pesticide. Safety methods should be negotiated with AHJs prior to the use/release of highly toxic gases. Issues to consider are:

Methods of warning occupants during the release.

Methods of warning fire fighters in the event of an incident.

Methods of detection, warning and evacuation in the event of a gas leak out of growing rooms into adjacent rooms.

Cost Impact

The code change proposal will increase the cost of construction .

Since application or release of gases indoor may result in the AHJs requiring additional safety measures, this will most likely result in an increase in cost of construction.

IBC: [F] 307.1, TABLE 307.1(1); IFC: 5003.1, 5003.1.1, TABLE 5003.1.1(1)

Proponent: Michael O'Brian (FCAC@iccsafe.org)

2018 International Building Code

[F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in *control areas* complying with Section 414, based on the maximum allowable quantity limits for *control areas* set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the International Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the International Fire Code.

Revise as follows:

For SI: 1 cubic foot = 0.028 m³, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NL = Not Limited; NA = Not Applicable; UD = Unclassified Detonable.

- a. For use of control areas, see Section 414.2.
- b. The aggregate quantity in use and storage shall not exceed the quantity listed for storage.
- c. The quantities of alcoholic beverages in retail and wholesale sales occupancies shall not be limited provided the liquids are packaged in individual containers not exceeding 1.3 gallons. In retail and wholesale sales occupancies, the quantities of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids with the remainder of the solutions not being flammable, shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons.
- d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e also applies, the increase for both notes shall be applied accumulatively.
- e. Maximum allowable quantities shall be increased 100 percent when stored in approved storage cabinets, day boxes, gas cabinets, gas rooms or exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10 of the International Fire Code. Where Note d also applies, the increase for both notes shall be applied accumulatively.
- f. Quantities shall not be limited in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
- g. Allowed only in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
- h. Containing not more than the maximum allowable quantity per control area of Class IA, IB or IC flammable liquids.
- i. The maximum allowable quantity shall not apply to fuel oil storage complying with Section 603.3.2 of the International Fire Code.
- j. Quantities in parentheses indicate quantity units in parentheses at the head of each column.
- k. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed when such materials are necessary for maintenance purposes, operation or sanitation of equipment when the storage containers and the manner of storage are approved.
- l. Net weight of the pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks, including packaging, shall be used.
- m. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2 of the International Fire Code.
- n. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with Section 414.2.5, see Tables 414.2.5(1) and 414.2.5(2).
- ~~o. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.~~
- p. The following shall not be included in determining the maximum allowable quantities:
 1. Liquid or gaseous fuel in fuel tanks on vehicles.
 2. Liquid or gaseous fuel in fuel tanks on motorized equipment operated in accordance with the International Fire Code.
 3. Gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code.
 4. Liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code.
 5. Alcohol-based hand rubs classified as Class I or II liquids in dispensers that are installed in accordance with Sections 5705.5 and 5705.5.1 of the International Fire Code. The location of the alcohol-based hand rub (ABHR) dispensers shall be provided in the construction documents.
- ~~q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section~~

2018 International Fire Code

5003.1 Scope. The storage, use and handling of all hazardous materials shall be in accordance with this section.

5003.1.1 Maximum allowable quantity per control area. The *maximum allowable quantity per control area* shall be as specified in Tables 5003.1.1(1) through 5003.1.1(4).

For retail and wholesale storage and display in Group M occupancies and Group S storage, see Section 5003.11.

- e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, day boxes, gas cabinets, gas rooms, exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10. Where Note d applies, the increase for both notes shall be applied accumulatively.
- f. Quantities shall not be limited in a building equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.
- g. Allowed only in buildings equipped throughout with an approved automatic sprinkler system.
- h. Containing not more than the maximum allowable quantity per control area of Class IA, Class IB or Class IC flammable liquids.
- i. The maximum allowable quantity shall not apply to fuel oil storage complying with Section 603.3.2.
- j. Quantities in parenthesis indicate quantity units in parenthesis at the head of each column. storage containers and the manner of storage are approved.
- l. Net weight of pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks including packaging shall be used.
- m. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.
- n. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with Section 5003.11, see Table 5003.11.1.
- ~~o. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.~~
- p. The following shall not be included in determining the maximum allowable quantities:
 1. Liquid or gaseous fuel in fuel tanks on vehicles.
 2. Liquid or gaseous fuel in fuel tanks on motorized equipment operated in accordance with this code.
 3. Gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code.
 4. Liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code.
 5. Alcohol-based hand rubs classified as Class I or II liquids in dispensers that are installed in accordance with Sections 5705.5 and 5705.5.1. The location of the alcohol-based hand rub (ABHR) dispensers shall be provided in the construction documents.
- ~~q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.7.2.~~

Reason:

This proposal is follow up work correlating the IBC and IFC provisions with the work done on Chapter 22 Combustible Dust and Chapter 37 Combustible Fibers in the IFC along with Section 426 of the IBC.

The proposal seeks to delete the MAQ listing of dust and combustible fibers from IBC Table 307.1(1) and IFC Table 5003.1.1(1).

The key reason for deleting the listings is because combustible dust is typically not a hazardous material, a small percentage may also be, but the dust hazard classification is not a hazardous material issue. The same for combustible fibers.

Table 5003.1.1(1) is the source table for IBC Table 307.1(1) and Chapter 50 of the IFC only applies to Hazardous Materials.

2018 IFC

“SECTION 5001

GENERAL

5001.1 Scope. Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials shall be in accordance with this chapter. This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that where specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.”

Likewise, Section 5003 of the IFC only applies to hazardous materials.

2018 IFC

“SECTION 5003

GENERAL REQUIREMENTS

5003.1 Scope. The storage, use and handling of all hazardous materials shall be in accordance with this section.”

So, though dust and combustible fibers are listed in the MAQ tables, the tables do not apply to any non-hazardous material dust or combustible fiber based upon the scoping of the code language.

It should be noted that Combustible Dust was not listed in the MAQ tables until the 2012 edition of the IFC/IBC and that the requirements for combustible fibers were moved from Chapter 52 into a new Chapter 37 starting with the 2015 edition of the IFC specifically because combustible fibers are not a hazardous material. (See code change F301-13) The same problem occurs within the scoping of Section 307 High-Hazard Group H in the Building Code.

2018 IBC

“SECTION 307

HIGH-HAZARD GROUP H

[F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in control areas complying with Section 414, based on the maximum allowable quantity limits for control areas set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the International Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the International Fire Code.”

“[F] HAZARDOUS MATERIALS. Those chemicals or substances that are physical hazards or health hazards as classified in Section 307 and the International Fire Code, whether the materials are in usable or waste condition.”

“[F] HEALTH HAZARD. A classification of a chemical for which there is statistically significant evidence that acute or chronic health effects are capable of occurring in exposed persons. The term “health hazard” includes chemicals that are toxic or highly toxic, and corrosive.”

“[F] PHYSICAL HAZARD. A chemical for which there is evidence that it is a combustible liquid, cryogenic fluid, explosive, flammable (solid, liquid or gas), organic peroxide (solid or liquid), oxidizer (solid or liquid), oxidizing gas, pyrophoric (solid, liquid or gas), unstable (reactive) material (solid, liquid or gas) or water-reactive material (solid or liquid).”

By scoping and definition, Section 307 applies to hazardous materials, chemicals. Combustible dust and combustible fiber hazards are not hazardous material or chemical hazards. So, in applying Section 307 on H Group occupancies you can only apply the requirements to those combustible dusts or combustible fibers that also happen to be chemicals.

The second reason for the change is that the hazard is not an MAQ related hazard. It doesn't matter how much combustible dust or combustible fibers are present. You can have tons of material present without a hazard being presented or you can have a small amount with a hazard presented. It is how the material is manufactured, generated or used in an occupancy that can create a fire or explosion hazard.

This was attempted to be addressed by the addition of note q to the table with similar language added to the occupancy descriptors under Group H-2 and Group H-3.

2018 IBC

"q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3."

2018 IFC

"q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.7.2."

In the IFC the note points to Section 104.7.2 which provides no guidance other than pointing out the fire code official can require a technical opinion and report. The added language also did not change the fact that this portion of the IBC and the Table in the IFC are scoped to hazardous materials and chemicals. This scoping problem also relates to the reference to information prepared in accordance with Section 414.1.3.

The field use of the language is subjective causing application where the hazard does not exist because the tables indicate any amount of combustible dust is a hazard and for combustible dust and the low threshold for combustible fibers, (note that combustible fibers includes combustible dust as a hazard).

Deletion of the listing for combustible dust and combustible fibers will eliminate an incorrect listing based upon the hazardous materials scoping of this portion of the code and eliminate incorrect application of the code to these materials. This does not eliminate or impact the Chapters and Sections of the IBC and IFC that effectively manage the hazards that can be presented by the materials based upon their use.

Cost Impact

The code change proposal will decrease the cost of construction .

The cost of construction will decrease by eliminating inaccurate application of the code to these materials.

For SI: 1 cubic foot = 0.02832 m³, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NA = Not Applicable, NL = Not Limited, UD = Unclassified Detonable.

- a. For use of control areas, see Section 5003.8.3.
- b. The aggregate quantity in use and storage shall not exceed the quantity listed for storage.
- c. The quantities of alcoholic beverages in retail and wholesale sales occupancies shall not be limited providing the liquids are packaged in individual containers not exceeding 1.3 gallons. In retail and wholesale sales occupancies, the quantities of medicines, foodstuff or consumer products and cosmetics containing not more than 50 percent by volume of water-miscible liquids with the remainder of the solutions not being flammable shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons.
- d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e applies, the increase for both notes shall be applied accumulatively.
- e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, day boxes, gas cabinets, gas rooms, exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10. Where Note d applies, the increase for both notes shall be applied accumulatively.
- f. Quantities shall not be limited in a building equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.
- g. Allowed only in buildings equipped throughout with an approved automatic sprinkler system.
- h. Containing not more than the maximum allowable quantity per control area of Class IA, Class IB or Class IC flammable liquids.
- i. The maximum allowable quantity shall not apply to fuel oil storage complying with Section 603.3.2.
- j. Quantities in parenthesis indicate quantity units in parenthesis at the head of each column.
- k. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed where such materials are necessary for maintenance purposes, operation or sanitation of equipment where the storage containers and the manner of storage are approved.
- l. Net weight of pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks including packaging shall be used.
- m. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.
- n. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with Section 5003.11, see Table 5003.11.1.
- o. Densely-packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.
- p. The following shall not be included in determining the maximum allowable quantities:
 1. Liquid or gaseous fuel in fuel tanks on vehicles.
 2. Liquid or gaseous fuel in fuel tanks on motorized equipment operated in accordance with this code.
 3. Gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code.
 4. Liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code.
 5. Alcohol-based hand rubs classified as Class I or II liquids in dispensers that are installed in accordance with Sections 5705.5 and 5705.5.1. The location of the alcohol-based hand rub (ABHR) dispensers shall be provided in the construction documents.
- q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.7.2.

- o. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.
- p. The following shall not be included in determining the maximum allowable quantities:
 1. Liquid or gaseous fuel in fuel tanks on vehicles.
 2. Liquid or gaseous fuel in fuel tanks on motorized equipment operated in accordance with the International Fire Code.
 3. Gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code.
 4. Liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code.
 5. Alcohol-based hand rubs classified as Class I or II liquids in dispensers that are installed in accordance with Sections 5705.5 and 5705.5.1 of the International Fire Code. The location of the alcohol-based hand rub (ABHR) dispensers shall be provided in the construction documents.
- q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section

Reason:

Footnote d in the 2015 Edition was deleted for the solid storage limit of Division 1.4G explosives based upon action taking place with NFPA 1124. However, there is full scale fire testing that indicates that an automatic sprinkler system designed to Ordinary Hazard Group 2 criteria, as defined in NFPA 13, is capable of controlling a fire involving consumer fireworks. In addition, recent fire tests conducted in a test program managed by FM Global has also demonstrated the ability of an automatic sprinkler system to control a fire involving consumer fireworks.

Cost Impact

The code change proposal will decrease the cost of construction .

The code change proposal will have an impact of decreasing the cost of construction for those applications in which the increased by Footnote d will not require the facility to be considered Group H-3.

For SI: 1 cubic foot = 0.02832 m³, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NA = Not Applicable, NL = Not Limited, UD = Unclassified Detonable.

- a. For use of control areas, see Section 5003.8.3.
- b. The aggregate quantity in use and storage shall not exceed the quantity listed for storage.
- c. The quantities of alcoholic beverages in retail and wholesale sales occupancies shall not be limited providing the liquids are packaged in individual containers not exceeding 1.3 gallons. In retail and wholesale sales occupancies, the quantities of medicines, foodstuff or consumer products and cosmetics containing not more than 50 percent by volume of water-miscible liquids with the remainder of the solutions not being flammable shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons.
- d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e applies, the increase for both notes shall be applied accumulatively.
- e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, day boxes, gas cabinets, gas rooms, exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10. Where Note d applies, the increase for both notes shall be applied accumulatively.
- f. Quantities shall not be limited in a building equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.
- g. Allowed only in buildings equipped throughout with an approved automatic sprinkler system.
- h. Containing not more than the maximum allowable quantity per control area of Class IA, Class IB or Class IC flammable liquids.
- i. The maximum allowable quantity shall not apply to fuel oil storage complying with Section 603.3.2.
- j. Quantities in parenthesis indicate quantity units in parenthesis at the head of each column.
- k. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed where such materials are necessary for maintenance purposes, operation or sanitation of equipment where the storage containers and the manner of storage are approved.
- l. Net weight of pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks including packaging shall be used.
- m. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.
- n. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with Section 5003.11, see Table 5003.11.1.
- o. Densely-packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.
- p. The following shall not be included in determining the maximum allowable quantities:
 1. Liquid or gaseous fuel in fuel tanks on vehicles.
 2. Liquid or gaseous fuel in fuel tanks on motorized equipment operated in accordance with this code.
 3. Gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code.
 4. Liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code.
 5. Alcohol-based hand rubs classified as Class I or II liquids in dispensers that are installed in accordance with Sections 5705.5 and 5705.5.1. The location of the alcohol-based hand rub (ABHR) dispensers shall be provided in the construction documents.
- q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.7.2.
- r. In Group I-2 occupancies and ambulatory care facilities, medical gas and oxidizing gases used for patient care in portable containers and in immediate use shall not contribute to the maximum allowable quantities of hazardous materials in a building and shall be in accordance with the

exception to Section 5003.8.3.2..

5003.8.3 Control areas. *Control areas* shall comply with Sections 5003.8.3.1 through 5003.8.3.5.3.

Exception: Higher education laboratories in accordance with Chapter 38 of this code and Section 428 of the International Building Code.

Add new text as follows:

5003.8.3.1 Construction requirements. *Control areas* shall be separated from each other by *fire barriers* constructed in accordance with Section 707 of the International Building Code or *horizontal assemblies* constructed in accordance with Section 711 of the International Building Code, or both.

Exception: In Group I-2 occupancies, control areas shall be permitted to be separated by smoke barriers complying with Section 709 of the IBC.

Revise as follows:

5003.8.3.2 Percentage of maximum allowable quantities. The percentage of maximum allowable quantities of hazardous materials per *control area* allowed at each story within a building shall be in accordance with Table 5003.8.3.2.

Exception: In Group I-2 occupancies and ambulatory care facilities, a maximum aggregate quantity of 3,000 cubic feet of oxidizing medical gases in portable containers each with a capacity of 25 cubic feet (708 L) or less shall be permitted in a single smoke compartment. The maximum number of control areas per story shall not exceed the number of smoke compartments provided per story.

5306.2 Interior supply location. Medical gases shall be located in areas dedicated to the storage of such gases without other storage or uses. Where containers of medical gases in quantities greater than the permit amount are located inside buildings, they shall be in a 1-hour exterior room, a 1-hour interior room or a gas cabinet in accordance with Section 5306.2.1, 5306.2.2 or 5306.2.3, respectively. Rooms or areas where medical gases are stored or used in quantities exceeding the *maximum allowable quantity per control area* as set forth in Section 5003.1 shall be in accordance with the International Building Code for high-hazard Group H occupancies.

Exception: Medical gases in portable containers complying with Section 5003.8.3 shall not be required to be stored within dedicated storage rooms.

For SI: 1 cubic foot = 0.028 m³, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NL = Not Limited; NA = Not Applicable; UD = Unclassified Detonable.

- a. For use of control areas, see Section 414.2.
- b. The aggregate quantity in use and storage shall not exceed the quantity listed for storage.
- c. The quantities of alcoholic beverages in retail and wholesale sales occupancies shall not be limited provided the liquids are packaged in individual containers not exceeding 1.3 gallons. In retail and wholesale sales occupancies, the quantities of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids with the remainder of the solutions not being flammable, shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons.
- d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e also applies, the increase for both notes shall be applied accumulatively.
- e. Maximum allowable quantities shall be increased 100 percent when stored in approved storage cabinets, day boxes, gas cabinets, gas rooms or exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10 of the International Fire Code. Where Note d also applies, the increase for both notes shall be applied accumulatively.
- f. Quantities shall not be limited in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
- g. Allowed only in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
- h. Containing not more than the maximum allowable quantity per control area of Class IA, IB or IC flammable liquids.
- i. The maximum allowable quantity shall not apply to fuel oil storage complying with Section 603.3.2 of the International Fire Code.
- j. Quantities in parentheses indicate quantity units in parentheses at the head of each column.
- k. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed when such materials are necessary for maintenance purposes, operation or sanitation of equipment when the storage containers and the manner of storage are approved.
- l. Net weight of the pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks, including packaging, shall be used.
- m. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2 of the International Fire Code.
- n. For storage and display quantities in Group M and storage quantities in Group S occupancies complying with Section 414.2.5, see Tables 414.2.5(1) and 414.2.5(2).
- o. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.
- p. The following shall not be included in determining the maximum allowable quantities:
 1. Liquid or gaseous fuel in fuel tanks on vehicles.
 2. Liquid or gaseous fuel in fuel tanks on motorized equipment operated in accordance with the International Fire Code.
 3. Gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code.
 4. Liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code.
 5. Alcohol-based hand rubs classified as Class I or II liquids in dispensers that are installed in accordance with Sections 5705.5 and 5705.5.1 of the International Fire Code. The location of the alcohol-based hand rub (ABHR) dispensers shall be provided in the construction documents.
- q. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section

414.1.3.

- r. In Group I-2 occupancies and ambulatory care facilities, medical gas and oxidizing gases used for patient care in portable containers and in immediate use shall not contribute to the maximum allowable quantities of hazardous materials in a building and shall be in accordance with the exception to Section 414.2.2.

[F] 414.2 Control areas. *Control areas* shall comply with Sections 414.2.1 through 414.2.5 and the International Fire Code.

Exception: Higher education laboratories in accordance with Section 428 and Chapter 38 of the International Fire Code.

[F] 414.2.1 Construction requirements. *Control areas* shall be separated from each other by *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both.

Exception: In Group I-2 occupancies, control areas shall be permitted to be separated by smoke barriers complying with Section 709.

[F] 414.2.2 Percentage of maximum allowable quantities. The percentage of maximum allowable quantities of hazardous materials per *control area* permitted at each floor level within a building shall be in accordance with Table 414.2.2.

Exception: In Group I-2 occupancies and ambulatory care facilities, a maximum aggregate quantity of 3,000 cubic feet of oxidizing medical gases in portable containers each with a capacity of 25 cubic feet (708 L) or less shall be permitted in a single smoke compartment. The maximum number of control areas per story shall not exceed the number of smoke compartments provided per story.

[F] 427.2 Interior supply location. Medical gases shall be located in areas dedicated to the storage of such gases without other storage or uses. Where containers of medical gases in quantities greater than the permitted amount are located inside the buildings, they shall be located in a 1-hour exterior room, 1-hour interior room or a gas cabinet in accordance with Section 427.2.1, 427.2.2 or 427.2.3, respectively. Rooms or areas where medical gases are stored or used in quantities exceeding the maximum allowable quantity per control area as set forth in Tables 307.1(1) and 307.1(2) shall be in accordance with Group H occupancies.

Exception: Medical gases in portable containers complying with Section 414.2 shall not be required to be stored within dedicated storage rooms.

Reason:

The purpose of this code change is to align high-rise requirements for storage of gases in high-rise I-2 occupancies. The current Fire Code requires higher-levels to conform to H-occupancy requirements. This code seeks to align protection requirements to what have been maintained in high-rise hospitals, rather than change the MAQ's.

Compressed oxidizing gases, including oxygen and nitrous oxide, are required for patient treatment in nearly all acute care hospitals and most outpatient surgical centers for a variety of purposes. While such health care facilities have bulk oxygen systems that include piped medical gas systems within the facilities, portable cylinders are necessary to supply specific types of patient care equipment and for mobile use of patients. The gas supply must be transportable. In addition, cylinders allow the gas pressure to be regulated whereas medical gas systems are at a constant pressure.

The IFC limits hazardous materials outside of Group H occupancies to quantities that have been deemed acceptable for the primary occupancy. Where the maximum allowable quantity (MAQ) is exceeded, the area is required to be protected as a Group H high hazard occupancy. In the case of oxidizing gases, the area would be classified as a Group H-3 occupancy.

One of the most common types of compressed gas cylinders in health care facilities is the E-size cylinder. A full E-size cylinder contains approximately 23-25 cubic feet of compressed oxygen. Thus, a maximum of 12 E-size cylinders would be permitted on the 11th floor of a building. Assuming that a reserve cylinder is provided, two cylinders per patient, compressed oxygen could be provided for up to six patients. For the vast majority of high-rise hospitals and medical centers, the limitation of 12 E-size cylinders on the upper stories would severely limit patient care. Many existing health care facilities may be in non-compliance with IFC requirements.

The 2012 edition of NFPA 99 has been adopted and is enforced by the Centers for Medicaid and Medicare Services (CMS), The Joint Commission (TJC) among accreditation agencies, and State Agencies. Thus, NFPA 99 is a mandatory code with respect to Federal regulations. Health care facilities are required to comply with the provisions of NFPA 99 and are subject to severe penalties for non-compliance. A link to NFPA 99 already exists in the IFC through the provisions for medical gas system installations. Health care facilities are surveyed for compliance with NFPA codes and standards at least once every three years and often more frequently to ensure continued compliance.

Unlike the IFC and IBC , NFPA 99 does not prescribe limitations based on the location of the compressed medical oxidizing gases in the building. The NFPA 99 limits for storage of medical oxidizing gases are based on the following thresholds:

300 cubic feet or less;

More than 300 cubic feet but not more than 3,000 cubic feet;

More than 3,000 cubic feet.

The proposed code changes seek to revise the IFC and IBC to be more consistent with the federally mandated code requirements while maintaining the control area concept thereby permitting a vast number of health care facilities to comply with the IFC and IBC.

CONTROL AREAS

Add a footnote r to IFC Table 5003.1.1(1) (IBC Table 307.1(1)) to be applied to the Oxidizing gas cell in the MATERIAL column.

Add an exception to Section 5003.8.3.1 (IBC 414.2.1) -This will permit existing requirements for smoke compartment construction to serve as barriers for control areas

Add an exception to Section 5003.8.3.2 (IBC 414.2.2) - 25 cubic feet is roughly the capacity of an E cylinder, which is the largest portable cylinder on the market and the most common cylinder found in hospitals. Larger cylinders would be expected to be in a med gas room on a lower floor. This will permit up to 3,000 cubic feet of oxygen, or 120 E size cylinders, per smoke compartment regardless of the location of the smoke compartment in the building.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will decrease the cost of construction .

This will limit the number of rooms in a hospital that will have to be considered hazardous thus reducing the cost of construction.

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L, 1 cubic foot = 0.02832 m³.

- a. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.
- b. The aggregate quantities in storage and use shall not exceed the quantity listed for storage.
- c. The aggregate quantity of nonflammable solid and nonflammable or noncombustible liquid hazardous materials allowed in outdoor storage per single property under the same ownership or control used for retail or wholesale sales is allowed to exceed the maximum allowable quantity per control area where such storage is in accordance with Section 5003.11.
- d. Quantities in parentheses indicate quantity units in parentheses at the head of each column.

Reason:

Class IV organic peroxides are "formulations that burn in the same manner as ordinary combustibles and that pose minimal reactivity hazard". As a result, Table 5003.1.1(1) does not limit the quantity of Class IV organic peroxide liquids and solids stored or used indoors. However, currently Table 5003.1.1(2) limits Class IV organic peroxides when stored or used outdoors making outdoor storage and use more restrictive than indoor storage and use and making Class IV organic peroxides the only class of hazardous materials with this distinction. Research of historical code changes related to organic peroxides revealed that this discrepancy has been in place since the first edition of the IFC and no justification for the discrepancy could be located. This proposal is to align the Class IV organic peroxide outdoor MAQ with the indoor MAQ by revising the outdoor MAQ to "not limited" for storage, use closed and use open.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The code change increases the quantity of Class IV organic peroxides allowed outdoors before additional controls are required to be implemented.

Internal ID: 1279

F284-18

IFC: 5003.2.2.1

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

5003.2.2.1 Design and construction. Piping, tubing, valves, fittings and related components used for hazardous materials shall be in accordance with the following:

1. Piping, tubing, valves, fittings and related components shall be designed and fabricated from materials that are compatible with the material to be contained and shall be of adequate strength and durability to withstand the pressure, structural and seismic stress and exposure to which they are subject.
2. Piping and tubing shall be identified in accordance with ASME A13.1 to indicate the material conveyed.
3. Manual valves or automatic remotely activated fail-safe emergency shutoff valves shall be installed on supply piping and tubing and provided with *ready access* at the following locations:
 - 3.1. The point of use.
 - 3.2. The tank, cylinder or bulk source.
4. Manual emergency shutoff valves and controls for remotely activated emergency shutoff valves shall be ~~identified and the location shall have access~~ clearly visible and indicated by means of a ~~sign, provided with ready access and identified in an approved manner.~~
5. Backflow prevention or check valves shall be provided where the backflow of hazardous materials could create a hazardous condition or cause the unauthorized discharge of hazardous materials.

Exceptions:

1. Piping for inlet connections designed to prevent backflow.
2. Piping for pressure relief devices.

Reason:

First, this proposal revises Item 4 by reorganizing the list of requirements into a simpler format. This removes the jumbled and confusing wording.

Secondly, this proposal removes the requirement for a sign. The first part of Item 4 requires that the valves are "identified", and then it says they must have a "sign." This is redundant and unnecessary.

The goal is that the valves are identified and accessible. The first part of the sentence addresses visibility and ready access to the valves; the second sentence now addresses identification of the valves. Identification is specified as needing to meet approval of the fire code official.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This simply clarifies application of the section.

F285-18

IFC: 5003.2.2.2

Proponent: Mark Fasel, representing Viega LLC (mark.fasel@viega.us)

2018 International Fire Code

Revise as follows:

5003.2.2.2 Additional regulations for supply piping for health-hazard materials. Supply piping and tubing for gases and liquids having a health-hazard ranking of 3 or 4 in accordance with NFPA 704 shall be in accordance with ASME B31.3 and the following:

1. Piping and tubing utilized for the transmission of highly toxic, toxic or highly volatile *corrosive* liquids and gases shall have welded, threaded, press-connected or flanged connections throughout except for connections located within a ventilated enclosure if the material is a gas, or an *approved* method of drainage or containment is provided for connections if the material is a liquid.
2. Piping and tubing shall not be located within *corridors*, within any portion of a *means of egress* required to be enclosed in fire-resistance-rated construction or in concealed spaces in areas not classified as Group H occupancies.

Exception: Piping and tubing within the space defined by the walls of *corridors* and the floor or roof above or in concealed spaces above other occupancies where installed in accordance with Section 415.11.6.4 of the International Building Code for Group H-5 occupancies.

Reason:

Because "Press-Connect" type connections are not specifically identified in section 5003.2.2.2(1), they are in some instances not recognized for use even though they are tested to, and in compliance to ASME B31.3.

The description of ASME B31.3 is as follows:

ASME B31.3 contains requirements for piping typically found in petroleum refineries; chemical, pharmaceutical, textile, paper, semiconductor, and cryogenic plants; and related processing plants and terminals. It covers materials and components, design fabrication, assembly, erection, examination, inspection and testing of piping.

ASME B31.3 applies to piping for all fluids including:

- (1) raw, intermediate, and finished chemicals;
- (2) petroleum products;
- (3) gas, steam, air and water;
- (4) fluidized solids;
- (5) refrigerants; and
- (6) cryogenic fluids

IFC: 5003.7.4 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Add new text as follows:

5003.7.4 Respiratory therapy. In Group I-2 and ambulatory care facilities, within areas with respiratory therapy services, sources of ignition shall be regulated in accordance with NFPA 99.

Reason:

Due to the high potential for fire risk to patients receiving respiratory therapy services the need to restrict the use of sources of ignition, such as smoking materials, open flames, sparking toys, and non-medical appliances with hot surfaces or sparking mechanisms, is necessary to provide appropriate safety to these patients (K925).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is an operational change regarding the restriction of sources of ignition and will not increase the cost of construction on the healthcare industry.

- d. Detached buildings are not required, for gases in gas rooms that support H-5 fabrication facilities where the gas room is separated from other areas by a fire barrier with a fire resistance rating of not less than 2 hours and the gas is located in a gas cabinet that is internally sprinklered, equipped with continuous leak detection, automatic shutdown and is not manifolded upstream of pressure controls. Additionally, the gas supply is limited to cylinders that do not exceed 125 lb (57 kg) water capacity in accordance with 49 CFR 173.192 for Hazard Zone A toxic gases.

Reason:

□Introduction:

This code change proposal to the IFC Table 5003.8.2 (IBC Table 415.6.2) removes the detached building requirement for pyrophoric gases, when the gas is located in gas rooms supporting H5 occupancies and in internally sprinklered gas cabinets, with leak detection and automatic shutdown. The following analysis supports the code change by explaining why a detached building is not justified nor will the removal of the requirement have any adverse impact. If the code change is approved, pyrophoric gases will still be required to comply with all other applicable requirements including, to be in gas rooms separated from the FAB by two hour construction. Also, the gas room will be located on an exterior wall, and where two exits are required, one shall be directly to the exterior. The gas room and cabinets will have a continuous gas detection system with a local alarm that will automatically shut off the gas at the source, and transmit an alarm to a local emergency control station.

Background/History:

A 2000 cu ft. code provision developed due to the fire service concern with traditional pyrophoric rooms, and the use of silane in open manifold systems with the potential for multiple cylinder/cascade releases.

It was initially published in the 1988 Edition of the UFC as documented in Larry Fluer's NFPA Research Foundation report issued in December 2008. One of the most common materials was silane where not only the pyrophoric nature of the material is a concern, but also the potential for accumulation and vapor cloud detonation when latent ignition occurs. There were incidents in the supply chain as well at use sites which highlighted these issues, and as a result, silane served as the exemplar "pyrophoric gas" material. It was also recognized that other gases such as phosphine and diborane had pyrophoric properties and were added to the consideration. Silane was used as the index "pyrophoric" gas to determine appropriate limits and controls (similar to the approach used for other categories, e.g. chlorine was the index gas used for toxics, etc.). There was a concern expressed by the fire service, and industry alike, that there should be a quantity limit of some sort following the concepts established for the use of detached building threshold limits in the fire and building codes, while at the same time recognizing that the gas is not inherently an explosive material. The most common silane container size used at the time was the 5000 gram cylinder, containing a nominal 132 cu ft of gas. An aggregate quantity of 2000 cu ft represented approximately 15 cylinders of this size. Larger cylinders of silane including bulk delivery were also recognized as an evolving means of delivery, and a conscious decision was made to step back from counting cylinders, and to use a quantity limit in cubic feet as the threshold for requiring detached storage with the recognition that the larger the quantity, the bigger the problem in the event of an occurrence. This decision paralleled the approach taken with the rest of the items in the detached building table.

As the silicon wafer sizes increased and the fabrication industry expanded, the use of silane increased dramatically. Many users were connecting multiple cylinders onto common manifolds to provide continuous supply to the FAB. There were numerous silane incidents (fires and explosions) at gas supplier and user sites. At that time there was limited research on silane safety. Since 1988 there has been extensive testing of silane and silane systems. Key studies:

Dr. L. Britton, Union Carbide - 1990's; D. F. Tamini, FM Global - 1995-1996; CGA, Socorro, NM - 1996; Prof. J. Chen, NFKST -2006-2016; CGA, Las Cruces, NM - 2010-2011

In addition, recognizing the unique hazards (pyrophoric with non-reliable ignition) nature of silane, the Compressed Gas

Association developed and published ANSI/CGA G-13 Standard for Storage and Handling of Silane and Silane Mixtures in 1992. A key conclusion was that many of the multiple cylinder incidents were caused by the cylinder Pressure Relief Devices leaking prematurely. The fire then caused adjacent cylinder PRD's to activate. With an exception for silane filled to the maximum density, PRD's are no longer used in the US.

Technical Justification:

The move to bulk silane and outdoor silane pads, and the application of ANSI/CGA G-13 Silane Safety Standard recommended controls to mitigate the unique hazards/properties of silane use, and the risks and hazards of other pyrophoric gases used in the semiconductor industry differ greatly from the assumptions applied to the requirements developed in the 1980's. 21st century H2 occupancy gas rooms are required by IFC to segregate HPM gases (including pyrophoric gases) in gas cabinets which limit the consequences of a gas leak. In addition, the hazard mitigation controls typically included:

Exhaust with capture velocity of 200 FPM or higher to prevent pyrophoric concentrations and release out of the enclosure

Continuously welded gas delivery lines

Leak detection and automatic shutdown

Excess flow protection

Restricted flow orifices

Automated and interlocked leak integrity testing of connections prior to introduction of HPM gas after a cylinder change

Gas Cabinet fire sprinklers

Gas rooms separated from the FAB by one hour construction when less than 300 sq ft or two hour construction when 300 sq ft or greater

Gas rooms shall be located on an exterior wall, and where two exits are required, one shall be directly to the exterior

The additional requirement to restrict manifolding of pyrophorics upstream of pressure monitoring devices, was included to prevent a large release from a single loss of containment scenario due to multiple gas cabinets connected in a manifold and used as one system. In addition, NFPA 55, Standard for Compressed Gas and Cryogenic Fluids is also concurrently assessing this technical issue. This proposal aligns with what the NFPA Task Force is presenting at the Second Draft Meeting in the spring of 2018.

Conclusion:

Approved gas cabinets, in gas rooms, have proven to be effective in isolating the gas hazards, even pyrophoric in over 25 years of service. The proposed code change will provide a safe system for control of pyrophoric gases in gas rooms serving H5 occupancies.

Attachment:

Cost Impact

The code change proposal will decrease the cost of construction .

The cost of construction will be decreased because a detached building will not be constructed. Besides removing the cost of the property and building construction, the cost of piping the gas to the fabrication facility will be eliminated.

F288-18

IFC: 5003.8.3.3; IBC: [F]414.2.3

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

5003.8.3.3 Number. The maximum number of *control areas* per floor within a building shall be in accordance with Table 5003.8.3.2. For the purposes of determining the number of control areas within a building, each portion of a building separated by one or more fire walls complying with Section 706 of the International Building Code shall be considered a separate building.

2018 International Building Code

Revise as follows:

[F] 414.2.3 Number. The maximum number of *control areas* within a building shall be in accordance with Table 414.2.2. For the purposes of determining the number of control areas within a building, each portion of a building separated by one or more fire walls complying with Section 706 shall be considered a separate building.

Reason:

The language regarding application of fire wall requirements changed in the 2018 IBC as a result of G130-15. Where previously, the code stated that fire walls created separate buildings, it now states that fire walls only create separate buildings when applying height, area and type of construction requirements.

This resulted in an unintended consequence in its application to control areas. The number of control areas in a building has previously been counted separately on each side of a fire wall. Based on the 2018 IBC change, quantities in these control areas now must be aggregated which has the potential to place many facilities out of compliance. This proposal states the for control area purposed, fire walls will continue to be assumed to create separate building and will allow that application of the control area requirements to continue.

The end result, is that a single-story building can have up to 4 control areas then be divided by a fire wall and up to another 4 control areas. This occurs often in strip malls. See the figure below.

Cost Impact

The code change proposal will decrease the cost of construction .

This will reduce the cost of construction, since a fire wall can be used to increase the number of control areas, rather than constructing a Group H occupancy.

- i. The permitted quantities shall not be limited in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
- j. Quantities are unlimited in an outdoor control area.
- k. Maximum allowable quantity of consumer products shall be increased to 10,000 pounds where individual packages are in the original sealed containers from the manufacturer and the toxic classification is exclusively based on the LC₅₀ threshold and no other hazardous materials classifications apply.

Reason:

Small businesses often move into warehouse/office suites in light industrial or business complexes without conducting any construction or other activity that would require a review by the fire department. These businesses are often discovered through the fire department's business inspection program. During a walk-thru an inspector would not see anything of significance, but may notice the presence of chemicals and would ask for a hazardous materials inventory, for most businesses this would not garner undue concern. But for some businesses this hazardous materials inventory would trigger a hazardous occupancy review that could have a negative impact on the long term health of the business.

As home ownership in the US increased the small business sector serving homeowners, and the related small service companies, has increased the number of smaller wholesale/distribution centers serving this group. A specific example is lawn care companies. The small wholesale centers serving this group of businesses can be the most affected by a fire department's review of hazardous materials. Many of the lawn chemicals present are classified as toxic based on the LC₅₀ threshold. The total amount of toxics present exceed the maximum allowable quantities thus reclassifying the space as a Group H-4 occupancy. The requirements generated by this classification cause a business significant hardship as the types of buildings occupied typically do not have fire suppression systems, rated construction or any other typical H-occupancy requirements.

The cost of complying with the code is normally not considered a reason to not follow their requirements. If a review of the actual risk is conducted, the H-occupancy requirements can be onerous and more than should be necessary.

While these small distribution centers exceed the maximum allowable quantities the chemicals present are normally in unopened original packaging from the manufacturer. They arrive on pallets wrapped in plastic. The warehouse manager will unwrap the pallets and redistribute the unopened packages to other pallets, creating a loaded pallet to be delivered to a customer. None of the packages are opened. There is no mixing or repackaging occurring, just redistributing to outbound pallets. Even if a spill were to occur, a minimal number of packages (or pounds) would be involved. Most likely the spill would be far under the maximum allowable quantity amount. Spills involving solids, typically in pellet form, do not present a significant inhalation risk.

Further, when evaluating the risk presented by solids in this situation, the reliance of the LC₅₀ threshold itself needs be taken into account.

The International Fire Code has established a definition for toxic materials based on acute toxicity values (oral, dermal and inhalation). For the purpose of this discussion, we are interested in the classification of materials based on the product's acute inhalation toxicity (LC₅₀). The International Fire Code relies on the LC₅₀ of a material for determining a

substances acute inhalation toxicity. However, there seems to be multiple voices in the scientific community that believe the LC₅₀ should not be used as a standalone metric for determining the toxicity of a substance.

This revision is partially based on the artificial nature of the LC₅₀ threshold measurement itself. The process necessary to prepare the sample for the testing does not simulate the expected normal conditions within a typical retail or wholesale building. The solids are required to be highly processed; using high heat and pressure along with mechanical grinding, to create particles sufficiently small enough to be infused deeply within the lungs of the test animals.

The particles (dusts or mists) are then fed into a test chamber or through a face mask to the test specimen. When these procedures are used for the test, they do not represent a real world condition. These procedures create an artificial environment that meet the conditions of the LC₅₀ testing protocol and it would be unlikely that these conditions would exist in a natural environment.

Chemicals in a solid form, including granules and pellets are generally too large to become airborne. Some of the product may be broken down during packaging and handling and create particles fine enough to create an airborne dust, but the situation under consideration is storage and it should be considered whether this potential airborne dust would contain respirable particles. Respirable particulates are generally considered particles with a mean diameter of less than 10 micrometers (PM10).

It would appear that this simulation would be unlikely, as particles in this size range are typically generated through mechanical means such as grinding, sawing, and sanding, or through continuous processes that break down the material such as conveying or mixing for long periods of time. With no use-open or repackaging process present, the PM10 fraction of dust from these products, as stored in a warehouse, likely represents a very small fraction of the entire particle size distribution. Given that the solid products are packaged in relatively small, individual packages, the mass emissions from an accidental spill would be small and the respirable fraction of dust would represent a small portion of the total dust.

Based on an analysis of the actual risk presented by storage in these occupancies an increase in the maximum allowable quantity for Group M and S occupancies is being proposed that addresses the current business model without incurring any additional significant risk.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The cost impact would be non-existent, except to the extent that a business would benefit from not incurring additional costs. This allows an increase in materials which will reduce compliance cost. This would simply not currently not be permitted in Group M occupancies.

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows:

5003.12 Outdoor control areas. Outdoor control areas for hazardous materials ~~in amounts not exceeding the maximum allowable quantity per outdoor control area~~ shall be in accordance with the following general requirements:

1. Outdoor control areas shall be kept free from weeds, debris and common combustible materials not necessary to the storage. The area surrounding an outdoor control area shall be kept clear of such materials for not less than 15 feet (4572 mm).
2. Outdoor control areas shall be located not closer than 20 feet (6096 mm) from a public street, public alley, public way or *lot line* that can be built on.

Exceptions:

1. For solid and liquid hazardous materials, a 2-hour fire-resistance-rated wall without openings extending not less than 30 inches (762 mm) above and to the sides of the storage area shall be allowed in lieu of such distance.
2. For compressed gas hazardous materials, unless otherwise specified, the minimum required distances shall not apply where *fire barriers* without openings or penetrations having a minimum *fire-resistance rating* of 2 hours interrupt the line of sight between the storage and the exposure. The configuration of the *fire barrier* shall be designed to allow natural ventilation to prevent the accumulation of hazardous gas concentrations.
3. Where a property exceeds 10,000 square feet (929 m²), a group of two outdoor control areas is allowed where *approved* and where each control area is separated by a minimum distance of 50 feet (15 240 mm).
4. Where a property exceeds 35,000 square feet (3252 m²), additional groups of outdoor control areas are allowed where *approved* and where each group is separated by a minimum distance of 300 feet (91 440 mm).

Add new text as follows:

5004.14 Outdoor storage location. Outdoor storage areas for hazardous materials shall be located as required by Section 5003.12 except where material specific requirements, including requirements in referenced standards, are provided in other chapters of this code.

Revise as follows:

5005.3.3 ~~Location.~~ Outdoor location.. Outdoor dispensing and use areas for hazardous materials shall be located as required by Section 5003.12 except where material specific requirements, including requirements in referenced standards, are provided in other chapters of this code. ~~for outdoor storage in accordance with Section 5004.~~

5005.4.3 ~~Location.~~ Outdoor location.. Outdoor-handling areas for hazardous materials shall be located as required by Section 5003.12 except where material specific requirements, including requirements in referenced standards, are provided in other chapters of this code. ~~for outdoor storage in accordance with Section 5004.~~

Reason:

The intent of this proposal is to provide correlation between Sections 5003, 5004 and 5005 as it applies to outdoor storage of hazardous materials.

Upon review of the requirements Section 5003, both quantities not exceeding the MAQs and quantities exceeding the MAQs are required to comply with all of Section 5003 General Requirements. As structured, when applying the IFC any specific requirement would take precedence over a general requirement, but the general requirements are the starting point.

When you review Section 5003.12 for Outdoor control areas you find that it is limited to "...amounts not exceeding the maximum allowable quantity per outdoor control area...". This is in conflict with Section 5003.1.4 which requires amounts

exceeding the MAQs to comply with the entire chapter. This wouldn't be a problem if requirements dealing with the location of outdoor storage of hazardous materials was provided for in Sections 5004 and 5005.

When reviewing Section 5004 Storage which provides for the storage of hazardous materials exceeding the MAQs, though there are some code requirements applicable to outdoor storage, there are no provisions for the location of the outdoor storage.

In reviewing Section 5005 which deals with Use, Dispensing and Handling of hazardous materials in amounts exceeding the MAQs you find Sections 5005.3.3 and 5005.4.3, both of which point you back to Section 5004 for requirements on the location requirements. As identified above, there are no requirements in Section 5004 dealing with the location of the materials.

This proposal addresses this by modifying Section 5003.12 to delete the language referring to amounts not exceeding the MAQ and adding language identifying the provisions as "general requirements".

Then a new section is added to Section 5004 pointing back to Section 5003.12 when there are no location requirements provided for in the chapters that provide requirements specific to a material or an activity using a hazardous material. This recognizes that there can be requirements within those specific chapters for locations of storage or use such as dispensing in Chapter 23, liquid storage of flammable or combustible liquids in Chapter 57 and in the case of flammable gases previous distance tables were removed and replaced with references to standards such as NFPA 2 and NFPA 55 that contain updated location requirements.

Finally Sections 5005.3.3 and 5005.4.3 have been modified to be similar in language to the new Section 5004.14 and to point back to Section 5003.12.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

As written, there is no intent to impact the cost of construction, however, by adding clarification on this issue cost can be reduced.

F291-18

IFC: 5004.3

Proponent: John Williams, Washington State Department of Health, representing Washington State Department of Health (john.williams@doh.wa.gov)

2018 International Fire Code

Revise as follows:

5004.3 Ventilation. Indoor storage areas and storage buildings shall be provided with mechanical exhaust ventilation or natural ventilation where natural ventilation can be shown to be acceptable for the materials as stored.

Exception-Exceptions:

1. Storage areas for flammable solids complying with Chapter 59.
2. Storage areas for medical gases complying with Chapter 53.

Reason:

The ventilation requirements for medical gas systems are already appropriately covered by Section 5306 which contains three different options for ventilation. These include prescriptive requirements for natural ventilation, mechanical ventilation and gas supply cabinets. This change points user to the more specific requirements for medical gases.

Cost Impact

The code change proposal will decrease the cost of construction .

The general provisions in this section require a manual exhaust shut-off. This requirement is not present in the three ventilation options contained in Chapter 53, therefore a cost savings.

Internal ID: 1608

F292-18

IFC: 5004.3

Proponent: Sarah Rice, The Preview Group, representing Myself (srice@preview-group.com)

2018 International Fire Code

Revise as follows:

5004.3 Ventilation. Indoor storage areas and storage buildings shall be provided with mechanical exhaust ventilation or natural ventilation where natural ventilation can be shown to be acceptable for the materials as stored.

Exceptions:

1. Storage areas for flammable solids complying with Chapter 59.
2. Where approved by the fire official, the exhaust ventilation system for areas where flammable and combustible liquids are stored in containers shall comply with the International Mechanical Code provided there are no dispensing operations and documentation has been provided.

Reason:

This code change is a follow-up to F359-16. The intent of this code change is to recognize that when there is no dispensing of flammable or combustible liquids, there is not the need for the same robust level of ventilation, and that the ventilation requirements found in the International Mechanical Code (IMC) should govern.

As was correctly brought up by the testifiers during the previous cycle, the authority to accept a different level of ventilation lies with the fire code official, when it can be demonstrated that these conditions are such that the density of flammable vapors does not constitute a hazard.

As outlined in the reason statement for F359-16, the requirement for the special exhaust system found in Section 5004.3.1 has its origins in, and is consistent with, those found in Chapter 9 of NFPA 30 for areas where there IS dispensing of flammable or combustible liquids (see below). This type of operation/process results in fumes being emitted into the atmosphere of the space. But storage without dispensing does not result in the same conditions.

This code change would allow the fire code official to examine those areas where flammable and combustible liquids are ONLY stored (no dispensing or pour-off) and if provided with documentation, they could be ventilated in accordance with the IMC.

The 2015 edition of NFPA 30; Flammable & Combustible Liquids Code, in Chapter 9 Storage of Liquids in Containers – General Requirements, and specifically in Section 9.14 states "Liquid storage areas where dispensing is conducted shall be provided with ventilation that meets the requirements of Section 18.6." With affirmation of this found in NFPA 30 Section 18.6 Ventilation for Dispensing Areas which reads "Liquid Storage areas where dispensing is conducted shall be provided with a gravity system or a continuous mechanical exhaust ventilation system. Mechanical ventilation shall be used if Class I liquids are dispensed within the room." [underlining is for emphasis only]

The proposed language makes it clear that the special exhaust system specified in Section 5004.3.1 would not be required where flammable and/or combustible liquids are ONLY stored, and there is no dispensing being conducted.

Cost Impact

The code change proposal will decrease the cost of construction .

An exhaust ventilation system designed to meet the ventilation rates in the IMC is less costly than one designed in accordance with IFC Section 5004.3.1

Proponent: Patrick McLaughlin, representing Household & Commercial Products Association (formerly CSPA) (pmclaugma@aol.com)

2018 International Fire Code

Revise as follows:

105.6.1 Aerosol products and aerosol cooking spray products and plastic aerosol 3 products. An operational permit is required to manufacture, store or handle an aggregate quantity of Level 2 or Level 3 aerosol products, aerosol cooking spray products or plastic aerosol 3 products in excess of 500 pounds (227 kg) net weight.

907.2.15 Aerosol storage uses. Aerosol product rooms and general-purpose warehouses containing aerosol products, aerosol cooking spray products or plastic aerosol 3 products shall be provided with an *approved* manual fire alarm system where required by this code.

5101.1 Scope. The provisions of this chapter, the International Building Code and NFPA 30B shall apply to the manufacturing, storage and display of aerosol products, aerosol cooking spray products and plastic aerosol 3 products. Manufacturing of aerosol products, aerosol cooking spray products and plastic aerosol 3 products using hazardous materials shall also comply with Chapter 50.

5101.4 Containers. Metal aerosol containers shall be limited to a maximum size of 33.8 fluid ounces (1000 ml). Plastic aerosol containers shall be limited to a maximum 4 fluid ounces (118 ml) except as provided in Section 5104.1.1 and 5104.1.2. Glass aerosol containers shall be limited to a maximum 4 fluid ounces (118 ml).

5103.2.3 Plastic aerosol products. Cartons or outer packaging containing aerosol products in plastic containers greater than 4 fluid ounces (118 ml) shall be clearly marked as follows:
PLASTIC AEROSOL 1 ~~3~~ or X

5104.1.1 Plastic Level aerosol-1 aerosol products. Aerosol products in plastic containers larger than 4 fluid ounces (118 ml), but not to exceed 33.8 fluid ounces (1000 ml), shall be allowed only where in accordance with this section. The commodity classification shall be Class III commodities, as defined in NFPA 13 where any of the following conditions are met:

1. Base product does not have a fire point where tested in accordance with ASTM D92, and nonflammable propellant.
2. Base product does not sustain combustion as tested in accordance with Appendix H, "Method of Testing for Sustained Combustibility," in DOTn 49 CFR Part 173, and nonflammable propellant.
3. Base product contains up to 20 percent by volume (15.8 percent by weight) of ethanol, isopropyl alcohol or a combination thereof in an aqueous mix, and nonflammable propellant.
4. Base product contains 4 percent by weight or less of an emulsified flammable liquefied gas propellant within an aqueous base. The propellant shall remain emulsified for the life of the product. Where such propellant is not permanently emulsified, the propellant shall be nonflammable.

Add new text as follows:

5104.1.2 Plastic aerosol 3 products. Plastic aerosol 3 products shall be defined as those that meet one of the following criteria:

1. Base product does not have a fire point where tested in accordance with ASTM D 92, and there is not more than 10% by weight flammable propellant.
2. Base product does not sustain combustion as tested in accordance with Appendix H, "method of testing for Sustained Combustibility," in DOTn 49 CFR, 173 and there is not more than 10% by weight flammable propellant.
3. Base product contains 50% by volume or less of flammable or combustible, water-miscible alcohols

in an aqueous mix, and there is not more than 10% by weight of flammable propellant.

Revise as follows:

~~5104.1.2~~ ~~5104.1.3~~ Plastic aerosol X products. Plastic aerosol X products are those products, in containers larger than 4 fluid ounces (118 ml), that do not meet the criteria provided in Section 5104.1.1 or 5104.1.2.

**TABLE 5104.3.2
SEGREGATED STORAGE OF LEVEL 2 AND 3 AEROSOL PRODUCTS AND PLASTIC AEROSOL 3 PRODUCTS IN
GENERAL PURPOSE WAREHOUSES**

STORAGE SEPARATION	MAXIMUM SEGREGATED STORAGE AREA ^a		SPRINKLER REQUIREMENTS
	Percentage of building area (percent)	Area limitation (square feet)	
Separation area ^{e, f}	15	20,000	Notes b, c
Chain-link fence enclosure ^d	20	20,000	Notes b, c
1-hour fire-resistance-rated interior walls	20	30,000	Note b
2-hour fire-resistance-rated interior walls	25	40,000	Note b
3-hour fire-resistance-rated interior walls	30	50,000	Note b

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. The maximum segregated storage area shall be limited to the smaller of the two areas resulting from the percentage of building area limitation and the area limitation.
- b. Automatic sprinkler system protection in aerosol product storage areas shall comply with NFPA 30B and be approved. Building areas not containing aerosol product storage shall be equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.
- c. Automatic sprinkler system protection in aerosol product storage areas shall comply with NFPA 30B and be approved. Sprinkler system protection shall extend a minimum 20 feet beyond the aerosol storage area.
- d. Chain-link fence enclosures shall comply with Section 5104.3.2.1.
- e. A separation area shall be defined as an area extending outward from the periphery of the segregated aerosol product storage area as follows.
 1. The limits of the aerosol product storage shall be clearly marked on the floor.
 2. The separation distance shall be not less than 25 feet and maintained clear of all materials with a commodity classification greater than Class III in accordance with Section 903.3.1.1.
- f. Separation areas shall only be permitted where approved.

5104.7 Storage in Group M occupancies. Storage of Level 2 and 3 aerosol products ~~and~~ aerosol cooking spray products, and plastic aerosol products in occupancies in Group M shall comply with Table 5104.7. Retail display shall comply with Section 5106.

TABLE 5104.7

**MAXIMUM QUANTITIES OF LEVEL 2 AND 3 AEROSOL PRODUCTS AND, AEROSOL COOKING SPRAY PRODUCTS
AND PLASTIC AEROSOL 3 PRODUCTS IN RETAIL STORAGE AREAS**

MAXIMUM NET WEIGHT PER FLOOR (pounds)

Basement	Not Permitted	Not Permitted	Not Permitted
Ground	2,500	5,000	Note d
Upper	500	1,000	Note d

For SI: 1 pound = 0.454 kg, 1 square foot = 0.0929 m².

- a. The total aggregate quantity on display and in storage shall not exceed the maximum retail display quantity indicated in Section 5106.3.
- b. Storage quantities indicated are the maximum permitted in any 50,000- square-foot area.
- c. The storage area shall be separated from the retail area with a 1-hour fireresistance-rated assembly.
- d. See Table 5104.3.2.

5105.1 General. The outside storage of Level 2 and 3 aerosol products, and plastic aerosol 3 products including storage in temporary storage trailers, shall be separated from exposures in accordance with Table 5105.1.

TABLE 5105.1
DISTANCE TO EXPOSURES FOR OUTSIDE STORAGE OF LEVEL 2 AND 3 AEROSOL PRODUCTS AND PLASTIC
AEROSOL 3 PRODUCTS

EXPOSURE	MINIMUM DISTANCE FROM AEROSOL STORAGE (feet)^a
Buildings	50
Exit discharge to a public way	50
Lot lines	20
Other outside storage	50
Public alleys, public ways, public streets	20

For SI: ~~1~~1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. The minimum separation distance indicated is not required where exterior walls having a 2-hour fire-resistance rating without penetrations separate the storage from the exposure. The walls shall extend not less than 30 inches above and to the sides of Level 2 and 3 aerosol products, and plastic aerosol 3 products.

5106.1 General. This section shall apply to the retail display of 500 pounds (227 kg) or more of Level 2 and 3 aerosol products ~~and, aerosol cooking spray products and plastic aerosol 3~~ products.

5106.2.1 Maximum quantities in retail display areas. Aerosol products ~~and, aerosol cooking spray products, and plastic aerosol 3~~ products in retail display areas shall not exceed quantities needed for display and normal merchandising and shall not exceed the quantities in Table 5106.2.1.

**TABLE 5106.2.1
 MAXIMUM QUANTITIES OF LEVEL 2 AND 3 AEROSOL PRODUCTS AND AEROSOL COOKING SPRAY PRODUCTS
 AND PLASTIC AEROSOL 3 PRODUCTS IN RETAIL DISPLAY AREAS**

MAXIMUM NET WEIGHT PER FLOOR (pounds)^b

Ground	2,500	10,000	10,000
Upper	500	2,000	Not Allowed

For SI: 1 pound = 0.454 kg, 1 square foot = 0.0929 m².

- a. The total quantity shall not exceed 1,000 pounds net weight in any one 100-square-foot retail display area.
- b. Per 25,000-square-foot retail display area.
- c. Minimum Ordinary Hazard Group 2 wet-pipe automatic sprinkler system throughout the retail sales occupancy.

5106.2.2 Aerosol cooking spray product and plastic aerosol 3 product storage and fire protection. The storage and handling of *aerosol cooking spray products* and *plastic aerosol 3 products* shall comply with this chapter and NFPA 30B.

5106.3.2 Automatic sprinkler protection. Aerosol product and plastic aerosol 3 product display and merchandising areas shall be protected by an *automatic sprinkler system* based on the requirements set forth in Tables 6.4.2.7(a) through 6.4.2.7(l) of NFPA 30B and the following:

1. Protection shall be based on the highest level of aerosol product in the array and the packaging method of the storage located more than 6 feet (1829 mm) above the finished floor.
2. Where using the cartoned aerosol products tables of NFPA 30B, uncartoned or display-cut Level 2 and 3 *aerosol products* and *plastic aerosol 3 products* shall not be permitted more than 6 feet (1829 mm) above the finished floor.
3. The design area for Level 2 and 3 *aerosol products* and *plastic aerosol 3 products* shall extend not less than 20 feet (6096 mm) beyond the Level 2 and 3 *aerosol product* and *plastic aerosol 3 product* display and merchandising areas.
4. Where ordinary and high-temperature ceiling sprinkler systems are adjacent to each other, noncombustible draft curtains shall be installed at the interface.

5106.3.3 Separation of Level 2 and 3 aerosol product and plastic aerosol 3 product areas. Separation of Level 2 and 3 aerosol product areas, *plastic aerosol 3 product areas* shall comply with the following:

1. Level 2 and 3 *aerosol product* or *plastic aerosol 3 product* display and merchandising areas shall be separated from each other by not less than 25 feet (7620 mm). See Table 5106.2.1.
2. Level 2 and 3 aerosol product or plastic aerosol 3 product display and merchandising areas shall be separated from flammable and *combustible liquids* storage and display areas by one or a combination of the following:
 - 2.1. Segregating areas from each other by horizontal distance of not less than 25 feet (7620 mm).
 - 2.2. Isolating areas from each other by a noncombustible partition extending not less than 18 inches (457 mm) above the merchandise.
 - 2.3. In accordance with Section 5106.5.
3. Where Item 2.2 is used to separate Level 2 or 3 aerosol *products* or *plastic aerosol 3 products* from flammable or *combustible liquids*, and the aerosol products are located within 25 feet (7620 mm) of flammable or *combustible liquids*, the area below the noncombustible partition shall be liquid tight at the floor to prevent spilled liquids from flowing beneath the aerosol products.

TABLE 5106.4
MAXIMUM STORAGE QUANTITIES FOR STORAGE AREAS ADJACENT TO RETAIL DISPLAY OF LEVEL 2 AND 3
AEROSOL PRODUCTS AND PLASTIC AEROSOL 3 PRODUCTS

MAXIMUM NET WEIGHT PER FLOOR (pounds)			
Floor	Unseparated^{a, b}	Separated	
		Storage Cabinets^b	1-hour Occupancy Separation
Basement	Not Allowed	Not Allowed	Not Allowed
Ground	2,500	5,000	In accordance with Sections 6.4.4.3 and 6.4.4.4 of NFPA 30B
Upper	500	1,000	In accordance with Sections 6.4.4.3 and 6.4.4.4 of NFPA 30B

For SI: 1 pound = 0.454 kg, 1 square foot = 0.0929 m².

- a. The aggregate quantity in storage and retail display shall not exceed the quantity limits for retail display.
- b. In any 50,000-square-foot area.

5106.5.7 Class I, II, III, IV and plastic commodities. Class I, II, III, IV and plastic commodities located adjacent to Level 2 and 3 aerosol products and plastic aerosol 3 products shall be protected in accordance with NFPA 13.

2018 International Building Code

Revise as follows:

[F] 307.1.1 Uses other than Group H. An occupancy that stores, uses or handles hazardous materials as described in one or more of the following items shall not be classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of Section 416 and the International Fire Code.
2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the International Fire Code.
3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment.
4. Cleaning establishments that utilize combustible liquid solvents having a flash point of 140°F (60°C) or higher in closed systems employing equipment *listed* by an *approved* testing agency, provided that this occupancy is separated from all other areas of the building by 1-hour *fire barriers* constructed in accordance with Section 707 or 1-hour *horizontal assemblies* constructed in accordance with Section 711, or both.
5. Cleaning establishments that utilize a liquid solvent having a flash point at or above 200°F (93°C).
6. Liquor stores and distributors without bulk storage.
7. Refrigeration systems.
8. The storage or utilization of materials for agricultural purposes on the premises.
9. Stationary storage battery systems installed in accordance with the International Fire Code.
10. Corrosive personal or household products in their original packaging used in retail display.
11. Commonly used corrosive building materials.
12. Buildings and structures occupied for aerosol product storage, aerosol cooking spray products or plastic aerosol 3 products shall be classified as Group S-1, provided that such buildings conform to the requirements of the International Fire Code.
13. Display and storage of nonflammable solid and nonflammable or noncombustible liquid hazardous materials in quantities not exceeding the maximum allowable quantity per *control area* in Group M or S occupancies complying with Section 414.2.5.
14. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the International Fire Code.
15. Stationary fuel cell power systems installed in accordance with the International Fire Code.
16. Capacitor energy storage systems in accordance with the International Fire Code.
17. Group B higher education laboratory occupancies complying with Section 428 and Chapter 38 of the International Fire Code.

[F] 414.1.2.1 Aerosol products, aerosol cooking spray products, plastic aerosol 3 products. Level 2 and 3 aerosol products, aerosol cooking spray products or plastic aerosol 3 products shall be stored and displayed in accordance with the International Fire Code. See Section 311.2 and the International Fire Code for occupancy group requirements.

[F] 414.2.5.3 Aerosol products, aerosol cooking spray products, plastic aerosol 3 products. The maximum quantity of aerosol products, aerosol cooking spray products or plastic aerosol 3 products in Group M

occupancy retail display areas, storage areas adjacent to retail display areas and retail storage areas shall be in accordance with the International Fire Code.

[F] 907.2.15 Aerosol storage uses. Aerosol product rooms and general-purpose warehouses containing aerosol products or aerosol cooking spray products or plastic aerosol 3 products shall be provided with an *approved* manual fire alarm system where required by the International Fire Code.

Reason:

The Household and Commercial Products Association (formerly CSPA) presented code change proposals, during the last code cycle, adding Plastic Aerosol 1 products to the International Fire Code. The proposals were accepted, but at the time, fire testing and development of automatic sprinkler protection requirements for other plastic aerosol products had not been conducted. Subsequently, a number of formulations in plastic have been studied by HCPA (CSPA), in conjunction with FM Global Research Campus, to determine the hazard level of the various formulations, and to develop a protection plan for this class of aerosol products that include limited amounts of flammable base product and limited amounts of flammable propellant in plastic containers.

Individual container fire tests were conducted to determine the heat of combustion for various formulations, and to observe how they react to fire. The formulation with the most utility and the most difficult fire protection challenge was chosen for full scale fire testing. Those tests have been successfully completed at FM Global Research Campus, and a robust fire protection design is now available to protect these products in storage. The protection design plan is detailed in NFPA 30B Code for the Manufacture and Storage of Aerosol Products under the definition of Plastic Aerosol 3. Plastic Aerosol 2 is reserved in NFPA 30B for formulations that may be developed in the future that can be protected by a less robust fire protection system.

The purpose of this proposal is to allow Plastic Aerosol 3 products, when protected in accordance with the controls that are being added to chapter 51 Aerosols, and the automatic fire sprinkler protection requirements being added to NFPA 30B Code for Manufacturing and Storage of Aerosol Products. The new aerosol products will bring advantages of use and recycling within the aerosol industry.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

The proposed code change will allow a new product, plastic aerosol 3, to be manufactured and stored if in compliance with the code change. Similar controls already exist for other aerosol products so there is no additional construction costs or cost savings if the aerosol industry chooses to manufacture and store plastic aerosol 3 products in their facilities.

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows:

5104.2.2 Aerosol cooking spray products. Storage of aerosol cooking spray products in A, B, E, F, I and R occupancies shall not be more than 1,000 pounds (454 kg) net weight.

Reason:

In Section 5104.2, Level 2 and 3 aerosol products are limited in Groups A, B, E, F, **I** and R occupancies to a maximum of 1,000 pounds. However, Section 5104.2.2 does not include Group I for aerosol cooking spray products. Section 5104.2.2 limits aerosol cooking spray products to 1,000 pounds in all of the same occupancies except for Group I.

Group I present a higher life hazard than the other occupancies. There is no logical reason not to include Group I into the list of occupancies where use of the aerosol cooking spray products are limited.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change does not affect construction and simply places an upper limit on these materials in Group I occupancies.

IFC: 5306.1.1 (New)

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Add new text as follows:

5306.1.1 Training. Personnel who handle medical gases and associated equipment and cylinders shall be trained on the use, safe handling and associated hazards.

Reason:

In addition to meeting the previous codes and standards referenced in this section in order to meet federal conditions of participation health care facilities must comply with the training requirements of medical gas systems and associated equipment and cylinders. This change will align the training requirements of medical gas systems and associated equipment and cylinders for healthcare facilities (K926).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This change is an operational change regarding training and will not increase the cost of construction on the healthcare industry.

2018 International Fire Code

Revise as follows:

5306.2.2 One-hour interior room. Where an exterior wall cannot be provided for the room, a 1-hour interior room shall be provided and shall be a room or enclosure separated from the remainder of the building by *fire barriers* constructed in accordance with Section 707 of the International Building Code or horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both, with a *fire-resistance rating* of not less than 1 hour. Openings between the room or enclosure and interior spaces shall be provided with self-closing, smoke- and draft-control assemblies having a *fire protection rating* of not less than 1 hour. An *automatic sprinkler system* shall be installed within the room. The room shall be exhausted through a duct to the exterior. Supply and exhaust ducts shall be enclosed in a 1-hour-rated shaft enclosure from the room to the exterior. *Approved* mechanical ventilation shall comply with the International Mechanical Code and be provided at a minimum rate of 1 cfm per square foot [0.00508 m³/(s • m²)] of the area of the room.

2018 International Building Code
