INTRODUCTION

This publication contains the Public Comment Agenda for consideration at the Public Comment Hearings of the International Code Council on October 24 – 29 at the Greater Richmond Convention Center, Richmond VA (see page 1). See page xxxvii for the hearing schedule.

This publication contains information necessary for consideration of public comments on the proposed code changes which have been considered at the ICC Committee Action Hearings held on April 15 – 23, 2018, at the Greater Columbus Convention Center in Columbus, OH. More specifically, this agenda addresses hearings on public comments on proposed code changes to the *International Building Code (Egress, Fire Safety and General)*, *International Fire Code*, *International Fuel Gas Code*, *International Mechanical Code*, *International Plumbing Code*, *International Private Sewage Disposal Code*, *International Property Maintenance Code*, *International Residential Code (Mechanical and Plumbing)*, *International Swimming Pool and Spa Code*, and the *International Wildland-Urban Interface Code*.

ICC GOVERNMENTAL MEMBER REPRESENTATIVES

Council Policy #28, Code Development (page x) requires that applications for Governmental Membership must have been received by March 20 of this year in order for the representatives of the Governmental Member to be eligible to vote at this Public Comment Hearing and the Online Governmental Consensus Vote, which occurs approximately two weeks after the hearings. Further, *CP#28* requires that ICC Governmental Member Representatives reflect the eligible voters **30 days prior** to the start of the Public Comment Hearings. This includes new, as well as changes, to voting status. Sections 9.1 and 9.2 of *CP#28* (page xxxiii) read as follows:

- 9.1 Eligible Final Action Voters:** Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated annually. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.
- 9.2 Applications:** Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

As such, new and updated eligible voter status must be received by ICC's Member Services Department **by September 24, 2018**. This applies to both voting at the Public Comment Hearings as well as the Online Governmental Consensus Vote which occurs approximately two weeks after the hearings. This must be done via the Electronic Voter Designation System. Access the Electronic Voter Designation System directly by logging on to www.iccsafe.org/EVDS and using the email address and password connected to your Primary Representative account. The online form can also be accessed by logging onto "My ICC" and selecting "Designate Voters" or through the Electronic Voter Designation link in the left hand menu on the ICC home page at www.iccsafe.org. These records will be used to verify eligible voter status for the Public Comment Hearing and the Online Governmental Consensus Vote. Voting members are strongly encouraged to review their membership record for accuracy so that any necessary changes are made prior to the September 24 deadline. **Representatives of any Governmental Member that has made application for membership after March 16, 2018 will not be able to vote.**

ICC POLICY ON FINANCIAL ASSISTANCE FOR GOVERNMENTAL MEMBER VOTING REPRESENTATIVES

ICC Council Policy 36 Financial Assistance defines the circumstances under which it is permissible for Governmental Member Voting Representatives to accept funds to enable a Governmental Member Voting Representative to attend ICC code hearings. The policy seeks to prohibit, or appropriately regulate financial assistance which is designed to increase Participation by a Particular interest group or by those supporting a Particular position on a proposed code change.

As part of the registration process (see below), eligible voting members are required to verify their voting status in order to receive a voting device. Improper acceptance of financial assistance, or misrepresentation by a Governmental Member Voting Representative about compliance with CP 36, which are discovered after a code hearing, may result in sanctions regarding voting at future hearings by the Governmental Member Voting Representative or by other Governmental Member Voting Representatives from the same governmental member. CP 36 provides, in pertinent Part:

- 2.0. Contributions.** To allow industry and the public to contribute to the goals of the ICC in transparent and accountable processes, organizations and individuals are permitted to contribute financial assistance to Governmental Members to further ICC Code Development Activities provided that:
 - 2.1** Contributions of financial assistance to Governmental Member Voting Representatives for the purposes of enabling participation in ICC Code Development Activities are prohibited except for reimbursements by the ICC or its subsidiaries, a regional, state, or local chapter of the ICC, or the local, state or federal unit of government such Governmental Member Voting Representative is representing. For the purposes of this policy financial assistance includes the payment of expenses on behalf of the Governmental Member or Governmental Member Voting Representative. Governmental Member Voting Representatives may self-fund for purposes of participating in ICC Activities.
 - 2.2** A Governmental Member accepting contributions of financial assistance from industry or other economic interests shall do so by action of its elected governing body or chief administrative authority. A Governmental Member Voting Representative may not directly accept financial assistance from industry or other economic interests.
 - 2.3** Any contributions to a Governmental Member of the ICC shall comply with applicable law, including but not limited to a Governmental Member's ethics, conflict of interest or other similar rules and regulations.

ADVANCE REGISTRATION

The Public Comment Hearings are only one component of the 2018 ICC Annual Conference and Group A Public Comment Hearings. **All attendees to the Public Comment Hearings are required to register. Registration for the Public Comment Hearings is FREE, and is necessary to verify voting status (see above). You are encouraged to register prior to the Public Comment Hearings. To register for the full Conference, the Education Program, or the Public Comment Hearings, go to http://media.iccsafe.org/2018_ICC_AnCon/register.html.**

NOTICE: If you or your companion require special accommodations to participate fully, please advise ICC of your needs.

ANTITRUST COMPLIANCE

ICC brings together numerous government officials and industry members to participate in the code and standard development process. ICC provides basic guidance on the antitrust laws that may be applicable to these and other activities sponsored by ICC (“ICC Activities”). [Click here](#) to view ICC’s policy on Antitrust Compliance.

AGENDA FORMAT

This Public Comment Hearing Agenda includes the Consent Agenda and the Individual Consideration Agenda for the code change proposals that comprise the 2018 Code Development Cycle. This will complete the Public Comment Hearings for the 2018 Code Development Cycle.

The Consent Agenda is comprised of proposed changes to the *International Building Code (Egress, Fire Safety and General)*, *International Fire Code*, *International Fuel Gas Code*, *International Mechanical Code*, *International Plumbing Code*, *International Private Sewage Disposal Code*, *International Property Maintenance Code*, *International Residential Code (Mechanical and Plumbing)*, *International Swimming Pool and Spa Code*, and the *International Wildland-Urban Interface Code*, which did not receive a successful assembly action or public comment, and therefore are not listed on the Individual Consideration Agenda.

The Individual Consideration Agenda is comprised of proposed changes, *which* either received a successful assembly action or received a public comment in response to the Code Committee’s action at the Committee Action Hearings.

Items on the Individual Consideration Agenda are published with information as originally published for the Committee Action Hearing as well as the published hearing results. Following the hearing results is the reason that the item is on the Individual Consideration Agenda followed by the public comments, which were received.

Public testimony will follow the procedures given in *CP#28-05 Code Development* as published on page x. Refer to the tentative hearing order on page xxxix.

MODIFICATIONS & PUBLIC COMMENTS

In addition to modifications made by a committee at the Committee Action Hearings, *CP#28 Code Development* allows successful modifications, which were voted on during the Online Assembly Vote following the Committee Action Hearings. In addition, modifications can be proposed in form of a Public Comment following the Committee Action Hearings. The Public Comment deadline was July 16, 2018 and all Public Comments received have been incorporated into this document. **Further modifications are not permitted beyond those published in this agenda.**

Proposed changes on the Individual Consideration Agenda at the Public Comment Hearings may have up to five possible motions - Approval as Submitted, Approval as Modified by the Code Committee, Approval as Modified by a successful Assembly Action, Approval as Modified by a Public Comment, or Disapproval. A Public Comment Hearings Discussion Guide will be posted and copies available at the hearing which includes a list of allowable motions for each code change proposal.

CONSENT AGENDA

The Public Comment Consent Agenda consists of proposals, which received neither a successful assembly action nor a public comment. The Public Comment Consent Agenda for each code will be placed before the assembly at the beginning of each code with a motion and vote to ratify final action in accordance with the results of the Committee Action Hearing.

INDIVIDUAL CONSIDERATION AGENDA

The Public Comment Hearing Individual Consideration Agenda is comprised of proposals, which have a successful assembly action or public comment. For each code, the proposed changes on the Individual Consideration Agenda shall be placed before the assembly for individual consideration of each item. The hearing order is found on page xxxix and the agenda starts on page 1.

ICC PUBLIC COMMENT HEARING PROCESS

The hearing process will follow CP #28. The process is summarized as follows and will occur for each code noted in the hearing order (CP #28 sections noted):

1. At the start of each of the individual hearings for the respective code (see page xxxix):
 - Requests to withdraw code changes
 - Requests to withdraw public comments
 - Requests to revise the hearing order
 - Consent Agenda voted (Section 7.5.5)
2. The first code change on the hearing order brought to the floor with a standing motion to sustain the committee action.
3. If the Committee Action is not Disapproval, a motion to approve a modification by a public comment may be presented (Section 7.5.9.6).
4. Public testimony on either the Committee Action (if Disapproval) or the public comment (Section 5.5.1)
5. ICC Governmental Member Representatives and Honorary Members (“eligible voters”) in attendance vote on the motion under consideration. (See page i)
6. Depending on the motion and action determined by the vote, subsequent allowable motions in accordance with Sections 7.5.9.8 can be considered or voting on the main motion in accordance with 7.5.9.7 is taken. (A Public Comment Hearing Discussion Guide will be posted and copies available at the hearing, which includes a listing of allowable motions.)
7. The public comment hearing result on the code change determined by a vote of the eligible voters is announced. In accordance with Section 7.5.7, reconsideration is not permitted. This result will be placed on the Online Governmental Consensus Vote (Section 8.0), which will be open approximately two weeks after the hearings are complete (see page v).
8. Repeat 2 – 7 for subsequent code changes
9. Go the next code indicated on the hearing order and repeat 1 – 8.

ELECTRONIC VOTING PUBLIC COMMENT HEARING FOLLOWED BY ONLINE GOVERNMENTAL CONSENSUS VOTE

The public comment hearing is the first step in the process to arrive at Final Action on code changes – Public Comment Hearing (PCH) voting followed by the Online Governmental Consensus Vote (OGCV) utilizing cdpACCESS®. Be sure to review the deadlines and eligible voter information on page i. The sections noted below are the applicable sections of CP #28 which is published on page x.

In accordance with Section 7.9.5.7 electronic voting will be used for voting at the PCH. Electronic voting devices will be available for all eligible voters and can be picked up at a designated area at the entrance to the hearing rooms after registration. Voting devices are to be returned to this designated area at the end of each day and picked up each morning. Therefore, you may want to allow extra time in the mornings to pick up your voting device before the hearings begin.

Public Comment Hearing Vote

The first step is the voting that will occur at the Public Comment Hearing. This process is regulated by Section 7.5.9 of CP #28.

The Consent Agenda will be voted with a motion to ratify the action taken at the Committee Action Hearings. This will be the Final Action on those code changes and they will not be considered in the Online Governmental Consensus Vote (Section 7.5.5).

As part of the Individual Consideration Agenda, individual motions for modifications to the main motion will be dealt with by a hand vote followed by the electronic vote if the moderator cannot determine the outcome of the hand vote. However, in accordance with Section 7.5.9.7, the vote on the main motion to determine the PCH action must be taken electronically with the vote recorded since this is necessary for the second step in the process (see below). As noted in Section 7.5.9.8, if the motion is not successful, motions for Approval as Submitted or Approval as Modified are in order. A motion for Disapproval is not in order. The voting majorities have not changed and are indicated in Section 7.6. As in the past, if the code change proposal does not receive any of the required majorities in accordance with Section 7.6, Section 7.5.9.9 stipulates that the PCH action will be Disapproval. However, the vote recorded will be the vote count on the main motion in accordance with Section 7.5.9.7.

Online Governmental Consensus Vote

The second step in the final action process is the Online Governmental Consensus Vote (OGCV). This process was first used in the 2014 Cycle, and is built into cdpACCESS and is regulated by Section 8.0. It is anticipated that the ballot period will start approximately two weeks after the Public Comment Hearings and will be open for two weeks.

The results of the PCH set the agenda and ballot options for the OGCV. This is stipulated in Section 8.1. For example, if the action taken at the PCH is AMPC 1, 3, 7 (Approved as Modified by Public Comments 1,3 and 7) then the OGCV ballot will be structured to allow eligible voters to vote for either AMPC 1,3, 7 or Disapproval in accordance with the table. The voting majority required for AMPC 1, 3, 7 at the PCH was a 2/3 majority which is the same majority that applies to the OGCV. The vote tally from the PCH will be combined with the vote tally from the OGCV to determine the Final Action. In the example cited, the

combined vote tally would be required to meet the 2/3 majority in order for the final action to be AMPC 1, 3, 7. If the voting majority is less than the 2/3 required, Section 10.3 stipulates the Final Action to be Disapproval.

Be sure to review Section 8.2 which identifies the composition of the ballot. Of note is item 4 where the PCH action is Approved as Modified. The resulting text will be presented in the ballot with the modification(s) incorporated into the original code change in order for the voter to see how the text would appear in the code. A key part of this ballot is also item 10 where the voter will have access to the hearing video from both hearings.

Non-eligible voters will also be able to login and view the OGCV ballot, but will not be permitted to vote.

Eligible voting members who voted at the Public Comment Hearings are not required to vote on the OGCV. The vote entered on the electronic voting device at the PCH will automatically be tabulated on the OGCV.

Final Action on Proposed Code Changes

Section 10.0 regulates the tabulation, certification and posting of the final action results. In accordance with Section 10.4, the Final Action will be published as soon as practicable and will include the action and vote counts from both the PCH and OGCV.

VIEW THE PUBLIC COMMENT HEARINGS ON YOUR PC

The Public Comment Hearings are scheduled to be “webcast”. Streaming video broadcast over the Internet will provide a gateway for all International Code Council members, the construction industry and other interested parties anywhere in the world to view and listen to the hearings. Logging on to the Internet broadcast will be as simple as going to the International Code Council web site, www.iccsafe.org and clicking on a link. [Actual site to be determined - be sure to check the ICC web site for further details].

The hearings can be seen free by anyone with Internet access. Minimum specifications for viewing the hearings are an Internet connection, sound card and Microsoft Windows Media Player. DSL, ISDN, Cable Modems or other leased-line connections are recommended for the best viewing experience. A dial-up modem connection will work, but with reduced video performance.

The 2018 cycle included a new hearing video feature – all hearing videos are now posted following the hearings at <http://hearingvideos.iccsafe.org/>.

ICC WEBSITE - WWW.ICCSAFE.ORG

While great care has been exercised in the publication of this document, there may be errata posted for the Public Comment Agenda. Errata, if any, identified prior to the Public Comment Hearings will be posted as updates to the Public Comment Hearing Agenda on the ICC website at www.iccsafe.org. Users are encouraged to periodically review the ICC Website for updates to the 2018 Public Comment Hearing Agenda.

2018/2019 ICC CODE DEVELOPMENT SCHEDULE

(February 10, 2017)

STEP IN CODE DEVELOPMENT CYCLE	DATE	
	2018 – Group A Codes IBC- E, IBC - FS, IBC -G, IFC, IFGC, IMC, IPC, IPMC, IPSDC, IRC – M, IRC- P, ISPSC, IWUIC, IZC	2019 – Group B Codes Admin, IBC-S, IEBC, IECC-C, IECC- R/IRC-E, IgCC (Ch. 1), IRC – B
2018 EDITION OF I-CODES PUBLISHED	Fall/2017 (except 2018 IgCC, see Group B Codes on next page)	
DEADLINE FOR RECEIPT OF APPLICATIONS FOR ALL CODE COMMITTEES	June 1, 2017 for the 2018/2019 Cycle. Call for committee posted in February /2017.	
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF CODE CHANGE PROPOSALS	January 8, 2018	January 7, 2019
WEB POSTING OF “PROPOSED CHANGES TO THE I-CODES”	February 28, 2018*	March 4, 2019*
COMMITTEE ACTION HEARING (CAH)	April 15 – 23, 2018 Greater Columbus Convention Center Columbus, OH	April 28 – May 8, 2019 Albuquerque Convention Center Albuquerque, NM
ONLINE CAH ASSEMBLY FLOOR MOTION VOTE	Starts approx. two weeks after last day of the CAH. Open for 2 weeks.	Starts approx. two weeks after last day of the CAH. Open for 2 weeks.
WEB POSTING OF “REPORT OF THE COMMITTEE ACTION HEARING”	May 30, 2018	June 11, 2019
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF PUBLIC COMMENTS	July 16, 2018	July 24, 2019
WEB POSTING OF “PUBLIC COMMENT AGENDA”	August 31, 2018*	September 4, 2019*
PUBLIC COMMENT HEARING (PCH) ANNUAL CONFERENCE DATES NOTED BY AC	October 24 – 31, 2018 Greater Richmond Convention Center Richmond, VA AC: October 21 – 23	October 23 – 30, 2019 Clark County, NV AC: October 20 - 22
ONLINE GOVERNMENTAL CONSENSUS VOTE (OGCV)	Starts approx. two weeks after last day of the PCH. Open for 2 weeks.	Starts approx. two weeks after last day of the PCH. Open for 2 weeks.
WEB POSTING OF FINAL ACTION	Following Validation Committee certification of OGCV and ICC Board confirmation.	Following Validation Committee certification of OGCV and ICC Board confirmation.

* Web posting of the “Proposed Changes to the I-Codes” and “Public Comment Agenda” will be posted no later than scheduled. ICC will make every effort to post these documents earlier, subject to code change/public comment volume and processing time.

2018 Group A Codes/Code committees:

- IBC-E: IBC Egress provisions. Chapters 10 and 11.
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC. See notes.
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33.
- IFC: The majority of IFC Chapter 10 is maintained by IBC-E. See notes.
- IFGC
- IMC
- IPC
- IPMC (code changes heard by the IPM/ZC (IPMC & IZC) code committee)
- IPSDC (code changes heard by the IPC code committee)
- IRC-M: IRC Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP code committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC - MP code committee)
- ISPSC
- IWUIC (code changes heard by the IFC code committee)
- IZC (code changes heard by the IPM/ZC (IPMC & IZC) code committee)

2019 Group B Codes/Code committees:

- Admin: Chapter 1 of all the I-Codes except the IECC, IgCC and IRC. Also includes the update of currently referenced standards in all of the 2018 Codes, except the IgCC.
- IBC-S: IBC Structural provisions. IBC Chapters 15 – 25 and IEBC structural provisions. See notes.
- IEBC: IEBC Non-structural provisions. See notes.
- IECC-C: IECC Commercial energy provisions.
- IECC-R/IRC-E: IECC Residential energy provisions and IRC Energy provisions in Chapter 11.
- IgCC: Chapter 1 of the IgCC. Remainder of the code is based on the provisions of ASHRAE Standard 189.1 *Standard for the Design of High-Performance Green Buildings, Except Low-Rise Residential Buildings*. The 2018 IgCC is scheduled to be published in the Summer/2018.
- IRC-B: IRC Building provisions. Chapters 1 – 10.

A 2020 Group C cycle is not scheduled.

Notes:

- Be sure to review the document entitled “2018/2019 Code Committee Responsibilities” which will be posted. This identifies responsibilities, which are different than Group A and B codes and committees which may impact the applicable code change cycle and resulting code change deadline. As an example, throughout Chapter 14 of the IBC (IBC – Fire Safety), there are numerous sections which include the designation “[BS]” which indicates that the provisions of the section are maintained by the IBC – Structural code committee. Similarly, there are several sections in Chapter 3 of the IMC, which include the designation “[BS]”. These are structural provisions, which will be heard by the IBC – Structural committee. The designations in the code are identified in the Code Committee Responsibilities document.
- I-Code Chapter 1: Proposed changes to the provisions in Chapter 1 of the majority of the I-Codes are heard in Group B (see Admin above for exceptions). Be sure to review the brackets ([]) of the applicable code.
- Definitions. Be sure to review the brackets ([]) in Chapter 2 of the applicable code and the Code Committee Responsibilities document to determine which code committee will consider proposed changes to the definitions.
- Proposed changes to the ICC Performance Code will be heard by the code committee noted in brackets ([]) in the section of the code and in the Code Committee Responsibilities document

CP #28-05 CODE DEVELOPMENT

Approved: 9/24/05
Revised: 7/27/18

1.0 Introduction

- 1.1. **Purpose of Council Policy:** The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).
- 1.2. **Objectives:** The ICC Code Development Process has the following objectives:
 - 1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.
 - 1.2.2 The open discussion of code change proposals by all parties desiring to participate.
 - 1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation or enforcement of laws, ordinances, rules or regulations relating to the public health, safety and welfare and by honorary members.
 - 1.2.4 The increased participation of all parties desiring to participate through an online submittal and voting process that includes opportunities for online collaboration.
- 1.3. **Code Publication:** The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.
 - 1.3.1 **Code Correlation:** The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. A Code Scoping Coordination Matrix shall determine which Code shall be the primary document, and therefore which code development committee shall be responsible for maintenance of the code text where a given subject matter or code text could appear in more than one Code. The Code Scoping Coordination Matrix shall be administered by the Code Correlation Committee as approved by the ICC Board. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 4.5.
- 1.4. **Process Maintenance:** The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which Codes are developed embodies core principles of the organization. One of those principles is that the final content of the Codes

is determined by a majority vote of the governmental and honorary members. It is the policy of the ICC Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.

- 1.5 Secretariat:** The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals and public comments shall be addressed to the Secretariat. The Secretariat shall have the authority to facilitate unforeseen situations which arise in the implementation of this council policy. Staff shall maintain a record of such actions.
- 1.6 Recording:** Individuals requesting permission to record any meeting or hearing, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that ICC shall retain sole ownership of the recording, and that they have insurance coverage for liability and misuse of recording materials. Equipment and the process used to record shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the recording. An unedited copy of the recording shall be forwarded to ICC within 30 days of the meeting. Recordings shall not otherwise be copied, reproduced or distributed in any manner. Recordings shall be returned to ICC or destroyed upon the request of ICC.

2.0 Code Development Cycle

- 2.1 Intent:** The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 3.5) and ending with publication of the Final Action on the code change proposals (see Section 10.4).
- 2.2 New Editions:** The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the previous edition.
- 2.3 Supplements:** The results of code development activity between editions may be published.
- 2.4 Emergency Action Procedures:**
 - 2.4.1 Scope:** Emergency actions are limited to those issues representing an immediate threat to health and safety that warrant a more timely response than allowed by the Code Development Process schedule.
 - 2.4.2 Initial Request:** A request for an emergency action shall be based upon perceived threats to health and safety and shall be reviewed by the Codes and Standards Council for referral to the ICC Board for action with their analysis and recommendation.
 - 2.4.3 Board and Member Action:** In the event that the ICC Board determines that an emergency amendment to any Code or supplement thereto is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the

ICC Board.

The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the Governmental Member Voting Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting authority.

2.5 Code Development Record. The code development record shall include the official documents and records developed in support of the given code development cycle. This includes the following:

1. Code Change Agenda (Section 4.8)
2. Audio and video recording of the Committee Action Hearing (Section 5.1)
3. The Online Assembly Floor Motion Ballot (Section 5.7.3)
4. Report of the Committee Action Hearing (Section 5.8)
5. Public Comment Agenda (Section 6.6)
6. Public Comment Hearing results (Section 7.5.8.10)
7. Audio and video recording of the Public Comment Hearing (Section 7.1)
8. The Online Governmental Consensus Ballot (Section 8.2)
9. Final Action results (Section 10.4)
10. Errata to the documents noted above

The information resulting from online collaboration between interested parties shall not be part of the code development record.

3.0 Submittal of Code Change Proposals

3.1 Intent: Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

3.2 Withdrawal of Proposal: A code change proposal may be withdrawn by the proponent (WP) at any time prior to membership action on the consent agenda at the Public Comment Hearing or prior to testimony on the code change proposal on the individual consideration agenda at the Public Comment Hearing. All actions on the code change proposal shall cease immediately upon the withdrawal of the code change proposal.

3.3 Form and Content of Code Change Submittals: Each code change proposal shall be submitted separately and shall be complete in itself. Each submittal shall contain the following information:

- 3.3.1 Proponent:** Each code change proposal shall include the name, title, mailing address, telephone number, and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.
- 3.3.1.1** If a group, organization or committee submits a code change proposal, an individual with prime responsibility shall be indicated.
- 3.3.1.2** If a proponent submits a code change proposal on behalf of a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated.
- 3.3.2 Code Reference:** Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.
- 3.3.2.1** If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.
- 3.3.2.2** If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.
- 3.3.3 Multiple Code Change Proposals to a Code Section.** A proponent shall not submit multiple code change proposals to the same code section. When a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 4.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.
- 3.3.4 Text Presentation:** The text of the code change proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.
- 3.3.4.1** A charging statement shall indicate the referenced code section(s) and whether the code change proposal is intended to be an addition, a deletion or a revision to existing Code text.
- 3.3.4.2** Whenever practical, the existing wording of the text shall be preserved with only such deletions and additions as necessary to accomplish the desired change.
- 3.3.4.3** Each code change proposal shall be in proper code format and terminology.
- 3.3.4.4** Each code change proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.
- 3.3.4.5** The proposed text shall be in mandatory terms.
- 3.3.5 Supporting Information:** Each code change proposal shall include sufficient supporting information to indicate how the code change proposal is intended to affect the intent and application of the Code.

- 3.3.5.1 Purpose:** The proponent shall clearly state the purpose of the code change proposal (e.g. clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.)
- 3.3.5.2 Reasons:** The proponent shall justify changing the current Code provisions, stating why the code change proposal is superior to the current provisions of the Code. Code change proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such code change proposals will improve the Code.
- 3.3.5.3 Substantiation:** The proponent shall substantiate the code change proposal based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 4.2 and determined as not germane to the technical issues addressed in the code change proposal may be identified as such. The proponent shall be notified that the code change proposal is considered an incomplete proposal in accordance with Section 4.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with the policy of the ICC Board. The burden of providing substantiating material lies with the proponent of the code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the reason statement. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.
- 3.3.5.4 Bibliography:** The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change proposal and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing. Supporting documentation may be provided via a link to a website provided by the proponent and included in the bibliography. The reason statement shall include the date the link was created.
- 3.3.5.5 Copyright Release:** The proponent of code change proposals, floor modifications and public comments shall sign a copyright release developed and posted by ICC.
- 3.3.5.6 Cost Impact:** The proponent shall indicate one of the following regarding the cost impact of the code change proposal:

- 1) The code change proposal will increase the cost of construction;
- 2) The code change proposal will decrease the cost of construction; or
- 3) The code change proposal will not increase or decrease the cost of construction.

The proponent shall submit information which substantiates such assertion. This information will be considered by the code development committee and will be included in the published code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the cost substantiation statement. The cost substantiation statement shall include the date the link was created.

Any proposal submitted which does not include the requisite cost impact information shall be considered incomplete and shall not be processed.

3.4 Online Submittal: Each code change proposal and all substantiating information shall be submitted online at the website designated by ICC. Two copies of each proposed new referenced standard in hard copy or one copy in electronic form shall be submitted. Additional copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the code development committee. Where such additional copies are requested, it shall be the responsibility of the proponent to send such copies to the respective code development committee.

3.5 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the code change deadline. Each code change proposal shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a code change proposal is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

3.6 Referenced Standards: In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

3.6.1 Code References:

3.6.1.1 The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.

3.6.1.2 The need for the standard to be referenced shall be established.

3.6.2 Standard Content:

3.6.2.1 A standard or portions of a standard intended to be enforced shall be written in mandatory language.

3.6.2.2 The standard shall be appropriate for the subject covered.

3.6.2.3 All terms shall be defined when they deviate from an

- ordinarily accepted meaning or a dictionary definition.
- 3.6.2.4 The scope or application of a standard shall be clearly described.
 - 3.6.2.5 The standard shall not have the effect of requiring proprietary materials.
 - 3.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.
 - 3.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.
 - 3.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.
 - 3.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.
 - 3.6.2.10 The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.
 - 3.6.2.11 The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

3.6.3 Standard Promulgation:

- 3.6.3.1 Code change proposals with corresponding changes to the code text which include a reference to a proposed new standard or a proposed update of an existing referenced standard shall comply with this section.

3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing. If the committee action at the Committee Action Hearing is Disapproval, further consideration on the Public Comment Agenda shall include a recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing.

3.6.3.1.2 Update of Existing Standards. Code change proposals which include technical revisions to the code text

to coordinate with a proposed update of an existing referenced standard shall include the submission of the proposed update to the standard in at least a consensus draft form in accordance with Section 3.4. If the proposed update of the existing standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal, including the update of the existing referenced standard, shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the updated standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing. If the committee action at the Committee Action Hearing is Disapproval, further consideration on the Public Comment Agenda shall include a recommendation stating that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing.

Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 4.6.

- 3.6.3.2** The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

4.0 Processing of Code Change Proposals

- 4.1 Intent:** The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published code change proposal accurately reflects that proponent's intent.
- 4.2 Review:** Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, number of copies, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple parts which fall under the maintenance responsibilities of different code committees, the Secretariat shall determine the code committee responsible for determining the committee action in accordance with Section 5.6 and the Code Scoping Coordination Matrix (see Section 1.3.1).
- 4.3 Incomplete Code Change Proposals:** When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected code change proposal after the final date, the proposal shall be held over until the next code development

cycle. Where there are otherwise no deficiencies addressed by this section, a code change proposal that incorporates a new referenced standard shall be processed with an analysis of the referenced standard's compliance with the criteria set forth in Section 3.6.

4.4 Editorial Code Change Proposals. When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate code development committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate code development committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the Committee Action Hearing. Code Correlation Committee proposals that are not added to a code development committee hearing agenda shall be published in the next edition of the code with no further consideration.

4.5 Copy Editing Code Text: The Chief Executive Officer shall have the authority at all times to make editorial style and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. Such editorial style or format changes shall not affect the scope or application of the Code requirements.

4.6 Updating Standards Referenced in the Codes: Standards referenced by the Codes that do not require coordination with a code change proposal to the code text shall be updated administratively by the Administrative Code Development Committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.

4.6.1 Updating ICC Standards Referenced in the Codes. All standards developed by ICC and referenced by the Codes which are undergoing an update shall be announced by ICC to allow stakeholders to participate in the update process. Where the updated standard is completed and available by December 1 of the third year of the code cycle, the published version of the new edition of the Code which references the standard shall refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued.

4.7 Preparation: All code change proposals in compliance with these procedures shall be prepared in a standard manner by the Secretariat and be assigned

separate, distinct and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 3.3.2 to facilitate the hearing process.

- 4.8 Code Change Agenda:** All code change proposals shall be posted on the ICC website at least 30 days prior to the Committee Action Hearing on those proposals and shall constitute the agenda for the Committee Action Hearing. Any errata to the Code Change Agenda shall be posted on the ICC website as soon as possible. Code change proposals which have not been published in the original posting or subsequent errata shall not be considered.

5.0 Committee Action Hearing

- 5.1 Intent:** The intent of the Committee Action Hearing is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The code development committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals. At the conclusion of the code development committee deliberations, the committee action on each code change proposal shall be placed before the hearing assembly for consideration in accordance with Section 5.7.

- 5.2 Committee:** The Codes and Standards Council shall review all applications and make committee appointment recommendations to the ICC Board. The Code Development Committees shall be appointed by the ICC Board.

5.2.1 Chairman/Moderator: The Chairman and Vice-Chairman shall be appointed by the Codes and Standards Council from the appointed members of the committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Committee Action_Hearing.

5.2.2 Conflict of Interest: A committee member shall withdraw from and take no part in those matters with which the committee member has an undisclosed financial, business or property interest. The committee member shall not participate in any committee discussion or any committee vote on the matter in which they have an undisclosed interest. A committee member who is a proponent of a code change proposal shall not participate in any committee discussion on the matter or any committee vote. Such committee member shall be permitted to participate in the floor discussion in accordance with Section 5.5 by stepping down from the dais.

5.2.3 Representation of Interest: Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the committee.

5.2.4 Committee Composition: The committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the committee members shall be regulators.

- 5.3 Date and Location:** The date and location of the Committee Action Hearing shall be announced not less than 60 days prior to the date of the hearing.

- 5.4 General Procedures:** *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Committee Action Hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the committee.
- 5.4.1 Chair Voting:** The Chairman of the committee shall vote only when the vote cast will break a tie vote of the committee.
- 5.4.2 Open Hearing:** The Committee Action Hearing is an open hearing. Any interested person may attend and participate in the floor discussion and assembly consideration portions of the hearing. Only code development committee members may participate in the committee action portion of the hearings (see Section 5.6). Participants shall not advocate a position on specific code change proposals with committee members other than through the methods provided in this policy.
- 5.4.3 Presentation of Material at the Public Hearing:** Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 5.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 3.3.5.3 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the code development committee at the public hearing.
- 5.4.4 Agenda Order:** The Secretariat shall publish a Code Change Agenda for the Committee Action Hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another code change proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.
- 5.4.4.1 Proponent Approval:** A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance in the hearing room and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to change the hearing order is not debatable.
- 5.4.4.2 Revised Agenda Order Approved:** A motion to revise the agenda order is subject to a 2/3 vote of those present.
- 5.4.5 Tabling:** Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to

table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Code Change Agenda for the code change proposals under consideration, or
2. To a specific location in the Code Change Agenda for the code change proposals under consideration.

5.4.5.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

5.4.5.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 5.4.5 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

5.4.6 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on by the committee in accordance with Section 5.6.

5.4.7 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

5.4.7.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

5.4.7.2 Proponent Testimony: The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

5.4.8 Points of Order: Any person participating in the public hearing may

challenge a procedural ruling of the Moderator or the Chairman. A majority vote of ICC Members in attendance shall determine the decision.

5.5 Floor Discussion: The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

5.5.1 Discussion Order:

1. Proponents. The Moderator shall begin by asking the proponent and then others in support of the code change proposal for their comments.
2. Opponents. After discussion by those in support of a code change proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. Rebuttal in support. Proponents shall then have the opportunity to rebut points raised by the opponents.
4. Re-rebuttal in opposition. Opponents shall then have the opportunity to respond to the proponent's rebuttal.

5.5.2 Modifications: Modifications to code change proposals may be suggested from the floor by any person participating in the public hearing. The person proposing the modification, or his/her designee, is deemed to be the proponent of the modification.

5.5.2.1 Submission. All modifications shall be submitted electronically to the ICC Secretariat in a format determined by ICC unless determined by the Chairman to be either editorial or minor in nature. The modification will be forwarded electronically to the members of the code development committee during the hearing and will be projected on the screen in the hearing room.

5.5.2.2 Criteria. The Chairman shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be ruled out of order if it:

1. changes the scope of the original code change proposal; or
2. is not readily understood to allow a proper assessment of its impact on the original code change proposal or the Code.

The ruling of the Chairman on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 5.4.8.

5.5.2.3 Testimony. When a modification is offered from the floor and ruled in order by the Chairman, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 5.5.1.

5.6 Committee Action: Following the floor discussion of each code change

proposal, one of the following motions shall be made and seconded by members of the committee:

1. Approve the code change proposal As Submitted (AS) or
2. Approve the code change proposal As Modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to code development committee members. If a committee member proposes a modification which had not been proposed during floor discussion, the Chairman shall rule on the modification in accordance with Section 5.5.2.2. If a committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the committee discussion and shall reopen the floor discussion for comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume committee discussion.

The code development committee shall vote on each motion with the majority dictating the committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each committee vote shall be supported by a reason.

The code development committee shall maintain a record of its proceedings including the action on each code change proposal.

5.7 Assembly Consideration: At the conclusion of the committee's action on a code change proposal and before the next code change proposal is called to the floor, the Moderator shall ask for a motion from the public hearing attendees who may object to the committee's action. If a motion in accordance with Section 5.7.1 is not brought forward on the committee's action, the results of the Committee Action Hearing shall be established by the committee's action.

5.7.1 Assembly Floor Motion: Any attendee may raise an objection to the committee's action in which case the attendee will be able to make a motion to:

1. Approve the code change proposal As Submitted from the Floor (ASF), or
2. Approve the code change proposal As Modified from the Floor (AMF) with a specific modification that has been previously offered from the floor and ruled in order by the Chairman during floor discussion (see Section 5.5.2) or has been offered by a member of the Committee and ruled in order by the Chairman during committee discussion (see Section 5.6), or
3. Disapprove the code change proposal from the floor (DF).

5.7.2 Assembly Floor Motion Consideration: On receipt of a second to the floor motion, the Moderator shall accept the motion and the second and notify the attendees that the motion will be considered in an online ballot following the hearing in accordance with Section 5.7.3. No additional testimony shall be permitted.

5.7.3 Online Assembly Floor Motion Ballot: Following the Committee

Action Hearing, all assembly floor motions which received a second shall be compiled into an online ballot. The ballot will include:

1. The code change proposal as published.
2. The committee action and reason from the Committee Action Hearing.
3. The floor motion, including modifications which are part of the floor motion.
4. Access to the audio and video of the Committee Action Hearing proceedings.
5. Identification of the ballot period for which the online balloting will be open.

5.7.4 Eligible Online Assembly Motion Voters: All members of ICC shall be eligible to vote on online assembly floor motions. Each member is entitled to one vote, except that each Governmental Member Voting Representative may vote on behalf of its Governmental Member. Individuals who represent more than one Governmental Member shall be limited to a single vote. Application, whether new or updated, for ICC membership must be received by the Code Council 30 days prior to the first day of the Committee Action Hearing. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

5.7.5 Assembly Action: A successful assembly action shall be a majority vote of the votes cast by eligible voters (see Section 5.7.4). A successful assembly action results in an automatic public comment to be considered at the Public Comment Hearing (see Section 7.4).

5.8 Report of the Committee Action Hearing: The results of the Committee Action Hearing, including committee action and reason, online assembly floor motion vote results and the total vote count for each assembly floor motion shall be posted on the ICC website not less than 60 days prior to the Public Comment Hearing, except as approved by the ICC Board.

6.0 Public Comments

6.1 Intent: The public comment process gives attendees at the Public Comment Hearing an opportunity to consider specific objections to the results of the Committee Action Hearing and more thoughtfully prepare for the discussion for public comment consideration. The public comment process expedites the Public Comment Hearing by limiting the items discussed to the following:

1. Consideration of items for which a public comment has been submitted; and
2. Consideration of items which received a successful assembly action.

6.2 Deadline: The deadline for receipt of a public comment to the results of the Committee Action Hearing shall be announced at the Committee Action Hearing but shall not be less than 30 days subsequent to the availability of the Report of the Committee Action Hearing (see Section 5.8).

6.3 Withdrawal of Public Comment: A public comment may be withdrawn by the public commenter at any time prior to public comment consideration of that comment. A withdrawn public comment shall not be subject to public comment

consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 7.5.5, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 7.5.5, the proposal shall continue as part of the individual consideration agenda in accordance with Section 7.5.6, however the public comment shall not be subject to public comment consideration.

6.4 Form and Content of Public Comments: Any interested person, persons, or group may submit a public comment to the results of the Committee Action Hearing which will be considered when in conformance to these requirements. Each public comment to a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

6.4.1 Public comment: Each public comment shall include the name, title, mailing address, telephone number and email address of the public commenter. Email addresses shall be published with the public comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal, committee action or successful assembly action. Public comments which are determined as not within the scope of the code change proposal, committee action or successful assembly action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 3.3.5.5 shall be provided with the public comment.

6.4.2 Code Reference: Each public comment shall include the code change proposal number.

6.4.3 Multiple public comments to a code change proposal. A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 6.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

6.4.4 Desired Final Action: In order for a public comment to be considered, the public comment shall indicate the desired Final Action as one of the following:

1. Approve the code change proposal As Submitted (AS), or
2. Approve the code change proposal As Modified by the committee

modification published in the Report of the Committee Action Hearing (AM) or published in a public comment in the Public Comment Agenda (AMPC), or

3. Disapprove the code change proposal (D)

6.4.5 Supporting Information: The public comment shall include a statement containing a reason and justification for the desired Final Action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 6.5 and determined as not germane to the technical issues addressed in the code change proposal or committee action may be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in accordance with the policy of the ICC Board. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Public Comment_Hearing. Supporting documentation may be provided via a link to a website provided by the public commenter and included in the reason statement and bibliography. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

6.4.6 Cost Impact: The proponent of the public comment shall indicate one of the following regarding the cost impact of the public comment to the code change proposal:

- 1) The net effect of the public comment and code change proposal will increase the cost of construction;
- 2) The net effect of the public comment and code change proposal will decrease the cost of construction; or
- 3) The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

The public commenter shall submit information which substantiates such assertion. This information will be considered at the Public Comment Hearing and will be included in the published public comment. Supporting documentation may be provided via a link to a website provided by the public commenter and included in the cost substantiation statement. The cost substantiation statement shall include the date the link was created.

Any public comment submitted which does not include the requisite cost impact information shall be considered incomplete and shall not be processed.

6.4.7 Online submittal: Each public comment and substantiating information shall be submitted online at the website designated by ICC. Additional copies may be requested when determined necessary by the Secretariat.

6.4.8 Submittal Deadline: ICC shall establish and post the submittal

deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the public comment deadline. Each public comment shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

6.5 Review: The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 4.2).

6.5.1 Incomplete Public Comment: When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.

6.5.2 Duplications: On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for public comment consideration. Each public commenter shall be notified of this action when it occurs.

6.5.3 Deadline: Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the public comment consideration. This deadline shall not apply to public comments submitted by the Code Correlation Committee. In order to correlate submitted public comments with action taken at the Committee Action Hearing on code change proposals that did receive a public comment, the Code Correlation Committee, in conjunction with staff processing of public comments, shall review the submitted public comments and submit the necessary public comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Public Comment Agenda as required in Section 6.6.

6.6 Public Comment Agenda: The Committee Action Hearing results on code change proposals that have not received a public comment and code change proposals which received public comments or successful assembly actions shall constitute the Public Comment Agenda. The Public Comment Agenda shall be posted on the ICC website at least 30 days prior the Public Comment Hearing. Any errata to the Public Comment Agenda shall be posted on the ICC website as soon as possible. Code change proposals and public comments which have not been published in the original posting or subsequent errata shall not be considered.

7.0 Public Comment Hearing_

7.1 Intent: The Public Comment Hearing is the first of two steps to make a final determination on all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 9.0). The second step, which follows the Public Comment Hearing, is the Online Governmental Consensus Vote that is conducted in accordance with Section

8.0.

- 7.2 Date and Location:** The date and location of the Public Comment Hearing shall be announced not less than 60 days prior to the date of the hearing.
- 7.3 Moderator:** The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Public Comment Hearing.
- 7.4 Public Comment Agenda:** The Public Comment Consent Agenda shall be comprised of code change proposals which have neither a successful assembly action nor public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a successful assembly action or public comment (see Section 6.1).
- 7.5 Procedure:** *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Public Comment Hearing except as these Rules of Procedure may otherwise dictate.
- 7.5.1 Open Hearing:** The Public Comment Hearing is an open hearing. Any interested person may attend and participate in the floor discussion.
- 7.5.2 Agenda Order:** The Secretariat shall publish a Public Comment Agenda for the Public Comment Hearing, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any code change proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.
- 7.5.2.1 Proponent Approval:** A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance at the hearing and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to change the hearing order is not debatable.
- 7.5.2.2 Revised Agenda Order Approved:** A motion to revise the agenda order is subject to a 2/3 vote of those present.
- 7.5.3 Tabling:** Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 5.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Public Comment Agenda for the code change proposals under consideration, or
2. To a specific location in the Public Comment Agenda for the code change proposals under consideration.

7.5.3.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

7.5.3.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 7.5.3 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

7.5.4 Presentation of Material at the Public Comment Hearing: Information to be provided at the hearing shall be limited to verbal presentations. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 6.4.5 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.

7.5.5 Public Comment Consent Agenda: The Public Comment Consent Agenda (see Section 7.4) shall be placed before the assembly with a single motion for Final Action in accordance with the results of the Committee Action Hearing. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion. This action shall not be subject to the Online Governmental Consensus Vote following the Public Comment Hearing (see Section 8.0).

7.5.6 Public Comment Individual Consideration Agenda: Upon completion of the Public Comment Consent Agenda vote, all code change proposals not on the Public Comment Consent Agenda shall be placed before the assembly for individual consideration of each item (see Section 7.4).

7.5.7 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on in accordance with Section 7.5.9.

7.5.8 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

7.5.8.1 Time Keeping: Keeping of time for testimony by an

individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

7.5.9 Discussion and Voting: Discussion and voting on code change proposals being individually considered shall be in accordance with the following procedures and the voting majorities in Section 7.6:

7.5.9.1 Proponent testimony: The Proponent of a public comment is permitted to waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

7.5.9.2 Points of Order: Any person participating in the public hearing may challenge a procedural ruling of the Moderator. A majority vote of ICC Members in attendance shall determine the decision.

7.5.9.3 Eligible voters: Voting shall be limited to eligible voters in accordance with Section 9.0.

7.5.9.4 Allowable Final Action Motions: The only allowable motions for Final Action are Approval as Submitted (AS), Approval as Modified by the committee (AM) or by one or more modifications published in the Public Comment Agenda (AMPC), and Disapproval (D).

7.5.9.5 Initial Motion: The code development committee action shall be the initial motion considered.

7.5.9.6 Motions for Modifications: Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second for a modification published in the Public Comment Agenda may be made (see Section 6.4.4). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all modifications.

7.5.9.7 Voting: After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If the motion fails to receive the majority required in Section 7.6, the Moderator shall ask for a new motion.

7.5.9.8 Subsequent Motion: If the initial motion is unsuccessful, a motion for either Approval as Submitted or Approval as Modified by one or more published modifications is in order. A motion for Disapproval is not in order. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If a successful vote is not achieved, Section 7.5.9.9 shall apply.

7.5.9.9 Failure to Achieve Majority Vote at the Public Comment Hearing. In the event that a code change proposal does not receive any of the required majorities in Section 7.6, the results of the Public Comment Hearing for the code change proposal in question shall be Disapproval. The vote count that will be reported as the Public Comment Hearing result will be the vote count on the main motion in accordance with Section 7.5.9.7.

7.5.9.10 Public Comment Hearing Results: The result and vote count on each code change proposal considered at the Public Comment Hearing shall be announced at the hearing. In the event the electronic voting system is not utilized and a hand/standing count is taken in accordance with Sections 7.5.9.7 and 7.5.9.8, the vote count will not be announced if an individual standing vote count is not taken. The results shall be posted and included in the Online Governmental Consensus Ballot (see Section 8.2).

7.6 Majorities for Final Action: The required voting majority for code change proposals individually considered shall be based on the number of votes cast of eligible voters at the Public Comment Hearing shall be in accordance with the following table:

Committee Action	Desired Final Action		
	AS	AM/AMPC	D
AS	Simple Majority	2/3 Majority	Simple Majority
AM	2/3 Majority	Simple Majority to sustain the Committee Action or; 2/3 Majority on each additional modification and 2/3 Majority on entire code change proposal for AMPC	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

8.0 Online Governmental Consensus Vote

8.1 Public Comment Hearing Results: The results from the Individual Consideration Agenda at the Public Comment Hearing (see Sections 7.5.6 and 7.5.9.10) shall be the basis for the Online Governmental Consensus Vote. The ballot shall include the voting options in accordance with the following table:

Committee Action	Public Comment Hearing result and Voting Majority	Online Governmental Consensus Ballot and Voting Majority	
AS	AS: Simple Majority	AS: Simple Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AS: Simple Majority	D: Simple Majority
AM	AS: 2/3 Majority	AS: 2/3 Majority	D: Simple Majority
	AM: Simple Majority	AM: Simple Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AM: Simple Majority	D: Simple Majority
D	AS: 2/3 Majority	AS: 2/3 Majority	D: Simple Majority
	AMPC: 2/3 Majority	AMPC: 2/3 Majority	D: Simple Majority
	D: Simple Majority	AS: 2/3 Majority	D: Simple Majority

8.2 Online Governmental Consensus Ballot: The ballot for each code change proposal considered at the Public Comment Hearing will include:

1. The Public Comment Hearing result and vote count.
2. The allowable Online Governmental Consensus Vote actions in accordance with Section 8.1.
3. Where the Public Comment Hearing result is As Submitted (AS) or Disapproval (D), the original code change proposal will be presented.
4. Where the Public Comment Hearing result is As Modified by the committee (AM) or As Modified by one or more Public Comments (AMPC), the original code change and approved modification(s) will be presented.
5. The committee action taken at the Committee Action Hearing.
6. ICC staff identification of correlation issues.
7. For those who voted at the Public Comment Hearing, the ballot will indicate how they voted, unless an electronic vote count is not taken in accordance with Section 7.5.9.10.
8. An optional comment box to provide comments.
9. Access to the Public Comment Agenda which includes: the original code change, the report of the committee action and the submitted public comments.
10. Access to the audio and video of the Committee Action and Public Comment Hearing proceedings.
11. Identification of the ballot period for which the online balloting will be open.

8.3 Voting process: Voting shall be limited to eligible voters in accordance with Section 9.0. Eligible voters are authorized to vote during the Public Comment Hearing and during the Online Governmental Consensus Vote; however, only the last vote cast will be included in the final vote tabulation. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

8.3.1 Participation requirement: A minimum number of participants to conduct the Online Governmental Consensus Vote shall not be required unless the code change proposal(s) were not voted upon utilizing the electronic voting devices at the Public Comment Hearing and the resulting vote was not assigned to each eligible voting member in accordance with Sections 7.5.9.7 and 7.5.9.8 . If this occurs, a minimum number of participants shall be required for those code change proposal(s) based on an assessment of the minimum number

of votes cast during the entire Public Comment Hearing and the Online Governmental Consensus Vote shall determine the final on action on the code change proposal(s) in accordance with Section 10.1.

9.0 Eligible Final Action Voters

9.1 Eligible Final Action Voters: Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated annually. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.

9.2 Applications: Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

10.0 Tabulation, certification and posting of results

10.1 Tabulation and Validation: Following the closing of the online ballot period, the votes received will be combined with the vote tally at the Public Comment Hearing to determine the final vote on the code change proposal. If a hand/standing count is utilized per Subsection 7.5.9.7 or 7.5.9.8, those votes of the Public Comment Hearing will not be combined with the online ballot. ICC shall retain a record of the votes cast and the results shall be certified by a validation committee appointed by the ICC Board. The validation committee shall report the results to the ICC Board, either confirming a valid voting process and result or citing irregularities in accordance with Section 10.2.

10.2 Voting Irregularities: Where voting irregularities or other concerns with the Online Governmental Consensus Voting process which are material to the outcome or the disposition of a code change proposal(s) are identified by the validation committee, such irregularities or concerns shall be immediately brought to the attention of the ICC Board. The ICC Board shall take whatever action necessary to ensure a fair and impartial Final Action vote on all code change proposals, including but not limited to:

1. Set aside the results of the Online Governmental Consensus Vote and have the vote taken again.
2. Set aside the results of the Online Governmental Consensus Vote and declare the Final Action on all code change proposals to be in accordance with the results of the Public Comment Hearing.
3. Other actions as determined by the ICC Board.

10.3 Failure to Achieve Majority Vote: In the event a code change proposal does not receive any of the required majorities for Final Action in Section 8.0, Final Action on the code change proposal in question shall be Disapproval.

10.4 Final Action Results: The Final Action on all code change proposals shall be published as soon as practicable after certification of the results. The results shall include the Final Action taken, including the vote tallies from both the Public Comment Hearing and Online Governmental Consensus Vote, as well the required majority in accordance with Section 8.0. ICC shall maintain a record of individual votes for auditing purposes, however, the record shall not be made public. The exact wording of any resulting text modifications shall be made available to any interested party.

11.0 Code Publication

11.1 Next Edition of the Codes: The Final Action results on code change proposals shall be the basis for the subsequent edition of the respective Code.

11.2 Code Correlation: The Code Correlation Committee is authorized to resolve technical or editorial inconsistencies resulting from actions taken during the code development process by making appropriate changes to the text of the affected code. The process to resolve technical or editorial inconsistencies shall be conducted in accordance with CP#44 Code Correlation Committee.

12.0 Appeals

12.1 Right to Appeal: Any person may appeal an action or inaction in accordance with Council Policy 1 Appeals. Any appeal made regarding voter eligibility, voter fraud, voter misrepresentation or breach of ethical conduct must be supported by credible evidence and must be material to the outcome of the final disposition of a code change proposal(s).

The following actions are not appealable:

1. Variations of the results of the Public Comment Hearing compared to the Final Action result in accordance with Section 10.4.
2. Denied requests to extend the voter balloting period in accordance with Sections 5.7.4 or 8.3.
3. Lack of access to the internet based online collaboration and voting platform to submit a code change proposal, to submit a public comment or to vote.
4. Code Correlation Committee changes made in accordance with Section 11.2.

13.0 Violations

13.1 ICC Board Action on Violations: Violations of the policies and procedures contained in this Council Policy shall be brought to the immediate attention of the ICC Board for response and resolution. Additionally, the ICC Board may take any actions it deems necessary to maintain the integrity of the code development process.

WITHDRAWN CODE CHANGE PROPOSALS

The following code change proposals were withdrawn subsequent to the Committee Action Hearings:

FS114-18
FS157-18
G51-18

Code change proposals withdrawn prior to the end of the committee action hearings are indicated as such in the 2018 Report of Committee Action Hearings.

2018 PUBLIC COMMENT HEARINGS SCHEDULE

October 24 - 29, 2018

Greater Richmond Convention Center
Richmond, VA

The upcoming 2018 ICC Annual Conference, Group A Public Comment Hearings and Building Safety and Design Expo will be utilizing the same schedule as last year. The Annual Business meeting will be on Monday, October 22nd, followed by the Expo and Education Programs. The conference activities will conclude on Tuesday, October 23rd with the Annual Banquet. Global Connections Day will be held on Wednesday. [Click here](#) for the conference schedule.

The Public Comment Hearings will start on Wednesday, October 24th at **12:00 pm (please note start time)**. The schedule anticipates that the hearings will be completed no later than 7:00 pm on Monday, October 29th. This may require adjustments to the daily start/end times based on hearing progress. The hearings will start with the Building related codes, starting with the Property Maintenance and Building code, followed by the Fire code and then the Plumbing/Mechanical/Fuel Gas (PMG) codes.

Unless noted by “Start no earlier than 8:00 am”, the hearing on each code will begin immediately upon completion of the hearing for the prior code. This includes moving the code up or back from the day indicated based on hearing progress. Actual start times for each code cannot be stipulated due to uncertainties in hearing progress. Be sure to review the tentative hearing order in the Public Comment Agenda (to be posted by August 31st) for code changes that are heard with a code other than that indicated by the code change prefix (see note 4).

Wednesday October 24	Thursday October 25	Friday October 26	Saturday October 27	Sunday October 28	Monday October 29
<p>Start 12 pm</p> <p>IPMC/IZC</p> <p>IBC-G</p> <p>End 7 pm</p>	<p>Start 8 am</p> <p>IBC-G</p> <p>IBC-FS</p> <p>End 7 pm</p>	<p>Start 8 am</p> <p>IBC-FS</p> <p>IBC-E</p> <p>IFC/IWUIC</p> <p>End 7 pm</p>	<p>Start 8 am</p> <p>IFC/IWUIC</p> <p>ISPSC (Start no earlier than 8 am)</p> <p>IFGC</p> <p>IMC</p> <p>End 7 pm</p>	<p>Start 10 am</p> <p>IMC</p> <p>IRC-M</p> <p>IPC/IPSDC</p> <p>End 7 pm</p>	<p>Start 8 am</p> <p>IPC/IPSDC</p> <p>IRC-P</p> <p>Finish 7 pm</p>

SEE NEXT PAGE FOR SCHEDULE NOTES AND LIST OF CODES

Hearing Schedule Notes:

1. Daily start and end hearing times are subject to change based on progress.
2. Mid-morning, lunch and mid-afternoon breaks to be announced. The hearings are scheduled without a dinner break. A lunch break is not scheduled for Wednesday, October 24th.
3. Due to the uncertainties in the hearing process, the start time indicated as "Start no earlier than 8 am" is conservatively estimated and is not intended to be a scheduled target.
4. Consult the hearing order for code changes to be heard with a code other than the code under which the code change is designated.

Codes: (be sure to consult the Cross Index of Proposed Code Changes with Public Comments for changes heard with a different code)

IBC – E: International Building Code – Egress provisions (Chs. 10 and 11)

IBC – FS: International Building Code – Fire Safety provisions (Chs. 7, 8, 9, 14, 26)

IBC – G: International Building Code – General provisions (Chs. 3 – 6, 12, 13, 27 – 33)

IFC/IWUIC: International Fire and Wildland-Urban Interface Codes

IFGC: International Fuel Gas Code

IMC: International Mechanical Code

IPC/IPSDC: International Plumbing and Private Sewage Disposal Codes

IPMC/IZC: International Property Maintenance and Zoning Codes (no code changes received to the IZC)

IRC – M: Mechanical provisions in the International Residential Code (Chs. 12 – 23)

IRC – P: Plumbing provisions in the International Residential Code (Chs. 25 – 33)

ISPSC: International Swimming Pool and Spa Code

TENTATIVE HEARING ORDER FOR EACH INDIVIDUAL CONSIDERATION AGENDA

Note: Code changes to be heard out of numerical order or to be heard with a different code designation are indented. Be sure to review the cross index on page xlii for code change which affect codes other than those under their respective code change number prefix.

2018 ICC CODE DEVELOPMENT CYCLE CROSS INDEX OF PROPOSED CODE CHANGES ON THE PUBLIC COMMENT AGENDA FOR INDIVIDUAL CONSIDERATION

Some of the proposed code changes include sections that are outside of the scope of the chapters or the code listed in the table of 2018-2019 Staff Secretaries on page x. This is done in order to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this cross index are proposed code changes that include sections of codes or codes other than those listed on page viii. For example, IBC Section 1705.17 is proposed for revision in code change FS53-18, which is found in the IBC-Fire Safety section of the code change proposal book. This section of the IBC is typically the responsibility of the IBC-Structural Committee as listed in the table of 2018-2019 Staff Secretaries. It is therefore identified in this cross index. Another example is Section 502.9.5 of the International Mechanical Code. The International Mechanical Code is maintained by the IMC Committee, but Section 502.9.5 will be considered for revision in proposed code change F276 which will be on the IFC Committee agenda. In some instances, there are other subsections that are revised by an identified code change that is not included in the cross index.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect Chapter 4 of the IBC, review the proposed code changes in the portion of the monograph for the IBC-General Code Development Committee (listed with a G prefix) then review this cross reference for Chapter 4 of the IBC for proposed code changes published in other code change groups. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

PREFIX	PROPOSED CHANGE GROUP (see monograph table of contents for location)
E	International Building Code - Means of Egress

PM8-18 Part I

IPMC: SECTION 310, 310.1, 310.2, 310.3, 310.4, ICC

Proposed Change as Submitted

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IPMC COMMITTEE. PART II WILL BE HEARD BY THE IFC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2018 International Property Maintenance Code

Add new text as follows

SECTION 310 STORM SHELTERS

310.1 Inspection and maintenance. Storm shelters required by Section 423 of the International Building Code, Section 1106 of the International Existing Building Code, or otherwise legally required in a jurisdiction shall be inspected and maintained in accordance with this section.

310.2 Door function. Storm shelter doors, and door hardware, shall be maintained to ensure proper door operation as required by ICC 500.

310.3 Damage or missing components. Storm shelters shall be maintained in accordance with ICC 500 so that walls and roofs are intact and undamaged. Any damage to the storm shelter or its impact-protective systems shall be repaired or replaced in accordance with ICC 500. Missing equipment or components shall be replaced.

310.4 Replacement components. Where it is necessary to replace impact-protective systems, including certified doors, shutters, windows or their frames, hardware, and closing mechanisms, replacements shall comply with applicable ICC 500 requirements.

Add new standard(s) follows

ICC

International Code Council
500 New Jersey Avenue, NW 6th
Floor
Washington DC 20001
US

ICC 500-2014:

ICC/NSSA Standard for the Design and Construction of Storm Shelters

Reason: Storm shelters are relied upon to protect citizens in communities prone to tornadoes, hurricanes, or other similar extreme weather events. It is important to make sure that the shelters, in particular the impact protection systems, doors, and latching components are maintained in an operable condition so they will provide shelter when needed. This proposal includes basic safety requirements for maintaining desired protection.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change would not result in any increase in the initial construction cost, but could be a minimal increase for the inspection, maintenance, and repairs, especially if the storm shelter is damaged by an inclement weather event.

Analysis: The referenced standard, ICC 500-2014, is currently referenced in other 2018 I-codes.

PM8-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that the proposal has merit but needs more work. It should be revised to apply to all storm shelters, not just those required by the IBC. Further it should be expanded to address systems within storm shelters. Lastly, the term "any damage" in Section 310.3 is too broad and could lead to inconsistent interpretation. (Vote: 7-2)

Assembly Action:

None

PM8-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Property Maintenance Code

SECTION 310 STORM SHELTERS

310.1 Inspection and maintenance. Storm shelters required by Section 423 of the International Building Code, Section 1106 of the International Existing Building Code, or otherwise legally required in a jurisdiction shall shelters shall be inspected and maintained in accordance with this section.

310.2 Door function. Storm shelter doors, and door hardware, shall be maintained to ensure proper door operation as required by ICC 500.

310.3 Damage or missing components. Storm shelters shall be maintained in accordance with ICC 500 so that walls and roofs are intact and undamaged. Any damage to the storm shelter or its impact-protective systems that impair its functionality shall be repaired or replaced in accordance with ICC 500. Missing equipment or components shall be replaced.

310.4 Replacement components. Where it is necessary to replace impact-protective systems, including certified doors, shutters, windows or their frames, hardware, and closing mechanisms, replacements shall comply with applicable ICC 500 requirements.

Commenter's Reason: The committee liked the proposal and felt it had merit, but they also felt that it needed work. This amended public comment addresses the concerns of the committee as follows:

- The committee felt that the proposal should apply to all storm shelters, not just those required by the IBC. This change was made in section 310.1.
- Additionally the committee felt that the term "any damage" was too broad and could lead to inconsistent enforcement. As a result section 310.3 has also been amended to specifically focus on damage that impairs the functionality of the shelter only and not to focus on other maintenance items such as missing paint and other cosmetic issues.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The change would not result in any increase in the initial construction cost, but could be a minimal increase for the inspection, maintenance, and repairs, especially if the storm shelter functionality is decreased.

Public Comment 2:

Proponent: Lucas Pump, representing Self (l.pump@cedar-rapids.org) requests As Submitted.

Commenter's Reason: This proposal adds basic safety requirements that are specific to the maintenance of *required*

storm shelters, that is not in previous code editions. This is maintenance code, and this speaks to the specific maintenance of these structures.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The maintenance of *required* storm shelters may increase - but, the initial cost of construction will not be affected.

PM8-18 Part I

PM8-18 Part II

IFC: 301.1, SECTION 320, 320.1, 320.2, 320.3, 320.4, ICC

Proposed Change as Submitted

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Fire Code

Revise as follows

301.1 Scope. The provisions of this chapter shall govern the occupancy and maintenance of all structures and premises for precautions against fire and the spread of fire and general requirements of fire and life safety.

Add new text as follows

SECTION 320 STORM SHELTERS

320.1 Inspection and maintenance. Storm shelters required by Section 423 of the International Building Code, Section 1106 of the International Existing Building Code, or otherwise legally required in a jurisdiction shall be inspected and maintained in accordance with this section.

320.2 Door function. Storm shelter doors and door hardware shall be maintained to ensure proper door operation as required by ICC 500.

320.3 Damage or missing components. Storm shelters shall be maintained in accordance with ICC 500 so that walls and roofs are intact and undamaged. Any damage to the storm shelter or its impact-protective systems shall be repaired or replaced in accordance with ICC 500. Missing equipment or components shall be replaced.

320.4 Replacement components. Where it is necessary to replace impact-protective systems, including certified doors, shutters, windows or their frames, hardware, and closing mechanisms, replacements shall comply with applicable ICC 500 requirements.

Add new standard(s) follows

ICC

International Code Council, Inc.
500 New Jersey Avenue, NW 6th
Floor
Washington DC 20001
US

ICC 500-2014:

ICC/NSSA Standard for the Design and Construction of Storm Shelters

Reason: Storm shelters are relied upon to protect citizens in communities prone to tornadoes, hurricanes, or other similar extreme weather events. It is important to make sure that the shelters, in particular the impact protection systems, doors, and latching components are maintained in an operable condition so they will provide shelter when needed. This proposal includes basic safety requirements for maintaining desired protection.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Analysis: The referenced standard, ICC 500-2014, is currently referenced in other 2018 I-codes.

PM8-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated objection to adding the standard to the code and that the requirements should not be retroactive. (Vote: 8-4)

Assembly Action:

None

PM8-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Lucas Pump, representing Self (l.pump@cedar-rapids.org) requests As Submitted.

Commenter's Reason: This proposal adds basic safety requirements that are specific to the maintenance of *required* storm shelters, that is not in previous code editions. This is maintenance code, and this speaks to the specific maintenance of these structures. The reference standard ICC 500 is currently referenced in other 2018 I-Codes.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The maintenance of *required* storm shelters may increase, but the initial cost of construction will not be affected.

PM8-18 Part II

PM9-18

IPMC: 404.4, 404.4.1, 404.5, Table TABLE 404.5

Proposed Change as Submitted

Proponent: Gerard Hathaway, NYS Dept. of State, Div. of Building Standards and Codes, representing New York State Department of State, Division of Building Standards and Codes (gerard.hathaway@dos.state.ny.us)

2018 International Property Maintenance Code

Revise as follows

404.4 ~~Bedroom~~ Habitable room and living room-bedroom requirements. Every habitable room and bedroom ~~and living room~~ shall comply with the requirements of Sections 404.4.1 through 404.4.5.

404.4.1 Room area. Every ~~living room shall contain not less than 120 square feet (11.2 m²) and every bedroom~~ habitable room shall contain not less than 70 square feet (6.5 m²) and every bedroom occupied by more than one person shall contain not less than 50 square feet (4.6 m²) of floor area for each occupant thereof.

404.5 Overcrowding. Dwelling units shall not be occupied by more occupants than permitted by the minimum area requirements of Table 404.5.

**TABLE 404.5
MINIMUM AREA REQUIREMENTS**

SPACE	MINIMUM AREA IN SQUARE FEET		
	1-2 occupants	3-5 occupants	6 or more occupants
Living room ^{a, b}	120 70	120	150
Dining room ^{a, b}	Norequirement	80	100
Bedrooms	Shall comply with Section 404.4.1		

For SI: 1 square foot = 0.0929 m².

- a. See Section 404.5.2 for combined living room/dining room spaces.
- b. See Section 404.5.1 for limitations on determining the minimum occupancy area for sleeping purposes.

Reason: The purpose of this code change is to coordinate the minimum room area requirements found in the International Property Maintenance Code (IPMC) with those found in the International Residential Code (IRC) and the International Building Code (IBC). We have received technical support questions on this subject in New York State, and nationally it has been discussed in industry related online chat rooms.

IPMC 404.4.1 requires that every living room contain not less than 120 square feet (11.2 m²) and every bedroom contain not less than 70 square feet (6.5 m²). The IBC has similar language which is somewhat compatible with the IPMC, requiring that every dwelling unit shall have not less than one room (not specifically a living room) that shall have not less than 120 square feet (11.2 m²) of net floor area, and that other habitable rooms (not only but including bedrooms) shall have a net floor area of not less than 70 square feet (6.5 m²). However, IRC R304.1 simply requires that habitable rooms (including living rooms, bedrooms, etc.) shall have a floor area of not less than 70 square feet (6.5 m²).

Possible scenarios: A dwelling unit could be constructed under the IRC or IBC with a 70 square foot living room as allowed by both the IRC and IBC, receive a Certificate of Occupancy, and they would not be in compliance with the 2018 IPMC, which requires a minimum 120 square foot living room.

The proposed changes to IPMC 404.4 and 404.4.1 are meant to use language (the term "habitable rooms") which is compatible with both the IRC and IBC for consistency. Also, to allow small dwellings to have the minimum 70 square foot living rooms as intended by both the IRC and IBC.

This code change proposal also includes a change in IPMC 404.5 Overcrowding, specifically Table 404.5 Minimum Area Requirements. The "Living Room"/"1-2 occupants" cell of the table has been changed to delete the minimum 120 square foot requirement, and allow a minimum 70 square foot Living Room for 1-2 occupants in small dwellings constructed under either the IRC or IBC.

This change continues the effort to allow smaller dwellings built under the IRC and IBC to be compatible with the IPMC once they are completed. Code change proposal RB106-13 (R304.1, R304.2), approved for the 2015 IRC, removed the requirement that every dwelling unit have at least one room not less than 120 square feet. One of the prime reasons given for that code change proposal was to allow small dwellings to be built under the IRC.

Cost Impact: The code change proposal will decrease the cost of construction. Allowing small homes to be built, without forcing them to provide a 120 square foot living room, will decrease cost.

PM9-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that a 70 square foot living room for up to 2 occupants was too small when compared to the efficiency unit requirements that require a minimum of 120 square feet for a maximum of one occupant. (Vote: 6-3)

Assembly Action:

None

PM9-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gerard Hathaway, representing Self (gerard.hathaway@dos.ny.gov) requests As Submitted.

Commenter's Reason:

Reason Statement in Response to Committee Disapproval, the original proposal as submitted and this builds on the original reason statement.

One committee member did not think the IPMC has the right or ability to consider a project, approved with a certificate of occupancy, designed in accordance with the IRC or IBC, to be non-compliant as soon as it is completed. IPMC Section 404.5 Overcrowding and Table 404.5 Minimum Area Requirements are retroactive for property maintenance purposes and apply to dwelling units built under the IRC and IBC for municipalities who have adopted the IRC, IBC and IPMC. Municipalities often have local requirements to re-inspect properties when they change hands to confirm that the conditions of the C of O are still in place or as a regular inspection schedule.

The Committee felt that a 70 square foot living room for up to 2 occupants was too small when compared to the efficiency unit requirements that require a minimum of 120 square feet for a maximum of one occupant.

Under IBC Section 1207.4 "Efficiency dwelling units" it is stated that; "An efficiency living unit shall conform to the code except as modified herein." The section allows smaller units if specific provisions are followed. The IPMC has a corresponding Section 404.6 with occupancy limitations that apply only to Efficiency Units constructed under the IBC, and does not apply to dwelling units constructed under the IRC.

The IPMC Efficiency Unit minimum floor area of 120SF is because it is allowed to be the only room except for the required separate closet and bathroom for one occupant, and increasing by 100SF per additional occupant.

The IRC allows a minimum floor area of 70SF per habitable room. However, must still be in compliance with the requirements of the IPMC. The dwelling unit constructed under the IRC to minimum area requirements would have floor areas that add-up as follows: Living Room (70SF), plus Bedroom (70SF for one occupant) plus bathroom closets and any other non-habitable spaces, this is already more than the 120SF Efficiency minimum. If there were two occupants that would add another 70SF if in separate bedrooms (one 100SF bedroom required if they shared).

Again, this proposal is meant simply to coordinate provisions of the IRC with the occupancy limitations of the IPMC.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The cost impact has no net effect.

Public Comment 2:

Proponent: Lucas Pump, representing Self (l.pump@cedar-rapids.org) requests As Submitted.

Commenter's Reason: This proposal aligns the IRC & IBC with the IPMC. A dwelling unit could be constructed under the IRC or IBC with a 70 sq. ft. living room, and would be immediately not in compliance with the current IPMC. This proposal makes sense, and it prevents conflicts with the other I-Codes. The action committee's reason statement is making a reference to total sq. footage of efficiency units - which is a completely different code section in 404.6. This proposal is referencing the room area of a specific room, not the total living area.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction.

This will allow for a smaller living room at 70 sq. ft. - versus the current 120 sq. ft. requirement, which will decrease the cost of construction.

PM9-18

PM10-18

IPMC: 602.2

Proposed Change as Submitted

Proponent: Kelly Kirk, City of Norfolk, representing City of Norfolk; Christina Jackson, City of Norfolk, representing City of Norfolk

2018 International Property Maintenance Code

Revise as follows

602.2 Residential occupancies. Dwellings shall be provided with heating facilities capable of maintaining a room temperature of 68°F (20°C) in all habitable rooms, *bathrooms* and *toilet rooms* based on the winter outdoor design temperature for the locality indicated in Appendix D of the International Plumbing Code. Cooking appliances shall not be used, nor shall portable unvented fuel-burning space heaters be used, as a means to provide required heating. Additionally, the installation of one or more portable space heaters shall not be used to achieve compliance with this section.

Exception: In areas where the average monthly temperature is above 30°F (-1°C), a minimum temperature of 65°F (18°C) shall be maintained.

Reason: This proposed change is submitted with the intent to bring the IPMC 602.2 verbiage in line with the current IRC R303.9 verbiage so that these I-Codes cohesively reflect the intent of the ICC as currently written in the IRC R303.9.

Bibliography: 2015 IPMC, Section 602.2 - Heating Facilities, Residential Occupancies; ICC; Fourth Printing, December 2015; Page 2.

2015 IRC, Section R303.9 - Required Heating; ICC; Second Printing, January 2016; Page 56.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
None

PM10-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 602.2 Residential occupancies. Dwellings shall be provided with heating facilities capable of maintaining a room temperature of 68°F (20°C) in all habitable rooms, bathrooms and toilet rooms based on the winter outdoor design temperature for the locality indicated in Appendix D of the International Plumbing Code. Cooking appliances shall not be used, nor shall portable unvented fuel-burning space heaters be used, as a means to provide required heating. ~~Additionally,~~ The installation of one or more portable space heaters shall not be used to achieve compliance with this section.
(no change to the exception)

Committee Reason: The committee agreed that this proposal brings the IPCM 602.2 verbiage in line with the current IRC R303.9 verbiage so that these I-Codes consistently address the installation of portable space heaters. The modification removes an unnecessary word. (Vote: 9-0)

Assembly Action:

None

PM10-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Steven Rosenstock, representing Edison Electric Institute (srosenstock@eei.org) requests Disapprove.

Commenter's Reason: This proposal should be disapproved for the following reasons:

- 1) It is unenforceable. In the property maintenance code, it would require code officials to try to track the sale and use of portable space heaters in residential and commercial buildings on a continuous basis. If found, then a code official would have to confiscate such units, which are available in hardware stores and on-line, and could be replaced in a day.
- 2) It should not apply to existing buildings. The language in the IRC is designed for new construction, to ensure that portable / temporary systems are not used to comply with requirements for heating.
- 3) In existing buildings, it would prevent the use of such systems during periods of building renovations when central heating systems are taken off-line.
- 4) In existing buildings, it would prevent their use in times of emergencies (e.g., a central heating system shut down and could not be repaired or replaced for a significant amount of time, possibly allowing unsafe thermal conditions).
- 5) In existing buildings, portable electric space heaters do not create any emissions or indoor air quality issues.
- 6) Portable electric space heaters are safe to use in existing buildings and are required to meet safety standards, such as UL 1278.
- 7) The International Fire Code (IFC) allows the use of listed portable electric space heaters. Therefore, this provision would conflict with the IFC.

According to the US Energy Information Administration, Nationwide, **37% of U.S. households** supplement their main equipment with a secondary source of heat. **Almost half of these households use portable electric heaters, the most common secondary heating choice in every climate region.** (*emphasis added*) (see <https://www.eia.gov/todayinenergy/detail.php?id=30672> for more information).

For all of these reasons, this proposal does not belong in the Property Maintenance code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this proposal will have no impact on the cost of construction. Portable electric space heaters are not installed during construction.

PM10-18

G1-18

IBC: 202, 202

Proposed Change as Submitted

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (sthomas@coloradocode.net)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows

[BG] ATRIUM. An opening connecting two or more stories other than ~~enclosed stairways~~ interior exit stairways or ramps, exit access stairways or ramps, elevators, hoistways, escalators, plumbing, electrical, air-conditioning or other equipment, which is closed at the top and not defined as a mall. Stories, as used in this definition, do not include balconies within assembly groups or mezzanines that comply with Section 505.

Reason: The terms "interior exit stairways or ramps" and "exit access stairway or ramps" referenced in Chapter 10 were added in the 2012 and 2015 IBC. However, they were not referenced in the Atrium definition. This change is only intended to clean up the language and provide consistency within the code. It may be considered to be editorial.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The change is editorial in nature. Therefore, there is no cost implication.

G1-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While the testimony of the proponents was clear, the proposal results in confusion. It is better to leave the definition we have and not add confusion based on regulations and exemptions in Chapter 10. (Vote 9-5)

Assembly Action:

None

G1-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, (stthomas@coloradocode.net) representing Colorado Chapter ICC ; Sarah Rice, representing The American Institute of Architects (srice@preview-group.com) ; David Collins, representing The American Institute of Architects (dcollins@preview-group.com) ; Wayne Jewell (wayne.jewell@greenoaktwp.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

[BG] ATRIUM. ~~An opening~~A vertical space which is closed at the top connecting two or more stories other than enclosed stairways, elevators, hoistways, escalators, plumbing, electrical, air conditioning or other equipment, which is closed at the top and not defined as a mall. Stories, as used in this definition, do not include balconies within assembly groups or mezzanines that comply with Section 505 in Groups I-2 and I-3 Occupancies or three stories in all other occupancies.

712.1.7 Atriums. Atriums complying with Section 404 that connect two or more stories in Groups I-2 or I-3 Occupancies or three stories in other occupancies shall be permitted.

Exceptions:

1. Atriums shall not be permitted within Group H Occupancies.
2. Balconies or stories within Groups A-1, A-4 and A-5, and mezzanines that comply with Section 505 shall not be considered a story as it applies to this section

~~In other than Group H occupancies, atriums complying with Section 404 shall be permitted~~

Commenter's Reason: The original intent of the proposal was to just add language that agreed with the current code language. However, the discussion at the Committee Hearing moved to the fact that the entire definition needed to be revised. I agreed to work with others who were interested and come up with a revised definition that did not have a laundry list and clarified what an atrium is. We also removed technical requirements from the definition. The definition in this public comment is much more simple than the previous one and defines what an atrium is. In addition, a change was made to the language in Section 712.1.7 to bring some of the language from the previous definition into the actual code requirement and revise the language to be easier to understand. There is no intent to change any technical requirements in this public comment.

There is a lot of confusion around a two story atrium since the definition starts out saying "An opening connecting two or more stories". Many people confuse this requirement with openings between two stories in Section 712.1.9. The two-story language has been removed from the definition. We then clarified the intent in Section 712.1.7 by saying that two-story atriums in Groups I-2 and I-3 Occupancies and three-story atriums in all other occupancies must comply with Section 404. So, if you have an opening just between two stories in other than Groups 1-2 or I-3, Section 712.1.9 would apply. If the opening connects three or more stories, it would then be an atrium and need to comply with Section 404. We also revised the language from "In other than Group H Occupancies". to an exception stating that the atrium provisions do not apply to Group H Occupancies.

The definition also had an exception within it for balconies and similar areas in assembly occupancies. This exception was relocated into an exception in Section 712.1.7 to maintain that allowance of balconies and mezzanines in Assembly uses.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is just a clarification of language.

G1-18

G15-18 Part I

PART I - IBC: 303.4, 309.1

PART II - IBC: TABLE 1004.5, (IFC[BE] TABLE 1004.5)

Proposed Change as Submitted

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE GENERAL CODE DEVELOPMENT COMMITTEE. PART II WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows

303.4 Assembly Group A-3. Group A-3 occupancy includes assembly uses intended for worship, recreation or amusement and other assembly uses not classified elsewhere in Group A including, but not limited to:

- Amusement arcades
- Art galleries more than 3,000 square feet
- Bowling alleys
- Community halls
- Courtrooms
- Dance halls (not including food or drink consumption)
- Exhibition halls
- Funeral parlors
- Greenhouses for the conservation and exhibition of plants that provide public access.
- Gymnasiums (without spectator seating)
- Indoor *swimming pools* (without spectator seating)
- Indoor tennis courts (without spectator seating)
- Lecture halls
- Libraries
- Museums
- Places of religious worship*
- Pool and billiard parlors
- Waiting areas in transportation terminals

309.1 Mercantile Group M. Mercantile Group M occupancy includes, among others, the use of a building or structure or a portion thereof for the display and sale of merchandise, and involves stocks of goods, wares or merchandise incidental to such purposes and accessible to the public. Mercantile occupancies shall include, but not be limited to, the following:

- Art galleries 3,000 square feet or less
- Department stores
- Drug stores
- Markets
- Greenhouses for display and sale of plants that provide public access.
- Motor fuel-dispensing facilities
- Retail or wholesale stores
- Sales rooms

Reason: Provides limited sized art gallery space occupancy classification and the corresponding occupant load factor alignment in the code with the common business practices of selling artistic wares and goods. This change will allow small commercial storefronts for retail sales of unique and limited-edition items to patrons browsing displayed works, interacting with sales people and making purchases, to be classified as Mercantile Occupancies. This change is similar in concept to the current small space allowances for an Assembly Occupancy to have a classification as a Business Occupancy.

This change maintains the required standards for hazards associated with the current occupancy classification of A-3 for Art Gallery spaces greater than 3,000 square feet and large Mercantile occupancies.

Cost Impact: The code change proposal will decrease the cost of construction

This code revision has an anticipated cost benefit to the AHJ and building owners/tenants by a reduction in overall expenditures throughout the entire process of permitting, construction, inspection, and operation of retail type businesses in small spaces where an occupancy classification change is currently required. This revision may also provide a cost benefit to the AHJ by increasing business opportunities for individuals and organizations by reducing or eliminating the cost barriers of substantial alterations in these smaller spaces that are often associated with a change in occupancy classification.

G15-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Section 303.1.1 allows smaller assembly spaces to be classified as Group B. The committee felt that this section addressed the issue adequately. The committee also noted that the size of the space may not be the best threshold, but how the space is being used may warrant a classification other than A-3 for galleries. (Vote 12-1)

Assembly Action:

None

G15-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Micah Chappell, representing Seattle Department of Construction and Inspection (micah.chappell@seattle.gov) requests As Submitted.

Commenter's Reason: G15-18 Part 1 & 2 provide for a use of small assembly spaces for art galleries that are not covered by 303.1.1 and 303.1.2 by allowing a space less than 3000sf and 100 occupants to be classified as an M Occupancy. This change aligns small art gallery space classification with the actual use.

Technical justification for the size and occupant load limitations:

30 gross occupant load factor creates a limited occupant load of 100 occupants on the 3000sf allowable space for the M occupancy Art Gallery.

30 gross occupant load factor is similar to the current assembly art gallery occupant load factor of 30 net but calculating on gross area eliminates the possibility of a spaces labeled as accessory areas or corridors (definition of floor area, net) to be used as a way to increase occupant loads without increasing safety standards.

Allowing small A-3 art galleries to have a classification of M occupancies will provide a code path for small spaces in existing non-sprinklered buildings, that may be on a floor other than the level of exit discharge (IBC Section 902.1.3) to be utilized without having to trigger substantial alterations required by an occupancy classification change.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This code revision has an anticipated cost benefit to the AHJ and building owners/tenants by a reduction in overall expenditures throughout the entire process of permitting, construction, inspection, and operation of retail type businesses in small spaces where an occupancy classification change is currently required. This revision may also provide a cost benefit to the AHJ by increasing business opportunities for individuals and organizations by reducing or eliminating the cost barriers of substantial alterations in these smaller spaces that are often associated with a change in occupancy classification.

G15-18 Part I

G15-18 Part II

IBC: TABLE 1004.5 (IFC[BE] TABLE 1004.5)

Proposed Change as Submitted

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows

**TABLE 1004.5
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR^a
Accessory storage areas, mechanical equipment room	300 gross
Agricultural building	300 gross
Aircraft hangars	500 gross
Airport terminal Baggage claim Baggage handling Concourse Waiting areas	20 gross 300 gross 100 gross 15 gross
Assembly Gaming floors (keno, slots, etc.) Exhibit gallery and museum	11 gross 30 net
Assembly with fixed seats	See Section 1004.6
Assembly without fixed seats Concentrated (chairs only—not fixed) Standing space Unconcentrated (tables and chairs)	7 net 5 net 15 net
Bowling centers, allow 5 persons for each lane including 15 feet of runway, and for additional areas	7 net
Business areas Concentrated business use areas	150 gross See Section 1004.8
Courtrooms—other than fixed seating areas	40 net
Day care	35 net
Dormitories	50 gross
Educational Classroom area Shops and other vocational room areas	20 net 50 net
Exercise rooms	50 gross
Group H-5 fabrication and manufacturing areas	200 gross
Industrial areas	100 gross
Institutional areas Inpatient treatment areas Outpatient areas Sleeping areas	240 gross 100 gross 120 gross
Kitchens, commercial	200 gross
Library Reading rooms Stack area	50 net 100 gross
Locker rooms	50 gross
Mall buildings—covered and open	See Section 402.8.2
Mercantile	60 gross
<u>Art gallery</u>	<u>30 gross</u>
Storage stock, shipping areas	300 gross
Parking garages	200 gross
Residential	200 gross
Skating rinks, swimming pools Rink and pool Decks	50 gross 15 gross
Stages and platforms	15 net
Warehouses	500 gross

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

- a. Floor area in square feet per occupant.

Reason:

Cost Impact: The code change proposal will decrease the cost of construction

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Disapproval of this proposal will match the action of the General Code Development Committee for Part 1. There was no technical justification for the 30 square foot gross. If the art gallery is a mercantile space, the current occupant load factor is 60 sq.ft. - what is different for an art gallery? How is an art gallery different from an exhibition space? What type of space this is intended to address needs to be clarified. (Vote: 13-0)

Assembly Action:

None

G15-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Micah Chappell, representing Seattle Department of Construction and Inspection (micah.chappell@seattle.gov) requests As Submitted.

Commenter's Reason: G15-18 Part 1 & 2 provide for a use of small assembly spaces for art galleries that are not covered by 303.1.1 and 303.1.2 by allowing a space less than 3000sf and 100 occupants to be classified as an M Occupancy. This change aligns small art gallery space classification with the actual use.

Technical justification for the size and occupant load limitations:

30 gross occupant load factor creates a limited occupant load of 100 occupants on the 3000sf allowable space for the M occupancy Art Gallery.

30 gross occupant load factor is similar to the current assembly art gallery occupant load factor of 30 net but calculating on gross area eliminates the possibility of a spaces labeled as accessory areas or corridors (definition of floor area, net) to be used as a way to increase occupant loads without increasing safety standards.

Allowing small A-3 art galleries to have a classification of M occupancies will provide a code path for small spaces in existing non-sprinklered buildings, that may be on a floor other than the level of exit discharge (IBC Section 902.1.3) to be utilized without having to trigger substantial alterations required by an occupancy classification change.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This code revision has an anticipated cost benefit to the AHJ and building owners/tenants by a reduction in overall expenditures throughout the entire process of permitting, construction, inspection, and operation of retail type businesses in small spaces where an occupancy classification change is currently required. This revision may also provide a cost benefit to the AHJ by increasing business opportunities for individuals and organizations by reducing or eliminating the cost barriers of substantial alterations in these smaller spaces that are often associated with a change in occupancy classification.

G15-18 Part II

G21-18

IBC: 310.2

Proposed Change as Submitted

Proponent: Daniel Willham, County of Fairfax, Virginia, representing Virginia Building and Code Officials Association (VBCOA) (daniel.willham@fairfaxcounty.gov)

2018 International Building Code

Revise as follows

310.2 Residential Group R-1. Residential Group R-1 occupancies containing *sleeping units* or more than two dwelling units where the occupants are primarily *transient* in nature, including:

- Boarding houses (transient)* with more than 10 occupants
- Congregate living facilities (transient)* with more than 10 occupants
- Hotels (*transient*)
- Motels (*transient*)

Reason: There appears to be a gap in the code for hotels (*transient*) that provide *dwelling units*. As currently written, neither the R-1 nor the R-2 descriptions provide clear direction on the classification of hotels (*transient*) that provide *dwelling units*. The commentary clarifies that R-1 occupancies can contain either *sleeping units*, *dwelling units*, or both, but the code as written does not explicitly address *transient* residential occupancies that contain (more than two) *dwelling units*. The key characteristic of group R-1 occupancies is the transient nature of the occupants and not the absence of *dwelling units*. This proposal simply adds language for dwelling units that mirrors that used in the description of R-2 non-transient occupancies. With this clarification, the difference between R-1 and R-2 occupancies will be clearly defined to depend only on the transient or non-transient nature of the occupants, respectively. For reference, an excerpt from the IBC commentary (pg3-37) follows this change proposal.

living facilities are also classified as Group R. Specifically, these facilities are classified as Group R-4. Mainstreaming people who are recovering from alcohol or drug addiction and people who are developmentally disabled is reported to have therapeutic and social benefits. A residential environment often fosters this mainstreaming.

A building or part of a building is considered to be a residential occupancy if it is intended to be used for sleeping accommodations (including assisted living facilities) and is not an institutional occupancy. Institutional occupancies are similar to residential occupancies in many ways. However, they differ from each other in that institutional occupants are in a supervised environment, and, in the case of Groups I-2 and I-3 occupancies, are under some form of restraint or physical limitation that makes them incapable of complete self-preservation. The number of these occupants who are under supervision or are incapable of self-preservation is one distinguishing factor for being classified as an institutional or residential occupancy.

The term Group R refers collectively to the four individual residential occupancy classifications: Groups R-1, R-2, R-3 and R-4. These classifications are differentiated in the code based on the following criteria: 1. Whether the occupants are transient or nontransient in nature; 2. The type and number of dwelling units or sleeping units contained in a single building; and 3. The number of occupants in the facility.

310.2 Definitions. The following terms are defined in Chapter 2:

BOARDING HOUSE.

CONGREGATE LIVING FACILITIES.

DORMITORY.

GROUP HOME.

GUEST ROOM.

LODGING HOUSE.

PERSONAL CARE SERVICE.

TRANSIENT.

❖ This section lists terms that are specifically associated with the subject matter of this section. It is important to emphasize that these terms are not exclusively related to this section but may or may not also be applicable where the term is used elsewhere in the code.

Definitions of terms can help in the understanding and application of the code requirements. The purpose for including a list within this chapter is to provide more convenient access to terms which may have a specific or limited application within this chapter. For the complete definition and associated commentary, refer back to Chapter 2. Terms that are italicized provide a visual identification throughout the code that a definition exists for that term. The use and

application of all defined terms are set forth in Section 201.

310.3 Residential Group R-1. Residential Group R-1 occupancies containing *sleeping units* where the occupants are primarily *transient* in nature, including:

Boarding houses (transient) with more than 10 occupants
Congregate living facilities (transient) with more than 10 occupants

Hotels (*transient*)

Motels (*transient*)

❖ The key characteristic of Group R-1 that differentiates it from other Group R occupancies is that the occupants are considered transient in nature (i.e., those whose length of stay is not more than 30 days). There is an expectation that the occupants are not as familiar with the building as those residents in nontransient facilities such as apartment buildings and single-family dwellings. If occupants are unfamiliar with their surroundings, they may not recognize potential hazards or be able to use the means of egress effectively.

The most common building types classified in Group R-1 are hotels, motels and boarding houses. Facilities classified as Group R-1 occupancies may include dwelling units, sleeping units, or a combination of both. Group R-1 occupancies do not typically have cooking facilities in the unit. When a unit is not equipped with cooking facilities, it does not meet the definition of a "dwelling unit" in Section 202. When this occurs, such units are treated as sleeping units for the application of code provisions (see Commentary Figure 310.3). A recent trend in development is the construction of "extended-stay hotels." While these units may have all of the characteristics of a typical dwelling unit (i.e., cooking, living, sleeping, eating, sanitation), the length of stay is still typically not more than 30 days. As such, these buildings would still be classified as Group R-1. If the length of stay is more than 30 days, these buildings would be classified as Group R-2. If a hotel offers rooms for short-term housing (i.e., more than 30 days), the facility must comply with the provisions for both Groups R-1 and R-2 (see Section 302.1).

Other occupancies are often found in buildings classified in Group R-1. These occupancies include nightclubs (Group A-2), restaurants (Group A-2), gift shops (Group M), business offices (Group B), health clubs (Group A-3) and storage facilities (Group S-1). When this occurs, the building is a mixed occupancy and is subject to the provisions of Section 508.

Transient congregate living facilities and boarding houses with 10 or fewer occupants can be constructed to the standards of Group R-3 occupancies rather than the general category of Group R-1. The primary intent of this provision is to permit bed-and-breakfast-type facilities to be established in existing single-family (one-family) structures. In comparison to the provision under Group R-2 which permits congregate living facilities with fewer than 16 nontransient

Bibliography: 2015 IBC Code and Commentary, Volume 1, International Code Council, 2015, pg. 3-37.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a clarification which will not affect construction cost.

Public Hearing Results

Errata: The image in the reason statement was improved.

Committee Action:

As Submitted

Committee Reason: Clarifies that dwelling units used as transient lodging such as short term rentals through systems such as Air B & B should also be classified as Group R-1.. (Vote: 10-4)

Assembly Action:

None

G21-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

310.2 Residential Group R-1. Residential Group ~~Units not used primarily as permanent residences.~~ R-1 occupancies ~~containing typically will include sleeping units but also include dwelling units when those units are not used primarily as permanent residences, or more than two dwelling units where the occupants are primarily transient in nature,~~ including:

- ~~Boarding houses (transient) with more than 10 occupants~~
- ~~Congregate living facilities (transient) with more than 10 occupants~~
- ~~Hotels (transient)~~
- ~~Motels (transient)~~

310.2.1 Vacation Rental (Cabin, Cottage, Bungalow, Chalet) (Transient). Group R-1 vacation rentals shall be permitted to comply with the construction requirements of the International Residential Code where:

1. The building is composed of a single dwelling unit;
2. The building is occupied by a family or no more than 10 unrelated adults;
3. The building has two exits directly to the exterior at the level of exit discharge; and,
4. The building is located to maintain a minimum fire separation distance of thirty feet.

Commenter's Reason: The Ohio Board of Building Standards has been struggling with the question of various types of facilities that are not clearly identified in the IBC. To better classify the R-1 group, the recommended language was inserted into the IBC to address dwelling units that are not "primarily a permanent residence." A new section for vacation rental units which are transient was also added and criteria put in place that allow them to be constructed per the residential code if it is a single dwelling unit, the occupant load is limited, there are two exits on the level of exit discharge, and the minimum fire separation distance of 30 feet is maintained.

This should clarify how many properties that are rented out on a regular basis, having all the standard features of a home would be regulated under the IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Many questions arise regarding how these specific facilities are to be treated. By this change the code will be clearer and more easily applied.

Public Comment 2:

Proponent: Andrew Klein, representing Lyric, Apartment Jet, National Multifamily Housing Council, Vacation Rental Management Association, Vacasa, Stay Alfred, The Guild, & WhyHotel (andrew@asklein.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

310.2 Residential Group R-1. Residential Group R-1 occupancies containing *sleeping units* or ~~more than two~~ dwelling units where the occupants are primarily *transient* in nature, including:

Apartment houses where 50% or more of the units house occupants who are primarily transient in nature
Boarding houses (*transient*) with more than 10 occupants
Congregate living facilities (*transient*) with more than 10 occupants
Hotels (*transient*)
Motels (*transient*)

310.3 Residential Group R-2. Residential Group R-2 occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:

Apartment houses where fewer than 50% of the units house occupants who are primarily transient in nature
Congregate living facilities (nontransient) with more than 16 occupants

Boarding houses (nontransient)
Convents
Dormitories
Fraternities and sororities
Monasteries

Hotels (nontransient)
Live/work units
Motels (nontransient)
Vacation timeshare properties

Commenter's Reason: This original Proposal, as well as this Public Comment, aim to codify the occupancy classification of multifamily apartment and condominium buildings where some units are made available for rent on a short-term basis through companies like Airbnb, VRBO, HomeAway, WhyHotel, Lyric and others. The original proposal was unenforceable and strayed from the intent of the Code.

The distinction between Group R-1 and R-2 occupancies deals with the level of risk associated with an occupant's level of familiarity with a building. Users of Airbnb type companies expect an at-home environment and are therefore accustomed to the features of the building in which they are renting a unit.

Residential condominiums are treated by the Code the same as multifamily apartments (Group R-2). Individual dwelling units in a Group R-2 occupancy could either be rented by tenants or owned by the occupants--the Code does not make a distinction between either type of tenancy. Furthermore, Section 310.4 also specifically lists vacation timeshare properties as a Group R-2 occupancy with no distinction based on actual rental time. The reason for this is that dwelling units in such buildings are intended to be a place of abode. Fair housing regulations do not include a 30-day criteria for transient/nontransient, similar to what has been traditionally used by the building codes (see the commentary to the definition of INTENDED TO BE OCCUPIED AS A RESIDENCE in the IBC); therefore, beach homes, timeshares and extended stay hotels are classified as R-2.

A building which essentially looks and functions as a multifamily Group R-2 occupancy does not warrant a change of occupancy to a Group R-1 if fewer than 50% of the dwelling units are made available on a short-term basis. This Public Comment adds much needed clarity to the Code so that the Code Official can determine at what point a change of occupancy is warranted for apartment buildings and condominiums where units are made available for rent on short-term bases.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The language codified by this Public Comment is consistent with most code interpretations.

G21-18

G28-18

IBC: [F] 403.3.2; IFC: 914.3.1.2

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE PROPOSAL WILL BE HEARD BY THE IFC COMMITTEE. PLEASE CONSULT THE AGENDA FOR THE IFC COMMITTEE.

2018 International Building Code

Revise as follows

[F] 403.3.2 Water supply to required fire pumps. In all buildings that are more than 420 feet (128 m) in building height, and buildings of Type IVA and IVB construction that are more than 120 feet in building height, required fire pumps shall be supplied by connections to not fewer than two water mains located in different streets. Separate supply piping shall be provided between each connection to the water main and the pumps. Each connection and the supply piping between the connection and the pumps shall be sized to supply the flow and pressure required for the pumps to operate.

Exception: Two connections to the same main shall be permitted provided that the main is valved such that an interruption can be isolated so that the water supply will continue without interruption through not fewer than one of the connections.

2018 International Fire Code

914.3.1.2 Water supply to required fire pumps. In all buildings that are more than 420 feet (128 m) in building height, and buildings of Type IVA and IVB construction that are more than 120 feet in building height, required fire pumps shall be supplied by connections to not fewer than two water mains located in different streets. Separate supply piping shall be provided between each connection to the water main and the pumps. Each connection and the supply piping between the connection and the pumps shall be sized to supply the flow and pressure required for the pumps to operate.

Exception: Two connections to the same main shall be permitted provided that the main is valved such that an interruption can be isolated so that the water supply will continue without interruption through not fewer than one of the connections.

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The Ad Hoc Committee has discussed a number of proposals to potentially increase the permitted height and area for Type IV structures, specifically mass timber buildings adding additional Types IVA, IVB & IVC. One of the basic requirements incorporated into these proposed increased heights and areas is the added active and passive protection features to these structures.

The Code Technology Committee, in response to the events of September 11, 2001, submitted proposals for water supply to super high-rise buildings of 420' and higher. This requirement was adopted due to the recognized importance of insuring a continuous water supply to the active fire protection systems in the event of a fire in these structures. This recommendation was highlighted in the National Institute of Standards and Technology's (NIST) report on the structural collapses on September 11th.

This code change proposal brings this same concept to Type IV structures of 120' and higher. This added protection feature would be unique to Type IVA and IVB construction (as proposed in a related code change - see table below) due to the potential contribution of the mass timber to the fuel load in the event of a fire. Due to the limitations of fire service aerial apparatus' ability to apply water to elevated floors the Ad Hoc Committee felt 120' was an appropriate height to initiate the requirement. Another consideration is that currently the code permits structures up to 85' so the committee identified the next level within the codes for additional requirements. Considerations were also given to the difficulty of fire service companies accessing elevated floors under fire conditions.

The Ad Hoc Committee has proposed greater permitted heights and areas of mass timber construction than those contained in the 2018 IBC. The Ad Hoc believes this code change proposal is an important component to these proposed increased heights and areas. If the permitted heights and areas of mass timber construction are raised it is imperative

we adopt related code change proposals to insure the reliable performance of active and passive protection features to insure the safety of occupants and responding fire fighters.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

G28-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval is based upon the proponent's published reason. (Vote: 14-0)

Assembly Action:

None

G28-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

G28-18

G32-18

IBC: 404.5

Proposed Change as Submitted

Proponent: Sarah Rice, representing Myself (srice@preview-group.com)

2018 International Building Code

Revise as follows

404.5 Smoke control. A smoke control system shall be installed in accordance with Section 909.

Exception-Exceptions:

1. In other than Group I-2, and Group I-1, Condition 2, smoke control is not required for *atriums* that connect only two stories.
2. A smoke control system is not required for atriums connecting more than two stories when all of the following are met:
 - 2.1. Only the 2 lowest stories shall be permitted to be open to the atrium.
 - 2.2. All stories above the lowest 2 stories shall be separated from the atrium in accordance with Section 404.6.

Reason: As stated in Section 909, the purpose of a smoke control systems is to provide a tenable environment for the evacuation or relocation of occupants. A smoke control system is NOT intended for the preservation of contents, the timely restoration of operations or for assistance in fire suppression or overhaul activities. Smoke control systems that are required and regulated by the IBC serve a different purpose than the smoke- and heat-venting provisions found in Section 910 and they are not considered exhaust systems under Chapter 5 of the International Mechanical Code. In an atrium that connects more than 2 stories, the smoke control systems is intended to maintained the height of the lowest horizontal surface of the smoke layer interface to at least 6 feet above any walking surface that forms a portion of a required egress system within the smoke zone for a period of not less than either 20 minutes or 1.5 times the calculated egress time, whichever is less.

But what if the only walking surfaces in the atrium are on the 2 lowest stories of the atrium? What if all the walls above the 2 lowest stories are solid without operable openings? What purpose does the smoke control system then serve? We contend none. And if the smoke control system has no real value, then why install it? See Figures 1 - 3 for examples of these spaces.

This proposed change seeks to exempt atriums that connect more than 2 stories from having to have a smoke control system when 1) there are no walking surfaces in the atrium above the 2 lowest stories and 2) there are no operable windows or doors above the 2 lowest stories in the atrium and 3) the walls of the atrium on the upper levels are constructed per Section 404.6 - atrium enclosures..

Cost Impact: The code change proposal will decrease the cost of construction
The cost savings of not providing smoke control system in a building with an atrium will decrease the cost of construction.

G32-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: Modify proposal as follows:
404.5 Smoke control.

A smoke control system shall be installed in accordance with Section 909.

Exceptions:

1. In other than Group I-2, and Group I-1, Condition 2, smoke control is not required for atriums that connect only two stories.
2. A smoke control system is not required for atriums connecting more than two stories when all of the following are met:
 - 2.1. Only the 2 lowest stories shall be permitted to be open to the atrium.
 - 2.2. All stories above the lowest 2 stories shall be separated from the atrium in accordance with ~~Section 404.6~~ the provision for a shaft in Section 713.4.

Committee Reason: Clarifies that the code allows a combination of an atrium with a shaft enclosure. The exception provides an alternative where a natural smoke sink is provided. The modification clarifies that the extension of the atrium needs to meet shaft construction requirements. The proposal doesn't redefine atrium, but replaces smoke control with a natural sink. The proponent may wish to consider via a public comment addressing a hatch or similar means to vent smoke at the top of the shaft. (Vote: 12-2)

Assembly Action:

None

G32-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dustin Wakefield, representing Bureau of Capital Outlay Management (dustin.wakefield@dgs.virginia.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

404.5 Smoke control. A smoke control system shall be installed in accordance with Section 909.

Exceptions:

1. In other than Group I-2, and Group I-1, Condition 2, smoke control is not required for *atriums* that connect only two stories.
2. A smoke control system is not required for atriums connecting more than two stories when all of the following are met:
 - 2.1. Only the 2 lowest stories shall be permitted to be open to the atrium.
 - 2.2. All stories above the lowest 2 stories shall be separated from the atrium in accordance with ~~the provision~~ the provisions for a shaft in Section ~~713.4~~ 713. The rating of such shaft construction shall be equal to the rating of the floor assembly as required in Table 601 or the provisions of 713.4, whichever is greater. Openings and penetrations in the shaft construction shall be limited to those necessary for the purpose of the shaft.

Commenter's Reason: This modification is necessary to clarify that the intent of this provision is to effectively "turn up" the rated floor assemblies beginning at the floor above the bottom two interconnected levels, thereby creating a "high bay" space with no interconnection of stories above this point. As such, the revised text indicates that the minimum hourly rating of the shaft enclosure is either the rating of the floor, or the provisions of 713.4 for fire-resistance rating of shafts (depending on the number of stories connected).

With the originally proposed modification, there could be cases where 2-hour floors are required, such as in Type I construction, and only two or three additional floors are interconnected above the bottom two levels. This would result in a 1-hour separation for the shaft, which is insufficient based on the intent described above.

Furthermore, this modification brings into play the other shaft provisions of 713, including prohibited openings and penetrations. It is important that these are limited to those items that are necessary for the purpose of the shaft. In this case, this would account for egress doors into the atrium from the upper floor levels as well as penetrations for conduits, sprinklers, etc. that serve the atrium.

Bibliography: There are no applicable external references for this proposed modification.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Any cost increase associated with this proposed modification is anticipated to be minimal. The increase would be due to the increase from 1-hour shaft construction to 2-hour shaft construction in certain scenarios in Type 1 construction or where floors are required to be rated for 2 hours for other reasons, such as occupancy separation. There could also be ancillary cost increases due to re-routing of various MEP infrastructure that are not permitted to penetrate into the shaft enclosure.

The alternative is always to provide a smoke control system, which would typically overshadow any of the miscellaneous increases in shaft wall construction cost or utility coordination.

G32-18

G34-18

IBC: 202, (New), 404.6, 716.4 (New), 716.4.1 (New), 716.4.2 (New), 716.4.3 (New), Chapter 35

Proposed Change as Submitted

Proponent: Tessa Quinones, The Hickman Group, representing Smoke Guard (admin@thehickmangroup.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

SECTION 202 DEFINITIONS

FIRE PROTECTIVE CURTAIN ASSEMBLY. An assembly consisting of a fabric curtain, bottom bar, guides, coil, operating, and closing system.

404.6 Enclosure of atriums. Atrium spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both.

Exceptions:

1. A *fire barrier* is not required where a glass wall forming a smoke partition or a 20-minute fire protective curtain assembly is provided. The glass wall or fire protective curtain assembly shall comply with all of the following:
 - 1.1. Automatic sprinklers are provided along both sides of the separation wall, fire protective curtain assembly and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass or fire protective curtain assembly not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass or fire protective curtain assembly is wet upon activation of the sprinkler system without obstruction;
 - 1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and
 - 1.3. The fire protective curtain assembly shall be installed in accordance with Section 716.4 and shall be actuated in conjunction with the atrium smoke control system, and
 - ~~1.3-1.4.~~ Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $\frac{3}{4}$ -hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of up to three floors of the *atrium* provided that such spaces are accounted for in the design of the smoke control system.
4. A *fire barrier* is not required between the atrium and the adjoining spaces where the atrium is not required to be provided with a smoke control system.

Add new text as follows

716.4 Fire protective curtain assembly. Approved fire protective curtain assemblies shall be constructed of any materials or assembly of component materials tested without hose stream in accordance with UL 10D, and shall comply with the Sections 716.4.1 through 716.4.3

716.4.1 Label. Fire protective curtain assemblies used as opening protectives in fire rated walls and smoke partitions shall be labeled in accordance with Section 716.2.9.

716.4.2 Smoke and draft control. Fire protective curtain assemblies used to protect openings where smoke and draft control assemblies are required shall comply with Section 716.2.1.4.

716.4.3 Installation. Fire protective curtain assemblies shall be installed in accordance with NFPA 80.

Add new standard(s) follows

10D-14:

Standard for Fire Tests of Fire Protective Curtain Assemblies

Reason: During the last cycle, FS 102-15 was disapproved at least in part on the proposed use of fabric fire protective curtain assemblies as an opening protective having a one-hour fire protection rating and to replace one hour fire barriers. This proposal allows the use of a 20-minute fire protective curtain assembly as an alternative to a non-rated glass wall when protected with sprinklers for the enclosure of an atrium. In addition, the proposal allows fire protective curtain assemblies as an opening protective as permitted by other sections of the IBC.

Both of these applications are consistent with the scope of UL 10D which reads:

These requirements cover the evaluation of fire protective curtain assemblies intended to provide supplemental passive fire protection as part of an engineered fire protection system. Fire protective curtain assemblies provide nonstructural separation only, and are not intended to be substituted for structural hourly rated partitions or opening protectives that have been tested for fire endurance and hose stream performance.

The proposed definition and uses are consistent with NFPA 80-2016 and UL 10D. Some products can also pass UL 1784 for an "S" label.

The proposed requirement that the assembly be "approved" in addition to "listed" allows the Code Official to specifically approve the proposed application.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The use of the fire protective curtain assembly is an option and as such, atria enclosures can continue to be constructed as currently permitted.

Analysis: A review of the standard proposed for inclusion in the code, UL 10D-14, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

G34-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 404.6 Enclosure of atriums.

Atrium spaces shall be separated from adjacent spaces by a 1-hour fire barrier constructed in accordance with Section 707 or a horizontal assembly constructed in accordance with Section 711, or both.

Exceptions:

1. A fire barrier is not required where a glass wall forming a smoke partition ~~or a 20-minute fire protective curtain assembly~~ is provided. The glass wall ~~or fire protective curtain assembly~~ shall comply with all of the following:
 - 1.1. Automatic sprinklers are provided along both sides of the separation wall, ~~fire protective curtain assembly~~ and doors, or on the room side only if there is not a walkway on the atrium side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass ~~or fire protective curtain assembly~~ not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass ~~or fire protective curtain assembly~~ is wet upon activation of the sprinkler system without obstruction;
 - 1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates; and
 - ~~1.3. The fire protective curtain assembly shall be installed in accordance with Section 716.4 and shall be actuated in conjunction with the atrium smoke control system, and~~
 - ~~1.4. 1.3~~ Where glass doors are provided in the glass wall, they shall be either self-closing or automatic-closing.
2. A fire barrier is not required where a glass-block wall assembly complying with Section 2110 and having a ³/₄-hour fire protection rating is provided.
3. A fire barrier is not required between the atrium and the adjoining spaces of up to three floors of the atrium provided that such spaces are accounted for in the design of the smoke control system.
4. A fire barrier is not required between the atrium and the adjoining spaces where the atrium is not required to be provided with a smoke control system.

Chapter 35- UL

10D-14 17:

Standard for Fire Tests of Fire Protective Curtain Assemblies

Committee Reason: The proposal is a simplified version (after the modification) of the original. The products have been used for years through the alternative methods process, they should be recognized in the code. (Vote: 8-6)

Assembly Action:

None

G34-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Dodge, representing McKeon Door Company (ddodge@mckeondoor.com) requests Disapprove.

Commenter's Reason: In the committee action hearings this code change was approved as modified. However, the modification did not adequately address all concerns from both the committee and the assembly. The final committee vote was a marginal AM, 8-6. While it may be considered helpful to have something in the code regarding fire and smoke rated fabric assemblies, this code change is not yet ready for final approval and publication due to the following reasons: One of the most common architectural design uses of this new technology, fire and smoke rated fabrics, is to separate vertical spaces horizontally into two-story spaces taking advantage of the exception in 404.5 eliminating the need for smoke evacuation systems in the atrium when the vertical space is limited to two floors only. UL10D, Fire Tests of Fire-Protective Curtain Assemblies was submitted as part of this code change. A representative from UL testified that UL10D is nothing more than UL10C without the hose-stream requirement, see G34-18 CAH video segment: <http://hearingvideos.iccsafe.org/videos/g34-18/>

1. Our current code addresses horizontal applications either as fixed structural floor assemblies or opening protectives within fixed structural floor assemblies as floor fire door assemblies that comply with NFPA 288. The scope of UL10D limits Fire-Protective Curtains to rated applications no greater than 20 minutes. The code change, as currently written could be misinterpreted to allow UL10D as justification for acceptance of NFPA 288 criteria.

2. The new 716.4 language and the new 202 definition language contradict each other.

3. The new language as submitted, 716.4.2, suggests these opening protectives can be used in any fire rated wall.

By disapproving this code change, the proponents can come back in the next cycle with a clean-up of these issues and eliminate the possibility of mis-applications of this new technology in the future.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

G34-18

G35-18

IBC: 404.10.1

Proposed Change as Submitted

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new text as follows

404.10.1 Exit stairs in an atrium. Where an atrium contains an interior exit stairway all the following shall be met:

1. The exit stair shall have access from a minimum of two directions.
2. The distance between an exit stair in an atrium, and a minimum of one exit stair enclosed in accordance with Section 1023.2 shall comply with Section 1007.1.1.
3. Exit access travel distance within the atrium shall be measured to the nosing of the landing at the top of the stair on each level served.
4. At least one exit shall not be located in the same atrium.

Reason: An exit stair is currently permitted to be in an atrium enclosure by IBC Sections 2023.1 and 1023.2, which allows enclosure per Section 404.6. These new provisions for the conditions for use of an atrium for an exit stair adds four specific criteria for their use as an exit.

Provision 1 - Accessed from two directions

This means that the exit stair in the atrium must have two paths of travel to allow the occupants to pass by the stair.

Provision 2 - Separation distance

To make it clear that the exit stair in the atrium must be separated from at least one other exit stair meeting IBC Section 1023.2 by the minimum separation distance prescribed in Section 1007.1.1.

Provision 3 - Travel distance

The travel distance within the atrium to the exit stair in the atrium is to be measured to the nosing at the level the stair is serving.

Provision 4 - At least one exit is not in the atrium.

Requires that at least one exit is not permitted to be in the same atrium. The current provisions of Section 404.10 prohibit more than 50% of exit stairs from egressing through the atrium at the level of exit discharge.

Cost Impact: The code change proposal will decrease the cost of construction. This change will facilitate design decisions, reduce the number of required exit enclosures in buildings with an atrium and help with review and approval, reducing the cost of construction.

G35-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal was approved because current Section 1023.2 already allows for a stairway within an atrium to be considered an exit stairway. This language in Items 2 and 3 would clarify that the exit access travel distance and exit separation requirements is measured to the top of the stairway. While the language in Item 1 for two directions could be subject to interpretation, Items 1 and 4 do further limit where a stairway in an atrium can serve as an exit, so this would improve safety. (Vote: 8-7)

Assembly Action:

None

G35-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

404.9 Exit access travel distance. Exit access travel distance for areas open to an atrium shall comply with the requirements of this section.

404.10.1 Exit stairs-stairways in an atrium. Where an atrium contains an interior exit stairway all the following shall be met:

1. The ~~exit stair~~ entry to the exit stairway is the edge of the closest riser of the exit stairway.
2. The entry of the exit stairway shall have access from a minimum of two directions.
3. The distance between the entry to an exit stair-stairway in an atrium, and the entrance to a minimum of one exit stair-stairway enclosed in accordance with Section 1023.2 shall comply with the separation in Section 1007.1.1.
4. Exit access travel distance within the atrium shall be measured to the nosing ~~closest riser of the landing at the top of the stair on each level served~~ exit stairway.
5. ~~At least one exit shall not~~ Not more than 50 percent of the exit stairways shall be located in the same atrium.

404.10.11 Interior exit stairways discharge. Not greater than 50 percent of interior exit stairways are permitted to egress through an atrium on the level of exit discharge in accordance with Section 1028.

Commenter's Reason: Open stairways in an atrium are permitted to be exit stairways per Section 1023.2 Exception 2. This proposal added additional criteria for that exit stairway. This modification does not change that allowance. This section is not placed correctly. Current Section 404.10 is for exit discharge - thus the suggested title change for clarification. This new section deals with an exit stairway. Therefore, this should not be a subset of exit discharge through the lobby. This new section should be between exit access and exit discharge sections. The renumbering fixes this.

The correct term is exit stairway, not exit stair - this is revised in the title and the Items.

It is important to clarify that dispersion, separation and travel distance is to the entry/closest riser of the open stairway in the atrium and the entrance to the exit stairway, not the stairway itself or the enclosure. This is the reason for the added Item 1 and revisions to Items 2, 3 and 4.

In Item 4, the language for measurement of the travel distance in Item 4 should match use the same terminology for other open exit stairways in the exception in Section 1017.3. The phrase "on each level served" is redundant.

In Item 5, the proposed language is consistent with exit discharge allowances in Section 1028 - the current language would allow more than 50%.

This public comment is submitted by the ICC BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions there of. In 2017 and 2018 the BCAC has held 5 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes and public comments. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The modification is a clarification of the approved text and will have no changes in construction requirements. The original proposal provided guidance on how an exit stairway within an atrium should comply with exit access travel distance and separation. The new item 5 is consistent with the exit discharge allowances. Since there was already an allowance for no enclosure in Section 1023.2 Exception 2, the original proposal is not a decrease in cost of construction.

2018 International Building Code

Revise as follows

**TABLE 406.5.4
OPEN PARKING GARAGES AREA AND HEIGHT**

TYPE OF CONSTRUCTION	AREA PER TIER (square feet)	HEIGHT (in tiers)		
		Ramp access	Mechanical access	
			Automatic sprinkler system	
			No	Yes
IA	Unlimited	Unlimited	Unlimited	Unlimited
IB	Unlimited	12 tiers	12 tiers	18 tiers
IIA	50,000 75,000	10 tiers	10 tiers	15 tiers
IIB	50,000	8 tiers	8 tiers	12 tiers
IV	50,000	4 tiers	4 tiers	4 tiers

For SI: 1 square foot = 0.0929 m².

Reason: When the International Building Code (IBC) the drafting committees were developing the IBC, they commonly used the least stringent fire safety provisions from one of the legacy codes (i.e. BOCA National Building Code, Standard Building Code, Uniform Building Code) in establishing the requirements. However, for open parking garages the least stringent values in the Standard Building Code (SBC) were not used. The SBC permitted open parking structures of non-combustible construction with less fire resistance (i.e. SBC Type IV construction, IBC Type II construction) to be built up to 400,000 sqft in area per tier. This area value, which was placed in the SBC in the early 1980's, was based on the use of noncombustible materials for construction of the open parking structure, the open sided features for the parking structure which reduced the risk of adverse impact from vehicle fires and the documented low fire risk vehicles pose to the stability of open parking structures[1],[2].

Additional studies of fire experience in open parking structures in the United States since those earlier ones still supports the conclusion that vehicle fires pose a low risk of fire damage to the parking structure. The more recent analysis of parking garage structure fires (i.e. NFPA[3], Parking Market Research Company [4]) by the Fire Safety Committee of the Parking Consultants Council concluded that in about 98.7% of the fires no structural damage occurred due to the parking structure fires studied[5]. This suggests that the present values in Table 406.5.4 for Open Parking Garages of IBC Type II construction are more stringent than necessary based on the low risk of fire damage to the structural elements from vehicle fires and should be permitted to increase.

During the 2015 Group A cycle for code changes to the 2012 IBC, a similar code change was submitted by PCI for consideration (G101-15). The IBC General Code Committee recommended disapproval of the proposal at the code development hearing, suggesting there was merit to allow bigger open parking garages when constructed using buildings of fire resistive construction, however the table values proposed in G101-15 were considered too large. Based on that feedback PCI has modified the original proposal to reduce the area per tier permitted for Type IIA construction as reflected in this code change.

The area per tier proposed is based on a common open parking garage design utilizing a footprint of 240-feet X 315-feet (4 bays @ 60-ft/bay X 35 parking spaces @ 9-ft each), which totals 75,600 sf. The table value was rounded to 75,000 sf. This area per tier, based on 10 tiers, results in an aggregate parking area consistent with the aggregate allowable floor area for an enclosed sprinklered S-2 parking garage, per Tables 504.4 and 506.2.

Based on the low risk of vehicle fires and resulting damage, and the open sided features of these garages, this proposal will permit open parking garages of Type IIA construction to be built to areas like those permitted for sprinklered enclosed parking garages.

Cost Impact: The code change proposal will decrease the cost of construction. Permitting larger open parking garages of Type IIA construction will result in a reduction in cost without any compromise in fire safety through savings in material and construction methods required for open parking structures that would otherwise have to meet Type IB construction.

G37-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee was not convinced there was evidence which warranted this increase in size. Testimony of recent fire loss in an open parking garage prompts concern. Another change has been proposed to the fire code to sprinkler these open parking garages. It was suggested if the sprinkler requirement passes, then a public comment for approval of this item for the Richmond hearing may be appropriate. More information is needed to approve this increase at this time. (Vote: 10-4)

Assembly Action:

None

G37-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Precast/Prestressed Concrete Institute (svskalko@svskalko-pe.com); Jason Krohn, Precast/Prestressed Concrete Institute, representing Precast/Prestressed Concrete Institute (jkrohn@pci.org); William Hall, Alliance for Concrete Codes and Standards, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests As Submitted.

Commenter's Reason: G37-18 should be Approved As Submitted since the technical information in the original reason statement supporting this proposal was not refuted during testimony at the Code Action Hearing (CAH). This proposal will allow an open parking garage of Type IIA construction, which has structural fire resistance of one-hour, to be built larger than an open parking garage constructed of Type IIB, which has no structural fire resistance. It appears the General Committee was reluctant to approve the proposal based on the evidence submitted after opposing testimony regarding a recent loss in an open parking garage raised concerns.

The recent fire loss in an open parking garage that the General Committee refers to in their reason for disapproval involves a fire incident that occurred in the UK at the first of 2018. All the details of this incident were not known at the time of the CAH. However, upon review of the final report by the Merseyside Fire and Rescue Service (MFRS), the parking garage in question, referred to as a car park in the UK, had design features less robust to the effects of fire and fire spread than the designs commonly followed in the United States [Merseyside Fire Rescue Service, *Kings Dock Car Park Fire Protection Report*, April 2018, Merseyside, UK].

The following are two of the most notable differences of these design features contributing to the spread of fire in the UK car park incident:

- ○ The car park had a light gauge aluminum floor drainage tray attached to the underside of, and in line with, the joints of the precast floor system. The trays lead to plastic vertical piping to transfer liquids to the building storm water drainage system. The design called for a 1/2-inch gap between floor panels to allow drainage into the aluminum tray below. This gap in the floor joints allowed burning fuel spills from vehicle gas tanks to flow directly to floors below allowing the fire to spread to vehicles on other floors.

In the United States the floor joints are not left open. They are typically sealed by a combination backer rod and sealant or covered by the placement of a concrete topping with tooled and sealed joints. This not only minimizes spread of fire to floors below by leaking fuels, but also inhibits the spread of flames from the incident floor to vehicles on floors above.

- ○ The building code requirements in the UK permitted only a 15-minutes structural fire resistance of the precast concrete floors for the Kings Dock car park. The fire exposure from the initial vehicle (and subsequent vehicles) damaged the underside of the floor panels above sufficient enough to permit the fire to extend upward to vehicles on the next parking level.

In the US the typical precast floor systems in open parking garages meets at least a minimum of a 1-hour fire resistance, which increases significantly the ability to prevent fire spread between floors.

A study of car park fires in the UK showed a total 3,096 fire incidences over a twelve-year period [BD2552 *Fire Spread in Car Parks*, Building Research Establishment for Department for Communities and Local Government, December 2010]. The average number of car park fires per year for that period was 258/year. This represents a very low number of incidences per year and thus low risk for fires in car parks. The experience with fire incidences in the US is also very low risk for this building occupancy type.

- ○ The US Fire Administration statistics show an average of over 1.7 million fires [FA-311, *Fire in the United States 1994-2004*, 14th edition, August 2007] for the period from 1999 to 2002. When compared to the average total parking garage fires described in the NFPA study cited in the original reason statement (1760 incidents), parking garage fires represent less than 0.1% of the fire incidences.
- ○ The Parking Market Research Company (PMRC) study referenced in the reason statement reached a similar conclusion on such low risk. That study looked at over 4,400 fire incidences for general vehicle parking including garages and surface lots with only 25% of these incidences in parking garages. During that same 3-year period approximately 7 million total fire incidences were reported. The parking garage fires for that 3-year period represent about 0.016% of the total fires.
- ○ The PMRC study also found that structural damage had not occurred in about 98.7% of open parking garage fires studied, which can be attributed to the excellent performance of open parking garages exposed to fire in the US.

Thus, except for that one unusual open parking garage fire incident in the UK, which had other mitigating circumstances contributing to fire spread, the data shows open parking garages to have a very low risk from vehicle fires. In addition, the design practices and features of open parking structures in the US, which minimize fire spread between floors and reasonably withstand the structural impact from fire effects, support allowing Type IIA garages to be built larger than those of Type IIB.

Recommend APPROVAL AS SUBMITTED for G37-18

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Permitting larger open parking garages of Type IIA construction will result in a reduction in cost without any compromise in fire safety through savings in material and construction methods required for open parking structures that would otherwise have to meet Type IIB construction.

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows

202 MECHANICAL-ACCESS ENCLOSED PARKING GARAGE An enclosed parking garage other than single car stacking systems which employs parking machines, lifts, elevators or other mechanical devices for vehicle moving from and to street level and in which public occupancy in the garage is prohibited in all areas except the vehicle access bay.

Add new text as follows

406.6.4 Mechanical-access garages. Mechanical-access enclosed parking garages shall be in accordance with Sections 406.6.4.1 through 406.6.4.5.

406.6.4.1 Separation. Mechanical-access enclosed parking garages shall be separated from other occupancies and accessory uses by not less than 2-hour fire barriers constructed in accordance with Section 707 or by not less than 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

406.6.4.2 Smoke removal. A mechanical smoke removal system, in accordance with Section 910.4, shall be provided for all areas containing an enclosed mechanical-access parking garage.

406.6.4.3 Fire control equipment. The fire control equipment, consisting of the fire alarm control unit, mechanical ventilation controls and emergency shut down shall be provided in a room with exterior access. The room size and location shall be approved by the fire code official.

406.6.4.4 Firefighter access. Access doors shall be provided at the ground level for firefighter access as approved by the fire code official.

406.6.4.5 Emergency shutdown switch. A manually activated emergency shutdown switch shall be provided for use by emergency personnel.

Revise as follows

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

N = No separation requirement.

NP = Not Permitted.

- a. See Section 420.
- b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but not to less than 1 hour.
- c. See Section ~~406.3.2~~ 406.3.2 and 406.6.4.
- d. Separation is not required between occupancies of the same classification.
- e. See Section 422.2 for ambulatory care facilities.
- f. Occupancy separations that serve to define fire area limits established in Chapter 9 for requiring fire protection systems shall also comply with Section 707.3.10 and Table 707.3.10 in accordance with Section 901.7.

2018 International Fire Code

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows

202 MECHANICAL-ACCESS ENCLOSED PARKING GARAGE An enclosed parking garage, other than single car stacking system, which employs parking machines, lifts, elevators or other mechanical devices for vehicle moving from and to street level and in which public occupancy in the garage is prohibited in all areas except the vehicle access bay.

Add new text as follows

903.2.10.2 Mechanical-access enclosed parking garages. An approved automatic sprinkler system shall be provided throughout buildings used for the storage of motor vehicles in a mechanical-access enclosed parking garage. The portion of the building that contains the mechanical-access enclosed parking garage shall be protected with a performance-based design specially engineered sprinkler system.

Revise as follows

**TABLE 903.2.11.6
ADDITIONAL REQUIRED FIRE SUPPRESSION SYSTEMS**

SECTION	SUBJECT

6504.1.1	Pyroxylin plastic storage cabinets
6504.1.3	Pyroxylin plastic storage vaults
6504.2	Pyroxylin plastic storage and manufacturing

For SI: 1 cubic foot = 0.023 m³.

Reason: Enclosed mechanical-access parking garages are being constructed in the United States on an increasing basis, yet there is no prescriptive code requirements for these occupancies. These occupancies are unique from the traditional open mechanical-access parking garage in that there are no openings, the entire structure is enclosed. These occupancies are more similar to automated high rack storage systems, they have no floors, no stairwells and no above ground level access, except maintenance walkways and ladders. With these being a silent occupancy type, the Code does not provide the code official with prescriptive requirements. There are fires involving parked vehicles with the vehicle parked and the ignition system off. If a fire were to occur in an enclosed mechanical-access parking garage, unless the local code authority required additional fire protection during construction, they do not have a point-setter to code requirements. Where these systems have been installed, there is not a consistent fire protection methodology to protecting these structures from a fire.

An enclosed mechanical-access parking garage offers many firefighting challenges; most are constructed in a building shell, without a floor system. The vehicles are parked in a cage/rack system, with no safe elevated access to the interior of the structure. With firefighter safety in mind and to have the ability to use fixed fire suppression to extinguish and/or control these fires, the code proposal is presented.

IFC Section 202 adds a definition for these occupancies. Open mechanical-access parking garages are defined in the Code, but do not pose the firefighting challenge as an enclosed mechanical access parking garage. An open parking garage has floors, stairwells, standpipe connections and natural ventilation. An enclosed garage is in a box, no stairwells or floors or standpipes for elevated firefighting, and no ventilation to remove the products of combustion, heat and super-heated gases.

IBC Section 406 6.1.3 is added to require a minimum 2-hour fire separation between these occupancies and other uses. If a fire were to occur in the occupancy, partitioning is needed to protect adjoining occupancies and other uses until the fire can be contained by the sprinkler system and mechanical ventilation.

IFC Section 320 is added to provide basic prescriptive requirements to provide for firefighter safety and to assist in the extinguishment of these fires, providing ground level access doors for firefighting operations, a room to consolidate the required fire control equipment, mechanical smoke removal and an emergency shut down switch. These occupancies are similar to high-piled automated storage systems. The general requirements are similar to high piled rack and automated storage requirements in Chapter 32.

IFC Section 903.2.10.2 is added to prescriptively require a performance-based designed sprinkler system. With the projected fire load in these occupancies and the inability to get water to the seat of the fire, a prescriptively designed sprinkler system is not anticipated to provide the required water for fire suppression.

Footnote c in IBC Table 508.4 is added to include the new section, 406.6.1.3.

Section 320 is being added to IFC Table 903.2.11.6 to the list of occupancies requiring additional fire suppression systems.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal is to provide prescriptive language for enclosed mechanical-access parking garages. These code requirements are being currently enforced as part of a performance-based design when approved and constructed. As the designed and builder will have prescriptive requirements, they will not be required to obtain an Alternative Materials and Methods approval for each project.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee sees the need to improve the code in this topic, but found the current proposal needs substantial work. They pointed out the following areas needing improvement: sprinkler design criteria; smoke control; the fire control equipment control room and to what extent it needs to parallel other control rooms, definition complexity and the impact this could have on low income housing. The proponent was urged to work with the BCAC to develop improved criteria. (Vote: 14-0)

Assembly Action:

None

G39-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Crystal Sujeski, representing Crystal Sujeski (crystal.sujeski@fire.ca.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

SECTION 202 DEFINITIONS

202 MECHANICAL-ACCESS ENCLOSED PARKING GARAGE An enclosed parking garage ~~other than single car stacking systems,~~ which employs parking machines, lifts, elevators or other mechanical devices for vehicle moving from and to street level and in which public occupancy in the garage is prohibited in all areas except the vehicle access bay.

406.6.4 Mechanical-access garages. Mechanical-access enclosed parking garages shall be in accordance with Sections 406.6.4.1 through 406.6.4.5.

406.6.4.1 Separation. Mechanical-access enclosed parking garages shall be separated from other occupancies and accessory uses by not less than 2-hour fire barriers constructed in accordance with Section 707 or by not less than 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

406.6.4.2 Smoke removal. A mechanical smoke removal system, in accordance with Section 910.4, shall be provided for all areas containing an ~~enclosed mechanical-access parking enclosed parking garage.~~

406.6.4.3 Fire control equipment room. The fire control equipment, consisting of the fire alarm control unit, mechanical ventilation controls and emergency shut down switch shall be provided in a room ~~with exterior access~~ located where the equipment is able to be accessed by the fire service from a secured exterior door of the building. The room shall be a minimum of 50 square feet in size and ~~location shall be in a location that is~~ approved by the fire code official.

406.6.4.4 Firefighter-Fire department access doors. Access doors shall be provided ~~at the ground level for firefighter access as approved by the fire code official~~ in accordance with Section 3206.7.

406.6.4.5-3.1 Emergency shutdown switch. ~~A~~ The mechanical parking system shall be provided with a manually activated emergency shutdown switch shall be provided for use by emergency personnel. The switch shall be clearly identified and shall be in a location approved by the fire code official.

2018 International Fire Code

SECTION 202 GENERAL DEFINITIONS

202 MECHANICAL-ACCESS ENCLOSED PARKING GARAGE An enclosed parking garage, ~~other than single car stacking system,~~ which employs parking machines, lifts, elevators or other mechanical devices for vehicle moving from and to street level and in which public occupancy in the garage is prohibited in all areas except the vehicle access bay.

903.2.10.2 Mechanical-access enclosed parking garages. An approved automatic sprinkler system shall be provided throughout buildings used for the storage of motor vehicles in a mechanical-access enclosed parking garage. The portion of the building that contains the mechanical-access enclosed parking garage shall be protected with a ~~performance-based design~~ specially engineered automatic sprinkler system.

Commenter's Reason: G39-18 has been modified to address the comments and feedback received at the committee action hearings held in Columbus, Ohio in April 2018. The modifications were derived by a task group of industry professionals, code consultants, fire officials, and building officials. The definition has been modified to correlate with the NFPA 88A Standard for Parking Structures document and include all automatic parking systems.

406.6.4.2 The modification was editorial to move the word enclosed after the term mechanical-access to stay consistent within the section.

406.6.4.3 The word "room" was added to the section heading to clarify that the equipment is intended to be housed within a defined space. To address a committee comment on the size of the room, the task group concluded that the appropriate size would be a minimum of 50 square feet. This dimension was derived by comparing the language and use of an emergency response area used in the California Building Code for L occupancy for supplies and equipment. The room is not intended to be used for fire suppression command and control use. The room is designed to only operate fire protection systems.

406.6.4.3.1 The emergency shut down switch has been clarified to what the function is intended to achieve. The section number was moved to become a subsection of the fire control equipment room for code user ease.

406.4.4.4 Fire Department access is a critical component of firefighting operations. The modification gives the minimum access for fire department response. With the similarities between mechanical-access enclosed parking garages and high-pile rack storage systems, the demand for fire fighter access requirements are comparable. To achieve consistency within the code for fire fighter access the reference to section 3206.7 has been added.

903.2.10.2 To address the committee comment about the term performance based design. We modified the proposal to correlate with the high-pile storage language in section 3208.5.1. The intent to require a "specially engineered automatic sprinkler system" is to identify the varied fuel loads, configurations, scope and size of these projects. In this way, the designer and code official will be assured that the hazard is adequately accounted for within the fire protection design.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The public comment modification will continue to achieve the same goals of the original intent of the proposal. The cost of construction will decrease as designers and code officials will have a minimum, consistent bases for design without having to create alternate means agreements with each jurisdiction the designer, developer intends to submit a project.

G39-18

G43-18

IBC: 407.4.4.1, 407.4.4.3

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows

407.4.4 Group I-2 care suites. *Care suites* in Group I-2 shall comply with Sections 407.4.4.1 through 407.4.4.4 and either Section 407.4.4.5 or 407.4.4.6.

407.4.4.1 Exit access through care suites. *Exit* access from all other portions of a building not classified as a *care suite* shall not pass through a *care suite*. ~~In a *care suite* required to have more than one exit, one exit access is permitted to pass through an adjacent *care suite* provided that all of the other requirements of Sections 407.4 and 1016.2 are satisfied.~~

407.4.4.2 Separation. *Care suites* shall be separated from other portions of the building, including other care suites, by a smoke partition complying with Section 710.

407.4.4.3 Access to corridor. Every care suite shall have a door leading directly to an exit access corridor or horizontal exit. Movement from habitable rooms within the care suite shall not require passage through more than three doors and 100 feet (30 480 mm) distance of travel within the care suite to a door leading to the exit access corridor or horizontal exit. Where a care suite is required to have more than one exit access door by Section 407.4.4.5.2 or 407.4.4.6.2, the additional door shall lead directly to an exit access corridor, horizontal exit or an adjacent suite.

Exception-Exceptions:

1. The distance of travel shall be permitted to be increased to 125 feet (38 100 mm) where an automatic smoke detection system is provided throughout the *care suite* and installed in accordance with NFPA 72.
2. Where two or more exit access doors are required by Section 407.4.4.5.2 or 407.4.4.6.2, not more than one of the doors shall be permitted to be an exit door leading to an exit stairway, exit ramp, exit passageway, or an exterior exit door.

Reason: Since this section was heavily edited in the 2012 version of the code, the federal rules have changed. This change reflects those changes and provides additional clarity relating to the exit access options out of a suite. The federal regulations stopped counting number of intervening rooms, instead relying on overall travel (K256 and K257). This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal allows for one door out of a suite to be an exit door. This allows for additional design flexibility without adding any additional requirements.

G43-18

Public Hearing Results

Errata: Editorial modifications:

407.4.4.3 Access to corridor. Every care suite shall have a door leading directly to an exit access corridor or horizontal exit. Movement from habitable rooms within the care suite shall not require more than 100 feet (30 480 mm) of travel within the care suite to a door leading to the exit access corridor or horizontal exit. Where a care suite is required to have more than one exit access door by Section 407.4.4.5.2 or 407.4.4.6.2, the additional door shall lead directly to an exit access corridor, horizontal exit or an adjacent suite.

Exceptions:

The distance of travel shall be permitted to be increased to 125 feet (38 100 mm) where an automatic smoke detection system is provided throughout the care suite and installed in accordance with NFPA 72.

Where two or more exit access doors are required by Section 407.4.4.5.2 or 407.4.4.6.2, not more than one of the doors shall be permitted to be an exit door leading to an exit stairway, exit ramp, exit passageway, or an exterior exit door.

Committee Action:

As Submitted

Committee Reason: The committee modified Section 407.4.4.3 to consistently use the defined term "care suite" instead of just "suite". The addition of "of" in the main text and "an" in Exception 2 was for better grammar. This was viewed as editorial only, so the committee did not vote on a modification.

The proposal was approved as appropriate for a facility that used a defend-in-place strategy for occupant safety during a fire event. This will coordinate the IBC with CMS requirements, thus reducing potential conflicts for hospitals and nursing homes. The committee suggested that Exception 2 is really a requirement, and should be moved up into the main text. (Vote: 14-0)

Assembly Action:

None

G43-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

407.4.4.3 Access to corridor. Every care suite shall have a door leading directly to an exit access corridor or horizontal exit. Movement from habitable rooms within the care suite shall not require more than 100 feet (30 480 mm) of travel within the care suite to a door leading to the exit access corridor or horizontal exit. Where a care suite is required to have more than one exit access door by Section 407.4.4.5.2 or 407.4.4.6.2, the additional door shall lead directly to an exit access corridor, ~~horizontal~~ exit or an adjacent suite.

ExceptionsException:

1. The distance of travel shall be permitted to be increased to 125 feet (38 100 mm) where an automatic smoke detection system is provided throughout the *care suite* and installed in accordance with NFPA 72.
2. ~~Where two or more exit access doors are required by Section 407.4.4.5.2 or 407.4.4.6.2, not more than one of the doors shall be permitted to be an exit door leading to an exit stairway, exit ramp, exit passageway, or an exterior exit door.~~

Commenter's Reason: This proposal is in response to a recommendation by the Means of Egress Code Development committee that Exception 2 was really a requirement and not an exception. Rather than lists the types of exits, the last sentence is now all inclusive.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal allows for one door out of a suite to be an exit door. This allows for additional design flexibility without adding any additional requirements.

G43-18

G54-18

IBC: 420.2, 705.3

Proposed Change as Submitted

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows

420.2 Separation walls. Walls separating *dwelling units* in the same building, walls separating *sleeping units* in the same building and walls separating *dwelling* or *sleeping units* from other occupancies contiguous to them in the same building shall be constructed as *fire partitions* in accordance with Section 708. Exterior walls separating units shall comply with Section 705.3.

Exceptions:

1. Where sleeping units include private bathrooms, walls between bedrooms and the associated private bathrooms are not required to be constructed as fire partitions.
2. Where sleeping units are constructed as suites, walls between bedrooms within the sleeping unit and the walls between the bedrooms and associated living spaces are not required to be constructed as fire partitions.
3. In Group R-3 and R-4 facilities, walls within the dwelling units or sleeping units are not required to be constructed as fire partitions.

705.3 Buildings on the same lot. For the purposes of determining the required wall and opening protection, projections and roof-covering requirements, buildings on the same lot and portions of the same building requiring dwelling or sleeping unit separation shall be assumed to have an imaginary line between them. Section 705.3 Exception 1 shall not be used where dwelling or sleeping unit separation is required.

Where a new building is to be erected on the same lot as an existing building, the location of the assumed imaginary line with relation to the existing building shall be such that the *exterior wall* and opening protection of the existing building meet the criteria as set forth in Sections 705.5 and 705.8.

Exceptions:

1. Two or more buildings on the same lot shall be either regulated as separate buildings or shall be considered as portions of one building if the aggregate area of such buildings is within the limits specified in Chapter 5 for a single building. Where the buildings contain different occupancy groups or are of different types of construction, the area shall be that allowed for the most restrictive occupancy or construction.
2. Where an S-2 parking garage of Construction Type I or IIA is erected on the same lot as a Group R-2 building, and there is no *fire separation distance* between these buildings, then the adjoining *exterior walls* between the buildings are permitted to have occupant use openings in accordance with Section 706.8. However, opening protectives in such openings shall only be required in the exterior wall of the S-2 parking garage, not in the exterior wall openings in the R-2 building, and these opening protectives in the exterior wall of the S-2 parking garage shall be not less than 1¹/₂-hour *fire protection rating*.

Reason: The code requires fire-rated construction between dwelling units, but does not specifically address the situation where the separating wall is exterior. The provisions of 705.3 establish a means to determine the required fire rating and allowable openings for exterior walls of two buildings on the same lot. The same principles should be applied to the requirements for dwelling unit separation.

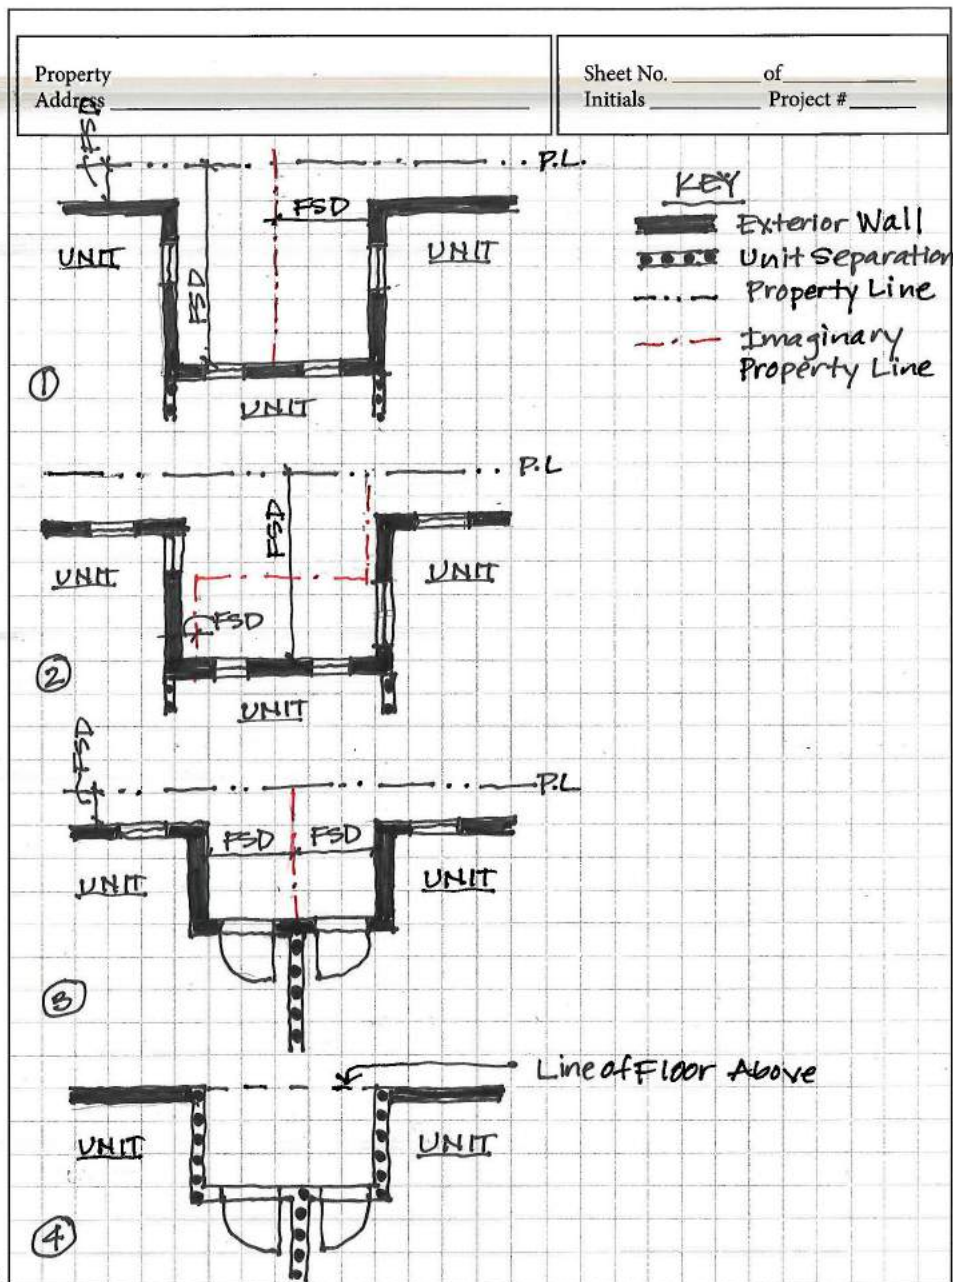

Dwelling unit separation is intended to prevent a fire in one unit from spreading to other units in a building. If adjacent units have unprotected openings in close proximity, fire can more readily spread between units, and to exterior balconies, cladding and roof.

With increasing demand for greater density housing, architects are designing more multifamily residential buildings with smaller units, often with windows on opposite sides of courts.

The provisions of Section 1206 control the minimum sizes of courts, but are silent on the fire-rating requirements, as this section is focused on light and ventilation.

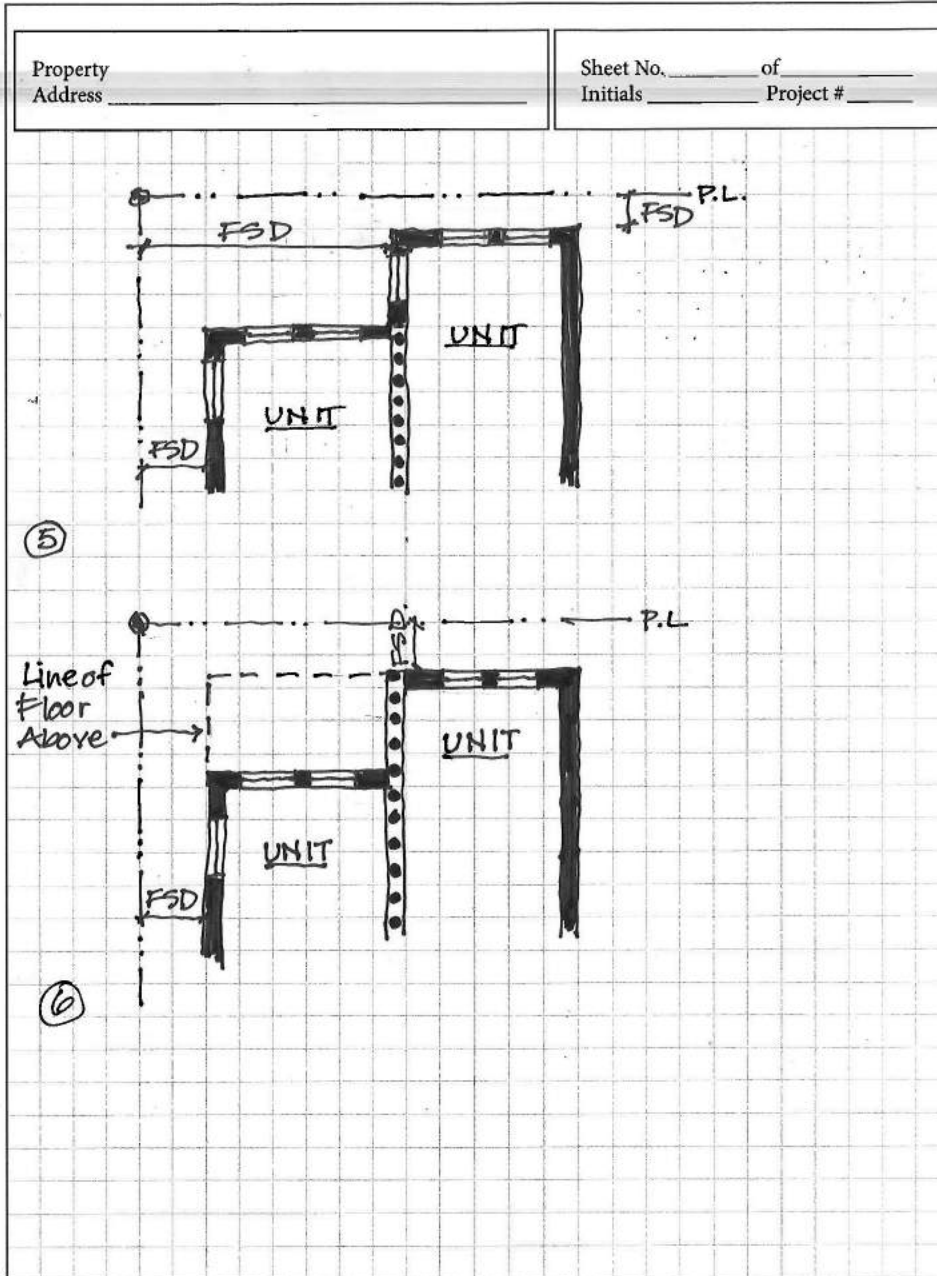

This revision will provide greater clarity for designers and increased safety and privacy for building residents.

Plan Review Calculations DPD

CS 5.21

Plan Review Calculations DPD

CS 521

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Minimal cost implications for construction. Potential property damage and life savings as fires are more likely to be limited to the unit of origin.

G54-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal would attempt to required buildings with stepped facades to be analyzed as if the steps represent different buildings on the same property. The committee found the proposal to be vague and unenforceable. It is not adequately supported with data that the building designs which it would prohibit are in fact, providing dangerous design conditions. . A case to require a building to be protected from itself was not made. The committee felt that the cost of construction was significantly understated. (Vote: 13-1)

Assembly Action:

None

G54-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Micah Chappell, representing Seattle Department of Construction and Inspection (micah.chappell@seattle.gov) requests As Submitted.

Commenter's Reason: The code change proposal is not to protect the building from itself, but to provide unit separation for the condition when adjacent unit exterior walls are in close proximity. We see the condition shown on the previously submitted sketches quite often in Seattle where the exterior wall of a building undulates to accommodate windows or unit entry doors. Another example is two window openings from adjacent units directly facing each other across a light well. The light well depth could be small as three feet to provide light or ventilation in a yard or court per IBC Section 1205.2 & 1205.3. If the light well were infilled with floor area then the unit separation would require a rated wall between the units and protected openings. Removing the floor area and treating those walls as exterior walls does not remove the hazard from adjacent units.

The philosophy of providing fire protection due to adjacent exterior hazards within the same building is a common approach in the current building code and can be found in the following building code locations:

1023.7: Protect adjacent exterior walls at an angle less than 180 degrees of a nonrated exit stair exterior wall or unprotected opening.

1023.3, 1024.4, 1028.1: Exit stairs/passageways that extend to an exit discharge are required to extend to the exterior edge of the building p. For inset exit doors, protection to be extended to building edge.

This code change proposal extends this protection to unit separation.

This code change proposal will increase construction costs.

I believe the original code proposal should be approved as proposed. This code change will provide clear guidance in how to address the hazard of adjacent units.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction Cost increase as indicated in original proposal.

G54-18

G72-18

IBC: 202, 308.1.1(New), 429 (New), Chapter 35

Proposed Change as Submitted

Proponent: Dave Fable, U.S. General Services Administration, representing U.S. General Services Administration

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows

LOCK-UP An area located within a building or structure having a predominant occupancy classification other than Group I-3, and where the occupants for penal or correctional purposes are detained for less than 24 hours by the use of security measures not under the occupants' control.

Add new text as follows

308.1.1 Lock-ups. Lock-ups located within a building or structure having a predominant occupancy classification other than Group I-3, where the area has capacity for not more than 50 detainees, and where no individual is detained for 24 hours or more, shall comply with the requirements of the predominant occupancy of the building or structure in which the lock-up is located and with the requirements of Section 429. Lock-ups having a capacity for more than 50 detainees or where any individual is detained for 24 hours or more shall be classified as Group I-3 occupancy and shall comply with the other applicable requirements in this code.

429 LOCK-UPS

429.1 General. Lock-ups located within a building or structure having a predominant occupancy classification other than Group I-3, where the area has capacity for not more than 50 detainees, and where no individual is detained for 24 hours or more, shall comply with the provisions in Sections 429.1 through 429.5 and other applicable provisions of this code.

429.2 Automatic Sprinkler System. Buildings and structures where lock-ups are located shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

429.3 Fire Alarm System. Buildings and structures where lock-ups are located shall be equipped with a fire alarm system that initiates the occupant notification signal installed in accordance with Section 907.6.

429.4 Lock-up Criteria. The lock-up shall comply with the requirements for the predominant occupancy of the building in which the lockup is located, and the following criteria:

1. Doors and other physical restraints to free egress by detainees can be readily released by staff within 2-minutes of the onset of a fire or similar emergency.
2. Staff is in sufficient proximity to the lock-up so as to be able to cause the 2-minute release required by Item 1 whenever detainees occupy the lockup.

Exception:Where staff is not in sufficient proximity to the lock-up so as to be able to cause the 2-minute release required by Item 2, an automatic smoke detection system shall be installed throughout the lock-up area installed in accordance with the requirements in NFPA 72.

3. Staff is authorized to cause the release required by Item 1.
4. Staff is trained and practiced in effecting the release required by Item 1.
5. Where the release required by Item 1 is caused by means of remote release, detainees are not to be restrained from evacuating without the assistance of others.
6. Where security operations necessitate the locking of required means of egress, the following shall apply:
 - 6.1. Detention-grade hardware complying with ASTM F 1577 shall be provided on swinging doors within the required means of egress.
 - 6.2. Sliding doors within the required means of egress shall be designed and engineered for detention and correctional use, and lock cylinders shall meet the cylinder test requirements of ASTM F 1577.

429.5 Fire department notification. The building owner/manager shall notify the fire department with responsibility to respond to the building or structure of the presence of the lockup.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

F1577-05 (2012):

Standard Test Methods for Detention locks for Swinging Doors

Analysis: A review of the standard proposed for inclusion in the code, [INSERT STANDARD], with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Reason: The intent of this code change proposal is to address the subject matter of 'lock-ups' where the occupants for penal or correctional purposes are detained for less than 24 hours by the use of security measures not under the occupants' control. A lock-up is basically a holding area in which persons are detained with some degree of security imposed on them that are commonly located in different types of occupancies. For example, lockups are typically located in U.S. Customs and Border Protection facilities at border crossings, airports and seaports; prisoner holding facilities at courthouses; local police departments; security offices at sports stadia; security offices at shopping mall complexes; etc. Currently, the requirements within the IBC require "lock-ups" to meet the rigorous defend in place requirements applicable to Institutional Group I-3 occupancies. This code change proposal provides requirements specifically for lock-ups located in building and structures having a predominant occupancy classification other than Institutional Group I-3 occupancy and provides a reasonable set of safe guards applicable to the predominant occupancy of the building in which the lock-up is located. The subject provisions for lock-ups are meant to apply to holding areas having a capacity of not more than 50 detainees, in which no individual is detained for 24 hours or more. The threshold for the holding area to limit the capacity to not more than 50 detainees is based on the requirements in NFPA 101, Life Safety Code, and seems reasonable for processing/holding areas for facilities at border crossings, airports and seaports and prisoner holding facilities at courthouses.

Section 202 has been revised to include a new definition for a lock-up. Section 308 has also been revised to include a new sub-section 308.1 on lock-ups

A new Section 429, Lock-Ups has been created to provide a reasonable set of safe guards applicable for when a predominant occupancy of the building or structure has an occupancy classification other than Institutional Group I-3 occupancy in which the lock-up is located. For example, safe guards include, but are not limited to: an automatic sprinkler system throughout the building or structure, a fire alarm system, a 2-minute timeframe for trained staff to release the detainees or an option for the installation of a smoke detection system within the lock-up area if the 2-minute timeframe for trained staff to release the detainees cannot be met, detention-grade door hardware to improve reliability, and building owner/manager notification of the local responding fire department of the presence of the lock-up.

Please note that the subject code change proposal is based on the requirements for lock-ups in the National Fire Protection Association 101, Life Safety Code (2018 edition).

The intent of this proposal is to reference ASTM Standard F 1577-05 (2012), Standard Test Methods for Detention Locks for Swinging Doors to improve the reliability of detention-grade hardware for lock-ups.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. We believe the subject code change proposal to include lock-ups will not affect the cost of construction either way.

Requiring lock cylinders of detention door hardware to meet the cylinder test requirements of ASTM F 1577 may increase construction costs.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F1577-05 (2012), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

G72-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This issue needs to be addressed especially to address facilities where 5 or fewer persons are 'locked' up and not free to egress in malls, small court houses. The committee spoke to areas where the proposal needs further development: 1. Clarity of locking arrangements, specifically unlocking during emergency situations. 2. Consider limiting the number of doors in the path of egress. 3. Relying on the 'owner' to call the fire department in case of emergencies. 4. Cost of compliance for very small jurisdictions that may have only 1 or 2 persons in lock up at any time. 5. Reconsider the maximum threshold. 6. Consider separating those needed for health care and those needed for law enforcement. (Vote 9-5)

Assembly Action:

None

G72-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com) requests As Submitted.

Commenter's Reason: Holding facilities have an extremely important role in various types of facilities. Security needs for retail operations, medical facilities and even governmental facilities often have to deal with persons that are violent or disturbed, have mental health issues that require that the operators of these facilities detain them for a period before the local authorities can retrieve the individual and take them to be dealt with. Without guidance from the IBC, many designers and owners are having to creatively identify the necessary features of such an area for temporarily holding such individuals.

We believe this proposal offers clear and concise requirements for designers, owners and building officials to use in creating appropriate facilities for detention without classifying the space as an I-3 occupancy.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

As stated in the original proposal.

For SI: 1 foot = 304.8 mm.

UL = Unlimited; NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the *International Fire Code*.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB and its various WGs held meetings, studied issues and sought input from various expert sources around the world. The TWB has posted those documents and input on its website for interested parties to follow its progress and to allow those parties to, in turn, provide input to the TWB.

At its first meeting, the TWB discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings:

1. No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.
2. No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.
3. No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.
4. No unusual fire department access issues.
5. Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.
6. Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

The comprehensive package of proposals from the TWB meet these performance objectives. The TWB also determined that fire testing was necessary to validate these concepts. At its first meeting, members discussed the nature and intention of fire testing so as to ensure meaningful results for the TWB and, more specifically, for the fire service. Subsequently a test plan was developed. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of joints, and to evaluate conditions for responding fire personnel. The Fire WG then refined the test plan, which was implemented with a series of five, full-scale, multiple-story building tests at the Alcohol, Tobacco and Firearms (ATF) laboratories in Beltsville, MD. The results of those tests, as well as testing conducted by others, helped form the basis upon which the Codes WG developed its code change proposals. This code change proposal is one of those developed by the Codes WG and approved by the TWB.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit:
<http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17

Allowable Height

This proposal addresses the allowable building height, in terms of feet, for the three new construction types proposed by the TWB. As set forth in the proposal to Section 602.4, the three new types of construction are Types IV-A, IV-B, and IV-C. The Committee examined each proposed type of construction for its safety and efficacy with regard to each occupancy type.

The following approach was used to develop proposed allowable heights of the new construction types, based on the conclusions of the Committee:

1. Based upon TWB review of fire safety and structural integrity performance, Type IV-B is equated to Type I-B for height (in feet). A noteworthy item to remember is that, per Section 403.2.1.1 of the IBC, Type IB construction is permitted to be reduced to 1-hour Fire Resistance rating; however, the TWB does not propose to allow the same reduction for Type IV-B. As a result, the comparison is between 2-hr mass timber construction that is partially exposed, versus 1-hr Type IB construction, and the Committee believes that 2-hr mass timber construction that is partially exposed per the limits of proposed Section 602.4 warrants the same heights as allowed for 1-hr Type I-B construction. It should be noted that the unprotected mass timber also needs to meet the 2 hour FRR, thus the protected area will likely be conservatively higher FRR than actually required;
2. Type IV-A should be somewhat larger than IV-B, as Type IV-A construction is entirely protected (no exposed mass timber permitted) and the required rating of the structure is equivalent to those required of Type I-A construction (3-hr rating for structural frame). However, the Committee did not find it acceptable to allow the unlimited heights of Type I-A to be applied to Type IV-A. Instead, the Committee applied a multiplier of 1.5 to the heights proposed for Type IV-B construction, in order to propose reasonable height allowances for IV-A construction;
3. The Committee viewed Type IV-C as similar to existing HT construction with the exception that IV-C has a 2 hour FRR where HT is acceptably fire resistant based on the large sizes of the members. As such, the height in feet is proposed to be equal to the height in feet of Type IV-HT. In terms of stories, however, the Committee proposed an additional number of stories for IV-C in recognition of its greater FRR.

4. While the base code seems to allow significant heights for buildings without sprinklers (e.g., Table 504.3 currently allows a height of 160 feet for NS Type I-B construction for many occupancy classifications), the Committee believes that no additional heights over what is already permitted for Type IV-HT would be proposed for the NS (non sprinklered) rows. As such, where separate rows are provided for heights for the NS situation, the proposed heights for Types IV-A, IV-B, and IV-C are the same as those heights already permitted for Type IV for the NS condition.

This methodology explains the majority of the recommendations here. Specifically, for occupancy groups A, B, E, F, I-4, M, R, S, U, the methodology described above accurately reflects how the height proposals were developed.

After undergoing this methodology to develop initial height recommendations, the Committee then applied professional judgment (from both a fire safety and a structural perspective), to develop a working draft table, cell by cell, for all occupancy types.

The exercise for establishing the allowable number of stories for the three new types of construction started with setting Type I-B allowances equivalent to Type IV-B. The tabular fire resistance ratings of building elements for these two types of construction is identical (not including the reduction permitted by 403.2.1.1), so the identical number of stories was deemed a reasonable starting point. From this point, the TWB Committee reviewed each occupancy classification to see if the Type I-B story allowance required adjustment.

Following is a summary of how allowable number of stories for sprinklered I-B were adjusted for IV-B:

- A-1, A-2, A-3, A-4, A-5, B, E, H-1, H-5, I-1(1), I-1(2), I-2, I-3, I-4, R-1, R-2, R-3, R-4, U: no adjustment, same number of allowable stories as Type I-B.
- F-1 and S-1: reduced from 12 to 7 (2 story increase from Type IV-HT)
- F-2, M, S-2: reduced from 12 to 8 (2 story increase from Type IV-HT)
- H-2: reduced from 3 to 2 (same as Type IV-HT)
- H-3: reduced from 6 to 4 (same as IV-Type HT)
- H-4: reduced from 8 to 7 (1 story increase from Type IV-HT)

Similarly, to establish the height in feet for Type IV-B:

- A-1, A-2, A-3, A-4, A-5, B, E, F-1, F-2, I-4, M, R-1, R-2, R-3, R-4, S-1, S-2, U: same allowable height as I-B.
- H-1, H-2, H-3: reduced from 180' to 90'
- H-4: reduced from 180' to 100'
- H-5: reduced from 160' to 90'
- I-1(1): reduced from 180' to 120'
- I-1(2): reduced from 180' to 65'
- I-2: reduced from 180' to 65'
- I-3: reduced from 180' to 120'

Adjusting IV-B up to IV-A for allowable number of stories:

- A-1, A-2, A-3, A-4, A-5, B, E, F-2, I-4, M, R-1, R-2, R-3, R-4, S-1, S-2, U - 1.5 x IV-B number of stories
- F-1, S-1 increase by 3 stories
- H-1, H-3 same as IV-HT
- H-2, H-4, H-5 increase by 1 story
- I-1(1), I-1(2), I-2, I-3 increase by 2 stories
- H-3 reduced from 6 to 4 (same as IV-HT)
- H-4 reduced from 8 to 7 (1 story increase from IV-HT)
- I-1(1), I-1(2), I-2, I-3, same as IV-HT

Adjusting IV-B to IV-A for building height:

- A-1, A-2, A-3, A-4, A-5, B, E, F-1, F-2, H-1, H-5, I-1(1), I-3, I-4, M, R-1, R-2, R-3, R-4, S-1, S-2, U: multiply 1.5 x Type IV-B (180 ft.)
- H-1, H-2, H-3, H-5: increase by 30 ft.
- H-4: increase by 40 ft.
- I-1(2), I-2: same as Type IV-HT

For instance, for Groups H-1, H-2, H-3, and H-5, while the table allows 160 feet for Type I-B construction, the Committee proposed a height of 90 feet for Type IV-B construction, and is using a multiplier of 1.33 to propose a height for Type IV-A construction of 120 feet height, intentionally made equal to the existing Heavy Timber heights.

For H-4, corrosives represent a health hazard (but not necessarily a fire hazard) to building occupants and first responders, the Committee believed that reduced heights were warranted. These are slightly greater than discussed above for the H-occupancy groups (140 feet versus 120 feet for IV-A construction, and 100 feet versus 90 feet for IV-B construction), but these still are far below what is permitted for Type I-B construction (180 feet permitted for the sprinklered condition), and is in recognition of the particular type of Hazardous occupancy covered by the H-4 occupancy group.

For Group I occupancies, there are two rows in the table, one being a row that includes I-1 Condition 1 and I-3 occupants (more capable of self-preservation) and the other being a row that includes I-1 Condition 2 and I-2 occupants (less capable of self-preservation). For I-1 Condition 1 and I-3 occupants, the Committee proposed a height of 120 feet for Type IV-B (versus 180 feet from the general methodology summarized above) and a height of 180 feet for Type IV-A (versus 270 feet from the general methodology summarized above). For those I-1 Condition 2 and I-2 occupants, the Committee took a very conservative approach and will only allow the heights that are already permitted by code for traditional Type IV construction.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

G75-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: In Table 503.4, the value under Type IV A construction is to be 180 instead of 270 and the value under Type IV B construction is to be 120 instead of 180. All other portions of the proposal are not modified.

Committee Reason: The modification proposed makes this proposal work. The proposal was excessive without it. Otherwise, many of the reasons cited by the committee for proposal G80-18 apply. (Vote: 12-2)

Assembly Action:

None

G75-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jonathan Humble, American Iron and Steel Institute, representing American Iron and Steel Institute (jhumble@steel.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

	S	UL	180	85	75	85	75	270	180	85	85	70	60

For SI:

1 foot = 304.8 mm.

UL = Unlimited; NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the *International Fire Code*.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Commenter's Reason: We recommend that the Type IV-B mass timber designation be deleted from the tall wood building proposals.

The origins of the development of the types of construction were originally developed to “account for the response or participation that a building’s structure will have in a fire condition originating within the building as a result of the occupancy or the fuel load” (Example source from BOCA National Building Code 1993 Commentary). The modern day types of construction are parsed out into three primary categories of construction; noncombustible (Types I and II), noncombustible/combustible (Types III and IV) and combustible (Type V). Subcategories were created to identify the protection; Type A for protected and Type B for unprotected.

What we have within proposals G75-18, G80-18, G84-18, G89-18, and G108-18 is the addition of a new construction category that has been proposed based on the need to satisfy aesthetics based on the combination of Types IV-A and IV-C, which is a departure from the black and white construction categories based on construction that is either non-combustible or combustible. We feel this inappropriate for the codes to begin to designate designer type construction categories.

In the past such mixing and matching of construction types into building or structure is more suited to the IBC Section 104.11 (Alternative materials, design and methods of construction and equipment), or through use of the ICC International Performance Code or performance analysis. We feel that these are the most appropriate options for the mixing-and-matching of construction types in building design.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This will not increase or decrease the cost of construction as this code change proposal and public comment address information that was not previously contained in the code, therefore there is no cost impact when compared to present requirements.

Public Comment 2:

Proponent: Brian M. McGraw, P.E., Virginia Department of Fire Programs, State Fire Marshal's Office, representing Virginia State Fire Marshal's Office, Virginia Fire Services Board (brian.mcgraw@vdfp.virginia.gov) requests As Modified by This Public Comment.

For SI: 1 foot = 304.8 mm.

UL = Unlimited; NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the *International Fire Code*.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Commenter's Reason: The Virginia Fire Services Board opposes Proposal G75-18 as originally submitted. We propose that the allowable heights in this proposal be reduced to those currently allowed for Type IV-HT construction until additional testing can be performed to validate the assumptions on which the currently proposed heights are based. While we do not oppose the concept of utilizing renewable resources, such as timber, in the construction of buildings, we are not convinced that 270 foot tall wood buildings provide an acceptable level of safety to occupants or responding firefighters.

The reason statement for this proposal indicates that the Ad-Hoc Committee on Tall Wood Buildings (TWB) discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings including:

- Egress systems designed to protect building occupants during the design escape time, plus a safety factor.
- Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

There is no reference in the stated performance objectives related to protecting firefighters and other emergency responders during the time required to access and extinguish a fire. The Report on High-Rise Fireground Field Experiments , NIST Technical Note 1797, published in April 2013, indicates times between 21 and 23 minutes from fire ignition for fire crews to reach the 11th floor of a high-rise building, depending on crew size. These times are based on studies involving major metropolitan fire departments. There are many variables that could significantly increase these times, including time for notification of the fire department, turnout time, response time and vertical travel time to reach higher floors.

There were 14 proposals submitted by the TWB. Only one, G28-18, addresses the reliability of fire suppression systems. It requires the water supply to required fire pumps be supplied by connections to not fewer than two water mains located in different streets for tall wood buildings that are more than 120 feet in building height. This proposal does nothing to increase the reliability of fire suppression system in buildings less than 120 feet tall. In addition, it does nothing to increase the reliability of the suppression systems within the building itself. There is no requirement to demonstrate the reliability of the fire suppression system as compared to the evacuation time and risk of collapse. It should also be noted that this proposal allows the construction of tall wood buildings to a height of 65 feet with no requirements for fire suppression systems.

We acknowledge that fire tests have been conducted; however, we do not believe that the results of the fire tests provide sufficient justification to allow tall wood building to be constructed to heights of 270 feet. The original proposal cites engineering judgment as the basis for a comparative analysis between Type I and Type IV buildings and the extrapolation of two-story fire tests to 270 foot tall structures. There has been no testing to demonstrate the performance of these structures after aging for a period of years or decades.

Bibliography: Report on High-Rise Fireground Field Experiments. NIST Technical Note 1797. Butler, Kathryn M. (editor). April 2013. https://cpse.org/wp-content/uploads/2018/02/NIST.TN_.1797-min.pdf

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal does not alter the method of construction; rather it limits the allowable height for this type of construction.

Public Comment 3:

Proponent: Michael O'Brian, International Association of Fire Chiefs, representing Riverside County Fire Department, representing California Fire Chiefs Association (mobrian@brightonareafire.com); Kevin Reinertson (kevin.reinertson@fire.ca.gov)requests As Modified by This Public Comment.

For SI: 1 foot = 304.8 mm.

UL = Unlimited; NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the *International Fire Code*.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Commenter's Reason: This is a series of comments to modify the proposed height, stories, and allowable area of the new Type IV-A, Type IV-B, and Type IV-C proposed construction classifications as proposed by the Ad-Hoc Committee on Tall Wood Buildings.

There is concern the formulas utilized are not fully supported by technical substantiation and are missing the needed technical support to allow the construction type to such heights. This change takes a moderate approach and reduces the allowable heights, area, and stories by a factor of 30%.

This proposed public comment doesn't dismiss the concept out of hand, we do feel the current proposals go too far, to fast in an area of significant and long-lasting importance.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No change in cost of construction as these heights have not been permitted before with this construction classification.

Public Comment 4:

Proponent: Gary Bridgens, representing Mass Timber Code Coalition (info@buildtallbuildsafe.com) requests As Modified by Committee.

Commenter's Reason: PUBLIC COMMENT

SUBMITTED BY GARY BRIDGENS

ON BEHALF OF THE MASS TIMBER CODE COALITION

The Mass Timber Code Coalition has been organized to provide information on the code proposals drafted by the Ad Hoc Committee on Tall Wood Buildings

Mass timber is not new to the *International Building Code* (IBC). Currently listed as Type IV Heavy Timber, this construction type is a proven option that fully complies with the structural and fire resistive requirements of the IBC. The code recognizes that mass timber is a fundamentally different material than dimension lumber used in more familiar "stick built" wood construction. The code also recognizes the inherent fire resistance of mass timber, where charring in a fire event provides protection of inner structures, as well as a consistent and predictable rate of charring.

With the expansion of the mass timber supply chain, panels of cross-laminated timber (CLT), nail-laminated timber (NLT) and glue-laminated timber (Glulam), requests for approvals of tall mass timber buildings (TMTB) by local authorities have become more common. Estimates by industry sources have identified 35 current proposals for tall mass timber buildings, ranging from 7 to 24 stories, in 21 different jurisdictions.

Importantly, this interest in tall mass timber construction has been reliant on various local codes and approval processes. The IBC does not currently account for these tall wood buildings, beyond the current Type IV Heavy Timber height and area limitations.

The Ad Hoc Committee on Tall Wood Buildings (AHC-TWB)

To ensure the IBC keeps pace with the changing construction marketplace, the Board of Directors of the International Code Council (ICC) appointed the Ad Hoc Committee on Tall Wood Buildings (AHC-TWB) in 2015. The AHC-TWB included members from the code official, regulatory, construction, engineering, architectural, fire services and materials communities.

The AHC-TWB was specifically charged with investigating the science of mass timber construction, undertaking any necessary new research and recommending any code changes needed to ensure safety in TMTB. The AHC-TWB set performance criteria of its own: any code change developed was required to achieve the following.

- No collapse under scenarios of complete burn-out of fuel without automatic sprinkler protection;
- No high radiation exposure from the subject building to adjoining properties that risk ignition under severe fire scenarios;
- No unusual response from radiation exposure from adjacent properties that risk ignition of the subject building under severe fire scenarios;
- No unusual fire department access issues;
- Egress systems to protect occupants during design escape times plus a margin of safety;
- Enhanced and redundant fire protection systems to ensure performance during various fire scenarios.

Code Change Proposals

After two years of work, the AHC-TWB has produced 14 code change proposals. All 14 of these proposals were recommended for approval by various ICC committees at the recent ICC 2018 Group A Committee Action Hearing.

The key change, G108-18, defines three new categories of Type -IV Mass Timber construction:

Type IV-A: 1 to 18 stories based on Occupancy Classification. 3-hour fire resistance rating with non-combustible protection throughout;

Type IV-B: 1 to 12 stories based on Occupancy Classification. 2-hour fire resistance rating with non-combustible

protection on most mass timber surfaces;

Type IV-C: 1 to 9 stories based on Occupancy Classification. 2-hour fire resistance rating with non-combustible protection for critical areas; exit enclosures, etc.

Each new construction type defined by the AHC-TWB (Type IV-A, B and C) has fire resistance requirements as robust or more robust than those required for comparable non-combustible (concrete and steel) buildings.

Other provisions provide standards for mass timber manufacturing, height/area restrictions, active and passive fire protection systems, fire safety during construction, enhanced water supply requirements, and standards for sealants and adhesives.

Fire Resistance of Mass Timber

Citing fire and market concerns, both the Portland Cement Association and the National Ready Mix Concrete Association have criticized the AHC-TWB code change proposals as “untested” and “unsound.” However, these criticisms fail to consider that:

The purpose of the International Building Code is to provide building officials with the tools they need to ensure public and first-responder safety. It is not to choose winners and losers in the market, nor is it to defend any single industry’s position;

Tall mass timber buildings already built are performing well;

Mass timber (and heavy timber before it) has undergone extensive fire resistance testing in multiple fire scenarios by Underwriters Laboratories, the Southwest Research Institute, the National Research Council of Canada and the U.S. Government’s ATF Fire Research Laboratory, the world’s largest indoor fire investigation lab.

Numerous mass timber floor/ceiling and wall assemblies have been tested at national laboratories using ASTM E119 standards. This testing history shows that mass timber has repeatedly achieved the hourly fire resistance requirements of the code. This is in part because of charring properties that provide a steady and predictable measurement of fire resistance. Additionally, detailed code requirements for non-combustible protection applied to the mass timber greatly enhance the hourly rating. Further, fire protection systems (active and passive) also ensure safety in mass timber structures.

The AHC-TWB benefitted from recent tests in 2017 at the U.S. ATF Fire Research Laboratory on full-scale mass timber buildings. Most tests assumed an unlikely failure of sprinkler systems:

Mass timber apartment with full fuel load. Fully protected by Type X gypsum wall board. Fire self-extinguished after 3 hours with no significant charring on mass timber surfaces;

Mass timber apartment with full fuel load. 20% exposed CLT ceiling. Test concluded at 4-hour mark after fuel burnout. CLT self-extinguished after charring;

Mass timber apartment with full fuel load. 2 CLT walls fully exposed. Fuel burnout at 4-hours. CLT walls self-extinguished after charring;

Mass timber apartment with full fuel load. All CLT surfaces fully exposed. One sprinkler system. Fire quickly extinguished;

Mass timber apartment with full fuel load. All CLT surfaces fully exposed. One sprinkler system. Fire allowed to grow to flashover (23 minutes) then quickly extinguished.

In fact, proposed Type IVA, B and C fire resistance requirements are the same or more robust than comparable steel and concrete construction. Further detail can be obtained at buildtallbuildsafe.com.

Benefits of Mass Timber Construction

In addition to the obvious environmental attributes of using a renewable resource in construction and the boost for the economies in timber-producing regions, builders and communities cite several distinctive benefits that make mass timber buildings an attractive option:

Builders report several benefits, including:

Job site safety. Mass timber panels are easy to install and can be delivered to a work site as needed, rather than stockpiled. Moreover, worker training is easier as is exposure to job site risk;

Job site efficiency. Persistent labor shortages are eased as more workers are qualified to work with mass timber panels. Jobs are built more quickly and materials are delivered as needed, thereby reducing costs;

Design. The favorable strength-to-weight ratio of CLT and the characteristics of wood offer more design options and more attractive built environments, improving business performance.

Local communities embrace mass timber construction:

Faster and quieter. The dislocation experienced by neighboring communities is reduced in mass timber projects. In addition to lower fire risks, things occur more quickly and panels are installed more simply than comparable steel and concrete sites;

Greener. Forestry officials cite the carbon sequestration properties of wood, but also the benefits to forest management of using wood products more efficiently and effectively, thereby further reducing decay and fire risk;

Energy efficient. Manufacturing mass timber is less energy intensive than other building materials. More importantly, the superior insulation characteristics of wood far outperform steel and concrete structures.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Public Comment 5:

Proponent: Sam Francis, representing American Wood Council (sfrancis@awc.org) requests As Modified by Committee.

Commenter's Reason: AWC was appointed to be a member of the ICC Tall Wood Building Ad Hoc Committee (TWB), the single wood industry representative on the TWB. AWC is not speaking for TWB on this issue. It simply is relaying information regarding the development of the proposals. Other members of the 16-member TWB included representation from architects, engineers, fire protection engineers, fire marshals, testing laboratories, and fire fighters, as well as the major materials industries. After two years of study, listening to testimony, reviewing documents, reviewing public input, conducting an extensive test program, and reviewing test results from tests around the world, the TWB made this proposal to ICC for the membership's consideration.

Early in the process, the TWB heard proposals from four different commentators suggesting maximum stories of 20, 24, 40, and 42 stories. The TWB worked through dozens of drafts of the proposed new types of construction, dozens more pertaining to the building height in stories, nearly a dozen pertaining to building height in feet and nearly a dozen regarding maximum permitted building area per floor. These documents were all posted to the TWB page of the ICC website. Comments were solicited for all drafts.

The first aspect of height and area taken up by the TWB was height in stories. That seemed to be the easiest to get at with the information gleaned from the testimony and documentation presented to the TWB. A public comment by AWC to G80 outlines how experts from around the world presented a case to the TWB that mass timber was equivalent to types I-A and I-B in every way other than the combustibility of the base material. They outlined various strategies for overcoming that combustibility issue. The TWB relied upon this concept of equivalent performance to determine its maximum permitted height in stories. The Reason Statement provided by the TWB Chairman, Steve DiGiovanni, clearly lays out the background for, and the process of, the deliberation on Height in Stories. That is a must read to understand this process and its outcomes.

Next, based upon comments submitted, TWB tried to assign height in feet to its chosen maximum stories. In its first drafts, the maximum number of stories for proposed type IV-A was 24 for a few occupancy groups. Similarly, IV-B was proposed to be limited to 12 stories based on the equivalency mentioned above. Thus, IV-B was assigned the same maximum height in feet as type I-B, 180 feet. In regards to the fire service's ability to address fires in mass timber buildings at these heights, the following rationale was used:

That seemed to be the easiest to get at with the information gleaned from the testimony and documentation presented to the TWB. A public comment by AWC to G80 outlines how experts from around the world presented a case to the TWB that mass timber was equivalent to types

I-A and I-B in every way other than the combustibility of the base material. They outlined various strategies for overcoming that combustibility issue. The TWB relied upon this concept of equivalent performance to determine its maximum permitted height in stories. The Reason Statement provided by the TWB Chairman, Steve DiGiovanni, clearly lays out the background for, and the process of, the deliberation on Height in Stories. That is a must read to understand this process and its outcomes.

Next, based upon comments submitted, TWB tried to assign height in feet to its chosen maximum stories. In its first drafts, the maximum number of stories for proposed type IV-A was 24 for a few occupancy groups. Similarly, IV-B was proposed to be limited to 12 stories based on the equivalency mentioned above. Thus, IV-B was assigned the same maximum height in feet as type I-B, 180 feet. In regards to the fire service's ability to address fires in mass timber buildings at these heights, the following rationale was used:

The height limit, in feet, proposed for Type IV-B is even more conservative when considering that Type IV-B requires a greater degree of fire resistance than that of I-B when the *fire-resistance rating* of the building elements in Type IB construction are reduced to only the *fire-resistance ratings* required for Type IIA as permitted by Section 403.2.1 of the IBC. In effect, the proposed 2 hour fire resistance ratings required for Type IV-B will be twice that allowed by the IBC, since its inception, for those buildings under 420 feet whose building elements are permitted to be of only 1 hour fire resistance in accordance with the high rise provisions of Chapter 4, which will not apply to the proposed mass timber construction types.

Type I-A is, in most cases unlimited in height. The TWB agreed that the performance of IV-A was equivalent, but its conservative approach meant that they chose not to permit IV-A to enjoy the unlimited height that I-A does. In fact, the approach was so conservative that it considered only increasing the height in feet by 50% over type IV-B. So a modest increase of 50% was chosen. This is infinitely less than the unlimited height in feet permitted in type I-A for nearly every use group.

The reason statement offered by the TWB for this proposal clearly explains that the allowable height in feet was determined by assessing the overall performance of the new types of construction and equating them to existing types of construction. It also clearly defines the acceptable performance which it found to be equivalent to the higher types. From the beginning, the TWB has been committed to criteria which result in acceptable performance.

The fire test program, drafted by the Fire Work Group of the TWB may be seen as videos of each of the five tests. They can be found at this link or on the ICC TWB web page.

https://www.youtube.com/playlist?list=PL_sDiz8JiMlwby77vfpSPucEhBuEK22P

This proposal is thoroughly conservative. The following points address claims made by opponents:

Concerns about exterior fire testing:

The TWB proposals significantly reduce the risk of exterior building surface flame propagation by prohibiting all combustibles on the exterior side of exterior walls (except for the required water resistive barrier). Continuous insulation on the exterior, where provided, will be non-combustible. In addition, protection with at least 40 minutes of noncombustible material (typically a layer of 5/8-inch type X gypsum wallboard) is required on the outside of mass timber exterior walls. What is proposed therefore is more conservative than any other construction type, including Types I and II, virtually eliminating the possibility of fire spread on exterior walls due to combustible materials.

Concerns about the testing's relevance to tall wood buildings:

The testing was designed by fire service representation on the TWB committee to directly address potential tall wood buildings, regardless of height. Rather than rely on standardized testing of building assemblies alone, with fire service input the TWB committee chose to undertake full-scale, multistory compartment testing, with high residential fuel loads for which no standardized test exists. Furthermore, in four of the five tests, the normal operation of the required automatic fire suppression system (sprinklers) was not allowed. The fires in tests applicable to the proposed 18 and 12 story limits (Types IV-A and IV-B respectively) were allowed to continue throughout the decay phase and well past burn-out,

Type I-A is, in most cases unlimited in height. The TWB agreed that the performance of IV-A was equivalent, but its conservative approach meant that they chose not to permit IV-A to enjoy the unlimited height that I-A does. In fact, the approach was so conservative that it considered only increasing the height in feet by 50% over type IV-B. So a modest increase of 50% was chosen. This is infinitely less than the unlimited height in feet permitted in type I-A for nearly every use group.

The reason statement offered by the TWB for this proposal clearly explains that the allowable height in feet was determined by assessing the overall performance of the new types of construction and equating them to existing types of construction. It also clearly defines the acceptable performance which it found to be equivalent to the higher types.

From the beginning, the TWB has been committed to criteria which result in acceptable performance.

Type IVB	180 <u>120</u>

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction This is a heretofore unknown type of construction. Adding alternatives in the code generally means creating more choice which should result in lower costs.

The impact of the incorrect modification is to add cost. The impact of this modification is the same as the impact in the original proposal because it only fixes the editorial problem

Public Comment 6:

Proponent: Patrick Ford, representing selfrequests Disapprove.

Commenter's Reason: Reason: These code changes would allow for structurally unsafe conditions to be inherently designed into tall buildings. As proposed, they would introduce new categories of Type IV construction into the code and expand the number of storeys, allowable areas, and maximum heights of buildings framed with combustible materials. I believe that for several reasons, this would greatly increase the risk to firefighters and building occupants, as well as neighboring buildings. Several of the major decisions that went into the creation of this proposal were based on "engineering judgment" and significant extrapolation of test data from a two storey test building to buildings with dozens more storeys.

Aside from the potentially dangerous and unproven provisions in general, there are several specifics relative to structural connections in these new building types and sizes. I do not believe that these were addressed or at the very least not adequately addressed.

The new building types and increased limits allowed for in these proposals should not be allowed, and the proposals should be disapproved for the following reasons:

The AHC-TWB report that was instrumental in many of the provisions indicates that connections were tested, but in fact, no exposed connections were ever tested in any of the assemblies.

The compartment tests did not test any connections, nor did any of the standard ASTM tests, including the E84, E119, E814, nor the NFPA 285 tests.

The full scale test did not have any exposed connections, yet the code explicitly notes exposed steel and metal caps or brackets allowed in type IV construction within the wood chapter. The exposed metal connectors and their fasteners penetrate well beneath the typical char layer of the structural member, significantly reducing the strength of the member at and near the connection itself. This can create many hot spots and potential critical structural failure locations throughout a tall building. No other tests addressed this issue either.

Adhesive based splice connections remain unproven, the overall adhesive requirements being based on a testing protocol derived after a failed test.

The Small Scale Adhesive Qualification Test Protocol (CSA 077 SSA.2) could conceivably be directed toward such connections or splices, but it is a test that lasts only 5 minutes per side of the tested specimen.

As an additional note, the full scale test was run on only a two storey structure, leaving any critical structural connections that may have been needed to support only a single storey above. With code proposals allowing for many times this, these concerns should be much more carefully vetted before approval.

It should also always be remembered that in no other type of tall building allowed by the code, is the structure itself also fuel for the fire.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There would be no cost increase associated with my comment because if the code proposal were defeated, there would be no change in the building allowable from the current code.

Public Comment 7:

Proponent: Robert Grupe, representing Grupe Gypsum Consulting, LLC (rcgconsult@outlook.com)requests Disapprove.

Commenter's Reason: Overall building performance is predicated on the individual systems that comprise the structure. Further these systems are a series of individual building materials that are integrated based on their performance attributes, and compatibility with adjacent building materials. The proposed Tall Wood-frame construction is based primarily on the use of Cross Laminated Timber, CLT. However the proposal does not address potential compatibility issues, and in some cases lacks critical data to support required performance. Therefore, the CLT, system is not ready for use in wholesale high-rise construction. There are at least two critical system design areas that require additional testing and verification. These two examples are offered here to provide areas of specific concern. These examples are expressed in specific published white papers on the use of Cross-Laminated Timber.

The first example is on acoustics, specifically that of sound transmission through floor-assemblies. The current International Building Code has established minimum requirements for floor-to-floor transmission. In a published white paper entitled **Mass Timber High-Rise Design Research: Museum Tower in Los Angeles Reimagined in Mass Timber** (2015) the following statement is made regarding acoustics:

Testing is required to determine the ability of this assembly to obtain the code-required acoustic performance.

The paper covered the design of a timber-framed high-rise building. The acoustical design of the structure was centered around two floor-ceiling systems proposed for this project, both of which did not have any acoustic testing to substantiate compliance. The above comment followed a written description of each proposed floor/ceiling assembly.

Another issue of concern relating to additional required research is the proper design of connections that can accommodate the naturally occurring shrinking and swelling of CLT members primarily due to seasonal changes. The issue is the compatibility and serviceability of sealants and membranes that are incorporated into the CLT system. The following is taken from the **CLT Handbook** (2013):

Differential movement between CLT and other wood-based products or materials (in case of mixed materials and systems) need to be taken into account at the design and detailing stages due to potential shrinkage-induced stress that could undermine the connection capacity in CLT. More information and guidelines related to detailing will be provided in future versions of this document as additional studies need to be performed.

The point to be made here is that these are critical components in system and ultimately building design that require additional testing and research. It is obvious from the above mentioned white paper and handbook that the composite action of the independent building materials that make up the building systems have yet to be fully researched, tested, and detailed for use in general construction.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 8:

Proponent: Patrick Hainault, representing Self (path@matsenford.com) requests Disapprove.

Commenter's Reason: "Tower of Fire destroys LA apartment complex under construction." This headline in the December 8, 2014 LA Times barely scratches the surface in describing the dangers from fires in buildings under construction when those buildings are framed with wood and wood-based materials. This fire not only destroyed at least 239 of the rental units and 2/3rds of the complex at the Da Vinci Apartments but caused significant damage to neighboring buildings and infrastructure, and greatly burdened the surrounding community in general. Yet, this proposal will dramatically raise the allowable heights and areas of buildings made from combustible materials.

It is not rationale to increase the allowable height of buildings as in this proposal when significant problems in much smaller buildings still present a well-documented risk to life and property. The assembly should overturn the committee decision to effectively prohibit the type of proposed construction until and if it can be proven safe during and after construction. The following paragraphs expand on the issues the assembly should consider in evaluating this proposal.

How do we even begin to come to grips with the risk to adjacent properties and occupied buildings during the construction phase when an 18-story wood structure allowed by this proposal is burning in a suburban or urban area? Without safeguards well beyond those currently in the code (or proposed as part of a series of related proposals) to protect adjacent properties and infrastructure, the impacts will be devastating. For example, the Da Vinci fire caused:

- Damage to adjacent buildings. At least four nearby buildings were damaged. The building at 221 N. Figueroa St., where the computers and cubicles melted, had significant damage on its 15 floors, with 300 windows blown out. Three floors were also damaged in the Los Angeles County Department of Health Services building at 313 N. Figueroa. LA Department of Water and Power staff identified at least 160 damaged windows. A Los Angeles Department of Building and Safety spokesman reported windows blew out in the north tower of its department headquarters, and the heat and smoke triggered sprinklers that soaked carpets and desks. Overall, the Da Vinci Apartments fire caused an estimated \$111.5 million in damages, including \$80 million in damage to city properties from the fire and the water used to extinguish it and \$20-\$30 million to the apartment complex.

- Damage to Infrastructure. A Caltrans spokesman estimated the fire caused \$1.5-million damage to the freeway. Roads were closed around the area including a major commuter route during rush hour. Caltrans officials reported an exit sign over the 110 Freeway melted and would have to be replaced, forcing another freeway closure later the same week.
- Extensive impacts on the community. The attached study of the economic risk to taxpayers and the community posed by mid-rise apartments produced by assistant adjunct professor Urvashi Kaul at Columbia University captures the total cost impacts from fires like the Da Vinci apartments and smaller incidents. This study finds that:
 - In Los Angeles County, alone, fires in mid-rise residential buildings with combustible frames could have a negative impact of \$22.6B over 15 years, including \$17.14B in direct losses from property damage.
 - On average, fire in a mid-rise residential building constructed using combustible framing material costs the Los Angeles County a total of \$141.81 per square foot in potential economic impact and \$2.38 per square foot in lost tax revenues.
 - Potential impact the County may face in a single year could be \$1.7 billion, including \$1.3 billion in direct property damage.

The assembly is also urged to reconsider the argument that cladding requirements proposed to address fires in buildings under construction will resolve these issues. As demonstrated in a large fire from 2015 in a wood-framed apartment building in Edgewater, NJ, cladding will not stop a fire from spreading once the framing in part of the building ignites. It doesn't create a barrier between unexposed framing and exposed framing, but only provides some resistance to ignition from within or outside of the building. The Edgewater fire spread rapidly throughout the buildings once framing behind a wall was ignited during repairs to the occupied and fully-clad building.

The Da Vinci and Edgewater fires are not uncommon incidents. Dozens of similar fires have occurred (see more at <http://buildwithstrength.com/america-is-burning/>) in buildings under construction since the market began broadly taking advantage of relatively recent changes to the IBC that allowed taller and larger wood-framed buildings. In a similar fire in Houston, the life of a construction worker literally hung in the balance as he was rescued from a burning wood framed building just seconds before the stories above came crashing down. The assembly can prevent these types of risks from greatly expanding by disapproving this proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 9:

Proponent: William Hall, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests Disapprove.

Commenter's Reason: At the recent ICC Committee hearings in Columbus, OH, your committee **Failed you**. The general committee charged with looking at proposals and weighing justification **FAILED** to do their job when it came to Tall Wood Buildings. Despite overwhelming testimony that fire tests were inadequate, the committee simply ignored the fact that the TWB ADHOC committee only considered a two story residential structure during testing, and then used **'Engineering Judgment'** to determine that those results will be sufficient for 18 stories.

WHERE is the testing for all the other occupancy groups? 100% increases in story height are proposed for other use groups **without any justification**.

The ICC TWB ADHOC Committee has taken it upon themselves to develop a prescriptive TWB approach that **exceeds** the allowable heights of every country in the world. The United States just recently began looking at Mass Timber for taller buildings and yet, if this proposal goes through, we will allow mass timber 6 stories higher than any other country.

Not only will the U.S. allow the tallest buildings, we will also allow 12 story Mercantile, Storage and Factory to be built **without** gypsum covering on 40% of the CLT surface.

While mass timber may be an acceptable building material, it has not gone through the rigors of that are needed for high rise buildings. **Do not let the U.S. be the testing ground for these Tall Wood Buildings.**

Vote Disapproval

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No effect

Public Comment 10:

Proponent: James Narva, National Assoc. of State Fire Marshals, representing National Assoc. of State Fire Marshals (jnarva@narvaassociates.com) requests Disapprove.

Commenter's Reason: The National Association of State Fire Marshals (NASFM) opposes the committee action to approve G75-18, G80-18, and G84-18 as submitted.

The proponent(s) of these proposals (TWB) are attempting to validate, and codify, various changes to the tables regarding height, area, and stories based, in part, on professional judgment of the committee. This concern is exacerbated by the understanding that the historic basis for the underlying table values were themselves somewhat arbitrary. Continued consideration of the TWB concept deserves a continuation of testing, evaluation, an abundance of caution, and always a default to the side of safety.

While NASFM doesn't dismiss the concept out of hand, we do feel the current proposals go too far, too fast, in an area of significant and long-lasting importance. The NASFM Model Codes Committee has observed the process and had members present at various meetings and TWB test burns.

In support of our opposition, we ask ICC members to consider the following aspects of these proposals:

- There is no scientific basis for increasing height and area limits beyond what is currently allowable in code for heavy timber buildings.
- There has been no live fire testing at or near the limits being proposed for these buildings.
- There has been no wind aided fire testing conducted.
- There is incomplete data regarding the fire loading of test burn buildings.
- There was no quantitative or qualitative analysis performed in the testing to measure smoke production from the materials
- There was no testing performed to evaluate the effects of exterior fires or how CLT materials are tested to NFPA 285 for compliance
- Professional judgement is insufficient justification for a change of this magnitude.
- No indication that any seismic testing has been performed or evaluated which goes to the issue of resiliency and sustainability.
- To allow a proliferation of larger, taller wood buildings without proper testing and justification is premature and would impact the fire suppression environment significantly.

In the Reason section of each of the three proposals it states the performance objectives for TWB are:

- No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.
- No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.
- No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.
- No unusual fire department access issues.
- Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.
- Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios.
- The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

Since no full-scale live fire testing has been conducted in buildings constructed to the limits being proposed, and the limited application of external influences to fire behavior, it is extremely difficult to accept that these proposals meet the committees own stated objectives. We are left with professional judgment as the only quantifiable substantiation presented for their passage. In addition, the reason statement places an over reliance on the presence of fire sprinklers. NASFM steadfastly supports the use of fire sprinklers. However, we are cognizant of the fact that sprinklers can never be 100% effective given the impact of human behavior in the areas of design, installation, maintenance, and intentional disabling.

NFPA *Sprinklers in Reported U.S. Fires during 2010 to 2014 Fact Sheet*, July 2017, states, "Sprinklers operated effectively in 88% of the fires large enough to activate them and reported sprinkler failures (660 per year) were twice as common as reported fires in which sprinklers were ineffective and did not control the fire."

- 40% of the combined sprinkler problems were due to system shut-offs.
- In three of every five (59%) incidents in which sprinklers failed to operate, the system had been shut off.
- In half (51%) of the fires in which sprinklers were ineffective, the water did not reach the fire.
- The term highly reliable as used by the TWB committee is subjective at best. While it is agreed that sprinklers provide a valuable life-saving service, it is speculative to base a major part of justification on this one item.
- Code committees, fire service organizations, and fire safety advocates have rightly demanded data to support decisions related to code changes. NASFM feels the limited testing, in conjunction with a proposed commitment to conduct additional tests, is insufficient currently to warrant changes of this magnitude.

On behalf of the National Association of State Fire Marshals we urge the membership to oppose the committee recommendation to approve this code change.

Bibliography: NFPA, *Sprinklers in Reported U.S. Fires during 2010 to 2014 Fact Sheet*, July 2017

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no cost increase or decrease associated with this comment due to the fact that it is a comment for dismissal of the original proposal.

Public Comment 11:

Proponent: Tien Peng, representing National Ready Mixed Concrete Association (tpeng@nrmca.org)requests Disapprove.

Commenter's Reason: While the Ad Hoc Committee had intended to validate the fire performance of cross laminated timber in fire conditions of buildings, the AWC/ATF compartment testing was limited in scope and not a thorough predictor of fire behavior for high rise building made of a new material. The testing so far is insufficient to capture the fire response characteristics in question. No tests were done to factor in wind, exterior performance, panel connections or moisture, which impacts material performance, fire-fighting and property damage. CLT is a great innovation for the wood industry but it s not ready for prime time and it s certainly not ready for us to build safely to 270 feet and 18 stories. The ICC should not adopt code provisions that will put people at risk.

1. CLT Reliability and Predictability Issues

Cross laminated timber does not have a long enough history to demonstrate their reliability and predictability. The structural design of modern tall buildings is governed by the need to efficiently transfer loading, particularly that from wind, whilst providing increasingly complex building functionality. The use of cross laminated timber implies a highly optimized systems which means the least amount of material to enabled efficient load transfer. Thus, in the event of a fire there is an increased risk not typical in mid-rise constructions, and especially not in a two-story mock up in a lab.

The NFPA with ARUP *Fire Safety Challenges of Tall Wood Buildings*paper noted (NFPA 2013)[i]:

- In a real fire situation, the load-bearing elements in CLT are expected to load-share , or redistribute in a method that is not easily predicted in simple fire testing.
- Previous CLT fire testing has resulted in delamination and char fall-off when exposed to fire conditions.
- This has the potential to increase the fire temperature and burning rate within the compartment, and could impact the structural fire resistance at later stages in the fire duration.

The full-scale fire testing in Norway (SPFR A15101 2016)[ii] showed:

- The temperature increased fast and flashover was reached after four minutes.
- Temperatures were significantly higher than the standard time-temperature curve according to EN 1363-1
- The fire did not cool down before manual suppression was initiated when the test room collapsed 1-hour 36 minutes after ignition
- The sprinklers in the adjacent corridor did not stop the fire from spreading out from the room of origin.
- The charring rate varied much faster than expected

We should not be putting lives in high rises at risk with this level of material unpredictability.

2. Exposed CLT Fire / Moisture /Delamination Issues

The National Institute of Standards (NIST) tests complete previously said there were concerns that flashover occurred earlier with CLTs, heat delamination of the exposed CLT affected its fire performance and a large re-flash occurred on the exposed wall with delamination of the second ply of the CLT. (NIST 2017)[i]

While fire departments understand the risk of collapse with solid wood, there is not enough documentation or history of bonded or laminated wood structures, and they may fail sooner under fire conditions. The problem is that under fire conditions an adhesive may either thermally soften or chemically degrade causing the member to lose its strength, leading to structural collapse. Hence, we see delamination from the NIST testing as well as the very real construction failure on portions of the new College of Forestry building at Oregon State University where a large section of subflooring made of cross-laminated timber gave way between the second and third stories.

Moisture is an important issue for delamination and in many parts of the country the laminated mass timber panels will experience an environment which may exceed the testing limits. Wood will change in all three orthogonal dimensions with changes in moisture, and the changes are not even. This not only means that some species swell more because of their higher density, but also wood of non-uniform density displays non-uniform swelling. Moreover, as wood swells and shrinks,

adhesives do not follow with the same volumetric expansion. RDH Building Science full-scale mock-up study (Lepage 2017) [ii]notes that, The research indicates that CLT and mass timber is susceptible to dangerously high moisture contents, particularly when exposed to liquid water in horizontal applications. and other research indicate that CLT is at risk of structural damage by decay and rotting fungi (Zabel and Morrell 1992)[iii]

Clearly, we should not be putting lives in high rises at risk with this level of material unpredictability.

3. Fire / Connections Vertical Fire Spread

All connections used in current projects are proprietary and no information is publicly available regarding their performance. In a high-rise fire event, it is essential that the fire be prevented from spreading upwards or downwards from the floor of origin, endangering the lives of those waiting on more remote floors. Typically, the floor slab provides a robust barrier inhibiting external fire spread so long as it remains firmly supported by the structure. However, the AWC/ATF compartment fire testing had not adequately accounted for the connections in the CLT technologies to meet this crucial objective. The deformation of the connections when exposed to fire can expose gaps and flammable materials which can lead to spread both upwards through flaming, and downwards through dripping molten materials. Once fire starts spreading away from the floor of origin the safety of the occupants is compromised. Examples of vertical fire spread include:

- Las Vegas Hilton, USA: 22 Stories in approximately 25 minutes
- Caracas Tower, Venezuela: 17 floors in a 24-hour period
- Windsor Tower, Spain: 19 floors, ~7 hours for spread, 24 hours total fire duration
- TVCC Tower, China: 44 floors, around 15 minutes

4. Fire / Stack Effect

A similar concerning pattern emerges when discussing wind and air movement fire performance. One problem common to high-rises but not found in low-rise buildings is the stack effect movement of air inside the building. This air movement is critical to understand what happens during a fire event, as it can intensify a fire or allow flames and combustion gases to move beyond the room of origin. Fire personnel responding to a high-rise fire event need to understand where smoke and toxic gases may be going. Yet, shrinkage, moisture and creep, common in wood products including CLT, will create unpredictable opportunities for air movement within a building.

Air pressure and thermal differential with the use of CLT panels can shift the neutral pressure plane of the building. In cold weather (positive stack effect), the velocity of air channeling into the core from the lower floors is a very real concern to the occupants when they have to defend in place as well as fire service if the fire egress is compromised with smoke. In warm weather (reverse stack effect), where typically the staging floor is two floors below the fire floor, there can be concern of contamination, if there is unpredictability of where the fire path may be taking.

5. Fire / Wind

We typically associate wind with brush and wildland fires but it is just as important in structural fires.

- In 2009 a Texas probationary fire fighter and captain die as a result of rapid fire progression in a wind driven residential fire. Sustained winds from east/south-east at 17 mph with gusts up to 26 mph.
- Virginia Firefighters Battle Three-Alarm Townhouse Fire in 2011. In assessing the high winds and the fire conditions Battalion Barnes says fire crews tried to attack the flames inside two townhouses, but were forced back by intense heat and falling ceilings.
- In 2012 Prince George s County (Maryland), firefighters arrive on scene to a structure fire with winds impacting the rear of the structure. Shortly after forcing the front door open, they saw a dramatic change in fire behavior. As they made entry, they quickly experienced high velocity and high temperature gases, injuring seven firefighters, two critically.

The American Wood Council compartment fire tests did not account for wind loads.

Wind can add to the hazard to a low-rise fire, but it is most concerning around the upper floors of tall buildings. And high-rise fires create unique safety challenges for occupants and firefighters, even without the influence of wind. Wind can change the FLOW PATH of a fire and in some cases create a blowtorch effect and untenable conditions. When a window in the fire apartment fails, the influx of wind can create significant and rapid increases in the heat production of a fire. Smoke and heat spreading through corridors and stairwells, for instance, can inhibit occupants ability to escape and can limit firefighters ability to rescue them. Conditions in a corridor are of critical importance because it is the route that firefighters use to approach a fire and that occupants use to exit a building.

During the course of any structure fire, the wind may also influence exterior conditions and firefighter safety. Accelerated winds near high rises are caused by the downdraft effect, where the air hits a building and, with nowhere else to go, is pushed up, down and around the sides. The air forced downwards increases wind speed at street level. Tests conducted by National Institute of Standards and Technology (NIST 2012), the Fire Fighting Technology Group, FFTG, on positive pressure ventilation determined that an external wind speed of as low as 10 mph could cause a vented room within a structure to quickly spread from an apartment unit to a vent point, represented by a stairwell door. The spreading had floor-to-ceiling and wall-to-wall fire involvement with blowtorch effects. Moreover, if several towers stand near each other, the channeling effect, a wind acceleration created by air having to be squeezed through a narrow space. This Venturi effect will endanger the adjacent buildings.

6. Fire on Exterior

The AWC/ATF compartment fire tests did not account for exterior fire conditions and the proposed exterior proposal does not meet the required testing of CLT assemblies.

An important aspect of fire behavior in the affected building involves the burning behavior of materials on the exterior. While the AWC/ATF test demonstrated an understanding of CLT in an interior fire situation, the circumstances contributing to ignition scenarios of the exterior can be equally complex and equally important. In the past few years we have seen a number of deadly high-rise fires that propagated on the exterior of the structure.

- 2018 Almas Tower in Dubai, UAE
- 2017 Marco Polo apartment complex in Hawaii
- 2018 Grenfell Tower fire in West London

Simply testing the interior fire scenario does not capture potentially important parameters affecting CLT elements in tall wood buildings. If a fire in a heavy-timber building is not extinguished by the initial attack, a tremendous conflagration with flames coming out of the windows will spread fire to adjoining buildings by radiated heat. In a high-rise fire event, it is essential that the fire be prevented from spreading upwards or downwards from the floor of origin, endangering the lives of those waiting on more remote floors.

Notably missing from the proposals is how the mass timber exterior assembly in buildings over 40 feet in height would comply with NFPA 285, *Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Nonload-bearing Wall Assemblies Containing Combustible Components*.

- *Section 1403.5*: For combustible water-resistive barriers in buildings over 40 feet in height of Type I, II, III, or IV construction.
- *Section 1407.10.4*: For metal composite materials (MCM) used on buildings of Type I, II, III, and **IV** construction.
- *Section 1409.10.4*: For high-pressure decorative exterior-grade compact laminates (HPL) exterior wall coverings used on buildings of Type I, II, III, and **IV** construction.
- *Section 1509.6.2*: Combustible mechanical equipment screens used on buildings of Type I, II, III, and **IV** buildings.
- *Section 2603.5.5*: Exterior walls of buildings of Type I, II, III, and **IV** construction of any height incorporating foam plastic insulation, except for one-story sprinklered buildings.

This is a requirement yet there is no reference to NFPA 285 testing of exterior CLT assemblies. One test by Nordic Engineered Wood published under the Canadian ULC S134 is not enough of a sample size to validate the tall wood proposals. Again, there is not enough historical fires with cross laminated timber to provide information that can be used in an 85-ft building, much less one at 270 feet.

7. Limits of Redundancy

The ICC TW-AHC claimed the added safety factor of active sprinkler systems adds to the safety of the proposals. Without a doubt, the inclusion of fire sprinkler systems in our buildings since the late 1980s has been effective at increasing the chances of survival in a fire. But when systems don't operate as intended (such as in a freeze failure with water damage) or fail in a high-rise fire condition, the impact can be large, not just in monetary terms, but also in the lives of the occupants and fire fighters.

The full-scale fire testing completed in Norway showed the sprinklers in the adjacent corridor did not stop the fire from spreading out from the room of origin. (SPFR A15101 2016).^[iv] Moreover, according to NFPA's report *U.S. Experience with Sprinklers*, sprinklers were effective at controlling the fire in 96% of fires in which they operated, but sprinklers were only effective in 88% of the fires large enough to activate them. The reported sprinkler failures (660 per year) were twice as common as reported fires in which sprinklers were ineffective and did not control the fire. A National Institute of Standards and Technology (NIST) study, *Estimates of Operational Reliability of Fire Protection Systems*, also demonstrates this over-reliance on fire sprinklers is misguided.

8. Untested Reference Standard

State and local governments that adopt and enforce model building codes which references a number of standards. Yet, the proposals regularly cite the newly referenced standard, *ANSI/APA PRG 320-2018: Standard for Performance-Rated Cross-Laminated Timber*, an untested document. The reference to ANSI/APA PRG 320-2018 resolves nothing and takes no legal responsibility for performance failure. APA PRG 320 has no real history of use or validation as a reliable document and no jurisdiction refers to this document. It is premature to utilize a standard that is rarely referenced and start building to 18 stories from it.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed public comment would **reduce cost of construction**. Substantiation and references below.

1. Research:

A recent feasibility study [[i]] reveals that CLT construction is significantly more costly than other well-established construction methods such as concrete. Renowned structural engineers, Cary Kopczynski & Company found that the cost of the CLT structural system for a typical 10 story apartment building would cost \$48 to \$56 per square foot compared to \$42 to \$46 per square foot for concrete, translating nearly **20% premium** for Cross Laminated Timber.

2. Brock Commons, British Columbia

Per "University of British Columbia: Report to The Board of Governors, Tall Wood Student Residence, Brock Commons Phase 1" Report [[ii]], dated September 30, 2014,

- "The capital cost for the project is estimated at \$44 million (\$40m standard construction, plus \$4m wood premium)."
- "The \$4m estimated premium for advanced wood design and construction is to be funded from external sources including \$3.45m secured to date from the Canada Wood Council (CWC) and Forest Innovation Investment."

This is a **10% premium** for Cross Laminated Timber at the 18-Story Brock Commons.

3. Framework Oregon:

Per the January 5, 2018 *Portland Oregonian* article "Wheeler Defends Decision to Invest in Pricey Complex" of the Portland Oregonian[[iii]],

- "While each unit is expected to cost an average \$480,000 to build, the city's contribution will amount to \$100,000 per apartment."
- Despite a pledge from Mayor Ted Wheeler to bring down the cost of affordable housing in Portland, the Portland Housing Bureau had nonetheless awarded the building \$6 million toward the \$29 million total. (A **21% subsidy** by the taxpayers for the 12- Story Framework project).

By the July 16, 2018 *Willamette Week (WW)* article "Plans for Record-Setting Timber Tower in Downtown Portland Fall Through" [[iv]] reported,

- The building, which was slated to include 60 *affordable* apartments, was projected to cost \$651.43 per square foot, *WW* reported in December. (The 660-square foot two bedroom apartments were projected to cost \$567,389 to build.)

4. Lumber Pricing:

And this doesn't consider the recent price increases of softwood lumber that have risen wildly from \$424 per board foot a year ago to \$536 in the second quarter of 2018. That's a **26% increase** in just one year. At the same time, concrete prices rose at a stable rate of 5%.

Public Comment 12:

Proponent: Adam Shoemaker, representing ClarkDietrich (adam.shoemaker@clarkdietrich.com) requests Disapprove.

Commenter's Reason: IBC Section 602.2 states that Types I and II construction are those types of construction in which the building elements listed in Table 601 are of noncombustible materials, except as permitted in Section 603 and elsewhere in this code.

In table 601, Type IB and proposed Type IVB have the same Fire-Resistance Rating (FRR) requirements. I don't believe you can justify in this proposal to allow combustible AND non-combustible elements with the same FRR to have the same allowable building heights in table 504.3. It is not reasonable to extrapolate a two-story fire test into a 180-foot tall building with combustible structural elements, when a structure with non-combustible elements has the same allowable height.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No cost effect.

Public Comment 13:

Proponent: Richard Swan, representing International Association of Fire Fighters (rswan@iaff.org) requests Disapprove.

Commenter's Reason: At this time the International Association of Fire Fighters is unable to support any change in the height or area of this type of construction. We believe there is still not enough research into many of the components and there is still little data on the materials and components used in the building of these products.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
If not adopted no change to the public on cost.

Public Comment 14:

Proponent: Larry Williams, representing Steel Framing Industry Association requests Disapprove.

Commenter's Reason: The leap in assumptions that fire tests on a two-story mock up can be extrapolated to fire performance of an 18-story building is an unreasonable extension in the allowance for use of "professional judgement." Proponents of G108-18 and related proposals state that the expected fire performance of mass timber buildings was "validated by a series of full scale multiple-story fire tests." However, the actual model tested was only two storeys in height, and from this test users are expected to have confidence that a 180-foot tall building construction with cross-laminated timber will exhibit identical performance.

The fundamental problem of this assumption is that some characteristics of large fires have not been observed on small fires, either because they do not occur in small fires or because they are too small to be detected. It seems likely that a different set of controls of fire behavior may take over after a fire reaches a certain size or intensity. The difficulty of extrapolating from small to large fires is further complicated by the fact that behavior of fire is a pattern phenomenon--the behavior at one point is often dependent on the behavior at another point. The behavior of one part of a fire may change even if burning conditions at that point do not vary when the characteristics of the fire at some other point changes.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with current requirements.

Public Comment 15:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18,

G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and 1103.5 of the International Fire Code.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Reason: Since development of the early building codes, and even with the International Building Code today, building size has typically been determined based on a combination of factors; (a) the occupancy type for the building; (b) the materials used to construct the building; and (c), the presence of automatic sprinkler protection. Regarding occupancy types, the fire loads associated with contents found in a particular occupancy group and the relative risk of danger to the occupants from fire because of the occupancy characteristics are considered. For the materials used to construct the building the presence of combustible materials used in the construction of the building structure itself are key. As the quantity of combustible materials decreases the relative risk of fire size, spread of fire to adjacent properties, and danger to the fire service are less such that the building sizes are allowed to increase. Another factor considered from a building materials aspect is the degree of fire resistance provided. When structural fire resistance is provided to the load carrying structural members the risk of damage to the structure or potential for collapse is also considered reduced. Finally, sprinkler protection has been utilized as a factor in allowing increases in the size of buildings. A good discussion of these concepts can be found in the report *"Fire-Resistance Classifications of Building Construction"*, Report BMS92, National Bureau of Standards, October 7, 1942.

One thing of importance in the report is that buildings constructed of noncombustible materials and provided with at least 1-hour of fire resistance (classified as Fireproof construction in the report) were considered to be a much lower risk to the safety of the occupants and fire service, and to the spread of fire, than buildings constructed of noncombustible materials with little or no fire resistance (classified as Incombustible construction in the report). The same was said for buildings constructed with a combination of noncombustible exterior walls and interior combustible structural materials (classified as Exterior-Protected construction in the report). Hence the report advised that these noncombustible buildings with at least 1-hour fire resistance could be built to taller heights due to the lack of combustible materials in the structural systems combined with some level of fire resistance.

Unfortunately, when you look at Tables 504.3 and 504.4 in the 2018 International Building Code, building occupancies with low internal fire loads such as Group B, Business and Group R, Residential, when constructed of one-hour fire rated noncombustible construction (i.e. Type IIA), are not given due credit for the enhanced fire risk attributes when compared to

buildings of one-hour fire resistance construction using a combination of noncombustible exterior walls and interior combustible structural materials (i.e. Types IIIA and Type IV). This is especially apparent when comparing these Group B and R occupancies to Group F, Factory and Group S, Storage Occupancies in Table 504.4.

Recognizing the lower fire risk of Type IIA construction compared to Type IIIA and Type IV construction, this code change proposes permitting Group B and Group R buildings of Type IIA construction to be built one story and 15-feet higher. These increases are attributed to elimination of the fire load present in the structural components, combined with the 1-hour fire resistance for these noncombustible structural elements, consistent with the fire safety premises for building construction types in BMS92. The new story heights are increased in proportion to the story heights/number of stories for existing buildings of Type IIA Group B and Group R, with rounding to be consistent with other values in Table 504.3.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Presently Group B and R occupancy buildings of noncombustible construction with 1-hour fire resistance (i.e. Type IIA) are only allowed to be built to the same story height as buildings of Group B and R occupancy with a combination combustible/noncombustible construction and a 1-hour fire resistance (i.e. Type IIIA and IV). However, to build Group B or R occupancy buildings of noncombustible construction taller, the fire resistance of the structural elements (i.e. columns and floors) are required to be increased to 2-hours (i.e. Type IB construction).

This proposal recognizes the improved fire safety of Group B and R occupancy buildings of Type IIA construction, compared to Types IIIA and IV construction of the same occupancy groups, since Type IIA buildings have a reduced fire load associated with the reduced use of combustible structural components. Allowing one additional story height of Group B and R occupancy buildings without having to increase the fire resistance of columns and floors will reduce the cost of construction of these noncombustible buildings Group B and R occupancies.

G76-18

Public Hearing Results

Errata: Missing table cells have been restored.

Committee Action:

Disapproved

Committee Reason: The committee felt that a newer study and analysis is needed before making this change in the current code. In addition, the proposal conflicts with Section 510.6. (Vote: 13-1)

Assembly Action:

None

G76-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Skalko, representing Precast/Prestressed Concrete Institute (svskalko@svskalko-pe.com); Jason Krohn, Precast/Prestressed Concrete Institute, representing Precast/Prestressed Concrete Institute (jkrohn@pci.org); William Hall, Alliance for Concrete Codes and Standards, representing Alliance for Concrete Codes and Standards (jhall@cement.org)requests As Submitted.

Commenter's Reason: REASON: G76-18 is recommended for Approval As Submitted based on an additional technical study to answer the General Committee concerns.

Previously in the support statement for G76-18 it was identified that buildings constructed of noncombustible materials and provided with at least 1-hour of fire resistance (classified as Fireproof construction in the report) were considered to be a much lower risk to the safety of the occupants and fire service, and to the spread of fire, than buildings constructed of noncombustible materials with little or no fire resistance (classified as Incombustible construction in the report). The same was said for buildings constructed with a combination of noncombustible exterior walls and interior combustible structural materials (classified as Exterior-Protected construction in the report). These conclusions were cited from the report *Fire-Resistance Classifications of Building Construction*, Report BMS 92, National Bureau of Standards, October 7, 1942.

In their reason for Disapproval the General Committee stated *a newer study and analysis is needed before making this change in the current code*. Responding to this reason for disapproval an additional analysis has been performed to show that a building constructed of noncombustible materials poses a far less risk to the occupants and fire service than one constructed wholly or partly of combustible materials. This analysis was done by comparing the fire load density (FLD) of the occupied floor for an example Group R, Residential constructed of Type IIA construction and the same building constructed of Type IIIA construction.

The FLD can be defined as the fire load per unit floor area of a building and is well documented to reflect the total fire load in a building consisting of: (1) *combustible materials generally comprising furniture, equipment and stored objects goods*; and (2), *combustible components of the structural elements (permanent fire load) which can burn during a fire*. [p 1131, Chapter 35, SFPE Handbook of Fire Protection Engineering, Vol. 1, 2016.]. In comparing buildings of Type IIA construction with Type IIIA construction, the fire load portion of the FLD attributable to furniture, equipment, etc. can be treated as equal since it can be assumed the residents of a dwelling will have the same general fire load regardless of the building construction type. Thus, the main difference in the FLD of the building which can pose additional risk to occupants and fire service will be reflected by the permanent fire load of the structural components which can burn during a fire (e.g. the structural wood components).

The example building used in the analysis is a fully sprinklered, 5-story apartment building that is 23,056 square feet in footprint area. The typical floor plan and dimensions are shown in Figure 1.

Building structural features are approximately as follows:

- Exterior walls (bearing) - 2X6 fire retardant treated studs @ 16-in o.c. Total length 766 feet
- Interior walls between dwelling units (bearing) DBL 2X4 wood studs @ 16-in o.c. Total length 480 feet
- Interior corridor walls (bearing) - 2X4 wood studs @ 16-in o.c. Total length 580 feet
- Floor system 18-inch wood floor trusses, 3/4-inch gypcrete on 3/4-structural wood floor panel, 5/8-in Type X GWB on resilient channels.
- Roof system pre-engineered wood trusses (4:12 slope), 5/8-in structural wood sheathing, asphalt shingle roof

FIGURE 1

Typical Floor for 5-story

Apartment Building

The permanent fire load of the structural components of a Type IIA building can generally be considered insignificant since the components are required to be of non-combustible materials according to the IBC. For the Type IIIA building the analysis examined the structural fire load contributed by the framing members of the exterior walls, the interior dwelling unit separation walls, the interior corridor walls and the structural wood floor panels. The additional contribution to the fire load density by the combustible interior non-bearing walls within each apartment and the floor trusses were not included. These were not considered for simplicity of the calculations but their inclusion would significantly increase the fire load density for each floor of the building so the conclusions reported are conservative.

In Section 7.3.2 of NFPA 557, *Standard for Determination of Fire Loads for Use in Structural Fire Protection Design, 2016*, the heat of combustion value for materials derived entirely of wood can be accepted as the value of 15MJ/kg. Further, in recognition of the fire retarding properties of some wood products, Section 7.3.4.6 of NFPA 557 permits the heat of combustion value to be taken as 10 MJ/kg. These values, converted to IP units, were used in this analysis. The IP units used are 6448 BTU/LB and 4,299 BTU/LB, respectively.

The wood species used in buildings of Type IIIA construction can vary depending on location and structural design parameters however, conservatively, the wood density was assumed to be 33-LB/FT³. This value is consistent with the mid-range density for several wood species commonly used for light wood frame buildings. Taking into consideration a combination of wood studs, and top and bottom plates, the fire load contribution of wood for the three wall systems based on the heat of combustion of the wood can be summarized as follows [Ceiling height of the example apartment was specified at 8-ft 11-in]:

- 766 feet of 2X6 fire retardant wood studs for the exterior walls contributes approximately 61 million BTUs to the fire load per floor.
- 480 feet of DBL 2X4 wood studs for the tenant walls contributes approximately 68 million BTUs to the fire load per floor.
- 580 feet of 2X4 wood studs for the corridor walls contributes approximately 42 million BTUs to the fire load per floor.

In addition to the walls noted, consideration was also given to include the quantity of wood floor sheathing contributing to the fire load for the typical floor. Based on nominal 3/4-thick structural wood panels and excluding the floor openings for the two stairs and elevator shaft, the contribution is estimated to be 276 million BTUs per story for the 23,056 ft² example building floor area.

Thus, the fire load attributable to much of the wood framing on each story of the example building is over 400 million BTUs of fire load. Divided by the building area this results in an FLD attributable to the main light framed wood walls and floor deck of about 17,350 BTU/ft². This value makes it apparent why the BMS 92 Study referenced above concluded that noncombustible buildings with one-hour fire resistance (i.e. Type IIA) were considered a much lower risk to the safety of the occupants and the fire service, and to the spread of fire than buildings classified as Exterior-Protected construction (i.e. Type III) in the report.

To further illustrate this point, Figures 2 and 3 show two buildings under construction. Figure 2 is a 6-story building of noncombustible framing (i.e. like Type II). Figure 3 is a 5-story building of combustible framing (i.e. like Type III). These pictures illustrate the difference in the amount of combustible materials present based on construction type reflected by the analysis above.

Figure 2

Noncombustible Framing

Figure 3

Combustible Framing

Recognizing the lower fire risk of Type IIA construction compared to Type IIIA and Type IV construction, this code change proposes permitting Group B and Groups R buildings of Type IIA construction to be built one story and 15-feet higher. These increases are attributed to elimination of the fire load present in the structural components, combined with the 1-hour fire resistance for these noncombustible structural elements, consistent with the fire safety premises for building construction types in BMS92. The new story heights are increased in proportion to the story heights/number of stories for

existing buildings of Type IIA Group B and Groups R, with rounding to be consistent with other values in Table 504.3. This proposal is also consistent with story increase allowed for Group F and S occupancy buildings, which contain much larger FLD due to contents, when changing from Type IIIA construction to Type IIA construction in Table 504.4.

The other item the General Committee noted in their reason statement was that the proposal conflicts with IBC Section 510.6. Upon examination of Section 510.6 this conclusion is not correct. In Section 510.1 the code identifies that the following provisions in this section (i.e. 510), including 510.6, are for the purpose of exempting from, or modify, the specific requirements of Chapter 5, such as allowable heights and areas based on the occupancy classification and type of construction. Thus, Section 510.6 specifically allows a height increase for Type IIA buildings in Groups R-1 and R-2 up to nine stories and 100-feet in height provided the other requirements in the section are followed. Nothing would prohibit the code user from applying Section 510.6 if they wanted to build a Group R-1 or R-2 building of Type IIA construction up to nine stories and 100-feet provided that section is followed.

By the same token, the code does not require any of the provisions in Section 510 be met provided the normal height and area requirements in Chapter 5 are met. Approval of G76-18 will allow Group R-1 R-2 buildings of Type IIA construction up to 6-stories in recognition that the fire risk to occupants and the fire service is significantly reduced when combustible structural components permitted in 5-story Type IIIA construction buildings are removed when Type IIA construction is chosen.

Recommend APPROVAL AS SUBMITTED for G76-18.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Presently Group B and R occupancy buildings of noncombustible construction with 1-hour fire resistance (i.e. Type IIA) are only allowed to be built to the same story height as buildings of Group B and R occupancy with a combination combustible/noncombustible construction and a 1-hour fire resistance (i.e. Type IIIA and IV). However, to build Group B or R occupancy buildings of noncombustible construction taller, the fire resistance of the structural elements (i.e. columns and floors) are required to be increased to 2-hours (i.e. Type IB construction).

This proposal recognizes the improved fire safety of Group B and R occupancy buildings of Type IIA construction, compared to Types IIIA and IV construction of the same occupancy groups, since Type IIA buildings have a reduced fire load associated with the reduced use of combustible structural components. Allowing one additional story height of Group B and R occupancy buildings without having to increase the fire resistance of columns and floors will reduce the cost of construction of these noncombustible buildings Group B and R occupancies.

- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB and its various WGs held meetings, studied issues and sought input from various expert sources around the world. The TWB has posted those documents and input on its website for interested parties to follow its progress and to allow those parties to, in turn, provide input to the TWB.

At its first meeting, the TWB discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings:

1. No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.
2. No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.
3. No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.
4. No unusual fire department access issues.
5. Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.

6. Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

The comprehensive package of proposals from the TWB meet these performance objectives.

The TWB also determined that fire testing was necessary to validate these concepts. At its first meeting, members discussed the nature and intention of fire testing so as to ensure meaningful results for the TWB and, more specifically, for the fire service. Subsequently a test plan was developed. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of joints, and to evaluate conditions for responding fire personnel. The Fire WG then refined the test plan, which was implemented with a series of five, full-scale, multiple-story building tests at the Alcohol, Tobacco and Firearms (ATF) laboratories in Beltsville, MD. The results of those tests, as well as testing conducted by others, helped form the basis upon which the Codes WG developed its code change proposals. This code change proposal is one of those developed by the Codes WG and approved by the TWB.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit: <http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17.

Number of Stories

This proposal addresses the building height, in terms of the number of stories, for the three new construction types proposed by the TWB. As set forth in the proposal to Section 602.4, the three new types of construction are Types IV-A, IV-B, and IV-C. The Committee examined each proposed type of construction for its safety and efficacy with regard to each occupancy.

The following approach was considered appropriate for the heights of the new construction types, based on the conclusions of the Committee:

1. Based upon TWB review of fire safety and structural integrity performance, Type IV-B is equated to Type I-B for height (in number of stories). A noteworthy item is that, per Section 403.2.1.1 of the IBC, Type I-B construction is permitted to be reduced to 1-hour Fire Resistance Rating (FRR); however, the TWB does not propose to allow the same reduction for Type IV-B. As a result, the comparison is between 2-hr mass timber construction that is permitted to be partially unprotected, versus 1-hr Type IB construction, and the Committee believes that 2-hr mass timber construction that is partially exposed per the limits of proposed Section 602.4 warrants the same heights as allowed for 1-hr Type I-B construction;
2. Type IV-A should be somewhat larger than IV-B, as Type IV-A construction is entirely protected (no exposed mass timber permitted) and the required rating of the structure is equivalent to those required of Type I-A construction (3-hr rating for structural frame). However, the Committee did not find it acceptable to allow the scale of heights

(many of which are unlimited) of Type I-A to be applied to Type IV-A. Instead, the Committee applied a multiplier of 1.5 to the heights proposed for Type IV-B construction (rounded up or down based on judgment) in order to propose reasonable height allowances for IV-A construction;

3. The Committee viewed Type IV-C as sufficiently similar to existing HT construction, especially in terms of the percentage of exposed wood (it is permitted to be entirely unprotected), and the resulting contribution to fire. While the height in feet for Type IV-C is proposed to be equal to the height in feet of Type IV-HT, the Committee felt that additional stories was warranted in some cases. Therefore, in terms of stories, the Committee proposes additional number of stories for Type IV-C construction when compared to traditional Type IV heavy timber construction. The Committee feels that some recognition is warranted for the fire resistance rating requirements (Type IV-C has 2-hour rating on structural elements, whereas traditional Type IV Heavy Timber used dimensional wood, which is understood to yield an approximate fire resistance rating equivalent to about 1-hour construction) and provided that flexibility when developing height, in terms of stories, for Type IV-C construction. A multiplier of 1.5 was applied from the Type IV-HT heights to develop reasonable numbers of stories for Type IV-C construction.
4. While the base code seems to allow significant heights for buildings without sprinklers (e.g., Table 504.4 currently allows 11 stories for NS Type I-B construction for many occupancy classifications), the Committee believes that no additional heights over what is already permitted for Type IV should be proposed for the NS (non sprinklered) rows. As such, where separate rows are provided for heights for the NS condition, the proposed heights for Types IV-A, IV-B, and IV-C are the same as those heights already permitted for Type IV for the NS condition.

This methodology explains the majority of the recommendations included in this proposal. Specifically, for occupancy groups A, B, E, R, and U, the methodology described above accurately reflects how the height proposals were developed.

The Committee applied professional judgment (from both a fire safety and a structural perspective) to develop a draft table, cell by cell, for all occupancy types. After further examination, reduced heights were proposed for F, H, I, M, and S occupancy classifications.

For F-1 occupancies, the Committee proposed a height of 7 stories for Type IV-B construction (versus the 12 stories currently permitted for I-B construction). A multiplier of 1.5 was used to propose a height of 10 stories for Type IV-A construction (when rounded down). No additional height was proposed for Type IV-C construction (Type IV-C proposed at 5 stories, and 5 stories is already permitted by code for Type IV-HT).

For F-2 occupancies, again the Committee is proposing a reduced number of stories, with 8 stories for Type IV-B construction (versus 12 stories that would be derived from the methodology). Again, a multiplier of 1.5 was used to propose a height of 12 stories for Type IV-A construction. No additional height is proposed for Type IV-C construction (Type IV-C proposed at 6 stories, and 6 stories is already permitted by code for Type IV-HT).

A conservative approach also explains the proposed heights for Group H occupancies. For Group H-1, only 1 story buildings are permitted by Table 504.4 for all construction types, so the proposal was adjusted to also limit all of the new Type IV construction types to 1 story as well.

For Groups H-2, H-3, and H-5, heights were intentionally made equal to the existing Heavy Timber heights. In other words, there is no proposal to any increased heights over what is already allowed by code for these use groups.

Group H-4, being corrosives which represents a health hazard (but not necessarily a fire hazard) to occupants and first responders, was also reduced, slightly. The TWB proposes 7 stories for Type IV-B construction (equivalency to Type I-B would have yielded 8 stories). The proposal allows only 8 stories for Type IV-A construction. No additional height is proposed for Type IV-C construction (Type IV-C proposed at 6 stories, and 6 stories is already permitted by code for Type IV-HT).

For Group I, the Committee took a more conservative approach and proposed an equivalent number of stories for Type IV-A construction, as is provided for Type I-B construction (10 stories for both construction types and occupancy types). The allowable heights for Type IV-B construction were selected to fall between the 10 stories for Type IV-A and the number of stories for Type IV-C construction. The Committee proposed a height of 7 stories for I-1, and 6 stories for I-2. No additional height was proposed for Type IV-C construction (IV-C construction heights in floors is equal to the number of floors already allowed for Type IV-HT, 5 stories for I-1, 4 stories for I-2).

For Group M occupancies, the Committee again took a conservative approach, and proposed an equivalent number of stories for Type IV-A construction, as is provided for Type I-B construction (12 stories for both construction types). The proposal for Type IV-B construction is 8 stories which is based on the use of the multiplier of 1.5 with respect to the Type IV-A proposal. A modest increase (from 5 to 6 stories) is proposed for Type IV-C construction due to the higher requirement for structural fire-resistance.

For Group S, while the base code does not differentiate between S-1 and S-2 in Type I-B construction (both 12 stories), the Committee recognized that the base code does provide a difference for Group F (10 stories for F-1, 12 stories for F-2). As explained above, this led the Committee to propose lower heights for F-1, than for F-2. The Committee felt this was appropriate with respect to the hazard differences between F-1 and F-2. Rather than basing our proposal for S occupancies on the same starting point of 12 stories, the Committee decided to simply copy the proposed heights for Group F into the rows for Group S for both IV-A and IV-B construction types. No additional height is proposed for IV-C construction (IV-C proposed at 5 stories for both S-1 and S-2, same as existing Type IV-HT heights).

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance-rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

G80-18

Public Hearing Results

Errata:

The complete table is now shown

Committee Action:

As Submitted

Committee Reason:

We need to have increased heights for these new construction types based on all the work that has been done. Tweaks can be made and debated in the public comment process for other story heights. However, Canada has already set presidents for tall wood structures. We may already have overkill in fire protection features to address the additional stories. The information supporting this proposal is online on the ICC website for those that have concerns. (Vote: 12-2)

Assembly Action:

None

TUL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building height in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and 1103.5 of the International Fire Code.
- g. For new Group I-4 occupancies, see Exceptions 2 and 3 of Section 903.2.6.

- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Commenter's Reason:

We recommend that the Type IV-B mass timber designation be deleted from the tall wood building proposals.

The origins of the development of the types of construction were originally developed to “account for the response or participation that a building’s structure will have in a fire condition originating within the building as a result of the occupancy or the fuel load” (Example source from BOCA National Building Code 1993 Commentary). The modern day types of construction are parsed out into three primary categories of construction; noncombustible (Types I and II), noncombustible/combustible (Types III and IV) and combustible (Type V). Subcategories were created to identify the protection; Type A for protected and Type B for unprotected.

What we have within proposals G75-18, G80-18, G84-18, G89-18, and G108-18 is the addition of a new construction category that has been proposed based on the need to satisfy aesthetics based on the combination of Types IV-A and IV-C, which is a departure from the black and white construction categories based on construction that is either non-combustible or combustible. We feel this inappropriate for the codes to begin to designate designer type construction categories.

In the past such mixing and matching of construction types into building or structure is more suited to the IBC Section 104.11 (Alternative materials, design and methods of construction and equipment), or through use of the ICC International Performance Code or performance analysis. We feel that these are the most appropriate options for the mixing-and-matching of construction types in building design.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This will not increase or decrease the cost of construction as this code change proposal and public comment address information that was not previously contained in the code, therefore there is no cost impact when compared to present requirements.

Public Comment 2:

- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

Commenter's Reason:

The Virginia Fire Services Board opposes Proposal G80-18 as originally submitted. We propose that the allowable heights in this be proposal be reduced to those currently allowed for Type IV-HT construction until additional testing can be performed to validate the assumptions on which the currently proposed heights are based. While we do not oppose the concept of utilizing renewable resources, such as timber, in the construction of buildings, we are not convinced that 18-story “tall wood buildings” provide an acceptable level of safety to occupants or responding firefighters.

The reason statement for this proposal indicates that the Ad-Hoc Committee on Tall Wood Buildings (TWB) “discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings” including:

- Egress systems designed to protect building occupants during the design escape time, plus a safety factor.

- Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

There is no reference in the stated performance objectives related to protecting firefighters and other emergency responders during the time required to access and extinguish a fire. The Report on High-Rise Fireground Field Experiments, NIST Technical Note 1797, published in April 2013, indicates times between 21 and 23 minutes from fire ignition for fire crews to reach the 11th floor of a high-rise building, depending on crew size. These times are based on studies involving major metropolitan fire departments. There are many variables that could significantly increase these times, including time for notification of the fire department, turnout time, response time and vertical travel time to reach higher floors.

There were 14 proposals submitted by the TWB. Only one, G28-18, addresses the reliability of fire suppression systems. It requires the water supply to required fire pumps be supplied by connections to not fewer than two water mains located in different streets for tall wood buildings that are more than 120 feet in building height. This proposal does nothing to increase the reliability of fire suppression system in buildings less than 120 feet tall. In addition, it does nothing to increase the reliability of the suppression systems within the building itself. There is no requirement to demonstrate the reliability of the fire suppression system as compared to the evacuation time and risk of collapse. It should also be noted that this proposal allows the construction of tall wood buildings to a height of 65 feet with no requirements for fire suppression systems.

We acknowledge that fire tests have been conducted; however, we do not believe that the results of the fire tests provide sufficient justification to allow tall wood building to be constructed to heights of 18 stories. The original proposal cites "engineering judgment" as the basis for a comparative analysis between Type I and Type IV buildings and the extrapolation of two-story fire tests to 18 story structures. There has been no testing to demonstrate the performance of these structures after aging for a period of years or decades.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal does not change the method of construction; rather it limits the height to which the type of construction can be built.

Commenter's Reason:

This is a series of comments to modify the proposed height, stories, and allowable area of the new Type IV-A, Type IV-B, and Type IV-C proposed construction classifications as proposed by the Ad-Hoc Committee on Tall Wood Buildings.

There is concern on the formulas utilized are not fully supported by technical substantiation and are missing the needed technical support to allow the construction type to such heights. This change takes a moderate approach and reduces the allowable heights, area, and stories by a factor of 30%.

This proposed public comment doesn't dismiss the concept out of hand, we do feel the current proposals go too far, to fast in an area of significant and long-lasting importance.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change will modify the allowable heights and will not increase or decrease as the allowable heights are new to the code

Public Comment 4:

Proponent:

Gary Bridgens, representing Mass Timber Code Coalition (info@buildtallbuildsafe.com) requests As Submitted

Commenter's Reason:

PUBLIC COMMENT

SUBMITTED BY GARY BRIDGENS

ON BEHALF OF THE MASS TIMBER CODE COALITION

The Mass Timber Code Coalition has been organized to provide information on the code proposals drafted by the Ad Hoc Committee on Tall Wood Buildings

Mass timber is not new to the *International Building Code (IBC)*. Currently listed as Type IV Heavy Timber, this construction type is a proven option that fully complies with the structural and fire resistive requirements of the IBC. The code recognizes that mass timber is a fundamentally different material than dimension lumber used in more familiar stick built wood construction. The code also recognizes the inherent fire resistance of mass timber, where charring in a fire event provides protection of inner structures, as well as a consistent and predictable rate of charring.

With the expansion of the mass timber supply chain, panels of cross-laminated timber (CLT), nail-laminated timber (NLT) and glue-laminated timber (Glulam), requests for approvals of tall mass timber buildings (TMTB) by local authorities have become more common. Estimates by industry sources have identified 35 current proposals for tall mass timber buildings, ranging from 7 to 24 stories, in 21 different jurisdictions.

Importantly, this interest in tall mass timber construction has been reliant on various local codes and approval processes. The IBC does not currently account for these tall wood buildings, beyond the current Type IV Heavy Timber height and area limitations.

The Ad Hoc Committee on Tall Wood Buildings (AHC-TWB)

To ensure the IBC keeps pace with the changing construction marketplace, the Board of Directors of the International Code Council (ICC) appointed the Ad Hoc Committee on Tall Wood Buildings (AHC-TWB) in 2015. The AHC-TWB included members from the code official, regulatory, construction, engineering, architectural, fire services and materials communities.

The AHC-TWB was specifically charged with investigating the science of mass timber construction, undertaking any necessary new research and recommending any code changes needed to ensure safety in TMTB. The AHC-TWB set performance criteria of its own: any code change developed was required to achieve the following.

1. No collapse under scenarios of complete burn-out of fuel without automatic sprinkler protection;
2. No high radiation exposure from the subject building to adjoining properties that risk ignition under severe fire scenarios;
3. No unusual response from radiation exposure from adjacent properties that risk ignition of the subject building under severe fire scenarios;
4. No unusual fire department access issues;
5. Egress systems to protect occupants during design escape times plus a margin of safety;
6. Enhanced and redundant fire protection systems to ensure performance during various fire scenarios.

Code Change Proposals

After two years of work, the AHC-TWB has produced 14 code change proposals. All 14 of these proposals were recommended for approval by various ICC committees at the recent ICC 2018 Group A Committee Action Hearing.

The key change, G108-18, defines three new categories of Type -IV Mass Timber construction:

Type IV-A: 1 to 18 stories based on Occupancy Classification. 3-hour fire resistance rating with non-combustible protection throughout;

Type IV-B: 1 to 12 stories based on Occupancy Classification. 2-hour fire resistance rating with non-combustible protection on most mass timber surfaces;

Type IV-C: 1 to 9 stories based on Occupancy Classification. 2-hour fire resistance rating with non-combustible protection for critical areas; exit enclosures, etc.

Each new construction type defined by the AHC-TWB (Type IV-A, B and C) has fire resistance requirements as robust or more robust than those required for comparable non-combustible (concrete and steel) buildings.

Other provisions provide standards for mass timber manufacturing, height/area restrictions, active and passive fire protection systems, fire safety during construction, enhanced water supply requirements, and standards for sealants and adhesives.

Fire Resistance of Mass Timber

Citing fire and market concerns, both the Portland Cement Association and the National Ready Mix Concrete Association have criticized the AHC-TWB code change proposals as untested and unsound. However, these criticisms fail to consider that:

1. The purpose of the International Building Code is to provide building officials with the tools they need to ensure public and first-responder safety. It is not to choose winners and losers in the market, nor is it to defend any single industry's position;

2. Tall mass timber buildings already built are performing well;
3. Mass timber (and heavy timber before it) has undergone extensive fire resistance testing in multiple fire scenarios by Underwriters Laboratories, the Southwest Research Institute, the National Research Council of Canada and the U.S. Government's ATF Fire Research Laboratory, the world's largest indoor fire investigation lab.

Numerous mass timber floor/ceiling and wall assemblies have been tested at national laboratories using ASTM E119 standards. This testing history shows that mass timber has repeatedly achieved the hourly fire resistance requirements of the code. This is in part because of charring properties that provide a steady and predictable measurement of fire resistance. Additionally, detailed code requirements for non-combustible protection applied to the mass timber greatly enhance the hourly rating. Further, fire protection systems (active and passive) also ensure safety in mass timber structures.

The AHC-TWB benefitted from recent tests in 2017 at the U.S. ATF Fire Research Laboratory on full-scale mass timber buildings. Most tests assumed an unlikely failure of sprinkler systems:

1. Mass timber apartment with full fuel load. Fully protected by Type X gypsum wall board. Fire self-extinguished after 3 hours with no significant charring on mass timber surfaces;
2. Mass timber apartment with full fuel load. 20% exposed CLT ceiling. Test concluded at 4-hour mark after fuel burnout. CLT self-extinguished after charring;
3. Mass timber apartment with full fuel load. 2 CLT walls fully exposed. Fuel burnout at 4-hours. CLT walls self-extinguished after charring;
4. Mass timber apartment with full fuel load. All CLT surfaces fully exposed. One sprinkler system. Fire quickly extinguished;
5. Mass timber apartment with full fuel load. All CLT surfaces fully exposed. One sprinkler system. Fire allowed to grow to flashover (23 minutes) then quickly extinguished.

In fact, proposed Type IVA, B and C fire resistance requirements are the same or more robust than comparable steel and concrete construction. Further detail can be obtained at buildtallbuildsafe.com.

Benefits of Mass Timber Construction

In addition to the obvious environmental attributes of using a renewable resource in construction and the boost for the economies in timber-producing regions, builders and communities cite several distinctive benefits that make mass timber buildings an attractive option:

Builders report several benefits, including:

1. **Job site safety.** Mass timber panels are easy to install and can be delivered to a work site as needed, rather than stockpiled. Moreover, worker training is easier as is exposure to job site risk;
2. **Job site efficiency.** Persistent labor shortages are eased as more workers are qualified to work with mass timber panels. Jobs are built more quickly and materials are delivered as needed, thereby reducing costs;
3. **Design.** The favorable strength-to-weight ratio of CLT and the characteristics of wood offer more design options and more attractive built environments, improving business performance.

Local communities embrace mass timber construction:

1. **Faster and quieter.** The dislocation experienced by neighboring communities is reduced in mass timber projects. In addition to lower fire risks, things occur more quickly and panels are installed more simply than comparable steel and concrete sites;
2. **Greener.** Forestry officials cite the carbon sequestration properties of wood, but also the benefits to forest management of using wood products more efficiently and effectively, thereby further reducing decay and fire risk;
3. **Energy efficient.** Manufacturing mass timber is less energy intensive than other building materials. More importantly, the superior insulation characteristics of wood far outperform steel and concrete structures.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Public Comment 5:

Proponent:

Sam Francis, representing American Wood Council (sfrancis@awc.org) requests As Submitted

Commenter's Reason:

AWC was appointed to be a member of the ICC Tall Wood Building Ad Hoc Committee (TWB), the single wood industry representative on the TWB. AWC is not speaking for TWB on this issue. It simply is relaying information regarding the development of the proposals. Other members of the 16-member TWB included representation from architects, engineers, fire protection engineers, fire marshals, testing laboratories, and fire fighters, as well as the major materials industries. After two years of study, listening to testimony, reviewing documents, reviewing public input, conducting an extensive test program, and reviewing test results from tests around the world, the TWB made this proposal to ICC for the membership's consideration.

Early in the process, the TWB heard proposals from four different commenters suggesting maximum stories of 20, 24, 40, and 42 stories. The TWB worked through dozens of drafts of the proposed new types of construction, dozens more pertaining to the building height in stories, nearly a dozen pertaining to building height in feet and nearly a dozen regarding maximum permitted building area per floor. These documents were all posted to the TWB page of the ICC website. Comments were solicited for all drafts.

The first draft of Table 504.4 (allowable stories) was based on the discussions by the TWB at its November, 2016 meeting and considered by the Codes Work Group (Codes WG) in February, 2017. In March, 2017, comments to the February draft were considered by the Codes WG. In May, 2017, the Codes WG reported to the TWB its recommendations for a maximum number of stories for Type IV-A of 24 for many use groups, including B and R.

In June the TWB considered reducing the recommended number of stories for several occupancies, including B and R, due to reported opposition to the higher limits. Thus, as a result, the maximum number of stories was reduced from 24 to 18 for many occupancies including R, and from 24 to 20 for Group B because of the lower fuel load and increased occupant awareness in Group B. These drafts were also posted by the TWB on the ICC website. No one publicly commented on the original recommendations nor on the TWB reductions in maximum stories to accommodate what was believed to be opposition to its position.

Finally, the TWB held its last meeting (by video conference) December 27, 2017 to finalize all proposals before the January 6, 2018 submittal deadline. In that meeting it was suggested that continuing to allow Group B to be 20 stories seemed to be an outlier and, for that reason alone, the TWB again reduced Group B to the current 18 story limit.

The reason statement offered by the TWB for this proposal clearly explains that the allowable stories was determined by assessing the overall performance of the new types of construction and equating them to existing types of construction. From the beginning of this process, the TWB considered the body of data and fire protection engineering principles, deliberated the issue and concluded that because of the complete package of extensive features such as the required fire resistance ratings, the extensive noncombustible protection required on the surface of the mass timber elements, the prohibition of light frame wood assemblies altogether, and many other restrictive features, the performance of IV-B was indeed equivalent to I-B in every way. This concept was presented by several researchers who had been invited to present to the TWB at its initial face-to-face meeting. Similarly, due to the even more extensive required features in Type IV-A, including redundant water supply, they concluded that the performance of Type IV-A was equivalent to I-A. The TWB agreed that the performance was equivalent, but its conservative approach meant that they chose not to permit IV-A to enjoy the unlimited number of stories that I-A does. In fact, it was so conservative that it initially considered only doubling of the number of stories, which is infinitely less than the unlimited number of stories permitted in type I-A for nearly every use group. They ultimately proposed even fewer stories than that.

Moreover, the number of stories proposed for Type IV-B are even more conservative when considering that Type IV-B requires a greater degree of fire resistance than that of I-B when the *fire-resistance rating* of the building elements in Type IB construction are reduced to only the *fire-resistance ratings* required for Type IIA as permitted by Section 403.2.1 of the IBC. In effect, the proposed 2 hour fire resistance ratings required for Type IV-B will be twice that allowed by the IBC, since its inception, for those buildings under 420 feet whose building elements are permitted to be of only 1 hour fire resistance in accordance with the highrise provisions of Chapter 4, which will not apply to the proposed mass timber construction types.

From the beginning, the TWB has been committed to criteria which result in acceptable performance. Critics of the proposed allowable number of stories have been heard to comment that 18 stories will not be the end of increased story limits, but, indeed, 18 stories was not the beginning of it, either! Rather, 18 stories is a conservative limit that was reduced, by concession, not evidence, from 24 stories, to 20 stories, and finally to 18 stories.

Finally, much has been said about the proposed heights, but it s important to consider this: unlike noncombustible construction types I-A and I-B, which for most use groups are unlimited in allowable area per story no matter how tall, these proposed mass timber construction types will be increasingly limited in allowable area per floor as the building gets higher. This is because Equations 5-2 and 5-3 in the IBC limit the total allowable area of the building to no more than three times the allowable area of a single story. (Story areas for most use groups in Types I-A and I-B are [never](#) limited no matter how tall because their single-story areas are unlimited.) As a result, in the proposed mass timber

construction types the compartmentalization of building areas between fire resistance rated and protected assemblies is vastly increased, and the allowable area between fire resistance rated and protected elements is vastly reduced, compared to Types I-A and I-B construction. See Tables 1 and 2 below for a comparison.

This proposal is thoroughly conservative. The following points address claims made by opponents:

Concerns about exterior fire testing:

The TWB proposals significantly reduce the risk of exterior building surface flame propagation by prohibiting all combustibles on the exterior side of exterior walls (except for the required water resistive barrier). Continuous insulation on the exterior, where provided, will be non-combustible. In addition, protection with at least 40 minutes of noncombustible material (typically a layer of 5/8-inch type X gypsum wallboard) is required on the outside of mass timber exterior walls. What is proposed therefore is more conservative than any other construction type, including Types I and II, virtually eliminating the possibility of fire spread on exterior walls due to combustible materials.

Concerns about the testing s relevance to tall wood buildings:

The testing was designed by fire service representation on the TWB committee to directly address potential tall wood buildings, regardless of height. Rather than rely on standardized testing of building assemblies alone, with fire service input the TWB committee chose to undertake full-scale, multistory compartment testing, with high residential fuel loads for which no standardized test exists. Furthermore, in four of the five tests, the normal operation of the required automatic fire suppression system (sprinklers) was not allowed. The fires in tests applicable to the proposed 18 and 12 story limits (Types IV-A and IV-B respectively) were allowed to continue throughout the decay phase and well past burn-out, the most conservative approach possible. In other words, because the fire tests were specifically designed to address tall wood buildings of any height, the absolute worst circumstances were assumed: sprinklers not working, no active suppression of any kind, and the fire allowed to burn until self-extinguishment after the burning room contents are consumed (a tiny percentage of all possible fire scenarios). This parallels expectations for Type I buildings.

Concerns that wind has not been addressed in the testing:

There are no current test standards for exterior exposure that includes wind as a component. This means that even Types I and II buildings--which may have combustible materials on the exterior of the exterior walls, such as foam plastic insulation--are not tested to specific wind criteria. The new construction types proposed for tall wood building do not permit combustible materials on the exterior of exterior walls (as opposed to all other construction types), and in addition all mass timber building elements in exterior walls are required to be protected on the exterior side by noncombustible material equaling at least 40 minutes of fire resistance (typically 5/8-inch Type X gypsum wallboard). This very conservative criteria is intended to take the possibility of exterior fire spread completely out of the question.

In regard to wind reaching the interior of the building, since the extensive noncombustible protection of the interior in building over 12 stories is designed to allow complete burn-out of contents in the case of sprinkler malfunction, if wind were to cause contents to burn faster, there is no negative impact on fire performance of the protected building elements themselves. Fire scientists believe that protected mass timber will respond favorably to a more severe fire that is flamed by wind, since burn-out of contents may be achieved sooner. In regard to Type IV-C which permits totally exposed mass timber throughout, the allowable height in feet from grade is not increased from what is allowed for current Type IV heavy timber construction, and 2-hour fire resistance ratings of building

elements are required throughout (as opposed to heavy timber dimensions only in current Type IV). Finally, combustible light frame walls are not permitted in the proposed new construction types, only mass timber elements

Concerns that loads from upper stories were not considered in the fire testing:

Structural loads will in large part govern the size of mass timber members, as it does concrete and steel members. As the loads from upper stories increase, the structural design requires loadbearing mass timber walls and columns to get bigger or more numerous. In buildings over 12 stories, these mass timber elements are required to be protected by at least three layers of 5/8 type X gypsum, as part of the 3-hour rating. This is an extremely conservative approach for all buildings ranging from 12 to 18 stories. The intent is to prevent the mass timber building elements from becoming involved in the fire even in the extremely small percentage of fire that are not controlled by the sprinkler system or eventually put out by the fire department.

Concerns that increased hazards from storage and mercantile occupancies, and their effect on firefighting, were not considered:

The TWB committee specifically addressed mercantile (M) and storage occupancies (typically S-1) and the hazards associated with their higher fuel loads. They did this by placing stricter limits on their height. M and S-1 occupancies groups are not allowed over 12 and 10 stories respectively even in Type IV-A, which has 3-hour walls and columns and 2-hour floors, and is required incorporate noncombustible protection equal to 2/3 of the required rating (three layers of 5/8 Type X gypsum wall board on loadbearing walls and columns). By comparison, Groups M and S-1 in Type I-A construction with the same ratings are unlimited in height. Type I-B allows both Groups M and S-1 up to 12 stories with only 2-hour walls and columns, whereas Type IV-B with equal ratings and required noncombustible protection is limited to eight stories (M) and seven stories (S-1).

Concerns about fire sealants and connections during the testing:

Researchers noted inconsistencies in some installations during the testing at ATF, but this has no bearing on the efficacy of the tests, which were successful in spite of these irregularities. Even so, to address this and undesirable results at the FPRF tests at NIST, a proposed requirement for all splices and intersections to have adhesive sealant followed by a proposed modification requiring special inspection of sealant installation was proposed by the TWB committee at the Committee Action Hearing. The sealant requirement was approved but the modification for its special inspection was ruled beyond the scope of the original proposal, but has been reconstituted as a Public Comment which can be put forward at the public comment hearings this fall.

Concerns that there is only limited information available about how CLT performs or can be used with other materials:

There is extensive information available about CLT construction from many sources, including the increasing number of manufacturers of CLT. For example, a CLT Handbook, addressing structural design, lateral design, connections, fire performance, sound performance, building envelope design, environmental performance, and handling during construction has been available for free for several years. The American Wood Council's National Design Specification for Wood Construction, an ANSI accredited standard, has been updated to incorporate structural and fire design provisions for CLT. There are other guidelines for structural and fire resistance issues published by AWC and other organizations, including information on hybrid systems with steel and concrete.

Among the other advantages of CLT are that it does not distort, lose its strength, or explosively spall when exposed to high temperatures. It has inherently high fire resistance due to its mass, and when protected with gypsum wallboard protection performs improves. Early testing of a highly loaded CLT exterior wall by AWC yielded a 3-hour rating with only one layer of 5/8 Type X gypsum wallboard. Also, in general, CLT responds well to flame impingement by remaining strong and stable when the gypsum is cracked or losing integrity. It is much less heat sensitive than certain noncombustible materials.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

This is about new types of construction. Adding new types of construction means more choices in construction. More alternatives means lower cost in many cases.

Public Comment 6:

Proponent:

Patrick Ford, representing self (pat@matsenford.com) requests Disapprove

.

Commenter's Reason:

Reason: These code changes would allow for structurally unsafe conditions to be inherently designed into tall buildings. As proposed, they would introduce new categories of Type IV construction into the code and expand the number of storeys, allowable areas, and maximum heights of buildings framed with combustible materials. I believe that for several reasons, this would greatly increase the risk to firefighters and building occupants, as well as neighboring buildings. Several of the major decisions that went into the creation of this proposal were based on "engineering judgment" and significant extrapolation of test data from a two storey test building to buildings with dozens more storeys.

Aside from the potentially dangerous and unproven provisions in general, there are several specifics relative to structural connections in these new building types and sizes. I do not believe that these were addressed or at the very least not adequately addressed.

The new building types and increased limits allowed for in these proposals should not be allowed, and the proposals should be disapproved for the following reasons:

1. The AHC-TWB report that was instrumental in many of the provisions indicates that connections were tested, but in fact, no exposed connections were ever tested in any of the assemblies.
2. The compartment tests did not test any connections, nor did any of the standard ASTM tests, including the E84, E119, E814, nor the NFPA 285 tests.
3. The full scale test did not have any exposed connections, yet the code explicitly notes exposed steel and metal caps or brackets allowed in type IV construction within the wood chapter. The exposed metal connectors and their fasteners penetrate well beneath the typical char layer of the structural member, significantly reducing the strength of the member at and near the connection itself. This can

create many hot spots and potential critical structural failure locations throughout a tall building. No other tests addressed this issue either.

4. Adhesive based splice connections remain unproven, the overall adhesive requirements being based on a testing protocol derived after a failed test.
5. The Small Scale Adhesive Qualification Test Protocol (CSA 077 SSA.2) could conceivably be directed toward such connections or splices, but it is a test that lasts only 5 minutes per side of the tested specimen.
6. As an additional note, the full scale test was run on only a two storey structure, leaving any critical structural connections that may have been needed to support only a single storey above. With code proposals allowing for many times this, these concerns should be much more carefully vetted before approval.

It should also always be remembered that in no other type of tall building allowed by the code, is the structure itself also fuel for the fire.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There would be no cost increase associated with my comment because if the code proposal were defeated, there would be no change in the building allowable from the current code.

Public Comment 7:

Proponent:

Robert Grupe, representing Grupe Gypsum Consulting, LLC (rcgconsult@outlook.com) requests Disapprove

.

Commenter's Reason:

Overall building performance is predicated on the individual systems that comprise the structure. Further these systems are a series of individual building materials that are integrated based on their performance attributes, and compatibility with adjacent building materials. The proposed Tall Wood-frame construction is based primarily on the use of Cross Laminated Timber, CLT. However the proposal does not address potential compatibility issues, and in some cases lacks critical data to support required performance. Therefore, the CLT, system is not ready for use in wholesale high-rise construction. There are at least two critical system design areas that require additional testing and verification. These two examples are offered here to provide areas of specific concern. These examples are expressed in specific published white papers on the use of Cross-Laminated Timber.

The first example is on acoustics, specifically that of sound transmission through floor-assemblies. The current International Building Code has established minimum requirements for floor-to-floor transmission. In a published white paper entitled ***Mass Timber High-Rise Design Research: Museum Tower in Los Angeles Reimagined in Mass Timber*** (2015) the following statement is made regarding acoustics:

“Testing is required to determine the ability of this assembly to obtain the code-required acoustic performance.”

The paper covered the design of a timber-framed high-rise building. The acoustical design of the structure was centered around two floor-ceiling systems proposed for this project, both of which did not have any acoustic testing to substantiate compliance. The above comment followed a written description of each proposed floor/ceiling assembly.

Another issue of concern relating to additional required research is the proper design of connections that can accommodate the naturally occurring shrinking and swelling of CLT members primarily due to seasonal changes. The issue is the compatibility and serviceability of sealants and membranes that are incorporated into the CLT system. The following is taken from the **CLT Handbook** (2013):

“Differential movement between CLT and other wood-based products or materials (in case of mixed materials and systems) need to be taken into account at the design and detailing stages due to potential shrinkage-induced stress that could undermine the connection capacity in CLT. More information and guidelines related to detailing will be provided in future versions of this document as additional studies need to be performed.”

The point to be made here is that these are critical components in system and ultimately building design that require additional testing and research. It is obvious from the above mentioned white paper and handbook that the composite action of the independent building materials that make up the building systems have yet to be fully researched, tested, and detailed for use in general construction.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements

Public Comment 8:

Proponent:

Patrick Hainault, representing Self (path@matsenford.com) requests Disapprove

Commenter's Reason:

“Tower of Fire destroys LA apartment complex under construction.” This headline in the December 8, 2014 LA Times barely scratches the surface in describing the dangers from fires in buildings under construction when those buildings are framed with wood and wood-based materials. This fire not only destroyed [at least 239](#) of the rental units and [2/3rds of the complex](#) at the Da Vinci Apartments but caused significant damage to neighboring buildings and infrastructure, and greatly burdened the surrounding community in general. Yet, this proposal will dramatically raise the allowable heights and areas of buildings made from combustible materials.

It is not rationale to increase the allowable height of buildings as in this proposal when significant problems in much smaller buildings still present a well-documented risk to life and property. The assembly should overturn the committee decision to effectively prohibit the type of proposed construction until and if it can be proven safe [during](#) and after construction. The following paragraphs expand on the issues the assembly should consider in evaluating this proposal.

How do we even begin to come to grips with the risk to adjacent properties and occupied buildings during the construction phase when an 18- story wood structure allowed by this proposal is burning in a suburban or urban area? Without safeguards well beyond those currently in the code (or proposed as part of a series of related proposals) to protect adjacent properties and infrastructure, the impacts will be devastating. For example, the Da Vinci fire caused:

- Damage to adjacent buildings. At least four nearby buildings were damaged. The building at 221 N. Figueroa St., where the computers and cubicles melted, had significant damage on its 15 floors, with 300 windows blown out. Three floors were also damaged in the Los Angeles County Department of Health Services building at 313 N. Figueroa. LA Department of Water and Power staff identified at least 160 damaged windows. A Los Angeles Department of Building and Safety spokesman reported windows blew out in the north tower of its department headquarters, and the heat and smoke triggered sprinklers that soaked carpets and desks. Overall, the Da Vinci Apartments fire caused an estimated \$111.5 million in damages, including [\\$80 million](#) in damage to city properties from the fire and the water used to extinguish it and [\\$20-\\$30 million](#) to the apartment complex.
- Damage to Infrastructure. A Caltrans spokesman estimated the fire caused \$1.5-million damage to the freeway. Roads were closed around the area including a major commuter route during rush hour. Caltrans officials reported an exit sign over the 110 Freeway melted and would have to be replaced, forcing another freeway closure later the same week.
- Extensive impacts on the community. The attached study of the economic risk to taxpayers and the community posed by mid-rise apartments produced by assistant adjunct professor Urvashi Kaul at Columbia University captures the total cost impacts from fires like the Da Vinci apartments and smaller incidents. This study finds that:
 - In Los Angeles County, alone, fires in mid-rise residential buildings with combustible frames could have a negative impact of \$22.6B over 15 years, including \$17.14B in direct losses from property damage.
 - On average, fire in a mid-rise residential building constructed using combustible framing material costs the Los Angeles County a total of \$141.81 per square foot in potential economic impact and \$2.38 per square foot in lost tax revenues.
 - Potential impact the County may face in a single year could be \$1.7 billion, including \$1.3 billion in direct property damage.

The assembly is also urged to reconsider the argument that cladding requirements proposed to address fires in buildings under construction will resolve these issues. As demonstrated in a large fire from 2015 in a wood-framed apartment building in Edgewater, NJ, cladding will not stop a fire from spreading once the framing in part of the building ignites. It doesn't create a barrier between unexposed framing and exposed framing, but only provides some resistance to ignition from within or outside of the building. The Edgewater fire spread rapidly throughout the buildings once framing behind a wall was ignited during repairs to the occupied and fully-clad building.

The Da Vinci and Edgewater fires are not uncommon incidents. [Dozens of similar fires](#) have occurred (see more at <http://buildwithstrength.com/america-is-burning/>) in buildings under construction since the market began broadly taking advantage of relatively recent changes to the IBC that allowed taller and larger wood-framed buildings. In a similar fire in Houston, the life of a construction worker literally hung in the balance as he was rescued from a burning wood framed building just seconds before the stories above came crashing down. The assembly can prevent these types of risks from greatly expanding by disapproving this proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 9:

Proponent:

William Hall, Portland Cement Association, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests Disapprove

Commenter's Reason:

At the recent ICC Committee hearings in Columbus, OH, your committee **Failed you**. The general committee charged with looking at proposals and weighing justification **FAILED** to do their job when it came to Tall Wood Buildings. Despite overwhelming testimony that fire tests were inadequate, the committee simply ignored the fact that the TWB ADHOC committee only considered a two story residential structure during testing, and then used "**Engineering Judgment**" to determine that those results will be sufficient for 18 stories.

WHERE is the testing for all the other occupancy groups? 100% increases in story height are proposed for other use groups **without any justification**.

The ICC TWB ADHOC Committee has taken it upon themselves to develop a prescriptive TWB approach that **exceeds** the allowable heights of every country in the world. The United States just recently began looking at Mass Timber for taller buildings and yet, if this proposal goes through, we will allow mass timber 6 stories higher than any other country.

Not only will the U.S. allow the tallest buildings, we will also allow 12 story Mercantile, Storage and Factory to be built **without** gypsum covering on 40% of the CLT surface.

While mass timber may be an acceptable building material, it has not gone through the rigors of that are needed for high rise buildings. **Do not let the U.S. be the testing ground for these Tall Wood Buildings.**

Vote Dissapproval

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No effect

Public Comment 10:

Proponent:

Marc Nard, Portland Cement Association, representing Portland Cement Association (mnard@cement.org) requests Disapprove

Commenter's Reason:

Mass Timber is a new and incompletely tested building method. There has been insufficient / inadequate testing of the complete system to date. As code officials prescriptive limits are strictly adhered to. You would not allow even a single story increase in the currently allowed construction height of 6 stories. If a contractor asked to be allowed to build to 7 stories he would be told NO that would exceed the height code allows. Now not only is the wood industry seeking to simply exceed the height limitation of 6 stories by one story the desire is to extend the height beyond 6 stories and in fact, without proper testing, NO wind testing or proper justification randomly raise the height allowance three times the current limit allowed to 18 stories. for Mass Timber structures.

18 Story structures far exceeds the level of fire department access. I have 12 years experience as a firefighter in the States of Indiana and Michigan and would urge DISAPPROVAL. Not being able to reach the fire in a combustible building is a recipe for disaster. Common sense and the experience learned from high rise fires dictates that to be safe we use NONCOMBUSTIBLE materials, Type 1 and Type II construction not just open the door for untested systems to be built as high rises. Having combustible construction above the level of fire department access puts occupants, fire fighters and emergency services persons at unnecessary risks.

Wood structures will burn and this affects them and adjacent structures as well. It simply does not provide the Resiliency, Safety and Piece of Mind that Concrete and Steel offer. Fire testing to date has been done on two story structures. We need testing on an 18 story structure both with and without sprinkler protection (they can fail or be inoperative on occasion) and we need testing with wind and water pooling to see how the system reacts to the additional deteriorating factors.

Cross Laminated Timber / Mass Timber burns and chars in a fire. Wood is a combustible product. Given enough heat and oxygen it acts as a fuel and will burn. Note: if the char rate is 1 per hour in a typical fire then after a 2 hour fire exposure a 6 inch wall assembly is now missing 4 inches of structural material. There is no repair method offered so that if there is a kitchen fire and the material is damaged no one as decided it would be an advantage to develop and disseminate the repair procedures prior to building and occupying these structures. This is a major mistake.

To date no standard, including NFPA 285, has a wind component that has been part of the testing of Mass Timber. The recent loss of life in the London high rise fire shows clearly that wind is an accelerating factor in a high rise fire. Support DISAPPROVAL do not experiment with structures people live in and use. Do the testing on full size structures prior to putting these extended height allowances into the code and be certain we test for wind effect.

In the case of a fire event there are two major overriding issues beyond the combustibility of wood products. First, where does the water go after a sprinkler head is activated either by fire or by accidental event (kids throwing a ball in an apartment and hitting a sprinkler head). Second, if the fire department does have to fight an active fire the additional volume of water from attack lines adds to the already added load of sprinkler head water. The connectors have not been tested. There is no provision for a drainage system. What effect will this have on adhesives holding these systems together. What about weather that causes windows to blow out and rain or wind blown debris to enter and pool in the structure. Mold and mildew are a serious concern that have not been addressed. The behavior of Mass Timber / CLT in high rise structures is completely dependent on

proper connections. All connections being used to date are considered proprietary meaning that there is no information available to the public on their design capacities and failure rate.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proponent has submitted a Cost Impact statement that declares that this will not increase the cost of construction. CLT / Mass Timber is a brand new technology which is bound to have a cost increase on the cost of construction using current code compliant non-combustible construction materials.

Disapproving this code change proposal will not increase or increase the cost of construction.

The proposed text provides information that was not previously in the code and thus there is no comparative data. This only underlines the necessity for approximate cost of construction materials and does not alleviate the need for comparison cost of construction values. Perspective building owners and designers have to have some gauge to go by as they determine materials cost in construction.

Public Comment 11:

Proponent:

Lawrence Novak, representing Portland Cement Association (lnovak@cement.org) requests Disapprove

Commenter's Reason:

- - Wood absorbs water, and the resulting rot and mold can seriously impair a wood structures' overall anticipated performance. Note: non-combustible materials such as concrete, masonry and structural steel do not rot.
 -
 - The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?
 -
 - Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
 -
 - Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
 -
 - It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a

sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues.

-
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
-
- To date, there has been no full scale CLT fire tests done to ASTM standards.
-
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Charring wood will add fuel to the fire and increase the heat and smoke output relative to noncombustible materials. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
-
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete, masonry and steel.
-
- Allowing wood framed structures to be built above the level of fire department access is a serious mistake. The vast majority of municipal ladder trucks cannot reach above the 7th floor.
-
- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

- Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 12:

Proponent:

Tien Peng, representing National Ready Mixed Concrete Association (tpeng@nrmca.org) requests Disapprove

Commenter's Reason:

While the Ad Hoc Committee had intended to validate the fire performance of cross laminated timber in fire conditions of buildings, the AWC/ATF compartment testing was limited in scope and not a thorough predictor of fire behavior for high rise building made of a new material. The testing so far is insufficient to capture the fire response characteristics in question. No tests were done to factor in wind, exterior performance, panel connections or moisture, which impacts material performance, fire-fighting and property damage. CLT is a great innovation for the wood industry but it's not ready for prime time and it's certainly not ready for us to build safely to 270 feet and 18 stories. The ICC should not adopt code provisions that will put people at risk.

1. CLT Reliability and Predictability Issues

Cross laminated timber does not have a long enough history to demonstrate their reliability and predictability. The structural design of modern tall buildings is governed by the need to efficiently transfer loading, particularly that from wind, whilst providing increasingly complex building functionality. The use of cross laminated timber implies a highly optimized systems which means the least amount of material to enabled efficient load transfer. Thus, in the event of a fire there is an increased risk not typical in mid-rise constructions, and especially not in a two-story mock up in a lab.

The NFPA with ARUP *Fire Safety Challenges of Tall Wood Buildings* paper noted (NFPA 2013)[i]:

- In a real fire situation, the load-bearing elements in CLT are expected to load-share , or redistribute in a method that is not easily predicted in simple fire testing.
- Previous CLT fire testing has resulted in delamination and char fall-off when exposed to fire conditions.
- This has the potential to increase the fire temperature and burning rate within the compartment, and could impact the structural fire resistance at later stages in the fire duration.

The full-scale fire testing in Norway (SPFR A15101 2016)[ii] showed:

- The temperature increased fast and flashover was reached after four minutes.
- Temperatures were significantly higher than the standard time-temperature curve according to EN 1363-1
- The fire did not cool down before manual suppression was initiated when the test room collapsed 1-hour 36 minutes after ignition
- The sprinklers in the adjacent corridor did not stop the fire from spreading out from the room of origin.
- The charring rate varied much faster than expected

We should not be putting lives in high rises at risk with this level of material unpredictability.

2. Exposed CLT Fire / Moisture /Delamination Issues

The National Institute of Standards (NIST) tests complete previously said there were concerns that flashover occurred earlier with CLTs, heat delamination of the exposed CLT affected its fire performance and a large re-flash occurred on the exposed wall with delamination of the second ply of the CLT. (NIST 2017)[j]

While fire departments understand the risk of collapse with solid wood, there is not enough documentation or history of bonded or laminated wood structures, and they may fail sooner under fire conditions. The problem is that under fire conditions an adhesive may either thermally soften or chemically degrade causing the member to lose its strength, leading to structural collapse. Hence, we see delamination from the NIST testing as well as the very real construction failure on portions of the new College of Forestry building at Oregon State University where a large section of subflooring made of cross-laminated timber gave way between the second and third stories.

Moisture is an important issue for delamination and in many parts of the country the laminated mass timber panels will experience an environment which may exceed the testing limits. Wood will change in all three orthogonal dimensions with changes in moisture, and the changes are not even. This not only means that some species swell more because of their higher density, but also wood of non-

uniform density displays non-uniform swelling. Moreover, as wood swells and shrinks, adhesives do not follow with the same volumetric expansion. RDH Building Science full-scale mock-up study (Lepage 2017)[ii]notes that, The research indicates that CLT and mass timber is susceptible to dangerously high moisture contents, particularly when exposed to liquid water in horizontal applications. and other research indicate that CLT is at risk of structural damage by decay and rotting fungi (Zabel and Morrell 1992)[iii]

Clearly, we should not be putting lives in high rises at risk with this level of material unpredictability.

3. Fire / Connections Vertical Fire Spread

All connections used in current projects are proprietary and no information is publicly available regarding their performance. In a high-rise fire event, it is essential that the fire be prevented from spreading upwards or downwards from the floor of origin, endangering the lives of those waiting on more remote floors. Typically, the floor slab provides a robust barrier inhibiting external fire spread so long as it remains firmly supported by the structure. However, the AWC/ATF compartment fire testing had not adequately accounted for the connections in the CLT technologies to meet this crucial objective. The deformation of the connections when exposed to fire can expose gaps and flammable materials which can lead to spread both upwards through flaming, and downwards through dripping molten materials. Once fire starts spreading away from the floor of origin the safety of the occupants is compromised. Examples of vertical fire spread include:

- Las Vegas Hilton, USA: 22 Stories in approximately 25 minutes
- Caracas Tower, Venezuela: 17 floors in a 24-hour period
- Windsor Tower, Spain: 19 floors, ~7 hours for spread, 24 hours total fire duration
- TVCC Tower, China: 44 floors, around 15 minutes

4. Fire / Stack Effect

A similar concerning pattern emerges when discussing wind and air movement fire performance. One problem common to high-rises but not found in low-rise buildings is the stack effect movement of air inside the building. This air movement is critical to understand what happens during a fire event, as it can intensify a fire or allow flames and combustion gases to move beyond the room of origin. Fire personnel responding to a high-rise fire event need to understand where smoke and toxic gases may be going. Yet, shrinkage, moisture and creep, common in wood products including CLT, will create unpredictable opportunities for air movement within a building.

Air pressure and thermal differential with the use of CLT panels can shift the neutral pressure plane of the building. In cold weather (positive stack effect), the velocity of air channeling into the core from the lower floors is a very real concern to the occupants when they have to defend in place as well as fire service if the fire egress is compromised with smoke. In warm weather (reverse stack effect), where typically the staging floor is two floors below the fire floor, there can be concern of contamination, if there is unpredictability of where the fire path may be taking.

5. Fire / Wind

We typically associate wind with brush and wildland fires but it is just as important in structural fires.

- In 2009 a Texas probationary fire fighter and captain die as a result of rapid fire progression in a wind driven residential fire. Sustained winds from east/south-east at 17 mph with gusts up to 26 mph.

- Virginia Firefighters Battle Three-Alarm Townhouse Fire in 2011. In assessing the high winds and the fire conditions Battalion Barnes says fire crews tried to attack the flames inside two townhouses, but were forced back by intense heat and falling ceilings.
- In 2012 Prince George's County (Maryland), firefighters arrive on scene to a structure fire with winds impacting the rear of the structure. Shortly after forcing the front door open, they saw a dramatic change in fire behavior. As they made entry, they quickly experienced high velocity and high temperature gases, injuring seven firefighters, two critically.

The American Wood Council compartment fire tests did not account for wind loads.

Wind can add to the hazard to a low-rise fire, but it is most concerning around the upper floors of tall buildings. And high-rise fires create unique safety challenges for occupants and firefighters, even without the influence of wind. Wind can change the FLOW PATH of a fire and in some cases create a blowtorch effect and untenable conditions. When a window in the fire apartment fails, the influx of wind can create significant and rapid increases in the heat production of a fire. Smoke and heat spreading through corridors and stairwells, for instance, can inhibit occupants ability to escape and can limit firefighters ability to rescue them. Conditions in a corridor are of critical importance because it is the route that firefighters use to approach a fire and that occupants use to exit a building.

During the course of any structure fire, the wind may also influence exterior conditions and firefighter safety. Accelerated winds near high rises are caused by the downdraft effect, where the air hits a building and, with nowhere else to go, is pushed up, down and around the sides. The air forced downwards increases wind speed at street level. Tests conducted by National Institute of Standards and Technology (NIST 2012), the Fire Fighting Technology Group, FFTG, on positive pressure ventilation determined that an external wind speed of as low as 10 mph could cause a vented room within a structure to quickly spread from an apartment unit to a vent point, represented by a stairwell door. The spreading had floor-to-ceiling and wall-to-wall fire involvement with blowtorch effects. Moreover, if several towers stand near each other, the channeling effect, a wind acceleration created by air having to be squeezed through a narrow space. This Venturi effect will endanger the adjacent buildings.

6. Fire on Exterior

The AWC/ATF compartment fire tests did not account for exterior fire conditions and the proposed exterior proposal does not meet the required testing of CLT assemblies.

An important aspect of fire behavior in the affected building involves the burning behavior of materials on the exterior. While the AWC/ATF test demonstrated an understanding of CLT in an interior fire situation, the circumstances contributing to ignition scenarios of the exterior can be equally complex and equally important. In the past few years we have seen a number of deadly high-rise fires that propagated on the exterior of the structure.

- 2018 Almas Tower in Dubai, UAE
- 2017 Marco Polo apartment complex in Hawaii
- 2018 Grenfell Tower fire in West London

Simply testing the interior fire scenario does not capture potentially important parameters affecting CLT elements in tall wood buildings. If a fire in a heavy-timber building is not extinguished by the initial attack, a tremendous conflagration with flames coming out of the windows will spread fire to adjoining buildings by radiated heat. In a high-rise fire event, it is essential that the fire be prevented

from spreading upwards or downwards from the floor of origin, endangering the lives of those waiting on more remote floors.

Notably missing from the proposals is how the mass timber exterior assembly in buildings over 40 feet in height would comply with NFPA 285, *Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Nonload-bearing Wall Assemblies Containing Combustible Components*.

- *Section 1403.5*: For combustible water-resistive barriers in buildings over 40 feet in height of Type I, II, III, or IV construction.
- *Section 1407.10.4*: For metal composite materials (MCM) used on buildings of Type I, II, III, and **IV** construction.
- *Section 1409.10.4*: For high-pressure decorative exterior-grade compact laminates (HPL) exterior wall coverings used on buildings of Type I, II, III, and **IV** construction.
- *Section 1509.6.2*: Combustible mechanical equipment screens used on buildings of Type I, II, III, and **IV** buildings.
- *Section 2603.5.5*: Exterior walls of buildings of Type I, II, III, and **IV** construction of any height incorporating foam plastic insulation, except for one-story sprinklered buildings.

This is a requirement yet there is no reference to NFPA 285 testing of exterior CLT assemblies. One test by Nordic Engineered Wood published under the Canadian ULC S134 is not enough of a sample size to validate the tall wood proposals. Again, there is not enough historical fires with cross laminated timber to provide information that can be used in an 85-ft building, much less one at 270 feet.

7. Limits of Redundancy

The ICC TW-AHC claimed the added safety factor of active sprinkler systems adds to the safety of the proposals. Without a doubt, the inclusion of fire sprinkler systems in our buildings since the late 1980 s has been effective at increasing the chances of survival in a fire. But when systems don t operate as intended (such as in a freeze failure with water damage) or fail in a high-rise fire condition, the impact can be large, not just in monetary terms, but also in the lives of the occupants and fire fighters.

The full-scale fire testing completed in Norway showed the The sprinklers in the adjacent corridor did not stop the fire from spreading out from the room of origin. (SPFR A15101 2016).[iv] Moreover, according to NFPA s report *U.S. Experience with Sprinklers*, sprinklers were effective at controlling the fire in 96% of fires in which they operated, but sprinklers were only effective in 88% of the fires large enough to activate them. The reported sprinkler failures (660 per year) were twice as common as reported fires in which sprinklers were ineffective and did not control the fire. A National Institute of Standards and Technology (NIST) study, *Estimates of Operational Reliability of Fire Protection Systems*, also demonstrates this over-reliance on fire sprinklers is misguided.

8. Untested Reference Standard

State and local governments that adopt and enforce model building codes which references a number of standards. Yet, the proposals regularly cite the newly referenced standard, *ANSI/APA PRG 320-2018: Standard for Performance-Rated Cross-Laminated Timber*, an untested document. The reference to ANSI/APA PRG 320-2018 resolves nothing and takes no legal responsibility for performance failure. APA PRG 320 has no real history of use or validation as a reliable document and no jurisdiction refers to this document. It is premature to utilize a standard that is rarely referenced and start building to 18 stories from it.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed public comment would **reduce cost of construction**. Substantiation and references below.

1. Research:

A recent feasibility study [[i]] reveals that CLT construction is significantly more costly than other well-established construction methods such as concrete. Renowned structural engineers, Cary Kopczynski & Company found that the cost of the CLT structural system for a typical 10 story apartment building would cost \$48 to \$56 per square foot compared to \$42 to \$46 per square foot for concrete, translating nearly **20% premium** for Cross Laminated Timber.

2. Brock Commons, British Columbia

Per “University of British Columbia: Report to The Board of Governors, Tall Wood Student Residence, Brock Commons Phase 1” Report [[ii]], dated September 30, 2014,

- “The capital cost for the project is estimated at \$44 million (\$40m standard construction, plus \$4m wood premium).”
- “The \$4m estimated premium for advanced wood design and construction is to be funded from external sources including \$3.45m secured to date from the Canada Wood Council (CWC) and Forest Innovation Investment.”

This is a **10% premium** for Cross Laminated Timber at the 18-Story Brock Commons.

3. Framework Oregon:

Per the January 5, 2018 *Portland Oregonian* article “Wheeler Defends Decision to Invest In Pricey Complex” of the *Portland Oregonian*[[iii]],

- “While each unit is expected to cost an average \$480,000 to build, the city’s contribution will amount to \$100,000 per apartment.”
- Despite a pledge from Mayor Ted Wheeler to bring down the cost of affordable housing in Portland, the Portland Housing Bureau had nonetheless awarded the building \$6 million toward the \$29 million total. (A **21% subsidy** by the taxpayers for the 12- Story Framework project).

By the July 16, 2018 *Willamette Week* (*WW*) article “Plans for Record-Setting Timber Tower in Downtown Portland Fall Through” ^{[[iv]]} reported,

- The building, which was slated to include 60 *affordable* apartments, was projected to cost \$651.43 per square foot, *WW* reported in December. (The 660-square foot two bedroom apartments were projected to cost \$567,389 to build.)

4. Lumber Pricing:

And this doesn’t consider the recent price increases of softwood lumber that have risen wildly from \$424 per board foot a year ago to \$536 in the second quarter of 2018. That’s a **26% increase** in just one year. At the same time, concrete prices rose at a stable rate of 5%.

Public Comment 13:

Proponent:

Greg Ralph, representing ClarkDietrich Engineering Services requests Disapprove

.

Commenter's Reason:

Proponents of G80 -18 claim the combustible CLT products have been validated by full scale multiple-story fire tests. In reality, the tests were only two stories. The low-rise tests have been severely extrapolated to the proposed 18 stories.

There is significant concern of the wisdom to extrapolate to these extremes. The characteristics of a fire event of this magnitude are unknown. The impact of the fuel load of these combustible materials is of significant concern. The proposed extrapolation from two stories to 18 is unreasonable.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared to the present requirements.

Public Comment 14:

Proponent:

Adam Shoemaker, representing ClarkDietrich (adam.shoemaker@clarkdietrich.com) requests Disapprove

.

Commenter's Reason:

In IBC Section 602.2 it states that Types I and II construction are those types of construction in which the building elements listed in Table 601 **are of noncombustible materials**, except as permitted in Section 603 and elsewhere in this code.

In table 601, Type IB and proposed Type IVB have the same Fire-Resistance Rating (FRR) requirements. I don't believe you can justify in this proposal to allow combustible AND non-combustible elements with the same FRR to have the same allowable number of stories above plane grade table 504.4. It is not reasonable to extrapolate the data from a two story fire test on combustible structural elements as an equal to Type IB non-combustible structural elements.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No cost impact.

Public Comment 15:

Proponent:

Paul Tennis, representing Portland Cement Association (pdtennis@comporium.net) requests Disapprove

.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.

- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 16:

Proponent:

Larry Williams, representing Steel Framing Industry Association (williams@steelframingassociation.org) requests Disapprove

Commenter's Reason:

The leap in assumptions that fire tests on a two-storey mock up can be extrapolated to fire performance of an 18-story building is an unreasonable extension in the allowance for use of "professional judgement."

Proponents of G108-18 and related proposals state that the expected fire performance of mass timber buildings was "validated by a series of full scale multiple-story fire tests." However, the actual model tested was only two storeys in height, and from this test users are expected to have confidence that a 180-foot tall building construction with cross-laminated timber will exhibit identical performance.

The fundamental problem of this assumption is that some characteristics of large fires have not been observed on small fires, either because they do not occur in small fires or because they are too small to be detected. It seems likely that a different set of controls of fire behavior may take over after a fire reaches a certain size or intensity. The difficulty of extrapolating from small to large fires is further complicated by the fact that behavior of fire is a pattern phenomenon--the behavior at one point is often dependent on the behavior at another point. The behavior of one part of a fire may

change even if burning conditions at that point do not vary when the characteristics of the fire at some other point changes.

The structural and fire resistance performance of cross-laminated timber is fundamentally determined by the performance of the adhesive used to hold the layers of the product together. Delamination as a result of exposure of CLT to heat and flame have been identified as an issue of concern through both independent research and tests conducted under the supervision of members of the Ad Hoc Tall Wood Committee.

The solution to this concern was the addition of language in the proposal to reference PRG 320-18 which had not been published at the time of the submission of the proposed G108-18. Since the proposal was submitted, the PRG 320-18 has been published with an Appendix B that is intended to provide a test procedure to be used in evaluating the elevated temperature performance of adhesives.

This Appendix B has been public for less than 5 months, and consequently has no history of use that would validate assumptions that we are being asked to make. In addition, it clearly states that not all factors needed for a risk assessment are incorporated into the development of the Appendix. Further, the task of verifying that any of the methods discussed in the Appendix is left to the user.

Given the important role that adhesives play in the structural performance and safety of a bonded system, too little is known or provided that would ensure that 180-foot tall structures would be safe in the event of a fire or exposure to heat.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with current requirements.

Public Comment 17:

Proponent:

Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org)

.

Commenter's Reason:

The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

PORTIONS OF TABLE REMOVED REMAIN UNCHANGED

For SI: 1 square foot = 0.0929 m².

UL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one story above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; SM = Buildings two or more stories above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building area in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the International Fire Code.
- g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.
- i. The maximum allowable area for a single-story nonsprinklered Group U greenhouse is permitted to be 9,000 square feet, or the allowable area shall be permitted to comply with Table C102.1 of Appendix C.

Reason:

The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB and its various WGs held meetings, studied issues and sought input from various expert sources around the world. The TWB has posted those documents and input on its website for interested parties to follow its progress and to allow those parties to, in turn, provide input to the TWB.

At its first meeting, the TWB discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings:

1. No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.
2. No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.
3. No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.
4. No unusual fire department access issues.
5. Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.
6. Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

The comprehensive package of proposals from the TWB meet these performance objectives.

Allowable Area

In addressing this topic, it was necessary to develop height and area criteria to address each new type of construction being proposed. Relying upon each new type of construction proposed for tall wood buildings (Types IV-A, IV-B and IV-C), the committee examined each type of construction for its safety and efficacy with regard to each occupancy type. This proposal on allowable areas should be considered as a companion proposal to the height proposals. The three proposals were developed with regard to one another as well as with regard to the new types of construction.

The TWB also determined that fire testing was necessary to validate these concepts. At its first meeting, members discussed the nature and intention of fire testing so as to ensure meaningful results for the TWB and, more specifically, for the fire service. Subsequently a test plan was developed. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stairway. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of joints, and to evaluate conditions for responding fire personnel. The Fire WG then refined the test plan, which was implemented with a series of five full-scale, multiple-story building tests at the Alcohol, Tobacco and Firearms (ATF) laboratories in Beltsville, MD. The results of those tests, as well as testing conducted by others, helped the Committee form the basis upon which the Codes WG developed its code change proposals. This code change proposal is one of those developed by the Codes WG and adopted by the TWB.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit: <http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17.

Each proposed new type of construction was examined for its fire safety characteristics and compared to the existing, long-standing type of construction known as Heavy Timber. The committee found that it was reasonable to develop a multiplier which could be applied to the traditional HT areas. This was done for each new type of construction. Thus, the proposed new Type IV-C was 1.25 times the HT allowable area, IV-B was 2.00 times the HT allowable area and IV-A was 3.00 times the HT allowable area.

These multipliers were examined in terms of relative performance compared to traditional HT. They were reexamined on a case-by-case basis based upon relative hazard and occupancy classification. Some hazards were perceived to be greater and, thus, areas were adjusted downward to reflect the hazard. Other situations were similarly considered. For example, Hazardous and Institutional occupancies do not fully follow the multiplier method, as most areas for those occupancies were reduced from what the multiplier method would suggest.

Also, the committee reconsidered this proposal with respect to the companion height proposal. This review was to be sure that allowable areas were commensurate with the risk posed by being allowed on some particular story or at some height above grade plane.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance-rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

For SI: 1 square foot = 0.0929 m².

UL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one story above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; SM = Buildings two or more stories above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.

- d. The NS value is only for use in evaluation of existing building area in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the International Fire Code.
- g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.
- i. The maximum allowable area for a single-story nonsprinklered Group U greenhouse is permitted to be 9,000 square feet, or the allowable area shall be permitted to comply with Table C102.1 of Appendix C.

Commenter's Reason:

We recommend that the Type IV-B mass timber designation be deleted from the tall wood building proposals.

The origins of the development of the types of construction were originally developed to “account for the response or participation that a building’s structure will have in a fire condition originating within the building as a result of the occupancy or the fuel load” (Example source from BOCA National Building Code 1993 Commentary). The modern day types of construction are parsed out into three primary categories of construction; noncombustible (Types I and II), noncombustible/combustible (Types III and IV) and combustible (Type V). Subcategories were created to identify the protection; Type A for protected and Type B for unprotected.

What we have within proposals G75-18, G80-18, G84-18, G89-18, and G108-18 is the addition of a new construction category that has been proposed based on the need to satisfy aesthetics based on the combination of Types IV-A and IV-C, which is a departure from the black and white construction categories based on construction that is non-combustible or combustible. We feel this inappropriate for the codes to begin to designate designer type construction categories.

In the past such mixing and matching of construction types into building or structure is more suited to the IBC Section 104.11 (Alternative materials, design and methods of construction and equipment), or through use of the ICC International Performance Code or performance analysis. We feel that these are the most appropriate options for the mixing-and-matching of construction types in building design.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This will not increase or decrease the cost of construction as this code change proposal and public comment address information that was not previously contained in the code, therefore there is no cost impact when compared to present requirements.

Public Comment 2:

- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building area in accordance with the International Existing Building Code.
- e. 903.2.6.oup I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the International Fire Code.
- g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.
- i. The maximum allowable area for a single-story nonsprinklered Group U greenhouse is permitted to be 9,000 square feet, or the allowable area shall be permitted to comply with Table C102.1 of Appendix C.

Commenter's Reason:

The Virginia Fire Services Board opposes Proposal G84-18 as originally submitted. We propose that the allowable areas in this proposal be reduced to those currently allowed for Type IV-HT construction until additional testing can be performed to validate the assumptions on which the currently proposed areas are based. While we do not oppose the concept of utilizing renewable resources, such as timber, in the construction of buildings, we are not convinced that “tall wood buildings” with floor areas of up to 432,000 square feet per floor provide an acceptable level of safety to occupants or responding firefighters.

The reason statement for this proposal indicates that the Ad-Hoc Committee on Tall Wood Buildings (TWB) “discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings” including:

- Egress systems designed to protect building occupants during the design escape time, plus a safety factor.
- Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

There is no reference in the stated performance objectives related to protecting firefighters and other emergency responders during the time required to access and extinguish a fire. The Report on High-Rise Fireground Field Experiments, NIST Technical Note 1797, published in April 2013, indicates times between 21 and 23 minutes from fire ignition for fire crews to reach the 11th floor of a high-rise building, depending on crew size. These times are based on studies involving major metropolitan fire departments. There are many variables that could significantly increase these times, including time for notification of the fire department, turnout time, response time and vertical travel time to reach higher floors.

There were 14 proposals submitted by the TWB. Only one, G28-18, addresses the reliability of fire suppression systems. It requires the water supply to required fire pumps be supplied by connections

to not fewer than two water mains located in different streets for tall wood buildings that are more than 120 feet in building height. This proposal does nothing to increase the reliability of fire suppression system in buildings less than 120 feet tall. In addition, it does nothing to increase the reliability of the suppression systems within the building itself. There is no requirement to demonstrate the reliability of the fire suppression system as compared to the evacuation time and risk of collapse. It should also be noted that this proposal allows the construction of tall wood buildings to a height of 65 feet with no requirements for fire suppression systems.

We acknowledge that fire tests have been conducted; however, we do not believe that the results of the fire tests provide sufficient justification to allow tall wood building to be constructed with areas of up to 432,000 square feet per story. The original proposal cites "engineering judgment" as the basis for a comparative analysis between Type I and Type IV buildings and the extrapolation of two-story fire tests to the proposed building areas. There has been no testing to demonstrate the performance of these structures after aging for a period of years or decades.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal does not change the method of construction; rather, it limits the allowable area for the specified type of construction.

For SI: 1 square foot = 0.0929 m².

UL = Unlimited; NP = Not Permitted; NS = Buildings not equipped throughout with an automatic sprinkler system; S1 = Buildings a maximum of one story above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; SM = Buildings two or more stories above grade plane equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.3.

- a. See Chapters 4 and 5 for specific exceptions to the allowable height in this chapter.
- b. See Section 903.2 for the minimum thresholds for protection by an automatic sprinkler system for specific occupancies.
- c. New Group H occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.5.
- d. The NS value is only for use in evaluation of existing building area in accordance with the International Existing Building Code.
- e. New Group I-1 and I-3 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6. For new Group I-1 occupancies, Condition 1, see Exception 1 of Section 903.2.6.
- f. New and existing Group I-2 occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.6 and Section 1103.5 of the International Fire Code.
- g. New Group I-4 occupancies see Exceptions 2 and 3 of Section 903.2.6.
- h. New Group R occupancies are required to be protected by an automatic sprinkler system in accordance with Section 903.2.8.

- i. The maximum allowable area for a single-story nonsprinklered Group U greenhouse is permitted to be 9,000 square feet, or the allowable area shall be permitted to comply with Table C102.1 of Appendix C.

Commenter's Reason:

This is a series of comments to modify the proposed height, stories, and allowable area of the new Type IV-A, Type IV-B, and Type IV-C proposed construction classifications as proposed by the Ad-Hoc Committee on Tall Wood Buildings.

There is concern on the formulas utilized are not fully supported by technical substantiation and are missing the needed technical support to allow the construction type to such heights. This change takes a moderate approach and reduces the allowable heights, area, and stories by a factor of 30%.

This proposed public comment doesn't dismiss the concept out of hand, we do feel the current proposals go too far, to fast in an area of significant and long-lasting importance.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The area for this proposal is not allowed currently and therefore doesn't increase or decrease

Public Comment 4:

Proponent:

Gary Bridgens, representing Mass Timber Code Coalition (info@buildtallbuildsafe.com) requests As Submitted

Commenter's Reason:

PUBLIC COMMENT

SUBMITTED BY GARY BRIDGENS

ON BEHALF OF THE MASS TIMBER CODE COALITION

The Mass Timber Code Coalition has been organized to provide information on the code proposals drafted by the Ad Hoc Committee on Tall Wood Buildings

Mass timber is not new to the *International Building Code* (IBC). Currently listed as Type IV Heavy Timber, this construction type is a proven option that fully complies with the structural and fire resistive requirements of the IBC. The code recognizes that mass timber is a fundamentally different material than dimension lumber used in more familiar "stick built" wood construction. The code also recognizes the inherent fire resistance of mass timber, where charring in a fire event provides protection of inner structures, as well as a consistent and predictable rate of charring.

With the expansion of the mass timber supply chain, panels of cross-laminated timber (CLT), nail-laminated timber (NLT) and glue-laminated timber (Glulam), requests for approvals of tall mass

timber buildings (TMTB) by local authorities have become more common. Estimates by industry sources have identified 35 current proposals for tall mass timber buildings, ranging from 7 to 24 stories, in 21 different jurisdictions.

Importantly, this interest in tall mass timber construction has been reliant on various local codes and approval processes. The IBC does not currently account for these tall wood buildings, beyond the current Type IV Heavy Timber height and area limitations.

The Ad Hoc Committee on Tall Wood Buildings (AHC-TWB)

To ensure the IBC keeps pace with the changing construction marketplace, the Board of Directors of the International Code Council (ICC) appointed the Ad Hoc Committee on Tall Wood Buildings (AHC-TWB) in 2015. The AHC-TWB included members from the code official, regulatory, construction, engineering, architectural, fire services and materials communities.

The AHC-TWB was specifically charged with investigating the science of mass timber construction, undertaking any necessary new research and recommending any code changes needed to ensure safety in TMTB. The AHC-TWB set performance criteria of its own: any code change developed was required to achieve the following.

1. No collapse under scenarios of complete burn-out of fuel without automatic sprinkler protection;
2. No high radiation exposure from the subject building to adjoining properties that risk ignition under severe fire scenarios;
3. No unusual response from radiation exposure from adjacent properties that risk ignition of the subject building under severe fire scenarios;
4. No unusual fire department access issues;
5. Egress systems to protect occupants during design escape times plus a margin of safety;
6. Enhanced and redundant fire protection systems to ensure performance during various fire scenarios.

Code Change Proposals

After two years of work, the AHC-TWB has produced 14 code change proposals. All 14 of these proposals were recommended for approval by various ICC committees at the recent ICC 2018 Group A Committee Action Hearing.

The key change, G108-18, defines three new categories of Type -IV Mass Timber construction:

Type IV-A: 1 to 18 stories based on Occupancy Classification. 3-hour fire resistance rating with non-combustible protection throughout;

Type IV-B: 1 to 12 stories based on Occupancy Classification. 2-hour fire resistance rating with non-combustible protection on most mass timber surfaces;

Type IV-C: 1 to 9 stories based on Occupancy Classification. 2-hour fire resistance rating with non-combustible protection for critical areas; exit enclosures, etc.

Each new construction type defined by the AHC-TWB (Type IV-A, B and C) has fire resistance requirements as robust or more robust than those required for comparable non-combustible (concrete and steel) buildings.

Other provisions provide standards for mass timber manufacturing, height/area restrictions, active and passive fire protection systems, fire safety during construction, enhanced water supply requirements, and standards for sealants and adhesives.

Fire Resistance of Mass Timber

Citing fire and market concerns, both the Portland Cement Association and the National Ready Mix Concrete Association have criticized the AHC-TWB code change proposals as “untested” and “unsound.” However, these criticisms fail to consider that:

1. The purpose of the International Building Code is to provide building officials with the tools they need to ensure public and first-responder safety. It is not to choose winners and losers in the market, nor is it to defend any single industry’s position;
2. Tall mass timber buildings already built are performing well;
3. Mass timber (and heavy timber before it) has undergone extensive fire resistance testing in multiple fire scenarios by Underwriters Laboratories, the Southwest Research Institute, the National Research Council of Canada and the U.S. Government’s ATF Fire Research Laboratory, the world’s largest indoor fire investigation lab.

Numerous mass timber floor/ceiling and wall assemblies have been tested at national laboratories using ASTM E119 standards. This testing history shows that mass timber has repeatedly achieved the hourly fire resistance requirements of the code. This is in part because of charring properties that provide a steady and predictable measurement of fire resistance. Additionally, detailed code requirements for non-combustible protection applied to the mass timber greatly enhance the hourly rating. Further, fire protection systems (active and passive) also ensure safety in mass timber structures.

The AHC-TWB benefitted from recent tests in 2017 at the U.S. ATF Fire Research Laboratory on full-scale mass timber buildings. Most tests assumed an unlikely failure of sprinkler systems:

1. Mass timber apartment with full fuel load. Fully protected by Type X gypsum wall board. Fire self-extinguished after 3 hours with no significant charring on mass timber surfaces;
2. Mass timber apartment with full fuel load. 20% exposed CLT ceiling. Test concluded at 4-hour mark after fuel burnout. CLT self-extinguished after charring;
3. Mass timber apartment with full fuel load. 2 CLT walls fully exposed. Fuel burnout at 4-hours. CLT walls self-extinguished after charring;
4. Mass timber apartment with full fuel load. All CLT surfaces fully exposed. One sprinkler system. Fire quickly extinguished;
5. Mass timber apartment with full fuel load. All CLT surfaces fully exposed. One sprinkler system. Fire allowed to grow to flashover (23 minutes) then quickly extinguished.

In fact, proposed Type IVA, B and C fire resistance requirements are the same or more robust than comparable steel and concrete construction. Further detail can be obtained at buildtallbuildsafe.com.

Benefits of Mass Timber Construction

In addition to the obvious environmental attributes of using a renewable resource in construction and the boost for the economies in timber-producing regions, builders and communities cite several distinctive benefits that make mass timber buildings an attractive option:

Builders report several benefits, including:

1. **Job site safety.** Mass timber panels are easy to install and can be delivered to a work site as needed, rather than stockpiled. Moreover, worker training is easier as is exposure to job site risk;
2. **Job site efficiency.** Persistent labor shortages are eased as more workers are qualified to work with mass timber panels. Jobs are built more quickly and materials are delivered as needed, thereby reducing costs;
3. **Design.** The favorable strength-to-weight ratio of CLT and the characteristics of wood offer more design options and more attractive built environments, improving business performance.

Local communities embrace mass timber construction:

1. **Faster and quieter.** The dislocation experienced by neighboring communities is reduced in mass timber projects. In addition to lower fire risks, things occur more quickly and panels are installed more simply than comparable steel and concrete sites;
2. **Greener.** Forestry officials cite the carbon sequestration properties of wood, but also the benefits to forest management of using wood products more efficiently and effectively, thereby further reducing decay and fire risk;
3. **Energy efficient.** Manufacturing mass timber is less energy intensive than other building materials. More importantly, the superior insulation characteristics of wood far outperform steel and concrete structures.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Public Comment 5:

Proponent:

Sam Francis, representing American Wood Council (sfrancis@awc.org) requests As Submitted

Commenter's Reason:

AWC was appointed to be a member of the ICC Tall Wood Building Ad Hoc Committee (TWB), the single wood industry representative on the TWB. AWC is not speaking for TWB on this issue. It simply is relaying information regarding the development of the proposals. Other members of the 16-member TWB included representation from architects, engineers, fire protection engineers, fire marshals, testing laboratories, and fire fighters, as well as the major materials industries. After two years of study, listening to testimony, reviewing documents, reviewing public input, conducting an

extensive test program, and reviewing test results from tests around the world, the TWB made this proposal to ICC for the membership's consideration.

Early in the process, the TWB heard proposals from four different commenters suggesting maximum stories of 20, 24, 40, and 42 stories. The TWB worked through dozens of drafts of the proposed new types of construction, dozens more pertaining to the building height in stories, nearly a dozen pertaining to building height in feet and nearly a dozen regarding maximum permitted building area per floor. These documents were all posted to the TWB page of the ICC website. Comments were solicited for all drafts.

The first aspect of height and area taken up by the TWB was height in stories. That seemed to be the easiest to get at with the information gleaned from the testimony and documentation presented to the TWB. A public comment by AWC to G80 outlines how experts from around the world presented a case to the TWB that mass timber was equivalent to types I-A and I-B in every way other than the combustibility of the base material. They outlined various strategies for overcoming that combustibility issue. The TWB relied upon this concept of equivalent performance to determine its maximum permitted height in stories. The Reason Statement provided by the TWB Chairman, Steve DiGiovanni, clearly lays out the background for, and the process of, the deliberation on Height in Stories. That is a must read to understand this process and its outcomes.

Next, based upon comments submitted, TWB tried to assign height in feet to its chosen maximum stories. In its first drafts, the maximum number of stories for proposed type IV-A was 24 for a few occupancy groups. Similarly, IV-B was proposed to be limited to 12 stories based on the equivalency mentioned above. Thus, IV-B was assigned the same maximum height in feet as type I-B, 180 feet. My Public Comment on G75 explains the TWB's rationale for assigning the stories in its proposal.

The TWB took up the allowable area issue. The Reason Statement of its proposal G84-18 describes in great detail the process by which the TWB created a draft H A table, reviewed it cell by cell for efficacy, reasonable fire safety and so on. Based on that review, the TWB modified results using professional judgment and input from commenters. Thus the H A proposal saw many cells of reduced allowable area. This is a well prepared package, well thought out, with good documentation which is all available on the ICC website, TWB page. It is the product of the performance approach the TWB chose to use in following the ICC Board of Directors instructions to study the issues. The technical support for the proposal is the criteria that these construction types meet the fire resistance required of other existing construction. The TWB then developed a fire test plan which validated the concepts.

Of equal importance here is that the TWB recognizes that mass timber is NOT wood frame, light weight construction, or stick built construction. In fact, in order to ensure that its performance objectives would be correctly interpreted and that any building constructed to these requirements would meet, and probably exceed, its performance expectations.

Some observers have the mistaken belief that the permitted areas of this proposal will allow larger areas than those permitted for concrete or steel construction. The TWB insists that since these types of construction are based on equivalent performance, they are a great decrease from I-A or I-B construction's allowable areas. See the tables attached at the end of this comment for a comparison of the allowable areas. Clearly, Unlimited area is considerably larger than the finite, limits of the TWB proposal.

The fire test program, drafted by the Fire Work Group of the TWB to validate these concepts, may be seen as videos of each of the five tests. They can be found at this link or on the ICC TWB web page.

This proposal is thoroughly conservative. Mass timber buildings are completely different from conventional wood construction of studs and joists. Besides the automatic fire suppression and other life safety systems required for all high rises (including enhanced water supply), all loadbearing walls in mass timber buildings will be solid wood slabs typically between 6 and 20 inches thick, fire resistance rated, and directly protected with noncombustible protection equally at least 2/3 of the required rating. Light frame wood stud construction is prohibited. Nonbearing partitions will be solid mass timber slabs or noncombustible (steel) studs. All loadbearing horizontal assemblies will be solid mass timber slabs between 4 and 12 inches thick, fire resistance rated, protected on the underside with noncombustible protection equaling at least 2/3 of the required rating, and on the upper side with not less than one inch of noncombustible material. Light frame wood joist construction is prohibited. All construction enclosing concealed spaces will be noncombustible (steel) framing or mass timber protected with noncombustible materials. Full scale compartments fire tests for this new construction system reflecting Types IV-A and IV-B construction have shown that conservative residential fuel loads will completely burn out without the mass timber becoming involved in the fire, or will self-extinguish following burn-out, all without the sprinkler system operating.

The following points respond to misleading claims made by opponents:

***Measures to prevent exterior fire propagation exceed current
tall building code requirements***

Proposed code requirements to prevent exterior fire spread on tall mass timber buildings are significantly more restrictive than what is permitted for non-combustible construction. **Simply put; no combustible materials are permitted on the exterior side of exterior walls** (except for a required water-resistive barrier). What is proposed for tall mass timber buildings is more conservative than any other construction type, including non-combustible Types I and II. Exterior walls of these buildings will require:

- Continuous insulation on the exterior, where provided, must be non-combustible.
- Protection with at least 40 minutes of fire resistance from noncombustible materials.
- Additional testing to an exterior fire propagation standard

***Tall wood building fire tests expand beyond standard testing
and consider severe real fire demonstrations***

No other building elements have been tested in fires as severe as those used to substantiate the building code proposals. Fire testing for mass timber exposed timber building elements to extreme fires, which, in reality, will be extremely rare in sprinklered tall wood buildings. In addition to reviewing results of standardized testing of mass timber building elements, the ICC Tall Wood Building (TWB) committee, which included members of the fire service, developed and witnessed full-scale, multistory building compartment fire testing. In the tests, in addition to having typical residential furnishings as a fuel load, a number of wood cribs were added to provide additional fuel to increase the challenge on the building. **The three unsprinklered tests resulted in the fire self-extinguishing, and in the two tests that included sprinklers, the fire was easily contained immediately after sprinkler activation.**

- These real fire scenarios with high fire loads proved the integrity of a typical building constructed with cross-laminated timber (CLT).
- Tests representing fires in buildings of proposed 18- and 12-story heights (Types IV-A and IV-B, respectively) were allowed to continue to burn for hours, throughout the decay phase and well past burn-out, the most conservative approach possible.
- In the tests, the absolute worst circumstances were presented: sprinklers not working, no fire suppression of any kind, and fires burning without any intervention until self-extinguishment. This parallels the expected performance of non-combustible Type I buildings.

Wind-driven fire is not a code requirement for any building,

- ***but precautionary requirements for mass timber ensure a lower risk factor***

There are no current fire test standards for exterior building exposure or vertical flame propagation that includes wind as a test element. **Even Type I and II buildings -- which are allowed to have combustible materials on exterior walls, such as foam plastic insulation -- are not tested with added wind.**

- Even in high wind, the new tall wood construction types will require non-combustible materials on the exterior, limiting the possibility of wind-driven exterior fire spread. [SH1]
- Interiors of buildings over 12 stories will require additional layers of interior non-combustible protection, providing protection against wind penetrating the exterior.
- Non-combustible protection of mass timber elements is designed to allow complete burn-out of contents in the case of sprinkler malfunction. If wind were to cause contents to burn faster, there is no negative impact on fire performance of the protected building elements themselves.
- Mass timber buildings, as proposed, would exclude the use of traditional light frame wood walls and floors, and mass timber elements would need to be completely protected with non-combustible materials for any building greater than 12 stories in height.

- ***Massive timber building elements can carry***

heavy loads for extended time periods under fire exposure

Like their concrete and steel counterparts, as loads from upper stories increase, structural design requires loadbearing mass timber walls and columns to get bigger.

- As required for steel, in buildings over 12 stories mass timber elements will be required to have at least three layers of 5/8 type X gypsum wallboard as additional protection, as part of a required 3-hour fire-resistance rating. This is an extremely conservative approach for all buildings ranging from 12 to 18 stories.
- The established objective was to ensure that mass timber building elements do not become involved in a fire, even in the extremely rare circumstance where there is no control by a sprinkler system or extinguishment by the fire service.
 - ***Greater hazards from storage and mercantile occupancies are recognized***

The ICC committee chose to specifically address mercantile (M) and storage occupancies (typically S-1), and the hazards associated with their higher fuel loads, by placing stricter limits on the height of buildings containing these occupancies.

M and S-1 occupancy groups will not be allowed over 12 and 10 stories, respectively, in building Types IV-B and IV-A, which have the greatest additional fire resistance

requirements. By comparison, Groups M and S-1 in non-combustible Type I-A construction are allowed to be unlimited in height, and beams and bearing walls can be reduced to a 2 hour fire resistance rating.

***The enforcement community readily understands the code
and the measures necessary to inspect tall mass timber buildings***

As with any new structural system, there will be a learning curve, and the wood products industry is committed to providing education. There is already an abundance of training available, and much of it is free. Many code officials have already taken advantage of these extensive training opportunities.

Fire sealants, fasteners, and connections contribute to overall performance

In some cases during fire testing, sealants were not used at all and all fire tests were nonetheless very successful.

If seen as important, a proposed modification requiring special inspection of a sealant installation could be put forward at the public comment hearings this fall. Multiple connection configurations were incorporated into the multi-story fire test structure. Floors of CLT were supported by wood and steel ledgers that were properly protected from heat exposure. Wood columns and beams were connected with steel, which was protected from fire as would be required by the code.

***Tall mass timber buildings have been successfully built in North America,
Europe, and Australia and are in use with great success***

There is extensive information available about CLT construction from many sources, including the increasing number of CLT manufacturers.

The published *CLT Handbook* addresses structural and lateral design, connections, fire performance, sound performance, building envelope design, environmental performance, and handling during construction, and is available for free. The American Wood Council's *National Design Specification for Wood Construction*, an ANSI accredited standard referenced in the *International Building Code*, now includes structural and fire design provisions for CLT. There are other guidelines for mass timber structural and fire resistance published by AWC and other organizations, including information on hybrid systems with steel and concrete. Among the advantages of CLT are:

- It does not distort, twist, rapidly lose strength, or explosively spall when exposed to high temperatures from fires.
- It has inherent high fire resistance due to its mass, and when protected with gypsum wallboard performance even improves. ASTM E119 testing of a loaded CLT exterior wall by AWC resulted in a 3-hour fire resistance rating when protected with only a single layer of 5/8 Type X gypsum wallboard.
- Mass timber responds well to flame and heat impingement by remaining strong and stable, providing continuous support for gypsum wallboard, allowing it to remain in place for a longer period of time.

- Mass timber is much less sensitive than certain noncombustible materials when subject to elevated temperature.

The enforcement community readily understands the code

and the measures necessary to inspect tall mass timber buildings

As with any new structural system, there will be a learning curve, and the wood products industry is committed to providing education. There is already an abundance of training available, and much of it is free. Many code officials have already taken advantage of these extensive training opportunities.

Adhesives used in CLT have excellent performance at elevated temperatures

The adhesives used in CLT have been standardized and requirements are mandated by the ANSI/APA standard PRG 320-18, which is also proposed for adoption in the 2021 *International Building Code*.

Variations in adhesive performance in early testing conducted by the National Fire Protection Research Foundation led to important revisions of PRG 320-18 that mandate required adhesive integrity under fire exposure, eliminating the possibility of delamination, fire regrowth or secondary flashover. CLT manufactured to APA PRG 320-18 requirements must demonstrate that the adhesive has been tested to these protocols. Qualifying adhesives are required in all proposed mass timber construction types.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

This proposal will offer more choices in Type of Construction. More alternatives generally means the ability to select a type which results in less cost.

Public Comment 6:

Proponent:

Patrick Ford, representing self (pat@matsenford.com) requests Disapprove

Commenter's Reason:

Reason: These code changes would allow for structurally unsafe conditions to be inherently designed into tall buildings. As proposed, they would introduce new categories of Type IV construction into the code and expand the number of storeys, allowable areas, and maximum heights of buildings framed with combustible materials. I believe that for several reasons, this would greatly increase the risk to firefighters and building occupants, as well as neighboring buildings. Several of the major decisions that went into the creation of this proposal were based on "engineering judgment" and significant extrapolation of test data from a two storey test building to buildings with dozens more storeys.

Aside from the potentially dangerous and unproven provisions in general, there are several specifics relative to structural connections in these new building types and sizes. I do not believe that these were addressed or at the very least not adequately addressed.

The new building types and increased limits allowed for in these proposals should not be allowed, and the proposals should be disapproved for the following reasons:

1. The AHC-TWB report that was instrumental in many of the provisions indicates that connections were tested, but in fact, no exposed connections were ever tested in any of the assemblies.
2. The compartment tests did not test any connections, nor did any of the standard ASTM tests, including the E84, E119, E814, nor the NFPA 285 tests.
3. The full scale test did not have any exposed connections, yet the code explicitly notes exposed steel and metal caps or brackets allowed in type IV construction within the wood chapter. The exposed metal connectors and their fasteners penetrate well beneath the typical char layer of the structural member, significantly reducing the strength of the member at and near the connection itself. This can create many hot spots and potential critical structural failure locations throughout a tall building. No other tests addressed this issue either.
4. Adhesive based splice connections remain unproven, the overall adhesive requirements being based on a testing protocol derived after a failed test.
5. The Small Scale Adhesive Qualification Test Protocol (CSA 077 SSA.2) could conceivably be directed toward such connections or splices, but it is a test that lasts only 5 minutes per side of the tested specimen.
6. As an additional note, the full scale test was run on only a two storey structure, leaving any critical structural connections that may have been needed to support only a single storey above. With code proposals allowing for many times this, these concerns should be much more carefully vetted before approval.

It should also always be remembered that in no other type of tall building allowed by the code, is the structure itself also fuel for the fire.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There would be no cost increase associated with my comment because if the code proposal were defeated, there would be no change in the building allowable from the current code.

Public Comment 7:

Proponent:

Patrick Hainault, representing Self (path@matsenford.com) requests Disapprove

Commenter's Reason:

“Tower of Fire destroys LA apartment complex under construction.” This headline in the December 8, 2014 LA Times barely scratches the surface in describing the dangers from fires in buildings under construction when those buildings are framed with wood and wood-based materials. This fire not only destroyed [at least 239](#) of the rental units and [2/3rds of the complex](#) at the Da Vinci Apartments but caused significant damage to neighboring buildings and infrastructure, and greatly

burdened the surrounding community in general. Yet, this proposal will dramatically raise the allowable heights and areas of buildings made from combustible materials.

It is not rationale to increase the allowable height of buildings as in this proposal when significant problems in much smaller buildings still present a well-documented risk to life and property. The assembly should overturn the committee decision to effectively prohibit the type of proposed construction until and if it can be proven safe [during](#) and after construction. The following paragraphs expand on the issues the assembly should consider in evaluating this proposal.

How do we even begin to come to grips with the risk to adjacent properties and occupied buildings during the construction phase when an 18- story wood structure allowed by this proposal is burning in a suburban or urban area? Without safeguards well beyond those currently in the code (or proposed as part of a series of related proposals) to protect adjacent properties and infrastructure, the impacts will be devastating. For example, the Da Vinci fire caused:

- **Damage to adjacent buildings.** At least four nearby buildings were damaged. The building at 221 N. Figueroa St., where the computers and cubicles melted, had significant damage on its 15 floors, with 300 windows blown out. Three floors were also damaged in the Los Angeles County Department of Health Services building at 313 N. Figueroa. LA Department of Water and Power staff identified at least 160 damaged windows. A Los Angeles Department of Building and Safety spokesman reported windows blew out in the north tower of its department headquarters, and the heat and smoke triggered sprinklers that soaked carpets and desks. Overall, the Da Vinci Apartments fire caused an estimated \$111.5 million in damages, including [\\$80 million](#) in damage to city properties from the fire and the water used to extinguish it and [\\$20-\\$30 million](#) to the apartment complex.
- **Damage to Infrastructure.** A Caltrans spokesman estimated the fire caused \$1.5-million damage to the freeway. Roads were closed around the area including a major commuter route during rush hour. Caltrans officials reported an exit sign over the 110 Freeway melted and would have to be replaced, forcing another freeway closure later the same week.
- **Extensive impacts on the community.** The attached study of the economic risk to taxpayers and the community posed by mid-rise apartments produced by assistant adjunct professor Urvashi Kaul at Columbia University captures the total cost impacts from fires like the Da Vinci apartments and smaller incidents. This study finds that:
 - In Los Angeles County, alone, fires in mid-rise residential buildings with combustible frames could have a negative impact of \$22.6B over 15 years, including \$17.14B in direct losses from property damage.
 - On average, fire in a mid-rise residential building constructed using combustible framing material costs the Los Angeles County a total of \$141.81 per square foot in potential economic impact and \$2.38 per square foot in lost tax revenues.
 - Potential impact the County may face in a single year could be \$1.7 billion, including \$1.3 billion in direct property damage.

The assembly is also urged to reconsider the argument that cladding requirements proposed to address fires in buildings under construction will resolve these issues. As demonstrated in a large fire from 2015 in a wood-framed apartment building in Edgewater, NJ, cladding will not stop a fire from spreading once the framing in part of the building ignites. It doesn't create a barrier between unexposed framing and exposed framing, but only provides some resistance to ignition from within or outside of the building. The Edgewater fire spread rapidly throughout the buildings once framing behind a wall was ignited during repairs to the occupied and fully-clad building.

The Da Vinci and Edgewater fires are not uncommon incidents. [Dozens of similar fires](#) have occurred (see more at <http://buildwithstrength.com/america-is-burning/>) in buildings under construction since the market began broadly taking advantage of relatively recent changes to the IBC that allowed taller and larger wood-framed buildings. In a similar fire in Houston, the life of a construction worker literally hung in the balance as he was rescued from a burning wood framed building just seconds before the stories above came crashing down. The assembly can prevent these types of risks from greatly expanding by disapproving this proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 8:

Proponent:

William Hall, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests Disapprove

Commenter's Reason:

At the recent ICC Committee hearings in Columbus, OH, your committee **Failed you**. The general committee charged with looking at proposals and weighing justification **FAILED** to do their job when it came to Tall Wood Buildings. Despite overwhelming testimony that fire tests were inadequate, the committee simply ignored the fact that the TWB ADHOC committee only considered a two story residential structure during testing, and then used "**Engineering Judgment**" to determine that those results will be sufficient for 18 stories.

WHERE is the testing for all the other occupancy groups? 100% increases in story height are proposed for other use groups **without any justification**.

The ICC TWB ADHOC Committee has taken it upon themselves to develop a prescriptive TWB approach that **exceeds** the allowable heights of every country in the world. The United States just recently began looking at Mass Timber for taller buildings and yet, if this proposal goes through, we will allow mass timber 6 stories higher than any other country.

Not only will the U.S. allow the tallest buildings, we will also allow 12 story Mercantile, Storage and Factory to be built **without** gypsum covering on 40% of the CLT surface.

While mass timber may be an acceptable building material, it has not gone through the rigors of that are needed for high rise buildings. **Do not let the U.S. be the testing ground for these Tall Wood Buildings.**

Vote Disapproval

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No effect

Public Comment 9:

Proponent:

Tien Peng, representing National Ready Mixed Concrete Association (tpeng@nrmca.org) requests Disapprove

Commenter's Reason:

While the Ad Hoc Committee had intended to validate the fire performance of cross laminated timber in fire conditions of buildings, the AWC/ATF compartment testing was limited in scope and not a thorough predictor of fire behavior for high rise building made of a new material. The testing so far is insufficient to capture the fire response characteristics in question. No tests were done to factor in wind, exterior performance, panel connections or moisture, which impacts material performance, fire-fighting and property damage. CLT is a great innovation for the wood industry but it's not ready for prime time and it's certainly not ready for us to build safely to 270 feet and 18 stories. The ICC should not adopt code provisions that will put people at risk.

1. CLT Reliability and Predictability Issues

Cross laminated timber does not have a long enough history to demonstrate their reliability and predictability. The structural design of modern tall buildings is governed by the need to efficiently transfer loading, particularly that from wind, whilst providing increasingly complex building functionality. The use of cross laminated timber implies a highly optimized systems which means the least amount of material to enabled efficient load transfer. Thus, in the event of a fire there is an increased risk not typical in mid-rise constructions, and especially not in a two-story mock up in a lab.

The NFPA with ARUP *Fire Safety Challenges of Tall Wood Buildings* paper noted (NFPA 2013)[i]:

- In a real fire situation, the load-bearing elements in CLT are expected to load-share , or redistribute in a method that is not easily predicted in simple fire testing.
- Previous CLT fire testing has resulted in delamination and char fall-off when exposed to fire conditions.
- This has the potential to increase the fire temperature and burning rate within the compartment, and could impact the structural fire resistance at later stages in the fire duration.

The full-scale fire testing in Norway (SPFR A15101 2016)[ii] showed:

- The temperature increased fast and flashover was reached after four minutes.
- Temperatures were significantly higher than the standard time-temperature curve according to EN 1363-1
- The fire did not cool down before manual suppression was initiated when the test room collapsed 1-hour 36 minutes after ignition
- The sprinklers in the adjacent corridor did not stop the fire from spreading out from the room of origin.
- The charring rate varied much faster than expected

We should not be putting lives in high rises at risk with this level of material unpredictability.

2. Exposed CLT Fire / Moisture /Delamination Issues

The National Institute of Standards (NIST) tests complete previously said there were concerns that flashover occurred earlier with CLTs, heat delamination of the exposed CLT affected its fire performance and a large re-flash occurred on the exposed wall with delamination of the second ply of the CLT. (NIST 2017)[i]

While fire departments understand the risk of collapse with solid wood, there is not enough documentation or history of bonded or laminated wood structures, and they may fail sooner under fire conditions. The problem is that under fire conditions an adhesive may either thermally soften or chemically degrade causing the member to lose its strength, leading to structural collapse. Hence, we see delamination from the NIST testing as well as the very real construction failure on portions of the new College of Forestry building at Oregon State University where a large section of subflooring made of cross-laminated timber gave way between the second and third stories.

Moisture is an important issue for delamination and in many parts of the country the laminated mass timber panels will experience an environment which may exceed the testing limits. Wood will change in all three orthogonal dimensions with changes in moisture, and the changes are not even. This not only means that some species swell more because of their higher density, but also wood of non-uniform density displays non-uniform swelling. Moreover, as wood swells and shrinks, adhesives do not follow with the same volumetric expansion. RDH Building Science full-scale mock-up study (Lepage 2017)[ii]notes that, The research indicates that CLT and mass timber is susceptible to dangerously high moisture contents, particularly when exposed to liquid water in horizontal applications. and other research indicate that CLT is at risk of structural damage by decay and rotting fungi (Zabel and Morrell 1992)[iii]

Clearly, we should not be putting lives in high rises at risk with this level of material unpredictability.

3. Fire / Connections Vertical Fire Spread

All connections used in current projects are proprietary and no information is publicly available regarding their performance. In a high-rise fire event, it is essential that the fire be prevented from spreading upwards or downwards from the floor of origin, endangering the lives of those waiting on more remote floors. Typically, the floor slab provides a robust barrier inhibiting external fire spread so long as it remains firmly supported by the structure. However, the AWC/ATF compartment fire testing had not adequately accounted for the connections in the CLT technologies to meet this crucial objective. The deformation of the connections when exposed to fire can expose gaps and flammable materials which can lead to spread both upwards through flaming, and downwards through dripping molten materials. Once fire starts spreading away from the floor of origin the safety of the occupants is compromised. Examples of vertical fire spread include:

- Las Vegas Hilton, USA: 22 Stories in approximately 25 minutes
- Caracas Tower, Venezuela: 17 floors in a 24-hour period
- Windsor Tower, Spain: 19 floors, ~7 hours for spread, 24 hours total fire duration
- TVCC Tower, China: 44 floors, around 15 minutes

4. Fire / Stack Effect

A similar concerning pattern emerges when discussing wind and air movement fire performance. One problem common to high-rises but not found in low-rise buildings is the stack effect movement

of air inside the building. This air movement is critical to understand what happens during a fire event, as it can intensify a fire or allow flames and combustion gases to move beyond the room of origin. Fire personnel responding to a high-rise fire event need to understand where smoke and toxic gases may be going. Yet, shrinkage, moisture and creep, common in wood products including CLT, will create unpredictable opportunities for air movement within a building.

Air pressure and thermal differential with the use of CLT panels can shift the neutral pressure plane of the building. In cold weather (positive stack effect), the velocity of air channeling into the core from the lower floors is a very real concern to the occupants when they have to defend in place as well as fire service if the fire egress is compromised with smoke. In warm weather (reverse stack effect), where typically the staging floor is two floors below the fire floor, there can be concern of contamination, if there is unpredictability of where the fire path may be taking.

5. Fire / Wind

We typically associate wind with brush and wildland fires but it is just as important in structural fires.

- In 2009 a Texas probationary fire fighter and captain die as a result of rapid fire progression in a wind driven residential fire. Sustained winds from east/south-east at 17 mph with gusts up to 26 mph.
- Virginia Firefighters Battle Three-Alarm Townhouse Fire in 2011. In assessing the high winds and the fire conditions Battalion Barnes says fire crews tried to attack the flames inside two townhouses, but were forced back by intense heat and falling ceilings.
- In 2012 Prince George's County (Maryland), firefighters arrive on scene to a structure fire with winds impacting the rear of the structure. Shortly after forcing the front door open, they saw a dramatic change in fire behavior. As they made entry, they quickly experienced high velocity and high temperature gases, injuring seven firefighters, two critically.

The American Wood Council compartment fire tests did not account for wind loads.

Wind can add to the hazard to a low-rise fire, but it is most concerning around the upper floors of tall buildings. And high-rise fires create unique safety challenges for occupants and firefighters, even without the influence of wind. Wind can change the FLOW PATH of a fire and in some cases create a blowtorch effect and untenable conditions. When a window in the fire apartment fails, the influx of wind can create significant and rapid increases in the heat production of a fire. Smoke and heat spreading through corridors and stairwells, for instance, can inhibit occupants ability to escape and can limit firefighters ability to rescue them. Conditions in a corridor are of critical importance because it is the route that firefighters use to approach a fire and that occupants use to exit a building.

During the course of any structure fire, the wind may also influence exterior conditions and firefighter safety. Accelerated winds near high rises are caused by the downdraft effect, where the air hits a building and, with nowhere else to go, is pushed up, down and around the sides. The air forced downwards increases wind speed at street level. Tests conducted by National Institute of Standards and Technology (NIST 2012), the Fire Fighting Technology Group, FFTG, on positive pressure ventilation determined that an external wind speed of as low as 10 mph could cause a vented room within a structure to quickly spread from an apartment unit to a vent point, represented by a stairwell door. The spreading had floor-to-ceiling and wall-to-wall fire involvement with blowtorch effects. Moreover, if several towers stand near each other, the channeling effect, a wind acceleration created by air having to be squeezed through a narrow space. This Venturi effect will endanger the adjacent buildings.

6. Fire on Exterior

The AWC/ATF compartment fire tests did not account for exterior fire conditions and the proposed exterior proposal does not meet the required testing of CLT assemblies.

An important aspect of fire behavior in the affected building involves the burning behavior of materials on the exterior. While the AWC/ATF test demonstrated an understanding of CLT in an interior fire situation, the circumstances contributing to ignition scenarios of the exterior can be equally complex and equally important. In the past few years we have seen a number of deadly high-rise fires that propagated on the exterior of the structure.

- 2018 Almas Tower in Dubai, UAE
- 2017 Marco Polo apartment complex in Hawaii
- 2018 Grenfell Tower fire in West London

Simply testing the interior fire scenario does not capture potentially important parameters affecting CLT elements in tall wood buildings. If a fire in a heavy-timber building is not extinguished by the initial attack, a tremendous conflagration with flames coming out of the windows will spread fire to adjoining buildings by radiated heat. In a high-rise fire event, it is essential that the fire be prevented from spreading upwards or downwards from the floor of origin, endangering the lives of those waiting on more remote floors.

Notably missing from the proposals is how the mass timber exterior assembly in buildings over 40 feet in height would comply with NFPA 285, *Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Nonload-bearing Wall Assemblies Containing Combustible Components*.

- *Section 1403.5*: For combustible water-resistive barriers in buildings over 40 feet in height of Type I, II, III, or IV construction.
- *Section 1407.10.4*: For metal composite materials (MCM) used on buildings of Type I, II, III, and IV construction.
- *Section 1409.10.4*: For high-pressure decorative exterior-grade compact laminates (HPL) exterior wall coverings used on buildings of Type I, II, III, and IV construction.
- *Section 1509.6.2*: Combustible mechanical equipment screens used on buildings of Type I, II, III, and IV buildings.
- *Section 2603.5.5*: Exterior walls of buildings of Type I, II, III, and IV construction of any height incorporating foam plastic insulation, except for one-story sprinklered buildings.

This is a requirement yet there is no reference to NFPA 285 testing of exterior CLT assemblies. One test by Nordic Engineered Wood published under the Canadian ULC S134 is not enough of a sample size to validate the tall wood proposals. Again, there is not enough historical fires with cross laminated timber to provide information that can be used in an 85-ft building, much less one at 270 feet.

7. Limits of Redundancy

The ICC TW-AHC claimed the added safety factor of active sprinkler systems adds to the safety of the proposals. Without a doubt, the inclusion of fire sprinkler systems in our buildings since the late 1980s has been effective at increasing the chances of survival in a fire. But when systems don't operate as intended (such as in a freeze failure with water damage) or fail in a high-rise fire condition, the impact can be large, not just in monetary terms, but also in the lives of the occupants and fire fighters.

The full-scale fire testing completed in Norway showed the The sprinklers in the adjacent corridor did not stop the fire from spreading out from the room of origin. (SPFR A15101 2016).[iv] Moreover, according to NFPA s report *U.S. Experience with Sprinklers*, sprinklers were effective at controlling the fire in 96% of fires in which they operated, but sprinklers were only effective in 88% of the fires large enough to activate them. The reported sprinkler failures (660 per year) were twice as common as reported fires in which sprinklers were ineffective and did not control the fire. A National Institute of Standards and Technology (NIST) study, *Estimates of Operational Reliability of Fire Protection Systems*, also demonstrates this over-reliance on fire sprinklers is misguided.

8. Untested Reference Standard

State and local governments that adopt and enforce model building codes which references a number of standards. Yet, the proposals regularly cite the newly referenced standard, *ANSI/APA PRG 320-2018: Standard for Performance-Rated Cross-Laminated Timber*, an untested document. The reference to ANSI/APA PRG 320-2018 resolves nothing and takes no legal responsibility for performance failure. APA PRG 320 has no real history of use or validation as a reliable document and no jurisdiction refers to this document. It is premature to utilize a standard that is rarely referenced and start building to 18 stories from it.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed public comment would **reduce cost of construction**. Substantiation and references below.

1. Research:

A recent feasibility study [[i]] reveals that CLT construction is significantly more costly than other well-established construction methods such as concrete. Renowned structural engineers, Cary Kopczynski & Company found that the cost of the CLT structural system for a typical 10 story apartment building would cost \$48 to \$56 per square foot compared to \$42 to \$46 per square foot for concrete, translating nearly **20% premium** for Cross Laminated Timber.

2. Brock Commons, British Columbia

Per “University of British Columbia: Report to The Board of Governors, Tall Wood Student Residence, Brock Commons Phase 1” Report [[ii]], dated September 30, 2014,

- “The capital cost for the project is estimated at \$44 million (\$40m standard construction, plus \$4m wood premium).”
- “The \$4m estimated premium for advanced wood design and construction is to be funded from external sources including \$3.45m secured to date from the Canada Wood Council (CWC) and Forest Innovation Investment.”

This is a **10% premium** for Cross Laminated Timber at the 18-Story Brock Commons.

3. Framework Oregon:

Per the January 5, 2018 *Portland Oregonian* article “Wheeler Defends Decision to Invest In Pricey Complex” of the *Portland Oregonian*[[iii]],

- “While each unit is expected to cost an average \$480,000 to build, the city’s contribution will amount to \$100,000 per apartment.”
- Despite a pledge from Mayor Ted Wheeler to bring down the cost of affordable housing in Portland, the Portland Housing Bureau had nonetheless awarded the building \$6 million toward the \$29 million total. (A **21% subsidy** by the taxpayers for the 12- Story Framework project).

By the July 16, 2018 *Willamette Week (WW)* article “Plans for Record-Setting Timber Tower in Downtown Portland Fall Through” [[iv]] reported,

- The building, which was slated to include 60 *affordable* apartments, was projected to cost \$651.43 per square foot, *WW* reported in December. (The 660-square foot two bedroom apartments were projected to cost \$567,389 to build.)

4. Lumber Pricing:

And this doesn’t consider the recent price increases of softwood lumber that have risen wildly from \$424 per board foot a year ago to \$536 in the second quarter of 2018. That’s a **26% increase** in just one year. At the same time, concrete prices rose at a stable rate of 5%.

Public Comment 10:

Proponent:

Adam Shoemaker, representing ClarkDietrich (adam.shoemaker@clarkdietrich.com) requests Disapprove

Commenter's Reason:

In IBC Section 602.2 it states that Types I and II construction are those types of construction in which the building elements listed in Table 601 are of noncombustible materials, except as permitted in Section 603 and elsewhere in this code.

I do not believe it is a conservative or safe approach to allow for 190% and 252% increases in allowable area for Type IVA and IVB combustible elements over that of non-combustible structural elements. The testing submitted does not show side by side comparisons of these two systems. It is not reasonable to extrapolate data from a 2-story fire test of combustible materials into such huge increases in area as compared to Type IB non-combustible construction.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No cost impact.

Public Comment 11:

Proponent:

Larry Williams, representing Steel Framing Industry Association (williams@steelframingassociation.org) requests Disapprove

Commenter's Reason:

The leap in assumptions that fire tests on a two-story mock up can be extrapolated to fire performance of an 18-story building is an unreasonable extension in the allowance for use of professional judgement.

Proponents of G108-18 and related proposals state that the expected fire performance of mass timber buildings was validated by a series of full scale multiple-story fire tests. However, the actual model tested was only two storeys in height, and from this test users are expected to have confidence that a 180-foot tall building construction with cross-laminated timber will exhibit identical performance.

The fundamental problem of this assumption is that some characteristics of large fires have not been observed on small fires, either because they do not occur in small fires or because they are too small to be detected. It seems likely that a different set of controls of fire behavior may take over after a fire reaches a certain size or intensity. The difficulty of extrapolating from small to large fires is further complicated by the fact that behavior of fire is a pattern phenomenon--the behavior at one point is often dependent on the behavior at another point. The behavior of one part of a fire may change even if burning conditions at that point do not vary when the characteristics of the fire at some other point changes.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with current requirements.

Public Comment 12:

Proponent:

Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason:

The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

G86-18

IBC: 506.3.2, 506.3.3, 506.3.3 (New), Table 506.3.3 (New)

Proposed Change as Submitted

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net)

2018 International Building Code

Revise as follows

506.3 Frontage increase. Every building shall adjoin or have access to a *public way* to receive an area factor increase based on frontage. Area factor increase shall be determined in accordance with Sections 506.3.1 through 506.3.3.

506.3.1 Minimum percentage of perimeter. To qualify for an area factor increase based on frontage, a building shall have not less than 25 percent of its perimeter on a *public way* or open space. Such open space shall be either on the same lot or dedicated for public use and shall be accessed from a street or approved *fire lane*.

506.3.2 Minimum frontage distance. To qualify for an area factor increase based on frontage, the *public way* or open space adjacent to the building perimeter shall have a minimum distance (~~*W*~~) of 20 feet (6096 mm) measured at right angles from the building face to any of the following:

1. The closest interior lot line.
2. The entire width of a street, alley or public way.
3. The exterior face of an adjacent building on the same property.

~~Where the value of *W* is greater than 30 feet (9144 mm), a value of 30 feet (9144 mm) shall be used in calculating the *building area* increase based on frontage, regardless of the actual width of the *public way* or open space. Where the value of *W* varies along the perimeter of the building, the calculation performed in accordance with Equation 5-5 shall be based on the weighted average calculated in accordance with Equation 5-4.~~

$$W = (L_1 \times w_1 + L_2 \times w_2 + L_3 \times w_3 \dots) / F$$

~~(Equation 5-4)~~

~~where:~~

~~*W* (Width: weighted average) = Calculated width of *public way* or open space (feet).~~

~~*L_n* = Length of a portion of the exterior perimeter wall.~~

~~*w_n* = Width (≥ 20 feet) of a *public way* or open space associated with that portion of the exterior perimeter wall.~~

~~*F* = Building perimeter that fronts on a *public way* or open space having a width of 20 feet (6096 mm) or more.~~

~~**Exception:** Where a building meets the requirements of Section 507, as applicable, except for compliance with the minimum 60-foot (18 288 mm) *public way* or *yard* requirement, and the value of *W* is greater than 30 feet (9144 mm), the value of *W* shall not exceed 60 feet (18 288 mm).~~

The frontage increase shall be based on the smallest public way or open space that is 20 feet (6096 mm) or greater, and the percentage of building perimeter having a minimum 20 feet (6096 mm) public way or open space.

506.3.3 Amount of increase. The area factor increase based on frontage shall be determined in accordance with ~~Equation 5-5:~~

$$I_f = [F/P - 0.25]W/30$$

~~(Equation 5-5)~~

~~where:~~

~~*I_f* = Area factor increase due to frontage.~~

~~*F* = Building perimeter that fronts on a *public way* or open space having minimum distance of 20 feet (6096 mm).~~

~~*P* = Perimeter of entire building (feet).~~

~~W = Width of public way or open space (feet) in accordance with Section 506.3.2.~~

~~Table 506.3.3.~~

~~$t_f = [F/P - 0.25]W/30$~~

Add new text as follows

**Table 506.3.3
FRONTAGE INCREASE FACTOR**

<u>Percentage (%) of Perimeter</u>	<u>Open Space</u>			
	<u>0 to less than 20 Feet</u>	<u>20 to less than 25 Feet</u>	<u>25 to less than 30 Feet</u>	<u>30 Feet or greater</u>
<u>0 to less than 25</u>	<u>0</u>	<u>0</u>	<u>0</u>	<u>0</u>
<u>25 to less than 50</u>	<u>0</u>	<u>0.17</u>	<u>0.21</u>	<u>0.25</u>
<u>50 to less than 75</u>	<u>0</u>	<u>0.33</u>	<u>0.42</u>	<u>0.50</u>
<u>75 to 100</u>	<u>0</u>	<u>0.5</u>	<u>0.63</u>	<u>0.75</u>

Reason: Calculating the frontage increase is a confusing process for little benefit. This proposal simplifies the process by creating a table outlining the increase based on the percentage of open space around the building and the distance of that open space. It still uses the concept of the percentage of open space around the building. The values in the table are based on the calculations using Equation 5-5. The proposal also deletes the confusing weighted average calculation that most people do not use.

For example, if you have a building that has a perimeter of open space of 63% and the smallest open space is 25 feet, the increase would be 0.42. Using the calculation in Equation 5-5, it would be 0.32. This is a 10% difference. The total increase for a Group B Occupancy of Type VB Construction would be 2,790 square feet using the equation and 3,780 using the table. This is a difference of 990 square feet. This is negligible in the overall scheme of allowable area calculations.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a simplification of an existing calculation in the code. It should not affect the cost of construction.

G86-18

Public Hearing Results

Errata:

The proposal has been corrected.

Committee Action:

Disapproved

Committee Reason:

The tabular version found some favor with the committee, but it wasn't convinced that even with the modifications offered that the change was neutral. A well crafted public comment with some examples may make this acceptable. (Vote: 10-4)

Assembly Action:

None

G86-18

Individual Consideration Agenda

Public Comment 1:

Proponent:

Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (sthomas@coloradocode.net) requests As Modified by This Public Comment

Modify as follows:

2018 International Building Code

506.3 Frontage increase.

Every building shall adjoin or have access to a *public way* to receive an area factor increase based on frontage. Area factor increase shall be determined in accordance with Sections 506.3.1 through 506.3.3.

506.3.1 Minimum percentage of perimeter.

To qualify for an area factor increase based on frontage, a building shall have not less than 25 percent of its perimeter on a *public way* or open space. Such open space shall be either on the same lot or dedicated for public use and shall be accessed from a street or approved *fire lane*.

506.3.2 Minimum frontage distance.

To qualify for an area factor increase based on frontage, the *public way* or open space adjacent to the building perimeter shall have a minimum distance of 20 feet (6096 mm) measured at right angles from the building face to any of the following:

1. The closest interior lot line.
2. The entire width of a street, alley or public way.
3. The exterior face of an adjacent building on the same property.

The frontage increase shall be based on the smallest public way or open space that is 20 feet (6096 mm) or greater, and the percentage of building perimeter having a minimum 20 feet (6096 mm) public way or open space.

506.3.3 Amount of increase.

The area factor increase based on frontage shall be determined in accordance with

Table 506.3.3.

FRONTAGE INCREASE FACTOR

<u>Percentage (%) of Perimeter</u>	<u>Open Space</u>			
	<u>0 to less than 20 Feet</u>	<u>20 to less than 25 Feet</u>	<u>25 to less than 30 Feet</u>	<u>30 Feet or greater</u>
<u>0 to less than 25</u>	<u>0</u>	<u>0</u>	<u>0</u>	<u>0</u>
<u>25 to less than 50</u>	<u>0</u>	<u>0.17</u>	<u>0.21</u>	<u>0.25</u>

<u>% perimeter</u>	<u>30 to less than 35 feet</u>	<u>35 to less than 40 feet</u>	<u>40 feet to less than 45 feet</u>	<u>45 feet to less than 50 feet</u>	<u>50 feet to less than 55 feet</u>	<u>55 feet to less than 60 feet</u>
<u>0 to less than 25</u>	<u>0</u>	<u>0</u>	<u>0</u>	<u>0</u>	<u>0</u>	<u>0</u>
<u>25 to less than 50</u>	<u>0.29</u>	<u>0.33</u>	<u>0.38</u>	<u>0.42</u>	<u>0.46</u>	<u>0.5</u>
<u>50 to less than 75</u>	<u>0.58</u>	<u>0.67</u>	<u>0.75</u>	<u>0.83</u>	<u>0.92</u>	<u>1.00</u>
<u>75 to 100</u>	<u>0.88</u>	<u>1.00</u>	<u>1.13</u>	<u>1.25</u>	<u>1.38</u>	<u>1.5</u>

Interpolation is permitted.

Commenter's Reason:

This proposal makes the frontage increase much easier to calculate. It takes the existing equation and puts into a table format. When we changed the equation in the 2015 IBC, many people are using the wrong value from the table and the calculation is wrong. The user of the code is supposed to use the NS number from Table 506.2 to determine the frontage increase. However, many people are incorrectly using the S1 or SM value from the table. These new tables will eliminate that confusion and potential error by putting the frontage increases into a table.

The committee was in support of the concept, but felt that some improvements could be made to the table. They suggested that language be added to allow the user to interpolate the values within the table. That language was added to this public comment. They also had concerns that the provisions of the exception to Section 506.3.2 was not included in the proposal. This exception permits a larger increase for those buildings listed in Section 507. An additional table has been added to this public comment to address that exception and provides those values. It is based on the same calculation but with higher values.

To use the table, you need to figure the percentage of the building perimeter that has at least a 20 foot open space. Then you determine the dimension of the smallest open space over 20 feet. You then take those two values and go into the table to determine the frontage increase. For example, if you have a building on a site as shown in Figure 1, you can see that three of the four perimeter walls have at least a 20 foot yard and the building is 100 X 100. Therefore, $300/400 = 75\%$ perimeter with at least a 20 foot yard. The smallest yard is 25 feet on the left side. Therefore, you go into the table and enter the bottom row at "75% to 100%" and go across to the "25 to less than 30 feet" column and find that you would get a 63% frontage increase based on this layout. You could interpolate within the table if you would like.

The intent of the proposal is to simplify the allowable area calculation and reduce the number of mistakes that we now see.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no change to the underlying code requirements

G86-18

G87-18

IBC: 508.3.1.2

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows

508.3.1.2 Group I-2, Condition 2 occupancies. Where one of the nonseparated occupancies is Group I-2, Condition 2, the ~~most restrictive~~ requirements of Sections 407, 509 and 712 shall apply throughout the fire area containing the Group I-2 occupancy. The ~~most restrictive~~ requirements of Chapter 10 for Group I-2, Condition 2 shall apply to the path of egress from the Group I-2, Condition 2 occupancy up to and including the exit discharge.

Reason: This section relates to the use of non-separated mixed uses in hospitals. Historically a hospital building has broadly been considered as an I-2 occupancy. However, designs are increasingly using this non-separated option to create situations that adversely impact the I-2 occupancy. This language was added in the previous cycle to with the intent to require certain non-separated facility designs to follow some of the basic requirements for Group I-2, Condition 2 hospitals. The goal was to point designers and code officials to four key components to consider when designing non-separated uses: Section 407 which contains specific healthcare requirements, Section 509 for incidental uses, Section 712 for vertical openings and Chapter 10 for egress. Failure to follow these could have adverse impacts on patients and staff. For example, unprotected floor openings allowed by 712 are prohibited in Group I-2, they are not prohibited in Group B. Without this section, a design would be allowed to punch a hole in the floor that adversely affects the I-2 patients on that floor.

An unintended consequence of the language is that by referencing the “most restrictive” requirements, the section prohibits the use of any exception permissible for Group I-2. It also doesn’t clearly identify which requirements should be considered. For example, we did not intend to apply Group H restrictions on these conditions just because they are more restrictive. There are several exceptions that should be maintained for these parts of the building, especially in Chapter 10. This change clarifies that all of the I-2 specific requirements apply, whether they are more or less restrictive.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will decrease the cost of construction. This clarification would remove requirements for more restrictive provisions where hospital provisions apply.

G87-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proponent asked for disapproval as they were unsure whether the proposal as submitted conflicts with the federal standards. (Vote: 14-0)

Assembly Action:

None

G87-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

508.3.1.2 Group I-2, Condition 2 occupancies. ~~Where one of the nonseparated occupancies is~~ The requirements for Group I-2, Condition 2, the requirements of in Sections 407, 509 and 712 shall apply throughout the fire area containing the Group I-2 occupancy. The requirements of Chapter 10 for Group I-2, Condition 2 shall apply to the path of egress from the Group I-2, Condition 2 occupancy up to and including the exit discharge.

Commenter's Reason: The revised language is a clarification of requirements. The provisions for hospitals should be applied on a component by component basis such as fire areas. This should not apply to everything in the building, however, the concentration should be on the fire area within the building. The last sentence applies when the means of egress from a hospital goes through a business area.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This clarification would remove requirements for more restrictive provisions where hospital provisions apply.

G87-18

G88-18

S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

N = No separation requirement.

NP = Not Permitted.

- a. See Section 420.
- b. The required separation from areas used only for private or pleasure vehicles shall be reduced by 1 hour but not to less than 1 hour.
- c. See Section 406.3.2.
- d. Separation is not required between occupancies of the same classification.
- e. See Section 422.2 for ambulatory care facilities.
- f. Occupancy separations that serve to define fire area limits established in Chapter 9 for requiring fire protection systems shall also comply with Section 707.3.10 and Table 707.3.10 in accordance with Section 901.7.

Reason: Filling in the balance of Table 508.4 will avoid confusion and make the table more clear and functional.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal is an editorial change and adds no new requirements to the code.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Committee members spoke both in support and opposition to this proposal which intends to replicate the existing information in the upper right half of the table in the lower left half. However errors were found in the proposal which showed that further refinement was needed. (Vote: 14-0)

Assembly Action:

None

G89-18

IBC: 508.4.4.1, 509.4.1.1 (New)

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Building Code

508.4.4 Separation. Individual occupancies shall be separated from adjacent occupancies in accordance with Table 508.4.

Revise as follows

508.4.4.1 Construction. Required separations shall be *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both, so as to completely separate adjacent occupancies. Mass timber elements serving as fire barriers or horizontal assemblies to separate occupancies in Type IV-B or IV-C construction shall be separated from the interior of the building with an approved thermal barrier consisting of a minimum of 1/2 inch (12.7 mm) gypsum board or a noncombustible equivalent.

Add new text as follows

509.4.1.1 Type IV-B and IV-C construction. Where Table 509 specifies a fire-resistance-rated separation, mass timber elements serving as fire barriers or a horizontal assembly in Type IV-B or IV-C construction shall be separated from the interior of the incidental use with an approved thermal barrier consisting of a minimum of 1/2 inch (12.7 mm) gypsum board or a noncombustible equivalent.

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

This code change proposal represents one of many submitted designed to address a new type of construction called mass timber (e.g. new construction types IV-A, IV-B, and IV-C).

On this subject of “fire barriers,” the committee determined that additional measures were necessary to address cases where mass timber is serving as a fire barrier or horizontal assembly. Section 508.4 describes the third option for separating mixed occupancies within a building. Section 509.4 discusses the fire-resistance rated separation that is required for incidental uses within a larger use group. Section 509 also permits, when stated, protection by an automatic sprinkler system without fire barriers, however the construction enclosing the incidental use must resist the passage of smoke in accordance with Section 509.4.2.

The concern is that without any modifications to these provisions regulating separated occupancies and incidental uses, a fire barrier or horizontal assembly could be designed using mass timber that would comply with the fire resistance rating, but which would allow any exposed mass timber to contribute to the fuel load. This can occur in Types IV-B and IV-C construction.

The committee applied professional judgment by choosing to emulate the existing thermal barrier requirements by applying those requirements to these two sections. The intent of this proposal is to have the thermal barrier delay or prevent the ignition of the mass timber, thus delaying or preventing the mass timber’s contribution to the fuel load. This will also allow additional time for fire and life safety measures to be executed as well as allow first responders additional time to perform their services.

The committee’s intent is that the thermal barrier only needs to cover an exposed wood surface. The thermal barrier is not required in addition to any noncombustible protection that is required in Section 602.4, nor does it add to the fire resistance rating of the mass timber.

Mass timber walls or floors serving as fire barriers for separated uses (Section 508.4) would need to have a thermal barrier on both faces of the assembly.

For Section 509.4 (incidental use separations) the intent is to provide the thermal barrier only on the side where the hazard exists, that is, the side facing the incidental use. For example, if a mass timber floor assembly of the incidental use contains a noncombustible topping this provision would not require the addition of a thermal barrier on mass timber

surfaces not facing the incidental use area. In addition, the thermal barrier would not be required if the sprinkler option is exercised.

It should be noted that this proposal is only addressing the contribution of exposed mass timber's face to the fuel load of a fire, and is not recommending any modifications to the fire resistance requirements of Sections 508 or 509 or to the other mass timber provisions.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

G89-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 508.4.4.1 Construction. Required separations shall be fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both, so as to completely separate adjacent occupancies. Mass timber elements serving as fire barriers or horizontal assemblies to separate occupancies in Type IV-B or IV-C construction shall be separated from the interior of the building with an approved thermal barrier consisting of a minimum of 1/2 inch (12.7 mm) gypsum board or a ~~noncombustible equivalent material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.~~

509.4.1.1 Type IV-B and IV-C construction. Where Table 509 specifies a fire-resistance-rated separation, mass timber elements serving as fire barriers or a horizontal assembly in Type IV-B or IV-C construction shall be separated from the interior of the incidental use with an approved thermal barrier consisting of a minimum of 1/2 inch (12.7 mm) gypsum board or a ~~noncombustible equivalent material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.~~

(Portions of proposal not shown are not modified.)

Committee Reason: The modification makes the proposal consistent with the current code. The proposal was approved based upon the proponents published reason statement. (Vote: 14-0)

Assembly Action:

None

G89-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jonathan Humble, representing American Iron and Steel Institute (jhumble@steel.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

508.4.4.1 Construction. Required separations shall be *fire barriers* constructed in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both, so as to completely separate adjacent occupancies. Mass timber elements serving as fire barriers or horizontal assemblies to separate occupancies in Type IV-B ~~or IV-C~~ construction shall be separated from the interior of the building with an approved thermal barrier consisting of a minimum of 1/2 inch (12.7 mm) gypsum board or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.

509.4.1.1 Type ~~IV-B and IV-C~~ construction. Where Table 509 specifies a fire-resistance-rated separation, mass timber elements serving as fire barriers or a horizontal assembly in Type IV-B ~~or IV-C~~ construction shall be separated from the interior of the incidental use with an approved thermal barrier consisting of a minimum of 1/2 inch (12.7 mm) gypsum board or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275.

Commenter's Reason: We recommend that the Type IV-B mass timber designation be deleted from the tall wood building proposals.

The origins of the development of the types of construction were originally developed to “account for the response or participation that a building’s structure will have in a fire condition originating within the building as a result of the occupancy or the fuel load” (Example source from BOCA National Building Code 1993 Commentary). The modern day types of construction are parsed out into three primary categories of construction; noncombustible (Types I and II), noncombustible/combustible (Types III and IV) and combustible (Type V). Subcategories were created to identify the protection; Type A for protected and Type B for unprotected.

What we have within proposals G75-18, G80-18, G84-18, G89-18, and G108-18 is the addition of a new construction category that has been proposed based on the need to satisfy aesthetics based on the combination of Types IV-A and IV-C, which is a departure from the black and white construction categories based on construction that is non-combustible or

combustible. We feel this inappropriate for the codes to begin to designate designer type construction categories.

In the past such mixing and matching of construction types into building or structure is more suited to the IBC Section 104.11 (Alternative materials, design and methods of construction and equipment), or through use of the ICC International Performance Code or performance analysis. We feel that these are the most appropriate options for the mixing-and-matching of construction types in building design.

(Note to staff: The modifications shown to the term "material" are an outcome of the cdpACCESS system and not part of this public comment.)

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This will not increase or decrease the cost of construction as this code change proposal and public comment address information that was not previously contained in the code, therefore there is no cost impact when compared to present requirements.

Public Comment 2:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

IBC: , 508.1, 508.5, 508.5.1, 508.5.2, 508.5.3, 508.5.4, 508.5.5, 508.5.6, 508.5.7, 508.5.8, 508.5.9, 508.5.10, 508.5.11

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Delete without substitution

~~SECTION 419 LIVE/WORK UNITS~~

Revise as follows

508.1 General. Each portion of a building shall be individually classified in accordance with Section 302.1. Where a building contains more than one occupancy group, the building or portion thereof shall comply with the applicable provisions of Section 508.2, 508.3 or, 508.4, 508.5, or a combination of these sections.

Exceptions:

1. Occupancies separated in accordance with Section 510.
2. Where required by Table 415.6.2, areas of Group H-1, H-2 and H-3 occupancies shall be located in a *detached building* or structure.
- ~~3. Uses within live/work units, complying with Section 419, are not considered separate occupancies.~~

~~419.1508.5~~ General Live/Work Units. A *live/work unit* shall comply with Sections ~~419.1-508.5~~ through ~~419.9-508.5.11~~.

Exception: Dwelling or sleeping units that include an office that is less than 10 percent of the area of the *dwelling unit* are permitted to be classified as *dwelling units* with accessory occupancies in accordance with Section 508.2.

~~419.1-1508.5.1~~ Limitations. All of the following shall apply to live/work areas:

1. The *live/work unit* is permitted to be not greater than 3,000 square feet (279 m²) in area.
2. The nonresidential area is permitted to be not more than 50 percent of the area of each *live/work unit*.
3. The nonresidential area function shall be limited to the first or main floor only of the *live/work unit*.
4. Not more than five nonresidential workers or employees are allowed to occupy the nonresidential area at any one time.

~~419.2508.5.2~~ Occupancies. *Live/work units* shall be classified as a Group R-2 occupancy. Separation requirements found in Sections 420 and 508 shall not apply within the *live/work unit* where the *live/work unit* is in compliance with Section ~~419-508.5~~. Nonresidential uses that would otherwise be classified as either a Group H or S occupancy shall not be permitted in a *live/work unit*.

Exception: Storage shall be permitted in the *live/work unit* provided that the aggregate area of storage in the nonresidential portion of the *live/work unit* shall be limited to 10 percent of the space dedicated to nonresidential activities.

~~419.3-508.5.3~~ Means of egress. Except as modified by this section, the *means of egress* components for a *live/work unit* shall be designed in accordance with Chapter 10 for the function served.

~~419.3-1508.5.4~~ Egress capacity. The egress capacity for each element of the *live/work unit* shall be based on the occupant load for the function served in accordance with Table 1004.5.

~~419.3-2508.5.5~~ Spiral stairways. *Spiral stairways* that conform to the requirements of Section 1011.10 shall be permitted.

~~419-4508.5.6~~ Vertical openings. Floor openings between floor levels of a *live/work unit* are permitted without enclosure.

~~[F]~~ **419-5508.5.7 Fire protection.** The *live/work unit* shall be provided with a monitored *fire alarm* system where required by Section 907.2.9 and an *automatic sprinkler system* in accordance with Section 903.2.8.

~~419-6508.5.8 Structural.~~ Floors within a *live/work unit* shall be designed for the live loads in Table 1607.1, based on the function within the space.

~~419-7508.5.9 Accessibility.~~ Accessibility shall be designed in accordance with Chapter 11 for the function served.

~~419-8508.5.10 Ventilation.~~ The applicable *ventilation* requirements of the International Mechanical Code shall apply to each area within the *live/work unit* for the function within that space.

~~419-9508.5.11 Plumbing facilities.~~ The nonresidential area of the *live/work unit* shall be provided with minimum plumbing facilities as specified by Chapter 29, based on the function of the nonresidential area. Where the nonresidential area of the *live/work unit* is required to be *accessible* by Section 1107.6.2.1, the plumbing fixtures specified by Chapter 29 shall be *accessible*.

Reason: Relocating Section 419 on Live/Work Units to Section 508 Mixed Occupancies provides a clearer description under Mixed Use Occupancies since the unit is not only residential nor business use. An example is a doctor's office occupying part of a detached dwelling, or townhouses with an office, store or restaurant on the first floor and a residence occupying parts or all of upper floors.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is an editorial relocation of existing requirements.

G90-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee approved the change recognizing that live/work units are a method of addressing mixed occupancy in a space and therefore is well placed in Section 508. The Chapter 4 location was felt to be no longer needed as these units have become more mainstream and not 'special' in nature. (Vote: 8-6)

Assembly Action:

None

G90-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

310.3.1 Live/Work Units Live/work units located within townhouses that comply with Section 508.5 are permitted to comply with the International Residential Code provided an automatic sprinkler system is installed in accordance with Section 903.3.1.3 or Section P2904 of the International Residential Code.

508.5 Live/Work Units. A *live/work unit* shall comply with Sections 508.5 through 508.5.11.

Exception-Exceptions:

1. Dwelling or sleeping units that include an office that is less than 10 percent of the area of the *dwelling unit* are permitted to be classified as *dwelling units* with accessory occupancies in accordance with Section ~~508-508.2~~.
2. Live/work units located within townhouses that comply with this section are permitted to comply with the International Residential Code provided an automatic sprinkler system is installed in accordance with Section 903.3.1.3 or Section P2904 of the International Residential Code.

Commenter's Reason: It has always been understood that live-work units located in townhouses could be constructed under the International Residential Code (IRC). In fact, the Effective Use of the International Building Code in the Preface states, The IRC can also be used for the construction of live/work units (as defined in Section 419) and small bed and breakfast-style hotels where there are five or fewer guest rooms and the hotel is owner occupied . Although this is not part of the specific code requirements, it does set forth the intent that live/work units could be constructed under the IRC. In addition, Section 101.2 of the IRC includes an exception that allows live/work units to be constructed under that that code. The exception states, "Live/work units located in townhouses and complying with the requirements of Section 419 of the International Building Code". This proposal would provide consistency between the two codes to allow townhouses to be constructed under the IRC as long as they also comply with Section 419 of the IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Since it was already assumed that live/work could be constructed under the IRC, there is no cost difference.

G90-18

G91-18

IBC: Table [F] TABLE 509

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (BCAC@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE

2018 International Building Code

Revise as follows

**[F] TABLE 509
INCIDENTAL USES**

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu per hour input ^a	1 hour or provide automatic sprinkler system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower ^a	1 hour or provide automatic sprinkler system
Refrigerant machinery room ^a	1 hour or provide automatic sprinkler system
Hydrogen fuel gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Incinerator rooms ^a	2 hours and provide automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic sprinkler system
In Group E occupancies, laboratories and vocational shops not classified as Group H	1 hour or provide automatic sprinkler system
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
In ambulatory care facilities, laboratories not classified as Group H	1 hour or provide automatic sprinkler system
Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour
Stationary storage battery systems having an energy capacity greater than the threshold quantity specified in Table 1206.2 of the International Fire Code	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Electrical installations and transformers ^a	See Sections 110.26 through 110.34 and Sections 450.8 through 450.48 of NFPA 70 for protection and separation requirements.

For SI: 1 square foot = 0.0929 m², 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m³.

a. See Chapter 6 of the International Fire Code for additional construction related requirements

Reason: This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

This is a simple footnote pointer so designers are aware of additional construction and/or installation requirements for these incidental use building systems that are located in Chapter 6 of the International Fire Code.

This proposal is part of a comprehensive update to IFC Chapter 6 by the F-CAC. F-CAC fully supports this proposal.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal adds a pointer to existing requirements in the IFC. No new or additional construction requirements are being introduced into the IBC.

G91-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved as it was seen as an unnecessary pointer. There appears to be very little related to Table 509 found within Chapter 6 of the IFC. (Vote: 11-3)

Assembly Action:

None

G91-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Submitted.

Commenter's Reason: Section 509 is used during the design process of the building. The proposed pointer, in the form of a footnote to IBC Table 509 for specific room or area types, directs the code user to the additional applicable construction/installation requirements in Chapter 6 of the Fire Code with the Building Code for these incidental uses, which otherwise might be missed.

Reference to Chapter 6 of the Fire Code is applicable, because it focuses on building systems and services as they relate to potential safety hazards and when and how they should be installed. This chapter brings together all building system- and service-related issues for convenience and provides a more systematic view of buildings. The following building services and systems construction/installation requirements for the following are addressed: fuel-fired appliances, electrical equipment, wiring and hazards, mechanical refrigeration, elevator operation, maintenance and fire service keys, commercial kitchen hoods, commercial kitchen cooking oil storage and hyperbaric facilities.

Additionally, the FCAC submitted 17 proposals as part of a comprehensive package addressing technical and organizational changes to Chapter 6 of the Fire Code. These changes included additional construction and installation requirements for building systems and services which were approved at the Committee Action Hearing, including installation of fuel oil tanks within buildings and non-portable fuel-fired appliances, construction of refrigeration machinery rooms, and listed and labeled electrical equipment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal adds a pointer to existing requirements in the IFC. No new or additional construction requirements are being introduced into the IBC.

Proposed Change as Submitted

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com); Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net)

2018 International Building Code

**[F] TABLE 509
INCIDENTAL USES**

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Furnace room where any piece of equipment is over 400,000 Btu perhour input	1 hour or provide automatic sprinkler system
Rooms with boilers where the largest piece of equipment is over 15psi and 10 horsepower	1 hour or provide automatic sprinkler system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Hydrogen fuel gas rooms, not classified as Group H	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E,I and R occupancies.
Incinerator rooms	2 hours and provide automatic sprinkler system
Paint shops, not classified as Group H, located in occupancies otherthan Group F	2 hours; or 1 hour and provide automatic sprinkler system
In Group E occupancies, laboratories and vocational shops notclassified as Group H	1 hour or provide automatic sprinkler system
In Group I-2 occupancies, laboratories not classified as Group H	1 hour and provide automatic sprinkler system
In ambulatory care facilities, laboratories not classified as Group H	1 hour or provide automatic sprinkler system
Laundry rooms over 100 square feet	1 hour or provide automatic sprinkler system
In Group I-2, laundry rooms over 100 square feet	1 hour
Group I-3 cells and Group I-2 patient rooms equipped with padded surfaces	1 hour
In Group I-2, physical plant maintenance shops	1 hour
In ambulatory care facilities or Group I-2 occupancies, waste and linen collection rooms with containers that have an aggregate volume of 10 cubic feet or greater	1 hour
In other than ambulatory care facilities and Group I-2 occupancies, waste and linen collection rooms over 100 square feet	1 hour or provide automatic sprinkler system
In ambulatory care facilities or Group I-2 occupancies, storage rooms greater than 100 square feet	1 hour
Stationary storage battery systems having an energy capacity greater than the threshold quantity specified in Table 1206.2 of the International Fire Code	1 hour in Group B, F, M, S and U occupancies; 2 hours in Group A, E, I and R occupancies.
Electrical installations and transformers	See Sections 110.26 through 110.34 and Sections 450.8 through 450.48 of NFPA 70 for protection and separation requirements.

For SI: 1 square foot = 0.0929 m², 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m³.

509.2 Occupancy classification. Incidental uses shall not be individually classified in accordance with Section 302.1. Incidental uses shall be included in the building occupancies within which they are located.

Delete without substitution

509.3 Area limitations. ~~Incidental uses shall not occupy more than 10 percent of the building area of the story in which they are located.~~

Reason: We submitted changes to eliminate the 10% area limitation on incidental uses over the last two code cycles. Each of those proposals were disapproved by the committee and the membership. We were told by the opponents, the way to fix the problem is to require incidental uses over 10% of the story area to be classified as an occupancy. Independently we each drafted a proposed change to say that if one incidental use; or an aggregate of incidental uses on a story exceeds the 10% limit that they would be classified as a distinct occupancy. The more we tried to provide rationale for such a change, the more the construct came crashing down.

The original purpose of incidental uses that are all specifically listed in Table 509 is to address a hazard of one type or another. Each of the uses in Table 509 poses a hazard to the balance of the primary use of the building or story. The solutions to address those risks are rated separations, automatic sprinkler system or both. The hazard exists whether the use is 5% of a story, 15% of a story or 50% of a story. The protection needs to be provided regardless of the area of the incidental use(s). The 10% limit is particularly impractical and onerous if strictly enforced on the health care industry. Laboratories, laundry rooms, maintenance shops, storage rooms; waste and linen collection - going over 10% is a frequent design issue.

The solution urged on us is to say things that are an incidental use when limited to 10% of the story (and part of the primary occupancy) are to be called a different occupancy when they get larger doesn't work either way you try to wrap the code around it.

A. Distinct uses - no longer incidental uses. If we say that these uses exceeding 10% of story are something else and no longer an incidental use, then the protections required by Table 509 disappear. If we assign other occupancies then we are left to rely on Section 508 mixed occupancies to provide protections. But often the protections will be less. In a non-separated approach you may get a fully sprinklered building, but you won't get rated separations. In a separated mixed occupancy approach you might get sprinklers; you might get rated separations; and sometimes you might get both, but you aren't going to be assured of the protections required for the smaller things allowed under incidental uses.

B. Distinct uses - but still incidental uses. If we say that these uses exceeding 10% are another occupancy AND remain an incidental use in order to preserve the protections. What have we done? We've proved that the 10% limit is meaningless because you are still getting the protections of incidental uses regardless of size.

A final point about assigning other occupancy categories to these uses (when exceeding 10%) is that the application of the code will be inconsistent from jurisdiction to jurisdiction; from project to project.

Eliminating the 10% limit makes sure that each of these uses in Table 509 will be consistently protected from project to project; jurisdiction to jurisdiction.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is intended to clarify the code language.

G93-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: After returning this item from the Table, the proponents stated they were unable to arrive at a compromise. There was a consensus that these items require protections as provided in Section 509. There was not a consensus on whether the 10% limit could be eliminated outright or if the elimination needs to be balanced by new provisions to address larger installations. When asked by the proponents, the committee was more supportive of efforts to fix the provisions over leaving them as they stand. (Vote: 11-3)

Assembly Action:

None

G93-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (sthomas@coloradocode.net) ; David Collins representing AIA (dcollins@preview-group.com) ; Sarah Rice (srice@preview-group.com); Wayne Jewell (wayne.jewell@greenoaktwp.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

509.2 Occupancy classification. ~~Incidental uses shall not be individually~~ An incidental use area shall be classified in accordance with Section 302.1. Incidental uses shall be included in the building occupancies within which they are located the occupancy of that portion of the building in which it is located or the building shall be classified as a mixed occupancy and shall comply with Section 508.

509.3 Area limitations. ~~Incidental~~ The area of incidental uses shall not occupy more than 10 percent of the building area of the story in which they are located be limited within a building.

Commenter's Reason: There is a serious hole in the current code as it relates to incidental uses. The current code limits incidental uses to 10% of the area of the story that they are located within, similar to accessory occupancies in Section 508.2.3. The problem is that there is no direction in the code as to what to do when the incidental use exceeds 10% of the story area or it is the entire building. We have tried to delete the 10% requirement over the past few code cycles to solve this issue. However, the committee has disapproved the change each time including this cycle. Therefore, we are changing our approach to respond to the committee and the opposition testimony to address this issue. The committee and opposition all stated that if the incidental use exceeded 10% of the area, then it should be classified as a specific occupancy. However, the current Section 509.2 states that you cannot classify an incidental use as an occupancy. So, this public comment revises that section to allow the design professional to classify the use as an occupancy or keep it as an incidental use. If they classify the use as an occupancy, then they would need to comply with Section 508 and determine whether it is an accessory occupancy, nonseparated occupancy or separated occupancy. It would be left to the discretion of the design professional.

Section 509.3 has been revised to state that the area of incidental uses is no longer limited. The primary purpose of this revision is for healthcare facilities. Most of the uses listed in Table 509 are located within healthcare occupancies. In many cases, these areas exceed the 10% limitation and has created a problem. This would allow healthcare to have as many incidental uses as they want and be consistent with NFPA 101 Life Safety Code. This has been a goal of the Health Care Subcommittee over the past few code cycles.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. In some cases, the separation between the uses could be eliminated.

G94-18

IBC: 510.2

Proposed Change as Submitted

Proponent: Lawrence Lincoln, Salt Lake City Corporation, representing Self (larry.lincoln@slcgov.com)

2018 International Building Code

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours. Where vertical offsets are provided as part of a *horizontal assembly*, the vertical offset and the structure supporting the vertical offset shall have a *fire-resistance rating* of not less than 3 hours.
2. The building below, including the *horizontal assembly*, is of Type IA construction.
3. *Shaft, stairway, ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.

Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

1. The building above the *horizontal assembly* is not required to be of Type I construction;
 2. The enclosure connects fewer than four *stories*; and
 3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. Where buildings above the horizontal assembly are of Type III, IV or V construction, stairways within enclosures specified in Item 3 shall be constructed of either noncombustible materials or fire retardant treated wood.
- ~~5.4-~~The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.
- ~~6. 5-~~The building below the *horizontal assembly* shall be protected throughout by an approved *automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
- ~~7. 6-~~The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

Reason: IBC section 1011.7 requires that Stairway construction be built of materials consistent with the types permitted for the type of construction of the building. Buildings designed in accordance with section 510.2 are inherently of two different types of construction where the horizontal assembly is the dividing line. When taking into consideration the materials that would be consistent with the type of construction of the stairway construction within a fire-rated stair enclosure, the transition from combustible materials (above the horizontal assembly) to noncombustible materials (below the horizontal assembly) makes no sense within the fire-rated stair enclosure when the type of construction above the horizontal assembly is of type III, IV or V and the type of construction below the horizontal assembly is type I-A (required by section 510.2). In other words, it makes no sense to transition from combustible materials to noncombustible materials when you are within the same environment (the fire-rated stair enclosure). Please note that this code proposal would allow fire-retardant-treated wood as a construction material within that portion of the fire-rated stair enclosure that is part of the type I-A construction. Since fire is never anticipated to originate within a fire-rated stair enclosure, this allowance seems reasonable.

Cost Impact: The code change proposal will decrease the cost of construction
The proposed code change will decrease the cost of construction as this code change would lessen a code requirement.

G94-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee saw the wording of G95-18 as a better solution to this issue. (Vote: 12-2)

Assembly Action:

None

G94-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Lawrence Lincoln, representing Self (larry.lincoln@slcgov.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours. Where vertical offsets are provided as part of a *horizontal assembly*, the vertical offset and the structure supporting the vertical offset shall have a *fire-resistance rating* of not less than 3 hours.
2. The building below, including the *horizontal assembly*, is of Type IA construction.
3. *Shaft, stairway, ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.

Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

1. The building above the *horizontal assembly* is not required to be of Type I construction;
 2. The enclosure connects fewer than four *stories*; and
 3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. Where buildings above the horizontal assembly are of Type III, IV or V construction, stairways within the enclosures specified in Item 3 shall be allowed to be constructed of either noncombustible materials or fire-retardant treated wood, any material allowed by the code.
 5. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.
 6. The building below the *horizontal assembly* shall be protected throughout by an approved *automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
 7. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

Commenter's Reason: IBC section 1011.7 requires that Stairway construction be built of materials consistent with the types permitted for the type of construction of the building. Buildings designed in accordance with section 510.2 are inherently of two different types of construction where the horizontal assembly is the dividing line. When taking into consideration the materials that would be consistent with the type of construction of the stairway construction located within a fire-rated stair enclosure, the transition from combustible materials (above the horizontal assembly) to noncombustible materials (below the horizontal assembly) makes no sense within the fire-rated stair enclosure when the type of construction above the horizontal assembly is of Type III, IV or V and the type of construction below the horizontal assembly is Type I-A (as required by section 510.2). In other words, it makes no sense to transition from combustible materials to noncombustible materials when you are within the same environment (the fire-rated stair enclosure). By mentioning Item 3 in this code change proposal, clarity is provided to the code user clearly indicating that combustible materials ('any material allowed by the code') are allowed to be used within the stairway enclosures required by Item 3,

when the building above the horizontal assembly is of Type III, IV or V construction. 'Pointers' from IBC section 1011.7 is unnecessary since IBC section 510.2 is a more specific requirement. Since fire is never anticipated to originate from within a fire-rated stair enclosure, regardless of the fire-rating of the stair enclosure, this code change allowance seems reasonable.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The proposed public comment and code change will decrease the cost of construction as this code change would lessen a code requirement of the installation of noncombustible materials to that of combustible materials.

G94-18

G95-18

Proposed Change as Submitted

Proponent: Lee Kranz, representing City of Bellevue, WA (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows

510.2 Horizontal building separation allowance. A building shall be considered as separate and distinct buildings for the purpose of determining area limitations, continuity of *fire walls*, limitation of number of *stories* and type of construction where all of the following conditions are met:

1. The buildings are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 3 hours. Where vertical offsets are provided as part of a *horizontal assembly*, the vertical offset and the structure supporting the vertical offset shall have a *fire-resistance rating* of not less than 3 hours.
2. The building below, including the *horizontal assembly*, is of Type IA construction.
3. *Shaft, stairway, ramp* and escalator enclosures through the *horizontal assembly* shall have not less than a 2-hour *fire-resistance rating* with opening protectives in accordance with Section 716.

Exception: Where the enclosure walls below the *horizontal assembly* have not less than a 3-hour *fire-resistance rating* with opening protectives in accordance with Section 716, the enclosure walls extending above the *horizontal assembly* shall be permitted to have a 1-hour *fire-resistance rating*, provided:

1. The building above the *horizontal assembly* is not required to be of Type I construction;
 2. The enclosure connects fewer than four *stories*; and
 3. The enclosure opening protectives above the *horizontal assembly* have a *fire protection rating* of not less than 1 hour.
4. Interior exit stairways located within the Type IA building are permitted to be of combustible materials where both of the following requirements are met:
- 4.1. The building above the Type IA building is of Type III, IV, or V construction.
 - 4.2. The stairway located in the Type IA building is enclosed by 3-hour fire-resistance rated construction with opening protectives in accordance with Section 716.
5. The building or buildings above the *horizontal assembly* shall be permitted to have multiple Group A occupancy uses, each with an *occupant load* of less 300, or Group B, M, R or S occupancies.
- 5-6. The building below the *horizontal assembly* shall be protected throughout by an approved *automatic sprinkler system* in accordance with Section 903.3.1.1, and shall be permitted to be any occupancy allowed by this code except Group H.
- 6-7. The maximum *building height* in feet (mm) shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the *grade plane*.

1011.7 Stairway construction. *Stairways* shall be built of materials consistent with the types permitted for the type of construction of the building, ~~except that wood handrails shall be permitted for all types of construction.~~

Exceptions:

1. Wood handrails shall be permitted in all types of construction.
2. Interior exit stairway in accordance with Section 510.2

1023.2 Construction. Enclosures for interior exit *stairways* and *ramps* shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. *Interior exit stairway* and *ramp* enclosures shall have a *fire-resistance rating* of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit *stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. *Interior exit stairways* and *ramps* shall have a *fire-resistance rating* not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions:

1. *Interior exit stairways and ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. *Interior exit stairways* within an *atrium* enclosed in accordance with Section 404.6.
3. *Interior exit stairway in accordance with Section 510.2.*

Reason: In podium buildings utilizing a 3-hour fire-resistance rated horizontal assembly constructed in accordance with Section 510.2 it is very common for the building above the horizontal assembly to be of combustible construction, including the landings, stair stringers and treads. The code currently requires that a transition be made from wood to metal, or some other non-combustible materials, within the stair enclosure at the point where the stair goes from being located in a combustible building to the Type IA non-combustible building. This is not practical or warranted. Fires do not typically start within the fire-resistance rated stair enclosure. Exception #4.2 of this proposal provides additional protection by requiring that the stair shaft be of not less than a 3-hour fire resistance rating with 3-hour rated door assemblies as required by Section 716. This essentially creates a vertical offset of the 3-hour horizontal assembly which is currently allowed by Section 510.2. This section states that "Where vertical offsets are provided as part of a horizontal assembly, the vertical offset and the structure supporting the vertical offset shall have a *fire-resistance rating* of not less than 3 hours."

We have also included two 'pointer' exceptions in Chapter 10. Without the pointer exceptions someone might argue that these Chapter 10 provisions are more restrictive and override the exception in 510.2. The exemption for wood handrails currently found in the text of Section 1011.7 has been reformatted by placing it into exception #1.

Cost Impact: The code change proposal will decrease the cost of construction. Allowing stairs to be of combustible construction will be less expensive than if they were required to be of non-combustible materials. Also, the cost to design the stair will be reduced because a transition from wood to steel (or other non-combustible materials) will no longer be required.

G95-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The issue of stairway construction through podium buildings has been a issue for many jurisdictions and the cause of many alternative method reviews - and approvals. This proposal was preferable to G94-18. It provides a good clarification of the stair transition between upper and lower buildings. The presence of sprinklers throughout both buildings adds to the acceptability of this approach. (Vote: 14-0)

Assembly Action:

None

G95-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Masonry Alliance for Codes and Standards (svskalko@svskalko-pe.com) ; William Hall, Alliance for Concrete Codes and Standards, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests Disapprove.

Commenter's Reason: G95-18 should be DISAPPROVED for the following reasons:

- The amount of wood material being introduced into the construction of the stair enclosure and exit stair by the new alternate provisions in Item (4) to 510.2 can increase the fire load associated with the means of egress significantly for podium style buildings covered by this section. Based on a review of the only (3) hour fire rated wood stud wall assemblies in the UL Directory, the complex wall details required to form the 3-hour enclosure require far more wood materials than typical 2X4 or 2X6 stud walls.

The 3-hour fire rated wall assemblies, U370, U382, U390 V304, showed the walls in the U-series require two separate stud walls be constructed, with a minimum 1-inch space between opposing studs, to create a cavity that is to be completely filled with a sprayed fiber cellulose material. The studs are spaced a maximum of 16-inches on center. The single V-series assembly requires the wall assembly to be constructed of 5-1/2-in X 6-in wood columns spaced at a maximum of 96-inches on center. The wood columns are connected together by horizontal 2 X 4 wood girts on each side spaced 16-inches on center.

The net effect of these assemblies will more than double the amount of wood (e.g. more studs, more top plates, etc.) presently permitted in the crucial means of egress enclosure within the Type IA construction for these podium style buildings.

- The proponent states *the proposal will decrease the cost of construction. Allowing stairs to be of combustible construction will be less expensive then if they were required to be of noncombustible materials* . That statement is not necessarily true based on a review of the listed wood stud wall assemblies required to meet the 3-hour fire resistance rating

The U-series 3-hour fire rated wall assemblies in the UL Directory (U370, U382, U390) require two separate stud walls (16-in o.c.) be constructed with a space between studs that is completely filled with a sprayed fiber cellulose material. The U-series wall assemblies are then covered with two layers of Type C gypsum board. The V-series assembly in the UL Directory (V304) is constructed of 5-1/2-in X 6-in wood columns @ 96-inches o.c. and connected together by horizontal 2 X 4 wood girts 16-inches o.c. on each side. Four (4) layers of 5/8-inch gypsum board are applied to the horizontal girts in staggered layers.

Based on other cost studies of wood frame walls versus masonry walls the costs for these complex wood stud walls could easily exceed that required for concrete or masonry walls (www.buildingstudies.org).

- The General Committee reason states *the presence of sprinklers throughout both buildings adds to the acceptability of this approach* . Nothing in this proposal requires buildings located above the 3-hour horizontal assembly to be sprinklered. It is possible to have multiple Group Assembly occupancies with separate fire area compartments in accordance with Section 707.3.10, or a Group B, M or S occupancy in the building above, without sprinkler protection being required. The proposal to allow the increased combustible construction for the stair enclosure and exit stair was approved incorrectly thinking that the buildings above and below the horizontal assembly are sprinklered.

G95-18 decreases the fire safety for the occupants and the fire service in buildings constructed using the podium provisions in Section 510.2 by allowing an increase in the amount of combustible materials based on reasons that are incorrect or not sufficiently justified.

Recommend DISAPPROVAL of G95-18

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The cost of construction will remain unchanged if the proposal is disapproved.

G95-18

G97-18

IBC: 510.4

Proposed Change as Submitted

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

Revise as follows

510.4 Parking beneath Group R. Where a ~~maximum one story above grade plane~~ Group S-2 parking garage, one story above grade plane, enclosed or open, or combination thereof, of Type I construction or open of Type IV construction, with a grade entrance, is ~~provided under~~ located below a building of Group R building, the Group S-2 parking garage and Group R building shall be considered separate and distinct buildings. The number of *stories* to be used in determining the minimum type of construction of the Group R building shall be measured from the floor above ~~such as the parking area garage~~. The floor assembly between the parking garage and the Group R above shall comply with the type of construction required for the parking garage and shall also provide a *fire-resistance rating* not less than the mixed occupancy separation required in Section 508.4.

The maximum building height in feet shall not exceed the limits set forth in Section 504.3 for the building having the smaller allowable height as measured from the grade plane.

Reason: The current language in this section is confusing and awkward. This section addresses the upper height limit in stories, but does not address it in feet.

Cost Impact: The code change proposal will decrease the cost of construction
By clarifying the intent of the code the cost of design, review and approval of projects should be simplified and reduce the overall cost of construction.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee agreed with the proponents reason statement. (Vote: 8-6)

Assembly Action:

None

G97-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeffrey Shapiro, representing National Fire Sprinkler Association (jeff.shapiro@intlcodeconsultants.com) requests Disapprove.

Commenter's Reason: Although this change was intended as a simple cleanup, there is a major unintended technical change that eliminates the current requirement for fire sprinklers to be included in the garage level. In the 2018 code, Section 903.2.8 requires all BUILDINGS containing a Group R fire area to be sprinklered, and because horizontal separation in Section 510.4 is not currently recognized as a basis for creating separate buildings, the Group R fire area triggers Section 903.2.8 and requires the entire building, including the garage to be sprinklered. The text being added by this proposal stating, "the Group S-2 parking garage and the Group R building shall be considered separate and distinct buildings" changes how the code applies because it designates the S-2 garage as a separate building, thereby disconnecting the garage from the sprinkler requirement in Section 903.2.8. Hence, if this proposal is approved, a building built to Section 510.4 would not require sprinklers under the 2021 edition. Because this consequence was not mentioned or justified by the original proposal or at the committee hearing, the proposal needs to be DISAPPROVED.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. If the section is deleted, the code will then defer to Section 510.2 for pedestal construction.

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows

[BS] WALL, LOAD-BEARING. Any wall meeting either of the following classifications:

1. Any metal or wood stud wall that supports more than 100 pounds per linear foot (1459 N/m) of vertical load in addition to its own weight.
2. Any *masonry* or concrete, or mass timber wall that supports more than 200 pounds per linear foot (2919 N/m) of vertical load in addition to its own weight.

Add new definition as follows

MASS TIMBER. Structural elements of Type IV construction primarily of solid, built-up, panelized or engineered wood products that meet minimum cross section dimensions of Type IV construction.

NONCOMBUSTIBLE PROTECTION (FOR MASS TIMBER).

Noncombustible material, in accordance with Section 703.5, designed to increase the fire-resistance rating and delay the combustion of mass timber.

Revise as follows

602.4 Type IV. ~~Type IV construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated wood, heavy timber (HT) or structural composite lumber (SCL) without concealed spaces. The minimum dimensions for permitted materials including solid timber, glued laminated timber, structural composite lumber (SCL), and cross laminated timber and details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.1 or 602.4.2 shall be permitted. Interior walls and partitions not less than 1-hour fire-resistance rating or heavy timber complying with Section 2304.11.2.2 shall be permitted.~~

Type IV construction is that type of construction in which the building elements are mass timber or noncombustible materials and have fire resistance ratings in accordance with Table 601. Mass timber elements shall meet the fire resistance rating requirements of this section based on either the fire resistance rating of the noncombustible protection, the mass timber, or a combination of both and shall be determined in accordance with Section 703.2 or 703.3. The minimum dimensions and permitted materials for building elements shall comply with the provisions of this section and Section 2304.11. Mass timber elements of Types IV A, IV B and IV C construction shall be protected with noncombustible protection applied directly to the mass timber in accordance with Sections 602.4.1 through 602.4.3. The time assigned to the noncombustible protection shall be determined in accordance with Section 703.8 and comply with 722.7.

Cross-laminated timber shall be labeled as conforming to the heat performance requirements of Section 6.1.3.4 of DOC PS1 and have no delamination in any specimen, except where occurring at a localized characteristic when permitted in the product standard.

Exterior load-bearing walls and nonload-bearing walls shall be mass timber construction, or shall be of noncombustible construction.

Exception: Exterior load-bearing walls and nonload-bearing walls of Type IV-HT Construction in accordance with Section 602.4.4.

The interior building elements, including nonload-bearing walls and partitions, shall be of mass timber construction or of noncombustible construction.

Exception: Interior building elements and nonload-bearing walls and partitions of Type IV-HT Construction in accordance with Section 602.4.4.

Combustible concealed spaces are not permitted except as otherwise indicated in Sections 602.4.1 through 602.4.4. Combustible stud spaces within light frame walls of Type IV-HT construction shall not be considered concealed spaces, but shall comply with Section 718.

In buildings of Type IV-A, B, and C, construction with an occupied floor located more than 75 feet above the lowest level of fire department access, up to and including 12 stories or 180 feet above grade plane, mass timber interior exit and elevator hoistway enclosures shall be protected in accordance with Section 602.4.1.2. In buildings greater than 12 stories or 180 feet above grade plane, interior exit and elevator hoistway enclosures shall be constructed of non-combustible materials.

Add new text as follows

602.4.1 Type IV-A. Building elements in Type IV-A construction shall be protected in accordance with Sections 602.4.1.1 through 602.4.1.6. The required fire resistance rating of noncombustible elements and protected mass timber elements shall be determined in accordance with Section 703.2 or Section 703.3.

602.4.1.1 Exterior protection. The outside face of exterior walls of mass timber construction shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a). All components of the exterior wall covering, shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.1.2 Interior protection. Interior faces of all mass timber elements, including the inside faces of exterior mass timber walls and mass timber roofs, shall be protected with materials complying with Section 703.5.

602.4.1.2.1 Protection time. Noncombustible protection shall contribute a time equal to or greater than times assigned in Table 722.7.1(a), but not less than 80 minutes. The use of materials and their respective protection contributions listed in Table 722.7.1(b) shall be permitted to be used for compliance with Section 722.7.1.

602.4.1.3 Floors. The floor assembly shall contain a noncombustible material not less than one inch in thickness above the mass timber. Floor finishes in accordance with Section 804 shall be permitted on top of the noncombustible material. The underside of floor assemblies shall be protected in accordance with 602.4.1.2.

602.4.1.4 Roofs. The interior surfaces of roof assemblies shall be protected in accordance with Section 602.4.1.2. Roof coverings in accordance with Chapter 15 shall be permitted on the outside surface of the roof assembly.

602.4.1.5 Concealed spaces. Concealed spaces shall not contain combustibles other than electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the International Mechanical Code, and shall comply with all applicable provisions of Section 718. Combustible construction forming concealed spaces shall be protected in accordance with Sections 602.4.1.2.

602.4.1.6 Shafts. Shafts shall be permitted in accordance with Sections 713 and Section 718. Both the shaft side and room side of mass timber elements shall be protected in accordance with Section 602.4.1.2.

602.4.2 Type IV-B. Building elements in Type IV-B construction shall be protected in accordance with Sections 602.4.2.1 through 602.4.2.6. The required fire resistance rating of noncombustible elements or mass timber elements shall be determined in accordance with Section 703.2 or Section 703.3.

602.4.2.1 Exterior protection. The outside face of exterior walls of mass timber construction shall be protected with non-combustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a). All components of the exterior wall covering shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354, and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.2.2 Interior protection. Interior faces of all mass timber elements, including the inside face of exterior mass

timber walls and mass timber roofs, shall be protected, as required by this section, with materials complying with Section 703.5.

602.4.2.2.1 Protection time. Noncombustible protection shall contribute a time equal to or greater than times assigned in Table 722.7.1(a), but not less than 80 minutes. The use of materials and their respective protection contributions listed in Table 722.7.1(b) shall be permitted to be used for compliance with Section 722.7.1.

602.4.2.2.2 Protected area. All interior faces of all mass timber elements shall be protected in accordance with Section 602.4.2.2.1, including the inside face of exterior mass timber walls and mass timber roofs.

Exceptions: Unprotected portions of mass timber ceilings and walls complying with Section 602.4.2.2.4 and the following:

1. Unprotected portions of mass timber ceilings, including attached beams, shall be permitted and shall be limited to an area equal to 20% of the floor area in any dwelling unit or fire area; or
2. Unprotected portions of mass timber walls, including attached columns, shall be permitted and shall be limited to an area equal to 40% of the floor area in any dwelling unit or fire area; or
3. Unprotected portions of both walls and ceilings of mass timber, including attached columns and beams, in any dwelling unit or fire area shall be permitted in accordance with section 602.4.2.2.3.
4. Mass timber columns and beams which are not an integral portion of walls or ceilings, respectively, shall be permitted to be unprotected without restriction of either aggregate area or separation from one another.

602.4.2.2.3 Mixed unprotected areas. In each dwelling unit or fire area, where both portions of ceilings and portions of walls are unprotected, the total allowable unprotected area shall be determined in accordance with Equation 6-1.

$(U_{tc}/U_{ac}) + (U_{tw}/U_{aw}) \leq 1$ (Equation 6-1) where:

U_{tc} = Total unprotected mass timber ceiling areas

U_{ac} = Allowable unprotected mass timber ceiling area conforming to Section 602.4.2.2.2, Exception 1

U_{tw} = Total unprotected mass timber wall areas

U_{aw} = Allowable unprotected mass timber wall area conforming to Section 602.4.2.2.2, Exception 2

602.4.2.2.4 Separation distance between unprotected mass timber elements. In each dwelling unit or fire area, unprotected portions of mass timber walls and ceilings shall be not less than 15 feet from unprotected portions of other walls and ceilings, measured horizontally along the ceiling and from other unprotected portions of walls measured horizontally along the floor.

602.4.2.3 Floors. The floor assembly shall contain a noncombustible material not less than one inch in thickness above the mass timber. Floor finishes in accordance with Section 804 shall be permitted on top of the noncombustible material. The underside of floor assemblies shall be protected in accordance with Section 602.4.1.2.

602.4.2.4 Roofs. The interior surfaces of roof assemblies shall be protected in accordance with 602.4.2.2 except, in nonoccupiable spaces, they shall be treated as a concealed space with no portion left unprotected. Roof coverings in accordance with Chapter 15 shall be permitted on the outside surface of the roof assembly.

602.4.2.5 Concealed spaces. Concealed spaces shall not contain combustibles other than electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the International Mechanical Code, and shall comply with all applicable provisions of Section 718. Combustible construction forming concealed spaces shall be protected in accordance with Section 602.4.1.2.

602.4.2.6 Shafts. Shafts shall be permitted in accordance with Section 713 and Section 718. Both the shaft side and room side of mass timber elements shall be protected in accordance with Section 602.4.1.2.

602.4.3 Type IV-C. Building elements in Type IV-C construction shall be protected in accordance with Sections 602.4.3.1 through 602.4.3.6. The required fire resistance rating of building elements shall be determined in accordance with Section 703.2 or Section 703.3.

602.4.3.1 Exterior protection. The exterior side of walls of combustible construction shall be protected with non-

combustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a). All components of the exterior wall covering, shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.3.2 Interior protection. Mass timber elements are permitted to be unprotected.

602.4.3.3 Floors. Floor finishes in accordance with Section 804 shall be permitted on top of the floor construction.

602.4.3.4 Roofs. Roof coverings in accordance with Chapter 15 shall be permitted on the outside surface of the roof assembly.

602.4.3.5 Concealed spaces. Concealed spaces shall not contain combustibles other than electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the International Mechanical Code, and shall comply with all applicable provisions of Section 718. Combustible construction forming concealed spaces shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a).

602.4.3.6 Shafts. Shafts shall be permitted in accordance with Section 713 and Section 718. Shafts and elevator hoistway and interior exit stairway enclosures shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a), on both the inside of the shaft and the outside of the shaft.

602.4.4 Type IV-HT. Type IV construction (Heavy Timber, HT) is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated heavy timber or structural composite lumber (SCL), without concealed spaces. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, structural composite lumber (SCL) and cross laminated timber (CLT) and details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.4.1 or 602.4.4.2 shall be permitted. Interior walls and partitions not less than one hour fire resistance rating or heavy timber conforming with Section 2304.11.2.2 shall be permitted.

Revise as follows

~~602.4.1~~**602.4.4.1 Fire-retardant-treated wood in exterior walls.** *Fire-retardant-treated wood* framing and sheathing complying with Section 2303.2 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less.

~~602.4.2~~**602.4.4.2 Cross-laminated timber in exterior walls.** *Cross-laminated timber* complying with Section 2303.1.4 shall be permitted within exterior wall assemblies not less than 6 inches (152 mm) in thickness with a 2-hour rating or less, provided the exterior surface of the cross-laminated timber is protected by one the following:

1. *Fire-retardant-treated wood* sheathing complying with Section 2303.2 and not less than ¹⁵/₃₂ inch (12 mm) thick;
2. *Gypsum board* not less than ¹/₂ inch (12.7 mm) thick; or
3. A noncombustible material.

~~602.4.3~~**602.4.4.3 Exterior structural members.** Where a horizontal separation of 20 feet (6096 mm) or more is provided, wood columns and arches conforming to heavy timber sizes complying with Section 2304.11 shall be permitted to be used externally.

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV				TYPE V	
	A	B	A	B	A	B	A	B	C	HT	A	B

Bearing walls Exterior ^{e, f} Interior	3	2	1	0	2	2	<u>3</u>	<u>2</u>	<u>2</u>	2	1	0
	3 ^a	2 ^a	1	0	1	0	<u>3</u>	<u>2</u>	<u>2</u>	1/HT	1	0
Nonbearing walls and partitions Exterior	See Table 602											
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	<u>0</u>	<u>0</u>	<u>0</u>	See Section 2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	<u>2</u>	<u>2</u>	<u>2</u>	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	<u>1^{1/2}</u>	<u>1</u>	<u>1</u>	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.

**TABLE 602
FIRE-RESISTANCE RATING REQUIREMENTS FOR EXTERIOR WALLS BASED ON FIRE SEPARATION
DISTANCE^{a, d, g}**

FIRE SEPARATION DISTANCE =X (feet)	TYPE OF CONSTRUCTION	OCCUPANCY GROUP H^e	OCCUPANCYGROUP F-1, M, S-1^f	OCCUPANCYGROUP A, B, E, F-2, I, Rⁱ, S-2, U^h
X < 5 ^b	All	3	2	1
5 ≤ X < 10	IA, IVA	3	2	11
	Others	2	1	
10 ≤ X < 30	IA, IB, IVA, IVB	2	1	1 ^c
	IIB, VB	1	0	0
	Others	1	1	1 ^c
X ≥ 30	All	0	0	0

For SI: 1 foot = 304.8 mm.

- a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 601.
- b. See Section 706.1.1 for party walls.
- c. Open parking garages complying with Section 406 shall not be required to have a fire-resistance rating.
- d. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the story in which the wall is located.
- e. For special requirements for Group H occupancies, see Section 415.6.
- f. For special requirements for Group S aircraft hangars, see Section 412.3.1.
- g. Where Table 705.8 permits nonbearing exterior walls with unlimited area of unprotected openings, the required fire-resistance rating for the exterior walls is 0 hours.
- h. For a building containing only a Group U occupancy private garage or carport, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.
- i. For a Group R-3 building of Type II-B or Type V-B construction, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB and its various WGs held meetings, studied issues and sought input from various expert sources around the world. The TWB has posted those documents and input on its website for interested parties to follow its progress and to allow those parties to, in turn, provide input to the TWB.

At its first meeting, the TWB discussed a number of performance objectives to be met with the proposed criteria for tall wood buildings:

1. No collapse under reasonable scenarios of complete burn-out of fuel without automatic sprinkler protection being considered.
2. No unusually high radiation exposure from the subject building to adjoining properties to present a risk of ignition under reasonably severe fire scenarios.
3. No unusual response from typical radiation exposure from adjacent properties to present a risk of ignition of the subject building under reasonably severe fire scenarios.
4. No unusual fire department access issues.
5. Egress systems designed to protect building occupants during the design escape time, plus a factor of safety.
6. Highly reliable fire suppression systems to reduce the risk of failure during reasonably expected fire scenarios. The degree of reliability should be proportional to evacuation time (height) and the risk of collapse.

The comprehensive package of proposals from the TWB meet these performance objectives.

Definitions

Included in the proposal for Section 602.4 are three new/revised definitions; Wall, Load-Bearing; Mass Timber; and Noncombustible protection (for mass timber). They are important to understanding the subsequent proposed change to Section 602.4.

Load-bearing wall: The modification to the term “load-bearing wall” has been updated to include “mass timber” as a category equivalent to that of masonry or concrete. Based on the research done by the wood trade associations, mass timber walls (e.g. sawn, glued-laminated, cross-laminated timbers) have the ability to support the minimum 200 pounds per linear foot vertical load requirement.

Mass Timber: The term “mass timber” is being proposed to represent both the legacy heavy timber (a.k.a. Type IV construction) and the three (3) new construction types that are proposed for Chapter 6 of the IBC. The purpose of creating this term and definition was to establish a single term which represented the various sawn and engineered timber products that are referenced in IBC Chapter 23 (Wood) and in PRG-320 “Standard for Performance-rated Cross-laminated Timber.”

“Noncombustible Protection (For Mass Timber): The definition of “Noncombustible Protection (For Mass Timber)” is created to address the passive fire protection of mass timber. Mass timber is permitted to have its own fire-resistance rating (e.g., Mass Timber only) or have a fire resistance rating based on the fire resistance through a combination of the mass timber fire-resistance plus protection by non-combustible materials as defined in Section 703.5 (e.g., additional materials that delay the combustion of mass timber, such as gypsum board). While it is not common to list a code section number within a definition it was felt necessary in this case to ensure that the user was able to understand the intent. The protection by a non-combustible material will act to delay the combustion of the Mass Timber.

Types of Construction

The Committee recognized that tall, mass timber buildings around the world generally fell into three categories: one in which the mass timber was fully protected by noncombustible protection, a second type in which the protection was permitted to be omitted to expose the wood in certain limited amounts of walls or ceilings, and a third type in which the mass timber for the structure was permitted to be unprotected.

The TWB also determined that fire testing was necessary to validate these concepts. At its first meeting, members discussed the nature and intention of fire testing so as to ensure meaningful results for the TWB and, more specifically, for the fire service. Subsequently a test plan was developed. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stairway. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of joints, and to evaluate conditions for responding fire personnel. The Fire WG then refined the test plan, which was implemented with a series of five, full-scale, multiple-story building tests at the Alcohol, Tobacco and Firearms (ATF) laboratories in Beltsville, MD. The results of those tests, as well as testing conducted by others, helped form the basis upon which the Codes WG developed its code change proposals. This code change proposal is one of those developed by the Codes WG and approved by the TWB.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit:

<http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17.

The completely protected type of construction, as noted above, is identified as Type IV-A. The protection is defined by a new section, 722.7, proposed in a separate code change. Testing has shown that mass timber construction protected with noncombustible protection, primarily multiple layers of 5/8-inch Type X gypsum board, can survive a complete burnout of a residential fuel load without engaging the mass timber in the fire. (See video or report above.) In considering this type of construction and its potential height and/or allowable area, the TWB wanted to make sure that code users realize that the protection specified in the text applies to all building elements. Thus, the text clearly requires protection for the floor surface, all wall and ceiling surfaces, the inside roof surfaces, the underside of floor surfaces, and shafts. In addition, Type IV-A construction is proposed to have the same fire resistance rating requirements as the existing Type I-A construction, which sets forth requirements for 2-hour and 3-hour structural elements. The specified fire resistance rating for Type IV-A construction is conservative in that the fire resistance rating of the structural elements was selected to be able to passively sustain the fuel loads associated with the various occupancies without the benefit of automatic sprinkler protection, and without involving the contribution of the structural members, similar to the strategy employed in the IBC for Type I construction.

Type IV-B allows some exposed wood surfaces of the ceiling, the walls or columns and beams. The amount of exposed surface permitted to be installed, as well as the required separation between unprotected portions, is clearly specified to limit the contribution of the structure in an interior fire. For example, two different walls may share the unprotected area but the two walls must be separated by a distance of 15 feet. Type IV-B has been subjected to the same fire tests under the same conditions as Type IV-A and the results demonstrate that a predictable char layer develops on mass timber in the same fashion as traditional sawn lumber, provided that substantial delamination is avoided. (See video or report above.) It should be noted that, while portions of the mass timber may be unprotected, concealed spaces, shafts and other specified areas are required to be fully protected by noncombustible protection. Type IV-B is provided with the same base fire resistance requirements as the existing Type I-B construction, which sets forth requirements for 2-hour structural elements. Please note that the allowance per IBC Section 403.2.1.1 to reduce I-B construction to 1-hour structural elements is not proposed for Type IV-B construction. Essentially, where a building is permitted to be constructed of I-B construction and has 1-hour protection, that same building will still require 2-hour structural elements for Type IV-B construction.

Type IV-C construction permits fully exposed mass timber. Important caveats are that concealed spaces, shafts, elevator hoistways, and interior exit stairway enclosures are not permitted to be exposed, but instead are required to have noncombustible protection. The IV-C construction is differentiated from traditional Heavy Timber construction in that Type IV-C construction is required to be 2-hour fire rated. While the added fire rating is required, the committee does not propose any additional height, in terms of feet, for Type IV-C buildings; in other words, the height in feet for Type IV-C and Type IV-HT are identical. However, due to the added fire resistance ratings, the committee has proposed added floors for some occupancy groups of Type IV-C construction.

Tables 601 and 602: Included in the proposal are modification of Tables 601 and 602. This is necessary to set the performance requirement for these new types of construction based upon mass timber. It should be noted that these Fire Resistance Ratings are set to have the requirements similar to those of Type I construction. In other words, IV-A has the same FRR as I-A; IV-B has the same FRR as I-B. Because there is no Type I corollary to IV-C, it was set the same as IV-B. The IV-C has to achieve all its fire resistance by the performance of the mass timber itself because no noncombustible protection is required. This is reflected in greatly reduced permitted height, in both feet and stories, in other TWB proposals to Table 504.3, 504.4 and 506.2.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Analysis: The standards referenced in the changes in this proposal, DOC PS1, ASTM E1354, ASTM E84 and UL 723, are already referenced in the International Codes.

G108-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 602.4 Type IV.

Type IV construction is that type of construction in which the building elements are mass timber or noncombustible materials and have fire resistance ratings in accordance with Table 601. Mass timber elements shall meet the fire resistance rating requirements of this section based on either the fire resistance rating of the noncombustible protection, the mass timber, or a combination of both and shall be determined in accordance with Section 703.2 or 703.3. The minimum dimensions and permitted materials for building elements shall comply with the provisions of this section and Section 2304.11. Mass timber elements of Types IV A, IV B and IV C construction shall be protected with noncombustible protection applied directly to the mass timber in accordance with Sections 602.4.1 through 602.4.3. The time assigned to the noncombustible protection shall be determined in accordance with Section 703.8 and comply with 722.7.

Cross-laminated timber shall be labeled as conforming to PRG 320 - 18 as referenced in Section 2303.1.4, ~~the heat performance requirements of Section 6.1.3.4 of DOC PS1 and have no delamination in any specimen, except where occurring at a localized characteristic when permitted in the product standard.~~

Exterior load-bearing walls and nonload-bearing walls shall be mass timber construction, or shall be of noncombustible construction.

Exception: Exterior load-bearing walls and nonload-bearing walls of Type IV-HT Construction in accordance with

602.4.1.1 Exterior protection.

The outside face of exterior walls of mass timber construction shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(~~a~~). All components of the exterior wall covering, shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.1.2.1 Protection time.

Noncombustible protection shall contribute a time equal to or greater than times assigned in Table 722.7.1(~~1a~~), but not less than 80 minutes. The use of materials and their respective protection contributions listed in Table 722.7.1(~~2b~~) shall be permitted to be used for compliance with Section 722.7.1.

602.4.2.1 Exterior protection.

The outside face of exterior walls of mass timber construction shall be protected with non-combustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(~~a~~). All components of the exterior wall covering shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance with ASTM E1354, and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.2.2.1 Protection time.

Noncombustible protection shall contribute a time equal to or greater than times assigned in Table 722.7.1(~~1a~~), but not less than 80 minutes. The use of materials and their respective protection contributions listed in Table 722.7.1(~~2b~~) shall be permitted to be used for compliance with Section 722.7.1.

602.4.3.1 Exterior protection.

The exterior side of walls of combustible construction shall be protected with non-combustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(~~a~~). All components of the exterior wall covering, shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ/kg as determined in accordance

with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

602.4.3.5 Concealed spaces.

Concealed spaces shall not contain combustibles other than electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the International Mechanical Code, and shall comply with all applicable provisions of Section 718. Combustible construction forming concealed spaces shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a).

602.4.3.6 Shafts.

Shafts shall be permitted in accordance with Section 713 and Section 718. Shafts and elevator hoistway and interior exit stairway enclosures shall be protected with noncombustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1(a), on both the inside of the shaft and the outside of the shaft.

(Portions of proposal not shown are not modified.)

Committee Reason: Some portions of the modification were editorial and other portions were needed as the referenced standard needed to be incorporated into the code change. The definitions clarify that there are different types of mass timber construction. It is a rational way of addressing protected vs. unprotected construction. This allows the code to keep up with innovations in construction practice that are actually occurring in the field. This is an opportunity for faster construction with less foundation. All testing was done that should have been done, and more than has ever been done for other construction types. (Vote: 13-1)

Assembly Action:

G108-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ali Fattah, City of San Diego, representing Selfrequests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

602.4.2.2.2 Protected area. All interior faces of all mass timber elements shall be protected in accordance with Section 602.4.2.2.1, including the inside face of exterior mass timber walls and mass timber roofs.

Exceptions: ~~Unprotected portions of mass timber ceilings and walls complying with Section 602.4.2.2.4 and the following:~~

- ~~1. Unprotected portions of mass timber ceilings, including attached beams, shall be permitted and shall be limited to an area equal to 20% of the floor area in any dwelling unit or fire area; or~~
- ~~2. Unprotected portions of mass timber walls, including attached columns, shall be permitted and shall be limited to an area equal to 40% of the floor area in any dwelling unit or fire area; or~~
- ~~3. Unprotected portions of both walls and ceilings of mass timber, including attached columns and beams, in any dwelling unit or fire area shall be permitted in accordance with section 602.4.2.2.3.~~
- ~~4. Mass timber columns and beams which are not an integral portion of walls or ceilings, respectively, shall be permitted to be unprotected without restriction of either aggregate area or separation from one another.~~

602.4.2.2.3 Mixed unprotected areas. ~~In each dwelling unit or fire area, where both portions of ceilings and portions of walls are unprotected, the total allowable unprotected area shall be determined in accordance with Equation 6-1. $(U_{tc}/U_{ac}) + (U_{tw}/U_{aw}) \leq 1$ (Equation 6-1) where:~~

~~U_{tc} = Total unprotected mass timber ceiling areas~~

~~U_{ac} = Allowable unprotected mass timber ceiling area conforming to Section 602.4.2.2.2, Exception 1~~

~~U_{tw} = Total unprotected mass timber wall areas~~

~~U_{aw} = Allowable unprotected mass timber wall area conforming to Section 602.4.2.2.2, Exception 2~~

Commenter's Reason: This public comment is submitted to address practical enforcement difficulties that will arise when permitting partially protected CLT and mass timber elements based on a determination of the floor area of a unit or a percentage of the fire area. This will very difficult to establish in the field and it will be difficult over the life of the building to keep track of these modifications. In fact alterations where drywall is removed may also be exempt from a building permit. by the IBC in chapter 1.

Three types of construction have been developed by the Tall Wood Ad-hoc Committee (unprotected, protected and better protected) that did an excellent job in explaining the code changes allowing tall wood buildings to anyone interested in participating. While there was limited opposition raised at the Committee Action Hearings by representatives from competing materials industries, and some regulatory members opposed to certain provisions had taken a wait and see approach and wanted to watch the debate. I happened to be on the fence receptive to both views. On the one hand if an assembly is protected why should there be a concern for what is in the assembly. On the other hand if the protection is breached the CLT can contribute to the fire load in that after the building contents have fully burned there is the possibility that the wood could continue to burn the fire testing notwithstanding. But I am in support of the concept and believe enough justification has been provided allow adoption into the code even if there is not 100% consensus.

A flaw in the sections proposed to be deleted in this public comment is that Section 711.2 requires that horizontal assemblies be continuous and that the supporting construction shall be protected to afford the required fire resistance rating of the horizontal assembly supported. The sections allow omission of the required protective covering for what may be good reasons with technical justification but in violation of the code concept that the load path should be maintained and that the full assembly needs to be protected to its supports.

Additionally there seems to be no amount of tolerance because the percentage of the unit area has to be converted to feet and square feet, so the consequence of exposing 5 more square feet for example can not be quantified by the Building Official. Also what happens when dwelling units are combined in whole or in part does the area of the new unit establish the base line? The fire area will be more than 20% or the 40% so does 1 tenant space get all the exposed wood ceiling and the adjacent no. Who will keep track of all the drywall removal.

We have had poor experiences with partially protected steel buildings where the protection was required for occupancy separations and not the type of construction and the proposal will be worst since it has the potential to bridge tenant spaces. I think it adds unnecessary complexity that can be addressed on a case by case basis through an alternate methods application. Additionally a ceiling will required to establish a sound transmission class and an IIC rating and by allowing the omission the two sections will make the task of determining compliance even more complex.

It is better to have a protected type of construction and an unprotected type of construction just like all the other building materials with the sub A and B designators for most type of construction. We request that the membership of ICC support the efforts of the Tall Wood Ad-hoc committee but not support the regulations proposed to be deleted.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The net effect of the public comment and code change proposal will minimally increase the cost of construction. However the proposal will streamline the permit approval and inspection process because it eliminates the effort and thus the costs to the jurisdiction and the property owner necessary to keep track of the quantity of exposed walls and ceilings within a fire area that can span multiple tenants and floor to floor. Since this is a new requirement that will not be implemented until 2022 it is difficult to quantify the cost impact since valuations are not available for the new types of construction. ICC's valuation for Type IV construction housing a = Group R-2 is \$139.91 and assume \$3/sqft for sprinklers therefore assume an approximate valuation of \$145 per sq ft. Installed drywall is approximately \$2.5 per sq ft so increasing drywall by 40% increases valuation by 1.72%.

It is worth noting that by omitting gypsum board from the ceilings and walls required to comply with sound transmission requirements in IBC Chapter 12 will incur additional costs for field testing.

This is a new technology and the code requires either protected or unprotected construction the deleted sections allow a hybrid. There is limited cost data at this time.

Public Comment 2:

Proponent: Jonathan Humble, representing American Iron and Steel Institute (jhumble@steel.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (HOURS)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV				TYPE V	
	A	B	A	B	A	B	A	B	C	HT	A	B
Primary structural frame ^f (see Section 202)	3 ^{a, b}	2 ^{a, b}	1 ^b	0	1 ^b	0	3 ^a	2 ^a	2 ^a	HT	1 ^b	0
Bearing walls Exterior ^{e, f} Interior	3	2	1	0	2	2	3	2	2	2	1	0
	3 ^a	2 ^a	1	0	1	0	3	2	2	1/HT	1	0
Nonbearing walls and partitions Exterior	See Table 602											
Nonbearing walls and partitions Interior ^d	0	0	0	0	0	0	0	0	0	See Section 2304.11.2	0	0
Floor construction and associated secondary members (see Section 202)	2	2	1	0	1	0	2	2	2	HT	1	0
Roof construction and associated secondary members (see Section 202)	1 ^{1/2} ^b	1 ^{b, c}	1 ^{b, c}	0 ^c	1 ^{b, c}	0	1 ^{1/2}	1	1	HT	1 ^{b, c}	0

For SI: 1 foot = 304.8 mm.

- a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
- b. Except in Group F-1, H, M and S-1 occupancies, fire protection of structural members in roof construction shall not be required, including protection of primary structural frame members, roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
- c. In all occupancies, heavy timber complying with Section 2304.11 shall be allowed where a 1-hour or less fire-resistance rating is required.
- d. Not less than the fire-resistance rating required by other sections of this code.
- e. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
- f. Not less than the fire-resistance rating as referenced in Section 704.10.

**TABLE 602
FIRE-RESISTANCE RATING REQUIREMENTS FOR EXTERIOR WALLS BASED ON FIRE SEPARATION
DISTANCE^{a, d, g}**

FIRE SEPARATION DISTANCE =X (feet)	TYPE OF CONSTRUCTION	OCCUPANCY GROUP H^e	OCCUPANCY GROUP F-1, M, S-1^f	OCCUPANCY GROUP A, B, E, F-2, I, Rⁱ, S-2, U^h
X < 5 ^b	All	3	2	1
5 ≤ X < 10	IA, IVA Others	32	2 1	11
10 ≤ X < 30	IA, IB, IVA, IVB IIB, VB Others	21 1	1 0 1	1 ^c 0 1 ^c
X ≥ 30	All	0	0	0

For SI: 1 foot = 304.8 mm.

- a. Load-bearing exterior walls shall also comply with the fire-resistance rating requirements of Table 601.
- b. See Section 706.1.1 for party walls.
- c. Open parking garages complying with Section 406 shall not be required to have a fire-resistance rating.
- d. The fire-resistance rating of an exterior wall is determined based upon the fire separation distance of the exterior wall and the story in which the wall is located.
- e. For special requirements for Group H occupancies, see Section 415.6.
- f. For special requirements for Group S aircraft hangars, see Section 412.3.1.
- g. Where Table 705.8 permits nonbearing exterior walls with unlimited area of unprotected openings, the required fire-resistance rating for the exterior walls is 0 hours.
- h. For a building containing only a Group U occupancy private garage or carport, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.
- i. For a Group R-3 building of Type II-B or Type V-B construction, the exterior wall shall not be required to have a fire-resistance rating where the fire separation distance is 5 feet (1523 mm) or greater.

602.4 Type IV. Timber (HT) or structural composite lumber (SCL) without concealed spaces. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, structural composite lumber (SCL), and cross-laminated timber and details of Type IV construction is that type of construction in which the building elements are mass timber or noncombustible materials and have fire resistance ratings in accordance with Table 601. Mass timber elements shall meet the fire resistance rating requirements of this section based on either the fire resistance rating of the noncombustible protection, the mass timber, or a combination of both and shall be determined in accordance with Section 703.2 or 703.3. The minimum dimensions and permitted materials for building elements shall comply with the provisions of this section and Section 2304.11. Mass timber elements of Types IV A, ~~IV B~~ and IV C construction shall be protected with noncombustible protection applied directly to the mass timber in accordance with Sections 602.4.1 through 602.4.3. The time assigned to the noncombustible protection shall be determined in accordance with Section 703.8 and comply with 722.7.

Cross-laminated timber shall be labeled as conforming to PRG 320 - 18 as referenced in Section 2303.1.4.

Exterior load-bearing walls and nonload-bearing walls shall be mass timber construction, or shall be of noncombustible construction.

Exception: Exterior load-bearing walls and nonload-bearing walls of Type IV-HT Construction in accordance with Section 602.4.4.

The interior building elements, including nonload-bearing walls and partitions, shall be of mass timber construction or of noncombustible construction.

Exception: Interior building elements and nonload-bearing walls and partitions of Type IV-HT Construction in accordance with Section 602.4.4..

Combustible concealed spaces are not permitted except as otherwise indicated in Sections 602.4.1 through 602.4.4. Combustible stud spaces within light frame walls of Type IV-HT construction shall not be considered concealed spaces, but shall comply with Section 718.

In buildings of Type IV-A, B, and C, construction with an occupied floor located more than 75 feet above the lowest level of fire department access, up to and including 12 stories or 180 feet above grade plane, mass timber interior exit and elevator hoistway enclosures shall be protected in accordance with Section 602.4.1.2. In buildings greater than 12 stories or 180 feet above grade plane, interior exit and elevator hoistway enclosures shall be constructed of non-combustible materials.

~~602.4.2 Type IV-B. Building elements in Type IV-B construction shall be protected in accordance with Sections 602.4.2.1 through 602.4.2.6. The required fire resistance rating of noncombustible elements or mass timber elements shall be determined in accordance with Section 703.2 or Section 703.3.~~

~~602.4.2.1 Exterior protection. The outside face of exterior walls of mass timber construction shall be protected with non-combustible protection with a minimum assigned time of 40 minutes as determined in Section 722.7.1. All components of the exterior wall covering shall be of noncombustible material except water resistive barriers having a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354, and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².~~

~~602.4.2.2 Interior protection. Interior faces of all mass timber elements, including the inside face of exterior mass timber walls and mass timber roofs, shall be protected, as required by this section, with materials complying with Section 703.5.~~

~~602.4.2.2.1 Protection time. Noncombustible protection shall contribute a time equal to or greater than times assigned in Table 722.7.1(1), but not less than 80 minutes. The use of materials and their respective protection contributions listed in Table 722.7.1(2) shall be permitted to be used for compliance with Section 722.7.1.~~

~~602.4.2.2.2 Protected area. _~~

~~-~~

~~All interior faces of all mass timber elements shall be protected in accordance with Section 602.4.2.2.1, including the inside face of exterior mass timber walls and mass timber roofs.~~

~~Exceptions: Unprotected portions of mass timber ceilings and walls complying with Section 602.4.2.2.4 and the following:~~

- ~~1. Unprotected portions of mass timber ceilings, including attached beams, shall be permitted and shall be limited to an area equal to 20% of the floor area in any dwelling unit or fire area; or~~
- ~~2. Unprotected portions of mass timber walls, including attached columns, shall be permitted and shall be limited to an area equal to 40% of the floor area in any dwelling unit or fire area; or~~
- ~~3. Unprotected portions of both walls and ceilings of mass timber, including attached columns and beams, in any dwelling unit or fire area shall be permitted in accordance with section 602.4.2.2.3.~~
- ~~4. Mass timber columns and beams which are not an integral portion of walls or ceilings, respectively, shall be permitted to be unprotected without restriction of either aggregate area or separation from one another.~~

~~602.4.2.2.3 Mixed unprotected areas. In each dwelling unit or fire area, where both portions of ceilings and portions of walls are unprotected, the total allowable unprotected area shall be determined in accordance with Equation 6-1. $(U_{tc}/U_{ac}) + (U_{tw}/U_{aw}) \leq 1$ (Equation 6-1) where:~~

~~U_{tc} = Total unprotected mass timber ceiling areas~~

~~U_{ac} = Allowable unprotected mass timber ceiling area conforming to Section 602.4.2.2.2, Exception 1~~

~~U_{tw} = Total unprotected mass timber wall areas~~

~~U_{aw} = Allowable unprotected mass timber wall area conforming to Section 602.4.2.2.2, Exception 2~~

~~602.4.2.2.4 Separation distance between unprotected mass timber elements. In each dwelling unit or fire area, unprotected portions of mass timber walls and ceilings shall be not less than 15 feet from unprotected portions of other walls and ceilings, measured horizontally along the ceiling and from other unprotected portions of walls measured horizontally along the floor.~~

~~602.4.2.3 Floors. The floor assembly shall contain a noncombustible material not less than one inch in thickness above the mass timber. Floor finishes in accordance with Section 804 shall be permitted on top of the noncombustible material.~~

~~The underside of floor assemblies shall be protected in accordance with Section 602.4.1.2.~~

~~**602.4.2.4 Roofs.** The interior surfaces of roof assemblies shall be protected in accordance with 602.4.2.2 except, in nonoccupiable spaces, they shall be treated as a concealed space with no portion left unprotected. Roof coverings in accordance with Chapter 15 shall be permitted on the outside surface of the roof assembly.~~

~~**602.4.2.5 Concealed spaces.** Concealed spaces shall not contain combustibles other than electrical, mechanical, fire protection, or plumbing materials and equipment permitted in plenums in accordance with Section 602 of the International Mechanical Code, and shall comply with all applicable provisions of Section 718. Combustible construction forming concealed spaces shall be protected in accordance with Section 602.4.1.2.~~

~~**602.4.2.6 Shafts.** Shafts shall be permitted in accordance with Section 713 and Section 718. Both the shaft side and room side of mass timber elements shall be protected in accordance with Section 602.4.1.2.~~

Commenter's Reason: We recommend that the Type IV-B mass timber designation be deleted from the tall wood building proposals.

The origins of the development of the types of construction were originally developed to “account for the response or participation that a building’s structure will have in a fire condition originating within the building as a result of the occupancy or the fuel load” (Example source from BOCA National Building Code 1993 Commentary). The modern day types of construction are parsed out into three primary categories of construction; noncombustible (Types I and II), noncombustible/combustible (Types III and IV) and combustible (Type V). Subcategories were created to identify the protection; Type A for protected and Type B for unprotected.

What we have within proposals G75-18, G80-18, G84-18, G89-18, and G108-18 is the addition of a new construction category that has been proposed based on the need to satisfy aesthetics based on the combination of Types IV-A and IV-C, which is a departure from the black and white construction categories based on construction that is non-combustible or combustible. We feel this inappropriate for the codes to begin to designate designer type construction categories.

In the past such mixing and matching of construction types into building or structure is more suited to the IBC Section 104.11 (Alternative materials, design and methods of construction and equipment), or through use of the ICC International Performance Code or performance analysis. We feel that these are the most appropriate options for the mixing-and-matching of construction types in building design.

(NOTE: Remainder of the section will need to be renumbered as will other related correlating sections.)

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This will not increase or decrease the cost of construction as this code change proposal and public comment address information that was not previously contained in the code, therefore there is no cost impact when compared to present requirements.

Public Comment 3:

Proponent: Jeffrey Shapiro, International Code Consultants, representing Self (jeff.shapiro@intlcodeconsultants.com)requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

602.4.1.1 Exterior protection. Combustible materials, including but not limited to assemblies and materials tested in accordance with Section 1410, shall not be used as any part of the building exterior.

Exceptions:

1. ~~Mass timber shall be permitted for exterior construction where all exterior facing surfaces are. The outside face of exterior walls of mass timber construction shall be protected with noncombustible protection with having a minimum assigned time of 80 minutes for high-rise buildings and 40 minutes as determined in for other buildings in accordance with Section 722.7.1. All components of the exterior wall covering, shall be of noncombustible material except water resistive barriers, during which time the mass timber shall not ignite.~~
2. ~~The exterior wall shall be permitted to include a water-resistive barrier having a peak heat release rate of less than 150kW 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ 18 MJ/kg as determined in accordance with ASTM E1354, and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².~~

602.4.2.1 Exterior protection. Combustible materials, including but not limited to assemblies and materials tested in accordance with Section 1410, shall not be used as any part of the building exterior.

Exceptions:

1. ~~Mass timber shall be permitted for exterior construction where all exterior facing surfaces are protected with noncombustible protection having. The outside face of exterior walls of mass timber construction shall be protected with non-combustible protection with a minimum assigned time of 80 minutes for high-rise buildings and 40 minutes as determined in for other buildings in accordance with Section 722.7.1. All components of the exterior wall covering shall be of noncombustible material except water resistive barriers, during which time the mass timber shall not ignite.~~
2. ~~The exterior wall shall be permitted to include a water-resistive barrier having a peak heat release rate of less than 150kW 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ 18 MJ/kg as determined in accordance with ASTM E1354, and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².~~

602.4.3.1 Exterior protection. Combustible materials, including but not limited to assemblies and materials tested in accordance with Section 1410, shall not be used as any part of the building exterior.

Exceptions:

1. ~~Mass timber shall be permitted for exterior construction where all exterior facing surfaces are protected with noncombustible protection having. The exterior side of walls of combustible construction shall be protected with non-combustible protection with a minimum assigned time of 80 minutes for high-rise buildings and 40 minutes as determined in for other buildings in accordance with Section 722.7.1. All components of the exterior wall covering, shall be of noncombustible material except water resistive barriers, during which time the mass timber shall not ignite.~~
2. ~~The exterior wall shall be permitted to include a water-resistive barrier having a peak heat release rate of less than 150kW 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18MJ 18 MJ/kg as determined in accordance with ASTM E1354 and having a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².~~

Commenter's Reason: The intent of this public comment is generally consistent with the original provisions, but modifications have been suggested to accomplish the following:

1. Strengthen the text to make it clear that a compliant water-resistive barrier is the ONLY combustible material permitted in the building exterior, with the exception of properly protected mass timber. This includes a clarification specifically prohibiting NFPA 285 assemblies to prevent the prospect of such assemblies being proposed as an alternative method of compliance. This is necessary because of changes proposed to NFPA 285 that would expand the use of NFPA 285 assemblies to include combustible structures. Until such time that NFPA 285 has been thoroughly vetted with respect to questions raised under FS99-18, this specific prohibition is necessary for Type IV construction given interest that has already been documented.

2. Require increased protection of exterior mass timber members for high-rise buildings. The risks associated with an exterior face fire involving a heavy timber structure, outside of the sprinklered envelope and minimally accessible or inaccessible to firefighters due to height, is too great for a 40-minute exposure, particularly recognizing that the exposure used in fire test methods specified in Section 703.3 (such as ASTM E119) are not necessarily representative of the heat

flux that might be associated with exterior fire conditions (such as a wind-driven fire event). There is no guarantee, and in fact it is not likely, that an assembly having a 40-minute rating in a standardized fire test will actually provide 40 minutes of protection in an actual fire event. Doubling the protection, essentially adding a second layer of 5/8-inch Type X gypsum board, is a prudent step to provide additional safety given limited experience with tall mass timber buildings.

3. Clarify that the noncombustible protection must do more than simply increase the fire-resistance rating of the exterior wall members. For exterior walls, given the concerns cited above, it is important that ignition of the structural members must be prevented for the prescribed time period. Presumably, this would already be accomplished by the currently specified test method, but it is appropriate for the requirement to be specifically stated.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Yup, this is going to cost more, but the cost is justified. Frankly, I prefer limiting mass timber to heights to below the high-rise threshold, but this is offered as an attempt to reach a negotiated solution, to address my primary concern with taller buildings, which is exterior fire spread, vs. a more stringent height restriction.

Public Comment 4:

Proponent: Gilbert Shields-Whitten, self, representing self requests As Submitted.

Commenter's Reason: One thing is clear from reading through the public comments for the ICC code change proposal for Tall Wood Buildings: the concrete industry is desperate to stop mass timber. The ICC should not be fooled by their latest efforts to mislead members of the public and the code community.

It is no secret that the National Ready Mixed Concrete Association (NRMCA) has been running a well-funded campaign to stop wood for some time. Their latest scheme to stuff the ballot with comments against mass timber is patently obvious.

How obvious?

Nearly every proponent submitting a request to DISAPPROVE code change proposal G108-18 works for a business in the concrete and cement industry based on the email address or company name provided.

All but a handful of comments have been copied and pasted based on talking points provided by NRMCA in a Call-To-Action document that was sent out to members at the end of June. PCA also provided suggested talking points.

Compare the suggested language below to the comments and you will see they are identical, including typos and grammatical errors.

Why would NRMCA and others do this? In their own words, money and market share.

The latest video produced by NRMCA makes the claim is made that the builders and wood industry conspired to weaken building codes which has resulted in rampant fires and costing money and lives

And at their annual meeting, they show that right now every single six-story building made with wood leaves half a million dollars of this industry's money on the table.

However, cross-laminated timber, which most of you have heard of at this point, is another big threat to putting concrete first. It has the potential to halt the progress of Build With Strength.

Don't be fooled by this and focus on the science.

ACTION REQUESTED! STOP TALL WOOD Urge the International Code Council (ICC) to Vote No on Mass Timber Proposals that Threaten Public Safety

This is an **extremely** critical issue and NRMCA needs your help in providing a public comment for **Disapproval on G108-18, a proposal that would allow Cross Laminated Timber use in up to 18 story buildings in the International Building Code**. Complete instructions are listed below as well as sample comments. Please consider taking this important step for your industry and please share with as many concrete industry colleagues as possible. Deadline for public

Select *Reason* and either enter (or copy paste) the sample reasons below, modify the sample reasons, or enter your own reason statement.

Some sample reasons you may want to consider for your Public Comment are:

- ○ There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?

Select *Cost Impact* and enter (or copy paste) the text below:

- ○ ■ Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

The International Code Council soon will vote on proposed code changes that among other things would allow tall wood buildings to be built up to 18 stories, despite a lack of rigorous scientific or in-the-field fire and structural testing.

NOW IS THE TIME TO TAKE ACTION by urging the ICC to say no to these dangerous proposals that are up for a final vote which closes on Nov 27, 2018. Join the public hearing process to let your voices be heard. This highly-combustible mass timber must be stopped! However, and to be clear, your comments need to be technical in nature and substantive. Just saying wood burns or I don't like CLT (while true) is not enough.

SUBMIT PUBLIC COMMENTS: Online public comments can be submitted by **July 16, 2018** through the ICC's [cdpACCESS website](#).

PCA's talking points:

STOP TALL WOOD PROPOSALS AT THE INTERNATIONAL CODE COUNCIL Background and Talking Points Multi-story mass timber buildings being considered by the International Code Council will present a threat to health and safety. The ICC code change proposals, and TALL WOOD structures built with cross-laminated timber (CLT) generally, are:

UNTESTED, UNPROVEN AND UNSOUND

UNTESTED: Wood-industry funded tests performed in the U.S. and Canada were completely inadequate, failing to examine real-world structural risk factors, potential firefighting safety impacts and other important risk factors to public health and safety. No exterior fire testing was performed for TALL WOOD. The limited testing done was irrelevant to the proposed code changes related to TALL WOOD as high as 18 stories. No tests were done to factor in wind, which impacts fire-fighting and property damage. Fire tests did not factor in heavy loads from upper stories, nor did they examine firefighting impacts from contents of storage or mercantile buildings. Fire sealants and connections were not done correctly, thus highlighting the problem with understanding the dangers TALL WOOD structures.

UNPROVEN: While non-combustible concrete and steel have been used for centuries to build tall buildings and structures, mass timber products, like cross-laminated timber, are unknown and unproven construction materials. Only the wood industry has information about how CLT performs and connects with other building materials, including dry wall, steel and concrete. Contractors and code officials have no experience in inspecting TALL WOOD buildings, thus raising potential structural and fire risks. The adhesives used in producing CLT have not been standardized, further raising risks associated with fire and structural performance. It is unclear how CLT performs with water damage from fire response efforts, heavy rain and floods or natural disasters.

UN SOUND: Common sense knows, and every day we see, that TALL WOOD buildings are high-risk and dangerous to public health and safety when it comes to natural and man-made disasters like hurricanes and wildfires. TALL WOOD buildings would be taller than the vast majority of firefighting equipment raising life safety and property damage risk exponentially.

Potential uses for TALL WOOD structures, such as dorms or assisted-living facilities, would put the most vulnerable Americans in harm's way. Submit public comments by July 16th or attend public hearings October 24-31 in Richmond, Va. Help STOP TALL WOOD ICC code changes!

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Approval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 5:

Proponent: Gary Bridgens, representing Mass Timber Code Coalition (info@buildtallbuildsafe.com) requests As Modified by Committee.

Commenter's Reason: PUBLIC COMMENT

SUBMITTED BY GARY BRIDGENS

ON BEHALF OF THE MASS TIMBER CODE COALITION

The Mass Timber Code Coalition has been organized to provide information on the code proposals drafted by the Ad Hoc Committee on Tall Wood Buildings

Mass timber is not new to the *International Building Code* (IBC). Currently listed as Type IV Heavy Timber, this construction type is a proven option that fully complies with the structural and fire resistive requirements of the IBC. The code recognizes that mass timber is a fundamentally different material than dimension lumber used in more familiar stick built wood construction. The code also recognizes the inherent fire resistance of mass timber, where charring in a fire event provides protection of inner structures, as well as a consistent and predictable rate of charring.

With the expansion of the mass timber supply chain, panels of cross-laminated timber (CLT), nail-laminated timber (NLT) and glue-laminated timber (Glulam), requests for approvals of tall mass timber buildings (TMTB) by local authorities have become more common. Estimates by industry sources have identified 35 current proposals for tall mass timber buildings, ranging from 7 to 24 stories, in 21 different jurisdictions.

Importantly, this interest in tall mass timber construction has been reliant on various local codes and approval processes. The IBC does not currently account for these tall wood buildings, beyond the current Type IV Heavy Timber height and area limitations.

The Ad Hoc Committee on Tall Wood Buildings (AHC-TWB)

To ensure the IBC keeps pace with the changing construction marketplace, the Board of Directors of the International Code Council (ICC) appointed the Ad Hoc Committee on Tall Wood Buildings (AHC-TWB) in 2015. The AHC-TWB included members from the code official, regulatory, construction, engineering, architectural, fire services and materials communities.

The AHC-TWB was specifically charged with investigating the science of mass timber construction, undertaking any necessary new research and recommending any code changes needed to ensure safety in TMTB. The AHC-TWB set performance criteria of its own: any code change developed was required to achieve the following.

- No collapse under scenarios of complete burn-out of fuel without automatic sprinkler protection;
- No high radiation exposure from the subject building to adjoining properties that risk ignition under severe fire scenarios;
- No unusual response from radiation exposure from adjacent properties that risk ignition of the subject building under severe fire scenarios;
- No unusual fire department access issues;
- Egress systems to protect occupants during design escape times plus a margin of safety;
- Enhanced and redundant fire protection systems to ensure performance during various fire scenarios.

Code Change Proposals

After two years of work, the AHC-TWB has produced 14 code change proposals. All 14 of these proposals were recommended for approval by various ICC committees at the recent ICC 2018 Group A Committee Action Hearing.

The key change, G108-18, defines three new categories of Type -IV Mass Timber construction:

Type IV-A: 1 to 18 stories based on Occupancy Classification. 3-hour fire resistance rating with non-combustible protection

throughout;

Type IV-B: 1 to 12 stories based on Occupancy Classification. 2-hour fire resistance rating with non-combustible protection on most mass timber surfaces;

Type IV-C: 1 to 9 stories based on Occupancy Classification. 2-hour fire resistance rating with non-combustible protection for critical areas; exit enclosures, etc.

Each new construction type defined by the AHC-TWB (Type IV-A, B and C) has fire resistance requirements as robust or more robust than those required for comparable non-combustible (concrete and steel) buildings.

Other provisions provide standards for mass timber manufacturing, height/area restrictions, active and passive fire protection systems, fire safety during construction, enhanced water supply requirements, and standards for sealants and adhesives.

Fire Resistance of Mass Timber

Citing fire and market concerns, both the Portland Cement Association and the National Ready Mix Concrete Association have criticized the AHC-TWB code change proposals as untested and unsound. However, these criticisms fail to consider that:

The purpose of the International Building Code is to provide building officials with the tools they need to ensure public and first-responder safety. It is not to choose winners and losers in the market, nor is it to defend any single industry's position;
Tall mass timber buildings already built are performing well;
Mass timber (and heavy timber before it) has undergone extensive fire resistance testing in multiple fire scenarios by Underwriters Laboratories, the Southwest Research Institute, the National Research Council of Canada and the U.S. Government's ATF Fire Research Laboratory, the world's largest indoor fire investigation lab.

Numerous mass timber floor/ceiling and wall assemblies have been tested at national laboratories using ASTM E119 standards. This testing history shows that mass timber has repeatedly achieved the hourly fire resistance requirements of the code. This is in part because of charring properties that provide a steady and predictable measurement of fire resistance. Additionally, detailed code requirements for non-combustible protection applied to the mass timber greatly enhance the hourly rating. Further, fire protection systems (active and passive) also ensure safety in mass timber structures.

The AHC-TWB benefitted from recent tests in 2017 at the U.S. ATF Fire Research Laboratory on full-scale mass timber buildings. Most tests assumed an unlikely failure of sprinkler systems:

Mass timber apartment with full fuel load. Fully protected by Type X gypsum wall board. Fire self-extinguished after 3 hours with no significant charring on mass timber surfaces;
Mass timber apartment with full fuel load. 20% exposed CLT ceiling. Test concluded at 4-hour mark after fuel burnout. CLT self-extinguished after charring;
Mass timber apartment with full fuel load. 2 CLT walls fully exposed. Fuel burnout at 4-hours. CLT walls self-extinguished after charring;
Mass timber apartment with full fuel load. All CLT surfaces fully exposed. One sprinkler system. Fire quickly extinguished;
Mass timber apartment with full fuel load. All CLT surfaces fully exposed. One sprinkler system. Fire allowed to grow to flashover (23 minutes) then quickly extinguished.

In fact, proposed Type IVA, B and C fire resistance requirements are the same or more robust than comparable steel and concrete construction. Further detail can be obtained at buildtallbuildsafe.com.

Benefits of Mass Timber Construction

In addition to the obvious environmental attributes of using a renewable resource in construction and the boost for the economies in timber-producing regions, builders and communities cite several distinctive benefits that make mass timber buildings an attractive option:

Builders report several benefits, including:

Job site safety. Mass timber panels are easy to install and can be delivered to a work site as needed, rather than stockpiled. Moreover, worker training is easier as is exposure to job site risk;

Job site efficiency. Persistent labor shortages are eased as more workers are qualified to work with mass timber panels. Jobs are built more quickly and materials are delivered as needed, thereby reducing costs;

Design. The favorable strength-to-weight ratio of CLT and the characteristics of wood offer more design options and more attractive built environments, improving business performance.

Local communities embrace mass timber construction:

Faster and quieter. The dislocation experienced by neighboring communities is reduced in mass timber projects. In addition to lower fire risks, things occur more quickly and panels are installed more simply than comparable steel and concrete sites;

Greener. Forestry officials cite the carbon sequestration properties of wood, but also the benefits to forest management of using wood products more efficiently and effectively, thereby further reducing decay and fire risk;

Energy efficient. Manufacturing mass timber is less energy intensive than other building materials. More importantly, the superior insulation characteristics of wood far outperform steel and concrete structures.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Public Comment 6:

Proponent: Brian M Adkins, Gonsalves & Santucci, Inc. DBA Conco (The Conco Companies), representing self (badkins@conconow.com) requests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires?
- In addition to all of the reasons above I believe it would be a colossal mistake to allow for inferior construction to take the place of the longevity and success that has been proven in the cast-in-place concrete industry.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 7:

Proponent: Leslie Ainsworth, representing Self (les@lesainsworth.com) requests Disapprove.

Commenter's Reason: Who would want to live in an 18 story building made of wood? What fire department would want to respond to a 2nd story fire in an 18 story building made of wood. There is no complete testing justification to increase the height limit to exceed 6 stories. Neither the Fire Code Action Committee or the Building Code Action Committee voted

to support this measure. Wood is not as fire resistant as non combustible building materials such as concrete and steel. This measure will cost lives. Who wants this on their conscience?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This will make the building more dangerous, and worth less in the future

Public Comment 8:

Proponent: ALBERT ANDREWS, ANDREWS CONCRETE PUMPING, representing ANDREWS CONCRETE PUMPING
PRESIDENT requests Disapprove.

Commenter's Reason: HAVE WE NOT LEARNED FROM THE PAST? WOOD STRUCTURES ARE BLOWN AWAY IN HIGH WINDS, CRUMBLE DURING NATURAL DISASTERS, CONSUMED DURING A FIRE IN MINUTES OR DAMAGED BEYOND REPAIR. WOOD STRUCTURES WILL NOT STAND THE TEST OF TIME. DO YOU WANT YOURSELF OR YOUR FAMILY AND FRIENDS IN WOOD BUILT HOTELS, MID OR HIGH RISE OFFICE BUILDINGS, MULTI STORY COMDOMINIUMS OR APARTMENTS? THEY ARE UNSUSTAINABLE AND LIFE THREATENING. INSURANCE RATES WILL SKY ROCKET AS SEEN IN THE PAST WHEN STRUCTURES DON'T STAND UP TO MOTHER NATURE OR OUR MISTAKES. THERE IS A REASON WHY STONE, MASONRY, CONCRETE AND STEEL STRUCTURES LAST. BE DOLLAR WISE AND MORALLY CORRECT. YOU WILL SLEEP BETTER KNOWING YOU MADE THE RIGHT DECISION.

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 9:

Proponent: Hari Krishna R Bandi, representing The Conco Companies (hbandi@conconow.com); Jennifer Nenni (jnenni@conconow.com); Carl Walker (carl@centralpumping.com) requests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is a serious mistake. Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel

Bibliography: Don't have one

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 10:

Proponent: Kenneth Barefield, Conco, representing Conco Companies (kbarefield@conconow.com) requests Disapprove.

Commenter's Reason: There is currently no complete testing or engineering justification for expanding the height

limitation for mass timber from 6 stories to 18 stories. There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 11:

Proponent: Jeffrey Bolichowski, MasonryWorx, representing MasonryWorx (jeff@armstrongstrategy.com) requests Disapprove.

Commenter's Reason: These comments represent the position of MasonryWorx, the provincial association for Ontario's brick, block and stone masonry industry.

Non-combustible concrete and steel have been used for centuries to build tall buildings and structures. However, mass timber products, like cross-laminated timber, are unknown and unproven. Common sense and history both demonstrate that tall wooden buildings are high-risk and pose significant dangers to public health and safety. This is particularly true when these wooden towers are tested by natural and man-made disasters such as hurricanes and wildfires.

There is currently no complete testing or engineering justification for tripling the height limitation for mass timber from the present six storeys to 18.

In fact, wood industry-funded tests in the United States and Canada were completely inadequate. These tests failed to examine real-world structural risk factors, potential firefighting safety impacts from weather, or material-related risk factors to public health and safety.

No exterior fire testing was performed for tall wood buildings, and the limited testing done was irrelevant to the proposed changes. The tests did not factor in wind, heavy loads from upper storeys, or firefighting impacts from contents of storage or mercantile buildings. Fire sealants and connections were also not done correctly.

The most significant oversights are wind and water testing. There has been no wind component involved in the fire testing of mass timber assemblies, despite the wind pressures tall buildings inevitably face. Similarly, mass timber systems have not been tested with the additional water load which accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident which opens a sprinkler head. These oversights are serious and glaring, and represent critical safety flaws.

Permitting wood structures to be built above the level of fire department access is a serious public safety risk, particularly with many fire departments unable to easily procure high-ladder trucks. These buildings would present significantly greater fire risks: Wood does not offer the resilience and fire protection of materials which do not combust, such as concrete block.

Particularly troubling is that, while cross-laminated timber will char in a fire, charring is not the same thing as not combusting. A char rate of 1" per hour in a fire will result in a six-inch-thick CLT wood load-bearing wall being left with only 2" of structure left after just two hours of burning. This is not acceptable, and it is not addressed in the code change proposal.

This change would permit the construction of tall buildings with dangerous materials which are untested, unproven and unsound. History and precedent have shown the dangers of tall wood buildings again and again.

Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes. Given the serious flaws in the testing process and the enormous safety hazards involved, we urge the ICC to vote NO on the use of highly-combustible mass timber in tall buildings.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 12:

Proponent: Timothy Bourcier, Commercial Metals Company, representing self (tim.bourcier@cmc.com); Daniel Zechmeister (dan@masonryinfo.org); James Farny (jamiefarny@yahoo.com); Mark Young (markyoung@brundagebone.com); Robert Mercer (r.brett.mercer@gmail.com); Jason Chojnacki (jason.chojnacki@vcimentos.com); Jason Grafton (jgrafton@cckservices.com); Kate Caddell (kate@ajandris.com); Brad Cottrell (brad.cottrell@cmc.com); Billy Milligan

(billy.milligan@cmc.com); Amy Trygestad (atrygestad@crsi.org); Kelly Walker (kelly@masonryinfo.org); Rouzbeh Mahmoudzadeh (rmahmoudzadeh@conconow.com); Melissa Kline (makline777@gmail.com); Anthony Johnson (tjohnson@crsi.org); Holly Bertucelli (hbertucelli@conconow.com)requests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc, there is no information on the performance of the proprietary connections during fires.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

- Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements

Public Comment 13:

Proponent: Brandon Bowers, representing Concorequests Disapprove.

Commenter's Reason: Unsafe, unethical and a mere shortcut for immoral reasons. Corporate greed once again coming into play leaving several thousand innocent people at risk.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 14:

Proponent: Michael Ziemba, Vototantim, representing self (mike.ziemba@vcimentos.com)requests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of other non-combustible materials like concrete and steel. Allowing wooden structures to be built above fire dept. access is not safe. Neither the Fire Code Action Committee or the Building Code Action Committee have voted to support this code change.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 15:

Proponent: Ben Brown, self, representing Self (bbrown@chasehipps.com)requests Disapprove.

Commenter's Reason: Safety and sustainability must guide this decision. Tall timber buildings are a fire hazard, this has been proven over and over again. We can't repeat our mistakes of the past. We also need buildings that are built to last. Concrete and steel can be tested and meet specifications over and over again.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 16:

Proponent: Gary Brown, representing R L McCoy (garybrown@rlmccoy.net) requests Disapprove.

Commenter's Reason: Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout.

A test standard for adhesives has been proposed, but not fully vetted by the cognizant committees.

It's still a wood by-product, once enough heat is created it will start to burn.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 17:

Proponent: Michael Calderon, representing The Conco Companies requests Disapprove.

Commenter's Reason: Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but no fully vetted by the cognizant committees.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 18:

Proponent: Ross Carbo, representing self (rcarbo@conconow.com) requests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 19:

Proponent: Kerem Cetinbas, representing MAC Corporation of VA (info@macofva.com) requests Disapprove.

Commenter's Reason:

- There are many unanswered questions in regard to the safety for the code change. Kindly note the comments below.
- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 20:

Proponent: dean chandler, representing self (dchandler@conconow.com) requests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 21:

Proponent: John Chrysler, Masonry Institute of America, representing Masonry Institute of America (jc@masonryinstitute.org) requests Disapprove.

Commenter's Reason: ● There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.

- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?

- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.

- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 23:

Proponent: Gregory Colvin, representing self (greg@ohioconcrete.org); Alpa Swinger (aswinger@cement.org); Robert Hamilton (bob.hamilton@conforms.com) requests Disapprove.

Commenter's Reason: There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposal section provides information that was not previously set forth in the code, thus there is no cost impact when compared with the present requirements.

Public Comment 24:

Proponent: ANNA DART, Conco Companies, representing Self; Leah Gunther, representing American Concrete Pumping Association (leah@concretepumpers.com) requests Disapprove.

Commenter's Reason:

- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 25:

Proponent: Charles Day, Votorantim / St Marys cement LLC, representing Self; John Doubikin (john.doubikin@vcimentos.com); Michael Marzka (michael.marzka@vcimentos.com); Bruce Moroz (bruce.moroz@vcimentos.com); David Jones (djones@addisontx.gov); Lawrence Novak (lnovak@cement.org) requests Disapprove.

Commenter's Reason:

- Wood absorbs water, and the resulting rot and mold can seriously impair a wood structures' overall anticipated performance. Note: non-combustible materials such as concrete, masonry and structural steel do not rot.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- To date, there has been no full scale CLT fire tests done to ASTM standards.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Charring wood will add fuel to the fire and increase the heat and smoke output relative to noncombustible materials. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete, masonry and steel.
- Allowing wood framed structures to be built above the level of fire department access is a serious mistake. The vast majority of municipal ladder trucks cannot reach above the 7th floor.
- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

- Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 26:

Proponent: joe dickinson, Walker Concrete Company, LLC, representing Walker Concrete Company, LLC; michael stevens (mstevens@natcem.com); Spencer Weitman (sweitman@natcem.com); Steve Wise (swise@natcem.com); Steve Lode (slode@natcem.com); Mark Mitzel (mmitzel@natcem.com); Bart Moore (bmoore@natcem.com) requests Disapprove.

Commenter's Reason: • Inadequate and/or incomplete testing and engineering do not provide justification for exceeding the existing height limitation for wood construction from 6 stories and raising it to 18 stories for Tall Wood structures.

- Allowing Tall Wood structures to be built above the level of fire department access puts building occupants and firefighters at significant additional risk.

- Wood does not offer the resilience and fire protection due to both manmade and natural disasters compared to non-combustible alternatives like concrete and steel.

- Cross-Laminated Timber chars in a fire. Charring is not equivalent to non-combustible. Charring is a deterioration of the wood (e.g. a 6" load bearing CLT with a char rate of 1" per hour will have lost over 60% of its structural strength after 2 hours in a fire). This is not acceptable and is not addressed in the code change proposals.

- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.

- It is unknown what impacts will occur to a Tall Wood structure if water accumulates as a result of a fire sprinkler system discharge due either to fire or an accidental activation. Moreover, testing has not been performed to determine

the structural performance when additional water is applied by active firefighting and the resulting damage such as swelling of the wood, combined impacts of water and high temperature to the structural integrity of the manufactured wood as well as connection systems. In addition, the potential for water damage must address the short as well as long-term impacts of mold and dry rot.

- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT are currently not standardized. The absence of a standard is key to determining whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives was proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities. In addition there is insufficient information on the performance of the proprietary connections during fires.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 27:

Proponent: Donald Doggett, Doggett Concrete, Inc., representing Doggett Concrete inc (ddoggett@doggettconcrete.com)requests Disapprove.

Commenter's Reason: This is a dangerous trend that will create fire hazards and structural risk that far outweigh any potential benefits for construction.

Bibliography: <http://vancitycondoguide.com/concrete-vs-wood-buildings/> "Well, it's a popular question, concrete vs wood buildings- which is better and what do you recommend I buy? It's a longstanding debate and today i'll shed some light on the debate and hopefully give you some key takeaways to help you with your purchasing decision. Concrete buildings, although generally more expensive than wood frame buildings, are worth it in the long term. It's important to always look long term, in all aspects of life. The same thinking can be applied to when investing in your next condo."

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There are no cost savings for the public that will be passed along. There will be increased cost in maintenance

Public Comment 28:

Proponent: Doug Dreiling, Buzzi Unicem USA, representing self (douglas.dreiling@buzziunicemusa.com)requests Disapprove.

Commenter's Reason: There are too many reasons, one of the biggest is the lack of independent testing. My son in-law is a fire fighter and he is very concerned with the dangers in a fire. The toxicity of the glues and fire retardants to start with. There was a fire just last year in Overland Park, KS, of a CLT, and the fire was so hot that house a half a mile away were affected with hot ambers.

Common sense tells you wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Public Comment 29:

Proponent: William Dwyer, representing Putzmeister America (dwyerb@putzam.com)requests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is a serious mistake. Also, wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 30:

Proponent: Bonnie Erickson, representing Self (bonnie_erickson2010@comcast.net)requests Disapprove.

Commenter's Reason: This is crazy, who wants to live in a high rise built with wood? Who wants to fight that fire? Who wants to insure it? Who wants to be responsible for the lives lost? And who wants to own it 20 years from now?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Code change will not increase or decrease construction cost, and will devalue the building

Public Comment 31:

Proponent: Patrick Ford, Matsen Ford Design Associates, Inc., representing selfrequests Disapprove.

Commenter's Reason: Reason: These code changes would allow for structurally unsafe conditions to be inherently designed into tall buildings. As proposed, they would introduce new categories of Type IV construction into the code and expand the number of storeys, allowable areas, and maximum heights of buildings framed with combustible materials. I believe that for several reasons, this would greatly increase the risk to firefighters and building occupants, as well as neighboring buildings. Several of the major decisions that went into the creation of this proposal were based on "engineering judgment" and significant extrapolation of test data from a two storey test building to buildings with dozens more storeys.

Aside from the potentially dangerous and unproven provisions in general, there are several specifics relative to structural connections in these new building types and sizes. I do not believe that these were addressed or at the very least not adequately addressed.

The new building types and increased limits allowed for in these proposals should not be allowed, and the proposals should be disapproved for the following reasons:

The AHC-TWB report that was instrumental in many of the provisions indicates that connections were tested, but in fact, no exposed connections were ever tested in any of the assemblies.

The compartment tests did not test any connections, nor did any of the standard ASTM tests, including the E84, E119, E814, nor the NFPA 285 tests.

The full scale test did not have any exposed connections, yet the code explicitly notes exposed steel and metal caps or brackets allowed in type IV construction within the wood chapter. The exposed metal connectors and their fasteners penetrate well beneath the typical char layer of the structural member, significantly reducing the strength of the member at and near the connection itself. This can create many hot spots and potential critical structural failure locations throughout a tall building. No other tests addressed this issue either.

Adhesive based splice connections remain unproven, the overall adhesive requirements being based on a testing protocol derived after a failed test.

The Small Scale Adhesive Qualification Test Protocol (CSA 077 SSA.2) could conceivably be directed toward such connections or splices, but it is a test that lasts only 5 minutes per side of the tested specimen.

As an additional note, the full scale test was run on only a two storey structure, leaving any critical structural connections that may have been needed to support only a single storey above. With code proposals allowing for many times this, these concerns should be much more carefully vetted before approval.

It should also always be remembered that in no other type of tall building allowed by the code, is the structure itself also fuel for the fire.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 32:

Proponent: Mariah Garcia, representing Conco (mgarcia@conconow.com)requests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is dangerous and a serious mistake! Wood does not offer the resilience and fire protection of non-combustible alternatives such as

concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 33:

Proponent: Nathan Germany, representing Tri-Way Concrete Pumping, Inc. (nathangermany@tri-wayconcretepumping.com)requests Disapprove.

Commenter's Reason: There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories, as wood does not offer the resilience and fire protection of non-combustible alternatives such as concrete and steel. In addition, Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. For example: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals. Plus, there has been no wind component involved in the fire testing of Mass Timber assemblies. Additionally, the adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. While a testing standard for these adhesives has been proposed, it has not been fully vetted by the cognizant committees. This type of testing is essential and failing to do so would be egregious mistake. In closing, allowing wood structures to be built above the level that allows for fire department access is a serious mistake. It poses a safety risk to not only to fire department rescuers, but to the general public living/working in and adjacent to these buildings, as their structural integrity will easily be compromised during a fire. This is a mistake.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 34:

Proponent: Steve Gonsalves, representing Concorequests Disapprove.

Commenter's Reason: Neither the fire code action committee nor the Building Code Action Committee voted to support this series of code changes. This is a serious and dangerous mistake! Allowing wood structures to be built above the level of fire department access is dangerous. Wood does not offer the support and resilience or fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 35:

Proponent: Edq Griffith, representing St. Marys Cement, Inc. (ed.griffith@vcimentos.com)requests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel, this is a serious safety issue and has been evidenced by disastrous fires.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 36:

Proponent: Robert Grupe, representing Grupe Gypsum Consulting, LLC (rcgconsult@outlook.com)requests Disapprove.

Commenter's Reason: Overall building performance is predicated on the individual systems that comprise the structure. Further these systems are a series of individual building materials that are integrated based on their

performance attributes, and compatibility with adjacent building materials. The proposed Tall Wood-frame construction is based primarily on the use of Cross Laminated Timber, CLT. However the proposal does not address potential compatibility issues, and in some cases lacks critical data to support required performance. Therefore, the CLT, system is not ready for use in wholesale high-rise construction. There are at least two critical system design areas that require additional testing and verification. These two examples are offered here to provide areas of specific concern. These examples are expressed in specific published white papers on the use of Cross-Laminated Timber. The first example is on acoustics, specifically that of sound transmission through floor-assemblies. The current International Building Code has established minimum requirements for floor-to-floor transmission. In a published white paper entitled **Mass Timber High-Rise Design Research: Museum Tower in Los Angeles Reimagined in Mass Timber** (2015) the following statement is made regarding acoustics:

Testing is required to determine the ability of this assembly to obtain the code-required acoustic performance.

The paper covered the design of a timber-framed high-rise building. The acoustical design of the structure was centered around two floor-ceiling systems proposed for this project, both of which did not have any acoustic testing to substantiate compliance. The above comment followed a written description of each proposed floor/ceiling assembly.

Another issue of concern relating to additional required research is the proper design of connections that can accommodate the naturally occurring shrinking and swelling of CLT members primarily due to seasonal changes. The issue is the compatibility and serviceability of sealants and membranes that are incorporated into the CLT system. The following is taken from the **CLT Handbook** (2013):

Differential movement between CLT and other wood-based products or materials (in case of mixed materials and systems) need to be taken into account at the design and detailing stages due to potential shrinkage-induced stress that could undermine the connection capacity in CLT. More information and guidelines related to detailing will be provided in future versions of this document as additional studies need to be performed.

The point to be made here is that these are critical components in system and ultimately building design that require additional testing and research. It is obvious from the above mentioned white paper and handbook that the composite action of the independent building materials that make up the building systems have yet to be fully researched, tested, and detailed for use in general construction.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 37:

Proponent: Larry Williams, Steel Framing Industry Association, representing Steel Framing Industry Association requests Disapprove.

Commenter's Reason: G108-18 proposes to modify IBC Section 202, Table 601, and various sections of 602, to recognize cross laminated timber (CLT) as a special class of Type IV construction.

The structural and fire resistance performance of cross-laminated timber is fundamentally determined by the performance of the adhesive used to hold the layers of the product together. Delamination as a result of exposure of CLT to heat and flame have been identified as an issue of concern through both independent research and tests conducted under the supervision of members of the Ad Hoc Tall Wood Committee.

The solution to this concern was the addition of language in the proposal to reference PRG 320-18 which had not been published at the time of the submission of the proposed G108-18. Since the proposal was submitted, the PRG 320-18 has been published with an Appendix B that is intended to provide a test procedure to be used in evaluating the elevated temperature performance of adhesives.

This Appendix B has been public for less than 6 months, and consequently has no history of use that would validate assumptions that we are being asked to make. In addition, it clearly states that not all factors needed for a risk assessment are incorporated into the development of the Appendix. Further, the task of verifying that any of the methods discussed in the Appendix is left to the user.

Given the important role that adhesives play in the structural performance and safety of a bonded system, too little is known or provided that would ensure that 180-foot tall structures would be safe in the event of a fire or exposure to heat.

The leap in assumptions that fire tests on a two-storey mock up can be extrapolated to fire performance of an 18-story building is an unreasonable extension in the allowance for use of "professional judgement."

Proponents of G108-18 and related proposals state that the expected fire performance of mass timber buildings was

“validated by a series of full scale multiple-story fire tests.” However, the actual model tested was only two storeys in height, and from this test users are expected to have confidence that a 180-foot tall building construction with cross-laminated timber will exhibit identical performance.

The fundamental problem of this assumption is that some characteristics of large fires have not been observed on small fires, either because they do not occur in small fires or because they are too small to be detected. It seems likely that a different set of controls of fire behavior may take over after a fire reaches a certain size or intensity. The difficulty of extrapolating from small to large fires is further complicated by the fact that behavior of fire is a pattern phenomenon--the behavior at one point is often dependent on the behavior at another point. The behavior of one part of a fire may change even if burning conditions at that point do not vary when the characteristics of the fire at some other point changes.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with current requirements.

Public Comment 38:

Proponent: Eric Gutierrez, Self, representing Selfrequests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 39:

Proponent: steve gynn, Votorantim, representing Votorantim (steven.gynn@vcimentos.com)requests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. The safety aspects alone without the support of the construction committees are enough to stop this action. Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.

What testing has been completed to prove the long term viability of tall wood structures in the event of a fire?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements

Public Comment 40:

Proponent: Frederick Hahn, Construction Forms, representing Self (rick.hahn@conforms.com)requests Disapprove.

Commenter's Reason: UNTESTED: Wood-industry funded tests performed in the U.S. and Canada were completely inadequate, failing to examine real-world structural risk factors, potential firefighting safety impacts from weather, and material-related risk factors to public health and safety.

UNPROVEN: While non-combustible concrete and steel have been used for centuries to build tall buildings and structures, mass timber products, like cross-laminated timber, are unknown and unproven construction materials.

UNSOUND: Common sense knows, and history shows, that TALL WOOD buildings are high-risk and dangerous to public health and safety when it comes to natural and man-made disasters like hurricanes and wildfires.

With recent fires that have occurred both during and after construction of these tinderboxes, there should be at the very least better studies done by independent sources. Concrete and steel have been proven over decades to be a far safer building from a fire safety standpoint.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 41:

Proponent: Patrick Hainault, Matsen Ford Design Associates, Inc., representing Selfrequests Disapprove.

Commenter's Reason: "Tower of Fire destroys LA apartment complex under construction." This headline in the December 8, 2014 LA Times barely scratches the surface in describing the dangers from fires in buildings under construction when those buildings are framed with wood and wood-based materials. This fire not only destroyed at least 239 of the rental units and 2/3rds of the complex at the Da Vinci Apartments but caused significant damage to neighboring buildings and infrastructure, and greatly burdened the surrounding community in general. Yet, this proposal will dramatically raise the allowable heights and areas of buildings made from combustible materials.

It is not rationale to increase the allowable height of buildings as in this proposal when significant problems in much smaller buildings still present a well-documented risk to life and property. The assembly should overturn the committee decision to effectively prohibit the type of proposed construction until and if it can be proven safe during and after construction. The following paragraphs expand on the issues the assembly should consider in evaluating this proposal.

How do we even begin to come to grips with the risk to adjacent properties and occupied buildings during the construction phase when an 18- story wood structure allowed by this proposal is burning in a suburban or urban area? Without safeguards well beyond those currently in the code (or proposed as part of a series of related proposals) to protect adjacent properties and infrastructure, the impacts will be devastating. For example, the Da Vinci fire caused:

- **Damage to adjacent buildings.** At least four nearby buildings were damaged. The building at 221 N. Figueroa St., where the computers and cubicles melted, had significant damage on its 15 floors, with 300 windows blown out. Three floors were also damaged in the Los Angeles County Department of Health Services building at 313 N. Figueroa. LA Department of Water and Power staff identified at least 160 damaged windows. A Los Angeles Department of Building and Safety spokesman reported windows blew out in the north tower of its department headquarters, and the heat and smoke triggered sprinklers that soaked carpets and desks. Overall, the Da Vinci Apartments fire caused an estimated \$111.5 million in damages, including \$80 million in damage to city properties from the fire and the water used to extinguish it and \$20-\$30 million to the apartment complex.
- **Damage to Infrastructure.** A Caltrans spokesman estimated the fire caused \$1.5-million damage to the freeway. Roads were closed around the area including a major commuter route during rush hour. Caltrans officials reported an exit sign over the 110 Freeway melted and would have to be replaced, forcing another freeway closure later the same week.
- **Extensive impacts on the community.** The attached study of the economic risk to taxpayers and the community posed by mid-rise apartments produced by assistant adjunct professor Urvashi Kaul at Columbia University captures the total cost impacts from fires like the Da Vinci apartments and smaller incidents. This study finds that:
 - In Los Angeles County, alone, fires in mid-rise residential buildings with combustible frames could have a negative impact of \$22.6B over 15 years, including \$17.14B in direct losses from property damage.
 - On average, fire in a mid-rise residential building constructed using combustible framing material costs the Los Angeles County a total of \$141.81 per square foot in potential economic impact and \$2.38 per square foot in lost tax revenues.
 - Potential impact the County may face in a single year could be \$1.7 billion, including \$1.3 billion in direct property damage.

The assembly is also urged to reconsider the argument that cladding requirements proposed to address fires in buildings under construction will resolve these issues. As demonstrated in a large fire from 2015 in a wood-framed apartment building in Edgewater, NJ, cladding will not stop a fire from spreading once the framing in part of the building ignites. It doesn't create a barrier between unexposed framing and exposed framing, but only provides some resistance to ignition from within or outside of the building. The Edgewater fire spread rapidly throughout the buildings once framing behind a wall was ignited during repairs to the occupied and fully-clad building.

The Da Vinci and Edgewater fires are not uncommon incidents. Dozens of similar fires have occurred (see more at <http://buildwithstrength.com/america-is-burning/>) in buildings under construction since the market began broadly taking advantage of relatively recent changes to the IBC that allowed taller and larger wood-framed buildings. In a similar fire in Houston, the life of a construction worker literally hung in the balance as he was rescued from a burning wood framed building just seconds before the stories above came crashing down. The assembly can prevent these types of risks from greatly expanding by disapproving this proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of

construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 42:

Proponent: William Hall, Portland Cement Association, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests Disapprove.

Commenter's Reason: At the recent ICC Committee hearings in Columbus, OH, your committee **FAILED you**. The general committee charged with looking at proposals and weighing justification **FAILED** to do their job when it came to Tall Wood Buildings. Despite overwhelming testimony that fire tests were inadequate, the committee simply ignored the fact that the TWB ADHOC committee only considered a two story residential structure during testing, and then used **'Engineering Judgment'** to determine that those results will be sufficient for 18 stories. They **FAILED** to ask for justification to allow other occupancy groups a 100% increase in height. WHERE is the testing for all the other occupancy groups? 100% increases in story height are proposed for other use groups **without any justification**.

The ICC TWB ADHOC Committee has taken it upon themselves to develop a prescriptive TWB approach that **exceeds the allowable heights of every country in the world**. The United States just recently began looking at Mass Timber for taller buildings and yet, if this proposal goes through, ICC will allow mass timber 6 stories higher than any other country.

Not only will the U.S. allow the tallest wood buildings, we will also allow 12 story Mercantile, Storage and Factory to be built **without** gypsum covering on 40% of the CLT surface. Again, more than any other Country.

While mass timber may be an acceptable building material, it has not gone through the testing rigors that are needed for safe high rise buildings. **Do not let the U.S. be the testing ground for these Tall Wood Buildings.**

Vote for Disapproval

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No effect

Public Comment 43:

Proponent: Mary Murphy Harrison, representing Barney & Dickenson Inc (mmh@stny.rr.com) requests Disapprove.

Commenter's Reason:
Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete, masonry, and steel.

There has been no wind testing of wood structures above 6 stories.

Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood/Mass Timber code Changes.

Most fire departments do not have the ability to fight fires above 6 stories effectively.

Water from sprinklers will accumulate in lower floors causing concerns for mold, water load, and water damage.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 44:

Proponent: Lindsey Haugh, Conco, representing Conco (lhaugh@mail.csuchico.edu) requests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel and with the frequency of wildfire devastation (especially in California) this act would permit possibility of future destruction.

Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 45:

Proponent: Shawna Helber, C.E. Collins & Assoc., representing Selfrequests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is a serious mistake.

Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 46:

Proponent: Jennifer Herrera, representing Conco (jherrera@conconow.com)requests Disapprove.

Commenter's Reason: There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories. Allowing wood structures to be built above the level of fire department access is a serious mistake. Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. Allowing wood structures to be built above the level of fire department access is a serious mistake.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. Wood is a serious mistake!! This will put the lives of people in danger if there were to be a fire or earthquake and people were on the top stories of a wooden structure.

Public Comment 47:

Proponent: Frank Howard, representing Howard Concrete Pumping Co., Inc. (fhoward1@howardconcretepumping.com)requests Disapprove.

Commenter's Reason:

Allowing wood structures to be built above the level of fire department access is a serious mistake, and Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. Further,there is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 48:

Proponent: Shane Huff, representing MMC Materials, Inc.requests Disapprove.

Commenter's Reason: I am opposed to increasing the current height limitations on mass timber construction for the following reasons:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 49:

Proponent: Anthony Inglese, representing self; Peter Lalley (plalley@conconow.com) requests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 50:

Proponent: Heidi Jandris, A. Jandris & Sons, Inc., representing A. Jandris & Sons, Inc. requests Disapprove.

Commenter's Reason: Fire test (ASTM E119) dates back to a time when homes were furnished with natural materials such as cotton, leather, wool and wood. Modern homes are furnished with much more flammable materials, which are petroleum based; carpets, foam furniture, plastic based coverings, etc. These materials are much more combustible and much quicker to reach flash point. Wood structures with increasingly flammable interior furnishings, often with toxic flame retardants as the answer are not compatible. Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes. Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.

UNTESTED: Wood-industry funded tests performed in the U.S. and Canada were completely inadequate, failing to examine real-world structural risk factors, potential firefighting safety impacts from weather, and material-related risk factors to public health and safety.

UNPROVEN: While non-combustible concrete and steel have been used for centuries to build tall buildings and structures, mass timber products, like cross-laminated timber, are unknown and unproven construction materials.

UNSOUND: Common sense knows, and history shows, that TALL WOOD buildings are high-risk and dangerous to public health and safety when it comes to natural and man-made disasters like hurricanes and wildfires.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 51:

Proponent: Shawn Kalyn, Votorantim St Marys Cement LLC, representing selfrequests Disapprove.

Commenter's Reason: There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories

VOC (volatile organic compounds) with the adhesives used in the glues of CLT s and flame retardants should be investigated for the limits of exposure for indoor air quality of inhabitants.

Moisture control and agents used for the prevention of mold control needs to be addressed for both construction and occupancy. Mold spores can bloom during construction as shown in OSB board where agents used did not control or kill of the spore growth internally within the product.

Allowing wood framed structures to be built above the level of fire department access is a serious mistake. The vast majority of municipal ladder trucks cannot reach above the 7th floor.

Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete, masonry and steel.

Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Charring wood will add fuel to the fire and increase the heat and smoke output relative to noncombustible materials. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals.

To date, there has been no full scale CLT fire tests done to ASTM standards. There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.

It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?

Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.

Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.

The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?

Wood absorbs water, and the resulting rot and mold can seriously impair a wood structures overall anticipated performance. Note: non-combustible materials such as concrete, masonry and structural steel do not rot.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

- Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 52:

Proponent: Janet Kasson, representing American Concrete Pumping Association (janet@concretepumpers.com)requests Disapprove.

Commenter's Reason: The code change will not increase or decrease the cost of construction

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 53:

Proponent: Danielle Kleinhans, representing Concrete Reinforcing Steel Institute (dkleinhans@crsi.org) requests Disapprove.

Commenter's Reason: There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories and wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 54:

Proponent: Steven Kosmatka, Portland Cement Association, representing Portland Cement Association (skosmatka@cement.org) requests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of non-combustible alternatives. Most fire departments cannot handle an 18 story fire in a building made of combustible material. Residents in nursing home or assisted living facilities would not be able to escape. Fire fighters cannot get 18 stories of wheel chair bound occupants down the stairs and out in time.

Fire and related engineering research is not adequate to support the proposal.

Please disapprove this proposal.

Bibliography: There is no properly conducted fire research with wind forces at 18 stories available to support the proposal's claims.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. 18 story wood construction is currently not allowed, therefore disapproving this action has no impact on construction cost relative to current code.

Public Comment 55:

Proponent: Robert Krulik, Ohio Concrete, representing self (bob@ohioconcrete.org) requests Disapprove.

Commenter's Reason:

- Wood absorbs water, and the resulting rot and mold can seriously impair a wood structures' overall anticipated performance. Non-combustible materials such as concrete, masonry and structural steel do not rot.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 57:

Proponent: Meredith Lambert, Conco, representing Conco (mlambert@conconow.com) requests Disapprove.

Commenter's Reason: I believe that this proposal promotes construction methodology which is not fire safe or in the best interests of the general public for materials. Further it is irresponsible to use wood in this manner further impacting the deforestation of our country and others.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 58:

Proponent: elizabeth Langhauser, representing Self (bplanghauser@gmail.com) requests Disapprove.

Commenter's Reason: Allowing wood structures to be build above the level of fire department access is a serious mistake. Furthermore, there is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 59:

Proponent: John Lee, Cemstone Products Company, representing Self requests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is a serious mistake.

There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals.

There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.

It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?

Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.

Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.

The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 60:

Proponent: Danny Mace, representing Self; Paul Tennis (pdtennis@comporium.net) requests Disapprove.

Commenter's Reason:

There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Allowing wood structures to be built above the level of fire department access is a serious mistake.

Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 61:

Proponent: Mark Manahan, Gonsalves & Santucci, Inc., representing self requests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires?
- This would increase the use of wood products in construction and contribute to deforestation and environmental problems.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

- This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 62:

Proponent: DOUGLAS MARQUIS, Conco, representing selfrequests Disapprove.

Commenter's Reason: As a witness to the devastation of a multi-level residential wood structure, I am opposed to building tall residential structures from combustible materials. Wood simply does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

The process should seriously reconsider supporting an approval when neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.

The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires?

I'm concerned this decision has already been rubber stamped for approval prior to this process.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 63:

Proponent: William Marsh, Hydro Rents Carolina, representing Hydro Rents Carolina (bill.marsh@hydro-rents.com)requests Disapprove.

Commenter's Reason: There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories. Additionally, wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 64:

Proponent: Christy Martin (Marie C. Martin) Exe. Director, Concrete Promotional Group, Inc., representing Concrete Promotional Group, Inc.requests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood framed structures to be built above the level of fire department access is a serious mistake. The vast majority of municipal ladder trucks cannot reach above the 7th floor.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete, masonry and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Charring wood will add fuel to the fire and increase the heat and smoke output relative to noncombustible materials. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals.
- To date, there has been no full scale CLT fire tests done to ASTM standards.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?
- Wood absorbs water, and the resulting rot and mold can seriously impair a wood structures overall anticipated performance. Note: non-combustible materials such as concrete, masonry and structural steel do not rot.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 65:

Proponent: Chris Mason, Prairie Material, representing Prairie Materialrequests Disapprove.

Commenter's Reason: I'm not convinced that there has been sufficient testing on the properties of the materials (and joining materials) in the event of a fire, as well as the long-term effects of water.

I m also concerned that the environmental gains may be overstated and, when taking into account, the life-cycle cost to obtain, process, deliver and assemble, the any potential gains would be negligible and not worth the risk.

On a very human and practical level, I wouldn't want to have my kids or grandkids sleeping in a wood high-rise. It s unsettling to think what could happen with regard to stairwells, elevator shafts and access for emergency services personnel, when taking into considerations flammability and generated heat.

I hope unbiased research and testing can continue and am not in favor green lighting the change at this time.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

It is yet unknown the extent to which this code change proposal may or may not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus, it appears there is not a known cost impact when compared with present requirements.

Public Comment 66:

Proponent: Tina McIntyre, CalPortland, representing self (tmcintyre@calportland.com)requests Disapprove.

Commenter's Reason:

There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories. A matter of safety must be considered.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of

construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. this proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 67:

Proponent: Dan McCoy, PE, representing R. L. McCoy, Inc. (danmccoy@rlmccoy.net)requests Disapprove.

Commenter's Reason: I've been concerned in recent years that wood has been getting stretched beyond reasonable limits. It used to be we were limited to four floors without some special analysis. We don't like using it for tall structures but sometimes, if it's allowed by code, contractors and/or architects will push it. Unfortunately, there are creep issues that can affect plumbing, etc. and the fire protection issue is very real. There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories. Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. Hopefully, the code council looks at this more closely.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 68:

Proponent: Ganesha Mohanram, Conco Companies, representing Conco Companies (gmohanram@conconow.com)requests Disapprove.

Commenter's Reason: We all know and been studying the difference between Wood construction and Concrete Construction. We have been talking how safe concrete structures when compared to wood construction. Cros laminated Timber chars in fire; however charring is not equivalent to non-combustible. Note: if the char rate is 1 per hour in a fire, then after 2 hours in a fire, a 6 thick CLT wood load bearing wall will only have 2 of structural material left. This is not acceptable and is not addressed in the code change proposals. And currently there is no satisfied engineering justification on construction high raised i.e from 6 stories to 18 stories with mass timber thus, allowing wood structures to be built above the level of fire department access is a serious mistake.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 69:

Proponent: Debbie Moreno, representing Conco (dmoreno@conconow.com)requests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories. I would never live or work in a high rise that is made of wood. A fire can take down a high rise in minutes, also the fact that would can rot overtime.....

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 70:

Proponent: Todd Morgan, Ramcrete, Inc, representing Ramcreterequests Disapprove.

Commenter's Reason: Allowing wood structures to be built about the level of fire department access is a serious mistake and puts many lives in harms way. Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete or steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 71:

Proponent: Marc Nard, Portland Cement Association, representing Portland Cement Association (mnard@cement.org)requests Disapprove.

Commenter's Reason: Mass Timber is a new and incompletely tested building method. There has been insufficient / inadequate testing of the complete system to date. As code officials prescriptive limits are strictly adhered to. You would not allow even a single story increase in the currently allowed construction height of 6 stories. If a contractor asked to be allowed to build to 7 stories he would be told NO that would exceed the height code allows. Now not only is the wood industry seeking to simply exceed the height limitation of 6 stories by one story the desire is to extend the height beyond 6 stories and in fact, without proper testing, NO wind testing or proper justification randomly raise the height allowance three times the current limit allowed to 18 stories. for Mass Timber structures.

18 Story structures far exceeds the level of fire department access. I have 12 years experience as a firefighter in the States of Indiana and Michigan and would urge DISAPPROVAL. Not being able to reach the fire in a combustible building is a recipe for disaster. Common sense and the experience learned from high rise fires dictates that to be safe we use NONCOMBUSTIBLE materials, Type 1 and Type II construction not just open the door for untested systems to be built as high rises. Having combustible construction above the level of fire department access puts occupants, fire fighters and emergency services persons at unnecessary risks.

Wood structures will burn and this affects them and adjacent structures as well. It simply does not provide the Resiliency, Safety and Piece of Mind that Concrete and Steel offer. Fire testing to date has been done on two story structures. We need testing on an 18 story structure both with and without sprinkler protection (they can fail or be inoperative on occasion) and we need testing with wind and water pooling to see how the system reacts to the additional deteriorating factors.

Cross Laminated Timber / Mass Timber burns and chars in a fire. Wood is a combustible product. Given enough heat and oxygen it acts as a fuel and will burn. Note: if the char rate is 1 per hour in a typical fire then after a 2 hour fire exposure a 6 inch wall assembly is now missing 4 inches of structural material. There is no repair method offered so that if there is a kitchen fire and the material is damaged no one as decided it would be an advantage to develop and disseminate the repair procedures prior to building and occupying these structures. This is a major mistake.

To date no standard, including NFPA 285, has a wind component that has been part of the testing of Mass Timber. The recent loss of life in the London high rise fire shows clearly that wind is an accelerating factor in a high rise fire. Support DISAPPROVAL do not experiment with structures people live in and use. Do the testing on full size structures prior to putting these extended height allowances into the code and be certain we test for wind effect.

In the case of a fire event there are two major overriding issues beyond the combustibility of wood products. First, where does the water go after a sprinkler head is activated either by fire or by accidental event (kids throwing a ball in an apartment and hitting a sprinkler head). Second, if the fire department does have to fight an active fire the additional volume of water from attack lines adds to the already added load of sprinkler head water. The connectors have not been tested. There is no provision for a drainage system. What effect will this have on adhesives holding these systems together. What about weather that causes windows to blow out and rain or wind blown debris to enter and pool in the structure. Mold and mildew are a serious concern that have not been addressed. The behavior of Mass Timber / CLT in high rise structures is completely dependent on proper connections. All connections being used to date are considered proprietary meaning that there is no information available to the public on their design capacities and failure rate.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proponent has submitted a Cost Impact statement that declares that this will not increase the cost of construction. CLT / Mass Timber is a brand new technology which is bound to have a cost increase on the cost of construction using current code compliant non-combustible construction materials.

Disapproving this code change proposal will not increase or increase the cost of construction.

The proposed text provides information that was not previously in the code and thus there is no comparative data. This only underlines the necessity for approximate cost of construction materials and does not alleviate the need for comparison cost of construction values. Perspective building owners and designers have to have some gauge to go by as they determine materials cost in construction.

Public Comment 72:

Proponent: Gwen Wang, Portland Cement Association, representing Self (gwang@cement.org)requests Disapprove.

Commenter's Reason:

There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories. Allowing wood structures to be built above the level of fire department access is a serious mistake.

Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 73:

Proponent: Mark Nowak, representing Steel Framing Industry Association requests Disapprove.

Commenter's Reason: This proposal should be disapproved for the following reasons:

The proposed language prohibits the use of combustible materials on the exterior of walls and in concealed spaces. This creates a conflict with the International Energy Conservation Code (IECC) and ASHRAE Standard 90.1 (Energy Standard for Buildings except Low Rise Residential Buildings).

Given all buildings will require continuous or other combustible insulation under the IECC or ASHRAE 90.1*, the two-story fire tests conducted in support of this proposal are inadequate** to extrapolate to buildings of the heights and number of stories permitted under the series of proposals that includes G108, G-75, G80, and G84-18.

Code officials and designers will face a dilemma over how to interpret the new requirements against the energy code requirements. One possible interpretation would effectively give these buildings an exemption to the use of the 90.1 and IECC envelope energy requirements, given there are no practical alternatives for compliance. The end result will be inconsistent enforcement or no energy code enforcement.

The proponents are attributing to these newly defined Type IV assemblies a performance level equivalent to some non-combustible materials, but traditional noncombustible materials can be constructed with combustible continuous exterior insulation. Clearly, the new Type IV construction categories do not offer the same level of protection, or the proponents would not have placed such a significant limitation on commonly-used combustible materials.

This proposal attempts to introduce several new categories of Type IV construction into the code that will greatly expand the number of stories, allowable area, and maximum height of buildings framed with materials made from combustible wood products such as cross-laminated timber. This greatly increases the risk to firefighters, building occupants, and neighboring buildings and infrastructure. Many of the major decisions that went into the creation of this proposal were based on expert opinion and relied on significant extrapolation to buildings with up to 9 times as many stories as the tests that were conducted. However, even within the context of these shortcomings, several key issues as discussed above were not adequately addressed or not addressed at all.

**With the IECC and 90.1, combustible material (insulation) on the exterior and/or in concealed spaces is almost always necessary for compliance. Even under the performance compliance path using energy modeling, it would be almost impossible to avoid the use of combustible continuous exterior insulation in the northern climate zones. Of the three major foam plastic insulation materials commonly used in buildings for continuous insulation - EPS, XPS, and polyisocyanurate - all are combustible.*

***There are no tests that were submitted to support that the proposed assemblies can meet the fire propagation tests in NFPA 285 (required in Chapter 26 of the IBC). Although the two-story tests conducted in support of the proposal were not intended to address this issue, that itself is a significant oversight. Simply declaring that noncombustible materials can't be used is not sufficient to overlook other code requirements that require such materials.*

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 74:

Proponent: Gabriel Ojeda, Fritz-Pak Corporation, representing Fritz-Pak Corporation (gabrielojeda@fritzpak.com) requests Disapprove.

Commenter's Reason: It was 104F yesterday in Dallas Texas. Can you imagine first responders having to deal with ambient heat plus having to fight a fire in a wood structure. There hasn't been enough testing and research on building over 6 stories to be safe for the occupants and first responders. Fire fighting equipment does not reach above 6 stories. Allowing construction of wood structures without enough testing and experience is not right.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Code change will not change or decrease cost of construction. However it will increase the risks that first responders must endure.

Public Comment 75:

Proponent: Thomas OMalley, Schwing America Inc, representing Schwing America Inc requests Disapprove.

Commenter's Reason:

- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 76:

Proponent: Maizer Ouijdani, Conco, representing Conco requests Disapprove.

Commenter's Reason:

- Allowing wood structures to be built above the level of fire department access is a serious mistake. Do not forget what happened in Chicago!

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 77:

Proponent: Jim Pajk, Votorantim St. Marys Cement LLC, representing self; Thomas Tietz (tom.tietz@cncement.org); Steve Parker (steve.parker@farmersbranchtx.gov) requests Disapprove.

Commenter's Reason:

- ○ There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- Allowing wood framed structures to be built above the level of fire department access is a serious mistake. The vast majority of municipal ladder trucks cannot reach above the 7th floor.
- Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete, masonry and steel.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Charring wood will add fuel to the fire and increase the heat and smoke output relative to noncombustible materials. Note: if the char rate is 1” per hour in a fire, then after 2 hours in a fire, a 6” thick CLT wood load bearing wall will only have 2” of structural material left. This is not acceptable and is not addressed in the code change proposals.
- To date, there has been no full scale CLT fire tests done to ASTM standards.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?
- Wood absorbs water, and the resulting rot and mold can seriously impair a wood structures’ overall anticipated performance. Note: non-combustible materials such as concrete, masonry and structural steel do not rot.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

- Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 78:

Proponent: Tien Peng, representing National Ready Mixed Concrete Association (tpeng@nrmca.org) requests Disapprove.

Commenter's Reason: While the Ad Hoc Committee had intended to validate the fire performance of cross laminated timber in fire conditions of buildings, the AWC/ATF compartment testing was limited in scope and not a thorough predictor of fire behavior for high rise building made of a new material. The testing so far is insufficient to capture the fire response characteristics in question. No tests were done to factor in wind, exterior performance, panel connections or moisture, which impacts material performance, fire-fighting and property damage. CLT is a great innovation for the wood industry but it s not ready for prime time and it s certainly not ready for us to build safely to 270 feet and 18 stories. The ICC should not adopt code provisions that will put people at risk.

1. CLT Reliability and Predictability Issues

Cross laminated timber does not have a long enough history to demonstrate their reliability and predictability. The structural design of modern tall buildings is governed by the need to efficiently transfer loading, particularly that from wind, whilst providing increasingly complex building functionality. The use of cross laminated timber implies a highly optimized systems which means the least amount of material to enabled efficient load transfer. Thus, in the event of a fire there is an increased risk not typical in mid-rise constructions, and especially not in a two-story mock up in a lab.

The NFPA with ARUP *Fire Safety Challenges of Tall Wood Buildings* paper noted (NFPA 2013)[i]:

- In a real fire situation, the load-bearing elements in CLT are expected to load-share , or redistribute in a method that is not easily predicted in simple fire testing.
- Previous CLT fire testing has resulted in delamination and char fall-off when exposed to fire conditions.
- This has the potential to increase the fire temperature and burning rate within the compartment, and could impact the structural fire resistance at later stages in the fire duration.

The full-scale fire testing in Norway (SPFR A15101 2016)[ii] showed:

- The temperature increased fast and flashover was reached after four minutes.
- Temperatures were significantly higher than the standard time-temperature curve according to EN 1363-1
- The fire did not cool down before manual suppression was initiated when the test room collapsed 1-hour 36 minutes after ignition
- The sprinklers in the adjacent corridor did not stop the fire from spreading out from the room of origin.
- The charring rate varied much faster than expected

We should not be putting lives in high rises at risk with this level of material unpredictability.

2. Exposed CLT Fire / Moisture /Delamination Issues

The National Institute of Standards (NIST) tests complete previously said there were concerns that flashover occurred earlier with CLTs, heat delamination of the exposed CLT affected its fire performance and a large re-flash occurred on the exposed wall with delamination of the second ply of the CLT. (NIST 2017)[i]

While fire departments understand the risk of collapse with solid wood, there is not enough documentation or history of bonded or laminated wood structures, and they may fail sooner under fire conditions. The problem is that under fire conditions an adhesive may either thermally soften or chemically degrade causing the member to lose its strength, leading to structural collapse. Hence, we see delamination from the NIST testing as well as the very real construction failure on portions of the new College of Forestry building at Oregon State University where a large section of subflooring made of cross-laminated timber gave way between the second and third stories.

Moisture is an important issue for delamination and in many parts of the country the laminated mass timber panels will experience an environment which may exceed the testing limits. Wood will change in all three orthogonal dimensions with changes in moisture, and the changes are not even. This not only means that some species swell more because of their higher density, but also wood of non-uniform density displays non-uniform swelling. Moreover, as wood swells and shrinks, adhesives do not follow with the same volumetric expansion. RDH Building Science full-scale mock-up study (Lepage 2017) [ii]notes that, The research indicates that CLT and mass timber is susceptible to dangerously high moisture contents, particularly when exposed to liquid water in horizontal applications. and other research indicate that CLT is at risk of structural damage by decay and rotting fungi (Zabel and Morrell 1992)[iii]

Clearly, we should not be putting lives in high rises at risk with this level of material unpredictability.

3. Fire / Connections Vertical Fire Spread

All connections used in current projects are proprietary and no information is publicly available regarding their performance. In a high-rise fire event, it is essential that the fire be prevented from spreading upwards or downwards from the floor of origin, endangering the lives of those waiting on more remote floors. Typically, the floor slab provides a robust barrier inhibiting external fire spread so long as it remains firmly supported by the structure. However, the AWC/ATF compartment fire testing had not adequately accounted for the connections in the CLT technologies to meet this crucial objective. The deformation of the connections when exposed to fire can expose gaps and flammable materials which can lead to spread both upwards through flaming, and downwards through dripping molten materials. Once fire starts spreading away from the floor of origin the safety of the occupants is compromised. Examples of vertical fire spread include:

- Las Vegas Hilton, USA: 22 Stories in approximately 25 minutes
- Caracas Tower, Venezuela: 17 floors in a 24-hour period
- Windsor Tower, Spain: 19 floors, ~7 hours for spread, 24 hours total fire duration
- TVCC Tower, China: 44 floors, around 15 minutes

4. Fire / Stack Effect

A similar concerning pattern emerges when discussing wind and air movement fire performance. One problem common to high-rises but not found in low-rise buildings is the stack effect movement of air inside the building. This air movement is critical to understand what happens during a fire event, as it can intensify a fire or allow flames and combustion gases to move beyond the room of origin. Fire personnel responding to a high-rise fire event need to understand where smoke and toxic gases may be going. Yet, shrinkage, moisture and creep, common in wood products including CLT, will create unpredictable opportunities for air movement within a building.

Air pressure and thermal differential with the use of CLT panels can shift the neutral pressure plane of the building. In cold weather (positive stack effect), the velocity of air channeling into the core from the lower floors is a very real concern to the occupants when they have to defend in place as well as fire service if the fire egress is compromised with smoke. In warm weather (reverse stack effect), where typically the staging floor is two floors below the fire floor, there can be concern of contamination, if there is unpredictability of where the fire path may be taking.

5. Fire / Wind

We typically associate wind with brush and wildland fires but it's just as important in structural fires.

- In 2009 a Texas probationary fire fighter and captain die as a result of rapid fire progression in a wind driven residential fire. Sustained winds from east/south-east at 17 mph with gusts up to 26 mph.
- Virginia Firefighters Battle Three-Alarm Townhouse Fire in 2011. In assessing the high winds and the fire conditions Battalion Barnes says fire crews tried to attack the flames inside two townhouses, but were forced back by intense heat and falling ceilings.
- In 2012 Prince George's County (Maryland), firefighters arrive on scene to a structure fire with winds impacting the rear of the structure. Shortly after forcing the front door open, they saw a dramatic change in fire behavior. As they made entry, they quickly experienced high velocity and high temperature gases, injuring seven firefighters, two critically.

The American Wood Council compartment fire tests did not account for wind loads.

Wind can add to the hazard to a low-rise fire, but it is most concerning around the upper floors of tall buildings. And high-rise fires create unique safety challenges for occupants and firefighters, even without the influence of wind. Wind can change the FLOW PATH of a fire and in some cases create a blowtorch effect and untenable conditions. When a window in the fire apartment fails, the influx of wind can create significant and rapid increases in the heat production of a fire. Smoke and heat spreading through corridors and stairwells, for instance, can inhibit occupants ability to escape and can limit firefighters ability to rescue them. Conditions in a corridor are of critical importance because it is the route that firefighters use to approach a fire and that occupants use to exit a building.

During the course of any structure fire, the wind may also influence exterior conditions and firefighter safety. Accelerated winds near high rises are caused by the downdraft effect, where the air hits a building and, with nowhere else to go, is pushed up, down and around the sides. The air forced downwards increases wind speed at street level. Tests conducted by National Institute of Standards and Technology (NIST 2012), the Fire Fighting Technology Group, FFTG, on positive pressure ventilation determined that an external wind speed of as low as 10 mph could cause a vented room within a structure to quickly spread from an apartment unit to a vent point, represented by a stairwell door. The spreading had floor-to-ceiling and wall-to-wall fire involvement with blowtorch effects. Moreover, if several towers stand near each other, the channeling effect, a wind acceleration created by air having to be squeezed through a narrow space. This Venturi effect will endanger the adjacent buildings.

6. Fire on Exterior

The AWC/ATF compartment fire tests did not account for exterior fire conditions and the proposed exterior proposal does not meet the required testing of CLT assemblies.

An important aspect of fire behavior in the affected building involves the burning behavior of materials on the exterior. While the AWC/ATF test demonstrated an understanding of CLT in an interior fire situation, the circumstances contributing to ignition scenarios of the exterior can be equally complex and equally important. In the past few years we have seen a number of deadly high-rise fires that propagated on the exterior of the structure.

- 2018 Almas Tower in Dubai, UAE
- 2017 Marco Polo apartment complex in Hawaii
- 2018 Grenfell Tower fire in West London

Simply testing the interior fire scenario does not capture potentially important parameters affecting CLT elements in tall wood buildings. If a fire in a heavy-timber building is not extinguished by the initial attack, a tremendous conflagration with flames coming out of the windows will spread fire to adjoining buildings by radiated heat. In a high-rise fire event, it is essential that the fire be prevented from spreading upwards or downwards from the floor of origin, endangering the lives of those waiting on more remote floors.

Notably missing from the proposals is how the mass timber exterior assembly in buildings over 40 feet in height would comply with NFPA 285, *Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Nonload-bearing Wall Assemblies Containing Combustible Components*.

- *Section 1403.5:* For combustible water-resistive barriers in buildings over 40 feet in height of Type I, II, III, or IV construction.
- *Section 1407.10.4:* For metal composite materials (MCM) used on buildings of Type I, II, III, and **IV** construction.
- *Section 1409.10.4:* For high-pressure decorative exterior-grade compact laminates (HPL) exterior wall coverings used on buildings of Type I, II, III, and **IV** construction.
- *Section 1509.6.2:* Combustible mechanical equipment screens used on buildings of Type I, II, III, and **IV** buildings.
- *Section 2603.5.5:* Exterior walls of buildings of Type I, II, III, and **IV** construction of any height incorporating foam plastic insulation, except for one-story sprinklered buildings.

This is a requirement yet there is no reference to NFPA 285 testing of exterior CLT assemblies. One test by Nordic Engineered Wood published under the Canadian ULC S134 is not enough of a sample size to validate the tall wood proposals. Again, there is not enough historical fires with cross laminated timber to provide information that can be used in an 85-ft building, much less one at 270 feet.

7. Limits of Redundancy

The ICC TW-AHC claimed the added safety factor of active sprinkler systems adds to the safety of the proposals. Without a doubt, the inclusion of fire sprinkler systems in our buildings since the late 1980 s has been effective at increasing the chances of survival in a fire. But when systems don t operate as intended (such as in a freeze failure with water damage) or fail in a high-rise fire condition, the impact can be large, not just in monetary terms, but also in the lives of the occupants and fire fighters.

The full-scale fire testing completed in Norway showed the The sprinklers in the adjacent corridor did not stop the fire from spreading out from the room of origin. (SPFR A15101 2016).[iv] Moreover, according to NFPA s report *U.S. Experience with Sprinklers*, sprinklers were effective at controlling the fire in 96% of fires in which they operated, but sprinklers were only effective in 88% of the fires large enough to activate them. The reported sprinkler failures (660 per year) were twice as common as reported fires in which sprinklers were ineffective and did not control the fire. A National Institute of Standards and Technology (NIST) study, *Estimates of Operational Reliability of Fire Protection Systems*, also demonstrates this over-reliance on fire sprinklers is misguided.

8. Untested Reference Standard

State and local governments that adopt and enforce model building codes which references a number of standards. Yet, the proposals regularly cite the newly referenced standard, *ANSI/APA PRG 320-2018: Standard for Performance-Rated Cross-Laminated Timber*, an untested document. The reference to ANSI/APA PRG 320-2018 resolves nothing and takes no legal responsibility for performance failure. APA PRG 320 has no real history of use or validation as a reliable document and no jurisdiction refers to this document. It is premature to utilize a standard that is rarely referenced and start building to 18 stories from it.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed public comment would **reduce cost of construction**. Substantiation and references below.

1. Research:

A recent feasibility study ^{[[i]]} reveals that CLT construction is significantly more costly than other well-established construction methods such as concrete. Renowned structural engineers, Cary Kopczynski & Company found that the cost of the CLT structural system for a typical 10 story apartment building would cost \$48 to \$56 per square foot compared to \$42 to \$46 per square foot for concrete, translating nearly **20% premium** for Cross Laminated Timber.

2. Brock Commons, British Columbia

Per "University of British Columbia: Report to The Board of Governors, Tall Wood Student Residence, Brock Commons Phase 1" Report ^{[[ii]]}, dated September 30, 2014,

- "The capital cost for the project is estimated at \$44 million (\$40m standard construction, plus \$4m wood premium)."
- "The \$4m estimated premium for advanced wood design and construction is to be funded from external sources including \$3.45m secured to date from the Canada Wood Council (CWC) and Forest Innovation Investment."

This is a **10% premium** for Cross Laminated Timber at the 18-Story Brock Commons.

3. Framework Oregon:

Per the January 5, 2018 *Portland Oregonian* article "Wheeler Defends Decision to Invest In Pricy Complex" of the Portland Oregonian^{[[iii]]},

- "While each unit is expected to cost an average \$480,000 to build, the city's contribution will amount to \$100,000 per apartment."
- Despite a pledge from Mayor Ted Wheeler to bring down the cost of affordable housing in Portland, the Portland Housing Bureau had nonetheless awarded the building \$6 million toward the \$29 million total. (A **21% subsidy** by the taxpayers for the 12- Story Framework project).

By the July 16, 2018 *Willamette Week (WW)* article "Plans for Record-Setting Timber Tower in Downtown Portland Fall Through" ^{[[iv]]} reported,

- The building, which was slated to include 60 *affordable* apartments, was projected to cost \$651.43 per square foot, *WW* reported in December. (The 660-square foot two bedroom apartments were projected to cost \$567,389 to build.)

4. Lumber Pricing:

And this doesn't consider the recent price increases of softwood lumber that have risen wildly from \$424 per board foot a year ago to \$536 in the second quarter of 2018. That's a **26% increase** in just one year. At the same time, concrete prices rose at a stable rate of 5%.

Public Comment 79:

Proponent: Chris Pernicano, representing San Diego Concrete Pumping Inc. (pernicanospumping@san.rr.com) requests Disapprove.

Commenter's Reason: Allowing wood structures to be built above fire department access is a big mistake Wood does not offer the resilience and fire protection of non combustible materials such as concrete and steel

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 80:

Proponent: Nick Popoff, St Marys Cement/Votorantim, representing Self (njpopoff@comcast.net) requests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete, masonry and steel. To increase the height from 6 stories to 18 stories doesn't appear to be wise from a

combustibility perspective. From a resilience and durability perspective, 18 stories is a lot of building that won't be able to stand the test of time...nor withstand some of nature's forces. I fear for the safety of anyone living in a wood structure higher than 6 stories

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. There will be no savings with this proposal...life cycle analysis will be diminished...the greatest risk is fire.

Public Comment 81:

Proponent: Nicholas Porte, Portland Cement Association, representing PCA (nporte@cement.org) requests Disapprove.

Commenter's Reason:

- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Charring wood will add fuel to the fire and increase the heat and smoke output relative to noncombustible materials.

Public Comment 82:

Proponent: Miguel Quiroz-Mosqueda, The Conco Companies, representing Self requests Disapprove.

Commenter's Reason: When neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes we should understand why, not just keep trying to push this proposal forward.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 83:

Proponent: Greg Ralph, representing ClarkDietrich Engineering Services requests Disapprove.

Commenter's Reason: The proposal greatly expands the allowable height and area of Type IV construction with materials made from combustible wood products, namely cross-laminated timber. Much of these changes are based on opinion and extrapolation of small scale testing. The expanded provisions tremendously increase the risk to occupants, first responders and all adjacent structures.

The glue that holds the strands of the CLT together is the critical link to the structural and fire performance. The proponents themselves have identified delamination due to exposure to fire and heat as an area of concern. Adequate testing to verify the durability of the adhesive has not been provided.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with the present requirements.

Public Comment 84:

Proponent: JONATHAN RAMOS, Conco, representing Conco requests Disapprove.

Commenter's Reason: To provide and ensure safe buildings in California. Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 85:

Proponent: Franzine Rendon, self, representing selfrequests Disapprove.

Commenter's Reason:

- There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 86:

Proponent: Ryan Richardson, The Conco Companies, representing The Conco Companiesrequests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is a serious mistake and could lead to extremely large disasters in our country. Even if a fire suppression system "could be" capable of extinguishing the initial fire the structure itself could not handle the subsequent damages from water. I think that the initially the cost of these buildings might seem appealing, but after a few years and some accidents/disasters the costs would skyrocket. Driven by insurance and repair costs, and many of reasons that will become apparent if these structures are approved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 87:

Proponent: G Michael Robinson, representing Carolina Stalite Co.requests Disapprove.

Commenter's Reason: Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood/Mass Timber Code changes. There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories. Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 88:

Proponent: Larry Rowland, Lehigh White Cment Company, representing selfrequests Disapprove.

Commenter's Reason: Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes. Tall Wood construction with mass timbers is untested. The wood-industry funded tests performed in the U.S. and Canada were completely inadequate, failing to examine real-world structural risk factors, potential firefighting safety impacts from weather, and material-related risk factors to public health and safety. Cross-Laminated Timber (CLT) chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.

Tall Wood construction is unproven: While non-combustible concrete and steel have been used for centuries to build tall buildings and structures, mass timber products, like cross-laminated timber, are unknown and unproven construction materials. It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues. I state again, neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.

Tall Wood construction is unsound: Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees. Furthermore the behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities. There is no information on the performance of the proprietary connections during fires. Common sense knows, and history shows, that TALL WOOD buildings are high-risk and dangerous to public health and safety when it comes to natural and man-made disasters like hurricanes and wildfires.

Bibliography: Satisfied

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 89:

Proponent: Todd Schrimpf, The Conco Companies, representing Selfrequests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Allowing wood structures to be built above the level of fire department access is a serious mistake.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 90:

Proponent: Sue Schumacher, Collins and Associates, representing Selfrequests Disapprove.

Commenter's Reason:

Allowing wood structures to be built above the level of fire department access is a serious mistake.

Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood Ad-Hoc. There is no information on the performance of the proprietary connections during fires?

Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.

On a personal note - Prior to beginning graduate school in Toledo, Ohio, my daughter leased an existing apartment not even questioning what the building was made of. Prior to moving in, a fireworks rocket hit the roof and caught fire; before the fire department could even arrive on the scene, the entire building was engulfed in flames and several attached buildings were lost as well before they were able to put it out. Questioning how this could happen, we later learned the buildings were constructed with wood. I thank God that she wasn't living there at the time of the fire and shudder to think what might have happened if she were.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 91:

Proponent: Jim Schumacher, retired, representing selfrequests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is a serious mistake. Too many people could die in wood built apartments fires

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of

construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 92:

Proponent: Adam Shoemaker, ClarkDietrich, representing ClarkDietrich (adam.shoemaker@clarkdietrich.com) requests Disapprove.

Commenter's Reason: This proposal aims to add three new Type IV Fire-Resistant Rating (FRR) Requirements to Table 601. In the IBC Section 602.1 it states that The building elements shall have a **fire-resistance rating** not less than that specified in Table 601 and exterior walls shall have a fire-resistance rating not less than that specified in Table 602. Where required to have a fire-resistance rating by Table 601, **building elements shall comply with the applicable provisions of Section 703.2**. In IBC Section 703.2 it then states that The fire-resistance rating of building elements, components or assemblies **shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263** or in accordance with Section 703.3. Section 703.3 again calls for comparisons against ASTM E119 and UL 263. The fire testing that was done to support this proposal did not include any ASTM E119 or UL 263 testing, therefore it should not be approved.

In addition, Section 602.2 states that Types I and II construction are those types of construction in which the building elements listed in Table 601 **are of noncombustible materials**, except as permitted in Section 603 and elsewhere in this code. I don't believe you can justify allowing Type IV combustible structural elements to have the same FRR as Type I and II NON-combustible structural elements. This is not a conservative or proven safe approach and should not be allowed.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No cost impact.

Public Comment 93:

Proponent: James Singleton, representing self requests Disapprove.

Commenter's Reason: At a time when carbon dioxide is at an all time high in our atmosphere composition. We need to mitigate the impact of deforestation of our planet. The change in this proposal would set an increase of demand of lumber products which greatly impacts our environment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment results in no change to existing code test. Therefore there is no change in the cost of construction.

Public Comment 94:

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Stephen V. Skalko, P.E. & Associates, LLC (svskalko@svskalko-pe.com) requests Disapprove.

Commenter's Reason: G108-18 should be disapproved because the issue of fire resistance of connections for mass timber construction has not been sufficiently addressed in this proposal. The present code requirements for nominal heavy timber members have an approximate 1-hour fire resistance. This code proposal adds three new types of heavy timber construction (Types IV-A, IV-B and IV-C) which have fire resistance requirements for the primary structural frame and secondary members for at least two hours (three-hours for Type IV-A primary members). There is no language to direct the code user on what should be provided or expected to protect the connections for these higher fire resistances. The topic of fire resistance protection of connections has been treated too lightly considering the importance of these connections for maintaining structural stability for these taller mass timber buildings during and after a fire incident. The ICC Tall Wood Building Committee was told that there are proprietary connections that have been used in Europe to accomplish these higher fire resistance ratings required. However, documentation in the form of fire tests, technical reports or other reference material has not been provided to substantiate these claims.

And the CLT Handbook available for designers is not much help either [CLT Cross-Laminated Timber Handbook US Edition, 2013]. In Chapter 8, Fire, Section 5 Connections the handbook states:

Due to the high thermal conductivity of steel, metallic fasteners and plates directly exposed to fire may heat up and conduct heat into the wood members. The wood components may then experience charring on the exposed surface and around the fastener. As a result, the capacity of the metallic connection is reduced to the strength reduction of the steel fasteners at

elevated temperatures and the charring of the wood members. Therefore, where a fire resistance rating is required by the IBC, connections and fasteners are required to be protected from fire exposure by wood, gypsum board or other protection approved for the required rating .

While the protection cited may increase the fire endurance of the metallic portions of the connections, the connection elements will still be subjected to elevated temperatures during a fire event. Data has not been provided to demonstrate what those elevated temperatures will be with the various protection systems noted so there is no way to evaluate the potential for internal charring of connector holes. There is also no methodology provided that would allow for a comprehensive post-fire evaluation of the remaining structure.

A technical research report on connections for tall wood buildings prepared for the National Research Council of Canada reported that the fire resistance for concealed connections may be on the order of 1 to 1-1/2 hours [Canadian Commission on Building and Fire Codes, Standing Committee on Fire Protection, *Review of Fire Resistant Design of Connections*, January 2017, page 8]. The report conclusion suggests that some extra overlay of wood may be necessary for the 2-hour and 3-hour fire resistance of mass timber provisions proposed by the ICC TWB Committee. This is not to suggest that 2-hour fire or 3-hour resistances of connections cannot be achieved. But, connections must be given extra attention and standard methods for the industry may not be sufficient.

This extra attention is what is lacking in the ICC TWB Code Proposals. Nothing in the proposals brings to the attention of the designer or code official this very important fire aspect of providing proper fire rated connections for the prescriptive CLT requirements. Before the membership approves provisions for taller mass timber buildings, the ICC TWB Committee should have the opportunity to perform their due diligence by a review of connections with fire resistances greater than 1-hour for mass timber buildings based on fire tests reports, technical reports or other reference material documenting that 2-hour and 3-hour fire resistance ratings can be achieved.

Because of the need to study in more depth what and how 2-hour and 3-hour fire rated connections for these proposed mass timber buildings is accomplished, this proposal should be DISAPPROVED and sent back to the ICC TWB Committee to address this critical shortcoming.

G108-18 should be disapproved because the issue of fire resistance of connections for mass timber construction has not been sufficiently addressed in this proposal. The present code requirements for nominal heavy timber members have an approximate 1-hour fire resistance. This code proposal adds three new types of heavy timber construction (Types IV-A, IV-B and IV-C) which have fire resistance requirements for the primary structural frame and secondary members for at least two hours (three-hours for Type IV-A primary members). There is no language to direct the code user on what should be provided or expected to protect the connections for these higher fire resistances. The topic of fire resistance protection of connections has been treated too lightly considering the importance of these connections for maintaining structural stability for these taller mass timber buildings during and after a fire incident.

The ICC Tall Wood Building Committee was told that there are proprietary connections that have been used in Europe to accomplish these higher fire resistance ratings required. However, documentation in the form of fire tests, technical reports or other reference material has not been provided to substantiate these claims.

And the CLT Handbook available for designers is not much help either [CLT Cross-Laminated Timber Handbook US Edition, 2013]. In Chapter 8, Fire, Section 5 Connections the handbook states:

Due to the high thermal conductivity of steel, metallic fasteners and plates directly exposed to fire may heat up and conduct heat into the wood members. The wood components may then experience charring on the exposed surface and around the fastener. As a result, the capacity of the metallic connection is reduced to the strength reduction of the steel fasteners at elevated temperatures and the charring of the wood members. Therefore, where a fire resistance rating is required by the IBC, connections and fasteners are required to be protected from fire exposure by wood, gypsum board or other protection approved for the required rating .

While the protection cited may increase the fire endurance of the metallic portions of the connections, the connection elements will still be subjected to elevated temperatures during a fire event. Data has not been provided to demonstrate what those elevated temperatures will be with the various protection systems noted so there is no way to evaluate the potential for internal charring of connector holes. There is also no methodology provided that would allow for a comprehensive post-fire evaluation of the remaining structure.

A technical research report on connections for tall wood buildings prepared for the National Research Council of Canada reported that the fire resistance for concealed connections may be on the order of 1 to 1-1/2 hours [Canadian Commission on Building and Fire Codes, Standing Committee on Fire Protection, *Review of Fire Resistant Design of Connections*, January 2017, page 8]. The report conclusion suggests that some extra overlay of wood may be necessary for the 2-hour and 3-hour fire resistance of mass timber provisions proposed by the ICC TWB Committee. This is not to suggest that 2-hour fire or 3-hour resistances of connections cannot be achieved. But, connections must be given extra attention and standard methods for the industry may not be sufficient.

This extra attention is what is lacking in the ICC TWB Code Proposals. Nothing in the proposals brings to the attention of the designer or code official this very important fire aspect of providing proper fire rated connections for the prescriptive CLT requirements. Before the membership approves provisions for taller mass timber buildings, the ICC TWB Committee should have the opportunity to perform their due diligence by a review of connections with fire resistances greater than 1-hour for mass timber buildings based on fire tests reports, technical reports or other reference material documenting that 2-hour and 3-hour fire resistance ratings can be achieved.

Because of the need to study in more depth what and how 2-hour and 3-hour fire rated connections for these proposed mass timber buildings is accomplished, this proposal should be DISAPPROVED and sent back to the ICC TWB Committee to address this critical shortcoming.

G108-18 should be disapproved because the issue of fire resistance of connections for mass timber construction has not been sufficiently addressed in this proposal. The present code requirements for nominal heavy timber members have an approximate 1-hour fire resistance. This code proposal adds three new types of heavy timber construction (Types IV-A, IV-B and IV-C) which have fire resistance requirements for the primary structural frame and secondary members for at least two hours (three-hours for Type IV-A primary members). There is no language to direct the code user on what should be provided or expected to protect the connections for these higher fire resistances. The topic of fire resistance protection of connections has been treated too lightly considering the importance of these connections for maintaining structural stability for these taller mass timber buildings during and after a fire incident.

The ICC Tall Wood Building Committee was told that there are proprietary connections that have been used in Europe to accomplish these higher fire resistance ratings required. However, documentation in the form of fire tests, technical reports or other reference material has not been provided to substantiate these claims.

And the CLT Handbook available for designers is not much help either [CLT Cross-Laminated Timber Handbook US Edition, 2013]. In Chapter 8, Fire, Section 5 Connections the handbook states:

Due to the high thermal conductivity of steel, metallic fasteners and plates directly exposed to fire may heat up and conduct heat into the wood members. The wood components may then experience charring on the exposed surface and around the fastener. As a result, the capacity of the metallic connection is reduced to the strength reduction of the steel fasteners at elevated temperatures and the charring of the wood members. Therefore, where a fire resistance rating is required by the IBC, connections and fasteners are required to be protected from fire exposure by wood, gypsum board or other protection approved for the required rating .

While the protection cited may increase the fire endurance of the metallic portions of the connections, the connection elements will still be subjected to elevated temperatures during a fire event. Data has not been provided to demonstrate what those elevated temperatures will be with the various protection systems noted so there is no way to evaluate the potential for internal charring of connector holes. There is also no methodology provided that would allow for a comprehensive post-fire evaluation of the remaining structure.

A technical research report on connections for tall wood buildings prepared for the National Research Council of Canada reported that the fire resistance for concealed connections may be on the order of 1 to 1-1/2 hours [Canadian Commission on Building and Fire Codes, Standing Committee on Fire Protection, *Review of Fire Resistant Design of Connections*, January 2017, page 8]. The report conclusion suggests that some extra overlay of wood may be necessary for the 2-hour and 3-hour fire resistance of mass timber provisions proposed by the ICC TWB Committee. This is not to suggest that 2-hour fire or 3-hour resistances of connections cannot be achieved. But, connections must be given extra attention and standard methods for the industry may not be sufficient.

This extra attention is what is lacking in the ICC TWB Code Proposals. Nothing in the proposals brings to the attention of the designer or code official this very important fire aspect of providing proper fire rated connections for the prescriptive CLT requirements. Before the membership approves provisions for taller mass timber buildings, the ICC TWB Committee should have the opportunity to perform their due diligence by a review of connections with fire resistances greater than 1-hour for mass timber buildings based on fire tests reports, technical reports or other reference material documenting that 2-hour and 3-hour fire resistance ratings can be achieved.

Because of the need to study in more depth what and how 2-hour and 3-hour fire rated connections for these proposed mass timber buildings is accomplished, this proposal should be DISAPPROVED and sent back to the ICC TWB Committee to address this critical shortcoming.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Mass timber buildings require protection of connections.

Public Comment 95:

Proponent: Jason Krohn, Precast/Prestressed Concrete Institute, representing Precast/Prestressed Concrete Institute (jkrohn@pci.org) requests Disapprove.

Commenter's Reason: G108-18 should be disapproved because the long-term performance of adhesives used in the cross-laminated timber after exposure to fire have not been thoroughly examined. Presentations on the results of fire tests performed on CLT by the National Research Council of Canada for the National Fire Protection Research Foundation were given to the ICC TWB Committee. One of the areas of concern that showed up in Phase 2 of those tests was delamination of a CLT floor/ceiling panel during the cooldown period of a test which resulted in a regrowth of the fire within the compartment. The delamination was attributed to a bonding failure of the adhesive that had been used in the manufacture of the CLT floor/ceiling panel after exposure to high heat.

To address this test finding, revisions to the adhesive requirements in 2015 edition of ANSI/APA PRG 320, *Standard for Performance Rated Cross-Laminated Timber* were incorporated through the APA standards process. PRG 320-2015 is referenced in the IBC as the performance standard for CLT members. In the 2018 edition of PRG 320 the adhesives used for CLT panels are required to be evaluated and meet criteria in the Annex B of the Standard titled *Practice for Evaluating Elevated Temperature Performance of Adhesives Used in Cross-Laminated Timber*. However, those criteria are for the purpose of evaluating the performance of adhesives used in CLT exposed to heat and flame under controlled conditions (Section B1.4). The pass/fail criteria in Section B1.3 expect the CLT floor-ceiling slab to sustain the applied load during the specified fire exposure for a period of 240 minutes without char layer fall-off resulting in fire regrowth during the cooling phase of a fully developed fire .

While this testing may be sufficient to show that an adhesive would have prevented delamination for the specified time period, it does not in any way demonstrate that the adhesives are still capable of providing the long term structural performance after exposure to elevated temperatures experienced during a fire event. And, neither does ANSI 405, *Standard for Adhesives for Use in Structural Glue Laminated Timber*, which is referenced in PRG 320, address long-term performance of adhesives that have been subjected to fire exposure. Like PRG 320, Section 2.1.7 of ANSI 405 is intended to qualify adhesives according to the CSA 0177 small scale flame test to avoid delamination due to intensive heat, such as fire exposure (C2.1.7). No methodology has been provided that would allow for a comprehensive post-fire evaluation of the remaining structure.

Before the membership approves provisions for taller mass timber buildings the ICC TWB Committee should have the opportunity to perform their due diligence by a review of the long-term performance of adhesives that have been subjected to fire exposure. This is especially important for buildings that may be as tall as 18-stories.

Because of the need to study in more depth the long-term performance of adhesives that have been subjected to fire exposure, this proposal should be DISAPPROVED and sent back to the ICC TWB Committee to address this critical issue.

G108-18 should be disapproved because the long-term performance of adhesives used in the cross-laminated timber after exposure to fire have not been thoroughly examined. Because of the need to study in more depth the long-term performance of adhesives that have been subjected to fire exposure, this proposal should be DISAPPROVED and sent back to the ICC TWB Committee to address this critical issue.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Using proper adhesives for long term resistance to the effects of fire are part of mass timber construction.

Public Comment 96:

Proponent: James Sorensen, representing Alberta Masonry Council requests Disapprove.

Commenter's Reason: Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. Concrete products have a much longer lifespan, reduce insurance premiums and require less maintenance. It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements. Concrete products will also reduce the long term maintenance costs of buildings.

Public Comment 97:

Proponent: ALAN SPARKMAN, Tennessee Concrete Association, representing Tennessee Concrete Association, Executive Director requests Disapprove.

Commenter's Reason: There are a number of important reasons I am opposed:

There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

- Allowing wood structures to be built above the level of fire department access is a serious mistake.
- Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.
- There has been no wind component involved in the fire testing of Mass Timber assemblies. This type of testing should be essential and required for any building system to be used at the heights anticipated in this proposal.
- It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and subsequent water damage and mold issues are likely to be significant.
- Neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes.
- Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees.
- The behavior of CLT is completely dependent on the connections, and all connections used to date are proprietary. There is no publicly available information on their design or capacities, even for the Tall Wood AdHoc. There is no information on the performance of the proprietary connections during fires, and the performance of different systems and materials will have a significant impact on the performance of these buildings for fire as well as wind and earthquakes.

Bibliography: Satisfied

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 98:

Proponent: Malcolm Stolarski, representing calportlandrequests Disapprove.

Commenter's Reason: □ Allowing wood structures to be built above the level of fire department access is a serious mistake, because wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 99:

Proponent: Robert Sullivan, representing CEMEX, Inc. (robertl.sullivan@cemex.com)requests Disapprove.

Commenter's Reason: There is currently no complete testing or engineering justification for expanding the height limitation for mass timber from 6 stories to 18 stories.

Allowing wood structures to be built above the level of fire department access is a serious mistake for the following reasons:

- 1) Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel.
- 2) Cross-Laminated Timber chars in a fire; however, charring is not equivalent to non-combustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals.

3) There has been no wind component involved in the fire testing of Mass Timber assemblies. This is a serious mistake. This type of testing is essential.

4) It is unknown what will happen to water that accumulates as a result of a fire sprinkler system discharge as a result of fire or accidental incident that opens a sprinkler head. The system has not been tested with the additional water load and what of the water damage and mold issues? □

5) Most importantly, neither the Fire Code Action Committee nor the Building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Changes. □ Adhesives used between the layers of CLT have not been standardized and are key to whether the CLT delaminates during fire and continues to advance till complete burnout. A test standard for the adhesives has been proposed, but not fully vetted by the cognizant committees. □

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 100:

Proponent: LEE THOMPSON, CHAMPION CONCRETE PUMPING, representing PRESIDENT requests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is a serious mistake. Neither the fire code action committee nor the building Code Action Committee voted to support this series of Tall Wood / Mass Timber Code Change.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 101:

Proponent: Patrick A. Thompson, Advanced Pumping LLC, representing Advanced Pumping LLC (pthompson@advancedpumping.net) requests Disapprove.

Commenter's Reason: Tall wood buildings are not safe. There is eminent risk to the lives of the occupants and first responders. Examples are the wood frame building that burned down in Mexico recently.

Wood does not offer the resilience and fire protection of steel or concrete, or fire proof coatings on steel. I would rather take my chances in a steel framed building, than a cross laminated wood framed building. Where is the proof that after the same length of time the cross laminated frame building would have the structural integrity for the first responders to make it in and out.

What happens when the fire starts at the lower floors and climbs up the building creating its own chimney affect. Or heaven forbid, the fire creates its own windstorm, and causes more oxygen to come in contact with the fuel "wood"???

How does someone verify the type of glue used in the lamination process will not add fuel to the fire???

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 102:

Proponent: Amy Vander Heyden, Conco, representing Conco requests Disapprove.

Commenter's Reason: As a licensed architect it is my professional obligation to protect the health, safety, and welfare of the public in buildings. I disapprove the proposed adoption of increased wood structures. There is insufficient testing and documentation that cross-laminated timber is sufficient in the event of a fire. Note the following:

- Charring is not equivalent to non-combustible so the dimensions of the timber would need to be significantly larger to compensate for required fire ratings.
- Missing testing and documentation of the wind component involved in fire testing
- Missing testing and documentation of the accumulation of water loads from sprinklers and long term mold risk during a rebuild.
- Neither the Fire Code Action Committee nor the Building Code Action Committee supported these changes.
- Incomplete testing, documentation, and regulation of the adhesives used within the layers of CLT
- Missing standardization, documentation, and legislation of connection details for which the structural integrity of the building is contingent.

Proceeding with this initiative is irresponsible and puts the public at unnecessary risk.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this code change proposal will not increase or decrease the cost of construction. This proposed section provides the information that was not previously set forth in the code, thus there is no cost impact when compared with present requirements.

Public Comment 103:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

G108-18

G113-18

IBC: 603.1

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception-Exceptions:

1. In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 2. Group I-2, combustible roof construction shall be covered by minimum of a Class A roof covering or roof assembly, and shall be separated from the story below by a horizontal assembly with a fire-resistance rating of not less than 2 hours.
- 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
 4. Roof coverings that have an A, B or C classification.
 5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
 6. Millwork such as doors, door frames, window sashes and frames.
 7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
 8. *Trim* installed in accordance with Section 806.
 9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
 10. Finish flooring installed in accordance with Section 805.
 11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
 12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
 13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
 14. Blocking such as for handrails, millwork, cabinets and window and door frames.
 15. Light-transmitting plastics as permitted by Chapter 26.
 16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
 17. Exterior plastic veneer installed in accordance with Section 2605.2.
 18. Nailing or furring strips as permitted by Section 803.15.
 19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
 20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
 21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
 22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
 23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
 24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
 25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
 26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason: This proposal creates conformance with more restrictive federal certification requirements (K162). The goal here is to create a complete two hour assembly below the lowest combustible member. This creates added layers of

protection for protect in place environment from fires originating in mechanical equipment, embers from adjacent fires, etc.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will increase the cost of construction

This proposal will increase cost based on the added 2-hour horizontal separation and potentially higher roof cover rating. However, it does not add cost to the healthcare industry because certified facilities already follow these requirements in the context of the CMS federal standards.

G113-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: NFPA 101 requirements of 2012 would allow this material. There should be a public comment on this that fixes the threshold. (Vote: 10-4)

Assembly Action:

None

G113-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exceptions:

1. In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
2. Group I-2, ~~combustible~~ roof construction containing fire-retardant-treated wood shall be covered by minimum of a Class A roof covering or roof assembly, and shall be separated from the story below by a horizontal assembly with the roof assembly shall have a fire-resistance rating of not less than 2 hours if required by the construction type.
- 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Commenter's Reason: The committee correctly disapproved the proposed language, which was intended to cover non-

fire retardant treated wood. In its current location, the proposal outlines what is required for FRT. There is a federal requirement that the roofs be covered with a class A rated roof, and that is reflected here. It also reminds the user to ensure that if the construction type requires a fire rated assembly, then roof assembly that contains the FRT must meet this rating.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal will increase cost based on the potentially higher roof cover rating. However, it does not add cost to the healthcare industry because certified facilities already follow these requirements in the context of the CMS federal standards.

G113-18

G121-18

IBC: 1204.1

Proposed Change as Submitted

Proponent: Peter Valkov, City of Fargo, ND, representing City of Fargo, North Dakota (pvalkov@cityoffargo.com); Christine Rose, City of Fargo, representing City of Fargo (crose@cityoffargo.com)

2018 International Building Code

Revise as follows

1204.1 General. Every space intended for human occupancy shall be provided with natural light by means of exterior glazed openings in accordance with Section 1204.2 or shall be provided with artificial light in accordance with Section 1204.3. Exterior glazed openings shall open directly onto a *public way* or onto a *yard* or *court* in accordance with Section 1205.

In Group E and I-4 occupancies, rooms intended to be used as classrooms or day care rooms shall be provided with natural light. Artificial light shall not be substituted for such required natural light.

Reason: I am driven to propose this change on behalf of all little members of our society who cannot propose this change themselves.

Through my profession, I am reviewing many day care and school plans. Every time I see a classroom without windows, every time I see day care using an old building purposed for store or storage and hastily re-purposed for day care without any regard for the need of natural light (and this happens too often), I feel extremely sad. I am also very concerned that we as a society force our kids to places that have no natural light. We force them as they do not have choice, or say, or option to make a decision.

Researching the importance of natural light for the health and the intellectual development in little children gives me hope such a change is more than needed and possible, it is long overdue.

Having discussed my idea with colleagues in the City of Fargo and design professionals from the area also provided me with positive feedback. Architects, I have spoken to, also confirmed this change is possible from a design standpoint and it won't provide burden on the schools and day care facilities alike.

Therefore, today, I state my hope this change is made integral part of the building code as a part of our constant quest for healthier and safer buildings. Buildings that promote better and more natural environment for those amongst us that need it the most!

14. <https://www.corbettinc.com/blog/2017/4/26/our-top-3-reasons-natural-light-benefits-students-schools>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The need and requirement for windows is already a part of the International Building Code. Therefore, I do not foresee any changes in construction cost as a result from such a change.

G121-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While the committee understands the concerns addressed by the proposal, many start up schools begin in the basement of a facility which often are already provided with sprinkler systems and code compliant egress facilities to make the building safe. This proposal would be too limiting regarding the types of spaces that could be used for such start up schools. Furthermore, many classrooms are not on an outside wall and may not have the opportunity to install skylights. If the proponent returns with a public comment, the committee also recommends that the proposed modifications be considered. The proponent mentioned existing buildings, which should be addressed in the International Existing Building Code. (Vote: 14-0)

Assembly Action:

None

G121-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Tom Zaremba, representing Glazing Industry Code Committee requests As Submitted.

Commenter's Reason: This is the first Code cycle for this laudable Proposal. The original Proponent did an excellent job of substantiating the health and environmental benefits of natural light, particularly for children whose brains and emotional habits are still developing and who are required to be in school or in day care during long portions of the daylight hours they experience throughout their most formative years. The importance of natural light to human health is quickly moving from research to building design, and its importance cannot responsibly be ignored. The Committee viewed the Proposal's purpose favorably and did not dispute these benefits. However, it disapproved the Proposal out of concern it would impose a barrier to starting schools and day care centers in Church basements and similar existing buildings, either by making them too expensive to retrofit or by preventing them entirely.

However, under IBC Sections 305.1.1 and 303.1.4, educational rooms accessory to places of worship with occupant loads < 100 per room (which includes virtually all educational rooms in these types of facilities) are not considered separate occupancies. Similarly, under IBC Section 305.2.1 and 305.2.2, rooms in religious facilities providing day care (which includes educational, supervision or personal care services) during services or for 5 or fewer children also remain as part of the Group A-3 Occupancy. In both situations relating to religious facilities, the educational or day care rooms would not change from Group A-3 so this Proposal would not affect them.

The Committee was also concerned that some classrooms are not on exterior walls or under roofs so as to permit skylights. However, Section 1204.2.1 permits such rooms to use natural light from adjoining spaces to meet the natural light requirements of the Code. It is already common for interior rooms have wall window and door lites that allow in light from corridors and social spaces along exterior walls.

We recognize the Proposal might benefit from modified language, either in this Cycle or the next, but the issue is too important to abandon without further discussion. The importance of natural light to human health is moving from research to building design practice, and it is time to recognize its importance by including it in these IBC occupancies. Since the new education and institutional day care facilities being built today will affect the health and welfare of our children for decades to come, this Proposal will ensure that our school children will benefit from natural lighting for years to come.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The additional requirements could add design costs to the cost of construction.

G121-18

G122-18

IBC: 1206.1

Proposed Change as Submitted

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows

1206.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent *dwelling units* and *sleeping units* or between *dwelling units* and *sleeping units* and adjacent public areas. ~~such as halls, corridors, stairways or service areas.~~

Reason: There are building designs where a dwelling unit or sleeping unit in a mixed occupancy building may be adjacent to a commercial space where airborne and structure-borne sound is significant and may interrupt the occupants of the dwelling or sleeping unit unless the common interior walls, partitions and floor/ceiling assemblies are designed to limit sound transmissions to an acceptable level. This proposal deletes the examples currently listed at the end of Section 1206.1 which effectively broadens the scope of uses where sound abatement requirements can be enforced and provides the building official with authority to require sound abatement when appropriate. Occupants of the affected dwelling units and sleeping units may not realize that additional sound abatement has been provided but the quality of their lives will improve as a result.

Cost Impact: The code change proposal will increase the cost of construction. This code change has the potential to increase the cost of construction because there may be a need to provide sound abatement between dwelling units or sleeping units and adjacent public areas.

G122-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This is not an expansion of the scope of this provision. It is a clarification. This is not limited to the areas that have been stricken. It includes public areas "such as," meaning many other things. Chapter 12 is interior environment. Exterior building features are not addressed in Chapter 12. (Vote: 8-7)

Assembly Action:

None

G122-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Cesar Lujan, representing National Association of Home Builders (clujan@nahb.org) requests Disapprove.

Commenter's Reason: The intent of the original proposal, as described in the reason statement, is to expand the sound transmission requirements in order to provide sound abatement between dwelling or sleeping units that are adjacent to commercial spaces in a mixed occupancy building. It removes the examples of public areas, providing the building official the authority to determine when sound abatement is appropriate between dwelling units and public areas. The IBC does not define "Public Areas". The IBC does, however, define "Public-Use Areas" and "Public Entrance". Any common area within a residential building (i.e. fitness room, library, party room) that is only accessible to building tenants and their guests is not a "Public Area". This would include corridors and stairways that can only be accessed by tenants and their guests in a secured building.

As stated in the proposal, the intent is to broaden the scope of uses where sound abatement requirements can be enforced, effectively providing the building official the authority to define what a "Public Area" is. However, the proposal may end up reducing the areas where sound abatement is required since "Public Areas" is not defined in the IBC. Furthermore, since "Service Areas" was removed from the list of examples of a public area, it would remove the need to provide sound abatement between dwelling units and these types of spaces. "Service Area" is a defined term in the IBC.

The proposed changes to this section of the IBC would make it difficult to consistently determine and enforce which common interior walls and partitions and floor/ceiling assemblies require sound transmission ratings. "Public Areas" is a term that is broad and debatable.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Will not increase the cost of construction compared to current code.

G122-18

G124-18

IBC: 1206.2

Proposed Change as Submitted

Proponent: Michael Schmeida, Gypsum Association, representing Gypsum Association (mschmeida@gypsum.org)

2018 International Building Code

Revise as follows

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for airborne noise where tested in accordance with ASTM E90. Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by an engineering analysis either conducted or reviewed by an approved acoustical professional based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

Reason: There are several engineering analysis tools for sound performance on the market. However, if the design professional is unfamiliar with acoustical engineering, they can be very misleading and therefore lead to a building performing under the expected performance levels. And as acoustical considerations are something most design professionals are not very familiar with at this point in time, the opportunity for error is above average. This change is intended to make sure that systems specified using the engineering analysis option are properly scrutinized by experts in acoustics and therefore are most likely going to perform as expected.

Cost Impact: The code change proposal will increase the cost of construction. The estimated cost impact would be \$500. However, it should be pointed out that the engineering analysis is an option - there are other ways to meet the criteria of this section already mandated by the code where no additional cost would be incurred.

G124-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This would put a burden on the code official. There is a lack of certification for this. It could be in conflict with 1206.2 and 1206.3. A professional engineer can do this. (Vote: 14-0)

Assembly Action:

None

G124-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Matthew Golden, Pliteq, representing Pliteq, Director of Research (mgolden@pliteq.com); Joseph Bridger (joe@sacnc.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for airborne noise where tested in accordance with ASTM E90. ~~Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90.~~ Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

Commenter's Reason: The current code change request was designed to fix an issue that was created with the previous cycle's change to this section (2018). That previous change added the following sentence to 1206.2: Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90.

There are two main issues with this language. The first is that there is no industry-agreed-upon method or approved standard to conduct this analysis. The referenced ASTM standard (E90) is only for measurements; it does not address extrapolation or interpolation of measured data to make judgments about other untested assemblies.

The second is with regard to who is qualified to conduct this analysis. Building acoustics is a small and specialized field. Unfortunately, there are professionals who believe that they know acoustics sufficiently to make these judgments who do not. Further, there is no current licensure for acoustical engineering, anyone can claim to be an expert in the field. (There has been a Professional Engineering in Acoustics available in Oregon but it is not longer offered. The Institute of Noise Control Engineering (INCE) has a Board Certification in Noise Control Engineering but it is not a licensure) Since it is a specialized field, even engineers licensed in other fields will generally not have adequate knowledge to determine acoustical performance of an untested assembly. Inaccurate judgments have been submitted and approved as code officials generally do not have sufficient acoustical expertise to determine if they are inaccurate. As a result, the committee's concern of burdening the code officials with the proposed change is already an existing reality under the 2018 code language.

Understanding the Committee's concerns with the proposed code modification, this revised modification is now proposed to address both the committee's concerns and the problems that have been occurring under the 2018 code. We propose to revert to the 2015 language by deleting the sentence until an appropriate licensure is established. This alleviates the burden on the code officials that currently exists without adding the burden of determining who is or is not qualified to make the judgment.

Bibliography: ASTM Standard E90, 2009 (2016). Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements, ASTM International, West Conshohocken, PA, 2009, DOI: 10.1520/E0090-09R16, www.astm.org.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change has no financial impact.

Public Comment 2:

Proponent: Samantha Rawlings, Veneklasen Associates, representing Veneklasen Associates (srawlings@veneklasen.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for airborne noise where tested in accordance with ASTM E90. ~~Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90.~~ Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

1206.3 Structure-borne sound. Floor-ceiling assemblies between *dwelling units* and *sleeping units* or between a *dwelling unit* or *sleeping unit* and a public or service area within the structure shall have an impact insulation class rating of not less than 50, or not less than 45 if field tested, where tested in accordance with ASTM E492. ~~Alternatively, the impact insulation class of floor-ceiling assemblies shall be established by engineering analysis based on a comparison of floor-ceiling assemblies having impact insulation class ratings as determined by the test procedures in ASTM E492.~~

Commenter's Reason: The current code change request was designed to fix an issue that was created with the previous cycle's change to this section (2018). That previous change added the following sentence to 1206.2 and a similar sentence to 1206.3:

Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90.

The issue with this section is that there is no industry-agreed-upon method or approved standard to conduct this analysis. The referenced ASTM standards (E90 for 1206.2 and E492 for 1206.3) are for measurements only; they do not address extrapolation or interpolation of measured data to make judgments about other untested assemblies. Further, there are professionals who believe that they know acoustics sufficiently to make these judgments who do not. Since there is no licensure for acoustical engineering, anyone can claim to be an expert in the field. Further, it is a specialized field that even engineers licensed in other fields will generally not have adequate knowledge to determine acoustical performance of an untested assembly. Inaccurate judgments have been submitted and approved as code officials generally do not have sufficient acoustical expertise to determine if they are inaccurate. As a result, the committee's concern of burdening the code officials with the proposed change is already an existing reality under the 2018 code language.

Understanding the Committee's concerns with the proposed code modification, this revised modification is now proposed to address both the committee's concerns and the problems that have been occurring under the 2018 code. We propose to revert to the 2015 language by deleting the sentences. This alleviates the burden on the code officials that currently exists without adding the burden of determining who is or is not qualified to make the judgment. It also eliminates the potential conflict with 1206.3, by making the same changes to 1206.2 and 1206.3.

Bibliography: ASTM Standard E90, 2009 (2016). Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements, ASTM International, West Conshohocken, PA, 2009, DOI: 10.1520/E0090-09R16, www.astm.org.
ASTM Standard E492, 2009 (2016). Standard Test Method for Laboratory Measurement of Impact Sound Transmission Through Floor-Ceiling Assemblies Using the Tapping Machine, ASTM International, West Conshohocken, PA 2009, DOI: 10.1520/E0492-09R16E01

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change has no financial impact.

G125-18

IBC: 1206.2, Chapter 35

Proposed Change as Submitted

Proponent: Michael Schmeida, representing Gypsum Association (mschmeida@gypsum.org)

2018 International Building Code

Revise as follows

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for airborne noise where tested in accordance with ASTM E90. Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. Intersections between walls and floors and wall-to-wall intersections shall be sealed or otherwise treated in accordance to ASTM C919. This requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

C919-12(2017):

Standard Practice for Use of Sealants in Acoustical Applications

Reason: This change addresses sound flanking paths not previously addressed, requiring intersections to be sealed. If unsealed, these paths can reduce the effectiveness of walls by at least 5 STC points versus the tested systems. A differential of 3 STC points becomes perceptible by humans and 5 points is the threshold at which it becomes a nuisance. Sound intrusion via these unsealed intersections can cause noticeable deterioration in sound isolation performance.

Nuisance noise has a measurable impact on human health. A report by the World Health Organization on noise effects and morbidity linked "noise annoyance" (as it was called in the report) to increased risk for several health issues including arthritic symptoms, hypertension, and migraines.

The code already contains requirements for sound transmission, but by not addressing intersections, it leaves a sound transmission path which can negate the effects of other measures taken to reduce sound transmission.

The handbook of sound engineers states that "an acoustical sealant is required to caulk all joints of a partition if the highest TL (transmission loss) is to be attained."

This simple and relatively inexpensive step will ensure sound transmission performance in actual installations lives up to the expectations set by laboratory testing.

Bibliography: WHO LARES Final Report, Noise Effects on Morbidity, Niemann and Maschke, Berlin Center for Public Health

Handbook for Sound Engineers, Jones, D. (2008), pp. 77-78

Noise Control Manual for Residential Buildings, Harris, D.A., (1997), pp. 73-76.

Cost Impact: The code change proposal will increase the cost of construction. This proposal is estimated to add approximately \$20 per room requiring sealing to construction costs, for sealant and labor.

Analysis: A review of the standard proposed for inclusion in the code, ASTM C919-12(2017), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proponent asked for disapproval. The increased cost could be a concern. (Vote: 13-1)

Assembly Action:

None

G125-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Tim Earl, representing The Gypsum Association (tearl@gbhinternational.com) requests As Modified by This Public Comment.

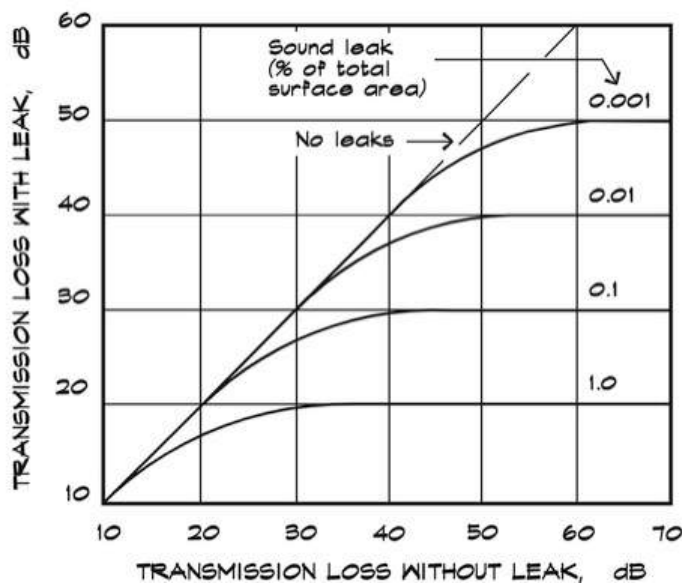

Modify as follows:

2018 International Building Code

1206.2 Airborne sound. Walls, partitions and floor-ceiling assemblies separating *dwelling units* and *sleeping units* from each other or from public or service areas shall have a sound transmission class of not less than 50, or not less than 45 if field tested, for airborne noise where tested in accordance with ASTM E90. Alternatively, the sound transmission class of walls, partitions and floor-ceiling assemblies shall be established by engineering analysis based on a comparison of walls, partitions and floor-ceiling assemblies having sound transmission class ratings as determined by the test procedures set forth in ASTM E90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings. ~~Intersections—All intersections between walls and floors and wall-to-wall wall-to-wall and wall-to-ceiling assemblies shall be either treated with joint compound and joint tape in accordance with ASTM C840 or sealed in accordance with sections 7 and 8 of ASTM C919. All floor-to-wall assembly intersections shall be sealed or otherwise treated in accordance to ASTM C919. This with sections 7 and 8 of ASTM C919. This~~ requirement shall not apply to entrance doors; however, such doors shall be tight fitting to the frame and sill.

Commenter's Reason: The proponent asked for disapproval of the original proposal at Committee Action Hearings in order to provide a better proposal that was both more accurate and in line with current practices. Work has shown that flanking from improperly treated joints can reduce the sound performance as demonstrated in the figure from Long, Marshall. *Architectural Acoustics, 2nd Edition*. Academic Press, 02/2014.

Composite transmission loss of a leaky panel as a function of the total percentage of leaks (Reynolds, 1981)

The code already addresses many of the other major sources of flanking, not having back-to-back outlet boxes as an example, but it does not address joints of partitions. As the figure shows, reducing the leakage by a factor of 10 improves performance by approximately 10dB. 3dB to 5dB is perceptible and 10 dB roughly reflects a doubling in performance. Even going from 1/100 of the wall leaking to 1/10,000 improves performance.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The expected cost of doing this with sealants alone would be approximately \$20/room, based on the estimate of one quart tube of acoustical caulk needed per room to seal the top and bottom and the few minutes to do it, assuming two of the walls need sealed. Since the tape and mud method is already done in the installation of drywall, those wall to wall, wall to floor, and wall to ceiling intersections not typically sealed and would not result in any added substantial cost - in most cases a couple of dollars or less, based on an estimate of an additional 10 feet of joints per room needing to be sealed.

G125-18

G130-18 Part II

IPMC: 404.6

Proposed Change as Submitted

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Property Maintenance Code

Revise as follows

404.6 Efficiency unit. Nothing in this section shall prohibit an efficiency ~~living dwelling~~ unit from meeting the following requirements:

1. A unit occupied by not more than one occupant shall have a minimum clear floor area of 120 square feet (11.2 m²). A unit occupied by not more than two *occupants* shall have a minimum clear floor area of ~~220-190~~ square feet (~~20.4-17.6~~ m²). A unit occupied by three *occupants* shall have a minimum clear floor area of ~~320-260~~ square feet (~~29.7-24.1~~ m²). These required areas shall be exclusive of the areas required by Items 2 and 3.
2. The unit shall be provided with a kitchen sink, cooking appliance and refrigeration facilities, each having a minimum clear working space of ~~30-40~~ inches (~~762-990~~ mm) in front. Light and *ventilation* conforming to this code shall be provided.
Exception: Dwelling units not required to be Accessible units. Type A units and Type B units shall have a clear working space of not less than 30 inches (762 mm) in front of the kitchen sink, cooking appliance and refrigerator.
3. The unit shall be provided with a separate *bathroom* containing a water closet, lavatory and bathtub or shower.
4. The maximum number of *occupants* shall be three.

Reason:

Cost Impact: The code change proposal will decrease the cost of construction

G130-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Referencing accessible units in the IPMC will cause confusion as most property maintenance inspectors can not be expected to identify accessible units and therefore may misapply the provisions. (Vote: 7-2)

Assembly Action:

None

G130-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Property Maintenance Code

404.6 Efficiency unit. Nothing in this section shall prohibit an efficiency dwelling unit from meeting the following requirements:

1. A unit occupied by not more than one occupant shall have a minimum clear floor area of 120 square feet (11.2 m²). A unit occupied by not more than two *occupants* shall have a minimum clear floor area of 190 square feet (17.6 m²). A unit occupied by three *occupants* shall have a minimum clear floor area of 260 square feet (24.1 m²). These required areas shall be exclusive of the areas required by Items 2 and 3.
2. The unit shall be provided with a kitchen sink, cooking appliance and refrigeration facilities, each having a minimum clear working space of ~~40-30~~ inches (990-762 mm) in front. Light and *ventilation* conforming to this code shall be provided-

~~**Exception:** Dwelling units not required to be Accessible units, Type A units and Type B units shall have a clear working space of not less than 30 inches (762 mm) in front of the kitchen sink, cooking appliance and refrigerator.~~

3. The unit shall be provided with a separate *bathroom* containing a water closet, lavatory and bathtub or shower.
4. The maximum number of *occupants* shall be three.

Commenter's Reason: This public comment restores the minimum clear working space in front of the kitchen facilities in an efficiency unit to 30 inches and deletes the exception that refers to Accessible units, Type A units and Type B units. The 40 inch clearance is required for a new building constructed in accordance with the IBC and the A117.1 standard, but is not necessarily required for an existing building. For an existing building, increasing the clear working space to 40 inches would only be required if the unit were altered or added to. Ordinary maintenance and repairs would not trigger a need to bring the clear working space into compliance.

The typical activity that would be required of a tenant or owner cited under the IPMC to bring the unit up to minimum health and safety standards is most likely the repair or replacement of a non-working appliance, or the repair or replacement of deteriorated floor, wall or ceiling finishes. The IPMC in turn requires such work (or any other work to correct conditions cited by the property maintenance inspector) to be in accordance with the IEBC. Unless the work was extensive enough to qualify as a Level 2 Alteration under the IEBC, an upgrade for accessibility would not be required. If such a level of work is needed, the IEBC would likely require the owner or their authorized agent (e.g. architect, contractor or other professional hired by the owner) to apply for a building permit and submit construction documents. Presumably, either the owner's authorized agent or the building official would catch the need to increase the clear working space.

The primary reason the IPMC committee voted to disapprove G130, Part II was over concerns the typical property maintenance inspector would not necessarily be familiar with ICC A117.1, ADA or the Fair Housing Act Design Guidelines, and therefore not know what Accessible Units, Type A units and Type B units are. The BCAC agrees with the committee that it isn't necessary for the property maintenance inspector to know when the clearance needs to be increased, as that would be triggered by work done under the IEBC and reviewed by the building department, and has removed the language of concern. As there were no other objections to the proposal, the BCAC asks the Committee Action of Disapprove be overturned and this Public Comment be considered.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The net effect of the public comment and code change proposal will not increase or decrease the cost of construction because the resulting change is simply to allow smaller areas for efficiency units.

G130-18 Part II

G130-18 Part I

IBC: 1207.4

Proposed Change as Submitted

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE GENERAL CODE DEVELOPMENT COMMITTEE. PART II WILL BE HEARD BY THE PROPERTY MAINTENANCE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Building Code

Revise as follows

1207.4 Efficiency dwelling units. An efficiency ~~living dwelling~~ unit shall conform to the requirements of the code except as modified herein:

1. The unit shall have a living room of not less than ~~220-190~~ square feet (~~20.4-17.6~~ m²) of floor area. An additional ~~100-70~~ square feet (~~9.3-6.5~~ m²) of floor area shall be provided for each occupant of such unit in excess of two.
2. The unit shall be provided with a separate closet.
3. ~~The For other than Accessible, Type A and Type B dwelling units, the~~ unit shall be provided with a kitchen sink, cooking appliance and ~~refrigeration facilities~~ refrigerator, each having a clear working space of not less than 30 inches (762 mm) in front. Light and ventilation conforming to this code shall be provided.
4. The unit shall be provided with a separate bathroom containing a water closet, lavatory and bathtub or shower.

Reason: The market is trending toward smaller living areas in multi-family R-2 structures particularly in urban areas. US Census statistics show that in 2000, app. 46,000 rental units built were less than 1,000 sq.ft. In 2015, 114,000 units and in 2016, 99,000 units were less than 1,000 sq.ft. The Urban Land Institute reported in 2013 that major Municipalities including New York City, San Francisco, Boston, Dallas and Philadelphia are allowing smaller apartments with Seattle and Portland (OR) having no minimum sizes. The proposed reduction allows for a modest decrease (13.6%) in the required living room area and (30%) in the floor area for each occupant of such unit in excess of two. Code Professionals are receiving proposals for dwelling units in R2 structures that are nonconforming with the minimum standards in the IBC. The Room Area standard for dwelling units in BOCA and SBBC as well as the 2000 edition of IBC required that one room must have a minimum floor area of 150 sq.ft. This was reduced to 120 sq.ft in the 2003 IBC and remains today. The minimum living room area for efficiency units in the 2000 IBC is the same as the 2018 IBC. No reduction has been proposed even though the overall dwelling unit room area standard has been reduced. The proposal complies with the current language in IBC Section 1207.3. which requires that habitable rooms be at least 120 sq.ft.

IBC 1207.4: The change from "living unit" to "dwelling unit" is to use a defined term to describe these efficiency apartments. The change in Item 3 corrects potential existing conflicts with Chapter 10 of ICC A117.1. which requiring a clear working space of 40 inches in front of the kitchen sink, cooking appliance and refrigerator for Accessible, Type A or B units. The change from "refrigeration facilities" to "refrigerator" is to use a more clearly understood term, and eliminate someone believing that another type of fixture, such as a beer cooler, would be sufficient.

IPC 404.6: The changes to the IPC are for coordination with the revisions to the IBC for efficiency apartments.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will decrease the cost of construction

This proposal could decrease the cost of construction where efficiency apartments are built to the lower minimum sizes required by the text that is proposed.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal addresses the increasing real need for smaller dwelling units. This proposed language is useable and enforceable. (Vote: 8-6)

Assembly Action:

None

G130-18 Part I

G133-18

IBC: 1209.3.1, 1209.3.1.1

Proposed Change as Submitted

Proponent: Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (Eirene.Knott@brrarch.com)

2018 International Building Code

[P] 1209.3.1 Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 occupancy housing areas.

Add new text as follows

1209.3.1.1 Water closet compartment size. Where a compartment is provided, the compartment shall be not less than 30 inches (762 mm) in width and not less than 60 inches (1524 mm) in depth for floor-mounted water closets and not less than 30 inches (762 mm) in width and 56 inches (1422) in depth for wall-hung water closets. The compartment shall provide not less than 21 inches (533 mm) of clearance in front of the water closet to any wall, fixture or door.

Reason: This proposal is bringing language from the IPC into the IBC where designers that utilize the IBC can find this information more readily. Most architectural firms do not have an IPC in their office, but rather rely upon the IBC to provide the information needed for the design aspect of the project. This code change brings language directly from the IPC with specifics that will be utilized by a designer so that the toilet room layout will comply with the requirements of the IPC. There is specific information in the IBC on the requirements for urinal partitions, so bringing language in specific to the toilet partitions would be a natural supplement to the information already provided

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is just adding language that already exists in the IPC so this will not impact the construction cost.

Analysis: This is a [P] controlled section. This is a matter of IBC-G Committee deciding whether it is appropriate to have the same language contained in the IPC placed in the IBC. Technical changes to this section should not be made by IBC-G.

G133-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is an area that is quite often missed and should be referenced. A public comment may be in order. But where do we stop regarding bringing in requirements from other codes? That is a slippery slope. It may be more appropriate to have a simple and brief pointer. Chapter 29 may be the proper place for this. (Vote: 13-0)

Assembly Action:

None

G133-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com); David Collins (dcollins@preview-group.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

[P] 2903 Installation of Fixtures

[P] 2903.1 Setting Fixtures shall be set level and in proper alignment with reference to adjacent walls.

[P] 2903.1.1 Water closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition, vanity or other obstruction. Where partitions or other obstructions do not separate adjacent fixtures, fixtures shall not be set closer than 30 inches (762 mm) center to center between adjacent fixtures. There shall be not less than a 21-inch (533 mm) clearance in front of a water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall be not less than 30 inches (762 mm) in width and not less than 60 inches (1524 mm) in depth for floor-mounted water closets and not less than 30 inches (762 mm) in width and 56 inches (1422 mm) in depth for wall-hung water closets.

Exception: An accessible children's water closet shall be set not closer than 12 inches (305 mm) from its center to the required partition or to the wall on one side.

[P] 2903.1.2 Public Lavatories In employee and public toilet rooms, the required lavatory shall be located in the same room as the required water closet.

[P] 2903.1.3 Location of fixtures and piping Piping, fixtures or equipment shall not be located in such a manner as to interfere with the normal operation of windows, doors or other means of egress openings.

[P] 2903.1.4 Water closet compartment Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.

[P] 2903.1.5 Urinal Partitions Each urinal utilized by the public or employees shall occupy a separate area with walls or partitions to provide privacy. The horizontal dimension between walls or partitions at each urinal shall be not less than 30 inches (762 mm). The walls or partitions shall begin at a height not greater than 12 inches (305 mm) from and extend not less than 60 inches (1524 mm) above the finished floor surface. The walls or partitions shall extend from the wall surface at each side of the urinal not less than 18 inches (457 mm) or to a point not less than 6 inches (152 mm) beyond the outermost front lip of the urinal measured from the finished backwall surface, whichever is greater.

Exceptions:

1. Urinal partitions shall not be required in a single-occupant or family/assisted-use toilet room with a lockable door.
2. Toilet rooms located in child day care facilities and containing two or more urinals shall be permitted to have one urinal without partitions.

Commenter's Reason: The committee disapproved the code change saying that it was a slippery slope bringing more language for requirements from other codes. This language is essential to the designer when designing a building. Both architects and interior designers need to know what the minimum code requirements are for toilet compartments and the spacing of the fixtures. By not having this language in the IBC, they are not aware of the requirements as most designers only utilize the IBC. Without some direction or pointer in the IBC, they will not know what these requirements are and their designs will not be code compliant.

The committee suggested my proposed language be placed in Chapter 29, so I have created a new section within the Chapter that has pulled language directly from the IPC relative to fixture installation.

The committee also wanted a simple and brief pointer. I am not sure how much more simple and brief it can be other than to tell someone to go to a specific section in the IPC. However, I have brought language directly from the IPC to make sure everything relative to fixtures was provided for design purposes. If this language ever changes, I am hopeful that it will be updated from the IPC and strongly urge the CCC to make sure this is scoped by the IPC.

The table below indicates where the language was taken from in the IPC to become part of the IBC.

Proposed IBC	2018 IPC
2903.1	405.3
2903.1.1	405.3.1
2903.1.2	405.3.2
2903.1.3	405.3.3
2903.1.4	405.3.4
2903.1.5	405.3.5

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change proposal will not increase or decrease the cost of construction .

This is just adding language that already exists in the IPC so this will not impact the construction cost.

G133-18

IBC: Chapter 12, 1201.1, SECTION 1210, 1210.1, 1210.2, 1210.2.1, 1210.2.2, 1210.2.3, 1210.2.4, 1210.2.5, 1210.2.6, 1210.2.7, 1210.2.8, 2010.2.9, 1210.2.10, 1210.2.11, 1210.3, 1210.3.1, 1210.3.2, 1210.3.3, 1210.3.4, 1210.3.5, Table TABLE 1210.3, 1210.3.6, 1210.3.7

Proposed Change as Submitted

Proponent: Craig Conner, representing self (craig.conner@mac.com); Jani Palmer, representing Environmental Protection Agency (Palmer.janise@epa.gov)

2018 International Building Code

CHAPTER 12 INTERIOR ENVIRONMENT

Revise as follows

1201.1 Scope. The provisions of this chapter shall govern ventilation, temperature control, lighting, *yards and courts*, sound transmission, room dimensions, surrounding materials ~~and~~, rodentproofing associated with the interior spaces of ~~buildings-buildings~~, and radon.

Add new text as follows

SECTION 1210 RADON

1210.1 Applicability. Section 1210 shall apply to use groups E and I located in radon zone 1 as defined in IRC Table AF101(1).

Exception: Compliance with Section 1210 shall not be required where the authority having jurisdiction has defined the radon zone as Zone 2 or 3.

1210.2 Radon testing. Radon testing shall be performed in accordance with Sections 1210.2.1 through 1210.2.11.

1210.2.1 Airtightness. Testing shall be performed after the building passes its airtightness test.

1210.2.2 Fan. Where the system includes a fan, testing shall be performed after the radon control system installation is complete and operating with the fan.

1210.2.3 Lowest level. Testing shall be performed at the lowest level that will be occupied, inclusive of unfinished spaces. Spaces that are physically separated and severed by different HVAC systems shall be tested separately.

1210.2.4 Spaces not tested. Testing shall not be performed in a closet, hallway, stairway, laundry room, furnace room, bathroom or kitchen.

1210.2.5 Test kits and monitors. Testing shall be performed with a commercially available test kit or with a continuous radon monitor that can be calibrated. Testing with test kits shall include two tests, which shall be averaged. Testing shall be in accordance with the testing device manufacturer's instructions.

1210.2.6 Testing agency. Testing shall be performed by the builder, a registered design professional or an approved third party.

1210.2.7 Time period. Testing shall extend at least 48 hours or to the minimum specified by the testing device manufacturer, which ever is longer. This initial testing shall be permitted to extend past occupancy.

1210.2.8 Test results. Test results shall be provided directly to the owner by the test lab or testing party. The test results shall be delivered before or after occupancy.

2010.2.9 Additional test kit. An additional pre-paid test kit shall be provided to the owner to use when they choose. The test kit shall include mailing, or emailing the results from the testing lab to the owner. The builder shall also be permitted to receive the test results.

1210.2.10 Test result. This section does not require a specific test result, rather it requires the test be performed and the results be provided to the registered design professional or owner.

1210.2.11 Test result report. The registered design professional or owner shall be informed prior to occupancy and in writing that "A radon test result of 4 pCi/L or above is the 'action level' set by the U.S. Environmental Protection Agency (EPA. EPA recommends radon reduction measures to lower radon levels below 4 pCi/L." Or "For a radon test result of 4 pCi/L or above [name of builder or jurisdiction having authority] recommends radon reduction measures to lower radon levels below 4 pCi/L."

1210.3 Radon reduction measures. Radon reduction measures shall be in accordance with Sections 1210.3.1 through 1210.3.6 and Table 1210.3.

1210.3.1 Soil-gas barriers and base course. A base course in accordance with Section 1805.4.1 shall be installed below slabs and foundations. There shall be a continuous base course under each soil-gas retarder that is separated by foundation walls or footings. Foundation walls and floors in contact with the soil shall be damp proofed or waterproofed in accordance with Section 1805. Punctures, tears and gaps around penetrations of the soil-gas retarder shall be repaired or covered with an additional soil-gas retarder. The soil-gas retarder shall be a continuous 6-mil (0.15 mm) polyethylene or an approved equivalent. Approved alternative soil gas collection areas, such as sealed crawlspaces, shall be permitted.

1210.3.2 Soil gas collection. There shall be an unobstructed path for soil gas flow within the base course and out through the vent in the roof. Soil gases below the foundation shall be collected by a perforated pipe with a diameter of not less than 4 inches (10 cm) and not less than 10 ft (3 m) in total length that is mechanically fastened to a tee with two horizontal openings within the base course for radon collection or an equivalent method. The tee fitting connection within the base course and the soil gas vent pipe that extends to the roof shall be designed to prevent clogging of the radon collection path. Alternately the soil gas collection shall be by approved radon collection mats or an equivalent approved method.

1210.3.3 Soil gas entry routes. Openings in slabs, soil-gas retarders, and joints such as plumbing, ground water control systems, soil-gas vent pipes, piping and structural supports, shall be sealed against air leakage at the penetrations with a polyurethane caulk, expanding foam or other approved sealing method. Gaps, seams and joints below grade in walls and footings that surround soil gas collection areas shall be closed with cementitious materials, damp proofing, or other approved products. Closure shall be provided to prevent air migration between the base course that serves soil gas collection and exterior foundation drain systems located outside of the walls or footings that surround the soil gas collection areas. Masonry unit walls below grade shall provide a barrier between soil gas and interior spaces, including but not limited to, barriers within the hollow masonry units, full grouting, solid masonry units or other approved method. Sumps intended for ground water control shall have gasketed lids or be otherwise sealed and shall not be connected to the soil-gas exhaust system.

1210.3.4 Soil gas vent. A gas-tight vent pipe not less than 3 to 4 inches in diameter shall extend from the soil-gas permeable layer through the roof. Alternately, the vent shall extend from the soil-gas permeable layer to at least 30 feet above grade and shall not be less than 4 feet vertically above or 10 feet horizontally away from operable windows, doors or skylights. The vent pipe shall be sloped to avoid collecting condensate or rainwater. The vent pipe size shall not be reduced at any location as it goes from gas collection to the roof. Exposed and visible interior vent pipes shall be identified with not less than one label reading "Radon Reduction System" on each floor and in habitable attics.

1210.3.5 Vent pipe diameter. The minimum vent pipe diameter shall be as specified in Table 1210.3.5.

**TABLE 1210.3.5
Maximum Vented Foundation Area**

Maximum Area Vented	Minimum Pipe Diameter
2,500 ft ² (232 m ²)	3 inch (7.6 cm)
4,000 ft ² (372 m ²)	4 inch (10 cm)
Unlimited	6 inch (15.2 cm)

1210.3.6 Multiple vented areas. In dwellings where interior footings or other barriers separate the soil-gas permeable layer, each area shall be fitted with an individual vent pipe. Vent pipes shall connect to a single vent that terminates above the roof or individual vent pipes shall terminate separately above the roof.

1210.3.7 Fan. Each sub-slab soil-gas exhaust system shall include a fan, or dedicated space for the post-construction installation of a fan. The electrical supply for the fan shall be located within 6 feet (1.8 m) of the fan.

Reason: Radon in schools presents a significant health risk. Thousands of schools are affected by radon. EPA found that 41% of schools that had high radon were located geographically within Zone 1 (high radon potential), It is common knowledge that there is no way to know your building's radon level unless you test. Post-construction mitigation is very expensive; preventative measures, such as adding radon reducing features during construction, can save future costs and lives.

Cost Impact: The code change proposal will increase the cost of construction. The cost of three test kits with prepaid analysis and prepaid postage is less than \$80, probably less than \$50 in builder quantity including tax. Where there were multiple spaces that are physically separated and served by different HVAC systems each space would incur that cost.

The cost of the measures in the building varies widely with building size. Many elements of the radon resistant features are already required by code; for example, the base course under the foundation, and air tightness for the building; these would not add cost for the radon system.

G135-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal contains a large amount of unenforceable language. A lot of substantiation was provided for schools, but not all Group I occupancies. The timing may not be right to make radon mitigation mandatory as there are testing and liability issues that still need to be worked out. There is science behind this proposal and it appears to be a significant problem, but school boards, possibly at the state level, should have been engaged. The starting place for this may be best as an appendix, much like in the residential code. It would be better to bring the tables over rather than reference the residential code. (Vote: 14-0)

Assembly Action:

None

Individual Consideration Agenda

Public Comment 1:

Proponent: Craig Conner, representing Environmental Protection Agency (craig.conner@mac.com); Jani Palmer, EPA; Gary Hodgden, AQP Inc, representing AQP Inc (gary@aair.com); Bruce Snead, representing self (bsnead@ksu.edu) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

1210.1 Applicability. Section 1210 shall apply to use groups E and ~~H4~~ located in radon zone 1 as defined in ~~IRC~~ Table AF101(1). 1210.1

Exception: Compliance with Section 1210 shall not be required where the authority having jurisdiction has defined the radon zone as Zone 2 or 3.

1210.2.1 Airtightness. Testing shall be performed after the building passes its airtightness ~~test requirements~~.

1210.2.3 Lowest level. Testing shall be performed at the lowest level that will be occupied, inclusive of unfinished spaces. Spaces that are physically separated and ~~severed~~ severed by different HVAC systems shall be tested separately.

1210.2.7 Time period. Testing shall extend at least 48 hours or to the minimum specified by the testing device manufacturer, which ever is longer. ~~This initial testing shall be permitted to extend past occupancy.~~

1210.2.8 Test results reported. Written test results from the test lab or testing party ~~The test results shall be delivered before or after occupancy. shall be provided with the construction documents.~~

2010.2.9 Additional test kit. An additional pre-paid test kit shall be provided ~~to for~~ the owner to use when they choose. The test kit shall include mailing, or emailing the results from the testing lab to the owner. ~~The builder shall also be permitted to receive the test results.~~

1210.2.10 Test result, result and fan. ~~This section does not require a specific test result, rather it requires the test be performed and the results be provided to the registered design professional or owner. Where the radon test result is 4 pCi/L or greater the radon vent pipe fan shall be installed.~~

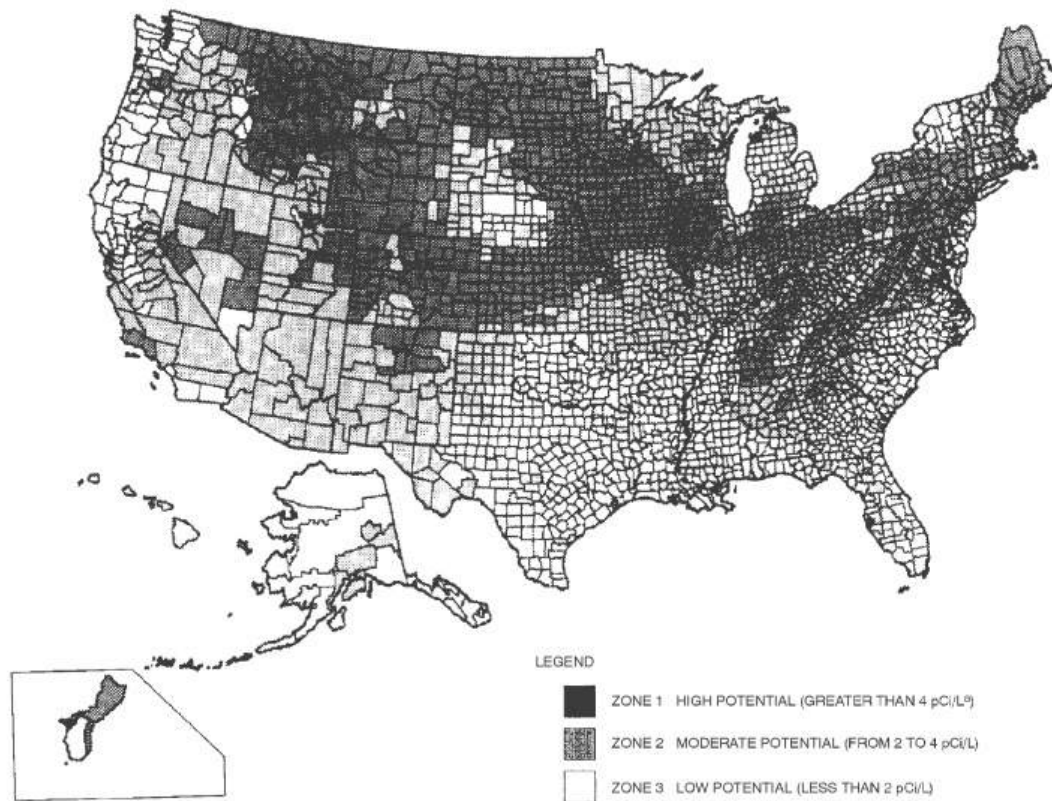

1210.2.11 Test result report. ~~The registered design professional or owner shall be informed prior to occupancy and in writing that "A radon test result of 4 pCi/L or above is the 'action level' set by the U.S. Environmental Protection Agency (EPA. EPA recommends radon reduction measures to lower radon levels below 4 pCi/L." Or "For a radon test result of 4 pCi/L or above [name of builder or jurisdiction having authority] recommends radon reduction measures to lower radon levels below 4 pCi/L."~~

1210.3.2 Soil gas collection. There shall be an unobstructed path for soil gas flow within the base course and ~~out~~ outside through the vent in the roof. ~~Soil gases below the foundation shall be collected by a perforated pipe with a diameter of not less than 4 inches (10 cm) and not less than 10 ft (3 m) in total length that is mechanically fastened to a~~

tee with two horizontal openings within the base course for radon collection or an equivalent method. The tee fitting connection within the base course and the soil gas vent pipe that extends to the roof shall be designed to prevent clogging of the radon collection path. Alternately the soil gas collection shall be by approved radon collection mats or an equivalent approved method.

1210.3.4 Soil gas vent. A gas-tight vent pipe not less than 3 to 4 inches in diameter shall extend from the soil-gas permeable layer through the roof. Alternately, the vent shall extend ~~from the soil-gas permeable layer to~~ to at least 30 feet above grade and shall not be less than 4 feet vertically above or 10 feet horizontally away from operable windows, doors or ~~skylights~~ skylights; ~~and the room opposite the side vent shall be tested for radon.~~ The vent pipe shall be sloped to avoid collecting condensate or rainwater. The vent pipe size shall not be reduced at any location as it goes from gas collection to the roof. Exposed and visible interior vent pipes shall be identified with not less than one label reading "Radon Reduction System" on each floor and in habitable attics.

1210.3.6 Multiple vented areas. In dwellings where interior footings or other barriers separate the soil-gas permeable layer, each area shall be fitted with an individual vent pipe. Vent pipes shall connect to a single vent that terminates ~~above the roof~~ outside or individual vent pipes shall terminate ~~separately above the roof~~ outside separately.

a. pCi/L standards for picocuries per liter of air. The U.S. Environmental Protection Agency (EPA) recommends that homes that measure 4 pCi/L and greater be mitigated.

The map assigns each U.S. county to one of three zones based on radon potential. Radon Zone 1 has the highest radon potential. Table AF101 lists the Zone 1 counties illustrated on the map.

Commenter's Reason: Protection of public health, safety and welfare is the core goal of the I-codes. I-codes are greatly reducing risks from hazards such as fire, earthquake, tornado, winds, electrocution, falling, and unsafe plumbing, Reducing risks from lung cancer caused by buildings is similarly needed, especially where children are likely to be present. This proposal applies only to schools and daycares (use groups E and I4) in areas with high radon potential. Schools and daycares should not contribute to future lung cancers in children.

American Cancer Society says "The leading cause of lung cancer in non-smokers is exposure to radon gas." (ref 1) The link between radon and lung cancer has been firmly established for about 20 years (ref 2). Radon is estimated to cause about 21,000 deaths per year from lung cancer (ref 2). Children exposed to high levels of radon are more likely to develop lung cancer later in life. (ref 3). Given the large number of fatalities induced by radon in buildings and the sensitivity of children, radon should be reduced in schools and daycares in high radon potential areas.

Most radon originates under the building foundation; therefore, most of the radon reduction construction is under the foundation. Installing radon reduction measures after the new foundation is in place is expensive.

More than half the states have some kind of statewide radon requirement or have local jurisdictions that have adopted radon requirements. You can look at your state law and radon in the LawAtlas. The LawAtlas covers both schools and daycares, as well as other aspects of radon law. (<http://lawatlas.org/datasets/state-radon-laws> click "explore", click your state)

Jurisdictions and schools boards have shown great concern for radon by their actions. Multiple states and school districts have recognized the need to protect school children from radon. These jurisdictions and school districts are primarily in the high radon potential zone (Zone 1) where this code change would apply. As reported by the LawAtlas, eight states require school testing. Those states are Colorado, Connecticut, Florida, Minnesota, New Jersey, Rhode Island, Virginia and West Virginia. Illinois recommends testing. Some states -- Connecticut, Rhode Island and West Virginia -- require that radon-resistant construction features be built into new schools that are located in high radon potential areas.

Multiple states and jurisdictions have recognized the need to protect children in daycare. These are primarily in the high radon potential zone (Zone 1) where this change would apply. As reported by the LawAtlas, some form of radon testing and/or mitigation in daycares is required in ten states. Those states are Connecticut, Iowa, Illinois, Michigan, New Hampshire, Rhode Island, New Jersey, Florida, and Idaho daycares.

Deaths from radon significantly exceed deaths from other building-related risks; such as fires, falls, electrocution, tornadoes, hurricanes, winds, fires, etc. In part this is because the codes have reduced these other risks, but have not yet addressed radon. Radon reduction should be added to the IBC.

This public comment responds to multiple comments from the committee and others:

--"air tightness test" was changed to "air tightness requirements", in recognition that commercial building have air tightness requirements, but may not be tested.

--Radon test results shall be included with construction documents.

--Test results delivered after occupancy would be after code enforcement authority has expired; therefore, the language allowing test results to be delivered after occupancy was removed.

--Radon zone map and table were brought into the IBC as requested by the committee. Zone table will be two pages long when formatted like in IRC.

Comments were made both for and against the radon-reduction requirements being in the main body of the code or an appendix. Due to the large death toll from radon in buildings and the impact on children, the proponents believe radon reduction and testing should be in the main body of the code for schools and daycares.

Bibliography: 1) Lung Cancer Risks for Non-Smokers. American Cancer Society. Nov 6, 2017
<https://www.cancer.org/latest-news/why-lung-cancer-strikes-nonsmokers.html>

2) U.S. National Research Council Committee on the Biological Effects of Ionizing Radiation. 1999.

<https://www.nap.edu/read/5499/chapter/1#viii><https://www.nap.edu/read/5499/chapter/5#97>

Historically the link between radon and lung cancer was not understood. Radon is an invisible, tasteless and odorless gas. There is a long period between exposure to radon and the symptoms of lung cancer. Recognition that radon increased lung cancers came from early studies of uranium miners, and was later confirmed more broadly. In 1999 it was concluded that residential radon, as well as smoking, were the most important contributors to the lung cancer. Note table 3-10, summed "total male" and "total female" for both "ever-smokers" and "never-smokers" Actual value in table is 21,800, but is rounded to 21,000.

3) "Canadian Lung Cancer Relative Risk from Radon Exposure for Short Periods in Childhood Compared to a Lifetime" International Journal of Environmental Research and Public Health. 2013 May; 10(5): 1916-1926.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3709356/>

The study concluded: "... exposure to radon during childhood increases the lifetime risk of developing lung cancer ... if a child lived in a home with very high radon concentration for only a few years, the risk of developing lung cancer later in the life could be equivalent to a lifetime exposure to moderate radon concentration."

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost of three test kits with prepaid analysis and prepaid postage is less than \$100, probably less than \$70 in builder quantity including tax. Where there were multiple spaces that are physically separated and served by different HVAC systems each space would incur that cost.

The cost of the radon mitigation measures in the building varies widely with building size. Many elements of the radon resistant features are already required by code; for example, the base course under the foundation, and air tightness for the building; these would not add cost for the radon system.

IBC: 202, 503.1.4, 1510.2.2

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows

[BG] PENTHOUSE. An enclosed, unoccupied rooftop structure used for sheltering mechanical and electrical equipment, tanks, elevators and related machinery, stairways and vertical shaft openings.

503.1.4 Occupied roofs. A roof level or portion thereof shall be permitted to be used as an occupied roof provided the occupancy of the roof is an occupancy that is permitted by Table 504.4 for the story immediately below the roof. The area of the occupied roofs shall not be included in the *building area* as regulated by Section 506. An occupied roof shall not be included in the building height or number of stories as regulated by Section 504 provided the penthouses and other enclosed roof structures comply with Section 1510.

Exceptions:

1. The occupancy located on an occupied roof shall not be limited to the occupancies allowed on the *story* immediately below the roof where the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and occupant notification in accordance with Section 907.5 is provided in the area of the occupied roof.
2. Assembly occupancies shall be permitted on roofs of open parking spaces of Type I or Type II construction, in accordance with the exception to Section 903.2.1.6.

SECTION 1510 ROOFTOP STRUCTURES

[BG] 1510.1 General. The provisions of this section shall govern the construction of rooftop structures.

1510.1.1 Area limitation. The aggregate area of penthouses and other enclosed rooftop structures shall not exceed one-third the area of the supporting roof deck. Such penthouses and other enclosed rooftop structures shall not be required to be included in determining the building area or number of stories as regulated by Section 503.1. The area of such penthouses shall not be included in determining the fire area specified in Section 901.7.

[BG] 1510.2 Penthouses. Penthouses in compliance with Sections 1510.2.1 through 1510.2.5 shall be considered as a portion of the story directly below the roof deck on which such penthouses are located. Other penthouses shall be considered as an additional story of the building.

[BG] 1510.2.1 Height above roof deck. Penthouses constructed on buildings of other than Type I construction shall not exceed 18 feet (5486 mm) in height above the roof deck as measured to the average height of the roof of the penthouse. Penthouses located on the roof of buildings of Type I construction shall not be limited in height.

Exception: Where used to enclose tanks or elevators that travel to the roof level, penthouses shall be permitted to have a maximum height of 28 feet (8534 mm) above the roof deck.

[BG] 1510.2.2 Use limitations. Penthouses shall not be used for purposes other than the shelter of mechanical or electrical equipment, tanks, elevators and related machinery, stairways or vertical shaft openings in the roof ~~assembly~~assembly, including ancillary spaces used to access elevators and stairways.

Reason: This is part of a series of 3 proposals dealing with occupied roofs. See BCAC proposals to Section 1006 and 1009.

Although it was felt the original intent of the egress associated with occupied roofs was clear, we felt there were a few remaining provisions that left doubt as to what was intended. It had been reported that some code officials had interpreted the existing code provision to treat an unoccupied roof as an additional story so as to decrease the actual allowable stories in Chapter 5. To clarify that occupied roofs are not considered stories and are permitted to be used

provide that egress is provided in accordance with all applicable sections of the IBC and IFC purposes in a manner “as if they were a story” without applying other “story” requirements like those associated with height and area limitations in Chapter 5 or fire area provisions of Chapter 9, we propose the above modifications as summarized below:

In Section 202, the definition of “PENTHOUSE” is proposed to be modified by adding the word “stairway”. This reinforces the existing and proposed language in Section 1510 that excludes certain allowable rooftop structures from being considered additional stories. The definition was not modified to include vestibule type areas as this is addressed in the proposed change to Section 1510.2.2.

The proposal in Section 503.1.4 Occupied roofs, adds a clarifying statement to support the concept that occupied roofs and other enclosed structures in Section 1510 are not an additional story.

Proposed modifications to Section 1510 Rooftop Structures include the additions of the word “Stairways” and the term, including ancillary spaces used to access elevators and stairways.” to Section 1510.2.2. Use Limitations.

As flat/ low-slope rooftops are increasingly, and intentionally, being designed and utilized for occupancies similar to those on occupied floor levels below, modifications to the current code are necessary to define *rooftop structures* that are occupied and ancillary to approved occupied roof uses and to clarify that these structures must comply with means of egress requirements, but are not a story for height and area limitations. In addition, the proposed modifications described above align the limitations for *Occupied roof ancillary structures* with those for penthouses as a reasonable approach based upon the shared characteristics of the two structure types.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal is a clarification reminder of the scope of requirements included in the identified sections.

G136-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This is an excellent clarification of the code and is coordinated with what was done in the last cycle. (Vote: 14-0)

Assembly Action:

None

G136-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Woestman, Kellen Company, representing Extruded Polystyrene Foam Association (XPSA) (jwoestman@kellencompany.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

Occupied Roof An unenclosed roof or area of a roof designed for human occupancy in which individuals congregate for amusement, educational or similar purposes or in which occupants are engaged at labor, and which is equipped with means of egress meeting the requirements of this code.

Commenter's Reason: There needs to be a clear definition of an occupied roof to help alleviate confusion with the definition of occupiable space. A roof is not an enclosed space, therefore the thermal barrier requirements, smoke development index, etc., used with interior finishes in an enclosed space does not apply. Rather, the occupied roof is constructed as a roof meeting the Occupancy Classification and Use in Section 302.1, height and area limitations in Section 503.1, as well as structural and egress requirements as specified by the code. The existing roof fire requirements in IBC Sections 1505.1, 1508.1, 2603.3 Exception 3, 2603.4.1.5 and 2603.6 also apply to occupied roofs.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Adding a definition should not increase or decrease the cost of construction.

G136-18

G137-18

IBC: 2703 (New), 2703.1 (New), 2703.2 (New), 2703.3 (New), 2703.4 (New), Chapter 35

Proposed Change as Submitted

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Building Code

Add new text as follows

SECTION 2703 LIGHTNING PROTECTION SYSTEMS

2703.1 General. Where provided, lightning protection systems shall comply with Sections 2703.2 through 2703.4

2703.2 Installation. Lightning protection systems for all new buildings and additions shall be installed in accordance with one of the following methods:

1. NFPA 780.
2. UL 96A.
3. Other approved methods.

UL 96A shall not be utilized for structures used for the production, handling, or storage of ammunition, explosives, flammable liquids or gases, and other explosive ingredients including dust.

2703.3 Additions to existing systems. Where additions are constructed to a building containing a lightning protection system and the existing building's lightning protection system is connected to the new lightning protection system, the entire system shall be inspected and brought into compliance with current standards.

2703.4 Surge protection. Surge protection devices shall be installed for all normal and emergency electrical systems and all communications systems in accordance with Section 2703.2 and NFPA 70.

Add new standard(s) follows

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096

96A-2016:

Standard for Installation Requirements for Lightning Protection Systems

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

780-17:

Standard for the Installation of Lightning Protection Systems

Reason: Requirements pertaining to Lightning Protection Systems are not currently found within the building code. This code change does not require the installation of lightning protection systems, but simply provides guidance to those that are installing and inspecting lightning protection. NFPA 780 and UL 96A are two standards that are widely used within the industry, but are not very well known to code officials. These standards are in harmony with the provisions of the National Electrical Code, NFPA 70. UL 96A can be used for the installation and inspection of many lightning protection systems but the standard has limitations that are identified in this proposal. This proposal also recognizes the existence of other approved methods currently used, and thus this proposal is not intended to limit these installations. This proposal is intended to provide the code official with help in addressing the installation of these types of systems.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The cost will not increase since these requirements are being used today to install and inspect lightning protection systems.

Analysis: A review of the standards proposed for inclusion in the code, NFPA 780-17 and UL 96A-2016, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

G137-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: When you have a non-mandatory requirement, it should be in an appendix or a standard. If someone wanted to do something less than this, they should not be mandated to do this unless a specific code requirement drives it. NFPA 70 already addresses this. It has not been demonstrated that there is a real problem. (Vote: 9-4)

Assembly Action:

None

G137-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com) requests As Submitted.

Commenter's Reason: Lightning protection systems, though not required by the building or electrical code, if installed incorrectly can pose a significant hazard to persons and property and be ineffective in providing protection from lightning. **There are potential safety hazards if a lightning protection system is installed incorrectly:**

The installation of lightning protection systems is much different from the installation of general electrical wiring. This is due to the high current densities, high rates of current rise, and resulting mechanical forces that happen during a lightning event. For these reasons, specialized material and installation methods such as those specified in NFPA 780 and UL 96A should be followed and the installation should only be installed by qualified personnel trained and certified in the installation of lightning protection systems. Some of the hazards that can arise during a lightning event from an incorrectly installed lightning protection system are:

- Side flashing between lightning conductors and conductive objects within the building resulting in a potential fire.
- Increased shock hazards from a rise in step and touch potential around lightning conductors and grounding electrodes.
- Damage to building structural components such as concrete foundations and steel columns and beams.

With this in mind a building with an incorrectly installed lightning protection system can pose a greater hazard than one without a lightning protection system.

Comprehensive lightning protection system installation is not adequately addressed in building and electrical codes:

While NFPA 70, the National Electrical Code references NFPA 780 it does so only in non-enforceable informational notes. Those informational notes referencing NFPA 780 only follow grounding and bonding requirements found in Article 250 and Chapter 8 for communications systems. The NEC contains some general grounding and bonding requirements for lightning protection systems but does not contain requirements such as, material, air terminal placement, or conductor routing found in the standards that are critical for a safe and effective system.

Lightning protection systems are not required, but if installed should be installed to the appropriate standards:

This proposal does not require the installation of a lightning protection system but will provide guidance to the code official and installer for the appropriate safety standards for installation of these systems if they are installed. NFPA 780 and UL 96A are two standards that are widely used within the industry, but are not well known to code officials.

Including requirements in Chapter 27 will ensure safety of lightning protection systems:

Including this new Section in Chapter 27 instead of an Appendices will make the necessary requirements readily available for the code official to enforce without the jurisdiction having to take additional steps to adopt an Appendix for such a critical issue. There are numerous examples of ICC codes sections that provide mandatory requirements for non-required equipment and systems. For example IBC 3110.3 does not require a vehicular gate opener but when one is provided it shall be listed in accordance with UL 325. Another example is IFC 901.4.2. This section addresses the installation of nonrequired fire sprinkler systems and requires that they meet the applicable parts of the IFC and IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
NFPA 780 and UL 96A are two standards that are already widely used within the lightning protection industry therefore the cost of construction would not increase as a result of this code change.

G137-18

G139-18

IBC: 3001.2, DOJ

Proposed Change as Submitted

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org)

2018 International Building Code

Revise as follows

3001.2 Emergency elevator communication systems for the deaf, hard of hearing and speech impaired. ~~An emergency two-way communication system shall be provided that:~~

- ~~1: Is a visual and text-based and a video-based 24/7 live interactive system.~~
- ~~2: Is fully-The elevator emergency communication shall provide effective communication as required by Section 36.303 of ADA Title III. The emergency communication shall be installed in accordance with the provisions of ASME A17.1/CSA B44 and NFPA 72 and shall be accessible by the deaf, hard of hearing and speech impaired, and shall include voice-only options for hearing individuals.~~
- ~~3: Has the ability to communicate with emergency personnel utilizing existing video conferencing technology, chat/text software or other approved technology available twenty-four hours a day, seven days a week, as a live interactive system.~~

Add new standard(s) follows

DOJ United States Department of Justice Civil Rights Division

ADA Title III Regulations - Americans with Disabilities Act, Public Accommodations and Commercial Facilities

Reason: Section 3001 defines the scope and reference standards for elevator Emergency Communication design requirements. This proposal removes an elevator design requirements from the building code, restoring it to the reference standards. The added reference to the ADA Title III is the regulation specifically for effective communication with the deaf, hard of hearing and speech impaired.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposal will neither increase or decrease the cost of construction because it is simply restoring the technical requirements to the reference standards as opposed to including them in the IBC.

Analysis:

A review of DOJ ADA Title III Regulations, as proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

ASME A17.1/CSA B44 and NFPA 72, as referenced in this proposal, are currently referenced in the code.

G139-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: G138-18 and G139 are trying to accomplish the same thing. The G138-18 approach is the correct approach. There is an agreement that if this criteria may be added to A117.1 in time. This can be addressed in in public comment period. However, it should be noted that, if this was approved and there were no public comments, this could trump the previous committee action to approve G138-18. (Vote: 14-0)

Assembly Action:

None

G139-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

3001.2 Emergency elevator communication systems for the deaf, hard of hearing and speech impaired.

The elevator emergency communication shall provide effective communication ~~as required by Section 36.303 of ADA Title III. The emergency communication,~~ shall be installed in accordance with the provisions of ASME A17.1/CSA B44 and NFPA 72 and shall be accessible by the deaf, hard of hearing and speech impaired, and be available twenty-four hours a day, seven days a week, as a live interactive system.

Commenter's Reason: Section 3001 defines the scope and reference standards for elevators and other conveyance systems. Technical requirements are found in the ASME A17.1/CSA B44 Safety Code for Elevators and Escalators. New detailed technical requirements for Emergency Communication design have been approved for the 2019 edition of A17.1/B44 to address. This proposal retains the base requirement for the system in the IBC but references the technical requirements being adding in the A17/B44 elevator code to provide guidance for designers and enforcement authorities. The requirements in A17.1/B44 were developed for consistency with the guidelines in the ADA Title III which is the regulation specifically for effective communication with the deaf, hard of hearing and speech impaired. The requirements in A17.1/B44 were developed through a rigorous consensus process and the working group included the proponent of the original IBC proposal, Mr. Cid, as well as other representatives with extensive accessibility experience.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposal will neither increase nor decrease the cost of construction because it is simply referencing the technical requirements in the ASME A17.1/CSA B44 standards as opposed to including them in the IBC.

Public Comment 2:

Proponent: Andrew Cid, representing Barrier Free Solutions For The Deaf and Hard of Hearing requests Disapprove.

Commenter's Reason: ONLINE COMMENT IN OPPOSITION TO #139-18 THAT WAS SUBMITTED BY INDUSTRY

First off, I want to say that I have been encouraged by the continuing cooperation provided by the elevator industry, the A17 ASME professionals and industry representatives in communicating with me, the accessibility community and its supporters, in striving to improve accessibility in elevators for millions of U.S. citizens and for the Deaf and Hard of Hearing, Speech Impaired and the Visually Challenged communities. Thank you to all of you who are working on this important issue. There are no adversaries on either side, only cooperating professionals who endeavor to improve safety in the U.S.

There was a comment provided in the Analysis section in proposal G139-18, submitted by the elevator industry, that referenced the ICC criteria for reference standards in CP#28. It is noted that this particular ICC document appears to be for the reference to the DOJ ADA Title III Regulation in the proposal G139-18, but in reviewing the provisions of Section 3.6 would appear to be applicable to an existing referenced standard only if technical revisions are being made. **In 3.6.3.1.2 it is noted that code change proposals which include technical revisions to the code text to coordinate with a proposed update of an existing referenced standard shall include the submission of the proposed**

update to the standard in at least a consensus draft form in accordance with Section 3.4. If the proposed update of the existing standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed on this procedural technicality.

Therefore, based on the lack of the elevator industry providing technical revisions to the existing A17.1 standard for emergency communication system in their proposal under #139-18 or even a particular reference to future activities on possible revisions to capture the intent of the recent provisions adopted in 3001.2 in the IBC further demonstrates that there is no specific support to incorporate the provisions of the IBC 3001.2 into the A17.1 document with their intent to retain the current provisions as found in the A17.1 document.

Based on the first paragraph, please note that since the draft / proposed standard language to A17 was not submitted in #139-18, then #139-18 should not proceed on an ICC technicality.

It may also appear that industry, despite the hard work of task force efforts to draft appropriate language to fully capture the spirit of 3001.2 (effective 2018), may not yet want to provide full explicit and clear provisions that can be fully utilized by the general public, especially the 75 million of the general population that may be (50M) deaf, hard of hearing and (25M) speech impaired.

To date, I do admit that I am very encouraged that industry is willing to provide, albeit small, incremental steps to improve access in elevators through their efforts and cooperation with us. However, industry has not yet agreed to a standard that captures the full intent and spirit of the new IBC code 3001.2 for 2018, which is to provide emergency use of full two-way face to face video (between both authorized personnel and the entrapped occupant), pre-programmed text questions/replies (no typing required on either end), or even the use of a qualified Sign Language Interpreter, as needed (which would be a very infrequent or rare occurrence, in an emergency).

A point of clarification as I am continuing my learning of the overall process of the relationship between codes and referenced standards that it would be acceptable to have a direct reference to a standard for particular provisions if the standard contains the fully relevant requirements. At this time, it does not appear that there have been any provisions offered by the A17.1 committee which would capture the FULL spirit and intent of the provisions of 3001.2 which has been accepted by the ICC membership.

This is in line with the ICC committee statement on my proposal that noted certain actions with this proposal could be taken if the A17.1 standard incorporated the desired language through it may simply be a duplication of the language, not a conflict which at this time does not appear to be in the offering.

I look forward to continue working with industry on a standard that captures the full spirit and intent of 2018 3001.2. I commend industry s cooperation and of its representatives and colleagues thus far, in working with the accessibility community, in striving to improve the lives of millions of U.S. citizens through an assurance of complete safety and accessibility in public spaces.

Bibliography: There is no attachment provided for this.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no cost impact of this Public Comment.

G139-18

G140-18

IBC: 3002.3, 3002.3.1

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows

3002.3 Emergency signs for other than occupant evacuation elevators... Where other than occupant evacuation elevators are provided, an *approved* pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the ~~exit stairways~~ ~~exits~~ and not to use the elevators in case of fire. The sign shall read: IN CASE OF FIRE, ELEVATORS ARE OUT OF SERVICE. USE EXIT ~~STAIRS~~.

Exceptions-Exception:

1. The emergency sign shall not be required for elevators that are part of an accessible *means of egress* complying with Section 1009.4.
2. ~~The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008.~~

Add new text as follows

3002.3.1 Emergency signs for occupant evacuation elevators. Where occupant evacuation elevators are provided, an approved pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use occupant evacuation elevators in the event of fire. The sign shall read: IN CASE OF FIRE, THIS OCCUPANT EVACUATION ELEVATOR IS AVAILABLE FOR EXITING THE BUILDING.

Analysis: Duplicated text in the International Fire Code not shown for brevity.

Reason: This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6 of the Fire Code. While the Code Committees will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal correlates with the series of proposals to the IFC Chapter 6 submitted by the F-CAC for correlation of Elevator requirements and specification of required signage for all elevators.

This proposal addresses the emergency signage for the elevators in the IBC and the IFC. The changes are reflected in the IBC as these are the parent sections for these requirements. If approved this language will be duplicated in Chapter 6 of the IFC. This also correlates with the signage requirements in ASME A17.1. Exit stairways were changed to "exits" because there could be ramps instead of stairways.

Two distinct sections are established between occupant evacuation elevators and other than those elevators.

This proposal also adds standardized language to both the IBC and the IFC for occupant evacuation elevator signage to ensure consistency between codes and to provide clear and concise building occupant instruction for their use.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) in support of the FCAC's efforts. BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will decrease the cost of construction

By providing standardized language for the emergency signs for occupant evacuation elevators, and correlating for consistency the standardized language for other elevators.

G140-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There is confusion regarding cueing at elevator lobbies and whether the elevator is available or not. The proposal doesn't specify clearly. The code official may enforce the requirement at all elevator call stations, not just occupant elevators. The flaw in this proposal is dealing with the typical highrise situations. It is should not be every elevator in every lobby. The use of the term "is" will create a situation where occupants may wait for an elevator that never comes. Tinker with the words "is" and "may" and possibly "pictorial." There may be a way to link the signage to the visual requirement that is going to be part of the A117.1 automated system.....so that when someone goes to an elevator lobby they would know whether the elevator will come or not....or when to go to the stairs. There is a need to identify the elevators, but this is not the way to do it. Maybe simple a sign saying "evacuation elevator, "occupant elevator," "when directed," or "this elevator available...: (Vote: 14-0)

Assembly Action:

None

G140-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

3002.3 Emergency signs for other than occupant evacuation elevators... Where other than occupant evacuation elevators are provided, an *approved* pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the exits and not to use ~~the these~~ elevators in case of fire. The sign shall read: IN CASE OF FIRE, ELEVATORS ARE OUT OF SERVICE. USE AVAILABLE EXIT.

Exception:

The emergency sign shall not be required for elevators that are part of an accessible *means of egress* complying with Section 1009.4.

-

3002.3.1 Emergency signs for occupant evacuation elevators. Where occupant evacuation elevators are provided in accordance with Section 3008, an approved pictorial sign of a standardized design shall be posted adjacent to each elevator call station ~~on all floors instructing notifying~~ occupants to use occupant evacuation elevators in the event of fire. The sign shall read: ~~IN CASE OF FIRE, THIS THESE OCCUPANT EVACUATION ELEVATOR IS AVAILABLE FOR EXITING THE BUILDINGELEVATORS ARE AVAILABLE AS AN EXIT.~~

Commenter's Reason: IBC Section 3008.1.1 requires that "signage shall be provided to denote which elevators are available for occupant evacuation." However, the code does not provide standardized language for that signage. Requiring standardized language would reduce confusion for the occupants regarding the use of these elevators, by providing consistency and clarity for the required signage.

As noted in the proposed new text for Section 3002.3.1, the standardized language for these occupant elevators is only applicable to the elevator call stations serving those elevators designated as occupant elevators in accordance with the requirements in IBC Section 3008.

Modifications have been made to the original proposal to address the specific direction from the code development committee.

The proposed standardized language for the sign is in alignment with ASME A17.1.

This text is repeated in IFC Section 606.3.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

This would require a sign at occupant evacuation elevators. A sign was already required at other elevators.

G140-18

G149-18

IBC: 3112, 3112.1, 3112.2

Proposed Change as Submitted

Proponent: Steve Martin, Florida Division of Emergency Management, representing Florida Division of Emergency Management (steve.martin@em.myflorida.com); Douglas Wise, Building Officials Association of Florida, representing Building Officials Association of Florida (douglaswise@att.net)

2018 International Building Code

Add new text as follows

3112 PUBLIC USE RESTROOM BUILDINGS IN FLOOD HAZARD AREAS

3112.1 General. Public use restroom buildings that contain toilet rooms, bathrooms, showers and changing rooms, and those portions of buildings that contain toilet rooms, bathrooms, showers and changing rooms, and where such buildings and portions of buildings are intended for public use and located on publicly owned lands in flood hazard areas, shall comply with the requirements of this section. Public use restrooms that are not elevated or dry floodproofed in accordance with Section 1612 shall comply with Section 3112.2. Portions of buildings that include uses other than public use toilet rooms, bathrooms, showers and changing rooms shall comply with Section 1612.

3112.2 Flood resistance. Public use restrooms that are located in flood hazard areas shall comply with the requirements of ASCE 24, except for elevation requirements, and shall comply with all of the following criteria:

1. The building footprint is not more than 1,500 square feet.
2. Located, designed and constructed to resist the effects of flood hazards and flood loads to minimize flood damage from a combination of wind and water loads associated with the base flood.
3. Anchored to prevent flotation, collapse or lateral movement resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy during conditions of the base flood.
4. Constructed of flood damage-resistant materials.
5. Where enclosed by walls, the walls have flood openings.
6. Mechanical and electrical systems are located above the base flood elevation.
7. Plumbing fixtures and plumbing connections are located above the base flood elevation.
8. An emergency plan, approved by the jurisdiction, is submitted to the building official where the building design specifies implementation of protection measures prior to the onset of flooding conditions.

Exceptions:

1. Minimum electric service required to address life safety and electric code requirements is permitted below the base flood elevation.
2. Plumbing fixtures and connections are permitted below the base flood elevation provided the fixtures and connections are designed and installed to minimize or eliminate infiltration of floodwaters into the sanitary sewage system and discharges from sanitary sewage systems into floodwaters.

Reason: Thousands of communities and state agencies have public open space and parks along rivers and shorelines. Many communities experience economic value from tourism and public access to areas that feature water resources. Under the current requirements of the IBC, restrooms for public use that are located in flood hazard areas must meet the same requirements as residential and commercial buildings. In flood hazard areas other than coastal high hazard areas and Coastal A Zones (i.e., in flood zones identified on Federal Emergency Management Agency Flood Insurance Rate Maps with the letter "A"), restroom buildings must either be elevated or dry floodproofed to or above the elevations required by the IBC/ASCE 24. In coastal high hazard areas (flood Zone V) and Coastal A Zones, restroom buildings must be elevated to or above the elevations required by the IBC/ASCE 24.

In Florida and other coastal states, this has resulted in construction of public use restrooms as high as 6 to 18 feet above grade. This poses many challenges, not the least of which is access. Figures 1, 2, 3 and 4 (below) illustrate elevated restrooms with long ramps. While ramps can be built to meet ADA requirements, to reach some heights required in some flood hazard areas the ramps may be as long as 300 feet. In coastal high hazard areas, such ramps likely conflict with the NFIP requirements that elevated buildings be "free of obstruction," and the presence of such ramps would likely interfere with the ability of walls around enclosures to break away under flood conditions. Those same provisions are required by IBC Section 1612, Flood Loads, which references ASCE 24, Flood Resistant Design and Construction.

Long ramps defeat accessibility when the distance of travel still renders restroom facilities inaccessible to many persons with disabilities or limited mobility. Although the IBC (and FEMA) permits elevators to extend below the base flood elevation, installing elevators to provide access to elevated public use restrooms is expensive and creates many maintenance issues, and a high rate of failure to function, especially in beach areas where blowing sand and windborne salt aerosols create corrosive conditions.

This proposal creates a new section in IBC Chapter 31, Special Construction to limit the scope to public use restrooms that include public use toilet rooms, bathrooms, showers and changing rooms and spaces. Portions of such buildings that include other uses would have to fully comply with the elevation and other flood resistant requirements of IBC Section 1612, Flood Loads, which references ASCE 24, Flood Resistant Design and Construction.

In recognition that most public use restrooms are built on public land using public funds, the proposal is to limit the potential financial losses associated with flooded public facilities in two ways: by limiting the footprint to not more than 1,500 square feet and by specifying design requirements that minimize or eliminate physical damage when flooding occurs. Enabling public use restrooms to be designed to withstand the hydrodynamic and hydrostatic loads below the base flood elevation is an appropriate alternative to the extremely high cost for design, construction and maintenance of highly elevated public restrooms and their required access ramps or elevators.

Although the proposed design requirements are intended to preclude significant damage during flood conditions up to and including conditions of the design flood (e.g., the base or 100-year flood), more severe floods can and do occur. Figure 5 (below) illustrates one modest design option that demonstrates the feasibility of the proposal. It shows a small masonry restroom on a beach after Hurricane Irma pushed onshore. The drawings for the building show below-grade piling support and it appears the masonry units were filled. Despite approximately 6-8 feet of flooding (including waves), there is no evidence of structural damage and the non-structural damage appears readily repairable.

The proposal includes requirements for flood resistance similar to those found in IBC Appendix G, Section G1001 for Utility and Miscellaneous Group U and similar to the requirements of ASCE 24-14 for Flood Design Class 1 (which is essentially equivalent to Structure/Risk Category I). Those requirements effectively are the same as the NFIP requirements in 44 Code of Federal Regulations Section 60.3(a)(3)(ii), (iii), and (iv). FEMA deems the flood provisions of the I-Codes, with reference to ASCE 24, to meet or exceed the requirements of the National Flood Insurance Program (NFIP).

The intent is to allow public use restrooms to be at-grade or above-grade but below the base flood (partially elevated), provided they meet the design requirements listed in 3112.2. The proponent acknowledges that, at present, FEMA guidance states that restroom buildings and comfort stations in coastal high hazard areas must be elevated and meet the same design and construction requirements as other buildings. This proposal is intended to meet the intent of all NFIP requirements, except elevation requirements, to minimize flood damage, while acknowledging the special needs and access required or appropriate for public use restrooms. The Florida Floodplain Management Association prepared a white paper on this subject: Policy and Design Options for Public Restrooms in Special Flood Hazard Areas (2014), www.FLfloods.org/ffmawhitepaper.

Figure 1. Florida, flood Zone V. Ramp wraps around entire building. Has composting toilets, battery and solar electric system, emergency plan requires pumping out tank and filling with clean water.

Figure 2. Coastal Mississippi, flood Zone V. This facility cost \$1.1 million.

Figure 3. Florida, Gulf Coast, flood Zone V. Ramp built after original elevator determined to be unsustainable due to significant maintenance problems.

Figure 4. Southwest Florida, flood Zone V. Extensive ramp wraps around three sides.

Figure 5. Florida, after Hurricane Irma, flood Zone V. No evidence of structural damage after estimated 5 ft stillwater plus waves. From upper left: facing beach, side, interior, rear.

Bibliography: Policy and Design Options for Public Restrooms in Special Flood Hazard Areas, Florida Floodplain Management Associations, 2014. 55 pages. www.FLfloods.org/ffmawhitepaper

Cost Impact: The code change proposal will decrease the cost of construction. The proposal will lower the initial cost of construction and lower routine and long-term facility maintenance. The cost to construct as specified in this proposal to resist the effects of flood hazards and flood loads may be somewhat higher than a typical non-elevated restroom building that is not designed to resist flood loads and flood damage (not currently allowed). However, the cost for construction under the proposal will be less than the cost to elevate and provide and maintain elevators and extensive ramp systems (current method of compliance).

G149-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal has some merit, but the language is too loose. "Public" could mean any building that is considered public in the Americans with Disabilities Act. "Governmental entities" may be a better term. (Vote: 9-5)

Assembly Action:

As Submitted

G149-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Steven Martin, Florida Division of Emergency Management, representing Florida Division of Emergency Management (steve.martin@em.myflorida.com); Douglas Wise, Palm Beach County, representing Building Officials Association of Florida (douglaswise@att.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

3101.1 Scope. The provisions of this chapter shall govern special building construction including *membrane structures*, temporary structures, *pedestrian walkways* and tunnels, automatic vehicular gates, awnings and *canopies*, marquees, signs, towers, antennas, relocatable buildings, swimming pool enclosures and safety devices, ~~and solar energy systems,~~ and public use restroom buildings on publicly owned lands in flood hazard areas.

~~3112~~3114 PUBLIC USE RESTROOM BUILDINGS IN FLOOD HAZARD AREAS

~~3112~~3114.1 General. ~~Public use restroom buildings that contain toilet rooms, bathrooms, showers and changing rooms, and those portions of buildings that contain~~ For the purpose of this section, public restroom buildings are located on publicly owned lands in flood hazard areas and intended for public use. Public restroom buildings and portions of other buildings that contain public restrooms, are limited to toilet rooms, bathrooms, showers and changing rooms, and where such, Public restroom buildings and portions of buildings are intended for public use and located on publicly owned lands in flood hazard areas, that contain public restrooms shall comply with the requirements of this section. Public use restrooms that are not elevated or dry floodproofed in accordance with Section 1612 shall comply with Section ~~3112~~3114.2. Portions of buildings that include uses other than public use toilet rooms, bathrooms, showers and changing rooms shall comply with Section 1612.

~~3112-2~~3114.2 Flood resistance. ~~Public use restrooms that are located on publicly owned lands in flood hazard areas shall comply with the requirements of ASCE 24, except for elevation requirements, and shall comply with all of the following criteria:~~

1. The building footprint is not more than 1,500 square feet.
2. Located, designed and constructed to resist the effects of flood hazards and flood loads to minimize flood damage from a combination of wind and water loads associated with the base flood.
3. Anchored to prevent flotation, collapse or lateral movement resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy during conditions of the base flood.
4. Constructed of flood damage-resistant materials.
5. Where enclosed by walls, the walls have flood openings.
6. Mechanical and electrical systems are located above the base flood elevation.
7. Plumbing fixtures and plumbing connections are located above the base flood elevation.
8. An emergency plan, approved by the jurisdiction, is submitted to the building official where the building design ~~specifies~~ documents specify implementation of protection measures prior to the onset of flooding conditions.

Exceptions:

1. Minimum necessary electric service equipment required to address health, life safety and electric code requirements is permitted below the base flood elevation in accordance with ASCE 24 provisions for electric elements installed below the minimum elevations.

2. Plumbing fixtures and connections are permitted below the base flood elevation provided the fixtures and connections are designed and installed to minimize or eliminate infiltration of floodwaters into the sanitary sewage system and discharges from sanitary sewage systems into floodwaters.

Commenter's Reason: This public comment addresses issues raised by committee members at the March 13, 2018 Committee Action Hearing by clarifying that this new section applies to public restroom buildings and portions of other buildings that contain public restrooms in flood hazard areas located only on publicly-owned land. The intent is to provide an alternative to elevating public restrooms in publicly-owned open spaces and parks along rivers and shorelines which otherwise may be challenging to access for persons with limited mobility because of excessively long ramps. Restrooms designed and constructed in accordance with this section, which references ASCE 24, Flood Resistant Design and Construction, will be minimal in nature and designed to resist flooding with minimal, if any damage.

FEMA deployed a Mitigation Assessment Team after Hurricane Irma to investigate damage, including how public restrooms were affected. The results of that field work were not released as of the deadline for submission of this public comment. Florida Division of Emergency Management staff participated in the field work and, along with the other team members, observed some below-BFE small public restrooms designed to resist flood loads that sustained superficial damage (finishes and fixtures) and were readily repairable. At a June 2018 meeting between the Florida Division of Emergency Management and senior management officials with the FEMA Flood Insurance and Mitigation Administration, FEMA concurred with the public comment and indicated the agency would work to achieve consistency across agency programs to develop guidance or procedures based on the proposed amendment. No opposition to the proposal was expressed during that meeting.

Another clarification to the proposal is to specify the minimum necessary "electric equipment" (rather than "electric service") that may be below the base flood elevation. ASCE 24 specifies requirements for electric elements installed below minimum required elevations, including conduits and cables; lighting circuits, switches, receptacles, and fixtures; wiring and splices suitable for submergence; and energizing from distribution panels located above and accessible from above flood elevation supplied by branch circuits originating from ground-fault circuit-interrupter breakers. ASCE 24 also requires installations to be in accordance with NFPA 70, National Electric Code. The proponents will submit to ICC proposed text for the commentary volume that describes allowances for light switches and fixtures, GFCI receptacles, exhaust fans, and electrical equipment and attendant utilities that are the minimum necessary to meet health and life safety requirements.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This public comment clarifies the intent and does not change the cost impact submitted as part of the original proposal.

Public Comment 2:

Proponent: Assembly Action requests As Submitted.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 53% (71) to 47% (63) by eligible members online during the period of May 9 - May 23, 2018.

Proposed Change as Submitted

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new definition as follows

INTERMODAL SHIPPING CONTAINER. A six-sided steel unit originally constructed as a general cargo container used for the transport of goods and materials.

Revise as follows

3101.1 Scope. The provisions of this chapter shall govern special building construction including *membrane structures*, temporary structures, *pedestrian walkways* and tunnels, automatic vehicular gates, awnings and *canopies*, marquees, signs, towers, antennas, relocatable buildings, swimming pool enclosures and safety devices, ~~and solar energy systems.~~ ~~systems and intermodal shipping containers.~~

Add new text as follows

SECTION 3114 INTERMODAL SHIPPING CONTAINERS

3114.1 General. The provisions of Section 3114 and other applicable sections of this code, shall apply to intermodal shipping containers that are repurposed for use as buildings or structures or as a part of buildings or structures.

Exceptions:

1. Intermodal shipping containers previously approved as existing relocatable buildings complying with Chapter 14 of the International Existing Building Code.
2. Stationary storage battery arrays located in intermodal shipping containers complying with Chapter 12 of the International Fire Code.
3. Intermodal shipping containers that are listed as equipment complying with the standard for equipment, such as air chillers, engine generators, modular data centers, and other similar equipment.

3114.2 Construction Documents. The construction documents shall contain information to verify the dimensions and establish the physical properties of the steel components, and wood floor components, of the intermodal shipping container in addition to the information required by Sections 107 and 1603.

3114.3 Intermodal shipping container information. Intermodal shipping containers shall bear an existing data plate containing the following information as required by ISO 6346 and verified by an approved agency. A report of the verification process and findings shall be provided to the building owner.

1. Manufacturer's name or identification number
2. Date manufactured.
3. Safety approval number.
4. Identification number.
5. Maximum operating gross mass (kg) (Lbs)
6. Allowable stacking load for 1.8G (kg) (lbs)
7. Transverse racking test force (Newtons)
8. Valid maintenance examination date

Where approved by the building official, the markings and existing data plate are permitted to be removed from the intermodal shipping containers before they are repurposed for use as buildings or structures or as a part of buildings or structures.

3114.4 Protection against decay and termites. Wood structural floors of intermodal shipping containers shall be protected from decay and termites in accordance with the applicable provisions of Section 2304.12.1.1.

3114.5 Under-floor ventilation. The space between the bottom of the floor joists and the earth under any intermodal shipping container, except spaces occupied by basements and cellars, shall be provided with ventilation in accordance with Section 1202.4.

3114.6 Roof assemblies. Intermodal shipping container roof assemblies shall comply with the applicable requirements of Chapter 15.

Exception: Single-unit stand-alone intermodal shipping containers not attached to, or stacked vertically over, other intermodal shipping containers, buildings or structures.

3114.7 Joints and voids. Joints and voids that create concealed spaces between intermodal shipping containers, that are connected or stacked, at fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved fire-resistant joint system in accordance with Section 715.

3114.8 Structural. Intermodal shipping containers which conform to ISO 1496-1 that are repurposed for use as buildings or structures, or as a part of buildings or structures, shall be designed in accordance with Chapter 16 and this section.

3114.8.1 Foundations. Intermodal shipping containers repurposed for use as a permanent building or structure shall be supported on foundations or other supporting structures designed and constructed in accordance with Chapters 16 through 23 of this code.

3114.8.1.1 Anchorage. Intermodal shipping containers shall be anchored to foundations or other supporting structures as necessary to provide a continuous load path for all applicable design and environmental loads in accordance with Chapter 16.

3114.8.2 Welds. All new welds and connections shall be equal to or greater than the original connections.

3114.8.3 Structural design. The structural design for the intermodal shipping containers repurposed for use as a building or structure, or as part of a building or structure, shall comply with Section 3114.8.4 or 3114.8.5.

3114.8.4 Detailed design procedure. A structural analysis meeting the requirements of this section shall be provided to the building official to demonstrate the structural adequacy of the intermodal shipping containers.

Exception: Intermodal shipping containers designed in accordance with Section 3114.8.5.

3114.8.4.1 Material properties. Structural material properties for existing intermodal shipping container steel components shall be established by material testing where the steel grade and composition cannot be identified by the manufacturer's designation as to manufacture and mill test.

3114.8.4.2 Seismic design parameters. The appropriate detailing requirements of ASCE 7; response modification coefficient, R ; overstrength factor, δ_{10} ; deflection amplification factor, C_d ; and limits on structural height, h_n , for the corrugated shear wall is permitted to be developed in accordance with generally accepted procedures where approved by the building official in accordance with Section 104.11. The seismic force-resisting system shall be designed and detailed in accordance with one of the following:

1. Where all or portions of the corrugated steel container sides are considered to be the seismic force-resisting system, design and detailing shall be in accordance with the ASCE 7 Table 12.2-1 requirements for light-frame bearing-wall systems with shear panels of all other materials, occupancies with an occupant load of 50 or less.
2. Where portions of the corrugated steel container sides are retained, but are not considered to be the seismic force-resisting system, an independent seismic force-resisting system shall be selected, designed and detailed in accordance with ASCE 7 Table 12.2-1, or
3. Where portions of the corrugated steel container sides are retained and integrated into a seismic force-resisting system other than as permitted by Section 3114.4.2 Item 1, seismic design parameters shall be developed from testing and analysis in accordance with Section 104.11 and ASCE 7 Section 12.2.1.1 or 12.2.1.2.

3114.8.4.3 Allowable shear value. The allowable shear values for the intermodal shipping container corrugated steel sheet panel side walls and end walls shall be demonstrated by testing and analysis in accordance with Section 104.11.

Where penetrations are made in the side walls or end walls designated as part of the lateral force-resisting system, the penetrations shall be substantiated by rational analysis.

3114.8.5 Simplified structural design of single-unit containers. Single-unit intermodal shipping containers conforming to the limitations of Section 3114.8.5.1 shall be permitted to be designed in accordance with the simplified structural design provisions of Section 3114.8.5.

3114.8.5.1 Limitations. Use of Section 3114.8.5 is subject to all the following limitations:

1. The intermodal shipping container shall be a single-unit, stand-alone unit supported on a foundation and shall not be in contact with or supporting any other shipping container or other structure.
2. The intermodal shipping container top and bottom rails, corner castings, and columns or any portion thereof shall not be notched, cut, or removed in any manner.
3. The intermodal shipping container shall be erected in a level and horizontal position with the floor located at the bottom.
4. The intermodal shipping container shall be located in Seismic Design Category A, B, C or D.

3114.8.5.2 Simplified structural design. Where permitted by Section 3114.8.5.1, single-unit, stand-alone intermodal shipping containers shall be designed using the following assumptions for the corrugated steel shear walls:

1. The appropriate detailing requirements contained in Chapters 16 through 23.
2. Response modification coefficient, $R=2$.
3. Overstrength factor, $\Omega_0=2.5$.
4. Deflection amplification factor, $C_d=2$, and
5. Limits on structural height, $h_n=9.5$ feet (2,900 mm).

3114.8.5.3 Allowable shear. The allowable shear for the corrugated steel side walls (longitudinal) and end walls (transverse) for wind design and for seismic design using the coefficients of Section 3114.8.5.2 shall be permitted to have the allowable shear values set forth in Table 3114.8.5.3 provided that all of the following conditions are met:

1. The total linear length of all openings in any individual side walls or end walls shall be limited to not more than 50% of the length of that side walls or end walls, as shown in Figure 3114.8.5.3(1).
2. Any full height wall length, or portion thereof, less than 4 feet (305 mm) long shall not be considered as a portion of the lateral force-resisting system, as shown in Figure 3114.8.5.3(2).
3. All side walls or end walls used as part of the lateral force-resisting system shall have an existing or new boundary element on all sides to form a continuous load path, or paths, with adequate strength and stiffness to transfer all forces from the point of application to the final point of resistance, as shown in Figure 3114.8.5.3(3).
4. Where openings are made in container walls, floors, or roofs for doors, windows and other openings:
 - 4.1 The openings shall be framed with steel elements that are designed in accordance with Chapter 16 and Chapter 22.
 - 4.2 The cross section and material grade of any new steel element shall be equal to or greater than the steel element removed.
5. A maximum of one penetration not greater than a 6-inch (152 mm) diameter hole for conduits, pipes, tubes or vents, or not greater than 16 square inches (10,322 sq mm) for electrical boxes, is permitted for each individual 8 foot length (2,438 mm) lateral force resisting wall. Penetrations located in walls that are not part of the wall lateral force resisting system shall not be limited in size or quantity. Existing intermodal shipping container vents shall not be considered a penetration, as shown in Figure 3114.8.5.3(4).
6. End wall door or doors designated as part of the lateral force-resisting system shall be welded closed.

3114.8.5.3(1)
Bracing Unit Distribution--Maximum Linear Length

3114.8.5.3(2)
Bracing Unit Distribution -- Minimum Linear Length

3114.8.5.3(4)
Bracing Unit Distribution -- Penetration Limitations

3114.8.5.3(3)
Bracing Unit Distribution -- Boundary Elements

TABLE 3114.8.5.3
Allowable Strength Values for Intermodal Shipping Container Corrugated Steel Siding Shear Walls
for Wind or Seismic Loading

CONTAINER DESIGNATION ²	CONTAINER DIMENSION (Nominal Length)	CONTAINER DIMENSION (Nominal Height)	ALLOWABLE SHEAR VALUES (PLF) ^{1,3}	
			Side Wall	End Wall
1EEE	45 feet (13.7 M)	9.5 feet (2896 mm)	75	843
1EE		8.6 feet (2591 mm)		
1AAA	40 feet (12.2 M)	9.5 feet (2896 mm)	84	
1AA		8.5 feet (2592 mm)		
1A		8.0 feet (2438 mm)		
1AX		< 8.0 feet (2438 mm)		
1BBB	30 feet (9.1 M)	9.5 feet (2896 mm)	112	
1BB		8.5 feet (2591 mm)		
1B		8.0 feet (2438 mm)		
1BX		< 8.0 feet (2438 mm)		
1CC	20 feet (9.1 M)	8.5 feet (2591 mm)	168	
1C		8.0 feet (2438 mm)		
1CX		< 8.0 feet (2438 mm)		
1D	10 feet (3.0 M)	8.0 feet (2438 mm)	337	
1DX		< 8.0 feet (2438 mm)		

1. The allowable strength shear for the side walls and end walls of the intermodal shipping containers are derived from ISO 1496-1 and reduced by a factor of safety of 5.
2. Container designation type is derived from ISO 668.
3. Limitations of Sections 3114.8.5.1 shall apply.

Add new standard(s) follows

ISO

International Organization for
Standardization
Chemin de Blandonnet 8 CP 401
1214 Vernier

ISO 668: 2013:**Series 1 Freight Containers - Classifications, dimensions and ratings**
ISO 1496-1: 2013:**Series 1 Freight Containers - Specification and Testing - Part 1: General Cargo Containers for General Purposes****ISO 6346: 1995, with Amendment 3: 2012:****Freight Containers - Coding, Identification and marking**

Reason: This code change purpose is to introduce intermodal shipping containers into the International Building Code based on requests by code officials in the U.S. Prior to this proposal, several jurisdictions had created their own individual regulations or ordinances, or had administered additional requirements beyond the code (e.g. Section 104.11 "Alternative materials, design and methods of construction and equipment") so as to be comfortable to ensure a safe structure. This code change proposal is in response to those requests to develop a set of consistent code provisions which cover the minimum safety requirements, but which do not duplicate existing code provisions.

This proposal covers:

- Creation of a new definition in order to separate the container from other I-code sections which refer to, but intentionally do not define, shipping containers,
- Creating exceptions so to differentiate the intermodal shipping container from other code sections which could be interpreted as applying to intermodal shipping containers under other applications (e.g. temporary storage, relocatable buildings, energy storage facilities, and listed equipment),
- Verification of containers construction, condition, and structural integrity to assist the structural engineer in the evaluation for building construction,
- References to other sections concerning foundations, decay and termite control, crawlspace ventilation, roof assemblies, interior finishes, and joints/intersections.
- Introduction of structural provisions unique to intermodal shipping containers and which do not duplicate the existing structural requirements, and
- Addition of three ISO standards for reference.

Chapter 2 - New definition - A new definition has been created in order that these provisions can be adequately enforced and not confused the other multiple varieties of definitions of containers currently in the market.

Section 3114.1 - This represents the charging statement that outlines the requirements for containers, and list the appropriate exceptions with the I-codes in order to coordinate with other provisions that may appear similar in nature and where intermodal shipping containers could possibly be used in those other applications.

Section 3114.2 - Construction documents - These provision emphasize the material requirements as specified in this section.

Section 3114.3 - Verification - These provisions focus on the characteristics of the intermodal shipping container prior to it being repurposed. In this case the provisions require a straight forward inspection by an approved agency, and verification of the data plate which is normally found on intermodal shipping containers. There was an intent not to specify who the approved agency would be for two reasons; 1) so as to allow the code official or state law(s) to handle this aspect recognizing that in each jurisdiction their requirements may be different, and 2) to avoid dictating an international agreement onto jurisdictions that are currently employed by the shipping and container manufacturers worldwide today. In this case, the standards are regulated by the International Convention of Safe Containers (CSC) that have policies and procedures for inspecting containers worldwide. These procedures include policies for Approved Continuous Examination Program (ACEP) at the time the container is used in production, and policies for third party inspection agencies. The list shown in this section is a extract from the ISO standard and serves as a reference of items to be verified in order to validate the type of container.

3114.4 through 3114.6 - While we have strived to focus on only those provisions that recognize the unique aspects of intermodal shipping containers, we felt that some direction references were appropriate. In this case specific pointers are provided to foundations, decay and termite control, crawlspace ventilation, and roof requirements addressing drainage and weather protection.

3114.7 - Joints and voids - This provision is provided to address the interstitial spaces that may be created when multiple intermodal shipping containers are connected or stacked, whereby that concealed space between the containers is protected to prevent fire and hot gasses from passing between containers.

Section 3114.8 - Structural - The structural provisions are divided into multiple categories, as follows: 1) the general characteristics for all containers; 2) engineered structural design; and 3) simplified method for single-unit stand-alone container.

3114.8.1 - Foundations or supports - Provisions have been included to outline the two options for securing the container; a foundation or the connection to another structure. This provision makes it clear that the load path anchorage is required for all containers and to ensure the designed performance provided by the remainder of the structural provisions.

3114.8.2 - Welds - An additional provision has been added to require that any new welds be designed and installed with welds of greater structural capabilities.

Section 3114.8.4 - Detailed structural analysis - The detailed analysis engineering approach represents the general engineering practice allowed for all other types of building constructions. For this section the engineer of record is allowed to practice as they normally would for any other building type. As may be noted much of this section requires submission through the alternative means and methods provisions in order to obtain a permit as information about intermodal shipping containers is not readily listed in the IBC provisions or referenced standards.

Section 3114.8.5 - Simplified analysis - The concept for the single container approach is to make the design and construction process simpler. The provisions include a strict listing of limitations for use of these provisions. The proposal also provides structural design information, and pre-established shear wall information that is contained in the ISO 1496-1 standard, which is used to design and construct intermodal shipping containers. The shear wall values were obtained from the ISO 1496-1 standard through engineering analysis using a factor of safety of 5. In addition, a provision was installed to limit the number and size of openings and service holes within the container, as well as to prevent building owners or designers from embellishing the size to something most engineers would define as an opening. This method is intended to address the simple structure approach and provide available information for use by the structural engineer to supplement their work.

Chapter 35 - Referenced Standards - Included with this proposal are three ISO standards which are relevant to the intermodal shipping container's construction. These standards are part of the industry standards regulated by the International Convention of Safe Containers (CSC) that have policies and procedures for inspecting containers worldwide.

BCAC - The International Code Council's Building Code Action Committee (BCAC) was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

The ICC Building Code Action Committee created a task group to facilitate the development of this proposal. Members of the assigned task group included representatives from: City of Long Beach, CA; County of Mecklenburg, NC; Modular Building Institute; American Iron and Steel Institute; Underwriters Laboratories; and the Portland Cement Association. Additional contacts included the State of California (Division of State Architect, Housing and Community Development), City of San Diego; City of Los Angeles, CA; City of Seattle; Clark County, NV; Falcon Structures, RADCO a Twining Company, SEABOX Company, FEMA ATC Seismic Code Support Committee, and other guests who provided their individual expertise.

Cost Impact: The code change proposal will decrease the cost of construction. The code change proposal will decrease the cost of construction. This new code section will provide clarity on how to consistently design with, permit, and field inspect shipping containers that are repurposed for building construction. Current use of repurposed intermodal shipping containers requires the building owner or designee to submit through the alternative means and methods administrative provisions.

Analysis: A review of the standards proposed for inclusion in the code, ISO 668, ISO 1496-1 and ISO 6346, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

G151-18

Public Hearing Results

Errata: The proposed table has been corrected.

Committee Action:

As Modified

Committee Modification: 3114.1 General. The provisions of Section 3114 and other applicable sections of this code, shall apply to intermodal shipping containers that are repurposed for use as buildings or structures or as a part of buildings or structures.

Exceptions:

Intermodal shipping containers previously approved as existing relocatable buildings complying with Chapter 14 of the International Existing Building Code.

Stationary storage battery arrays located in intermodal shipping containers complying with Chapter 12 of the International Fire Code.

Intermodal shipping containers that are listed as equipment complying with the standard for equipment, such as air chillers, engine generators, modular data centers, and other similar equipment.

Intermodal shipping containers used as experimental equipment or apparatuses.

3114.3 Intermodal shipping container information. Intermodal shipping containers shall bear an existing data plate containing the following information as required by ISO 6346 and verified by an approved agency. A report of the verification process and findings shall be provided to the building owner.

Manufacturer's name or identification number

Date manufactured.

Safety approval number.

Identification number.

Maximum operating gross mass or weight (kg) (Lbs)

Allowable stacking load for 1.8G (kg) (lbs)

Transverse racking test force (Newtons)

Valid maintenance examination date

Where approved by the building official, the markings and existing data are permitted to be removed from the intermodal shipping containers before they are repurposed for use as buildings or structures or as a part of buildings or structures.

3114.8.4.2 Seismic design parameters. ~~The appropriate detailing requirements of ASCE 7; response modification coefficient, R; overstrength factor; deflection amplification factor, C_d; and limits on structural height, h_n, for the corrugated shear wall is permitted to be developed in accordance with generally accepted procedures where approved by the building official in accordance with Section 104.11. The seismic force-resisting system shall be designed and detailed in accordance with one of the following:~~

Where all or portions of the corrugated steel container sides are considered to be the seismic force-resisting system, design and detailing shall be in accordance with the ASCE 7 Table 12.2-1 requirements for light-frame bearing-wall systems with shear panels of all other materials.

Where portions of the corrugated steel container sides are retained, but are not considered to be the seismic force-resisting system, an independent seismic force-resisting system shall be selected, designed and detailed in accordance with ASCE 7 Table 12.2-1, or

Where portions of the corrugated steel container sides are retained and integrated into a seismic force-resisting system other than as permitted by Section 3114.4.2 Item 1, seismic design parameters shall be developed from testing and analysis in accordance with Section 104.11 and ASCE 7 Section 12.2.1.1 or 12.2.1.2.

3114.8.5.3 Allowable shear. The allowable shear for the corrugated steel side walls (longitudinal) and end walls (transverse) for wind design and for seismic design using the coefficients of Section 3114.8.5.2 shall be ~~permitted to have the allowable shear values set forth in~~ in accordance with Table 3114.8.5.3 provided that all of the following conditions are met:

The total linear length of all openings in any individual side walls or end walls shall be limited to not more than 50% of the length of that side walls or end walls, as shown in Figure 3114.8.5.3(1).

Any full height wall length, or portion thereof, less than 4 feet (305 mm) long shall not be considered as a portion of the lateral force-resisting system, as shown in Figure 3114.8.5.3(2).

All side walls or end walls used as part of the lateral force-resisting system shall have an existing or new boundary element on all sides to form a continuous load path, or paths, with adequate strength and stiffness to transfer all forces from the point of application to the final point of resistance, as shown in Figure 3114.8.5.3(3).

Where openings are made in container walls, floors, or roofs for doors, windows and other openings: 4.1. The openings shall be framed with steel elements that are designed in accordance with Chapter 16 and Chapter 4.2. The cross section and material grade of any new steel element shall be equal to or greater than the steel element removed.

5. A maximum of one penetration not greater than a 6-inch (152 mm) diameter hole for conduits, pipes, tubes or vents, or not greater than 16 square inches (10,322 sq mm) for electrical boxes, is permitted for each individual 8 foot length (2,438 mm) lateral force resisting wall. Penetrations located in walls that are not part of the wall lateral force resisting system shall not be limited in size or quantity. Existing intermodal shipping container vents shall not be considered a penetration, as shown in Figure 3114.8.5.3(4).

6. End wall door or doors designated as part of the lateral force-resisting system shall be welded closed.

TABLE 3114.8.5.3

Allowable ~~Strength~~ Shear Values for Intermodal Shipping Container Corrugated Steel Siding Shear Walls for Wind or Seismic Loading

(No changes to body of table)

The allowable ~~strength~~ shear for the side walls and end walls of the intermodal shipping containers are derived from ISO 1496-1 and reduced by a factor of safety of 5.

Container designation type is derived from ISO 668.

Limitations of Sections 3114.8.5.1 shall apply

(Portions of proposal not shown are not modified)

Committee Reason: The modifications add clarifications that will help the approval process go smoothly, but the committee would like to see a public comment to change the term "corrugated" container to "intermodal" container to be consistent with other language in the proposal. Other discrepancies in the modifications are minor and could also be cleaned up in the public comment process. The proposal addresses a need for guidance regarding the approval of intermodal shipping containers in the context of the building code. (Vote: 14-0)

Assembly Action:

None

G151-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

3114.1 General. The provisions of Section 3114 and other applicable sections of this code, shall apply to intermodal shipping containers that are repurposed for use as buildings or structures or as a part of buildings or structures.

Exceptions:

1. Intermodal shipping containers previously approved as existing relocatable buildings complying with Chapter 14 of the International Existing Building Code.
2. Stationary storage battery arrays located in intermodal shipping containers complying with Chapter 12 of the International Fire Code.
3. Intermodal shipping containers that are listed as equipment complying with the standard for equipment, such as air chillers, engine generators, modular data centers, and other similar equipment.
4. Intermodal shipping containers housing or supporting experimental equipment are exempt from the requirements of Section 3114 provided they comply with all of the following:
 - 4.1. Such units shall be single stand-alone units supported at grade level and used as experimental equipment or apparatuses, only for occupancies as specified under Risk Category I in Table 1604.5;
 - 4.2. Such units are located a minimum of 8 feet from adjacent structures, and are not connected to a fuel gas system or fuel gas utility; and
 - 4.3. In hurricane-prone regions and flood hazard areas, such units are designed in accordance with the applicable provisions of Chapter 16.

Commenter's Reason: Without scoping limits, this exception could permit varying uses and locations in which the container could pose substantial earthquake safety hazard to surrounding structures and persons. This could include containers located in or on structures, where container shifting could damage the structure, or fall and injure persons in the vicinity. This could also include fire hazard if a container shifts and gas lines are damaged. This safety concern is addressed by the public comment language which provides scoping limits defining conditions under which risk is minimal such that regulation of the structural design and anchorage is not needed. The proposed language addresses:

- Occupancies that represent low risk to human life,
- Supported at grade where the risk of damage or injury due to falling is minimal,
- Eight foot distance to surrounding structures provides a zone for container shifting without causing damage to other structures,
- Prohibition of fuel gas intends to avoid fire ignition hazards should the container shift under seismic or wind loading,
- For hurricane prone and flood hazard areas, Chapter 16 will trigger requirements to reduce hazard.

These are believed to be scoping limits that can be readily screened for, permitting true low-hazard uses to occur with minimal regulation.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The resulting new provisions will provide clarity on how to consistently design with, permit, and field inspect shipping containers that are repurposed for building construction. Current use of repurposed intermodal shipping containers requires the building owner or designee to submit through the alternative means and methods administrative provisions.

Public Comment 2:

Proponent: Ed Kullik, representing ICC Building Code Action Committee (bcac@icc-safe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

**TABLE 3114.8.5.3
Allowable Shear Values for Intermodal Shipping Container Corrugated Steel Siding Shear-Walls
for Wind or Seismic Loading**

CONTAINER DESIGNATION ²	CONTAINER DIMENSION (Nominal Length)	CONTAINER DIMENSION (Nominal Height)	ALLOWABLE SHEAR VALUES (PLF) ^{1,3}	
			Side Wall	End Wall
1EEE	45 feet (13.7 M)	9.5 feet (2896 mm)	75	843
1EE		8.6 feet (2591 mm)		
1AAA	40 feet (12.2 M)	9.5 feet (2896 mm)	84	
1AA		8.5 feet (2592 mm)		
1A		8.0 feet (2438 mm)		
1AX				
1BBB	30 feet (9.1 M)	9.5 feet (2896 mm)	112	
1BB		8.5 feet (2591 mm)		
1B		8.0 feet (2438 mm)		
1BX				
1CC	20 feet (9.1 M)	8.5 feet (2591 mm)	168	
1C		8.0 feet (2438 mm)		
1CX				
1D	10 feet (3.0 M)	8.0 feet (2438 mm)	337	
1DX				

1. The allowable shear for the side walls and end walls of the intermodal shipping containers are derived from ISO 1496-1 and reduced by a factor of safety of 5.
2. Container designation type is derived from ISO 668.
3. Limitations of Sections 3114.8.5.1 shall apply

3114.8.4.2 Seismic design parameters. The seismic force-resisting system shall be designed and detailed in accordance with one of the following:

1. Where all or portions of the corrugated steel container sides are considered to be the seismic force-resisting system, design and detailing shall be in accordance with the ASCE 7 Table 12.2-1 requirements for light-frame bearing-wall systems with shear panels of all other materials,
2. Where portions of the corrugated steel container sides are retained, but are not considered to be the seismic force-resisting system, an independent seismic force-resisting system shall be selected, designed and detailed in accordance with ASCE 7 Table 12.2-1, or
3. Where portions of the corrugated steel container sides are retained and integrated into a seismic force-resisting system other than as permitted by Section 3114.4.2 Item 1, seismic design parameters shall be developed from testing and analysis in accordance with Section 104.11 and ASCE 7 Section 12.2.1.1 or 12.2.1.2.

3114.8.5.3(4) Bracing Unit Distribution -- Penetration Limitations

Commenter's Reason: Section 3114.8.4.2 - This is an editorial correction in order to cite the correct section number. Table 3114.8.5.3 title - This represents a change to heading to delete "siding shear". The change is based on public testimony and comments received during the committee action hearing to keep terms consistent throughout the code change proposal.

Figures 3114.8.5.3 (1) through (4) - It was brought to our attention that it may be beneficial to identify parts of the intermodal shipping container more clearly rather than use a simple line drawing figure. This is for the benefit of the user to more readily recognize existing conditions versus the permissible cut-aways as allowed by Section 3114.8.5.3. In response we are proposing to add identifying text (the rails, lift slots, and holes) to illustrate those existing elements that are part of the manufacture of intermodal shipping containers.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The resulting new provisions will provide clarity on how to consistently design with, permit, and field inspect shipping containers that are repurposed for building construction. Current use of repurposed intermodal shipping containers requires the building owner or designee to submit through the alternative means and methods administrative provisions.

FS3-18

IBC: 703.5.1, Chapter 35

Proposed Change as Submitted

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing North American Insulation Manufacturers Association (NAIMA)

2018 International Building Code

Revise as follows

703.5.1 Elementary materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136, or ASTM E2652, using the acceptance criteria prescribed by ASTM E136.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959

E2652-16:

Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone-shaped Airflow Stabilizer at 750oC

Reason: Several of the I-Codes have varying definitions of the term “non-combustible material”, each based upon the way in which the concept of “non-combustible” is used within that Code. Throughout the ICC code system, the concept of “noncombustible material” is based on the idea that the material should not ignite or burn when subjected to fire or heat. Our intent is to require the same pass/fail criteria as currently exists in ASTM E136, using all fo the thermocouples required by ASTM E136, but using the ASTM E2652 apparatus. When ASTM E2652 is used, the pass/fail criteria and methodology are those required by ASTM E136.

The concept of “noncombustible materials” and “noncombustibility” in terms of types of construction is widely used throughout the International Codes. The IBC, IFC, IEBC and IFGC do not contain a separate definition of “noncombustible”, even though they use the terminology “non-combustible materials”.

In common usage, the term “noncombustible” is used to denote materials which do not ignite or are not capable of sustaining combustion. The common Dictionary definitions for “noncombustible” are typically as follows:

Noncombustible, adj - incapable of being burned

(Merriam -Webster’s International Dictionary of the English Language, Unabridged, 2013)

In the traditional use of the terminology and concept of “non-combustible” in the Codes has been based on acceptable performance when tested in accordance with ASTM E136, Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 Degrees C. Materials passing the test are permitted limited flaming and other indications of combustion. However, these have traditionally been acceptable. Understandably, ASTM E136 does not replicate the full spectrum of actual building fire exposure conditions. However, this test method does provide an assessment indicating those materials which do not act to aid combustion or add appreciable heat to an ambient fire.

ASTM has published another standard ASTM E2652-16, entitled Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C. This test method is similar to ASTM E136, but based on the international standard for Noncombustibility. The key difference between the two standards is in the equipment. The apparatuses in this test method and in Test Method E 136 is that the furnace tube in this test method has a conical air-flow stabilizer section attached at its bottom. Both test methods use cylindrical furnace tubes. Like ASTM E136, the test Standard does not include mandatory pass/fail criterion. It allows those criteria to be determined by the Codes or other users. Appendix X3 also contains a comparison of results obtained from this apparatus versus ASTM E136. ASTM E136 has already been revised to include ASTM E2652 as an alternate methodology.

Bibliography: ASTM E2652-16 - *Standard Test Method for Behavior of Materials in a Tube Furnace with a Cone- shaped Airflow Stabilizer, at 750°C*.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is an additional option only.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2562-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

FS3-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The proposal brings in a new standard as an option to ASTM E136. The two standards reference each other and are considered equivalent for testing materials. The committee expressed concern about the integration of FS2 and FS3, urging a public comment be submitted to meld FS3 revision into the format of the FS2 approved change. (Vote 14-0)

Assembly Action:

None

FS3-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

703.5 Noncombustibility tests. The tests indicated in ~~Sections~~ Section 703.5.1 and 703.5.2.1 shall serve as criteria for acceptance of building materials as set forth in Sections 602.2, 602.3 and 602.4 in Types I, II, III and IV construction. The term ~~"noncombustible"~~ "noncombustible" does not apply to the flame spread characteristics of *interior finish* or *trim* materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or flame spread beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

703.5.1 Elementary ~~Noncombustible~~ materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) thick that has a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as non-combustible.

~~**703.5.2 Composite materials.** Materials having a structural base of noncombustible material as determined in accordance with Section 703.5.1 with a surfacing not more than 0.125 inch (3.18 mm) thick that has a *flame spread index* not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible materials.~~

Commenter's Reason: This public comment incorporates into FS3 the changes accepted by the technical committee for both FS2 and FS3. This complies with the request of the technical committee. In the absence of this public comment, there may be a conflict between the code text approved in FS2 and FS3. This public comment uses the language accepted for FS2 and for FS3 and blends it.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment (and the public proposal) simply adds an alternate test method for assessing noncombustibility.

FS3-18

FS5-18

IBC: 703.8

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new text as follows

703.8 Determination of noncombustible protection time contribution. . The time, in minutes, contributed to the fire resistance rating by the noncombustible protection of mass timber building elements, components, or assemblies, shall be established through a comparison of assemblies tested using procedures set forth in ASTM E 119 or UL 263. The test assemblies shall be identical in construction, loading, and materials, other than the noncombustible protection. The two test assemblies shall be tested to the same criteria of structural failure.

1. Test Assembly 1 shall be without protection.
2. Test Assembly 2 shall include the representative noncombustible protection. The protection shall be fully defined in terms of configuration details, attachment details, joint sealing details, accessories and all other relevant details.

The noncombustible protection time contribution shall be determined by subtracting the fire resistance time, in minutes, of Test Assembly 1 from the fire resistance time, in minutes, of Test Assembly 2.

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB determined that the fire resistance rating of mass timber structural elements, embodied in a series of proposals including this one, shall consist of the inherent fire resistance rating of the mass timber and the additional fire resistance rating of the *Noncombustible Protection* described in new definitions proposals. The TWB determined that at least 2/3 of the required fire resistance rating should come from the *Noncombustible Protection*. The TWB decided to provide both a performance path, as embodied in this proposal, and a prescriptive path, embodied in another proposal for Section 722.7.

This proposal constitutes the performance path for determining the contribution of noncombustible protection for mass timber elements. The proposal outlines a protocol to accomplish this. This proposal should be considered as a companion proposal to the proposals creating new types of mass timber construction in Section 602.4 and the code proposal in Section 722.7. The proposed new Section 602.4 requires the use of noncombustible protection on most mass timber elements in most of the proposed new types of construction.

This proposal, new section 703.8, is created to provide the method by which any material not contained in the prescriptive Table in Section 722.7 may be tested to show the time, in minutes, which it contributes as *noncombustible protection*. This procedure is representative of the procedure used in the past to determine the protection times for various membranes in Section 722.6 Component Additive Method for wood construction. It is neither new nor ambiguous in its use. Recent testing by AWC confirms the values derived from historic testing. A report is available at the following link: <http://bit.ly/WFC-firetestofGWBonCLT> . This link was confirmed active on 12/27/17.

This procedure should not be confused with “membrane protection” which is based on temperature rise on the unexposed side of a membrane attached to construction elements. Noncombustible construction is, instead, noncombustible material meeting the requirements of Section 703.5. Its contribution to the fire resistance rating of any building element is determined by this proposed new section. Simply put, it is determined by measuring the fire resistance time, in minutes and determined by structural failure, of a mass timber building element and then conducting a second test measuring the fire resistance time, in minutes and determined by structural failure, of the identical mass timber element with identical load, construction and condition, but with the proposed noncombustible protection applied to it. The difference in time between the two samples is the contribution, in minutes, of the noncombustible protection.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

FS5-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The proponents have done their homework. This is how heavy timber should be done. The western fire test validated this approach and that should be taken into consideration. (Vote: 14-0)

Assembly Action:

None

FS5-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jonathan Humble, American Iron and Steel Institute, representing American Iron and Steel Institute (jhumble@steel.org)requests Disapprove.

Commenter's Reason: We recommend disapproval of this code change proposal. The proposal uses the phrase noncombustible protection time contribution which is misleading because the test process described allows both the contribution of the non-combustible protection in addition to the mass timber (wood) behind the protection to determine protection time.

This represents re-writing of an existing standard through the ICC code development process, which has historically been rejected in the past. This work should first be evaluated by the standard writing organizations.

Neither ASTM E119 or UL 263 contain criteria of structural failure (in those exact words) that FS5-18 suggests where it states, in part, "The two test assemblies shall be tested to the same criteria of structural failure ". As a result, because of use this different terminology from the test standards it is not clear what criteria should be used.

Bibliography: ASTM-E119, "Standard Test Methods for Fire Tests of Building Construction and Materials", ASTM International, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959
www.astm.org

UL-263, "Standard for Safety Fire Tests of Building Construction and Materials", UL Headquarters, 333 Pfingsten Road, Northbrook, IL 60062, USA

<http://www.ul.com>

https://www.standardsportal.org/usa_en/sdo/ul.as

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There will be no cost impact because if disapproved the materials in question will have to follow the current IBC requirements for fire resistance.

Public Comment 2:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

FS5-18

FS6-18

IBC: 703.9 (New), Chapter 35

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new text as follows

703.9 Sealing of adjacent mass timber elements. In buildings of Type IVA, IVB, and IVC construction, sealant or adhesive shall be provided to resist the passage of air in the following locations:

1. At abutting edges and intersections of mass timber building elements required to be fire resistance-rated
2. At abutting intersections of mass timber building elements and building elements of other materials where both are required to be fire resistance-rated.

Sealants shall meet the requirements of ASTM C920. Adhesives shall meet the requirements of ASTM D3498.

Exception:Where sealant or adhesive is not a required component of a fire resistance-rated assembly.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

D3498-03(2011):

Standard Specification for Adhesives for Field-Gluing Plywood to Lumber Framing for Floor Systems

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

Mass timber has inherent properties of fire resistance, serving both to provide structural fire resistance and to safeguard against the spread of fire and smoke within a building or the spread of fire between structures.

When mass timber panels are connected together, fire tests have demonstrated that it is important for the abutting edges and intersections in the plane of and between the different planes of panels that form a separation to be sealed. The structures tested as part of the fire tests supporting this submittal were constructed with this sealing.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3-1/2 minutes each, please visit:

<http://bit.ly/ATF-firetestvideos>.

Both of these links were confirmed active on 12/27/17.

The US CLT manual recommends a bead of construction adhesive. Construction adhesive or other sealant can be used to prevent air flow. When a wall or horizontal assembly serves as the separation between two atmospheres, a fire creates differential pressure where heated gasses raise the pressure and work to drive fire and hot gasses through the structure. Voids that are not properly sealed can serve as a conduit for air movement during a fire, so abutting edges and intersections are recommended to be sealed.

Periodic special inspections during construction are required to make sure it is clear that the appropriate sealant or

adhesive is used and to establish inspections to verify for ongoing quality control. However, Chapter 17 is a Group B topic. It will be taken up then. It is shown below for clarity and to emphasize the importance the TWB places on proper application of sealants and adhesives in mass timber construction.

1705.19 Sealing of Mass Timber. Periodic special inspections of sealants or adhesives shall be conducted where sealant or adhesive required by Section 703.9 is applied to mass timber building elements as designated in the approved construction documents.

Some panels are manufactured under proprietary processes to ensure there are no voids at these intersections. Where this proprietary process is incorporated and tested, there is no requirement for sealant or adhesive and an exception is provided for this instance. Where the sealant is not required and is not specifically excluded it is still considered to be a good practice covered by this section.

This code change proposal does not apply to “joints” as defined in Section 202 of the IBC as joints have their own requirements for the placement and inspection of fire resistant joint systems in IBC Section 715. Joints are defined as having an opening that is designed to accommodate building tolerances or to allow independent movement. Panels and members that are connected together as covered by this code change proposal do not meet the definition of a joint since they are rigidly connected and do not have an opening.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB of IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D3498-03(2011), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

FS6-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This is necessary to maintain the integrity of the system. It was suggested that a public comment related to the proposed modification may be in order. (Vote: 14-0)

Assembly Action:

None

FS6-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen DiGiovanni, representing Ad Hoc Committee for Tall Wood Buildings (sdigiovanni@clarkcountynv.gov) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

703.9 Sealing of adjacent mass timber elements. In buildings of Type IVA, IVB, and IVC construction, sealant or adhesive shall be provided to resist the passage of air in the following locations:

1. At abutting edges and intersections of mass timber building elements required to be fire resistance-rated
2. At abutting intersections of mass timber building elements and building elements of other materials where both are required to be fire resistance-rated.

Sealants shall meet the requirements of ASTM C920. Adhesives shall meet the requirements of ASTM D3498.

Exception: ~~Where sealant or adhesive is not~~ Sealants or adhesives need not be provided where they are not a required component of a tested fire resistance-rated assembly.

1705.19 Sealing of mass timber Periodic special inspections of sealants or adhesives shall be conducted where sealant or adhesive required by Section 703.9 is applied to mass timber building elements as designated in the approved construction documents.

Commenter's Reason: There are two changes proposed. The first change is to the exception for proposed Section 703.9. The original wording of the exception was not clear as to whether it exempted sealants from meeting the ASTM standards, or whether it was intended to exempt the sealant altogether. This exception is expanded to clarify that sealants and adhesives are not required where voids are a part of a tested fire assembly, when such assembly is tested without the use of sealants and adhesives in the void space. The second change adds a special inspection requirement to address sealants and adhesives that are a part of the required design. There is a need to ensure that the details of construction are adhered to, and the special inspection is seen as a means to ensure that these construction details are adequately emphasized during the construction process. This change was proposed as a modification during code hearings and ruled out of order at that time, and in doing so the committee suggested that the appropriate path for adding the special inspection requirement was to submit this public comment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Public Comment 2:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18,

G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

FS6-18

FS8-18

IBC: 704.6.1 (New)

Proposed Change as Submitted

Proponent: Crystal Sujeski, representing Crystal Sujeski (crystal.sujeski@fire.ca.gov)

2018 International Building Code

704.6 Attachments to structural members. The edges of lugs, brackets, rivets and bolt heads attached to structural members shall be permitted to extend to within 1 inch (25 mm) of the surface of the fire protection.

Add new text as follows

704.6.1 Secondary (non-structural) attachments to structural members. Where primary and secondary structural steel members require fire protection, secondary (non-structural) tubular steel attachments to those structural members shall be protected with the same fire resistive rating as required for the structural member. The protection shall extend from the structural member a distance of not less than 12 inches. An open tubular attachment shall be filled with an equivalent fire protection method for a distance of 12-inch length from the structural member, or the entire length of the open tube, whichever is less.

Reason: Primary structural frame members shall comply with Table 601 for fire resistance rating. Secondary (non-structural) steel tubes provide support for a building's exterior curtain wall and are thereby considered to be unrated members that do not require any fire protection. The connection of non-structural tubes to primary structural members has potentially adverse thermal effects on the required fire resistance rating of the primary steel frame members.

Building attachments for miscellaneous non-structural items (hangers, braces, framing tracks, erection lifting lugs, wall supports, etc.) are typically not required to be individually fire protected. In addition, fire resistance rated assemblies are tested without attachments, and with a homogeneous and continuous protection system or material. Thus, rated assemblies are explicitly limited to only the tested or approved components given in the published listing, which does not include bare steel attachments or discontinuous member protection. If such secondary steel attachments are connected to a fire resistance rated steel assembly, they may jeopardize the assembly's rating and protection system by the introduction of "thermal shorts", which can cause unexpected and excessive heat conduction, convection, or radiation through the attachment or its connection to the primary assembly.

The proposal to require a 12-inch extension of fireproofing on all non-structural attachments is based on a general industry practice as described in ANSI/UL 263 BXUV (exhibit C). Attached in the documentation is exhibit A, a letter from Steve Unser, a chief building official from the City of Creve Coeur, MO stating a policy to address the "12- inch rule" of fireproofing structural attachments to fireproofed beams and columns.

Moreover, in cases where an open tubular steel connection is utilized it is vital that the interior surfaces of the tube walls are fireproofed and the bottom ends of the tubes are closed. Without this protection, this condition results in bare (unprotected) steel areas at the attachment that could be directly exposed to radiant and convective heat from a fire source.

Attached (exhibit B1 and B2) is a modeling analysis of a high-rise project in Stockton, CA prepared by Jensen Hughes Senior Engineers Nestor Iwankiw and Thomas Forsythe. Their analysis further supports the proposed code change that would require fire proofing of secondary non-structural attachments.

Under the current code, fire-proofing requirements for non-structural attachments and their connections remain ambiguous. This lack of clarity makes fire protection enforcement difficult due to increased construction costs for contractors, builders and owners. Furthermore, special inspectors, fire and building officials are not taught to look for these deficiencies, resulting in numerous buildings with unprotected steel that can potentially have serious implications on public safety and welfare.

The proposal establishes a legal basis for requiring the additional fire protection as described herein.

The 'attached' documentation can be viewed at this link established 2/21/18

https://www.dropbox.com/sh/t0hlmrxf63gejfh/AABEvqgYih_QPK928kuUwazKa?dl=0

Cost Impact: The code change proposal will increase the cost of construction

This code change will increase the cost of construction; however, without additional fire protection the structural integrity of the building may be compromised.

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 704.6.1 Secondary ~~(non-structural)~~ attachments to structural members.

Where primary and secondary structural steel members require fire protection, secondary ~~(non-structural)~~ tubular steel attachments to those structural members shall be protected with the same fire resistive ~~rating material and thickness~~ as required for the structural member. The protection shall extend away from the structural member a distance of not less than 12 inches, or shall be applied to the entire length when the attachment is less than 12 inches long. ~~When the ends are open, the fire resistive material and thickness shall be applied to both exterior and interior of the tubular steel attachment. shall be filled with an equivalent fire protection method for a distance of 12-inch length from the structural member, or the entire length of the open tube, whichever is less.~~

Committee Reason: The modification refines the language to better reflect the intent of the proposal. The change clarifies an area of framing and the appropriate level of protection. Structural tubing has been a question of the years and there is evidence of heat transferring into the structure from such tubing. Perhaps a public comment expanding this solution to other attachments of shapes other than tubular. (Vote 11-3)

Assembly Action:

None

FS8-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Crystal Sujeski, representing Crystal Sujeski (crystal.sujeski@fire.ca.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

704.6.1 Secondary attachments to structural members. Where primary and secondary structural members require fire protection, secondary ~~tubular~~ steel attachments to those structural members shall be protected with the same fire resistive material and thickness as required for the structural member. The protection shall extend away from the structural member a distance of not less than 12 inches, or shall be applied to the entire length when the attachment is less than 12 inches long. When an attachment is hollow and the ends are open, the fire resistive material and thickness shall be applied to both the exterior and interior of the ~~tubular~~ hollow steel attachment.

Commenter's Reason: This public comment has modified the proposal FS-8 to address the committee comments to expand the requirements for fire protection to be all inclusive of secondary steel attachments and not just limited to tubular steel.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost of construction will be increased minimally, however without additional fire protection the structural integrity of the building may be compromised.

FS8-18

FS10-18

IBC: 202, 202, 704.14, 603.1, 722.5.2.2, 722.5.2.3

Proposed Change as Submitted

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

2018 International Building Code

SECTION 202 DEFINITIONS

Revise as follows

~~**[BF] INTUMESCENT FIRE-RESISTANT COATINGS-MATERIALS.** Thin film liquid mixture applied to substrates by brush, roller, spray or trowel which, intumescent fire-resistive material expands into a protective foamed layer to provide fire-resistant protection of the substrates when exposed to flame or intense heat.~~

Add new text as follows

704.14 Intumescent fire-resistant materials (IFRM). Intumescent fire-resistant materials (IFRM) shall be consistent with the fire-resistance rating, the listing and manufacturers installation instructions. The instructions shall include, but are not limited to, substrate condition, application temperatures, surface conditions and IFRM handling, storage, mixing, conveyance, method of application, curing and ventilation. The finished condition of IFRM applied to structural members or horizontal assemblies shall not, upon complete drying or curing, exhibit delamination.

Revise as follows

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings materials, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

722.5.2.2 Sprayed fire-resistant materials. The provisions in this section apply to structural steel beams and girders protected with sprayed fire-resistant materials. Larger or smaller beam and girder shapes shall be permitted to be substituted for beams specified in *approved* unrestrained or restrained fire-resistance-rated assemblies, provided that the thickness of the fire-resistant material is adjusted in accordance with the following expression:

$$h_2 = h_1 [(W_1 / D_1) + 0.60] / [(W_2 / D_2) + 0.60]$$

(Equation 7-17)

where:

h = Thickness of sprayed fire-resistant material in inches.

W = Weight of the structural steel beam or girder in pounds per linear foot.

D = Heated perimeter of the structural steel beam in inches.

Subscript 1 refers to the beam and fire-resistant material thickness in the *approved* assembly. Subscript 2 refers to the substitute beam or girder and the required thickness of fire-resistant material. The *fire resistance* of structural steel beams and girders protected with intumescent or mastic fire-resistant ~~coatings~~ materials shall be determined on the basis of fire-resistance tests in accordance with Section 703.2.

722.5.2.3 Structural steel trusses. The *fire resistance* of structural steel trusses protected with fire-resistant materials sprayed to each of the individual truss elements shall be permitted to be determined in accordance with this section. The thickness of the fire-resistant material shall be determined in accordance with Section 722.5.1.3. The weight-to-heated-perimeter ratio (W/D) of truss elements that can be simultaneously exposed to fire on all sides shall be determined on the same basis as columns, as specified in Section 722.5.1.1. The weight-to-heated-perimeter ratio (W/D) of truss elements that directly support floor or roof assembly shall be determined on the same basis as beams and girders, as specified in Section 722.5.2.1. The *fire resistance* of structural steel trusses protected with intumescent or mastic fire-resistant ~~coatings~~ materials shall be determined on the basis of *fire resistance* tests in accordance with Section 703.2.

Reason: There has been a section in the IBC that refers to Sprayed Fire-Resistant Materials (SFRM) for many years. Currently is no section in the IBC for a different type of material that produces the same result, Intumescent Fire-Resistant Materials (IFRM). The requirements for IFRM are as important as those for SFRM. Therefore, this section should be added to the code. The language is taken from the SFRM section and modified to fit IFRM's.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Adding this section to the code brings another option for fire-resistance in buildings.

FS10-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While there was support from committee members to change the terminology from 'coatings' to 'materials', the overall proposal was not ready for approval. The definition was found to be confusing. The wording of Section 704.14 implies that the IFRM meets the fire resistance rating where is the IFRM and the base to which it is applied that is meeting the rating. Section 705.15 should also be revised to correlate with the new definition. Committee encouraged the proponent to fix the various issues and bring a public comment to the Richmond hearing. (Vote 8-6)

Assembly Action:

None

FS10-18

Individual Consideration Agenda

Public Comment 1:

Proponent: William McHugh, The McHugh Company, representing National Fireproofing Contractors Association (billmchugh-jr@att.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

SECTION 202 DEFINITIONS

INTUMESCENT FIRE-RESISTANT MATERIALS. Thin film liquid mixture applied to substrates, intumescent fire-resistant material expands into a protective layer to provide fire-resistant protection of the substrates when exposed to flame or intense heat.

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent ~~and mastic~~ fire-resistant materials, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

704.14 Intumescent fire-resistant materials (IFRM). Intumescent fire-resistant materials (IFRM) shall be consistent with the fire-resistance rating, the listing and manufacturers installation instructions. The instructions shall include, but are not limited to, substrate condition, application temperatures, surface conditions and IFRM handling, storage, mixing, conveyance, method of application, curing and ventilation. The finished condition of IFRM applied to structural members or horizontal assemblies shall not, upon complete drying or curing, exhibit delamination. comply with Section 704.14.1

704.14.1 Intumescent fire-resistant materials (IFRM). Intumescent fire-resistant materials (IFRM) shall be installed in accordance with the listing and the manufacturers installation instructions.

722.5.1.3 Sprayed fire-resistant materials. The *fire resistance* of wide-flange structural steel columns protected with sprayed fire-resistant materials, as illustrated in Figure 722.5.1(5), shall be permitted to be determined from the following expression:

$$R = [C_1(W/D) + C_2]h$$

where:

(Equation 7-13)

R = Fire resistance (minutes).

h = Thickness of sprayed fire-resistant material (inches).

D = Heated perimeter of the structural steel column (inches).

C_1 and C_2 = Material-dependent constants.

W = Weight of structural steel columns (pounds per linear foot).

The *fire resistance* of structural steel columns protected with ~~intumescent or mastic fire-resistant coatings materials~~ shall be determined on the basis of *fire-resistance* tests in accordance with Section 703.2.

722.5.2.2 Sprayed fire-resistant materials. The provisions in this section apply to structural steel beams and girders protected with sprayed fire-resistant materials. Larger or smaller beam and girder shapes shall be permitted to be substituted for beams specified in *approved* unrestrained or restrained fire-resistance-rated assemblies, provided that the thickness of the fire-resistant material is adjusted in accordance with the following expression:

$$h_2 = h_1 [(W_1 / D_1) + 0.60] / [(W_2 / D_2) + 0.60]$$

where:

(Equation 7-17)

h = Thickness of sprayed fire-resistant material in inches.

W = Weight of the structural steel beam or girder in pounds per linear foot.

D = Heated perimeter of the structural steel beam in inches.

Subscript 1 refers to the beam and fire-resistant material thickness in the *approved* assembly.

Subscript 2 refers to the substitute beam or girder and the required thickness of fire-resistant material.

The *fire resistance* of structural steel beams and girders protected with ~~intumescent or mastic fire-resistant coatings materials~~ shall be determined on the basis of fire-resistance tests in accordance with Section 703.2.

722.5.2.3 Structural steel trusses. The *fire resistance* of structural steel trusses protected with fire-resistant materials sprayed to each of the individual truss elements shall be permitted to be determined in accordance with this section. The thickness of the fire-resistant material shall be determined in accordance with Section 722.5.1.3. The weight-to-heated-perimeter ratio (W/D) of truss elements that can be simultaneously exposed to fire on all sides shall be determined on the same basis as columns, as specified in Section 722.5.1.1. The weight-to-heated-perimeter ratio (W/D) of truss elements that directly support floor or roof assembly shall be determined on the same basis as beams and girders, as specified in Section 722.5.2.1. The *fire resistance* of structural steel trusses protected with ~~intumescent or mastic fire-resistant materials~~ shall be determined on the basis of *fire resistance* tests in accordance with Section 703.2.

[BF] 1705.15 ~~Mastic and intumescent~~ Intumescent fire-resistant coatings materials. *Special inspections* and tests for ~~mastic and intumescent fire-resistant coatings materials~~ applied to structural elements and decks shall be performed in accordance with AWCI 12-B. *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*.

Commenter's Reason: The concept of defining Intumescent fire-resistant Materials (IFRM) in the context of fireproofing had very positive comments from the Fire-Safety Committee. This public comment is submitted to address the objections of the opponents and suggestions from the committee to modify the sections 714, 722.5.1.3, 722.5.2.2, 722.5.2.3 and 1705.15, to make the definition clearer, and coordinate the new definition in other areas of the code that were not in the original proposal. Additionally, for additional clarity, section 714 was broken into two sections, with an installation section added for consistency among the material categories.

The key change was moving the term from Mastic and intumescent fire-resistant coatings to to the term Intumescent fire-resistant materials (IFRM). These IFRM s are defined and scoped for use as materials used with structural building elements and or assemblies. The IFRM s are not meant to be used to fill gaps at doors, windows, or used as firestopping.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is a terminology change and not a technical change and does not increase costs.

Proposed Change as Submitted

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Himself (sthomas@coloradocode.net)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows

BUILDING PROJECTION. An unenclosed floor, roof or appendage extending beyond the exterior wall of a building such as, but not limited to cornices, eave overhangs, exterior decks or balconies, porte cocheres and similar protrusions.

Revise as follows

705.2 ~~Projections.~~ Building projections. ~~Cornices, eave overhangs, exterior balconies and similar projections extending beyond the exterior wall.~~ Building projections shall conform to the requirements of this section and Section 1405. Exterior egress balconies and exterior exit stairways and ramps shall comply with Sections 1021 and 1027, respectively. ~~Projections.~~ Building projections shall not extend any closer to the line used to determine the *fire separation distance* than shown in Table 705.2.

Exception: Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section for projections between the buildings.

**TABLE 705.2
MINIMUM DISTANCE OF BUILDING PROJECTION**

FIRE SEPARATION DISTANCE-FSD (feet)	MINIMUM DISTANCE FROM LINE USED TO DETERMINE FSD
0 to less than 2	Projections not permitted
2 to less than 3	24 inches
3 to less than 5	24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof
5 or greater	40 inches

For SI: 1 foot = 304.8 mm; 1 inch = 25.4 mm.

705.2.1 Types I and II construction. ~~Projections.~~ Building projections from walls of Type I or II construction shall be of noncombustible materials or combustible materials as allowed by Sections 705.2.3.1 and 705.2.4.

705.2.2 Type III, IV or V construction. ~~Projections.~~ Building projections from walls of Type III, IV or V construction shall be of any *approved* material.

705.2.3 Combustible building projections. Combustible building projections extending to within 5 feet (1524 mm) of the line used to determine the *fire separation distance* shall be of not less than 1-hour *fire-resistance-rated* construction, heavy timber construction, complying with Section 2304.11, *fire-retardant-treated wood* or as permitted by Section 705.2.3.1.

Exception: Type VB construction shall be allowed for combustible projections in Group R-3 and U occupancies with a *fire separation distance* greater than or equal to 5 feet (1524 mm).

705.2.3.1 Balconies and similar projections. Balconies, decks and similar building projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of heavy timber construction in accordance with Section 2304.11. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:

1. On buildings of Types I and II construction, three stories or less above grade plane, fire-retardant-treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood and plastic composites that comply with ASTM D7032 and Section 2612 are permitted for pickets, rails and similar guard components that are limited to 42 inches (1067 mm) in height.
3. Balconies, decks and similar projections on buildings of Types III, IV and V construction shall be permitted to be of Type V construction and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony or deck areas, the aggregate length of the balcony on each floor shall not be limited.

705.3 Buildings on the same lot. For the purposes of determining the required wall and opening protection, building projections and roof-covering requirements, buildings on the same lot shall be assumed to have an imaginary line between them.

Where a new building is to be erected on the same lot as an existing building, the location of the assumed imaginary line with relation to the existing building shall be such that the *exterior wall* and opening protection of the existing building meet the criteria as set forth in Sections 705.5 and 705.8.

Exceptions:

1. Two or more buildings on the same lot shall be either regulated as separate buildings or shall be considered as portions of one building if the aggregate area of such buildings is within the limits specified in Chapter 5 for a single building. Where the buildings contain different occupancy groups or are of different types of construction, the area shall be that allowed for the most restrictive occupancy or construction.
2. Where an S-2 parking garage of Construction Type I or IIA is erected on the same lot as a Group R-2 building, and there is no *fire separation distance* between these buildings, then the adjoining *exterior walls* between the buildings are permitted to have occupant use openings in accordance with Section 706.8. However, opening protectives in such openings shall only be required in the exterior wall of the S-2 parking garage, not in the exterior wall openings in the R-2 building, and these opening protectives in the exterior wall of the S-2 parking garage shall be not less than 1¹/₂-hour *fire protection rating*.

Reason: The committee felt that a definition for building projections would be helpful in the administering of the code. We submitted a public comment and received opposition to the revised language. We have taken the comments from the committee hearing and the public comment hearing and created this proposal. There is quite a bit of confusion as to what a projection is. We have provided guidance and examples of what we feel are projections. The term unenclosed floors is intended to keep from having a upper story that is enclosed from being called a projection. Decks and balconies would be examples of unenclosed floors.

We have also changed the term 'Projection' to 'Building Projection' to differentiate this definition from other sections of the code that uses similar language. For example projection rooms and projections into ramps. It is not our intent to apply this definition to those sections of the code. The rest of the change involves coordinating the existing language with the new definition.

The fire characteristics are different for projections than they are for horizontal assemblies within a building. First there is no enclosed space above the projection. The second is that the heat and smoke from a fire under a projection will go up and then out to the atmosphere. The heat and smoke is not trapped within a room like it is within a building. That is why I believe projections are handled differently in the code.

The photo below is the porte cochere entry at the City Center project in Clark County, Nevada. The question is what is this structure. Is it a projection that is regulated by Section 705.2 or is a building element regulated by Table 601. That is the question I am trying to clarify in the code. This change would clarify that this structure would be a projection and would need to comply with Section 705.2

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a clarification of the current code.

FS15-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal had merit but still had issues that need resolution. The definition should be refined. There needs to be a selection of term - architectural vs building. The issue of unenclosed elements needs to be better addressed. (Vote 9-5)

Assembly Action:

None

FS15-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

~~BUILDING-ARCHITECTURAL PROJECTION.~~ ~~An unenclosed~~ A floor, roof or other appendage extending outward from and beyond the exterior wall of a building such as, but not limited to cornices, eave overhangs, exterior decks or balconies, porte cocheres and similar protrusions.

705.2 ~~Building Architectural projections.~~ ~~Building Architectural~~ projections shall conform to the requirements of this section and Section 1405. Exterior egress balconies and exterior exit stairways and ramps shall comply with Sections 1021 and 1027, respectively. ~~Building Architectural~~ projections shall not extend any closer to the line used to determine the *fire separation distance* than shown in Table 705.2.

Exception: Buildings on the same lot and considered as portions of one building in accordance with Section 705.3 are not required to comply with this section for projections between the buildings.

705.2.1 Types I and II construction. ~~Building Architectural~~ projections from walls of Type I or II construction shall be of noncombustible materials or combustible materials as allowed by Sections 705.2.3.1 and 705.2.4.

705.2.2 Type III, IV or V construction. ~~Building Architectural~~ projections from walls of Type III, IV or V construction shall be of any *approved* material.

705.2.3 Combustible ~~building architectural~~ projections. Combustible ~~building architectural~~ projections extending to within 5 feet (1524 mm) of the line used to determine the *fire separation distance* shall be of not less than 1-hour *fire-resistance-rated* construction, heavy timber construction, complying with Section 2304.11, *fire-retardant-treated wood* or as permitted by Section 705.2.3.1.

Exception: Type VB construction shall be allowed for combustible architectural projections in Group R-3 and U occupancies with a *fire separation distance* greater than or equal to 5 feet (1524 mm).

705.2.3.1 Balconies and similar architectural projections. Balconies, decks and similar ~~building architectural~~ projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of heavy timber construction in accordance with Section 2304.11. The aggregate length of the architectural projections shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:

1. On buildings of Types I and II construction, three stories or less above grade plane, fire-retardant-treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood and plastic composites that comply with ASTM D7032 and Section 2612 are permitted for pickets, rails and similar guard components that are limited to 42 inches (1067 mm) in height.
3. Balconies, decks and similar projections on buildings of Types III, IV and V construction shall be permitted to be of Type V construction and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony or deck areas, the aggregate length of the balcony on each floor shall not be limited.

705.3 Buildings on the same lot. For the purposes of determining the required wall and opening protection, ~~building architectural~~ projections and roof-covering requirements, buildings on the same lot shall be assumed to have an imaginary line between them.

Where a new building is to be erected on the same lot as an existing building, the location of the assumed imaginary line with relation to the existing building shall be such that the *exterior wall* and opening protection of the existing building meet the criteria as set forth in Sections 705.5 and 705.8.

Exceptions:

1. Two or more buildings on the same lot shall be either regulated as separate buildings or shall be considered as portions of one building if the aggregate area of such buildings is within the limits specified in Chapter 5 for a single building. Where the buildings contain different occupancy groups or are of different types of construction, the area shall be that allowed for the most restrictive occupancy or construction.
2. Where an S-2 parking garage of Construction Type I or IIA is erected on the same lot as a Group R-2 building, and there is no *fire separation distance* between these buildings, then the adjoining *exterior walls* between the buildings are permitted to have occupant use openings in accordance with Section 706.8. However, opening protectives in such openings shall only be required in the exterior wall of the S-2 parking garage, not in the exterior wall openings in the R-2 building, and these opening protectives in the exterior wall of the S-2 parking garage shall be not less than 1¹/₂-hour *fire protection rating*.

**TABLE 705.2
MINIMUM DISTANCE OF ~~BUILDING~~ ARCHITECTURAL PROJECTION**

FIRE SEPARATION DISTANCE-FSD (feet)	MINIMUM DISTANCE FROM LINE USED TO DETERMINE FSD
0 to less than 2	Projections not permitted
2 to less than 3	24 inches
3 to less than 5	24 inches plus 8 inches for every foot of FSD beyond 3 feet or fraction thereof
5 or greater	40 inches

For SI: 1 foot = 304.8 mm; 1 inch = 25.4 mm.

Commenter's Reason: The code needs to have a definition of a projection. There is too much confusion on what a projection is or is not. This proposal attempts to define what a projection is to make it easier for the user of the code. This public comment addresses the committee's comments during the Columbus hearings. We have changed the term Building Projection to Architectural Projection as requested throughout the code. There was also confusion on what we meant by unenclosed. So we have removed that term from the definition as well. The intent of the public comment is to just change the definition and no other technical requirements in the code. We believe the public comment addresses the Committee's concerns and reason for disapproval.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is just a definition to clarify the code.

FS19-18

IBC: 705.6, 705.7

Proposed Change as Submitted

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net)

2018 International Building Code

Add new text as follows

705.6 Continuity. The fire-resistance rating of exterior walls shall extend from the top of the foundation or floor/ceiling assembly below to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. The underside of a floor/ceiling or roof/ceiling assembly having a fire-resistance rating that is not less than the fire-resistance rating of the exterior wall.

Parapets shall be provided as required by Section 705.11.

Revise as follows

~~**705.6**~~**705.7 Structural stability.** ~~Exterior walls shall extend to the height required by Section 705.11.~~ Interior structural elements that brace the exterior wall but that are not located within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Table 601 for that structural element. Structural elements that brace the exterior wall but are located outside of the exterior wall or within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Tables 601 and 602 for the exterior wall.

Reason: The current code language provides continuity language for other fire-resistant rated wall assemblies, but not exterior walls. Therefore, there is confusion in the design and construction community on how to build the exterior walls. The proposal provides such language and clarifies the intent of the code for exterior walls. The language is similar to that of a fire partition.

Current Section 705.6 includes language regarding parapets that really doesn't belong in a structural requirement. Therefore, we have relocated language regarding parapets to the new Section for Continuity. It is better located there.

Cost Impact: The code change proposal will decrease the cost of construction

The proposal will reduce the cost because the confusion will be eliminated and people will not be making things up.

FS19-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal raised as many issues as it was solving on the topic of wall continuity. Is the continuity just for the wall, or does it include the foundation that might be exposed above grade? What is impact on floors which support the walls, do they need the same rating? (Vote 14-0)

Assembly Action:

None

FS19-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (stthomas@coloradocode.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

705.6 Continuity. The fire-resistance rating of exterior walls shall extend from the top of the foundation or floor/ceiling assembly below to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. ~~The underside of a one-hour fire-resistant rated floor/ceiling or roof/ceiling assembly having a fire-resistance rating that is not less than the fire-resistance rating of the exterior wall.~~

Parapets shall be provided as required by Section 705.11.

705.7 Structural stability. Interior structural elements that brace the exterior wall but that are not located within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Table 601 for that structural element. Structural elements that brace the exterior wall but are located outside of the exterior wall or within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Tables 601 and 602 for the exterior wall.

Commenter's Reason: The IBC has continuity requirements for many different types of wall assemblies including fire walls, fire barriers, etc. However, there is no language for the continuity of exterior walls. This has created issues over the past few years as Type III Construction has become so popular. We had the same language issue with Type VA construction in the past, but it didn't seem to be a problem for many people. The original intent of our proposal was to clarify the continuity requirements for exterior walls. This public comment is intended to provide a more reasonable requirement than the original proposal. It requires fire-resistant rated exterior walls to either continue to the underside of the floor sheathing or to the bottom of a one-hour fire-resistant rated floor/ceiling or roof/ceiling assembly. The extension to the fire-resistant rated horizontal assembly is consistent with the AWC Pamphlet DCA-3 on Fire-Resistance-Rated Wood-Frame Wall and Floor/Ceiling Assemblies. The document provides several tested assemblies where the floor systems are one-hour fire-resistant rated. We believe this is sufficient protection of the floor framing located at the exterior wall plane.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is intended to be a clarification of the code requirements.

FS19-18

FS20-18

IBC: 202 (New), 705.6.1 (New), 707.5.2 (New)

Proposed Change as Submitted

Proponent: Paul Coats, American Wood Council, representing American Wood Council (pcoats@awc.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows

PLATFORM CONSTRUCTION. A system of construction where the floor structure is supported by the bearing exterior and interior walls below, and supports the exterior walls and interior partitions above it.

SECTION 705 EXTERIOR WALLS

Add new text as follows

705.6.1 Platform framing. Where floors connect to exterior walls in platform construction, the structural framing shall be protected at the intersection to maintain the continuity of the fire-resistance rating required of the wall, as required by Section 704.1. The fire-resistance rating shall be maintained through the use of materials permitted by the type of construction, but not limited to, one or more of the following: the ceiling membrane, solid blocking, solid wood elements, the rim board, protection by noncombustible materials, or other features or protection deemed to achieve the required fire-resistance rating. The requirements of Section 703.2.5 and 705.7 shall apply. The material requirements for the portion of the floor in the plane of the exterior wall shall be as for floor construction in accordance with the type of construction.

SECTION 707 FIRE BARRIERS

707.5.2 Platform framing. Where floors or roofs connect to fire barriers in platform construction, the structural framing shall be protected at the intersection to maintain the continuity of the required fire resistance rating for the fire barrier, and the support of the fire barrier in accordance with Section 704.1. The fire-resistance rating shall be maintained through the use of materials permitted by the type of construction, including but not limited to, one or more of the following: solid blocking, solid wood elements, the rim board, protection by noncombustible materials, or other features or protection deemed to achieve the required fire-resistance rating.

Reason: This code change provides improved continuity of protection when exterior walls and fire barriers intersect with floors in buildings using platform construction.

Ratings required for exterior walls by either Table 602 or Table 601 may be greater than the rating required for the floors. As a result, questions arise about the protection of the wall/floor intersection in platform construction where differently rated elements come together. The protection of the intersection should be in accordance with the underlying principles of continuity and support for the rated wall construction. There are many practical solutions being used currently that would comply with this proposed code change. They involve the use of solid wood blocking or other protection to provide the continuity in fire resistance rating for the construction supporting the wall. AWC has developed details that may be approved by the code official for the exterior wall/floor intersection which can be found in the AWC Design for Code Acceptance (DCA) No. 3, Fire Rated Wood Wall and Floor Assemblies. They can be viewed and downloaded here: <http://awc.org/codes-standards/publications/dca3>. Link established 2.21.18.

The same questions arise for platform-framed fire barriers protecting shafts and interior stair enclosures, which often are required to be two-hour rated while the supporting floor construction is one-hour, therefore similar provisions were added to 707.5 for fire barriers.

Fire retardant treated wood (FRTW) is permitted for exterior walls of Type III and IV construction. Some code officials have required the floor construction in the plane of the exterior wall (the end of the floor in platform construction) to be FRTW, which is costly and burdensome and provides very little safety advantage since the intersection is already protected by FRTW or noncombustible cladding on the exterior. The proposal clarifies that for exterior wall intersections, the elements of the floor construction (joists, rim board, floor sheathing, and blocking if used) can be in accordance with the materials requirements for floors. The cladding component of the wall would need to be fire retardant treated or noncombustible as for the exterior wall framing itself.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

There are a variety of current interpretations and applications for fire resistance in platform construction involving exterior walls and fire barriers. This proposed change may slightly reduce or slightly increase construction costs, depending on the current approach of individual jurisdictions.

FS20-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is so specific to wood construction that there will be unintended consequences for other materials. Language is confusing and would be difficult to enforce. Introducing wood into a non-combustible wood changes the nature of that wall. This needs refinement before it clearly address the issues raised by the opponents. (Vote 13-1)

Assembly Action:

None

FS20-18

Individual Consideration Agenda

Public Comment 1:

Proponent: James Smith, American Wood Council, representing American Wood Council (jsmith@awc.org); Paul Coats, American Wood Council, representing American Wood Council (pcoats@awc.org); SAM W FRANCIS, AWC, representing AWC (sfrancis@awc.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

705.6 Structural stability. *Exterior walls* shall extend to the height required by Section 705.11. Interior structural elements that brace the exterior wall but that are not located within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Table 601 for that structural element. Structural elements that brace the exterior wall but are located outside of the exterior wall or within the plane of the exterior wall shall have the minimum *fire-resistance rating* required in Tables 601 and 602 for the exterior wall. The supporting construction needed to provide vertical support of the exterior wall shall be protected to afford the required fire resistance of the wall being supported.

Commenter's Reason: Our original proposal included modifications dealing with both the materials used in the exterior walls (the FRT wood exception) and the fire resistive integrity (the 2-hour rating) of horizontal building elements (floors) that support the walls. The committee disapproved the proposal because, among other things, they felt the language was confusing and, for that reason, difficult to enforce. They indicated the proposal needed refinement to more clearly address the issues raised by the opponents. In an effort to provide that clarity, we have chosen to submit two separate PC s: one comment on the materials and this comment dealing with only the fire resistive integrity. Some jurisdictions have prohibited traditional platform construction details in attempts to enhance the fire resistance continuity of exterior walls, requiring alternative connections that may actually decrease fire safety for building occupants. Though well intentioned, alternative connections that protect the exterior wall end up sacrificing the inherent strength of the platform intersection for both structural and fire performance. We believe this pared-back public comment still makes it clear that floors can support exterior walls per traditional platform design without jeopardizing the fire performance of the building, and that the fire resistance of the intersection will be maintained.

In our effort to maintain clarity while also keeping it simple we chose language that is already in use and familiar to code officials. That similar language can be found in sections 707.5.1, 709.4, 711.2, 712.1.15 & 716.3.3.1 of the IBC.

The American Wood Council has published fire resistance guidelines for the materials used for the fire resistance of traditional platform construction in Design for Code Acceptance No. 3, Fire-Resistance-Rated Wood-Frame Wall and Floor/Ceiling Assemblies, which can be downloaded here: <http://www.awc.org/codes-standards/publications/dca3>. Although not referenced standards, the Design for Code Acceptance (DCA) series of AWC documents are intended to assist users of the codes and our standards in understanding how the codes and standards can be used together to meet the intent of the code. We included the link to DCA 3 within this reason statement for use as a tool that we feel will help those considering this public comment understand how this complicated issue can be satisfied with our proposed simplified language.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. The public comment clarifies what the code already requires, and therefore there is no increase or decrease of construction costs.

Public Comment 2:

Proponent: Paul Coats, PE, CBO, American Wood Council, representing American Wood Council (pcoats@awc.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

705.4 Materials. *Exterior walls* shall be of materials permitted by the building type of construction. The material requirements for portions of floor or roof assemblies in the plane of the exterior wall shall be as required for interior building elements according to the building type of construction.

Commenter's Reason: The original proposal included modifications dealing with both the materials issues and the continuity of the fire resistance of the floor/wall intersection in platform construction. In response to committee concerns, we have submitted two simplified public comments: one public comment on the fire resistance issue and this one dealing with only the materials question.

Some jurisdictions have required floor or roof elements that intersect with the exterior wall to comply with the materials requirements for the wall. For instance, in Type III platform construction where the exterior walls are fire retardant treated wood (FRTW), some jurisdictions have required the floor sheathing, floor joists, or rim board to be fire retardant treated wood where they extend into the plane of the exterior wall. This is impractical and costly in relation to any real safety benefit.

The requirement for FRTW addresses ignition resistance and flame spread in the exterior wall, and FRTW in the floor adds nothing to the fire resistance of the intersection, which can be provided by any number of means. It seems practical that as long as the wood elements germane to the wall are FRTW (such as studs, sills, plates, exterior wall sheathing, etc.), and the ends of floors or roofs are protected for the required fire resistance when supporting the exterior wall (rim boards, floor or roof sheathing, joists and rafters, etc.), the intent of the code is met. The use of the words "interior building elements" in this public comment means floor or roof assemblies in the same way that Section 602.3 refers to "interior building elements" as being interior to the exterior walls. This public comment is consistent with common interpretations regarding materials requirements for floors and roofs in Type III construction.

The American Wood Council has published fire resistance guidelines for the materials and fire resistance of traditional platform construction in Design for Code Acceptance No. 3, Fire-Resistance-Rated Wood-Frame Wall and Floor/Ceiling Assemblies, which can be downloaded here: <http://www.awc.org/codes-standards/publications/dca3>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Because floor and roof structures are not currently required to comply with materials requirements for walls, this is a clarification of current requirements and will not increase or decrease the cost of construction.

FS20-18

FS21-18

IBC: 705.10

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Add new text as follows

705.10 Penetrations. Penetrations of exterior walls required by this section to have a fire-resistance rating shall comply with Section 714.

Exception: Penetrations in exterior walls that are permitted to have unprotected openings.

Reason: Protection of penetrations through fire-resistance-rated assemblies is a fundamental feature of compartmentation and the need to prevent fire and smoke spread. The IBC requires penetrations to be protected in fire walls (706.9), fire barriers (707.7), fire partitions (708.7), smoke barriers (709.6), smoke partitions (710.6), and vertical openings (712.1.4). The IBC distinguishes between openings and penetrations. In the context of IBC section 705.8, openings are not penetrations. So in the IBC, exterior wall penetrations (e.g. for pipes, ducts, and other services) do not require opening protectives. They are separate and distinct. Consequently, the IBC does not require protection of through-penetrations through exterior walls, even when they are fire-resistance-rated, and regardless of the limiting distance. Conversely, joints in exterior walls are already required to be protected in Section 705.9, and ducts & air transfer openings are required to be protected in Section 705.10.

The IBC does not currently limit the size, type, or number of unprotected penetrations in exterior walls. Tables 601 and 602 require exterior walls to have a fire-resistance rating under some circumstances. Further, Chapter 7 also requires fire rated opening protectives, rated joints, and ducts and transfer openings to be protected depending upon the limiting distance. This proposal would treat penetrations through rated exterior walls in the same manner as fire-resistant joints in exterior walls. It would require penetrations in exterior walls to be firestopped only when protected openings are required based on Chapter 6 and Chapter 7 limiting distance requirements.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will increase the cost of construction. Where unprotected openings are not permitted, penetrations which could previously be left unprotected will now require protection in accordance with Section 714.

FS21-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: No history of building to building fires resulting from small 'penetrations'. Creates a lot of design problems without providing clear solutions. Section 714 is clear, the solutions should be there. There is support for regulating penetrations. After a certain distance there can be unrated openings. The proposal was unclear how this threshold of allowing unrated openings works with this proposal. (Vote 9-4)

Assembly Action:

None

FS21-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

714.4 Fire-resistance-rated walls. Penetrations into or through exterior walls, fire walls, fire barriers, smoke barrier walls and fire partitions shall comply with Sections 714.4.1 through 714.4.3. Penetrations in *smoke barrier walls* shall also comply with Section 714.5.4.

Commenter's Reason: The intent of this proposal is to add a new requirement to protect penetrations in exterior wall in the same manner as the existing requirements to protect joints, openings, and duct and air transfer openings in exterior walls. New Section 705.10 was developed to accomplish that goal. The intent was subsequent sections would be renumbered.

During the Committee Action Hearings, the Fire Safety Committee rightfully pointed out that FS21-18 failed to update Section 714.4 to add exterior walls to the list of wall types where the protection of penetrations is required. This Public Comment corrects that oversight.

The Fire Safety Committee also questioned the threshold at which penetrations need to be protected. The threshold is stated in the Exception in exactly the same manner as currently specified for Joints in Section 707.9. If unprotected openings are permitted by Table 705.8, then penetrations do not require protection.

During testimony on FS21-18, confusion arose between the new proposed requirement for penetrations and existing Section 705.10 covering the protection of ducts and air transfer opening. That confusion resulted from 1) the new provision covering penetrations was identified as Section 705.10 as was the existing provision for ducts and air transfer openings, and 2) both provisions used the word penetrations. Just to be clear, the new requirement for penetrations relates to Section 714 whereas the existing requirement for ducts and air transfer openings relates to Section 717.

In an effort to respond to the Committee's comments, we are offering two Public Comments. Public Comment 1 accomplishes the following:

- Updates Section 714.4 to include exterior walls as requested by the Committee.
- Changes the Section Number of the new requirement covering penetrations so as to avoid confusion with the existing section covering ducts and air transfer openings.

Public Comment 2 accomplishes the following:

- Eliminates the words Penetrations by from the existing Section 705.10 covering ducts and air transfer openings.
- Changes the Section Number of the new requirements covering penetrations so as to avoid confusion with the existing section covering ducts and air transfer openings.
- Renumbers the existing Section 705.10 in recognition of the addition of the new provision relating to penetrations.

Public Comment 1 is essential to provide a technically viable code change. Public Comment 2 provides additional clarity to differentiate a penetration from a duct and air transfer opening, but is not essential to the proposal. Through the voting process the membership can decide whether only Public Comment 1 is needed or whether the additional clarity provided by Public Comment 2 is desirable.

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction Where unprotected openings are not permitted, penetrations which could previously be left unprotected will now require protection in accordance with Section 714.

Public Comment 2:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

705.109 Penetrations. Penetrations of exterior walls required by this section to have a fire-resistance rating shall comply with Section 714.

Exception: Penetrations in exterior walls that are permitted to have unprotected openings.

-

705.910 Joints. Joints made in or between *exterior walls* required by this section to have a *fire-resistance rating* shall comply with Section 715.

Exception: Joints in *exterior walls* that are permitted to have unprotected openings.

705.910.1 Voids. The void created at the intersection of a floor/ceiling assembly and an exterior curtain wall assembly shall be protected in accordance with Section 715.4.

705.1011 Ducts and air transfer openings. ~~Penetrations by air~~ Air ducts and air transfer openings in fire-resistance-rated *exterior walls* required to have protected openings shall comply with Section 717.

Exception: Foundation vents installed in accordance with this code are permitted.

Commenter's Reason: The reason statement for Public Comment 1 recaps the intent of this proposal, the Fire Safety Committee's comments during the Committee Action Hearing and intent of the two Public Comments being proposed. Public Comment 1 is essential to provide a technically viable code change. Public Comment 2 provides additional clarity to differentiate a penetration from a duct and air transfer opening, but is not essential to the proposal. Through the voting process the membership can decide whether only Public Comment 1 is needed or whether the additional clarity provided by Public Comment 2 is desirable.

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction Where unprotected openings are not permitted, penetrations which could previously be left unprotected will now require protection in accordance with Section 714.

FS22-18

IBC: 706.1.1

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Building Code

Revise as follows

706.1.1 Party walls. Any wall located on a *lot line* between adjacent buildings, which is used or adapted for joint service between the two buildings, shall be constructed as a *fire wall* in accordance with Section 706. Party walls shall be constructed without openings and shall create separate buildings.

Exceptions:

1. Openings in a party wall separating an *anchor building* and a mall shall be in accordance with Section 402.4.2.2.1.
2. ~~Fire-Party walls~~ and fire walls are not required on lot lines dividing a building for ownership purposes where the aggregate height and area of the portions of the building located on both sides of the lot line do not exceed the maximum height and area requirements of this code. For the code official's review and approval, he or she shall be provided with copies of dedicated access easements and contractual agreements that permit the owners of portions of the building located on either side of the lot line access to the other side for purposes of maintaining fire and life safety systems necessary for the operation of the building.

Reason: This section mixes use of the terms fire wall and party wall, and both should be mentioned in Exception 2 to make it clear that walls constructed in accordance with Exception 2 are allowed to have penetrations in accordance with the restrictions stated in the exception.

Cost Impact: The code change proposal will not increase or decrease the cost of construction Intended as a clarification of existing provisions.

FS22-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The intent of the section is clearer with the added text. (Vote 9-5.)

Assembly Action:

FS22-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

706.1.1 Party walls. ~~Any~~ A party wall is any wall located on a *lot line* between adjacent buildings, which is used or adapted for joint service between the two buildings ~~and shall be constructed as a fire wall~~ in accordance with Section 706. Party walls shall be constructed without openings and shall create separate buildings.

Exceptions:

1. Openings in a party wall separating an *anchor building* and a mall shall be in accordance with Section 402.4.2.2.1.
2. ~~Party walls and fire walls~~ are not required on lot lines dividing a building for ownership purposes where the aggregate height and area of the portions of the building located on both sides of the lot line do not exceed the maximum height and area requirements of this code. For the code official's review and approval, he or she shall be provided with copies of dedicated access easements and contractual agreements that permit the owners of portions of the building located on either side of the lot line access to the other side for purposes of maintaining fire and life safety systems necessary for the operation of the building.

Commenter's Reason: In the proponent's reason statement he notes, This section mixes use of the terms fire wall and party wall... He goes on to say that, ...walls constructed in accordance with Exception 2 are allowed to have penetrations... He is correct that the terms "party wall" and "fire wall" are mixed in Section 706.1.1. Since Section 706.1.1 is titled Party walls, the fix is to delete the term fire wall in Exception 2. His concern about allowance for penetrations (and openings) is not necessary. Exception 2 states that party walls are not required under prescribed ownership conditions. Accordingly, if there is no party wall, there are no openings or penetrations to protect. In addition to deleting the term fire wall from Exception 2, Section 706.1.1 has been clarified to provide for an implied definition of party wall.

The original proposal confused the construction requirements for party walls and further confusion could result if a code practitioner was looking to the published reason statement to provide logic for the code change. This public comment clarifies the provision while addressing the proponent's original concern.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment is essentially editorial in nature.

FS23-18

IBC: 706.5, 706.5.1, 706.5.2

Proposed Change as Submitted

Proponent: Ronald Clements Jr, representing Chesterfield County Building Inspection Department
(clementsro@chesterfield.gov)

2018 International Building Code

Revise as follows

706.5 Horizontal continuity. *Fire walls shall be continuous from exterior wall to exterior wall and shall terminate in accordance with this section extend not less than 18 inches (457 mm) beyond the exterior surface of exterior walls.*

Exceptions:

- ~~1. Fire walls shall be permitted to terminate at the interior surface of combustible exterior sheathing or siding provided that the exterior wall has a fire-resistance rating of not less than 1 hour for a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.~~
- ~~2. Fire walls shall be permitted to terminate at the interior surface of noncombustible exterior sheathing, exterior siding or other noncombustible exterior finishes provided that the sheathing, siding or other exterior noncombustible finish extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall.~~
- ~~3. Fire walls shall be permitted to terminate at the interior surface of noncombustible exterior sheathing where the building on each side of the fire wall is protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

Add new text as follows

706.5.1 Termination at 180 degree or greater exterior wall angle. Where the angle between the exterior walls on either side of the fire wall is equal to or greater than 180 degrees (3.14 rad), the fire wall termination shall comply with one of the following:

1. The fire wall shall terminate at the interior surface of any exterior sheathing or siding permitted by this code provided that the exterior wall has a fire-resistance rating of not less than 1 hour for a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.
2. The fire wall shall terminate at the interior surface of noncombustible exterior sheathing with non-combustible exterior siding or other noncombustible exterior finishes provided that the non-combustible sheathing and siding or other exterior noncombustible finish extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.
3. The fire wall shall terminate at the interior surface of noncombustible exterior sheathing with any siding or exterior finish materials permitted by this code provided that the non-combustible sheathing extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall and the buildings on each side of the fire wall are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.
4. The fire wall shall terminate at the interior surface of masonry or concrete exterior walls where the masonry or concrete exterior walls extend a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.
5. The fire wall shall terminate at the interior surface of any exterior sheathing or siding permitted by this code provided the buildings on each side of the fire wall are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1.
6. The fire wall shall extend not less than 18 inches (457 mm) beyond the exterior surface of the exterior wall.

706.5.2 Termination at less than 180 degree exterior wall angle. Where the angle between the exterior walls on either side of the fire wall, within 4 feet (1220 mm) of the fire wall, is less than 180 degrees (3.14 rad), the fire wall termination shall extend to the plane of the exterior sheathing or surface of one of the exterior walls on either side of the fire wall. An imaginary line shall be established extending out from the fire wall termination point between the exterior walls on both sides of the fire wall for the purpose of establishing the fire separation distance for the exterior walls. The fire-resistance rating and opening protection requirements for the exterior walls shall meet Sections 705.5 and 705.8 based on the fire separation distance established by the imaginary line.

Delete without substitution

~~**706.5.1 Exterior walls.** Where the fire wall intersects exterior walls, the fire-resistance rating and opening protection of the exterior walls shall comply with one of the following:~~

- ~~1. The exterior walls on both sides of the fire wall shall have a 1-hour fire-resistance rating with $\frac{3}{4}$ -hour protection where opening protection is required by Section 705.8. The fire-resistance rating of the exterior wall shall extend not less than 4 feet (1220 mm) on each side of the intersection of the fire wall to exterior wall. Exterior wall intersections at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad) do not need exterior wall protection.~~
- ~~2. Buildings or spaces on both sides of the intersecting fire wall shall assume to have an imaginary lot line at the fire wall and extending beyond the exterior of the fire wall. The location of the assumed line in relation to the exterior walls and the fire wall shall be such that the exterior wall and opening protection meet the requirements set forth in Sections 705.5 and 705.8. Such protection is not required for exterior walls terminating at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad).~~

Reason: The fire wall horizontal termination provisions are set up with section 706.5 providing the termination methods for fire wall terminations where the exterior walls on either side are at an angle of 180 degrees or greater and section 706.5.1 providing the termination methods for fire wall termination where the exterior walls on either side are at an angle less than 180. 706.5.1 is an additional requirement, when the angle is less than 180, to the base requirement in 706.5. This does not work in practice. If a fire wall terminates at the vertex of a 90 degree angle between the two exterior walls on either side the fire wall cannot extend 18 inches beyond the surface of the exterior wall nor can the fire wall extend to the surface of the exterior sheathing so the sections cannot build on one another. Section 706.5.1 refers to conditions when a fire wall intersects the exterior wall. Geometrically an intersection is a point common to two lines so the condition detailed in 706.5 for a 180 termination is an intersection of the exterior wall by the fire wall so one could argue that the last sentence of 706.5.1 items 1 and 2 override the requirements of 706.5 when the exterior walls are at 180 to each other. That is not the intent. This code change fixes the problem by separating out the termination requirements based on the angle between the exterior walls. The 706.5.1 method applies when the angle between exterior walls is 180 degrees or greater and the 706.5.2 method applies when the angle between exterior walls is less than 180 degrees. Additionally the base requirement for the 18" extension is the exception, not the rule, so the exceptions have been re-organized into options and the 18 inch exception is now another option. The termination methods that allow termination at sheathing have opening protection requirements added since the code is currently silent on this fact. Current code would allow the entire 4 foot to be open. New option 4 was added to allow termination of the fire wall at an exterior masonry or concrete wall, this is currently not addressed. New option 5 was added to allow for a full NFPA 13 sprinkler to count as equivalent to 4 feet on non-combustible siding.

Section 706.5.2 addresses the firewall termination where the exterior walls on either side are at an angle less than 180 degrees. The first exception was removed because it makes no sense to allow this method when it would not be allowed if the buildings were separated by an inch. If two adjacent buildings are separated and joined by a fire wall and they have exterior walls that are exposed to each other at angles less than 180 degrees they should be treated as separate buildings for exposure purposes just as any two separate buildings would be treated. Current exception 1 gives you a less restrictive method when the building are touching; that makes no sense. The imaginary line exception is now a single requirement. The section was also cleaned up so it is clear how to apply the imaginary line. The current text literally states that the wall itself will assume to have an imaginary line. Walls cannot assume things. The current text also does not clearly state that the imaginary line is to be used to establish fire separation distances. Since that is not provided based on current text there is no protection requirement because section 705.5 and 705.8 are based on fire separation distance defined in chapter 2.

Example of less than 180 termination

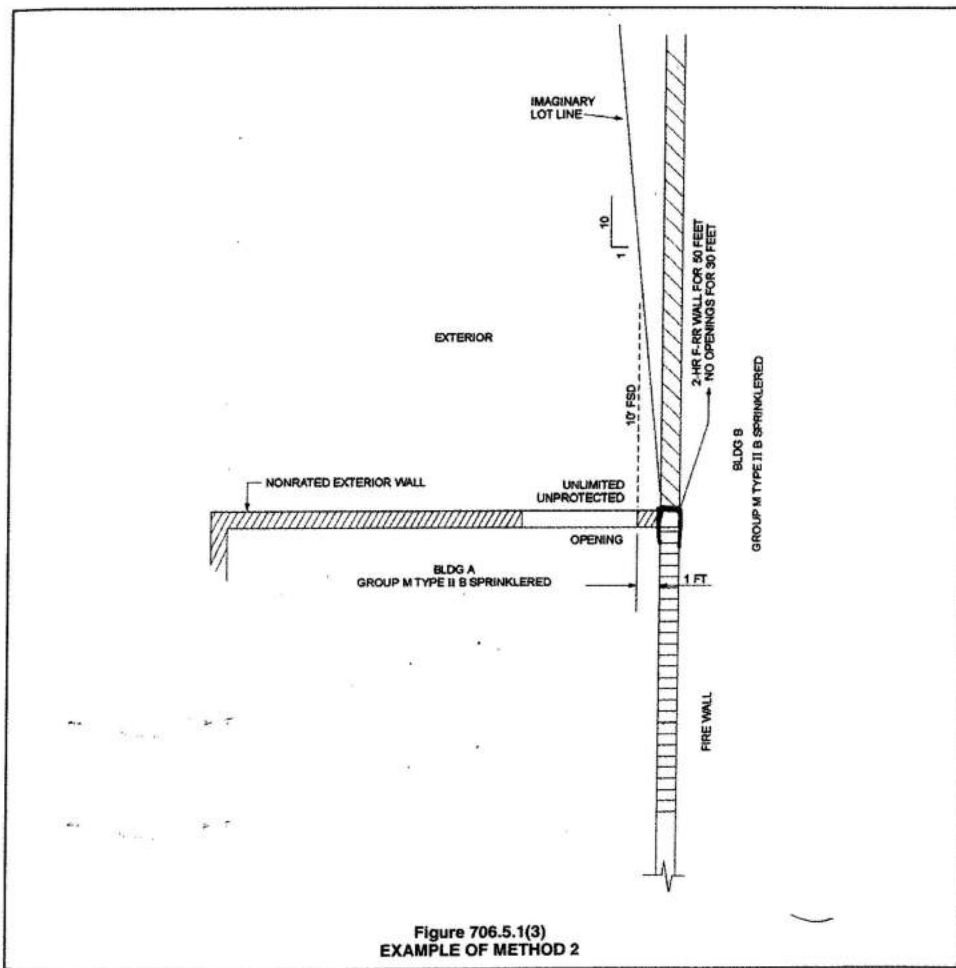

Figure 706.5.1(3)
EXAMPLE OF METHOD 2

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a clarifying code change.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that the current text is clear and doesn't need change. The proposed text is confusing (Vote 14-0)

FS23-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ronald Clements Jr, representing Chesterfield County Building Inspection Department (clementsro@chesterfield.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

706.5.1 Termination at 180 degree or greater exterior wall angle. Where the angle between the exterior walls on either side of the fire wall is equal to or greater than 180 degrees (3.14 rad), the fire wall termination shall comply with one of the following:

1. The fire wall shall terminate at the interior surface of any exterior sheathing or siding permitted by this code provided that the exterior wall has a fire-resistance rating of not less than 1 hour for a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.
2. The fire wall shall terminate at the interior surface of noncombustible exterior sheathing with non-combustible exterior siding or other noncombustible exterior finishes provided that the non-combustible sheathing and siding or other exterior noncombustible finish extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.
3. The fire wall shall terminate at the interior surface of noncombustible exterior sheathing with any siding or exterior finish materials permitted by this code provided that the non-combustible sheathing extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall and the buildings on each side of the fire wall are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.
4. The fire wall shall terminate at the interior surface of masonry or concrete exterior walls where the masonry or concrete exterior walls extend a horizontal distance of not less than 4 feet (1220 mm) on both sides of the fire wall. Openings within such exterior walls within 4 feet (1220 mm) of the fire wall shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour.
5. ~~The fire wall shall terminate at the interior surface of any exterior sheathing or siding permitted by this code provided the buildings on each side of the fire wall are protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1.~~
6. The fire wall shall extend not less than 18 inches (457 mm) beyond the exterior surface of the exterior wall.

706.5.2 Termination at less than 180 degree exterior wall angle. Where the angle between the exterior walls on either side of the fire wall, within 4 feet (1220 mm) of the fire wall, is less than 180 degrees (3.14 rad), the fire wall termination shall extend to the plane of the outermost exterior wall sheathing or surface of one of the exterior walls on either side of the fire wall. An imaginary line shall be established extending out from the fire wall termination point between the exterior walls on both sides of the fire wall for the purpose of establishing the fire separation distance for the exterior walls. The fire-resistance rating and opening protection requirements for the exterior walls shall meet Sections 705.5 and 705.8 based on the fire separation distance established by the imaginary line.

Commenter's Reason: The original code change has a very detailed and technically sound reason statement that fully explains why this code change is needed both to address structural issues with text and section organization, and to correct technical issues with the code provisions. No individual, organization or industry spoke in opposition to the code

change. The committee did not provide any technical justification for their action to deny the code change. Regarding the modification proposed, Steve Skalko representing MACS suggested two minor modifications to proposed section 706.5.1 exception #5 and section 706.5.2. Exception #5 is a new exception so to simplify the code change and address Steve's issue my modification removes exception #5, simplifying the code change. Section 706.5.2 has been clarified to address the condition where the exterior walls on either side of the fire wall termination point are offset; with the revised text it is clear that the fire wall terminates at the outermost of the two offset walls.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
See original.

FS23-18

FS24-18

IBC: 706.6.1

Proposed Change as Submitted

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows

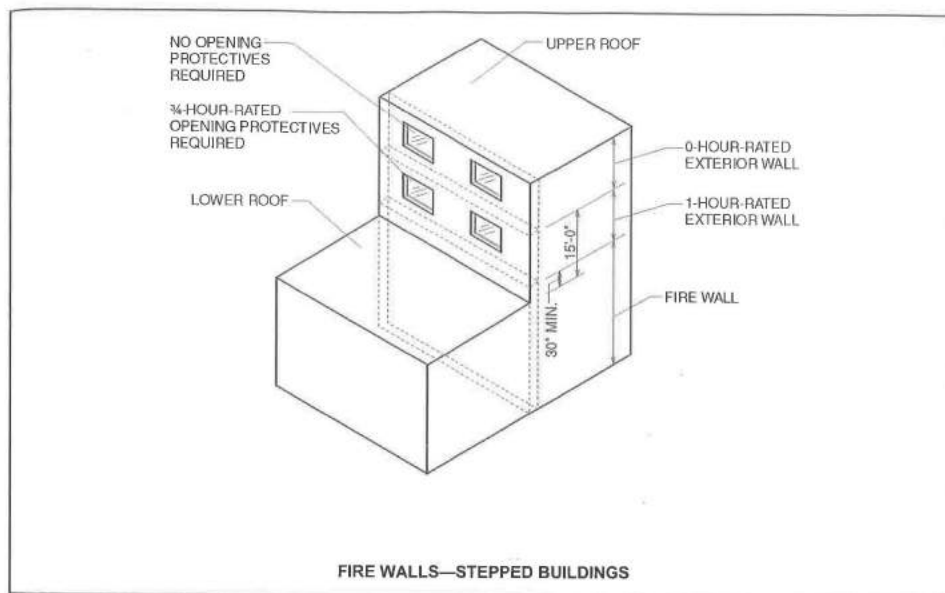

706.6.1 Stepped buildings. Where a *fire wall* also serves as an *exterior wall* for a building and separates buildings having different roof levels, such wall shall terminate at a point not less than 30 inches (762 mm) above the lower roof level, provided the exterior wall for a height of 15 feet (4572 mm) level. Exterior walls above the fire wall extending more than 30 inches (762 mm) above the lower roof is shall be of not less than 1-hour fire-resistance-rated construction from both sides with openings protected by fire assemblies having a fire protection rating of not less than 3/4 hour. Portions of the exterior walls greater than 15 feet (4572 mm) above the lower roof shall be of non-fire-resistance rated construction unless otherwise rated construction is required by other provisions of this code.

Exception: Where the A fire wall terminates serving as part of an exterior wall for a building that separates buildings having different roof levels shall be permitted to terminate at the underside of the roof sheathing, deck or slab of the lower roof, provided that all of the following requirements are met:

1. The lower roof assembly within 10 feet (3048 mm) of the fire wall has not less than a 1-hour *fire-resistance* rating, and the
2. The entire length and span of supporting elements for the rated roof assembly has shall have a fire-resistance rating of not less than 1-hour.
- ~~2-3.~~ Openings in the lower roof shall not be located within 10 feet (3048 mm) of the *fire wall*.
4. 1-hour fire- resistance rated exterior wall protection above the lower roof, as specified in this section, is not required unless fire resistance rated construction is required by other provisions of this

Reason: Section 706.6.1 is confusing as currently written. It is intended to regulate the design of fire walls and exterior walls above and in-line with the fire walls for buildings having stepped roof levels. The intent of this section is to maintain adequate separation between the two portions of the same building so that one side will not be damaged for the time required by Section 706.4. This is done by extending the fire wall to at least 30" above the lower roof and rating the exterior wall above and in-line to not less than 1-hour up to 15' above the lower roof. The second option is to provide a 1-hour rated roof assembly extending not less than 10' over from the fire wall with no openings permitted within the 10' portion of the roof adjacent to the fire wall.

This proposal does not change the requirements of the section. Rather, the text has been re-written to clarify the expectations for the exterior wall located above the lower roof and sets clear expectations in the exception for horizontal protection by itemizing these requirements.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This code change is being made in an attempt to clarify the code. It will not change the cost of construction of fire walls.

FS24-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee found the overall proposal provides better and more understandable text. This is not a technical change. The committee encouraged the proponent to submit a public comment to further refine the language. They noted extra words at the end of item 1; a conflict in style between the 4 items and finally a suggestion that part 4 of the exception may not be a requirement of the exception but rather an allowance of the exception. (Vote 13-1)

Assembly Action:

None

FS24-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

706.6.1 Stepped buildings. Where a *fire wall* also serves as an *exterior wall* for a building and separates buildings having different roof levels, such wall shall terminate at a point not less than 30 inches (762 mm) above the lower roof level. Exterior walls above the fire wall extending more than 30 inches (762 mm) above the lower roof shall be of not less than 1-hour fire-resistance-rated construction from both sides with openings protected by fire assemblies having a *fire protection rating* of not less than $\frac{3}{4}$ hour. Portions of the exterior walls greater than 15 feet (4572 mm) above the lower roof shall be of non-fire-resistance rated construction unless otherwise rated construction is required by other provisions of this code.

Exception: A *fire wall* serving as part of an exterior wall ~~for a building~~ that separates buildings having different roof levels shall be permitted to terminate at the underside of the roof sheathing, deck or slab of the lower roof, provided items 1, 2, and 3 below are met. The exterior wall above the *fire wall* is not required to be of fire-resistance rated construction, unless required by other provisions of this code ~~all of the following requirements are met:~~

1. The lower roof assembly within 10 feet (3048 mm) of the fire wall has not less than a 1-hour *fire-resistance* rating, and the
2. The entire length and span of supporting elements for the rated roof assembly ~~shall have~~ has a *fire-resistance rating* of not less than 1-hour.
3. Openings in the lower roof ~~shall be~~ are not be located within 10 feet (3048 mm) of the *fire wall*.
4. ~~1-hour fire-resistance-rated exterior wall protection above the lower roof, as specified in this section, is not required unless fire-resistance-rated construction is required by other provisions of this~~

Commenter's Reason: This public comment addresses recommendations made by members of the Fire Safety Committee at the Group A Committee Action Hearings in Columbus, OH. The Committee approved the proposed changes 13 to 1 but felt there was even more improvements that could be made to this otherwise very confusing code language dealing with regulating fire walls at stepped roof buildings.

In this Public comment we have relocated some of the language in item #4 to the beginning of the exception because, as one of the Committee members said, "Item #4 is not a requirement, as specified in the beginning of the exception; it's more something you're allowed to do". To correct this, we have indicated in the beginning of the exception that if you comply with the requirements, then the portion of the exterior wall above the *fire wall* is not required to be of fire-resistance rated construction unless required by other provisions of the code. This adds clarity for the reader trying to interpret the provision.

The changes in requirements 2 and 3 create grammatical consistency in relation to the charging language at the beginning of the exception. This public comment includes all recommendations made by the Fire Safety Committee members who commented on the proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of

construction

This code change is for clarification only. There is no cost impact for construction.

FS24-18

FS29-18

IBC: 707.8, 707.9

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows

~~**707.8 Joints, joints and voids.** Joints made in or between fire barriers, and joints made at the intersection of fire barriers with underside of a fire-resistance-rated floor or roof sheathing, slab or deck above, and the exterior vertical wall intersection shall comply with Section 715.~~

~~The following joints and voids shall be protected in accordance with Section 715.~~

- ~~1. Joints in or between fire barriers.~~
- ~~2. Joints between fire barriers and fire-resistance-rated wall assemblies.~~
- ~~3. Joints between fire barriers and the underside of fire-resistance-rated floors or floor/ceiling assemblies.~~
- ~~4. Joints between fire barriers and the underside of fire-resistance-rated roofs or roof/ceiling assemblies.~~
- ~~5. Voids at the intersection of fire barriers and nonfire-resistance-rated exterior curtain wall assemblies.~~
- ~~6. Voids between fire barriers and the underside of nonfire-resistance-rated roofs or roof/ceiling assemblies.~~
- ~~7. Voids between fire barriers and the underside of nonfire-resistance-rated floors or floor/ceiling assemblies.~~

Delete without substitution

~~**707.9 Voids at intersections.** The voids created at the intersection of a *fire barrier* and a nonfire-resistance-rated roof assembly or a nonfire-resistance-rated exterior wall assembly shall be filled. An approved material or system shall be used to fill the void, and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.~~

Reason: Other FCAC proposals reorganize and make changes to Section 715, including adding protection requirements for voids, so Section 707.9 is no longer needed. This proposal simplifies the references to Section 715 and includes all of the joints and voids that require protection. Depending on the action on the other proposals Item (7) may need to be deleted from this proposal.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The changes are editorial and do not add new construction requirements.

FS29-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Based on the proponent's testimony, without FS30 and FS31-18, this proposal is incomplete. The committee expressed concern whether the list is complete and clear between joints and voids. For example if two rated assemblies adjoin each other and that 'intersection' doesn't need to accommodate movement, how is it classified? (Vote 13-0)

Assembly Action:

None

FS29-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

707.8 Joints and voids.

The following joints and voids shall be protected in accordance with Section 715.

1. Joints in or between fire barriers.
2. Joints between fire barriers and fire-resistance-rated wall assemblies.
3. Joints between fire barriers and the underside of fire-resistance-rated floors or floor/ceiling assemblies.
4. Joints between fire barriers and the underside of fire-resistance rated roofs or roof/ceiling assemblies.
5. Voids at the intersection of fire barriers and nonfire-resistance-rated exterior curtain wall assemblies.
- ~~6. Voids between fire barriers and the underside of nonfire-resistance-rated roofs or roof/ceiling assemblies.~~
- ~~7. Voids between fire barriers and the underside of nonfire-resistance-rated floors or floor/ceiling assemblies.~~

Commenter's Reason: The ICC Fire Code Action Committee (FCAC) developed a number of proposals intended to reorganize and make changes to Section 715. Item FS29-18 created the Section 707.8 charging language and cross-reference for the various Section 715 technical requirements. In the proposal reason statement, the proponent states, This proposal simplifies the references to Section 715 and includes all of the joints and voids that require protection. Depending on the action on the other proposals Item (7) may need to be deleted from the proposal. As regards the last sentence, this turned out to be a bait and switch proposal. The Fire Safety Committee disapproved both Items FS30-18 and FS31-18. Both proposals dealt with Continuity Head of Wall Joint Systems in buildings with nonfire-resistance-rated construction. The need for such a joint fire protection system in building on non-rated construction has long been questioned. If a chain is only as strong as its weakest link, the Continuity Head of Wall Joint System is the strongest link and serves no logical purpose. There should be no reference to such systems when associated with nonfire-resistance-rated construction. If an owner/architect/developer wishes to exceed the minimum provisions of the code, they may certainly do so. More stringent options should not be specified within given technical requirements.

When Items FS30-18 and FS31-18 were disapproved by the committee, the proponents testified that FS29-18 was incomplete and recommended disapproval. This action was contrary to the statement in their initial reason statement: Depending on the action on the other proposals Item (7) may need to be deleted from the proposal. Based on that proponent statement, FS30-18 and FS31-18 were disapproved and their reference in Section 707.8 should be deleted. Accordingly, the public comment deletes Items 6 and 7 from the list of joints and voids. This is consistent with the actions of the committee and the reason statement of the proponent.

More importantly, it will reverse the attempts to expand the use of fire rated joint systems to buildings of nonrated construction. Although in the cost impact statement for FS31-18 the proponent declared that the requirement would not increase the cost of construction, such systems are very expensive and are out of technical context in buildings of more

economic construction. It should be remembered that buildings of IIB, IIIB and VB construction are limited in height and area and such exotic joint protection methods are of questionable benefit.

Approval of this public comment is consistent with logic, fire protection philosophy, the Fire Safety Committee's actions and the proponent's published reason statement.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This public comment eliminates the suggestion that more expensive joint protection systems should be used.

FS29-18

FS31-18

IBC: 202 (New), 202, 707.9, 715.6 (New), Chapter 35

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows

CONTINUITY HEAD-OF-WALL JOINT SYSTEM. An assemblage of specific materials or products that are designed to resist the passage of fire through voids created at the intersection of fire barriers and the underside of nonfire-resistance-rated roofs for a prescribed period of time.

Revise as follows

~~**[BF] F RATING.** The time period that the through-penetration firestop system or continuity head-of-wall joint system limits the spread of fire through the penetration ~~when tested in accordance with ASTM E814 or UL 1479 or void.~~~~

~~**[BF] T RATING.** The time period that the penetration firestop system, including the penetrating item, or the continuity head-of-wall joint system limits the maximum temperature rise to 325°F (163°C) above its initial temperature through the penetration or void on the nonfire side ~~when tested in accordance with ASTM E814 or UL 1479 side.~~~~

~~**707.9 Voids at intersections.** The voids created at the intersection of a *fire barrier* and a nonfire-resistance-rated roof assembly or a nonfire-resistance-rated exterior wall assembly shall be filled. ~~An approved material or system shall be used to fill the void, and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases protected with a material or system which complies with Section 715.~~~~

Add new text as follows

715.6 Voids at intersections of fire barriers and underside of nonfire-resistance-rated roofs. The voids created at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof sheathing, slab or deck above shall be protected by an approved continuity head-of-wall joint system installed as tested in accordance with ASTM E2837 to provide an F rating/T rating for a time period not less than the required fire-resistance rating of the wall assembly in which it is installed or be filled with an approved material or system. Such materials or systems shall be securely installed in accordance with the manufacturer's installation instructions in or on the void for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases. Continuity head-of-wall joint systems shall also be installed in accordance with the listing criteria.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

E2837-17:

Standard Test Method for Determining the Fire Resistance of Continuity Head-of-Wall Joint Systems Installed Between Rated Wall Assemblies and Nonrated Horizontal Assemblies

Reason: This proposal clarifies language for protecting voids at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof assembly as follows:

- Section 707.9 was revised to follow the format of Section 707.8, and the protection requirements were moved to Section 715.

- A new Section 715.5 includes the protection requirements previously in Section 707.9 for voids at intersections of fire barriers and the underside of nonfire-resistance-rated roofs. In addition, Section 715.5 includes an option for protecting this void with a continuity head-of-wall joint system.
- A definition of continuity head-of-wall joint system was provided.
- The definitions of F rating and T rating were revised to reference continuity head-of-wall joint systems. In addition, reference to the two firestop test standards was removed from the definitions.
- The definition of T rating was revised to correct an error in the metric conversion of the temperature rise criteria. When converting a **temperature rise**, the equation is $^{\circ}\text{C} = 5/9(^{\circ}\text{F})$. The 32°F portion of the equation for converting actual temperatures falls out of the equation.
- ASTM E2837 was added as new referenced standard.
- There are currently approximately 20 continuity head-of-wall joint system tested and certified by UL meeting an F rating/T rating.
- This proposal to include ASTM E2837 test aligns with the requirements added in the 2018 edition of NFPA 101.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal simply provides another option for demonstrating code compliance.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2837-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

FS31-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee found this proposal to be unnecessary. The existing provisions are adequate. The proponent may wish to restructure as an alternate method. (Vote 11-2)

FS31-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Tony Crimi, representing International Firestop Council (tcrimi@sympatico.ca) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

715.6-715.5 Voids at intersections of fire barriers and underside of nonfire-resistance-rated roofs. The voids created at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof sheathing, slab or deck above shall be protected by one of the following methods:

1. By filling with an approved material or system to retard the interior spread of fire and hot gases.
2. By an approved continuity head-of-wall joint system installed as tested in accordance with ASTM E2837 to provide an F rating/T rating for a time period not less than the required fire-resistance rating of the wall assembly in which it is installed or be filled with an approved material or system. Such materials or systems shall be securely installed in accordance with the manufacturer's installation instructions in or on the void for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases. Continuity head-of-wall joint systems shall also be installed in accordance with the listing criteria.

Commenter's Reason: The original intent of this proposal was two-fold. First, it moved the requirements on how to protect the void between a fire barrier and the underside of a non fire-resistance-rated roof from Section 707 covering fire barriers to Section 715 covering joints and voids, leaving just a pointer in Section 707, and second, it added the option of protecting this void with a material or system tested to a new ASTM Standard. During the Committee Action Hearing, the discussion centered on whether a tested system was needed to evaluate the method of protecting this void. Ultimately, the Fire Safety Committee decided the current method of filling the void with an approved material was adequate and disapproved this proposal. This public comment is an attempt to reconsider that decision in light of the following:

The order of reference to the two types of protection has been change to place the traditional requirement to fill the void first, followed by the use of a tested system.

The use of a tested system is an option, not a requirement. Even if this Public Comment is approved, filling the void will still be an option.

The requirement that the materials and systems shall be securely installed in accordance with the manufacturer's instruction in or on the void for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to resist the passage of fire and hot gases has been deleted from this proposed Section in recognition of FS52-18 which added same language for all joints and voids. FS52-18 was Approved as Submitted 13-0.

When the void is filled with an approved material or system, the code official must evaluate the acceptability of the material and method of filling the void, including whether or not the material or system will dislodge, loosen or otherwise impair the ability of the void to accommodate expected building movements and resist the passage of fire and hot gases. On what basis will the code official make this decision? With a tested system that evaluation has already been made through the cycling and fire testing in accordance with ASTM E2837. With a tested system, it is just a matter of verifying the material or system used was installed in accordance with the requirements of the tested system.

This Public Comment addresses both the original intents of the proposal; those being moving the protection requirements for how to protect this void to Section 715, and introducing the use of materials or system tested to ASTM E2837.

Also note that the section number is being revised as it is desired to have these provisions before the section on spandrels which is currently Section 715.5.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal simply provides another option for demonstrating code compliance.

Public Comment 2:

Proponent: Michael O'Brian, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

707.9 Voids at intersections. The voids created at the intersection of a *fire barrier* and a nonfire-resistance-rated roof assembly or a nonfire-resistance-rated exterior wall assembly shall be filled. ~~An approved material or system shall be used to fill the void, and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases protected with a material or system which complies with Section 715.~~

715.5 Voids at intersections of fire barriers and underside of nonfire-resistance-rated roofs. Voids created at the intersection of a fire barrier and the underside of a nonfire-resistance-rated roof sheathing, slab or deck above shall be filled with an approved material or system to retard the interior spread of fire and hot gases.

Commenter's Reason: The original intent of this proposal was two-fold. First, move the requirements on how to protect the void between a fire barrier and the underside of a non fire-resistance-rated roof from Section 707 covering fire barriers to Section 715 covering joints and voids, leaving just a pointer in Section 707, and second, adding the option of protecting this void with a material or system tested to a new ASTM Standard.

During the Committee Action Hearing, the discussion centered on whether a tested system was needed to evaluate the method of protecting this void. Ultimately, the Fire Safety Committee decided the current method of filling the void with an approved material was adequate and disapproved this proposal.

This Public Comment was prepared to only address moving the protection requirements to Section 715. Note it was prepared as a complete replacement of the original proposal. The language used in new Section 715.5 is identical to that Approved under FS52-18 and FS53-18 for protecting other voids using an approved material and system. If successful, the requirements for how to protect all joints and voids will be in one place, that being Section 715.

Also note that the section number being proposed is intended to come before the section on spandrels which is currently Section 715.5.

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal simply provides another option for demonstrating code compliance.

IBC: 708.3, 708.3.1, 708.4.1, 711.2.3, 711.2.4, 711.2.4.1, 711.2.4.1.1, 711.2.4.3, 711.2.4.3.1

Proposed Change as Submitted

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Masonry Alliance for Codes and Standards (svskalko@svskalko-pe.com); William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org)

2018 International Building Code

Revise as follows

708.3 Fire-resistance rating. Except as provided in Section 708.3.1 *Fire partitions shall have a fire-resistance rating of not less than 1 hour.*

Add new text as follows

708.3.1 Group I-1, R-1 and R-2 buildings. For Group I-1, R-1 and R-2 occupancies in buildings of Type III, IV and V construction that are more than two stories in height or that have dwelling or sleeping units located on a floor level that is more than 25-feet above the grade plane, the separation walls required by Section 420.2 shall be fire barriers that comply with Section 707 and shall have a 2-hour fire resistance rating. In addition, any load bearing walls shall meet the requirements of Section 1604 without sheathing.

Exceptions:

1. Corridor walls permitted to have a $1/2$ -hour fire-resistance rating by Table 1020.1.
2. Dwelling unit and sleeping unit separations in buildings of Types IIB, IIIB and VB construction shall have fire-resistance ratings of not less than ~~1/2~~ 1-hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Revise as follows

708.4.1 Supporting construction. The supporting construction for a *fire partition* shall have a *fire-resistance rating* that is equal to or greater than the required fire-resistance rating of the supported *fire partition*.

Exception: In buildings of Types IIB, IIIB and VB construction, the supporting construction requirement shall not apply to 1-hour fire partitions separating tenant spaces in covered and open mall buildings, *fire partitions* separating dwelling units, *fire partitions* separating sleeping units and *fire partitions* serving as corridor walls.

711.2.3 Supporting construction. The supporting construction shall be protected to afford the required *fire-resistance rating* of the *horizontal assembly* supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the *horizontal assembly* is not required to be fire-resistance rated at the following:

1. *Horizontal assemblies* at the separations of incidental uses as specified by Table 509 provided that the required *fire-resistance rating* does not exceed 1 hour.
2. ~~Horizontal~~ One-hour fire resistance rated horizontal assemblies at the separations of *dwelling units* and *sleeping units* as required by Section 420.3.

711.2.4 Fire-resistance rating. The *fire-resistance rating* of *horizontal assemblies* shall comply with Sections 711.2.4.1 through 711.2.4.6 but shall be not less than that required by the building type of construction.

711.2.4.1 Separating mixed occupancies. Except as provided in Section 711.2.4.1.1, Where the *horizontal assembly* separates mixed occupancies, the assembly shall have a *fire-resistance rating* of not less than that required by Section 508.4 based on the occupancies being separated.

Add new text as follows

711.2.4.1.1 Group I-1, R-1 and R-2 buildings. For Group I-1, R-1 and R-2 occupancies in buildings of Type III, IV and V construction that are more than two stories in height or that have dwelling or sleeping units located on a floor level that is

more than 25-feet above grade plane, the horizontal assemblies providing the separations of dwelling and sleeping units as required by Section 420.3 shall have a 2-hour fire resistance rating. In addition, any load bearing walls supporting the horizontal assembly shall comply with the requirements of Section 1604 without the use of sheathing.

711.2.4.3 Dwelling units and sleeping units. Except as provided in Section 711.2.4.3.1, Horizontal assemblies serving as dwelling or sleeping unit separations in accordance with Section 420.3 shall be not less than 1-hour fire-resistance-rated construction.

711.2.4.3.1 Group I-1, R-1 and R-2 buildings. For Group I-1, R-1 and R-2 occupancies in buildings of Type III, IV and V construction that are more than two stories in height or that have dwelling or sleeping units located on a floor level that is more than 25-feet above grade plane, the horizontal assemblies at the separation of dwelling and sleeping units as required by Section 420.3 shall have a 2-hour fire resistance rating. In addition, any load bearing walls supporting the horizontal assemblies shall meet the requirements of Section 1604 without the use of sheathing.

Exception: Horizontal assemblies separating dwelling units and sleeping units shall be not less than 1-hour fire-resistance-rated construction in a building of Types IIB, IIIB and VB construction, where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Reason: The changing construction methods and the noticeable shift to light weight materials for Group I-1, R-1 and R-2 occupancy buildings; and the continued national trend in reducing fire department staffing numbers, this proposed code language provides for two distinct safety provisions. The first is the increased compartmentalization of the building to reduce fire spread and damage using passive fire protection methods. The second safety provision is the ability of the structure to be constructed in such a way that it retains its structural integrity after being subject to a fire. The provisions of **Section 101.3 Intent**, state:

"The purpose of this code is to establish the minimum requirements to safeguard the public health, safety and general welfare through structural strength, means of egress facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations."

Currently many of these load bearing walls are constructed in such a way that the wall sheathing is a critical part of the structural integrity of the wall. The sheathing is used for localized member stability, global stability, and in many cases the lateral load resisting system for the entire building. During an adverse event, such as a fire this sheathing can be compromised by fire damage, mechanical damage, and water damage compromising the overall structural integrity of the building. Where the current standard test used for fire resistance is the ASTM E119, Standard Test Methods for Fire Tests of Building Construction and Materials, in practice this test does not account for the reduction in strength and stiffness that results from fire and water damage. It is not practical to think that every assembly would be tested at designed load levels and the resulting strength and stiffness data used in design, as a result the proposed provisions would provide for the structure to rely on the sheathing only as a fire resistive element and would allow the structure to maintain its design strength after the sheathing was compromised or removed for any reason.

The proposed story level and floor height is based on the ability for a fire department to make a rescue from the exterior of the structure using the equipment commonly found on an NFPA 1901 equipped motorized fire engine, this using the most common extension ladder size, being a 24 foot long extension ladder which can easily reach a second floor window. In addition, for structures three stories or greater in height, the level of vertical load and potential lateral load on these walls increases and as a result an additional level of safety is needed.

The success of NFPA 13 & 13R sprinkler systems to manage and control fire is acknowledged however, the provisions of this code change are designed to assist those active fire protection systems in effectively doing their job and to provide structural stability and strength that is dictated under the provisions of Section 101.3.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Based on an independent third-party study of rectangular 4-story Type V multi-family dwellings if constructed in three different cities, this code change proposal may or may not increase the cost of construction, depending on location and material costs at the time of the construction.

A multi-family residential structure must be schematically designed to meet all of the requirements of the 2015 International Building Code to accurately evaluate the relative construction cost. Once designed, the cost comparison buildings were reviewed for code compliance, and cost estimates prepared. The study was prepared by Walter G. M. Schneider III, Ph.D., P.E., MCP, CBO, CFO and Ryan L. Solnosky, Ph.D., P.E.

The building model chosen for the project was a 4 story multi-family residential structure encompassing approximately 25,000 gross square feet of building area per floor. The cost comparisons are based on the proposed target building assembled using a mixed bedroom scheme for residential occupancies.

The following construction types were included in the evaluation:

- Conventional wood framing with floor system (Type VA construction)
- Light gauge steel framing with concrete slab floor on steel deck (Type IIB construction)
- Load bearing concrete masonry with precast concrete floor (Type IIB construction)
- Load-bearing precast concrete walls and precast concrete floor (Type IIB construction)
- Load-bearing insulated concrete form (ICF) walls* and precast concrete floor (Type IIB construction)
- Load-bearing insulated concrete form (ICF) walls* and ICF concrete floor (Type IIB construction)

* For the ICF systems walls separating dwelling units were specified as concrete masonry.

The cost estimate for each building model included the complete fit out of each building with the exception of movable appliances and furniture.

From the cost estimates for the 3-city study, the report concluded that the compartmentalized construction method utilizing concrete based construction materials was cost competitive with light weight conventional wood frame construction.

Copies of the study are available on request.

FS34-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The increases required by this proposal are unwarranted. The cost impact statement is not credible. We always seek a balance when increasing protections and the practical. This proposal does not balance. (Vote 14-0)

Assembly Action:

FS34-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Douglas Schreffler, Logan Fire Company, representing selfrequests As Submitted.

Commenter's Reason: The purpose of this code is to establish the minimum requirements to safeguard the public health, safety and general welfare through structural strength, means of egress facilities, stability, sanitation, adequate light and ventilation, energy conservation, and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations. It has been well documented by NIST and UL that the fire loads in modern buildings are higher than historically has been the case, and the heat release rates are higher as well, leading to hotter, more aggressive fires. With the ASTM E-119 test reaching its one hundredth birthday this year and the basis of testing being changed very little over the years, including the all-important time temperature curve, the level of safety for firefighters and first responders has deteriorated since the test has not kept current with current fire trends.

The first part of this proposal seeks to maintain a minimum level of safety for our firefighters and first responders who have to enter buildings during fire conditions, to perform searches and conduct fire suppression activities. This is being accomplished in FS34-18 by the increase in fire rating of assemblies to increase the level of safety to make up for the change in fire intensity, compared to the 100 year old calibrated time-temperature curve in ASTM E-119.

The second part of the FS34-18 proposal addresses the change in how buildings are being constructed under the code. While it has been an option to use load bearing studs to carry high vertical loads in buildings, the way this is being accomplished is changing. Traditionally, the lateral bracing for the studs was provided by bracing elements within the wall like wood or metal blocking based on the type of construction that was being used. In addition, the lateral loads were being resisted by either discrete strapping, wood based panel sheathing, or by a discrete lateral force resisting system. This has also changed with a trend in utilizing the sheathing product as the lateral force resisting system and the element to provide the lateral support to the individual studs. The problem with this approach is that during a fire these materials are compromised or destroyed and the structural integrity is lost. The fire department applies water as part of the extinguishing effort and many of the interior sheathing products partially or completely lose their stiffness and strength as a result. After the initial extinguishment effort, the fire department then actively removes much of the remaining sheathing as part of a process called overhaul. The overhaul process is designed to identify the extent of the fire activity and ensure complete extinguishment. The result is further deterioration of the structural stability of the building and may result in a sudden collapse occurring.

One of the primary issues is that these walls are not easily identified in the field. As a result, firefighters and workers are not aware of what sheathing is acceptable to remove and what sheathing is critical for the stability of the building. The result of which will be the reduction of safety to the point where firefighters and first responders are injured or killed as a result.

The proposal helps address this issue, by requiring that the load carrying capabilities of the structural elements be accomplished without the use of sheathing and would require that positive blocking or strapping be used. These are readily identifiable and seldom removed without conscious thought.

I would like to respond to the committees comment that the increases required by this proposal are unwarranted. The nature of this proposal is seeking to balance the safety of the firefighters and first responders as required by the scope of the code with an identified shortcoming. This proposal allows the code to possibly achieve a similar level of safety that was previously enjoyed and expected prior to the move to leaning down the building to the point where a single issue could produce catastrophic failure. I would contend that this proposal does provide a level of balance that is consistent with the code process.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
See original proposal.

FS36-18

IBC: 708.4

Proposed Change as Submitted

Proponent: Paul Battaglia, STC Sound Control, representing STC Sound Control, President (paul@stcsoundcontrol.com)

2018 International Building Code

Revise as follows

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below and be securely attached to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. The underside of a floor/ceiling or roof/ceiling assembly having a fire-resistance rating that is not less than the fire-resistance rating of the fire partition.

Exceptions:

1. Fire partitions shall not be required to extend into a crawl space below where the floor above the crawl space has a minimum 1-hour fire-resistance rating.
2. Fire partitions serving as a corridor wall shall not be required to extend above the lower membrane of a corridor ceiling provided that the corridor ceiling membrane is equivalent to corridor wall membrane, and either of the following conditions is met:
 - 2.1. The room-side membrane of the corridor wall extends to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above.
 - 2.2. The building is equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, including automatic sprinklers installed in the space between the top of the fire partition and underside of the floor or roof sheathing, deck or slab above.
3. Fire partitions serving as a corridor wall shall be permitted to terminate at the upper membrane of the corridor ceiling assembly where the corridor ceiling is constructed as required for the corridor wall.
4. Fire partitions separating tenant spaces in a covered or open mall building complying with Section 402.4.2.1 shall not be required to extend above the underside of a ceiling. Such ceiling shall not be required to be part of a fire-resistance-rated assembly, and the attic or space above the ceiling at tenant separation walls shall not be required to be subdivided by fire partitions.
5. Fire partitions shall be permitted to extend from the top of a floor underlayment system that is not a component of the floor/ceiling assembly where the building is equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: This proposal is intended to allow *continuous* installation of floor underlayment systems, such as those required for impact noise isolation, without compromise to fire safety in buildings. Continuous installation will save 13% of system cost and speed construction. It will also provide isolation of structure-borne sound not possible with discontinuous underlayment installation.

Acoustical underlayment systems are required by IBC 1207.3 to attain high Impact Isolation Classification (IIC) ratings for floors in facilities with dwelling units and sleeping rooms. Continuous installation of underlayment is currently an integral part of many fire-rated floor/ceiling systems that include gypsum cement poured over acoustical mats, recycled newspaper mats, and plywood panels installed over rubber pads (ex: UL Design L563).

Fire partitions may be placed directly on top of these fire-rated floor/ceiling systems under the current IBC 708.4 since they are part of the fire-resistance rated floor/ceiling assembly. *There is no difference in construction details or fire behavior between adjacent rooms when fire partitions are placed on top of the underlayment systems whether the underlayment system is integral to the floor/ceiling system or it isn't.*

We propose that fire partitions should be allowed to be placed directly on these underlayment systems where they are *not* a part of the fire-rated system, especially where automatic sprinkler systems are installed. Furthermore, an underlayment system that performs as a component of a fire-rated floor/ceiling assembly will provide additional fire safety when added to an otherwise complete assembly.

Continuous installation of underlayment provides the additional benefit of structure-borne sound isolation between floors by creating a discontinuous path for sound and vibration between the underlayment and the subfloor.

Cost Impact: The code change proposal will decrease the cost of construction

Under current Code requirements a fire-rated partition must be installed on the top of the floor/ceiling assembly prior to placing the additional underlayment. The proposal will allow installation of underlayment systems over an entire building floor system prior to construction of any partitions, thus eliminating additional cutting and fitting around in-place partitions that add 13% to the system cost. It will also eliminate interruptions in the installation process and the related and unnecessary costs of remobilization.

	Fire Partitions in Place	Continuous Installation
Total Floor Area of Underlayment	11,240	11,586
Perimeter Length	1,943	564
Full Panels @ 4x8	352	363
Pads in Field @ 10 per panel	3,520	3,630
Pads at Perimeter @ 2'	972	282
Total Pads	4,492	3,912
Panel Cuts (feet) @ perimeter	1,943	564
Manhours for cuts @ 1.2 minutes/foot	39	11
Perimeter panels installed @ 4'	486	141
Material cost of pads @ \$0.9556	\$ 4,292.08	\$ 3,738.31
Material cost of panels @ \$31.16	\$ 10,968.32	\$ 11,311.08
Manhours: Pads @ 80/hour	56	49
Manhours: Panels @ 15/hour	56	34
Total Manhours	151	94
Total Material Costs	\$ 15,260.40	\$ 15,049.39
Total Labor Costs @ \$32/hour	\$ 4,827.32	\$ 3,000.96
Total Cost per Square Foot	\$ 1.79	\$ 1.56
Savings for continuous (%)	13%	
Per square foot savings	\$ 0.23	

FS36-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The provisions were found to be vague. What is meant by the phrase 'not a component'. The term 'underlayment' is not intended the same as one might use for the underlayment of flooring, and therefore should be defined, or a different word used. Overall there is insufficient information to guide the code user (Vote 12-2)

Assembly Action:

None

FS36-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Paul Battaglia, representing STC Sound Control, President (paul@stcsoundcontrol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

SECTION 202 DEFINITIONS

Floor/Ceiling Assembly Floor construction with required fire protective materials that provide a fire-resistance rating.

Interior Floor Underlayment

Material or system of materials that is adhered, fastened, or placed on floor construction for patching, leveling, or acoustical purposes, including any supporting materials of 1/2-inch height or less such as sleepers, mats, spacers, or pads.

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through ~~603.1.3~~603.1.27:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

 1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
6. Millwork such as doors, door frames, window sashes and frames.
7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
8. *Trim* installed in accordance with Section 806.
9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
10. Finish flooring installed in accordance with Section 805.
11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
14. Blocking such as for handrails, millwork, cabinets and window and door frames.
15. Light-transmitting plastics as permitted by Chapter 26.
16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
17. Exterior plastic veneer installed in accordance with Section 2605.2.
18. Nailing or furring strips as permitted by Section 803.15.
19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
27. Interior floor underlayment.

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below and be securely attached to one of the following:

1. The underside of the floor or roof sheathing, deck or slab above.
2. The underside of a floor/ceiling or roof/ceiling assembly having a fire-resistance rating that is not less than the fire-resistance rating of the fire partition.

Exceptions:

1. Fire partitions shall not be required to extend into a crawl space below where the floor above the crawl space has a minimum 1-hour fire-resistance rating.
2. Fire partitions serving as a corridor wall shall not be required to extend above the lower membrane of a corridor ceiling provided that the corridor ceiling membrane is equivalent to corridor wall membrane, and either of the following conditions is met:
 - 2.1. The room-side membrane of the corridor wall extends to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above.
 - 2.2. The building is equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, including automatic sprinklers installed in the space between the top of the fire partition and underside of the floor or roof sheathing, deck or slab above
3. Fire partitions serving as a corridor wall shall be permitted to terminate at the upper membrane of the corridor ceiling assembly where the corridor ceiling is constructed as required for the corridor wall.
4. Fire partitions separating tenant spaces in a covered or open mall building complying with Section 402.4.2.1 shall not be required to extend above the underside of a ceiling. Such ceiling shall not be required to be part of a fire-resistance-rated assembly, and the attic or space above the ceiling at tenant separation walls shall not be required to be subdivided by fire partitions.
5. Fire partitions shall be permitted to extend from the top of ~~a~~ an interior floor underlayment system ~~that is not a component of the floor/ceiling assembly~~ where the building is equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2.

Commenter's Reason: This Public Comment supplements the Proposal and answers concerns raised at the Committee Hearings in April 2018. A definition of “interior floor underlayment” has been included. Also, a definition of “floor/ceiling assembly” is proposed since it has not yet been included in the Codes. “Interior floor underlayment” is included in the list of materials permitted in Construction Types I & II. The original proposal regarding continuity of fire partitions remains as an Exception, and includes fire protection.

Floor underlayment is not well-represented in the Codes. These commonly include luan plywood, recycled newspaper panels (Homasote), gypsum cement (Gypcrete) over polymeric filament mats (Acousti-mat), cork, recycled rubber mats (Regupol), and rubber pads supporting wood panels (Acoustic Sleeper). The majority of these systems are combustible, and they are not tested for critical radiant flux as are interior floor finishes (IBC 804).

Most of the interior floor underlayments that are commonly used in *non-combustible* construction have been tested and listed by Underwriters Laboratories as components of floor/ceiling assemblies in *combustible* construction. The details of fire partitions mounted on underlayment systems is a common occurrence with these UL Designs, and should be extended to non-combustible construction.

The Purpose of this proposal remains the same – eliminate an acoustical structure-borne sound flanking path that occurs as a result of the current Code language while retaining fire safety. The most effective example is a wall-mounted television set on a fire partition that is required to extend from the top of a concrete deck to the bottom of the deck above, with repetitious floor plans -- neighbors hear each others TV's quite efficiently. If the same partition were to be mounted on top of an acoustical underlayment system rather than directly on the deck, the sound path would be interrupted and privacy obtained.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Cost savings can be expected, approximately 13% of the underlayment system cost due to continuous installation as indicated in the proposal.

FS36-18

FS39-18

IBC: 710.5, 710.5.3

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows

710.5 Openings. Openings in smoke partitions shall comply with Sections 710.5.1 and ~~710.5.2~~, through 710.5.3

Add new text as follows

710.5.3 Pass through openings in Group I-2 Condition 2. Where pass through openings are provided in smoke partitions in Group I-2, Condition 2 occupancies, such openings shall comply with the following:

1. Smoke compartment in which the pass through openings occur do not contain a patient care suite or sleeping room.
2. Pass through openings are installed in a door or vision panel that is not required to have a fire protection rating.
3. The top of the pass through opening is located a maximum of 48 inches above the floor.
4. The aggregate area of all such pass through openings within a single room shall not exceed 80 square inches (0.05m²).

Reason: At Section 710.5.3, the addition of pass through openings is to recognize important operational functions in the context of the corridor wall. There are several examples of this operational practice. Hospital pneumatic tube delivery systems cannot handle some materials and others where the shaking of the material compromises its effectiveness. In particular, chemotherapy, gross lab materials (tissue biopsy, small organ, etc.) and cash / checks are restricted from being delivered via pneumatic tube system, which is why walk-up pickup and delivery is still an important operational feature of some areas.

First, in a hospital pharmacy, air pressure relationships are established to keep a safe environment. From an operational standpoint, there are frequent pickups by patient care staff from an in-house pharmacy that require direct hand-off and signing of forms. In addition, there are basic security requirements from DEA and state pharmacy boards that require the pharmacy material to be secured, whether it is narcotics, opioids or chemotherapy materials. Opening and closing the door compromises the air relationships prescribed by the IMC Section 407.1, as well as security.

In a laboratory setting, air pressure relationships are critical, and many samples get delivered by hand through a pass-through. Cashier areas are set like a secured bank windows, due to the co-payment cash being delivered by staff, or a patient with a financial issue to be discussed.

This concept has existed in hospitals for a long time, because it has been allowed by the federal standard (K364). This code changes seeks to establish the same criteria to respond to the operational need of the corridor, while maintaining its integrity.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will increase the cost of construction. Costs will increase with this change because it allows extra features to be added to an opening. However, it does not add cost to the healthcare industry because we already follow these requirements in the context of the federal standard.

FS39-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: We do need to coordinate with the federal standards, yet there was a concern that the openings are too large and perhaps shutter to reduce actual leakage. The committee suggested a modification to clarify that all 4 items must be complied with. (Vote 13-1)

Assembly Action:

None

FS39-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

710.5.3 Pass through openings in Group I-2 Condition 2. Where pass through openings are provided in smoke partitions in Group I-2, Condition 2 occupancies, such openings shall comply with all of the following:

1. The smoke ~~Smoke~~ compartment in which the pass through openings occur do not contain a patient care suite or sleeping room.
2. Pass through openings are installed in a wall, door or vision panel that is not required to have a fire ~~protection-resistance~~ rating.
3. The top of the pass through opening is located a maximum of 48 inches above the floor.
4. The aggregate area of all such pass through openings within a single room shall not exceed 80 square inches (0.05m²).

Commenter's Reason: The modification is in response to the improvements suggested by the committee and will provide greater clarification of the requirements.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Costs will increase with this change because it allows extra features to be added to an opening. However, it does not add cost to the healthcare industry because we already follow these requirements in the context of the federal standard.

FS39-18

FS46-18

IBC: 202, 202, 714.2.1

Proposed Change as Submitted

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows

FIRESTOP IDENTIFICATION DEVICE A label or placard, of any type, that identifies the firestop system.

Add new text as follows

714.2.1 Firestop identification devices. Penetration firestop systems shall be permanently identified with a device, label or other method. The device shall be handwritten with permanent ink, or pre-printed, legible tag or label, or format readable by an electronic device. The device shall be located on both sides of the fire barrier, smoke barrier or fire wall. The device shall at a minimum have the following information:

1. Listing system number or engineering judgement number.
2. Date of Installation
3. Installing company name, contact information.
4. Manufacturer name of the firestop system.
5. "Warning, Penetration Firestop System - Do Not Remove or Tamper."

Adhesive or mechanically attached identification devices shall be located within 6 inches (150 mm), of the penetration firestop system edge, on top of the horizontal assembly, 6 inches (150 mm) below or beside the firestop system. For multiple penetrations of the same listing number arranged within 6 inches (150 mm) of each other, the device shall be located centered under or within 6 inches (150 mm) to either side of the grouping. Hanging tags shall be attached to the penetrating item with permanent wire, string or plastic tie, within 6 inches (150 mm) of the assembly.

Reason: Installing penetration firestop systems looks as easy as applying red caulk to an assembly. Firestop systems are not easy to install. Firestop systems are very complex, detailed listed systems that take understanding of the tolerances so they work when called upon by fire.

This proposal adds a requirement to identify the firestop system used to maintain fire-resistance at the assembly. This is a way for the special inspection agency inspector, during construction, and building owner and manager, during the life of the building, to understand quickly what listing has been used. The listing has the information needed to evaluate the installation and maintain compliance during construction and through the building life cycle. It's not red caulk that's been installed. It's an assemblage of materials designed to keep fire from spreading outside the room of origin. The identification device makes the verification process much more efficient and effective.

Cost Impact: The code change proposal will increase the cost of construction

The cost of an identification device will add a very small amount to the cost of construction, but will decrease the cost of inspection and maintenance. The identification device cost per penetration firestop system is approximately \$0.10US per penetration.

FS46-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee, in part, saw the value of such systems, but not everyone. In addition the committee expressed a number of concerns. This doesn't help improper installations, field changes not reflected on plans and then changed again in the field. Nothing prohibits improper labelling. The contractors should provide this as part of showing their compliance with the code. The label on the wall of 1 or 2 hours, etc, should be enough to indicate the type of penetration protection. (Vote 8-6)

Assembly Action:

None

FS46-18

Individual Consideration Agenda

Public Comment 1:

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com) requests As Submitted.

Commenter's Reason: Clearly the Fire Safety Committee was split on the benefit of this change as evidenced by an 8-6 vote.

While the use of a firestop identification device does not, in and of itself, prevent incorrect installations, it certainly enhances the likelihood of proper oversight and enforcement. Providing the required marking on the wall simply identifies the assembly as have a certain characteristic, such as being a fire barrier. It does not provide any information regarding the protection of the penetrations of the assembly. With over 9,000 listed firestop systems in the UL s directory and thousands more in the FM Approval Guide and Intertek s directory, it s not easy to identify the system that was installed. The identification device provides an efficient method for the code official, owner s representative, and/or special inspection agency to identify what system was supposedly installed and whether the system is appropriate for the specific application. It also allows such individuals to then verify that the system was installed in accordance with the listing criteria and the manufacturer s installation instructions. Lastly, it provides the building owner with the system information so that the systems can be properly identified in the inventory required by the IFC and so that the proper maintenance and repair procedures, as identified in the manufacturer s installation instructions, can be identified and followed.

The Committee Reason states the contractors should provide such information as part of their way of demonstrating compliance with the code requirements. The FCIA membership agrees and the practice is common amongst many contractors. However, unless firestop identification systems are required by the Code, they will not be provided by all contractors.

The following photograph shows one application that would comply with the proposed language. It should be noted that there are other systems that utilize other technologies, such as bar coding, that would also provide the information and would be far less obvious to the occupants within the area.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Some contractors provide the identification devices already and do it with competitive pricing such that one could say there is no increase in cost. The actual cost of the identification device is approximately \$0.10 US per penetration. Even if there is a small increase in the cost of construction, providing the information will most likely decrease the cost of inspection and maintenance.

FS46-18

Proposed Change as Submitted

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows

714.4.2 Membrane penetrations. *Membrane penetrations* shall comply with Section 714.4.1. Where walls or partitions are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced.

Exceptions:

1. *Membrane penetrations* of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 16 square inches (0.0103 m²) in area, provided that the aggregate area of the openings through the membrane does not exceed 100 square inches (0.0645 m²) in any 100 square feet (9.29 m²) of wall area. The *annular space* between the wall membrane and the box shall not exceed 1/8 inch (3.2 mm). Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
 - 1.1. By a horizontal distance of not less than 24 inches (610 mm) where the wall or partition is constructed with individual noncommunicating stud cavities.
 - 1.2. By a horizontal distance of not less than the depth of the wall cavity where the wall cavity is filled with cellulose loose-fill, rockwool or slag *mineral wool* insulation.
 - 1.3. By solid *fireblocking* in accordance with Section 718.2.1.
 - 1.4. By protecting both outlet boxes with *listed* putty pads.
 - 1.5. By other *listed* materials and methods.
2. *Membrane penetrations* by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the wall membrane and the box shall not exceed 1/8 inch (3.2 mm) unless *listed* otherwise. Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
 - 2.1. By the horizontal distance specified in the listing of the electrical boxes.
 - 2.2. By solid *fireblocking* in accordance with Section 718.2.1.
 - 2.3. By protecting both boxes with *listed* putty pads.
 - 2.4. By other *listed* materials and methods.
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of a wall opening protective material system for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by boxes other than electrical boxes, provided that such penetrating items and the *annular space* between the wall membrane and the box, are protected by an *approved membrane penetration firestop system* installed as tested in accordance with ASTM E814 or UL 1479, with a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water, and shall have an F and T rating of not less than the required *fire-resistance rating* of the wall penetrated and be installed in accordance with their listing.
5. The *annular space* created by the penetration of an automatic sprinkler, provided that it is covered by a metal escutcheon plate.
6. *Membrane penetrations* of maximum 2-hour fire-resistance-rated walls and partitions by steel electrical boxes that exceed 16 square inches (0.0103 m²) in area, or steel electrical boxes of any size having an aggregate area through the membrane exceeding 100 square inches (0.0645 m²) in any 100 square feet (9.29 m²) of wall area, provided that such penetrating items are protected by *listed* putty pads or other *listed* materials and methods, and installed in accordance with the listing.
7. The wall membrane of 1- or 2-hour fire-resistance-rated wall assemblies is permitted to be interrupted with a double wood end stud at the intersection of light frame wood wall assemblies provided: the intersecting wall has a membrane of 5/8 inch Type X gypsum, all penetrating items through the double wood stud are protected in accordance with Section 714.4.1.1 or 714.4.1.2, and the interrupted membrane is tight to the double wood stud. The cavity of the 1- or 2- hour fire-resistance-rated wall assembly shall be blocked solid with material suitable as a fire block in Section 718.2 if the wall membrane is interrupted on both sides of the wall within a single stud space.

Reason: This proposal provides an exception for wall assemblies similar to exception 7 currently in Section 714.5.2 for membrane penetrations of a horizontal assembly. Additional material suitable as a fire block is added to the wall cavity if a similar condition occurs on both sides of the 1- or 2- hour rated wall into the same stud cavity. Double studs at the intersection have an intrinsic fire resistance rating greater than the layer of 5/8" gypsum board and is suitable in this wall application similar to the horizontal assembly found in section 714.5.2.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal is merely guiding the user as to how to treat the intersection of two fire rated walls. In the absence of any current guidelines, this could potentially increase the cost of construction.

FS48-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approved based on proponent's reason statement. The new text parallels horizontal assembly protections. (Vote 11-2)

Assembly Action:

None

FS48-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Thomas, Colorado Code Consulting, LLC, representing Himself (stthomas@coloradocode.net)requests Disapprove.

Commenter's Reason: This proposal is trying to say that a wall intersection is a penetration. This is a bad precedent to set. They are trying to compare this to the case where a wall intersects a floor- or roof-ceiling assembly. That change was based on language in the UL Directory regarding non-rated walls intersecting rated horizontal assemblies. There is no similar language in the UL Directory regarding walls intersecting other walls. The proponent has not provided any documentation to show that this has been problem. Many UL Designs include the wall intersection in their tested assembly listing. No information was provided regarding the rating of the two walls. Is there a difference between a non-rated wall intersecting a rated wall and a rated wall intersecting a rated wall? There was also no information provided to show that there is a problem with wood, but not for steel stud walls. Is there a difference between the two types of materials? This language is not needed in the code. The only justification is that we do it for horizontal assemblies, so we should do the same for walls. There needs to be more technical justification to show the need for this change.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

If the item is disapproved, there will be no change to the cost of construction.

FS48-18

FS49-18

IBC: 714.4.3, 714.5.3

Proposed Change as Submitted

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows

714.4.3 Dissimilar materials. Noncombustible penetrating items shall not connect to combustible items beyond the point of firestopping unless it can be demonstrated that the *fire-resistance* integrity of the wall is maintained.

Exceptions:

1. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is combustible, the combustible material shall extend not less than 6 inches past both sides of the approved penetration firestop system before transitioning to non-combustible materials. The 6 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.
2. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is non-combustible, the non-combustible material shall extend not less than 36 inches past both sides of the approved penetration firestop system before transitioning to combustible materials. The 36 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.

714.5.3 Dissimilar materials. Noncombustible penetrating items shall not connect to combustible materials beyond the point of firestopping unless it can be demonstrated that the *fire-resistance* integrity of the *horizontal assembly* is maintained.

Exceptions:

1. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is combustible, the combustible material shall extend not less than 6 inches past both sides of the approved penetration firestop system before transitioning to non-combustible materials. The 6 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.
2. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is non-combustible, the non-combustible material shall extend not less than 36 inches past both sides of the approved penetration firestop system before transitioning to combustible materials. The 36 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.

Reason: Many plumbing system installations involve the combined use of combustible and noncombustible piping, drains, waste and vents. For example, cast iron (noncombustible) drains may be used for sound control but plastic (combustible) vents are combined on each story for cost savings. The reason for these designs is understandable but the integrity of fire-resistive rated construction may be compromised as a result of mixing these materials. The 6" and 36" dimensions are drawn from Section 8.3.5.5 of the 2015 edition of NFPA 101, which provides a method that maintains the integrity of the fire-resistive rated assembly as reflected in this proposal. This code change will also reduce delays and the cost of construction by eliminating the need for testing.

8.3.5.5 Transitions.

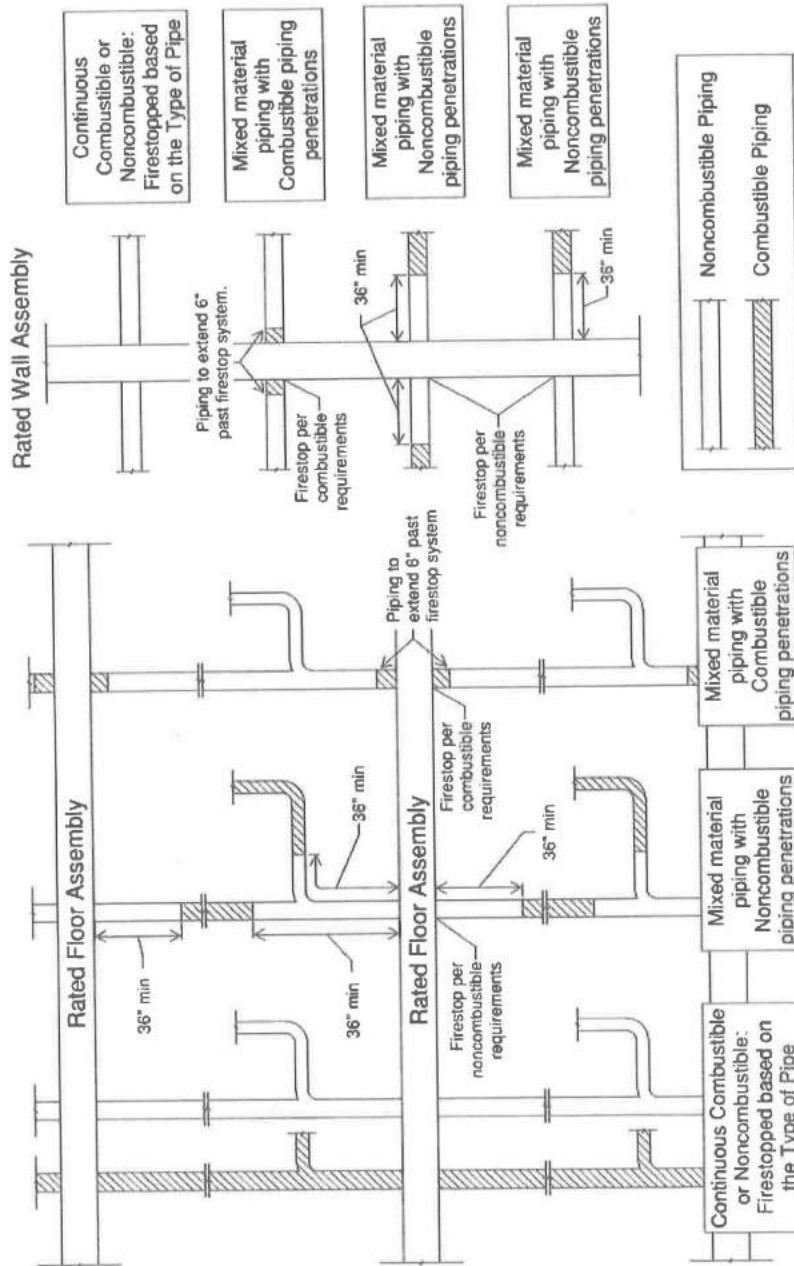

8.3.5.5.1

Where piping penetrates a fire resistance-rated wall or floor assembly, combustible piping shall not connect to noncombustible piping within 36 in. (915 mm) of the firestop system or device without demonstration that the transition will not reduce the fire resistance rating, except in the case of previously approved installations.

8.3.5.5.2

Unshielded couplings shall not be used to connect noncombustible piping to combustible piping unless it can be demonstrated that the transition complies with the fire-resistive requirements of [8.3.5.1](#).

Dissimilar Materials Penetrating a Rated Assembly
 IBC 714.3.3 & 714.4.3 and NFPA 101 8.3.5.5

Bibliography: 2015 Edition of NFPA 101, Section 8.3.5.5.1 and 8.3.5.5.2.

Cost Impact: The code change proposal will decrease the cost of construction

This code change will reduce the cost of construction by eliminating the need for testing.

FS49-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal is not providing the clarity it seeks. There is concern about the insufficient testing. What is the science behind the 36 inch distance. Perhaps a more specific exception to the pipes which were the focus of the debate. (Vote 14-0)

Assembly Action:

None

FS49-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

714.4.3 Dissimilar materials. Noncombustible penetrating items shall not connect to combustible items beyond the point of firestopping unless it can be demonstrated that the *fire-resistance* integrity of the wall is maintained:

Exception:

~~1. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is combustible, the combustible material shall extend not less than 6 inches past both sides of the approved penetration firestop system before transitioning to non-combustible materials. The 6 inches shall be measured as the developed length and must be continuous through all fittings and transitions.~~

~~2. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is non-combustible, the~~ Non-combustible materials shall be permitted to connect to combustible materials ~~shall extend not less than 36 inches past both sides of an the approved through-penetration firestop system before transitioning to combustible materials that has a T rating or is exempted from a T rating, in accordance with Section 714.4.1.2.~~ The 36 inches shall be measured as the developed length and must be continuous through all fittings and transitions.

714.5.3 Dissimilar materials. Noncombustible penetrating items shall not connect to combustible materials beyond the point of firestopping unless it can be demonstrated that the *fire-resistance* integrity of the *horizontal assembly* is maintained.

Exception:

- ~~1. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is combustible, the combustible material shall extend not less than 6 inches past both sides of the approved penetration firestop system before transitioning to non-combustible materials. The 6 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.~~
- ~~2. Where dissimilar materials are used and the portion of the penetrating material extending into or through the fire-resistance rated assembly is non-combustible, the~~ Non-combustible material shall be permitted to connect to combustible materials ~~extend not less than 36 inches past both sides of the an approved penetration firestop system before transitioning to combustible materials that has a T-rating or is exempted from a T-rating, in accordance with Section 714.5.1.2.~~ The 36 inches shall be measured as the developed length and shall be continuous through all fittings and transitions.

Commenter's Reason: At the Committee Action Hearings in Columbus, it was pointed out that our original code change was flawed because it included an exception for combustible materials penetrating a fire-resistance rated floor or wall assembly but the charging language in both IBC Sections 714.4.3 and 714.5.3 applies only to noncombustible materials transitioning to combustible.

This Public Comment modifies the original code change to be consistent with NFPA 101, Section 8.3.5.5 which requires noncombustible materials to extend at least 36" past the membrane of a fire-resistance rated floor or wall assembly before transitioning to combustible materials. We presume this is to allow for conductive heat found in noncombustible materials to dissipate before the transition to combustible materials are made thereby reducing the potential for fire spread.

In this Public Comment, all references to combustible materials have been deleted. When combustible materials penetrate a fire-resistance rated floor or wall assembly conductive heat is not an issue and the code does not regulate the distance before a transition from combustible to noncombustible materials is made. The breach made in the fire-resistance rated wall or floor for combustible penetrating items will be protected by listed fire-stop assemblies which will "choke-off" the opening through the use of intumescent materials. The combustible materials will readily burn-away in a fire but the fire should not spread if an approved fire stop assembly is installed.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. If approved this code change will reduce the cost of construction by allowing for combustible and non-combustible transitions to occur without the need for tests to be required.

IBC: 202 (New), 202, 715.4, 715.4.1 (New), 715.5, 715.6, 715.7, 715.8, 1705.17

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows

PERIMETER FIRE CONTAINMENT SYSTEM. An assemblage of specific materials or products that are designed to resist for a prescribed period of time the passage of fire through voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor or floor/ceiling assemblies.

Revise as follows

~~[BF]~~ **F RATING.** The time period that the through-penetration firestop system or perimeter fire containment system limits the spread of fire through the penetration ~~when tested in accordance with ASTM E814 or UL 1479 or void.~~

~~**715.4 Exterior curtain wall/fire-resistance-rated floor intersection-intersections.** Where fire-resistance-rated floor or floor/ceiling assemblies are required, voids ~~voids~~ created at the intersection of the exterior curtain wall assemblies and ~~such floor fire-resistance-rated floor or floor/ceiling assemblies~~ shall be ~~sealed~~ protected with an approved perimeter fire containment system to prevent the interior spread of fire. Such systems shall ~~be securely installed and tested in accordance with ASTM E2307 to provide an F rating for a time period not less than the fire-resistance rating of the floor or floor/ceiling assembly.~~ Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section 705.8.5. **Exception:** ~~Voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be sealed with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the fire-resistance rating of the floor assembly.~~
705.8.5.~~

Add new text as follows

715.4.1 Fire test criteria. Perimeter fire barriers shall be tested in accordance with the requirements of ASTM E2307.

Exception: Voids created at the intersection of the exterior curtain wall assemblies and floor assemblies where the vision glass extends to the finished floor level shall be permitted to be protected with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the *fire-resistance rating* of the floor assembly.

Revise as follows

~~**715.4.1-715.5 Exterior curtain wall/nonfire-resistance-rated floor assembly intersections.** Voids created at the intersection of exterior curtain wall assemblies and nonfire-resistance-rated floor or floor/ceiling assemblies shall be ~~sealed~~ filled with an approved material or system to retard the interior spread of fire and hot gases between stories.~~

~~**715.4.2-715.6 Exterior curtain wall/vertical fire barrier intersections.** Voids created at the intersection of nonfire-resistance-rated exterior curtain wall assemblies and vertical fire barriers shall be filled. An approved material or system shall be used to fill the void and shall be securely installed in or on the intersection for its entire length so as not to dislodge, loosen or otherwise impair its ability to accommodate expected building movements and to retard the passage of fire and hot gases.~~

~~**715.5-715.7 Spandrel wall.** Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section 705.8.5. Where Section 705.8.5 does not require a fire-resistance-rated spandrel wall, the requirements of Section 715.4 shall still apply to the intersection between the spandrel wall and the floor.~~

~~715.6-715.8 Fire-resistant joint systems~~ **715.8 Fire-resistant joints and voids in smoke barriers.** *Fire-resistant joint systems protecting joints* in smoke barriers, and ~~joints~~ *perimeter fire containment systems protecting voids* at the intersection of a horizontal *smoke barrier* and an exterior curtain wall, shall be tested in accordance with the requirements of UL 2079 for air leakage. The L rating of the joint system shall not exceed 5 cfm per linear foot (0.00775 m³/s m) of joint at 0.30 inch (7.47-74.7 Pa) of water for both the ambient temperature and elevated temperature tests.

[BF] 1705.17 Fire-resistant penetrations and joints. In high-rise buildings or in buildings assigned to *Risk Category III or IV, special inspections for through-penetrations*, membrane penetration firestops, *fire-resistant joint systems* and ~~perimeter fire barrier containment systems~~ that are tested and *listed* in accordance with Sections 714.4.1.2, 714.5.1.2, 715.3 and 715.4 shall be in accordance with Section 1705.17.1 or 1705.17.2.

Reason: The primary intent of this proposal is to introduce the phrase “Perimeter Fire Containment Systemr” to describe the method of protecting the void at the intersection of an exterior curtain wall assembly and a fire-resistance-rated floor or floor/ceiling assembly. Having such a phrase simplifies the code language by having a short and concise phrase to describe such intersections. This proposal also creates consistency with other provisions of Section 715 which states voids which are not required to be tested to any particular fire test standards are to be “filled”, and joints and voids which are required to be tested to a specific standard are to be “protected”. The revisions to Section 715.8 are intended to update the section heading to include both types of joints and voids referenced in the body of the Section and include the new language perimeter fire barrier.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. All changes are editorial in nature and as such will not change construction practices.

FS53-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: Modify proposal as follows:

715.4.1 Fire test criteria.

Perimeter fire ~~barriers~~containment systems shall be tested in accordance with the requirements of ASTM E2307.

Exception: Voids created at the intersection of the exterior curtain wall assemblies and floor assemblies where the vision glass extends to the finished floor level shall be permitted to be protected with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the fire-resistance rating of the floor assembly.

Committee Reason: Through the new term and its definition, we now have a common method of identifying what is needed to address voids created by the intersection of exterior curtain wall assemblies and the rated floor/ceiling assemblies. (Vote 13-0)

Assembly Action:

None

FS53-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dustin J. Wakefield, PE, LEED AP, Virginia Department of General Services, representing Bureau of Capital Outlay Management requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

715.4 Exterior curtain wall/fire-resistance-rated floor intersections. Voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor or floor/ceiling assemblies shall be protected with an *approved* perimeter fire ~~containment system~~barrier to prevent the interior spread of fire. Such systems shall provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor or floor/ceiling assembly. Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section 705.8.5.

715.4.1 Fire test criteria. *Perimeter fire* ~~containment systems~~barriers shall be tested in accordance with the requirements of ASTM E2307.

Exception: Voids created at the intersection of the exterior curtain wall assemblies and floor assemblies where the vision glass extends to the finished floor level shall be permitted to be protected with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the *fire-resistance rating* of the floor assembly.

715.8 Joints and voids in smoke barriers. *Fire-resistant joint systems protecting joints in smoke barriers, and perimeter fire* ~~containment systems~~barriers protecting voids at the intersection of a horizontal *smoke barrier* and an exterior curtain wall, shall be tested in accordance with the requirements of UL 2079 for air leakage. The L rating of the joint system shall not exceed 5 cfm per linear foot (0.00775 m³/s m) of joint at 0.30 inch (74.7 Pa) of water for both the ambient temperature and elevated temperature tests.

[BF] 1705.17 Fire-resistant penetrations and joints. In high-rise buildings or in buildings assigned to *Risk Category* III or IV, *special inspections for through-penetrations, membrane penetration firestops, fire-resistant joint systems* and perimeter fire ~~containment systems~~barriers that are tested and *listed* in accordance with Sections 714.4.1.2, 714.5.1.2, 715.3 and 715.4 shall be in accordance with Section 1705.17.1 or 1705.17.2.

PERIMETER FIRE CONTAINMENT SYSTEM-BARRIER. An assemblage of specific materials or products that are designed to resist for a prescribed period of time the passage of fire through voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor or floor/ceiling assemblies.

F RATING. The time period that the through-penetration firestop system or perimeter fire ~~containment system barrier~~ limits the spread of fire through the penetration or void.

Commenter's Reason: We do not believe the proposed change of terminology is appropriate. These listed joint systems at the intersection of rated floor assemblies and exterior curtain wall systems are tested in accordance with ASTM E2307 - Standard Test Method for Determining Fire Resistance of Perimeter Fire Barriers Using Intermediate-Scale, Multi-Story Test Apparatus.

The proposal to change the name of these joint systems to Perimeter Fire Containment Systems does not appear to be supported by the code or the referenced standards, rather, this terminology tends to show up in various product manufacturers brochures and literature. Industry terminology should be aligning with the available technical data and governing codes - not the other way around.

It is therefore our opinion that the language in the IBC currently referencing Perimeter Fire Barriers should remain unchanged for consistency throughout the code and with the governing test standards.

Bibliography: <https://www.astm.org/Standards/E2307.htm>
Link created on 07/12/2018

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Since this is solely a terminology issue, there is no anticipated cost impact on the design or construction process.

FS53-18

FS54-18

IBC: 715.4, 715.5

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Building Code

Revise as follows

715.4 Exterior curtain wall/floor intersection. Where fire-resistance-rated floor or floor/ceiling assemblies are required, voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies shall be sealed with an *approved* system to prevent the interior spread of fire. Such systems shall be securely installed and tested in accordance with ASTM E2307 to provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor assembly. ~~Height and fire-resistance requirements for curtain wall spandrels shall comply with Section 705.8.5.~~

Exception: Voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be sealed with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the *fire-resistance rating* of the floor assembly.

715.5 Spandrel wall.~~Curtain wall spandrels.~~ Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section 705.8.5. Where Section 705.8.5 does not require a fire-resistance-rated spandrel wall, the requirements of ~~Section~~ Sections 715.4 and 715.4.1 shall still apply to the intersection between the spandrel wall and the floor.

Reason: This proposal accomplishes several goals. First, it deletes a redundant reference to Section 705.8.5 from Section 715.4. The same reference is also in Section 715.5 covering curtain wall spandrels. Second, it cleans up inconsistent references to the curtain wall spandrels between the title and the body of Section 715.5. Third, it clarifies that this requirement applies to both the void at the intersection of a fire-resistance-rated floor and the curtain wall, covered in Section 715.4, and the void at the intersection of a nonfire-resistance-rated floor and the curtain wall, covered in Section 715.4.1.

The proposal compliments a proposal which reorganizes Section 715.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. All changes are editorial in nature and as such will not change construction practices.

FS54-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The intent of the proposal was for consistent use of the term 'curtain wall spandrel'. There were at least 2 locations where the needed amendment was not proposed. The proponent is urged to return with a public comment. (Vote 12-1)

Assembly Action:

None

FS54-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

715.4 Exterior curtain wall/floor intersection. Where fire-resistance-rated floor or floor/ceiling assemblies are required, voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies shall be sealed with an *approved* system to prevent the interior spread of fire. Such systems shall be securely installed and tested in accordance with ASTM E2307 to provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor assembly.

Exception: Voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies where the vision glass extends to the finished floor level shall be permitted to be sealed with an approved material to prevent the interior spread of fire. Such material shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) for the time period not less than the *fire-resistance rating* of the floor assembly.

715.5 Curtain wall spandrels.. Height and *fire-resistance* requirements for curtain wall spandrels shall comply with Section 705.8.5. Where Section 705.8.5 does not require a fire-resistance-rated ~~spandrel~~ curtain wall spandrels, the requirements of Sections 715.4 and 715.4.1 shall still apply to the intersection between the ~~spandrel~~ curtain wall spandrels and the floor.

Commenter's Reason: During the Committee Action Hearings the Fire Safety Committee rightfully pointed out that FS54-18 failed to update two references to curtain wall spandrels in Section 715.5. As such, the proposal was disapproved. This Public Comment corrects those oversights.

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

All changes are editorial in nature and as such will not change construction practices.

	1	3/4	Maximum size tested	D-H-45	3/4	D-H-45			
Smoke barriers	Fire protection								
	1	1/3	Maximum size tested	D-20	3/4	D-H-OH-45			

For SI: 1 square inch = 645.2 mm.

- a. Two doors, each with a fire protection rating of 1½ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.
- b. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.
- c. Under the column heading "Fire-rated glazing marking door vision panel," W refers to the fire-resistance rating of the glazing, not the frame.
- d. See Section 716.2.5.1.2.1.
- e. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.
- f. Two doors installed on opposite sides of the same opening in a fire partition shall both comply with the requirements in Table 716.1(2).

Reason:

Two doors installed on opposite sides of the same opening in a fire partition are common in adjoining hotel rooms. Currently the code is silent on the requirements for this type of "communicating" door. NFPA 101 states that only one door must be rated at a guest-to-guest room opening and some AHJ's rely on this as an interpretation since the IBC is silent. However, if only one door were rated and it was open when a fire started then the fire partition separating the rooms would be compromised. This code change proposal adds a footnote to Table 716.1(2) to indicate that both doors must be rated when installed on opposite sides of the same opening. This footnote is applied in the table under the Type of Assembly column at the row for "Other fire partitions".

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The code change proposal will not increase or decrease the cost of construction. This code change proposal is only making a requirement more clear for a specific application. It is reasonable to assume that this is how the code is typically enforced for this application anyways so there will likely not be an increase or decrease in the cost of construction. .

FS56-18

Public Hearing Results

Errata:

A clearer version of the table was provided.

Committee Action:

Disapproved

Committee Reason:

There is no documentation of the two door design being an issue in the field. As the design is usually limited to connection just 2 guest rooms, the concern over fire spread is exaggerated. (Vote 8-6)

Assembly Action:

None

FS56-18

Individual Consideration Agenda

- e. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.
- f. [Two doors, each with a fire rating of 20 minutes, installed on opposite sides of the same opening in a fire partition, shall be deemed equivalent in fire protection rating to one 45 minute fire door.](#)

Commenter's Reason:

This is to add clarification to existing text for situations when you have a series of doors in a rated partition, like you would see in a pass between shared hotel rooms. Based on the committee comments, they felt that if you had two 20 minute rated doors in the single frame in one hour fire partition between hotel rooms they would be equivalent to the 45 minute rated door assembly that is required in Table 716.1 (2). This new footnote would take the place of the new footnote language in the original proposal which would require both doors to be 45 minute rated.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This code change proposal is only making a requirement more clear for a specific application. It is reasonable to assume that this is how the code is typically enforced for this application anyways so there will likely not be an increase or decrease in the cost of construction.

Public Comment 2:

Proponent:

Timothy Pate, representing Colorado Chapter Code Change Committee (tpate@broomfield.org) requests As Submitted

Commenter's Reason:

This public comment is to request membership to overturn the committee and approve the original proposal. The proposal was to add clarification to the existing code to show that when you have a set of connector doors between adjoining hotel rooms they both need to be 45 minute rated. These walls are fire partitions and the only time you can have 20 minute rated doors is when they open into the fire rated corridor. All other doors in one hour rated fire partitions as per Table 716.1 (2) are required to be 45 minute rated. Some of the committee statements were that these doors are typically both closed when rooms are not rented together so if both were 20 minute rated then it would still provide adequate protection. I have researched and not been able to find any rated door and frame assemblies that have two 20 minute rated doors in a single frame that would get a 45 minute rating. I believe that it is important to provide the proper fire protected separation between hotel rooms especially considering the transient population that uses these rooms and are not familiar with their surroundings. It is always possible that one of these doors could be left open even though the other door is locked from the other side. In these cases you would only get the 20 minute rated separation at this opening. I have reviewed many hotel plans and they always show these connector doors to both be 45 minute rated so it is apparent that these national architects believe that is what the code intends.

I urge the membership to overturn the committee and approve the original proposal as submitted.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is just to clarify the existing code requirements

FS56-18

FS60-18

IBC: 202, 202, 716.2.2.1.1

Proposed Change as Submitted

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

SECTION 202 DEFINITIONS

Add new definition as follows

TERMINATED STOPS. Factory feature of a door frame where the stops of the door frame are terminated not more than 6 inches from the bottom of the door frame. Terminated stops are also known as "hospital stops" or "sanitary stops".

Revise as follows

716.2.2.1.1 Smoke and draft control. The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot ($0.01524 \text{ m}^3/\text{s} \times \text{m}^2$) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited. Terminated stops shall be prohibited on doors required by Section 405.4.3 to comply with Section 716.2.2.1 and prohibited on doors required by Section 3006.3 Item 3, 3007.6.3, or 3008.6.3 to comply with Section 716.2.2.1.1.

Reason: The code today is silent regarding door frames with terminated stops. Interior door frames in many buildings have terminated stops, especially – but not only in – health care facilities. Some interior door frames in business occupancies, and other occupancies, may also have terminated stops.

Unfortunately, the IBC currently does not include an important requirement that door assemblies required to meet the testing requirements of UL1784 when tested without an artificial bottom seal, as required in IBC Sections 405.4.3, 3006.3(3), 3007.6.3, and 3008.6.3, should be prohibited from using door frames with terminated stops. This proposal addresses this oversight.

For other smoke and draft control door assemblies required to be tested to UL1784, this proposal is consistent with the testing requirements of UL 1784.

Terminated stops are a factory feature of a door frame, where the stops are terminated above the floor. The bottom of the stop is closed at a 45-degree or 90-degree angle. The purpose of terminated stops is to make it easier to clean that area of the floor without the extra corners to catch debris or pathogens, and to avoid getting moveable items caught on the stop. Terminated stops are also known as "hospital stops" or "sanitary stops."

Door frame with terminated stop.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal addresses what is currently allowed and prohibited in the code, but not explicitly "spelled out".

FS60-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee was convinced by the proponent's reasons statement. In addition, the doors are seeing wide ranging use in health care occupancies without documented issued. (Vote 11-3)

None

FS60-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Keith Pardoe, representing Pardoe Consulting, LLC (kpardoe@pardoeconsultingllc.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

SECTION 202 DEFINITIONS

TERMINATED STOPS. Factory feature of a door frame where the stops of the door frame are terminated not more than 6 inches from the bottom of the door frame. Terminated stops are also known as "hospital stops" or "sanitary stops".

716.2.2.1.1 Smoke and draft control. The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot ($0.01524 \text{ m}^3/\text{s}\cdot\text{m}^2$) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited.

Exceptions:

1. Doors ~~Terminated stops shall be prohibited on doors~~ required by Section 405.4.3 shall not be permitted to have door frames with terminated stops.
2. Doors required by Sections ~~to comply with Section 716.2.2.1 and prohibited on doors required by Section 3006.3 Item 3, 3007.6.3, or 3008.6.3 to comply with Section 716.2.2.1.1~~ shall not be permitted to have door frames with terminated stops.

Commenter's Reason: See Public Input 257, regarding FS60-18.

I recommend the committee consider approving the changes presented in this public input for the following reasons:

1) The change presented in FS60-18 is intended to address exceptions to the standard method of testing the air leakage-rate around swinging doors. That is to say, that in most applications the doors are permitted to be tested with an artificial door bottom that can extend up as much as 6 inches from the bottom of the door frames. When tested with an artificial door bottom seal, the door frames can have terminated stops.

2) There are several conditions where smoke and draft controls doors are used that require the air leakage-rate tests to be performed WITHOUT the artificial door bottom seal. Such conditions are elevator shafts, elevator lobby doors, etc. as pointed to by the references to sections 405.4.3, 3006.3 Item 3, 3007.6.3, and 3008.6.3 that specifically state the UL 1784 test shall be conducted WITHOUT an artificial door bottom seal.

3) Since above referenced sections are exceptions to the standard method of testing, they should be separated from the main provision of 716.2.2.1.1 and appropriately listed as being exceptions.

4) Another reason for separating terminated stops from the main provision is that terminated stops are not referenced in UL 1784, and it would likely create confusion among users in the field; leading to misapplication of these limited exceptions.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Approving this modification will not have a cost impact.

Public Comment 2:

Proponent: Keith Pardoe, Pardoe Consulting, LLC, representing Pardoe Consulting, LLC requests Disapprove.

Commenter's Reason: Please refer to PC 305 regarding FS60-18.

I recommend the committee disapprove this proposed change in its current form for the following reasons:

1) The placement and phrasing of the proposed change might create confusion as to where door frames of smoke and draft controls doors are permitted to have terminated stops. The proposed change addresses an exception to 716.2.2.1.1, which relies on users of the code to lookup the referenced sections. Some users of the code might assume the prohibition of terminated stops applies to all smoke and draft control doors, which is not the intent of this proposal.

2) NFPA 105, Standard for Smoke Door Assemblies and Other Opening Protectives (2016) edition, specifically section 6.3.2.2 permits the door frames to have terminated stops.

6.3.2.2 Door frames with terminated stops shall be permitted, provided the lowest portion of the terminated stops is not greater than 6 in. (152 mm) above the bottom of the frame.*

A.6.3.2.2 Door stops in the door frames are necessary elements that provide support for the installation of gasketing materials. Door frames with terminated stops are sometimes used in rooms or spaces where the floors are subject frequent cleaning. Terminated stops convert the lowest portion of the door frames to flat profile, eliminating corners where dirt and debris might be trapped. In these cases, smoke and draft control gasketing should extend the full height of the shortened frame soffit or door stop. See Figure A.6.3.2.2.

3) NFPA 105 requires smoked door assemblies to be tested in accordance with UL 1784, which apply to fire rated and non-fire rated smoke door assemblies. Where the IBC or other building codes reference the UL 1784 test do not prohibit the use of an artificial door bottom during the tests the door frames are permitted to have terminated stops. The artificial door bottom referred to in the proposal's reason statement, is a device that is used during the UL 1784 test to seal the bottom of the door assembly in order to more accurately measure the air-leakage rate along the vertical and top edges of the doors. (It is a piece of duct tape, in many cases.) More importantly, it is not a physical component that is installed on doors in the field.

4) Smoke and Draft Control doors do not require any type of gasketing or seal at door bottoms unless the doors are installed in a pressurized area (e.g., stair tower with smoke evacuation systems) as specified in NFPA 105 (See item 5.2.4.4.2 (6) and 6.7.1.4). In the case of swinging doors installed in elevator shafts and elevator lobbies, the neutral plane of a fire within the shafts might be below the floor level of doors serving these areas. Consequently, the IBC requires smoke and draft control doors in these applications to be tested without an artificial bottom seal, which means that door frames with cannot have terminated stops; and, the gasketing materials must form a continuous seal the along the full height of the doors.

5) An alternate version of this change is presented in PC 305.

FS60-18

FS73-18

IBC: 718.2.1

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows

718.2.1 Fireblocking materials. *Fireblocking* shall consist of the following materials:

1. Two-inch (51 mm) nominal lumber.
2. Two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints.
3. One thickness of 0.719-inch (18.3 mm) wood structural panels with joints backed by 0.719-inch (18.3 mm) wood structural panels.
4. One thickness of 0.75-inch (19.1 mm) particleboard with joints backed by 0.75-inch (19 mm) particleboard.
5. One-half-inch (12.7 mm) gypsum board.
6. One-fourth-inch (6.4 mm) cement-based millboard.
7. Batts or blankets of mineral wool, mineral fiber or other *approved* materials installed in such a manner as to be securely retained in place.
8. Cellulose insulation installed as tested for the specific application.
9. Mass timber complying with Section 2304.11.

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The purpose of this code change proposal is to recognize that mass timber as a suitable fireblocking material. The current list of acceptable materials lists “nominal lumber”, therefore since mass timber (e.g. Sawn, glued-laminated, and cross laminated timbers) are of greater mass the correlation from single nominal lumber to mass timber was determined to be of equal or greater blocking resistance to reduce the ability of fire, smoke and gasses from moving to different part of the building through combustible concealed spaces.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB of IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
3308.4 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit <http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, please visit <http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

FS73-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Mass timber is acceptable for fire blocking given the other materials on the list. (Vote: 14-0)

Assembly Action:

None

FS73-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

Proposed Change as Submitted

Proponent: John Harrington, FM Global, representing FM Global (john.harrington@fmglobal.com)

2018 International Building Code

Revise as follows

718.2.6 Exterior wall coverings. *Fireblocking* shall be installed within concealed spaces of exterior wall coverings and other exterior architectural elements where permitted to be of combustible construction as specified in Section 1405 or where erected with combustible frames. *Fireblocking* shall be installed at maximum intervals of 20 feet (6096 mm) in either dimension so that there will be no concealed space exceeding 100 square feet (9.3 m²) between *fireblocking*. Where wood furring strips are used, they shall be of *approved* wood of natural decay resistance or preservative-treated wood. If noncontinuous, such elements shall have closed ends, with not less than 4 inches (102 mm) of separation between sections.

Exceptions:

1. *Fireblocking* of cornices is not required in single-family dwellings. *Fireblocking* of cornices of a two-family dwelling is required only at the line of dwelling unit separation.
2. *Fireblocking* shall not be required where the exterior wall covering is installed on noncombustible framing and the face of the exterior wall covering exposed to the concealed space is covered by one of the following materials:
 - 2.1. Aluminum having a minimum thickness of 0.019 inch (0.5 mm).
 - 2.2. Corrosion-resistant steel having a base metal thickness not less than 0.016 inch (0.4 mm) at any point.
 - 2.3. Other *approved* noncombustible materials.
3. *Fireblocking* shall not be required where the exterior wall covering has been tested in accordance with, and complies with the acceptance criteria of, NFPA 285, or the 16 foot parallel panel test as described in ANSI/FM 4880. The exterior wall covering shall be installed as tested in accordance with NFPA 285, or the 16 foot parallel panel test per ANSI/FM 4880.

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285, or the 16 foot (4877 mm) parallel panel test as described in ANSI/FM 4880. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

1406.10.4 Full-scale tests. The MCM system shall be tested in accordance with, and comply with, the acceptance criteria of either NFPA-285, or the 16 foot parallel panel test as described in ANSI/FM 4880. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use.

1408.10.4 Full-scale tests. The HPL system shall be tested in accordance with, and comply with, the acceptance

criteria of either NFPA 285 or the 16 foot parallel panel test as described in ANSI/FM 4880. Such testing shall be performed on the HPL system with the HPL in the minimum and maximum thicknesses intended for use.

2603.5.5 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of either NFPA 285 or the 16 foot parallel panel test as described in ANSI/FM 4880.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
 - 2.1. There is no airspace between the insulation and the concrete or masonry.
 - 2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

Update standard(s) as follows

CHAPTER **35 REFERENCED STANDARDS**

FM

FM Approvals
Headquarters Office 1151 Boston-
Providence Turnpike P.O. Box 9102
Norwood MA 02062

4880-~~2015~~2017:

Approval Standard for Class 1 Fire Rating of Building Panels or Interior Finish Materials

Reason: ANSI/FM 4880 is a consensus fire test standard that can be used to test fire exposure to the interior side or exterior side of exterior walls. The 16 ft parallel panel test is described in ANSI/FM 4880. The 16 ft parallel panel test as an alternative to the NFPA 285 test will not result in a related cost increase.

Bibliography: Agarwal, Gaurav, "Evaluation of the Fire Performance of Aluminum Composite Material (ACM) Assemblies using ANSI/FM 4880, FM Global Research Technical Report, December 20017.
Nam, Soonil and Bill, Robert G Jr. "A New Intermediate-scale Fire Test for Evaluating Building Material Flammability", SFPE Journal of Fire Protection Engineering, Feb 2009

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposal offers another method to determine use of the exception. No affect on cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, FM 4880-2017, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018. The 2015 edition of the standard is currently referenced. This proposal increases the use of the standard as well as proposes to go to the 2017 edition.

FS74-18

Public Hearing Results

Errata: The published proposal failed to include Section 1406.10.4 which was part of the proponent's submittal.

1406.10.4 Full-scale tests.

The MCM system shall be tested in accordance with, and comply with, the acceptance criteria of either NFPA-285, or the 16 foot parallel panel test as described in ANSI/FM 4880. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use.

Committee Action:

Disapproved

Committee Reason: There has not been sufficient testing of the new standard to provide clear answers. It is not equivalent to NFPA 285. The criteria in NFPA are clear and understood. There needs to be a broader range of testing. (Vote 14-0)

Assembly Action:

None

FS74-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Harrington, representing FM Global (john.harrington@fmglobal.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1406.10.4 Full-scale tests. The MCM system shall be tested in accordance with, and comply with, the acceptance criteria of either NFPA 285, or the 16 foot parallel panel test as described in ANSI/FM 4880. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use.

1408.10.4 Full-scale tests. The HPL system shall be tested in accordance with, and comply with, the acceptance criteria of either NFPA 285 or the 16 foot parallel panel test as described in ANSI/FM 4880. Such testing shall be performed on the HPL system with the HPL in the minimum and maximum thicknesses intended for use.

Commenter's Reason: 4880 is a consensus fire that can be used to test fire exposure to the interior or exterior side of exterior walls. ANSI/FM 4881 is also a standard that refers to just exterior panels and within FM 4881 it points to ANSI/FM 4880 for the fire test requirements. ANSI/FM 4881 is a standard that will be introduced during this cycle with the Group B code proposals for reference standards to be included within ICC. The 16 ft parallel panel fire test is correlated to the 50 ft FM corner test and tests an inside re-entrant corner of the wall configuration. It uses a larger heat flux consistent for external fire exposures and also covers the lesser heat flux from an interior fire exposure. The parallel panel test does not look like a building configuration because it is a smaller scale test designed to recreate fire exposure created in a large scale fire with inside corners and larger heat flux exposure, and when you scale it down you need to modify the panels arrangement to recreate the needed heat flux. ANSI/FM 4880 and ANSI/FM 4881 can be run by any testing lab. The 16 ft parallel panel test is not a replacement for NFPA 285, it is another tool for the code to use to ensure buildings are built to limit fire spread when conditions beyond a flat exterior wall may exist.

Bibliography: No cost impact from this proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposal offers another method to determine use of the exception. No affect on cost of construction.

Public Comment 2:

Proponent: Justin Koscher, Polyisocyanurate Insulation Manufacturers Association (jkoscher@pima.org); John Woestman, Kellen Company, representing Extruded Polystyrene Foam Association (jwoestman@kellencompany.org); Jay Crandell, ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council

(jcrandell@aresconsulting.biz)requests Disapprove.

Commenter's Reason: Please uphold the unanimous ICC Fire Safety Code Committee action for disapproval. In reaching its decision, the Committee cited the need for more research to fully assess the equivalency of NFPA 285 and the FM 4880 16-foot Parallel Panel Test (FM 4880 16' PPT). The proponent fails to provide sufficient supporting evidence and test data in order to prove that the FM 4880 16' PPT should be approved as an alternative method to the NFPA 285 test standard in the IBC. For example, the submitted justification contained a technical report that described only seven wall assemblies tested in accordance with FM 4880 16' PPT. The review then compared these results to similar assemblies evaluated using NFPA 285. Only four of these assemblies were actually tested to the NFPA 285 standard. The other three assemblies were evaluated by the proponent using data from engineering analyses.

Additionally, in June 2018, the NFPA Standards Council approved the NFPA Fire Test Committee's request to establish a new project to evaluate the suitability of the FM 4880 16' PPT as an alternative to NFPA 285, subject to two conditions: (1) window openings - or the lack thereof within the FM 4880 16' PPT - will need to be addressed; and (2) whether the application of any new document will be mandated by the Codes. Given these developments, the NFPA Fire Test Committee should be allowed to complete its work before ICC voting members give further consideration to this concept. Therefore, the proposal should be disapproved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
None.

FS74-18

FS78-18

IBC: 722.2.3

Proposed Change as Submitted

Proponent: Michael Hill, representing Self

2018 International Building Code

Revise as follows

722.2.3 Concrete cover over reinforcement. The minimum thickness of concrete cover over reinforcement in concrete slabs, reinforced beams and prestressed beams shall comply with this section. The structural capacity of concrete slabs, reinforced beams and prestressed beams at elevated temperatures shall be determined by calculation.

Reason: Many engineers, architects and building officials do not fully understand the difference between the tables in sections 721 and 722. The proposed addition of text to this section will reinforce the requirement for the design professional to determine the capacity of the concrete members at elevated temperatures by engineering calculations.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Clarification only

FS78-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal appears to be addressing structural capacity in the provisions regarding fire resistance. It adds an analysis that is not now required. This will add costs. It appears to be located in the wrong location of the code.. The existing section is about concrete cover, the code change is about structural strength. (Vote 14-0)

Assembly Action:

None

FS78-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael Hill, City of San Diego, representing City of San Diego requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

722.2.3 Concrete cover over reinforcement. The minimum thickness of concrete cover over reinforcement in concrete slabs, reinforced beams and prestressed beams shall comply with this section. The structural capacity of concrete slabs, reinforced beams and prestressed beams at elevated temperatures shall be determined by calculation as required by Section 722.1 and ACI 216.1/TMS 0216.

Commenter's Reason: The two measures for designing structural elements for fire resistance are limiting heat transmission and provide sufficient strength to prevent collapse in fire conditions. These measures are known as the heat transmission endpoint and the structural endpoint. The methods in Chapter 722 consider heat transmission endpoint by requiring sufficient mass (thickness) to prevent heat transmission to the opposite side of the element, but the structural endpoint is not considered in the minimum cover tables. This proposal would provide a pointer to the designer to address the structural requirements.

In response to the committee's opinion that the proposal should be located in a structural section, the provisions and procedures in ICC Section 722 including Tables 722.2.3(1) and 722.2.3(2) can be used to establish the fire resistance rating of materials and assemblies by calculation in lieu of the prescriptive requirements of ICC Section 721. Although structural requirements are usually found in the material chapters, the structural requirements for fire rated construction are not addressed in any other section of the ICC.

In response to the committee's opinion that this proposal will increase construction costs, the proposal is revised to provide additional reference to existing structural requirements. The proposal does not require any additional analysis above what is already required by ICC Section 722.1. ICC Section 722.1 permits the calculated fire resistance of concrete, concrete masonry and clay masonry in accordance with ACI 216.1/TMS 0216.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed code change is for clarification only. The proposal does not require any analysis beyond what is already required by ICC Section 722.1.

Public Comment 2:

Proponent: Michael Hill, representing City of San Diego (mik1lyn@earthlink.net) requests As Submitted.

Commenter's Reason: The two measures for designing structural elements for fire resistance are limiting heat transmission and provide sufficient strength to prevent collapse in fire conditions. These measures are known as the heat transmission endpoint and the structural endpoint. The methods in Chapter 722 consider heat transmission endpoint by requiring sufficient mass (thickness) to prevent heat transmission to the opposite side of the element, but the structural endpoint is not considered in the minimum cover tables. This proposal would provide a pointer to the designer to address the structural requirements.

In response to the committee's opinion that the proposal should be located in a structural section, the provisions and procedures in ICC Section 722 including Tables 722.2.3(1) and 722.2.3(2) can be used to establish the fire resistance rating of materials and assemblies by calculation in lieu of the prescriptive requirements of ICC Section 721. Although structural

requirements are usually found in the material chapters, the structural requirements for fire rated construction are not addressed in any other section of the ICC.

In response to the committee's opinion that this proposal requires additional analysis that will increase construction costs, the proposal does not require any additional analysis above what is already required by ICC Section 722.1. ICC Section 722.1 permits the calculated fire resistance of concrete, concrete masonry and clay masonry in accordance with ACI 216.1/TMS 0216. The provisions and procedures in ICC Section 722 including Tables 722.2.3(1) and 722.2.3(2) can be used to establish the fire resistance rating of materials and assemblies by calculation in lieu of the prescriptive requirements of ICC Section 721.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed code change is for clarification only. The proposal does not require any additional analysis.

FS81-18

IBC: 722.7, 722.7.1, Table TABLE 722.7.1(1), Table TABLE 722.7.1(2), 722.7.2, 722.7.2.1, 722.7.2.2

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC GENERAL COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new text as follows

722.7 Fire resistance rating of mass timber. The required fire resistance of mass timber elements in Section 602.4 shall be determined in accordance with Section 703.2 or Section 703.3. The fire resistance rating of building elements shall be as required in Tables 601 and 602 and as specified elsewhere in this code. The fire resistance rating of the mass timber elements shall consist of the fire resistance of the unprotected element added to the protection time of the noncombustible protection.

722.7.1 Minimum required protection. Where required by Sections 602.4.1 through 602.4.3, noncombustible protection shall be provided for mass timber building elements in accordance with Table 722.7.1(1). The rating, in minutes, contributed by the noncombustible protection of mass timber building elements, components, or assemblies, shall be established in accordance with Section 703.8. The protection contributions indicated in Table 722.7.1(2) shall be deemed to comply with this requirement when installed and fastened in accordance with Section 722.7.2.

TABLE 722.7.1(1)
PROTECTION REQUIRED FROM NONCOMBUSTIBLE COVERING MATERIAL

<u>Required Fire Resistance Rating of Building Element per Tables 601 and 602 (hours)</u>	<u>Minimum Protection Required from Noncombustible Protection (minutes)</u>
<u>1</u>	<u>40</u>
<u>2</u>	<u>80</u>
<u>3 or more</u>	<u>120</u>

TABLE 722.7.1(2)
PROTECTION PROVIDED BY NONCOMBUSTIBLE COVERING MATERIAL

<u>Noncombustible Protection</u>	<u>Protection Contribution (minutes)</u>
<u>1/2 inch Type X Gypsum Board</u>	<u>30</u>
<u>5/8 inch Type X Gypsum Board</u>	<u>40</u>

722.7.2 Installation of gypsum board noncombustible protection. Gypsum board complying with Table 722.7.1(2) shall be installed in accordance with this section.

722.7.2.1 Interior surfaces. Layers of Type X gypsum board serving as noncombustible protection for interior surfaces of wall and ceiling assemblies determined in accordance with Table 722.7.1(1) shall be installed in accordance with the following:

1. Each layer shall be attached with Type S drywall screws of sufficient length to penetrate the mass timber at least 1 inch when driven flush with the paper surface of the gypsum board.

Exception: The third layer, where determined necessary by Section 722.7, shall be permitted to be attached with 1 inch #6 Type S drywall screws to furring channels in accordance with ASTM C645.

2. Screws for attaching the base layer shall be 12 inches on center in both directions.
3. Screws for each layer after the base layer shall be 12 inches on center in both directions and offset from the screws of the previous layers by 4 inches in both directions.
4. All panel edges of any layer shall be offset 18 inches from those of the previous layer.
5. All panel edges shall be attached with screws sized and offset as in items 1 through 4 above and placed at least 1 inch but not more than 2 inches from the panel edge.
6. All panels installed at wall-to-ceiling intersections shall be installed such that ceiling panels are installed first and the wall panels are installed after the ceiling panel has been installed and is fitted tight to the ceiling panel. Where multiple layers are required, each layer shall repeat this process.
7. All panels installed at a wall-to-wall intersection shall be installed such that the panels covering an exterior wall or a wall with a greater fire resistance rating shall be installed first and the panels covering the other wall shall be fitted tight to the panel covering the first wall. Where multiple layers are required, each layer shall repeat this process.
8. Panel edges of the face layer shall be taped and finished with joint compound. Fastener heads shall be covered with joint compound.
9. Panel edges protecting mass timber elements adjacent to unprotected mass timber elements in accordance with Section 602.4.2.2 shall be covered with 1-1/4 inch metal corner bead and finished with joint compound.

722.7.2.2 Exterior surfaces. Layers of Type X gypsum board serving as noncombustible protection for the outside of the exterior heavy timber walls determined in accordance with Table 722.7.1(1) shall be fastened 12 inches on center each way and 6 inches on center at all joints or ends. All panel edges shall be attached with fasteners located at least 1 inch but not more than 2 inches from the panel edge. Fasteners shall comply with one of the following:

1. Galvanized nails of minimum 12 Gage with a 7/16 inch head of sufficient length to penetrate the mass timber a minimum of 1 inch.
2. Screws which comply with ASTM C1002 (Type S, Type W, or Type G) of sufficient length to penetrate the mass timber a minimum of 1 inch.

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

Typically, mass timber elements will be large due to structural requirements. In addition, CLT panels typically are utilized in odd number laminations. This typically results in excess capacity which means better fire endurance. Thus, mass timber elements are conservative in their fire resistance rating. Furthermore, the TWB decided to provide both a prescriptive path, as embodied in this proposal, and a performance path, embodied in another proposal.

This proposal outlines a method to calculate the fire resistance rating of a protected wood element by adding the fire resistance rating of the unprotected wood member together with the protection time provided by the noncombustible protection applied to the exposed wood.

This proposal should be considered as a companion proposal to the proposals creating new types of mass timber construction in Section 602.4 and the code proposal for Section 703.8 outlining a testing protocol to determine the contribution of noncombustible protection. This code proposal allows the user to select a prescriptive solution utilizing Type X gypsum wall board, which is deemed to comply with the basic requirements of this section and those of the proposed Section 602.4. Since this is a prescriptive solution, conditions of use such as attachment, finishing and edge treatment when bordering exposed mass timber areas, are also included in this section.

A proposal in Section 703.8 both forms the performance path for this determination and is the basis by which the contribution of the *Noncombustible Protection* to the fire resistance rating is determined. Testing of beams, columns, walls and ceiling panels has been used to establish the values found in table 722.7.1(b) for 1/2-inch Type X and 5/8-inch Type X gypsum board as well. Recent testing by AWC confirms the values derived from historic testing. A report is available at the following link: <http://bit.ly/WFC-firetestofGWBonCLT> . This link was confirmed active on 12/27/17.

Tests proposed in Section 703.8 may be used in the future to justify additional materials added to this table and should not be confused with "membrane protection" which is based on temperature rise on the unexposed side of a membrane attached to construction elements. Noncombustible construction is, instead, noncombustible material meeting the requirements of Section 703.5. Its contribution to the fire resistance rating of any building element is determined by this proposed new section. Simply put, it is determined by measuring the fire resistance time in minutes to the point of structural failure of a mass timber building element and then conducting a second test measuring the fire resistance time in minutes taken to the same point of structural failure. Each test is to be conducted with identical mass timber element

with identical load, construction and condition, but with the proposed noncombustible protection applied to the second assembly. The difference in time between the two samples is the contribution, in minutes, of the noncombustible protection.

Background information: The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the “Meeting Minutes and Documents” and “Resource Documents” sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Analysis: The referenced standards, ASTM C645 and ASTM C1002, are currently referenced in 2018 I-codes.

FS81-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: In the column of TABLE 722.7.1(2) that addresses 1/2 inch Type X Gypsum Board, change the protection contribution value (in minutes) to 25 instead of 30.

Committee Reason: The modification coordinates well with the existing language in the code. The committee recommends approval based upon the proponent's reason statement. (Vote: 14-0)

Assembly Action:

None

FS81-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael Kerner, ClarkDietrich Buildings Systems, representing ClarkDietrich Building Systems requests Disapprove.

Commenter's Reason: There are incorrect references to the types of screws to be used as well as an incorrect specification reference.

Paragraph 7.22.7.2.1, Item 1: Delete type S screws. These are not the type of screw for attaching gypsum board to wood members.

Under the "Exemption" the wrong ASTM specification is referenced. ASTM C645 should be deleted. This is a product specification, not an installation specification.

Paragraph 7.22.7.2.2, Item 2: Delete any reference to Type S and Type G screws. These are not the appropriate screws for attaching gypsum board to wood member. Type S screws are for attachment to cold-formed steel framing members and Type G screws are for attaching gypsum board to gypsum board.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no cost impact to disapproving the original proposal. See the cost impact statement contained in the proposal.

Public Comment 2:

Proponent: Adam Shoemaker, representing ClarkDietrich (adam.shoemaker@clarkdietrich.com) requests Disapprove.

Commenter's Reason: Proposed section 722.7.2.1 references the wrong type of screw for this application per ASTM standards, and C645 is not the correct reference for furring channel installation.

Proposed section 722.7.2.2 references the wrong type of screw for this application per ASTM standards.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No cost impact.

Public Comment 3:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

FS82-18

IBC: 803.9, IFC 803.9

Proposed Change as Submitted

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Building Code

Revise as follows

803.9 High-density polyethylene (HDPE) and polypropylene (PP)-Solid thermoplastics.. Where solid thermoplastics that melt and drip when exposed to flame, including but not limited to, polypropylene (PP), high-density polyethylene or polypropylene is (HDPE), solid polycarbonate, solid polystyrene, and solid acrylic materials, are used as an interior finish, ~~it~~they shall comply with Section 803.1.1.

2018 International Fire Code

[BF] 803.9 High-density polyethylene (HDPE) and polypropylene (PP)-Solid thermoplastics.. Where solid thermoplastics that melt and drip when exposed to flame, including but not limited to, polypropylene (PP), high-density polyethylene or polypropylene is (HDPE), solid polycarbonate, solid polystyrene, and solid acrylic materials, are used as an interior finish, ~~it~~they shall comply with Section 803.1.1.

Reason: The same reason that HDPE and PP are not permitted to be used as interior finish simply based on testing to ASTM E84 also applies to some solid thermoplastics that melt and drip when exposed to flame. For proper fire safety they should be tested to NFPA 286.

Note that this applies purely to interior finish and that it does not cover foam plastics, which are already required to be tested to NFPA 286 if used as interior finish.

Cost Impact: The code change proposal will increase the cost of construction. This will require more materials to be tested in accordance with a more rigorous (and more reliable) but more costly fire test.

FS82-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee determined there was no data presented to indicate there was a problem, the committee was unclear what the proposal applied to, and they had concerns for potential unintended consequences. (Vote 14-0).

Assembly Action:

None

FS82-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

803.9 High-density polyethylene (HDPE) and polypropylene (PP). Where high-density polyethylene or polypropylene is used as an *interior finish*, it shall comply with Section 803.1.1.

803.10 Thermoplastics other than foam plastics Where a thermoplastic material, other than a foam plastic, is used as an interior finish, it shall comply with Section 803.1.1.

Exception: Where a thermoplastic material, other than a foam plastic, is tested in accordance with ASTM E84 or UL 723 and the test report states that all portions of the test specimen ahead of the flame front remained in position during the test.

2018 International Fire Code

[BF] 803.9 High-density polyethylene (HDPE) and polypropylene (PP). Where high-density polyethylene or polypropylene is used as an interior finish, it shall comply with Section 803.1.1.

[BF] 803.10 Thermoplastics other than foam plastics Where a thermoplastic material, other than a foam plastic, is used as an interior finish, it shall comply with Section 803.1.1.

Exception: Where a thermoplastic material, other than a foam plastic, is tested in accordance with ASTM E84 or UL 723 and the test report states that all portions of the test specimen ahead of the flame front remained in position during the test.

Commenter's Reason: This public comment addresses the concerns expressed by the committee and commenters. The following has been changed: instead of talking about "solid" thermoplastics it talks about thermoplastics that are not foam plastics. It also replaces the terms "melt and drip" by the actual performance during the fire test, using language similar to that used elsewhere in the code, such as in sections on polypropylene siding and plastic composites. In ASTM E84 (Steiner tunnel) the material is exposed to a flame from below the test specimen. It is well known that some rigid thermoplastics (also known in the plastics industry as solid thermoplastics, as opposed to foamed thermoplastics) will melt when exposed to a flame from below. The result may be (if the test specimen melts and falls to the floor before the flame front reaches it) misleading because the test specimen is not actually exposed. The code recognizes that this behavior is typical of PP and HDPE, which is why the section requires that they be tested to NFPA 286 and not to ASTM E84 when used as interior finish. Therefore, the code change proposal (with the modifications) is intended to treat other rigid (not foamed) thermoplastics the same way as PP and HDPE. This code proposal does not affect foam plastics, which are properly covered by chapter 26.

Instead of placing the item in the same section a new section is proposed to be created. This proposal does not replace any code section but adds a new code section, both to the IBC and to the IFC.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

This code proposal will require some plastic materials to be tested to a more expensive fire test (NFPA 286 instead of ASTM E84) because the test results from using ASTM E84 for those materials are inappropriate.

FS82-18

FS83-18

IBC: 803.9 (IFC [BF] 803.9)

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBENGINEER@aol.com)

2018 International Building Code

Revise as follows

803.9 High-density polyethylene (HDPE) and polypropylene (PP). Where high-density polyethylene or polypropylene is used as an *interior finish*, it shall comply with Section 803.1.1. Where high-density polyethylene toilet and urinal partitions are used, they shall comply with Section 1209 and the interior finish requirements of Section 803.1.1 or 803.1.2.

Reason: This proposal adds a requirement indicating that toilet and urinal partitions made of HDPE or PP are not regulated by this section. The interior finish requirements for toilet and urinal partitions would still apply, however, the Class of material in Table 803.3 would be the applicable requirements. The interior finish requirements are concerned with the fire aspects of a building component. However, there is no history of a fire concern with HDPE water closet and urinal. A study was completed by NFPA Research entitled, "Non-Residential Structure Fires That Originated in Lavatories, Locker Rooms or Coat Check Rooms," dated November 2017, authored by Marty Ahrens. The report shows no fire issue with water closet or urinal partitions. There are no fire deaths reported from fires originating in a commercial toilet room. The results are not surprising.

HDPE partition manufacturers have a framing system that protects the edges of the HDPE material. As a result, the HDPE partitions cannot readily ignite. The typical cause of a fire origin in a toilet room is the waste basket or electrical appliance. There is no fire ignition source in the vicinity of a water closet or urinal partition.

What must be understood is that while fire-retardant chemicals can be added to HDPE used for water closet and urinal partitions, however, the chemicals change the exterior surface requirements of the partitions. The fire-retardant chemicals make the surface more porous. It also makes the surface less scratch resistant. As a result, the partitions would no longer have the same cleanliness and sanitation aspect required for a water closet or urinal partition. This would in effect eliminate the acceptance of HDPE partitions.

The NFPA study clearly establishes that a fire hazard with HDPE water closet or urinal partitions does not exist. It is more important to emphasize the sanitary and health issues as identified in Section 1209.

Cost Impact: The code change proposal will decrease the cost of construction. The change will remove an unnecessary requirement for water closet and urinal partitions.

FS83-18

Public Hearing Results

Errata: Section numbers shown to indicate the coordinating section in the IFC that will change.

Committee Action:

Disapproved

Committee Reason: The committee did not find adequate fire issues associated with bathrooms to warrant the proposed requirements, and desired consistency with the G-7 decision, which was disapproval of a proposal to eliminate toilet room privacy partitions from the definition of Interior Wall and Ceiling Finish. (Vote 14-0)

Assembly Action:

None

FS83-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing American Society of Plumbing Engineers - Sr. Director of Technical and Regulatory Affairs (jbeengineer@aol.com); Andrew Klein, representing Building Owners and Managers Association International (andrew@asklein.com); Matt Sigler, Plumbing Manufacturers International, representing Plumbing Manufacturers International (msigler@safeplumbing.org); Ramiro Mata, representing American Society of Plumbing Engineers - Sr. Director of Technical and Regulatory Affairs (rmata@aspe.org)requests As Submitted.

Commenter's Reason: This change will allow toilet and urinal partitions to be evaluated in accordance with ASTM E84 or UL 723, as well as, NFPA 286. The current requirement only allow testing in accordance with NFPA 286. NFPA 286 is not an appropriate test for determining the viability of plastic toilet and urinal partitions. NFPA 286, often referred to as the room corner fire test, is a standard for fire testing of interior wall finish material and/or ceiling finish material to determine equivalency to a Class A material.

The intent of the standard is to evaluate the flammability characteristics of wall and ceiling finish material. The room size for the fire test is 8 feet wide by 12 feet long by 8 feet high. In order to perform this evaluation, wall finish material being tested is applied to the entire wall surface of three walls. The fire source for the test is a 12 inch by 12 inch by 6 inch high burner that is located in the corner against the two walls. The heat output of the burner is 40 kW (136,485 Btu/hr) for the first 5 minutes and 160 kW (549,942 Btu/hr) for the next 10 minutes. The burner is designed to have the flame reach the ceiling during the last 10 minutes of the test.

When testing interior wall finish material, the total amount of wall area covered by the material is 256 square feet. A toilet or urinal partition is not applied to a wall as an interior finish material. Furthermore, toilet and urinal partitions do not account for 256 square feet of surface area in a toilet room that is 8 feet by 12 feet in area. Toilet partitions are not even installed against a wall, they are installed out from a wall to provide a privacy barrier around a water closet. The wall serves as the privacy barrier for a corner or rear section of a water closet compartment. In a room 8 feet by 12 feet, only one water closet compartment would typically be installed based on ADA dimensional requirements. If a second water closet compartment was installed, there would not be adequate space, based on the Plumbing Code requirements, for the two lavatories that would also be required.

An ADA compartment would measure 56 inches by 60 inches. Partitions are 56 inches in height, typically installed 12 inches from the finished floor. The total square footage of the toilet partition would be 45 square feet; NOT 256 square feet of material.

The fire test required by NFPA 286 would require 5.7 times the surface area or material volume to be tested compared to what could possibly be installed in the test size room. Increasing the volume of material is a simple means of causing a failure during a fire test by adding an unrealistic fuel load. A more appropriate fire test would be of the anticipated volume of the material, as well as, anticipating the fire source.

Another fallacy of applying NFPA 286 to toilet partitions is the burner requirements during the test. The burner must provide a heat output of 40 kW or 136,485 Btu/hr for the first five minutes. For the remaining 10 minutes, the heat output must be 160 kW or 549,942 Btu/hr. This heat output requires an extensive fuel load to generate the equivalent heat release in an actual fire in a commercial toilet room.

Toilet partitions are only located in commercial toilet rooms or bathrooms. There is no fuel load of any significance in a commercial toilet room. There is no fuel source under a toilet partition, whereas the burner is applied directly to the toilet partition in the NFPA 286 test. Within the confines of a toilet partition is a water closet. The water closet is made of

vitreous china and filled with water. There is no fuel source. If a flush valve is connected to the water closet, the flush valve is made of brass, which is not a fuel source. The floors in commercial toilet rooms are ceramic tile, which do not burn.

The only fuel load associated with a commercial toilet room is typically a trash container and paper dispenser. However, both are located a distance away from a toilet partition. Other possible fuel loads in a commercial toilet room could be a baby changing station, which is made of the same material as a toilet partition but is not required to comply with NFPA 286. A plastic shower enclosure is another fuel load, which also is not required to comply with NFPA 286.

Hence, there is no fuel load in a commercial toilet room that can generate a heat release of 160 kW or 549,942 Btu/hr near a plastic toilet partition.

When a new fire test is added to the Building Code, a full analysis should be performed to determine its applicability. No such analysis was performed on plastic toilet partitions. If a proper fire analysis was performed, it would clearly show that NFPA 286 should not apply to toilet or urinal partitions. There is no fire concern with plastic toilet and urinal partitions.

Plastic toilet and urinal partitions have been installed for more than 25 years. NFPA Research, Data and Analytics Division prepared a report entitled, "Non-Residential Structure Fires That Originated in Lavatories, Locker Rooms or Coat Check Rooms," dated November 2017. Not one fire death was reported involving a plastic toilet or urinal partition. This is not surprising since there is no recorded fire problem associated with plastic toilet partitions.

The more important requirements for toilet and urinal partitions relate to sanitation and performance. Plastic toilet and urinal partitions do not facilitate the growth of bacteria. This is important in a toilet room environment to maintain proper sanitation. They are also readily cleanable.

Plastic toilet partitions are low maintenance and moisture resistant, even in extreme wet or humid environments. Plastic toilet and urinal partitions are fabricated from high density polyethylene (HDPE). Many manufacturers use an advanced formula of at least 30% pre-consumer recycled HDPE in their partitions.

From a performance standpoint there is a concern with toilet room partitions being subjected to vandalism, graffiti, and scratching. Plastic partitions are hard to scratch. This is verified by testing to ASTM D2197. Graffiti is easily removed. This is verified by testing to ASTM D6578. They are also hard to dent, which is verified by testing to ASTM D2794.

Based on performance and the lack of a fire problem, plastic toilet and urinal partitions should be permitted to be tested in accordance with ASTM E84 or UL 723 as a Class C interior finish material, not mandated to be a Class A material tested to NFPA 286.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This will lower the cost of construction by allowing Class C HDPE toilet and urinal partitions. There is no justification for prohibiting these partitions that have been successfully installed and used for more than 25 years.

FS83-18

FS85-18

IBC: Table TABLE 803.13

Proposed Change as Submitted

Proponent: Gregory Nicholls, representing The American Institute of Architects (gnicholls@preview-group.com)

2018 International Building Code

Revise as follows

**TABLE 803.13
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY**

GROUP	SPRINKLERED ¹			NONSPRINKLERED		
	Interior exit stairways and ramps and exit passageways ^{a, b}	<u>Enclosures for fire-resistive rated corridors, and enclosure for surfaces adjacent to exit access stairways and ramps, and unenclosed exit discharge elements</u> ^{a, n}	Rooms and enclosed spaces ^c	Interior exit stairways and ramps and exit passageways ^{a, b}	<u>Enclosures for fire-resistive rated corridors, and enclosure for surfaces adjacent to exit access stairways and ramps, and enclosed portions of exit discharge elements</u> ^{a, n}	Rooms and enclosed spaces ^c
A-1 & A-2	B	B	C	A	A ^d	B ^e
A-3 ^f , A-4, A-5	B	B	C	A	A ^d	C
B, E, M, R-1	B	C ^m	C	A	B	C
R-4	B	C	C	A	B	B
F	C	C	C	B	C	C
H	B	B	C ^g	A	A	B
I-1	B	C	C	A	B	B
I-2	B	B	B ^{h, i}	A	A	B
I-3	A	A ^j	C	A	A	B
I-4	B	B	B ^{h, i}	A	A	B
R-2	C	C	C	B	B	C
R-3	C	C	C	C	C	C
S	C	C	C	B	B	C
U	No restrictions			No restrictions		

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929 m².

a. Class C interior finish materials shall be permitted for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.15.1.

- b. In other than Group I-3 occupancies in buildings less than three stories above grade plane, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.
- c. Requirements for rooms and enclosed spaces shall be based on spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered to be enclosing spaces and the rooms or spaces on both sides shall be considered to be one room or space. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.
- d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall be not less than Class B materials.
- e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.
- f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.
- g. Class B material is required where the building exceeds two stories.
- h. Class C interior finish materials shall be permitted in administrative spaces.
- i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.
- j. Class B materials shall be permitted as wainscoting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.
- k. Finish materials as provided for in other sections of this code.
- l. Applies when protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
- m. Corridors in ambulatory care facilities shall be provided with Class A or B materials.
- n. Unenclosed exit discharge elements include those providing the fire-resistive rated floors below

Reason: The current table does not clearly or adequately address what should be done with exit discharge elements allowed by Section 1028.1 exception 1. The reference to "lobbies" appears to be an antiquated reference to the older versions of the legacy codes that used that term in the exit discharge description. But the problem is that the intermediate space (such as a lobby or vestibule) allowed by the exception does not have to be enclosed when certain conditions are met, and is not an interior exit stairway, ramp or passageway.

This proposal seeks to revise the table to provide clear direction on where these exit discharge elements belong, and provide those spaces with requirements less restrictive than enclosed exit elements but more restrictive than typical spaces. Experience seeing numerous office and hotel lobbies used as an exit discharge element would lead us to believe that this table has not been applied to the finishes in exit discharge spaces, so this change also attempts to remain in focus to actual construction.

With these areas such as corridors, exit access elements and discharges which are often open to the rest of the floor, where does the authority of this table stop and start? For corridors that are not required to be rated, what difference is there between the spaces they can and often are open to and the corridor itself? So the proposal delineates fire-resistive corridors from others that can be treated as rooms and spaces. For the unenclosed exit access stairs and ramps and the unenclosed exit discharge elements, the new text provides some clarity that the limits of the finish ratings would only apply to the walls and ceilings by the ramps, stairs, vestibules and lobby/exit discharge path. The addition of footnote n provides for the rated floor below these elements required by the conditions in the exception to Section 1028.1.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The current code is not clear on what is required for finishes in exit discharge elements, so there is no comparative cost.

FS85-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee determined the current table is understandable and not in need of clarification. Furthermore they concluded corridors should not be split between sprinkled and non-sprinkled as proposed. (Vote 14-0)

Assembly Action:

None

FS85-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

**TABLE 803.13
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY^k**

GROUP	SPRINKLERED ^l			NONSPRINKLERED		
	Interior exit stairways and ramps and exit passageways ^b	Enclosures for fire-resistive-rated corridors Corridors, and enclosure for surfaces adjacent to exit access stairways and ramps, and unenclosed exit discharge elements ^{a,n}	Rooms and enclosed spaces ^c	Interior exit stairways and ramps and exit passageways ^{a,b}	Enclosures for fire-resistive-rated corridors Corridors, and enclosure for surfaces adjacent to exit access stairways and ramps, and enclosed portions of exit discharge elements ^{a,n}	Rooms and enclosed spaces ^c
A-1 & A-2	B	B	C	A	A ^d	B ^e
A-3 ^f , A-4, A-5	B	B	C	A	A ^d	C
B, E, M, R-1	B	C ^m	C	A	B	C
R-4	B	C	C	A	B	B
F	C	C	C	B	C	C
H	B	B	C ^g	A	A	B
I-1	B	C	C	A	B	B
I-2	B	B	B ^{h, i}	A	A	B
I-3	A	A ^j	C	A	A	B
I-4	B	B	B ^{h, i}	A	A	B
R-2	C	C	C	B	B	C
R-3	C	C	C	C	C	C
S	C	C	C	B	B	C
U	No restrictions			No restrictions		

For SI:

1 inch = 25.4 mm, 1 square foot = 0.0929 m².

a. Class C interior finish materials shall be permitted for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.15.1.

- b. In other than Group I-3 occupancies in buildings less than three stories above grade plane, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.
- c. Requirements for rooms and enclosed spaces shall be based on spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered to be enclosing spaces and the rooms or spaces on both sides shall be considered to be one room or space. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.
- d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall be not less than Class B materials.
- e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.
- f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.
- g. Class B material is required where the building exceeds two stories.
- h. Class C interior finish materials shall be permitted in administrative spaces.
- i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.
- j. Class B materials shall be permitted as wainscotting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.
- k. Finish materials as provided for in other sections of this code.
- l. Applies when protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
- m. Corridors in ambulatory care facilities shall be provided with Class A or B materials.
- n. Unenclosed exit discharge elements include those providing the fire-resistive rated floors below

Commenter's Reason: The committee rejected the portion of the proposal to have separate requirements for sprinkled and unsprinkled corridors, so that has been eliminated by this modification.

But, although the committee did indicate the existing table is understandable, they missed the problem of it being incomplete. The current Table 803.13 IBC does not tell the user what is required for unenclosed exit discharge elements, such as the exit discharge options in Section 1028.1, exceptions 1 and 2. Here the code allows exits to discharge to interior spaces without any classification in the current table. These level of exit discharge areas and vestibules are not: Interior exits or passageways, corridors, exit access stairways or ramps. They should not have the lowest level of finish materials, as allowed for typical rooms and enclosed spaces.

This proposed code change provides the appropriate compromise position between exits and rooms, and clarifies the code to prevent both too restrictive or too loose an interpretation of how to regulate finishes in exit discharge areas and vestibules.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

As the code currently is silent on this question, this should make it easier for the user to understand and apply the code.

FS85-18

Proposed Change as Submitted

Proponent: Theresa Weston, representing Air Barrier Association (theresa.a.weston@dupont.com)

2018 International Building Code

Revise as follows

1402.2 Weather protection. *Exterior walls* shall provide the building with a weather-resistant *exterior wall envelope*. The *exterior wall envelope* shall include flashing, as described in Section 1404.4. The *exterior wall envelope* shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a *water-resistive barrier* behind the exterior veneer, as described in Section 1403.2, and a means for draining water that enters the assembly to the exterior. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1404.3 and Section C402.5 of the International Energy Conservation Code.

Exceptions:

1. A weather-resistant *exterior wall envelope* shall not be required over concrete or masonry walls designed in accordance with Chapters 19 and 21, respectively.
 2. Compliance with the requirements for a means of drainage, and the requirements of Sections 1403.2 and 1404.4, shall not be required for an *exterior wall envelope* that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E331 under the following conditions:
 - 2.1. *Exterior wall envelope* test assemblies shall include not fewer than one opening, one control joint, one wall/eave interface and one wall sill. Tested openings and penetrations shall be representative of the intended end-use configuration.
 - 2.2. *Exterior wall envelope* test assemblies shall be not less than 4 feet by 8 feet (1219 mm by 2438 mm) in size.
 - 2.3. *Exterior wall envelope* assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m²).
 - 2.4. *Exterior wall envelope* assemblies shall be subjected to a minimum test exposure duration of 2 hours.
- The *exterior wall envelope* design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the *exterior wall envelope*, joints at the perimeter of openings or intersections of terminations with dissimilar materials.
3. *Exterior insulation and finish systems* (EIFS) complying with Section 1407.4.1.

Reason: Air leakage control is currently dealt with in the I-codes based on energy efficiency considerations, but it is also critical to protection against moisture condensation. Air leakage can move 100x more moisture than vapor diffusion, and vapor retarders will not work properly without air leakage control. As stated in the Whole Building Design Guide: *“Moisture contributed by air leakage is a significant source and should be a serious concern in the design of the wall system. In fact, the design of the building envelope for minimizing air leakage is more critical than the design of the vapor barrier.*

To illustrate this point, consider that the amount of moisture contributed to a building by the air that flows through a crack 1/16th inch thick by 1 foot long is just over 5 pints per day in a light breeze. In contrast, the amount of moisture contributed by vapor diffusion through a 10 foot by 50-foot painted block wall over the same period equals just under 1/3 of a pint (about 5 ounces).”

It is important to include air leakage control in Section 1402.2 as it will highlight its importance to moisture management and facilitate the inclusion of air leakage control in water management details.

Cost Impact: The code change proposal will increase the cost of construction. For jurisdictions that adopt both the IBC and IECC, there will be no cost impact as this proposed provision is already in existing code provisions. For jurisdictions that do not adopt the IECC, there will be increased cost of incorporating air barriers into the construction, but that cost will be offset by reducing air infiltration related condensation moisture issues and associated liability.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee determined the proposed requirements needs to be in the IBC, not provided as a reference to the IECC, and a limitation to the prescriptive approach was not desirable. (Vote 10-4).

Assembly Action:

None

FS91-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Theresa Weston, representing Air Barrier Association (theresa.a.weston@dupont.com)requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1404.3 Vapor retarders. Vapor retarders as described in Section 1404.3.3 shall be provided in accordance with Sections 1404.3.1 and 1404.3.2, or an approved design using accepted engineering practice for hygrothermal analysis. Vapor retarders shall be installed in accordance with 1404.3.3

1404.3.3 Installation Vapor retarders shall be installed in accordance with the manufacturer s instructions or an approved design. Where a vapor retarder also functions as an air barrier, the vapor retarder shall be installed as a continuous air barrier in accordance with the International Energy Conservation Code.

Commenter's Reason: The committee appeared to agree with the concept that vapor retarders needed to be installed as or in conjunction with an air barrier, but was uncomfortable with a specific reference to the IECC sections. This public comment clarifies and focuses the original intent of the proposal to be specific the vapor barrier installation and only references the IECC so that a conflict will not occur between the IBC and the IECC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This should not cause any cost increase, as it does not add new requirements. Rather it clarifies the installation of already required components.

FS91-18

FS93-18

IBC: 202 (New), 1402.2, 1404.5 (New), 1404.5.1 (New), 1404.5.2 (New), Chapter 35

Proposed Change as Submitted

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz)

2018 International Building Code

Add new definition as follows

WIND-DRIVEN RAIN INDEX. A representation of the combined climate effects of wind and rain which affect the magnitude and frequency of rain deposition on building exterior surfaces.

Revise as follows

1402.2 Weather protection. *Exterior walls* shall provide the building with a weather-resistant *exterior wall envelope*. The *exterior wall envelope* shall include flashing, as described in Section 1404.4. The *exterior wall envelope* shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a *water-resistive barrier* behind the exterior veneer, as described in Section 1403.2, and a means for draining water that enters the assembly to the exterior. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1404.3. Where required by Section 1404.5, additional provisions for weather protection shall be provided.

Exceptions:

1. A weather-resistant *exterior wall envelope* shall not be required over concrete or masonry walls designed in accordance with Chapters 19 and 21, respectively.
2. Compliance with the requirements for a means of drainage, and the requirements of Sections 1403.2 and 1404.4, shall not be required for an *exterior wall envelope* that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E331 under the following conditions:
 - 2.1. *Exterior wall envelope* test assemblies shall include not fewer than one opening, one control joint, one wall/eave interface and one wall sill. Tested openings and penetrations shall be representative of the intended end-use configuration.
 - 2.2. *Exterior wall envelope* test assemblies shall be not less than 4 feet by 8 feet (1219 mm by 2438 mm) in size.
 - 2.3. *Exterior wall envelope* assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m²).
 - 2.4. *Exterior wall envelope* assemblies shall be subjected to a minimum test exposure duration of 2 hours.

The *exterior wall envelope* design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the *exterior wall envelope*, joints at the perimeter of openings or intersections of terminations with dissimilar materials.

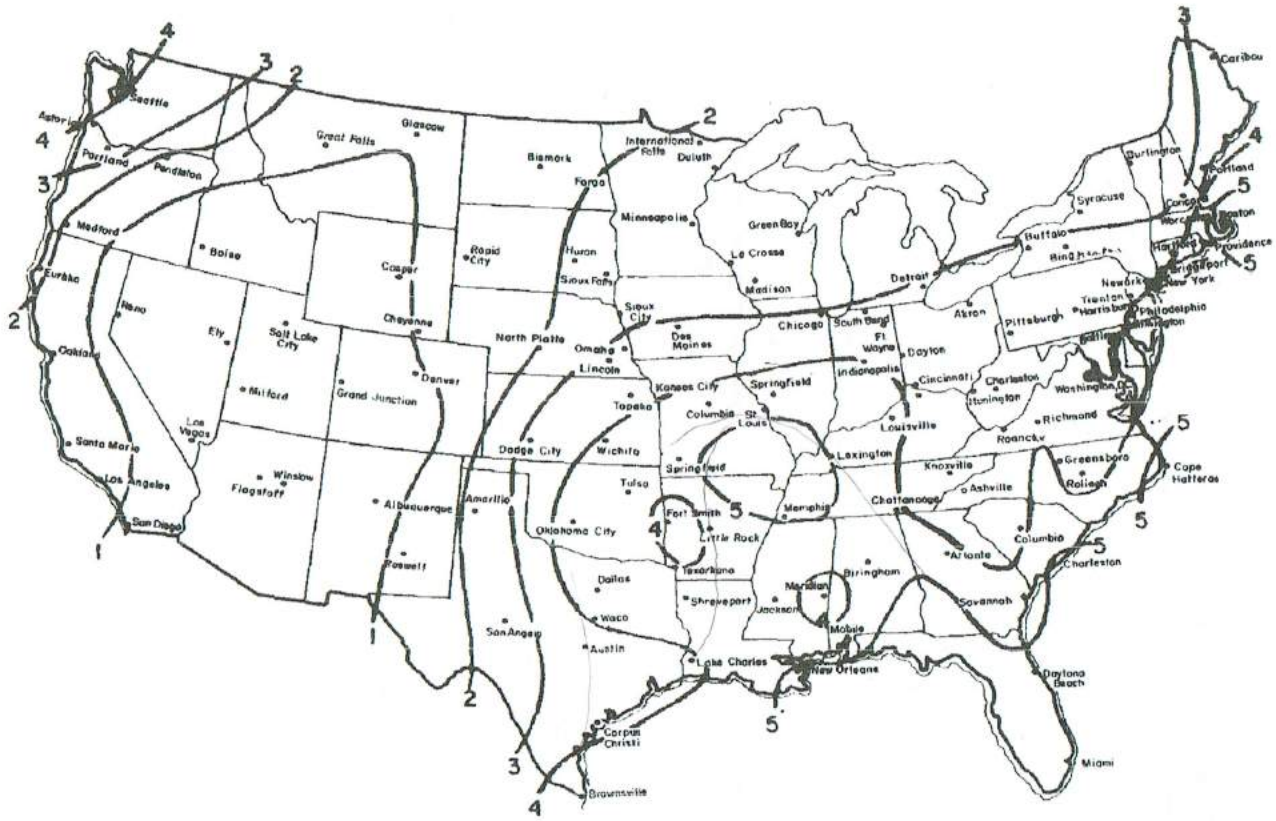

3. *Exterior insulation and finish systems* (EIFS) complying with Section 1407.4.1.

Add new text as follows

1404.5 Additional provisions for weather protection. The provisions of Section 1404.5.1 and 1404.5.2 shall apply in the required wind-driven rain index and climate zones and, where not required, shall be permitted.

1404.5.1 Enhanced drainage. Where the wind-driven rain index of Figure 1404.5.1 is 4 or greater, the means of drainage required by Section 1402.2 shall be satisfied by one of the following:

1. A drained air space not less than nominal 3/16-inch deep behind the cladding,
2. An open drainage material, not less than nominal 1/4-inch thick and with a cross-section area that is not less than 80 percent open, installed between the cladding and backing,
3. Hollow-backed metal or vinyl siding installed in accordance with the manufacturer's instructions, or
4. An approved drainage design with drainage performance at least equivalent to Items 1, 2, or 3, or not less than 90 percent drainage efficiency as measured in accordance with ASTM E 2273 or Annex A2 of ASTM E 2925.

1404.5.1
WIND-DRIVEN RAIN INDEX

1404.5.2 Protection against inward vapor drive. Where claddings addressed in Sections 1404.10 and 1404.15 are used in Climate Zones 1A, 2A, or 3A in accordance with Chapter 3 of the International Energy Conservation Code and installed over wood-based or gypsum-based sheathing, a ventilated air space shall be provided in accordance with Exception 2 in Section 2510.6 and drainage shall be provided in accordance with Items 1, 2, or 4 of Section 1404.5.1.

Exceptions:

1. An approved drainage and ventilation design, including vent inlets and outlets, with ventilation performance at least equivalent to Items 1 or 2 of Section 1404.5.1 as measured in accordance with Annex A1 of ASTM E 2925.
2. An air space for ventilation shall not be required where foam plastic insulating sheathing complying with ASTM C 578 or ASTM C 1289 is located between the cladding and the wood-based or gypsum-based sheathing.

Add new standard(s) follows

E2925-17:

Standard Specification for Manufactured Polymeric Drainage and Ventilation Materials Used to Provide a Rainscreen Function

Reason: Proposed new Section 1404.5 is needed to provide adequate moisture performance for exterior wall coverings

and vulnerable wall materials in hazardous climate conditions that are prone to cause moisture problems. In these cases, the generic minimum weather protection practices in the code are unreliable and increase the risk of moisture durability problems including material degradation, rot, and mold. This proposal will serve to address this problem and provide risk-consistent solutions in coordination with climate hazards (e.g., wind-driven rain) as they vary across the U.S. In regions of low-to-moderate hazard, this proposal requires no change in practice but permits the enhanced provisions to be used.

First, the existing exceptions in Section 1402.2 are unchanged. Therefore, where these existing exceptions apply, the enhanced requirements of proposed Section 1404.5 would not apply because the charging language for use of Section 1404.5 is located in Section 1402.2.

Second, the provisions of proposed Section 1404.5 are required only in the more extreme climates of the U.S. with regard to moisture effects on exterior walls of buildings. However, the practices employed are beneficial in all climates; therefore, they are permitted to be used in other climate conditions.

Within Section 1404.5, proposed Section 1404.5.1 addresses drainage for exterior wall coverings in climates with significant wind-driven rain hazard. In these climates, the need for enhanced drainage is well understood from experience and research. For example, these provisions are modeled very closely after provisions found in the National Building Code of Canada (Section 9.27) as applied to climates with significant wind-driven rain. The NBC provisions were necessitated by wide-spread water intrusion problems and are based on research, field studies, and expert judgment. In the U.S. similar problems are occurring, particularly with conventional stucco installations on wood frame construction. These provisions will also help mitigate risk of water intrusion damage related to normal imperfections in exterior wall covering installation.

Also within Section 1404.5, proposed Section 1404.5.2 addresses inward vapor drives which present a well-known cause of moisture problems for walls clad with "reservoir claddings" such as adhered veneer (1404.10) and stucco (1404.15). These cladding types absorb water rainwater and then while drying (particularly with impinging energy from the sun) create significant inward vapor drives, forcing water vapor through underlying layer(s), such as the water resistive barrier, and into moisture sensitive materials within the wall assembly (such as wood-based and gypsum-based sheathings). Moisture sensitive materials such as wood-based and gypsum-based sheathings backing stucco and adhered veneers are particularly vulnerable if not adequately protected. Other reservoir claddings, like anchored masonry veneer (i.e., not adhered), already comply with Section 1404.5.2 due to the presence of a nominal 1-inch or greater vented air space behind the veneer.

The proposed provisions of Section 1404.5.2 coordinate with changes made last code cycle for Section 2510.6, exception 2. However, these requirements are broadly applicable and, thus, are best located in Chapter 14 and not hidden in an incomplete exception statement back in Chapter 25. More importantly, Section 1404.5.2 ensures the ventilated air space required in Exception 2 of Section 2510.6 also complies with the drainage requirements of Section 1404.5.1 and this serves to define a minimum size or effectiveness of the ventilated air space. Additionally, the charging language for Section 1404.5 permits these enhanced practices or options to be used in any climate zone, not just those limited conditions addressed in Exception 2 of Section 2510.6.

The exceptions in Section 1404.5.2 provide useful alternative means of addressing inward vapor drives from reservoir claddings. The first exception provides a means to justify use of alternative drainage and ventilation designs. The second exception provides a means to avoid use of a ventilated air space. It works by way of blocking the inward movement of water vapor from the reservoir cladding by use of lower permeance foam plastic insulating sheathing behind the cladding. This practice has been used successfully to prevent inward vapor drives from reservoir claddings and protect underlying moisture sensitive wall materials. It is also commonly used with 1-coat stucco systems. The drainage requirements of Section 1404.5.1 would still apply where applicable.

The provisions of Section 1404.5 are supported by various sources as documented in the research report ("Moisture Control Guide") referenced in the bibliography. The wind-driven rain map provided as new Figure 1404.5.1 is based on an ASTM paper as noted as the source for the figure. It is also very consistent with a more recent wind-driven rain climatology study by the University of Georgia.

From a resiliency perspective, it is no less appropriate to consider actions to address variation of building durability climate hazards across the U.S. as it is to consider variation in structural hazards such as wind, snow, and earthquake loads as they also vary across the U.S. In fact, durability problems related to climate-driven moisture effects and associated vulnerabilities of construction materials and methods often contribute to damages from structural hazards. Thus, this proposal will help ensure intended structural performance for the service life of a building.

Bibliography: Model Moisture Control Guidelines for Light-Frame Walls: A Building Code Supplement for Builders, Designers, and Code Officials, ABTG Research Report No. 1701-01, 2017, Applied Building Technology Group LLC, <https://www.appliedbuildingtech.com/rr/1701-01>

Cost Impact: The code change proposal will increase the cost of construction
cdpACCESS does not provide a option to declare "The code change proposal will increase and decrease cost of

construction" (which is perhaps a more appropriate description of the cost impact of this proposal for reasons that follow).

For most of the U.S. these provisions do not apply and there is no cost impact. However, proposed Section 1404.5.1 will increase costs for cladding installation on some types of construction in the more hazardous wind-driven rain climates by requiring provision of adequate drainage behind claddings. However, there is no change or cost impact for claddings that already meet the requirements (e.g., anchored brick veneer) or which are already inherently drained (e.g., vinyl siding). There also is no change or cost impact for walls of concrete or masonry construction per Section 1402.2, Exception 1, or for claddings meeting the existing performance requirement of Section 1402.2, Exception 2 (e.g., barrier EIFS).

Proposed Section 1404.5.2 would appear to increase cost for stucco and adhered veneer installations that are in hot-humid climates and which do not already address inward driven moisture, but the drainage and ventilation requirements are already vaguely required (complete in concept but not in detail) in Exception 2 of Section 2510.6 of the code. Also, Exception 1 of Section 1402.2 prevents any cost impact to installations on concrete or masonry construction. Finally, proposed Section 1404.5.2 includes additional options for compliance (e.g., exceptions) that may actually reduce cost of compliance for some stucco and adhered veneer installations.

Without robust data on the variation in construction types and cladding types by regional climate conditions, it is difficult to determine the magnitude of cost impact and whether or not it is a net increase or decrease in cost for a population of buildings representative of those built using the IBC. But, it is clear in some specific cases there could be a cost increase. In these specific cases, one conventional solution that would satisfy both Sections 1404.5.1 and 1404.5.2 would be to provide furring behind the cladding (and this is not necessarily the low-cost solution). The total cost of furring including overhead and profit per the 2017 RS Means Open Shop Building Construction Costs manual ranges from about \$0.60/SF (\$1.17/LF 1x3 wood furring pneumatically nailed to wood framing at 24"oc) to \$2.22/SF (metal furring at 16"oc). Considering the many cases where there is no cost impact, this proposal will range in cost impact of \$0/SF to as much as \$2.22/SF depending on a number of factors. It is likely that the net impact is closer to \$0/SF than \$2.22/SF.

AVERAGE ANNUAL PRECIPITATION AMOUNT (INCHES)

CHAPTER 35 REFERENCED STANDARDS

ASTM

E2925 - 17: Standard Specification for Manufactured Polymeric Drainage and Ventilation Materials Used to Provide a Rainscreen Function 1402.2.1

Commenter's Reason: This public comment represents an attempt to address constructive feedback from the FS committee and various commenters on the original FS93 proposal, focusing on the wind-driven rain provisions. All those who testified at the committee hearing have been provided opportunity to review and comment as was intended by the proponent's request to disapprove at the first hearing as a result of insufficient time to develop an appropriate modification. This public comment is a result of that outreach, but should not be taken as having achieved complete unanimity.

It is well-known that wind-driven rain is the primary hazard related to water-intrusion in building walls; therefore, it is important to recognize appropriate risk-consistent practices in the code to address areas subject to known and extreme rain exposure, especially on a routine annual basis. Where applicable, this proposal will also help address areas with extreme, but lower-frequency events such as tropical storms and hurricanes. A well-known and commonly employed technique is to use a rainscreen cladding system which this proposal supports in a manner that is broadly inclusive of various materials and methods.

Specifically, this proposal responds to the various comments from the committee and floor testimony as documented by video footage at the committee hearing:

1. Precipitation map: This PC replaces the originally proposed wind-driven rain index map because it did not cover all U.S. states (e.g., AK and HI) and wind-driven rain index data is not readily available. The proposed new U.S. map is an average annual precipitation map produced by NOAA and includes contours showing variation in precipitation at a national scale, including AK and HI. However, on a county-by-county basis, appropriate micro-scale data is best sourced from local climate data because rainfall amounts can vary significantly in some states or even counties. Such local data and state/local maps are readily available. Thus, the proposal allows the proposed national map or local climate data to be used as similarly done for other climatic criteria in the IBC (see several examples from IBC listed below).

2. Criteria Impact: Several commenters also were concerned with the original proposal impacting too large an area of the U.S. This map reduces the extent of areas affected by use of 50 inches of average annual rainfall as the trigger for the enhanced drainage provisions. To relax this criteria any further would begin to remove areas with a known history of

problems that have been or can be resolved with enhanced drainage requirements. Based on a University of Georgia study of wind-driven rain climatology, this rainfall region also aligns reasonably well with regions that routinely experience significant wind-driven rain and, therefore, the 50" annual precipitation criteria reasonably isolates the most extreme wind-driven rainfall locations of the U.S. Finally, localities may adopt or amend this criteria based on local experience as commonly done through the local adoption process. For example, states or counties within hurricane prone regions (that are not otherwise captured by the 50 annual average precipitation region) may consider these enhanced drainage (rainscreen) provisions to help address concern with water intrusion during more extreme (and less routine) wind-driven rain conditions.

3. Compliance Options: There was disagreement on creating a laundry list as originally proposed and, therefore, this PC has shortened the list of compliance options to two simple conditions: (1) provide a minimum drainage space or (2) an assembly with a drainage material or method that meets currently accepted and widely used standardized performance testing requirements for drainage. Many (if not all) existing drainage materials and drainable wraps comply with the cited ASTM test standards and 90% drainage efficiency criteria. Thus, this PC is inclusive and will help support a level playing field and provide market assurances for materials and methods providing enhanced drainage capabilities. The 90% drainage efficiency is also consistent with current requirements in the IBC (Section 1407.4.1) and IRC (Section R703.9.2) for drainable EIFS.

4. An exception is provided to allow the flexibility to use alternative site-specific designed solutions to mitigate wind-driven rain effects. This recognizes that designers may use features such as overhangs to protect walls or portions of walls from wind-driven rain.

5. Specifying a minimum drainage space also will help address one committee member's concern with control of exterior fire propagation by avoiding drainage spaces that are larger than necessary to provide adequate drainage and also provide guidance in configuring wall assemblies (where a drainage space is provided) for NFPA 285 assembly testing to ensure fire performance and drainage needs are coordinated for durability and safety.

6. Finally, the provision is moved to a more appropriate location as a subsection of 1402.2 (rather than being a separate section referenced from Section 1402.2) which simplifies the proposal and code organization.

It should be noted that the approach taken in this proposal and its allowance to use local climatic or hazard conditions is consistent with several other similar applications in the IBC as follows:

[From 1609.3] *In nonhurricane-prone regions, when the basic design wind speed, V , is estimated from regional climatic data, the basic design wind speed, V , shall be determined in accordance with Chapter 26 of ASCE 7.*

[From 1611.1] *The design rainfall shall be based on the 100-year hourly rainfall rate indicated in Figure 1611.1 or on other rainfall rates determined from approved local weather data.*

[From 1612.3.1] *Obtain and reasonably utilize any design flood elevation and floodway data available from a federal, state or other source.*

[From 2304.12.4] *In geographical areas where hazard of termite damage is known to be very heavy,*

[From 2304.12.2.3] *Supporting member for permanent appurtenances. Naturally durable or preservative treated wood shall be utilized for those portions of wood members that form the structural supports of buildings, balconies, porches or similar permanent building appurtenances where such members are exposed to the weather without adequate protection from a roof, eave, overhang or other covering to prevent moisture or water accumulation on the surface or at joints between members. Exception: Buildings located in a geographical region where experience has demonstrated that climatic conditions preclude the need to use durable materials where the structure is exposed to the weather.*

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The first cost impact is limited to only those regions with high exposure to rain and, within those regions, only to cases where rainscreen claddings or drainage systems are not already employed that meet the requirements. This proposal will serve to decrease cost and improve resiliency over the life-cycle of a building in these high hazard areas. See the original proposal's cost impact statement for more detail.

Public Comment 2:

Proponent: Jay Crandell, P.E., ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1402.2.1 Moist climate zones. Where adhered masonry veneer or cement plaster are used on frame walls in Climate Zones 1A, 2A, or 3A, a ventilated air space shall be provided between the cladding and a water-resistive barrier applied over wood-based sheathing in accordance with Section 2510.6 in addition to a means for draining water to the exterior.

Exception: An air space for ventilation shall not be required where foam plastic insulating sheathing complying with ASTM C 578 or ASTM C 1289 is located between the cladding and the frame wall assembly.

Commenter's Reason: This public comment focuses on the "moist climate zone" portion of the original FS93 proposal. This portion of the original proposal did not receive any opposition at committee hearing. It is consistent with provisions already included in Section 2510.6 of the IBC last code cycle. However, this proposal places these requirements more prominently within the weather protection provisions of Chapter 14. A coordinating change will be made to Section 2510.6 in the Group B hearing cycle.

The only technical change represented in this PC (and also in the original proposal's treatment of moist climate zones) is the exception statement which recognizes an accepted and successful practice for use of foam plastic insulating sheathing behind adhered veneers and stucco cement plaster. The foam sheathing creates a block to inward water vapor drives from reservoir claddings such that a ventilated air-space is not required. Drainage is still required because the exception only applies to the airspace for ventilation.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This proposal is based on language currently on Section 2510.6 (see Exception 2), so there is no cost impact in regard to the existing provisions. However, the exception statement provides potential for cost decrease for assemblies that employ foam plastic insulating sheathing as an alternative means to control inward vapor drives (without eliminating the need to provide a means for drainage).

FS93-18

FS94-18

IBC: 1402.3

Proposed Change as Submitted

Proponent: David Collins, The American Institute of Architects, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

Add new text as follows

1402.3 Fenestration. Vertical fenestration and skylights, including windows and doors, shall comply with the International Energy Conservation Code, as applicable.

Reason: The IECC contains detailed requirements regarding doors, windows and skylights which apply to all buildings. Primarily fenestration is located in the exterior walls of the building. Obviously skylights are located in the roof. The IBC already addresses the quantity and fire resistance of openings in Chapter 7. Chapter 14 addresses the overall integrity of exterior walls. Providing energy efficient fenestration is part of the design consideration of exterior walls. The fenestration requirements are somewhat complex and should remain in the IECC, but the existence of the IECC provisions need to be referenced in the IBC to reduce the possibility of them being overlooked. This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This requirement already exists in the IECC. Inclusions in the IBC doesn't result in any construction not already anticipated.

FS94-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee deemed the proposed pointer not necessary, indicating users should know to use all the codes. (Vote 14-0).

Assembly Action:

None

FS94-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com) requests As Submitted.

Commenter's Reason: Criteria for exterior openings in the ICC family of codes address various elements of regulation of openings. The IBC includes limitations for the number and percentage of area permitted in a wall based on the location of the building on a site. The IECC limits the area of the openings based on exposure and the energy efficiency of the opening device (window, door, etc.). It is the responsibility of the designer to determine the implications of these two distinct sets of criteria. All too often the user of the code (designer and code official) over look one in favor of the other. This change is a simple effort to remind all users of the code what the limitations are for fenestrations within the family of codes so that errors will not occur costing loss of important features of code compliance that must be rectified, or worse the owner/user of the facility is impacted by costly failures of the building to perform.

The ICC family of codes includes various pointers to other provisions within its codes or even literally duplicates them to assure their use and appropriate application. This change does the same. We urge your approval of this simple code change.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction This change will reduce the cost of redesign or changes during the construction process due to inadvertant oversight of important provisions in the ICC Codes.

FS94-18

FS95-18

IBC: 1402.5

Proposed Change as Submitted

Proponent: Tim Earl, GBH International, representing self (tearl@gbhinternational.com)

2018 International Building Code

Add new text as follows

1402.5 Exterior wall envelope. Exterior walls on buildings of Type I, II, III, or IV construction that are greater than 40 feet (12,192 mm) in height above grade plane where the exterior wall envelope contains a combustible material, the complete exterior wall envelope shall be tested as a system in accordance with and comply with the acceptance criteria of NFPA 285 unless compliance with NFPA 285 is specifically exempted elsewhere in this Chapter.

Exception: An exterior wall envelope where the only combustible component is a water-resistive barrier in compliance with section 1402.6.

Reason: This code change proposal is a generic requirement that ensures that all exterior wall envelope systems containing combustible materials must be tested to NFPA 285 as a complete system (if they exceed 40 ft. in height) unless otherwise exempted by other provisions of Chapter 14.

This proposal is followed by a series of proposals addressing various issues associated with combustible materials in exterior walls. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope. Just as at present, no testing of completely non-combustible exterior walls would be required.

An alternate proposal addresses added requirements in the case of the presence of projections or interior corners.

The issue of wind effects has been raised but no standard test (or standardized variations of a standard test) exists that can address that.

The definition of "exterior wall envelope" in the IBC makes it clear that it is the "product" that needs to be tested because the fire performance of any system is affected by the fire performance of all its components. Therefore, if each component is fire tested individually and they all meet the requirements, there is no assurance that the entire system (meaning the exterior wall envelope) will perform adequately and meet the requirements.

This was always the intent for fire performance testing and minimum fire safety requirements of the chapter, but the section as currently written is not as clear as it should be. This is intended to address concerns with current language and requirements that could ultimately lead to tragic fires like the one in Grenfell Tower(London, England).

Note: The current definition for EXTERIOR WALL ENVELOPE in the IBC follows:

A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

Cost Impact: The code change proposal will increase the cost of construction

While it was always the intent that systems be tested, if users were not testing the entire exterior wall system, they will now be required to do so.

FS95-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee indicated the proposal was difficult to understand and the issue should be addressed in Section 1405. (Vote 9-5)

Assembly Action:

None

FS95-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1402.5 Exterior wall envelope. Exterior walls on buildings of Type I, II, III, or IV construction that are greater than 40 feet (12,192 mm) in height above grade plane where the exterior wall envelope contains a combustible material other than a water resistive barrier in compliance with Section 1402.6, the complete exterior wall envelope shall be tested as a system in accordance with and comply with the acceptance criteria of NFPA 285 ~~unless compliance with NFPA 285 is specifically exempted elsewhere in this Chapter.~~ **Exception:** ~~An exterior wall envelope where the only combustible component is a water resistive barrier in compliance with section 1402.6~~. Exterior wall systems containing foam plastic insulation shall comply with Section 2603.

SECTION 1405 COMBUSTIBLE MATERIALS ON THE EXTERIOR SIDE OF EXTERIOR WALLS EXTERIOR WALL COVERINGS

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This public comment addresses the Committee concerns to make the requirement clearer and more concise that exterior wall systems with combustible components be tested to NFPA 285. The use of the term exterior wall envelope (as opposed to system or other terminology) is consistent with the current definitions (See Below). Any combustible electrical, plumbing or mechanical components would not be included in the NFPA 285 full envelope test, as these are not included the definition of the exterior wall envelope.

This requirement to test the complete exterior wall system is essential to ensure that any wall design with a combination of combustible and noncombustible building components is tested to NFPA 285 in a fashion to ensure the system will appropriately limit fire spread along the outside surface or within the exterior wall envelope. This requirement would prohibit separate testing of individual components which may perform very differently from the complete exterior wall envelope or system.

Current IBC definitions:

EXTERIOR WALL ENVELOPE. A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.

EXTERIOR WALL COVERING. A material or assembly of materials applied on the exterior side of exterior walls for the purpose of providing a weather-resisting barrier, insulation or for aesthetics, including but not limited to, veneers, siding, exterior insulation and finish systems, architectural trim and embellishments such as cornices, soffits, facias, gutters and leaders.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. While it was always the intent that systems be tested, if users were not testing the entire exterior wall system, they will now be required to do so.

Proposed Change as Submitted

Proponent: Ronald Nickson, Nickson Code Consulting, representing Rockwool (nicksongcodeconsulting@gmail.com)

2018 International Building Code

Add new text as follows

1402.6 Flame spread of wall and attic protection. Where a building is not required to comply with NFPA 285, the exterior walls, or combination of exterior walls and eaves shall comply with Section 1402.6.20 when subject to fire testing in accordance with Sections 1402.6.2 through 1402.6.23.

Exceptions:

1. When there is or no observed flame spread above the lower 8 feet of the 16-foot test assembly, the wall assembly being tested is considered to have passed the test and is acceptable for use on the exterior of buildings.
2. Where eaves are located at a height greater than 8 feet above grade, the wall includes a gable vent or the building is designed with a parapet and low sloped roof, the exterior wall system above 8 feet from grade can be constructed using any alternative approved materials, provided the assembly of the lower 8 feet above grade of the wall assembly is permitted in accordance with Exception 1 to Section 1402.6.

1402.6.1 Wall sections deemed to comply. Wall assemblies listed below are deemed to comply with Section 1402.6 when the water-resistant barrier is the only combustible component and the water-resistive barrier has a peak heat release rate of less than 150 kW/m², a total peak heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

1. The following wall assemble is deemed to comply with Section 1402.6 and is acceptable for use on the exterior wall of buildings when the attic space, exterior wall with gable vents, or parapet with low sloped roofs are more than 16 feet above grade plane. The wall assembly is required on the lower portion of the wall to a height of 16-feet above grade plane.
 - 1.1. Vinyl siding over water-resistant barrier and 1/2 inch plywood.
2. The following wall assemblies are deemed to comply with the Exception to Section 1402.6 and are acceptable for use on all exterior walls. The wall assembly is required on the lower portion of the wall to a height of 8-feet above grade plane.
 - 2.1. Fiber cement siding over water-resistant barrier and 1-inch R-5 EPS.
 - 2.2. 3/8-inch base coat stucco over water-resistant barrier and 1/2-inch plywood.
 - 2.3. 3/8-inch base coat stucco over water-resistant barrier, 1-inch R-5 EPS and 1/2-inch plywood.
 - 2.4. EIFS with 3/16-inch base coat of fiberglass mesh w/acrylic finish over water-resistant barrier and 1/2-inch plywood.
 - 2.5. EIFS with 3/16-inch base coat of fiberglass mesh w/acrylic finish over water-resistant barrier 1.5-inches EPS and 1/2-inch plywood.
 - 2.6. Vinyl siding over water-resistant barrier, mineral wool boards and 1/2-inch OSB.

1402.6.2 Fire test. This fire-test-response procedure prescribes a method to assess the fire performance of a vertically oriented specimen, eave projection and roof that encloses an attic space, exposed to direct flame impingement in a simulated external fire. When tested in accordance with 1402.6, when present, the eave construction shall be uniform and continuous around the perimeter of the test specimen.

1402.6.3 Test assembly. The test assembly wall dimensions shall be 16 feet wide and 16 feet high and have a supporting wall on each end that extends back 8 feet at a 90-degree angle to the 16-foot wall. The eave shall be

constructed as an 18-inch projection, extending horizontally from the top of the 16-foot wall section. The roof and attic spaces shall be constructed such that the roof extends from the projection's fascia at an angle of 6:12. The roof shall be covered with 5/8-inch OSB roof sheathing and roofing materials. The roof members shall have an intermediate supporting vertical member extending from the top of the 16-foot wall as well as at the ends of the 8 foot walls.

1402.6.4 Joint detail. The test assembly shall incorporate joint detail(s) representative of actual installation.

1402.6.5 Wall detail. The wall assembly used as the test specimen shall include sheathing, weather barrier and cladding attached to the exterior surface of the structural support elements.

1402.6.6 Wall material. For wall assemblies composed of layered materials, such as sheathing, water-resistive barrier, continuous exterior insulation and siding (cladding), the installation of such layered materials shall be in accordance with the manufacturer's instructions, or in the absence of such instructions, applicable building code requirements. In the absence of manufacturer's specifications, the wall assembly shall include the following minimum components: nominal 2x4 studs spaced 16 in (410 mm) on center, and the desired exterior siding material. If sheathing is used, tests shall be run on typical 7/16 in. oriented strand board (OSB) of Exposure 1 rating. Where specified by the manufacturer, sheathing materials and installation shall be in accordance with the manufacturer's instructions. The type, thickness, and installation method of any sheathing method of any sheathing shall be included in the report.

1402.6.7 Accelerated aging/weathering and pre-test conditions of test material. When required by a regulatory or other agency a pre-test accelerated aging/weathering of the samples shall be completed. The manufacturer shall have the option to conduct such weathering. Weathering shall be conducted as specified by the regulatory agency or applicable methods as specified for the product. Details of the weathering method used, or reference to a standard test method, shall be included in the report.

1402.6.8 Test samples. Two hygroscopic samples of each materials from the same stock from which the test assembly was constructed shall be tacked to the test assembly during construction in such a manner that they are easily removed. These pieces shall be conditioned with the completed test specimen.

1402.6.9 Storage. The completed test assemblies and samples shall be stored indoors at temperatures not lower than 60°F (16°C) nor higher than 90°F (32°C) for the period of time necessary to cure the assembly components. Test assemblies are to be stored so that each will be surrounded by freely circulating air.

1402.6.10 Sample testing. Just prior to the assembly testing, the pieces of hygroscopic materials prepared in 705.2.5.2.1 shall be tested for moisture content.

1402.6.11 Moisture determination. Samples of like materials shall be reported as the average. For lumber and other wood-based materials, use Test Method ASTM D4442. Alternatively, the moisture content for lumber and other wood-based materials is permitted to be measured using a moisture meter. For other hygroscopic materials, use test methods appropriate for those materials.

1402.6.12 Lumber used in the construction of the supporting wall structure. The moisture content shall not be more than 12 percent. For wood sheathing, the moisture content shall not exceed 8%. For other hygroscopic materials, the moisture shall be within ranges specified by the manufacturer before the assembly is constructed. These specified ranges shall be typical for exposure.

1402.6.13 Burner details. The ignition source for the test shall be gas diffusion burner with a nominal 4 in. wide by 39 in. (100 mm wide by 1000 mm) long porous top surface of a refractory material. With the exception of top surface dimensions, the essential configuration of the burner is comparable to the burner design describe in Test Method E2257.

1402.6.14 Burner enclosure. The burner enclosure shall be positioned so that it is centered relative to the width of the 16-foot test wall. The distance from the bottom of the test assembly to the top surface of the burner shall be 12 plus or minus 2 inches. (300 plus or minus 50 mm). The bottom of the test assembly shall be protected from burner fire exposure by the placement of a 4 foot (1220 mm) wide thermal barrier.

1402.6.15 Procedure. The ambient temperature in the test room shall be above 60°F (15°C) and the relative humidity shall be less than 75 percent. The test room shall be draft-protected and equipped with an exhaust hood system for removal of products of combustion during the test.

1402.6.16 Horizontal air flow. The horizontal air flow, measured at a horizontal distance of 20 inches. (0.5m) from the edge of the wall assembly, shall not exceed 1.64 feet per second (0.5 m/s).

1402.6.17 Test assembly position. Prior to testing position the test assembly under the exhaust hood and set the gas burner for the prescribed level of output.

1402.6.18 Burner output. Once the burner output is verified, position the specimen holder assembly at the desired test location under the collection hood.

1402.6.19 Burner ignition. Simultaneously ignite the gas burner and start the timer marking the beginning of the test. Control the burner to a constant 100 kw output. Control the hood duct flow to collect all products of combustion.

1402.6.20 Flame exposure. Continue the flame exposure for a period of 20 minutes, or until such time that observations of flames in the attic space have been made. The specimen will have passed the test if no flame intrusion was observed into the attic space.

1402.6.21 Documentation. Perform photographic or video documentation, or both, before, during and after each test.

1402.6.22 Report. The report shall include the following:

1. Name and address of the testing laboratory.
2. Name and address of test sponsor.
3. Description of the test assembly including construction details of the wall system, details of individual components and the manufacturer's installation details and limitations as applicable.
4. Number of specimens tested.
5. Conditioning of test assemblies.
6. Pre-test accelerated aging/weathering exposure, as applicable.
7. Moisture content of hygroscopic elements of the wall system construction at the time of testing.
8. Details of the calibration including heat supply rate.
9. Date of test, identification number and date of report.

1402.6.23 Test Results. The test results shall include:

1. A notation of the time and location of the breach of the flame into the attic space.
2. A determination of the presence of glow on the unexposed side of the assembly at the end of the 60-minute observation period.
3. Observations of the burning characteristics of the exposed surface of the test during and after the test exposure.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

D4442-16:

Standard Test method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter

E2257-17:

Standard Test Method for Room Fire Test of Wall and Ceiling Materials and Assemblies

Reason: The proposed change establishes a material-neutral, engineering solution, that allows for a wide range of options and design solutions to address the issue of fire spreading across the exterior wall and breaching the attic space, from fires that originate on the exterior of a building. The risks associated to exterior fires of this type have been rising dramatically due to changes in the energy code that require more wall insulation. The increased insulation can be accommodated by increasing the wall thickness and installing more insulation in the wall cavity or by adding continuous insulation to the exterior of the more typical 2x4 or 2x6 wall. The exterior insulation does not present a fire hazard if it is non-combustible or protected in a way to prevent the insulation from being involved in a fire originating near the exterior wall from fires in nearby buildings, landscaping and in some cases radiative heat from the windows of a nearby building. This code proposal incorporated into the IBC is a means to evaluate the spread of fire on the exterior of buildings that also includes testing to determine if the fire spreads into the attic. The provisions in the proposal are based on fire

testing research performed at UL, Fire Service Summary Report: Study of Residential Attic Fire Mitigation Tactics and Exterior Fire Spread Hazards on Firefighter Safety, funded by the Department of Homeland Security, and UL fire test, Verification Services Project for Exterior Wall Mock-up Fire Demonstration with Comfortboard 80 Insulation Products. Work is now underway with UL/ANSI to develop a standard that can be referenced in future editions of the ICC Codes. Section 1402.6.1 adding the list of wall configurations deemed to comply includes wall assemblies that were tested in the above referenced test by UL. Based on that testing the listed wall assemblies would comply with the test procedure proposed by this code change. The section is based on provisions in the IECC that lists materials and assemblies that are deemed to comply with the IECC requirements for air leakage.

A report from NFPA Research entitled, Residential Structure Fires Originating On Outer Walls, Spreading On Exterior Walls Or Trim, and Beginning On An Outer Wall with Plastic, January 2018, identifies the problem that now exists because of the increased use of unprotected combustible products used to meet the current energy code requirements. The report documents the number of residential fires where the item contributing most flame spread was exterior sidewall covering and surface finish. From 2005 to 2015, this type of fire occurs on average 7663 times per year, causing an annual average of 50 casualties, 345 injuries and \$539 million in property loss.

UL fire test, Verification Services Project for Exterior Wall Mock-up Fire Demonstrations with Comfortboard 80 Insulation Products has shown that a fire can reach the attic in a building through the soffit in 2-3 minutes in buildings with unprotected combustible products in the exterior wall. In buildings with light siding and non-combustible insulation, tested using the same procedure, the exterior of the building does not catch on fire and thus the issue of the fire getting into the attic never happens.

The methodology proposed for fire testing in this proposal, assess the flame spread of the exterior wall and the time it takes for a fire to breach the attic space. To have a complete solution to the spread of fire into the attic it is imperative that the exterior wall meet the criteria in Section 1405.1 concerning Combustible Materials on the Exterior Side of Exterior Walls. A companion change has been submitted to add Type V construction to the section.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The cost impact if any is minor. Some cost will be incurred by material manufacturers to determine compliance with the required test procedure. Material and installation cost are basically natural.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E2257-17 and ASTM D4442-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

FS96-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee determined the modification (Nickson 8) was out of order, upon which the proponent requested disapproval. The committee disapproved, noting the language was cumbersome and complex, and there was no merit without the modification. (Vote 14-0)

Assembly Action:

None

FS96-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ronald Nickson, representing Rockwool (nicksoncodeconsulting@gmail.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1402.6 Flame spread up the exterior wall surface. Where a building is not required to comply with NFPA 285, exterior walls and exterior walls with eaves shall comply with Section 1402.6.1.

1402.6.1 Wall sections deemed to comply. Wall assemblies specified in Sections 1402.6.1.1 and 1402.6.1.2 are deemed to comply with Section 1402.6 where the water-resistant barrier is the only combustible component provided the water-resistant barrier complies with both of the following:

1. A peak heat release rate of 150 kW/m, a total peak heat release of less than 20 MJ/m and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354.
2. A flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723.

The ASTM E1354 test shall be conducted on a specimen at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

1402.6.1.1 Wall Assembly The following wall assembly, with no external insulation, is deemed to comply with Section 1402.6 and is acceptable for use on the exterior wall of buildings when the attic space, exterior wall with gable vents, or parapet with low sloped roof is more than 16 feet (4880 mm) above grade plane:
Vinyl siding over water-resistant barrier and 1/2 inch wood structural panel.

1402.6.1.2 Deemed to comply wall assemblies. The following wall assemblies are deemed to comply with Section 1402.6 and are acceptable for use on the lower 8 feet (2440 mm) of all exterior walls. The materials of exterior wall systems shall not be limited above the lower 8 feet above grade where eaves are located at a height greater than 8 feet (2440 mm) above grade, where the wall includes a gable vent, or where the building is designed with a parapet and a low sloped roof, provided the wall assembly of the lower 8 feet (2440 mm) above grade consists with one of the following:

1. Fiber cement siding over 1 inch polystyrene water-resistant barrier and 1/2 inch wood structural panel.
2. Fiber cement siding over mineral wool insulation, water-resistant barrier and 1/2 inch wood structural panel.
3. 3/8 inch base coat stucco over water-resistant barrier and 1/2 inch wood structural panel.
4. 3/8 inch base coat stucco over 1 inch polystyrene water-resistant barrier and 1/2 inch wood structural panel.
5. Any thickness base coat stucco over mineral wool insulation, water-resistant barrier and 1/2 inch structural panel.
6. EIFS with 3/16 inch base coat of fiberglass mesh with acrylic finish over 1.5 inch EPS, water-resistant barrier and 1/2 inch structural panel.
7. EIFS with any thickness of base coat and finish coat over mineral wool insulation, water-resistant barrier and 1/2 inch wood structural panel.
8. Vinyl siding over mineral wool insulation, water-resistant barrier and 1/2 inch wood structural panel.
9. 8 inch wood lap siding over water-resistant barrier and 1/2 inch wood structural panel.
10. 8 inch wood lap siding over mineral wool insulation, water-resistant barrier and 1/2 inch wood structural panel.
11. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25mm) thickness of masonry or concrete and meeting one of the following:
 - 11.1. There is no airspace between the insulation and the concrete, masonry or thermal barrier.
 - 11.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E84 or UL 723 and the maximum airspace between the insulation and the concrete, masonry or thermal barrier is not more than 1 inch (25 mm).

Commenter's Reason: The public comment, supported by the ICC Fire Code Action Committee (FCAC) and the National Association of State Fire Marshals (NASFM), simplifies and revises the original proposal to a listing of the wall configurations that are acceptable when the exterior wall is not required to comply with IBC Section 1402.5, which requires walls greater than 40 feet in height to be tested in accordance with NFPA 285. The proposal is in response to the recent changes in the IECC for increased insulation, which in some cases is installed on the exterior of the wall and can contribute to the spread of fire up the exterior wall. This concern is documented by NFPA and the U.S. Fire Administration's National Fire Incident Reporting System (NFIRS 5.0) which documents that there is an annual average of 7645 residential fires that spread on the exterior wall surface with 50 casualties, 345 injuries and \$539M in property damage.

The deemed to comply wall configurations are based on testing completed by UL following the procedures of ASTM E2707 with various burner flame ignitions ranging from 50 kW - 300 kW. Of the 32 test completed, 20 were with a flame ignition of 100 kW. The 100 kW flame was selected as the basis for the original proposal, this public comment and the deem to comply wall configurations because it allows for testing of the flame spread up the exterior of the wall as compared to the 150 kW basis for ASTM E2707 which is designed for flame penetrations thru the wall. The tests completed by UL were either 2x4 or 2x6 walls with structural wood panels (plywood or OSB) and different exterior materials. Walls with non-combustible siding, such as EIFS, stucco, fiber cement over no insulation or a combustible insulation had no sustained ignition when exposed to the 100 kW fire in the UL testing. Walls with no sustained ignition are included in the proposal as deemed to comply wall configurations. Other wall configurations with mineral wool exterior insulation are also included as deemed to comply based on testing done on walls with mineral wool exterior insulation which also had no flame spread up the exterior surface of the wall. Walls with siding that melted (vinyl) and mineral wool insulation also passed the test. Walls with a siding that melted with foam plastic insulation failed the test. Vinyl siding over structural wood panels (no exterior insulation) passed the test when the wall was 16 feet high.

The UL testing is reported in two reports: (1) Study of Residential Attic Fire Mitigation Tactics and Exterior Fire Spread Hazards on Fire Fighter Safety (available at: <https://ulfirefightersafety.org/docs/Attic-Final-Report-Online.pdf>), and (2) Verification Services Project for Exterior Wall Mock-up Fire Demonstration with Comfortboard 80 Insulation (available by request from proponent).

The deemed to comply wall sections include the majority of current wall configurations. Other wall configurations can be approved by the code official per IBC Section 104.11 Alternative materials, designs and methods of construction and equipment.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. In zones 6-7 there could be a cost increase depending upon the design and the basis for cost consideration. However, in zones 1-5 and 8 design using the U-value configuration for solution and code compliance as compared to the R-value code solution are available that will reduce the cost of construction.

Public Comment 2:

Proponent: John Woestman, Kellen Company, representing Extruded Polystyrene Foam Association (jwoestman@kellencompany.org); Justin Koscher, Polyisocyanurate Insulation Manufacturers Association (jkoscher@pima.org); Jay Crandell, ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz) requests Disapprove.

Commenter's Reason: Please support the Committees unanimous vote for disapproval. In the original proposal, the proponent created a fire test to address a problem that was not substantiated. The proponent then attempted to move a floor modification and described a substantial change to an existing consensus-based standard (ASTM E2707) using the code development process. Although his request was ruled out of order, the proponent stated he would bring it back in Public Comment.

In both cases, Section 3.6.3.2 of ICC CP-28 states that the standards referenced by the ICC codes shall be developed and maintained through a consensus process such as ASTM or ANSI. The modifications to the ASTM standard have not been vetted through a consensus process by a balanced group of stakeholders, as evidenced by the significant alterations and scope of the public comment.

Although the original FS96-18 cited a number of citations justifying the need for and providing a fire test as a response, for this change, no details have been submitted. One of these reports included a UL research program which was to develop improved firefighter tactics by providing the fire service with scientific knowledge on the dynamics of attic and exterior fires. The applicability of this work to FS96-18 is unknown.

This topic belongs in a consensus standard setting organization such as ASTM and should not be included in the IBC until this work is completed.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment requests disapproval - the code will not be changed with support of this public comment.

FS96-18

FS99-18

IBC: 1402.5, 1402.5.1, Table Table 1402.5

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, Lake Travis Fire Rescue, representing Lake Travis Fire Rescue (jshapiro@ltfr.org)

2018 International Building Code

Revise as follows

1402.5 Vertical and lateral fire testing of exterior walls for flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane ~~and contain a combustible water-resistive barrier shall be tested that include combustible components shall be tested for flame propagation~~ in accordance with and comply with the acceptance criteria of ~~NFPA 285~~ the test methods in Table 1402.5. The complete exterior wall envelope shall be tested. For the purposes of this section, fenestration products, flashing of fenestration products and water-resistive-barrier flashing and accessories at other locations, including through wall flashings, shall not be considered part of the water-resistive ~~barrier~~ barrier.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

Add new text as follows

1402.5.1 Supplemental requirements for test method. Where compliance with this section is required by Table 1402.5, the following shall apply:

1. Where an exterior wall will include one or more horizontal projections, the wall assembly shall be tested in accordance with NFPA 285 using a test sample that incorporates a horizontal projection that extends 5 feet from the exterior wall surface and is located 36 inches above the window opening. The tested assembly shall be required to comply with the acceptance criteria of NFPA 285.
2. Where an exterior wall will include one or more interior corners, the wall assembly shall be tested in accordance with one of the following options:
 - 2.1 NFPA 285 using a test sample that incorporates a corner that is located at the left or right edge of the window opening and extends an exterior wall surface at a right angle to the plane of the window that creates a 5 foot deep interior corner. The tested assembly shall be required to comply with the acceptance criteria of NFPA 285.
 - 2.2 NFPA 285 using the standard wall assembly and an additional test using the 16 foot parallel panel test specified in FM 4880. The tested assembly shall be required to comply with the acceptance criteria of both NFPA 285 and FM 4880.
3. Where an exterior wall will include both horizontal projections and interior corners, the wall shall be tested in accordance with both Item 1 and Item 2.
4. Tests in Item 1 and Item 2.1 shall be conducted with wind applied at 60 second intervals, accomplished by cycling the fan or fans on and off for the duration of the test. Fans shall apply a uniformly distributed wind speed of 30 feet per second to the face of the test assembly when running at full speed.

**Table 1402.5
REQUIRED EXTERIOR WALL FIRE TEST METHOD**

Exterior Wall Configuration^a	Required Test Method
<u>Flat wall surface</u>	<u>NFPA 285</u>
<u>Projections or interior corners</u>	<u>See Section 1402.5.1</u>

a. Where no projections or interior corners exceed 12 inches, measured perpendicular to the wall surface, the wall is considered to be a flat wall surface

Reason: For the past year, I have been attempting to get the NFPA 285 committee to consider adjustments to the NFPA 285 test procedure to address the issues of building geometry and wind. My approach has been to fight attempts to expand the use of NFPA 285 to include any wall assembly until changes are made to the standard to address these concerns. The development process for NFPA 285 has been very contentious on this issue, with the committee completely reversing course from one meeting to the next, and ultimately, the NFPA Standards Council refused to issue the latest update and returned the entire document to the technical committee.

The fire service has very little voice in the NFPA 285 process compared to industry interests, and it has been very difficult to get the committee to give these concerns due consideration, and on this issue, I am representing the perspective of the fire service and a code official. Lacking the ability to get appropriate consideration from the NFPA 285 technical committee, I am seeking to get the IBC to establish parameters for exterior wall tests that would be dictated to anyone writing test protocols for IBC buildings with walls regulated by this section.

The fire service is well aware of the effects of wind driven fires and of building geometry when it comes to fire behavior, and we can ill afford the risk of catastrophic high-rise fires involving exterior walls. While it has been claimed that there have been no such documented losses involving NFPA 285 compliant panels on buildings, the lack of a bad fire does not equate to a conclusion that everything is fine. Instead, numerous catastrophic exterior fires that have occurred just happened to occur on buildings with non-compliant walls assemblies. What would have happened if NFPA 285 compliant panels were used? Nobody can say for certain.

The current NFPA 285 test method is scoped to ONLY include non-bearing geometrically flat curtain walls attached to buildings, and I have no issue with the current test method continuing for this application. However, the effectiveness of this test method for assemblies with overhangs and inside corners that can intensify the fire exposure needs to be known before these untested geometric variations should be permitted by NFPA 285 or the IBC. UL's mantra is "know by test." We haven't tested, therefore, we don't know.

The addition of a wind application to the proposed samples with overhangs and/or corners recognizes that wind turbulence is likely to further increase fire intensity. Inside corners will form a flame vortex, and overhangs are expected to concentrate heat beneath the overhang. Either could cause an assembly that might pass the basic NFPA 285 test to fail.

The suggested parameters for the depth of extensions and wind speed (which approximately equates to 20 mph) are my best estimate, as a fire protection engineer and former firefighter, at a reasonable test. I have asked a variety of individuals involved in this issue to offer suggestions or run sample tests and got nowhere.

The fire service would be unwise to accept the risk of catastrophic high-rise fires by knowingly standing by while the NFPA 285 test method is exploited. Without knowing the fire performance consequences of stretching the test method to allow assemblies that are not well represented in the test, we cannot reasonably assure public safety or firefighter safety. We must do a better job of making sure we get this issue right because Grenfell Tower was a wake up call with respect to the consequences of inadequate testing. Do we really want to allow buildings to be built with untested wall configurations only to later learn that we screwed up and created a large pool of dangerous existing buildings? The time to address these concerns is now, before NFPA 285 loses its current scoping constraints and before tall wood buildings gain access to a test method that wasn't designed for that application.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Currently, NFPA 285's scope is limited to not include all types of wall assemblies that are being addressed by this proposal. Compliance with additional tests being proposed may or may not have an impact on the cost of construction, depending on whether existing assemblies and materials are able to pass the proposed test protocols.

Public Hearing Results

Errata: The table did not appear in the CAH.

Committee Action:

Disapproved

Committee Reason: The committee concluded there are too many questions of how wall geometry and wind are considerations in the testing procedures, there is no standardized method for measuring the effects of wind on fire, and it is not known how wind will effect buildings over 40'. (Vote 14-0).

Assembly Action:

None

FS99-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane ~~and contain a combustible water-resistive barrier that include combustible components~~ shall be tested ~~in~~ for flame propagation in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

1402.5.1 Supplemental tests for exterior walls with projections. Where an exterior wall includes projections that exceed 24 inches as measured from the exterior wall, the complete exterior envelope shall be tested in accordance with one of the following options:

1. NFPA 285 using a standard wall assembly, and additional that incorporates a wing wall that is located at the edge of the window opening and extends 5 feet perpendicularly from the plane of the wall and the full height of the test sample, and is constructed with identical materials and methods as the test sample. The heat flux specified at a height of 2.0 ft above the window opening shall be increased by 100% to double the heat flux from that prescribed by NFPA 285. The tested assembly shall be required to comply with the acceptance criteria of NFPA 285.
2. NFPA 285 using the standard wall assembly and an additional test using the 16 foot parallel panel test specified in FM 4880. The tested assembly shall be required to comply with the acceptance criteria of both NFPA 285 and FM 4880.

Commenter's Reason: Exterior wall fire spread is an ongoing concern in the fire safety community. During code hearings, there were a variety of proposals intended to bolster the exterior wall testing requirements from the IBC. These proposals addressed a variety of issues, such as projections and wind. Of the many proposals, only FS98-18 and

FS105-18 were approved. FS98 changed the title to Section 1402.5 to “Water Barriers” and FS105 added an exception to allow additional materials to be water-resistive barriers; essentially, none of the approved proposals addressed exterior flame spread of other materials or address projections or wind.

As both FS98 and FS105 reinforce the use of Section 1402.5 as a means to address combustibility of the water resistive barrier, this proposal seeks to separate the issue of exterior wall flame spread. As such, this proposal is submitted to change the existing code section 1402.5, and then add a subsection thereto. In addition, this proposal can work with any other public comments that may clarify the language from the 2018 Section 1402.5, as the true technical change is added as a standalone subsection. Regardless of whether solely through this public comment or in conjunction with others, by having new code sections, the code is clear in requiring exterior wall tests be conducted for the purpose of exterior flame spread analysis, separate from those requirements to address the water barrier material.

The original proposal addressed both vertical (i.e. re-entrant angle wall) and horizontal (i.e. balconies) projections. This comments seeks to maintain the vertical projection by the addition of the wing wall. The balcony style horizontal projection is not addressed, as there is concern that the balcony feature would act as a fire block material that could potentially allow a wall assembly to pass, when it otherwise would not.

The wing wall is substantiated by observation of other international exterior wall test standards. For instance, the wing wall is a feature that is already incorporated into standards such as ISO 13785 and BS 8414. Please note that the proposed NFPA 285 wing wall requirements for 5 feet depth and alignment with a window edge are similar features to those present in the aforementioned international standards.

For the issue of wind, there are two impacts to consider. First, wind is expected to change the geometry of the flame front by moving the flame around, and potentially away from, the wall. While there are scenarios where the geometry effects would increase flame spread, there are just as likely scenarios where the geometry changes would allow a wall to pass, when it otherwise would not. Second, wind is expected to increase fire intensity. While the issue of geometry yields an inconclusive effect, there is no doubt that an increase in fire intensity during testing will result in a more rigorous test procedure.

Again, in observing the international tests, the exterior heat flux immediately above the window opening (0.6 m above) are somewhat greater than that provided for in NFPA 285. In time increments, the NFPA 285 heat flux requirements at 2 feet (610 mm) above the window opening range up to a maximum of 3.8w/cm². However, the heat flux for BS 8414, for instance, is approximately 7.5 w/cm² at a height of 0.6 m above the window opening. This represents an increased heat flux of approximately double the heat flux requirement of NFPA 285. As a 100% increase is seen as a significant increase in heat flux, the proposal seeks to require that this increased heat flux be used for the option that utilizes NFPA 285 testing only.

As provided in the original proposal, this comment provides an option to use a standard NFPA 285 test, and associate this with the FM 4880 parallel panel test. As FM 4880 has increased heat flux, and addresses the issue of projections by facing the panels to each other, this comment agrees that the FM 4880 test is a suitable option for this purpose.

In summary, the issue of exterior wall flame spread is current and present, and there is a need to bolster our requirements. This proposal seeks to provide reasonable increases to current acceptance criteria, which are already present in other test standards, in order to address the current exterior wall flame spread issues.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Currently, NFPA 285 (without modification) is accepted for all wall assemblies. This proposal will require additional testing for wall assemblies, which will likely result in construction cost increases as these additional test costs and passed on.

Public Comment 2:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org); Jeffrey Shapiro, Lake Travis Fire Rescue (jshapiro@lfr.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1410 VERTICAL AND LATERAL FLAME PROPAGATION FIRE TEST

1410.1 General. Where another section of this code requires fire testing to comply with this section, testing to determine the fire propagation characteristics shall comply with Sections 1410.1.1 through 1410.1.3

1410.1.1 Test Procedure. Testing shall be conducted in accordance with NFPA 285.

1410.1.2 Acceptance criteria. The test specimen shall comply with the NFPA 285 acceptance criteria.

1410.1.3 Application of test results. Test results shall be applied in accordance with one of the following:

1. NFPA 285 Test results shall be directly applicable to exterior wall assemblies and panels used as components of curtain wall assemblies, which are installed without interior corners or horizontal projections that exceed 12 inches as measured perpendicular to the wall surface.
2. For conditions not covered by Item 1, application of the NFPA 285 test results shall be subject to the approval of the building official based on the recommendation of a registered design professional prepared in accordance with Section 104.11.

Evaluation of the suitability of the proposed exterior wall for the intended installation shall include the possible need for: testing an assembly with interior corners and horizontal projections, increasing the severity of the NFPA 285 fire exposure, and conducting additional tests using other approved exterior wall test methods.

718.2.6 Exterior wall coverings. *Fireblocking* shall be installed within concealed spaces of exterior wall coverings and other exterior architectural elements where permitted to be of combustible construction as specified in Section 1405 or where erected with combustible frames. *Fireblocking* shall be installed at maximum intervals of 20 feet (6096 mm) in either dimension so that there will be no concealed space exceeding 100 square feet (9.3 m²) between *fireblocking*. Where wood furring strips are used, they shall be of *approved* wood of natural decay resistance or preservative-treated wood. If noncontinuous, such elements shall have closed ends, with not less than 4 inches (102 mm) of separation between sections.

Exceptions:

1. *Fireblocking* of cornices is not required in single-family dwellings. *Fireblocking* of cornices of a two-family dwelling is required only at the line of dwelling unit separation.
2. *Fireblocking* shall not be required where the exterior wall covering is installed on noncombustible framing and the face of the exterior wall covering exposed to the concealed space is covered by one of the following materials:
 - 2.1. Aluminum having a minimum thickness of 0.019 inch (0.5 mm).
 - 2.2. Corrosion-resistant steel having a base metal thickness not less than 0.016 inch (0.4 mm) at any point.
 - 2.3. Other *approved* noncombustible materials.
3. *Fireblocking* shall not be required where the exterior wall covering has been tested in accordance with ~~and complies with the acceptance criteria of, NFPA 285~~Section 1410. The exterior wall covering shall be installed as tested in accordance with ~~NFPA 285~~Section 1410.

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with ~~and comply with the acceptance criteria of NFPA 285~~Section 1410. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

1406.10.4 Full-scale tests. The MCM system shall be tested in accordance with ~~and comply with, the acceptance criteria of NFPA 285~~Section 1410. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use.

1408.10.4 Full-scale tests. The HPL system shall be tested in accordance with ~~and comply with, the acceptance criteria of NFPA 285~~Section 1410. Such testing shall be performed on the HPL system with the HPL in the minimum and

maximum thicknesses intended for use.

[BG] 1510.6.2 Type I, II, III or IV construction. Regardless of the requirements in Section 1510.6, *mechanical equipment screens* that are located on the roof decks of buildings of Type I, II, III or IV construction shall be permitted to be constructed of combustible materials in accordance with any one of the following limitations:

1. The fire separation distance shall be not less than 20 feet (6096 mm) and the height of the mechanical equipment screen above the roof deck shall not exceed 4 feet (1219 mm) as measured to the highest point on the *mechanical equipment screen*.
2. The fire separation distance shall be not less than 20 feet (6096 mm) and the *mechanical equipment screen* shall be constructed of fire-retardant-treated wood complying with Section 2303.2 for exterior installation.
3. Where exterior wall covering panels are used, the panels shall have a flame spread index of 25 or less when tested in the minimum and maximum thicknesses intended for use, with each face tested independently in accordance with ASTM E84 or UL 723. The panels shall be tested in the minimum and maximum thicknesses intended for use in accordance with ~~Section 1410~~ and shall ~~comply with the acceptance criteria of, NFPA 285 and shall~~ be installed as tested. Where the panels are tested as part of an exterior wall assembly in accordance with ~~NFPA 285~~Section 1410, the panels shall be installed on the face of the *mechanical equipment screen* supporting structure in the same manner as they were installed on the tested exterior wall assembly.

2603.5.5 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with ~~and comply with the acceptance criteria of NFPA 285~~Section 1410.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
 - 2.1. There is no airspace between the insulation and the concrete or masonry.
 - 2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

Commenter's Reason: At the committee hearing, there was broad support for the idea of limiting application of NFPA 285 test results to installations that are consistent with what is actually tested. NFPA 285 ONLY tests flat, vertical wall assemblies (see first photo below for an illustration of the test setup and fire exposure). It does not evaluate the ability of assemblies to survive increased fire exposure (heat flux) caused by inside corners; it does not evaluate the risk of fire penetration into wall assemblies at intersections with horizontal overhangs; and it does not evaluate the ability of horizontally installed assemblies to resist fire penetration (conditions such as those shown in the third photo below). Even without those variables, the fire exposure used in the test is questionably inadequate to judge performance in a realistic fire exposure (such as the one shown in the second photo below, which was taken during the American Wood Council's recent demonstrations of new Type IV construction methods). But with the added variables, which will certainly increase the exposure and risk of assembly failure, it is clearly inappropriate to allow NFPA 285 assemblies to be applied carte blanche under the IBC without further consideration of the fire risk.

Objections to the original proposal primarily focused on the difficulty of determining suitable prescriptive code-based modifications to a referenced fire test method. This public comment resolves that concern by limiting application of the NFPA 285 test method to what is tested and requiring that any other application of the test results be dealt with as an alternative method of compliance because it would involve using the test method beyond its historic scope limitations and the test setup.

The scope of NFPA 285 currently states:

This standard provides a test method for determining the fire propagation characteristics of exterior non-load-bearing wall assemblies and panels used as components of curtain wall assemblies, that are constructed using combustible materials or that incorporate combustible components, and that are intended to be installed on buildings required to have exterior walls of noncombustible construction.

Ignoring the aforementioned concerns and the fact that the current test method has not been publicly vetted for expanded applications, issues raised multiple times during the current NFPA 285 development cycle, the NFPA 285 Technical Committee recently acted without legitimate justification to remove the scope restrictions that limit the test method to non-bearing assemblies. They also expanded applications to include combustible structures, such as mass

timber high-rise buildings, in the next edition. That increases the possibility for an exterior wall fire to directly involve structural elements of a combustible high-rise building outside of the sprinklered envelope and above the height limit of fire department master streams.

The intent of this public comment is assuring that any application of the NFPA 285 test that goes beyond the standardized test method or what is actually tested must be treated as an alternative method of compliance (not unlike the approach approved by the Fire Safety Code Development Committee for Proposal FS1-2018). This will assure that the code official will have input into the process of determining whether the NFPA 285 test results are being appropriately applied, based on the recommendation and analysis of a recognized design professional, and whether additional testing or analysis may be necessary to gain approval. Like all alternative method proposals, each instance will require individual analysis, and the same solution may not be appropriate in all cases.

Given recent major fires involving exterior wall fire propagation, and particularly the Grenfell incident, it is unconscionable to not have the next edition of the IBC establish a reasonable limit on the use of NFPA 285 test results equating to conditions that are actually tested. This is especially important given the irresponsible action of the NFPA 285 committee to propose a scope expansion without first reviewing and reconsidering the suitability of the current test parameters for real-life applications, especially those involving combustible structures. Although catastrophic fires to date have not been documented as NFPA 285 examples, that certainly does not equate to a conclusion that such fires could not occur. Case-in-point, where are the fire incidents demonstrating NFPA 285 successes?

In conclusion, when NFPA 285 tested assemblies are installed outside of the tested configuration, the performance of the tested assembly is currently entirely unknown. Therefore, the supplemental analysis and code official approval required by this public comment is appropriate to ensure that the potential dangers to the public and to firefighters will not be overlooked or ignored.

NOTE: Other than the addition of Section 1410, the remaining portions of this public comment simply change the reference pointers from NFPA 285 to the new Section 1410. The revision shown for Section 1402.5 is NOT intended to override the outcome on Proposal FS99-18. The only Section 1402.5 change to be made by this public comment is revising the NFPA 285 reference that ends up in this section so that it points to the new Section 1410.

This public comment is also submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Currently, NFPA 285's scope is limited to not include all types of wall assemblies that are being addressed by this proposal. Compliance with additional technical analysis as proposed may have an impact on the cost of construction as it may require additional tests.

Public Comment 3:

Proponent: Jesse Beitel, Jensen Hughes representing XPSA, representing Extruded Polystyrene Foam Association (jbeitel@haifire.com); Jay Crandell (jcrandell@aresconsulting.biz); Richard Justin Koscher (jkoscher@pima.org) requests Disapprove.

Commenter's Reason: Please uphold the unanimous ICC Fire Safety Code Committee action for disapproval. The proposal intended to add modifications in the NFPA 285 test method such as changes in test wall configuration(s) and requirements for the application of a wind exposure to the test wall.

The Committee, unanimously voted disapproval of this proposal due to questions concerning how proposed test details would be performed, their impact on performance of the test and the capability of the test laboratories to carry out the proposed test modifications in a manner that would ensure reproducible and repeatable test results.

The use of a wind exposure has many potential problem. In fact, the NFPA 285 test was developed so that the test can be conducted indoors and eliminate the non-reproducibility caused by winds during the outdoor two-story building test (UBC26-4).

The proposed change to add a corner configuration or add other wall features, presents some of the same issues with respect to how to build these features, how does this change the test and does other items such as instrumentation, pass/fail criteria, etc. need to be changed as well.

Additionally, any changes to the applicability of the test standard or its scope will change the use of the standard and because significant issues with respect to previously tested assemblies and how new assemblies are to be tested.

These types of changes are significant and must be properly vetted and discussed by the Committee responsible for the test standard and go through the standard revision process so it will meet the requirements for use in ICC Codes. Additionally it is imperative to have exploratory, reproducibility and repeatability testing performed (as was done with the current NFPA 285) before the changes are incorporated into the test method.

The NFPA 285 is under the purview of the NFPA Technical Committee on Fire Tests. The Committee in June, 2018 discussed these potential changes as well as others to the scope of the standard and determined that they would be discussed in the next revision cycle of NFPA 285. Currently, there is no data to demonstrate the need for these changes, no data to show the effect of these changes on tested wall assemblies etc. Thus, it was not possible to include these items in the test method at this point in time.

Finally, NFPA 285 is an excellent test to determine vertical and horizontal flame-spread on or with exterior walls. The actual real world fires that have involved NFPA complying wall assemblies, the wall assemblies have performed as predicted by the NFPA 285 test.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
None

FS103-18

IBC: 1402.5

Proposed Change as Submitted

Proponent: Thomas Meyers, Building Intuition, LLC, representing Self (codeconsultant@gmail.com)

2018 International Building Code

Revise as follows

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².
3. Walls in which the water-resistive barrier is applied over pressure-impregnated, fire-retardant-treated-wood complying with Section 2303.2 and the water-resistive barrier complies with Exception 1 or Exception 2.

Reason: Recent building cladding fires, such as the Grenfell Tower fire in London, have prompted review of the application of the NFPA 285 test standard to identify potential existing conflicts and areas of needed improvement or clarification.

Section 1402.5 appears to create a conflict resulting in significant industry confusion regarding the use of *fire-retardant-treated wood* (FRTW) in Types I, II, III, & IV construction as allowed by Section 602 and 603. This section suggests that FRTW cannot be used with a NFPA 285 compliant water-resistive barrier beyond 40 feet in height. The code currently allows FRTW used in Type III construction to extend to 85 feet in height. As FRTW does not meet the definition of “noncombustible” per Section 703.5, Exceptions 1 and 2 cannot be applied. This change provides for the needed clarification to permit FRTW to be used as permitted in Section 602 and 603 in conjunction with a NFPA 285 compliant water-resistive barrier.

Cost Impact: The code change proposal will not increase or decrease the cost of construction Potential construction savings where FRTW use was denied due to existence of a combustible water-resistive barrier.

FS103-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee determined there was no technical justification to introduce fire retardant treated wood. (Vote 12-2)

Assembly Action:

None

FS103-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Thomas Meyers, Building Intuition, LLC, representing Self (codeconsultant@gmail.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².
3. Walls in which the *water-resistive barrier* is applied over ~~pressure-impregnated~~, fire-retardant-treated-wood complying with Section 2303.2 and the *water-resistive barrier* complies with Exception 1 or Exception 2.

Commenter's Reason: This section specifically addresses the use of water resistive barriers on buildings of Type I, II, III, and IV construction. During testimony on this item, the following issues were raised:

1. The proposed exception's limitation to only pressure preservative fire retardant materials is too restrictive. This public comment removes that restriction.

2. There is no technical justification for the change. Testimony was provided showing that at least one fire retardant treated wood manufacturer has multiple assemblies that pass this standard using combustible insulative and water resistive materials within the assembly. Unfortunately, most of the testimony focused on the NFPA 285 and considerable disagreement on its validity for testing certain materials and assemblies used on building exteriors. Regardless, this is the test standard that was approved in a previous code cycle and compliance is required until either the standard is revised or until a new standard is proposed as a replacement.

Meanwhile, Type III buildings are being constructed across the United States using a combination of fire retardant treated wood in conjunction with thin water resistive barriers. This code section has caused considerable problems in approvals processes as projects are stalled and subject to engineering judgments and other "alternates" justifications to carry on construction that has otherwise been safely demonstrated for decades.

Approval of the public comment will allow the continued successful practice of using combustible water resistive barriers in conjunction with fire retardant treated wood.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The current confusion caused by this code section has added performance documentation costs for project approvals.

Staff Analysis: If approved, these changes would be applied to the section as approved by FS98.

FS103-18

FS104-18

IBC: 1402.5

Proposed Change as Submitted

Proponent: Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov)

2018 International Building Code

Revise as follows

1402.5 Vertical and lateral flame propagation. *Exterior walls* on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².
3. Exterior walls on buildings of Type III construction in which the water-resistive barrier is installed directly on exterior gypsum sheathing and the exterior wall has a wall covering of adhered veneer or stucco applied directly to the water-resistive barrier.

Reason: The IBC requires that exterior walls incorporating combustible water-resistive barriers in buildings higher than 40 ft and constructed of Type I, I, III or IV construction be tested to NFPA 285. Grade building paper has not been tested, Type V buildings can have a height that exceeds 40 ft and are not addressed. All the wall assemblies listed do not incorporate wood studs. The proposed code change ensures that the ignition of the water resistive barrier will not be caused by ignition of the combustible sheathing such as OSB or plywood. Section 703.5.2 conceptually addresses this issue similarly to that where a thin material is laminated on a non-combustible material can be considered non-combustible if it meets a flame spread rating. Exception 1 in Section 1402.5 also recognizes the benefit of the combustible water resistive barrier in a non-combustible wall. Similarly this code change recognize that the ignition potential for a combustible water resistive barrier sandwiched between two non-combustible sheathing materials or plaster without flue space is very limited. While there may be drainage planes between the stucco and the water resistive barrier the flue space is small enough to be negligible.

We have received several alternate methods and materials requests to utilize Grad D paper in lieu of listed proprietary water resistive barriers since the generic legacy material has not been tested ad all the listed wall assemblies are listed on metal framing. We have also reviewed fire analysis of heat release rates, time to ignition and various other parameters comparing the legacy material to the proprietary materials and they appear to have comparable properties and as a result chose to not include Type V buildings permitted to have a height in excess of 40 ft to this code change.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposed code change provides an option that does not require the use of proprietary water resistive barriers.

FS104-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee concluded the proposal did not contribute to improved fire safety, it did not clarify the properties of first resistant barriers, nor did it define adhered veneer. (Vote 13-1).

Assembly Action:

None

FS104-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ali Fattah, City of San Diego, representing San Diego Area Chapter of ICCrequests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

1402.5 Vertical and lateral flame propagation. Exterior walls on buildings of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*.

Exceptions:

1. Walls in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. Walls in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* has a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².
3. Exterior walls on buildings of Type III construction in which the *water-resistive barrier* is installed directly on exterior gypsum sheathing and the exterior wall has a wall covering of adhered veneer or stucco applied directly to the *water-resistive barrier*. The *water-resistive barrier* shall have a peak heat release rate of less than 150 kW/m², a total heat release of less than 20 MJ/m² and an effective heat of combustion of less than 18 MJ/kg as determined in accordance with ASTM E1354 and a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723. The ASTM E1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

Commenter's Reason: This public comment has been submitted in response to feedback from the committee and speakers that spoke in opposition to the proposal. Persons in opposition were supposed of the concept where exterior walls utilizing wood framing is addressed in the exceptions. Code requirements that can not be enforced, whether because the requirements conflict with a referenced standard, or whether tested assemblies do not exist to implement a code requirement are not enforced.

When combustible water resistive barriers were first regulated in chapter 14 the main impetus was due observations made when testing wall assemblies utilizing claddings and foam plastic insulation. Cladding systems typically include void spaces that create a flue effect up behind the cladding that allows fire to spread vertically within the way assembly. At the time of the original code change conventional methods typical for installation of stucco used as an exterior wall covering were not evaluated nor were exterior wall assemblies incorporating wood. Only proprietary materials incorporating plastics have been tested and they are popular in exterior wall assemblies including claddings such as siding products, MCM, stone veneers, etc. have been tested to demonstrate compliance with IBC Section 1402.5 and the assembly listings list them for use in metal framed exterior walls.

Type V construction is excluded due the height limit imposed on the type of construction and since the entire exterior wall assembly is permitted to be combustible. Missed in the code requirement when Section 1402.5 were first developed is the reality that:

The height Type V construction can be extended up to 60 feet; and
That Type III construction when incorporating fire retardant treated wood (FRTW) within the exterior wall is original. While incorporating better protected exterior load bearing walls and FRTW Type III construction is still combustible.

A further complication is the fact that as presently written NFPA 285 requires testing of cladding assemblies attached to non-combustible framing presumably to verify the behavior of the cladding alone knowing that the exterior wall assembly might fail the test sooner.

During testimony a misunderstanding of Type III construction was evident. The construction is limited to a height of up to 85 ft and that the exterior wall covering is always required to be non-combustible. Furthermore the WRB is not the only combustible element so exception 1 to Section 1402.5 can not apply to Type III construction. We also learned from the testimony that exception # 1 ad 2 were developed based on observations in testing and that justification was not provided in the code change as initially proposed to effectively extend the applicability of exception 1 to Type III construction.

We have become aware of listing agencies, and agencies producing research reports, that evaluate exterior wall assemblies incorporating WRB for conformance with IBC Section 1402.5 have begun to recognize comparisons of WRB not tested in a particular assembly in listing wall assemblies that have not been tested to NFPA 285. Furthermore, these agencies are producing engineering judgements addressing the use of wood framing in wall assemblies that have been tested with non-combustible framing. That was the spirit of the original code change where we sought to justify the omission of testing in cases where both interior and exterior exposure to the WRB are eliminated and thus the possibility of ignition diminished. Furthermore, the original code change also recognized the limited ability for fire to spread within the wall assembly de a lack of flue space in stucco assemblies for example.

The public comment recognizes that there should be a limit to the combustibility of the WRB so proposed exception # 3 incorporates the limitations in exception 2.

We hope that the membership of ICC will help jurisdictions in the southwest better enforce Chapter 14 of the IBC and allow the use of combustible WRB materials in combustible wall assemblies and assemblies that incorporate WRB materials such as Grade D paper that comply with the flammability limits of exception 2.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The code change will reduce the need for costly full exterior wall assemblies or the need for engineering judgement and the processing of Code Modifications or Alternate Methods and Materials applications all of which require additional processing costs.

FS104-18

FS108-18

IBC: 1403.2

Proposed Change as Submitted

Proponent: Joseph Lstiburek, representing Self (joe@buildingscience.com)

2018 International Building Code

Revise as follows

1403.2 Water-resistive barrier. Not fewer than one layer of No.15 asphalt felt, complying with ASTM D226 for Type 1 felt or other *approved* materials with a water resistance complying with ASTM E2556, Type I, shall be attached to the studs or sheathing, with flashing as described in Section 1404.4, in such a manner as to provide a continuous *water-resistive barrier* behind the *exterior wall* veneer.

Reason:

The existing code language gives insufficient guidance for other approved materials. The added language addresses this issue and provides a specific performance requirement for water resistance and provides consistency with other sections of the code that relate specifically to water-resistive barriers.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change gives better guidance for water resistance.

FS108-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 1403.2 Water-resistive barrier.

Not fewer than one layer of water-resistive barrier material ~~No. 15 asphalt felt, complying with ASTM D226 for Type 1 felt or other approved materials with a water resistance complying with ASTM E2556, Type I,~~ shall be attached to the studs or sheathing, with flashing as described in Section 1404.4, in such a manner as to provide a continuous water-resistive barrier behind the exterior wall veneer. Water-resistive barriers shall comply with one of the following:

(1) No. 15 felt complying with ASTM D226, Type 1,

(2) ASTM E2556, Type I or II,

(3) ASTM E331 in accordance with Section 1402.2, or

(4) other approved materials installed in accordance with the manufacturer's installation instructions.

Committee Reason: The committee determined the proposal clarifies the intent of the section, the modification addresses all material types, allows for innovation, and is consistent with appropriate standard references. (Vote 14-0)

Assembly Action:

None

FS108-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Richard Popp, Meyer Concrete Pumping & Conveyor Service, LLC., representing Meyer Concrete Pumping & Conveyor Service, LLC.requests Disapprove.

Commenter's Reason: Allowing wood structures to be built above the level of fire department access is a serious mistake. Wood does not offer the resilience and fire protection of non-combustible alternatives like concrete and steel. Cross-Laminated Timber chars in a fire; however, charring is not equivalent to noncombustible. Note: if the char rate is 1" per hour in a fire, then after 2 hours in a fire, a 6" thick CLT wood load bearing wall will only have 2" of structural material left. This is not acceptable and is not addressed in the code change proposals. Should you pass this, you are putting countless lives and making an even larger impact on the generations to come as the world's forests are being depleted. Be smart about this and do not pass this.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change will not increase or decrease the cost of construction

FS108-18

FS110-18

IBC: 1403.8

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows

1403.8 ~~Plastics.~~ Plastic construction elements. ~~Plastic panel, apron or spandrel walls as defined in this code construction elements of the exterior wall envelope, including aprons, panels and spandrels shall not be limited in thickness, provided that such plastics and their assemblies conform to the applicable requirements of Chapter 26 and are constructed of approved weather-resistant materials of adequate strength to resist the wind loads for cladding specified in Chapter 16. Plastic spandrel walls shall also comply with the applicable requirements of section 715.5. Light transmitting plastic wall panels shall comply with Section 2607.~~

Reason: This code change proposal is intended to clarify the requirements for plastic construction elements in exterior walls. This section is confusing as currently written.

Section 1404.8 does not address plastics in general, but does contain some requirements for specific plastic construction elements on exterior walls. The following terms are not defined in the IBC code: plastic panels, plastic aprons and plastic spandrel walls. The only reference to spandrel walls (and not specifically to plastic spandrel walls) is in section 715.5. Plastic panels are not mentioned in the code, except for light transmitting plastic wall panels that are referenced in section 2607.

In view of the fact that the section as written is confusing, this proposal will serve to clarify the requirements for better understanding by designers and building code officials, without changing requirements.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

Bibliography:

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal simply clarifies the section for better use and understanding.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee concluded the existing language was clear without this change, and this broadened the scope of with regards to plastics. (Vote 14-0).

Assembly Action:

None

FS110-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

1403.8 Plastic construction elements panels, aprons or spandrel walls. Plastic construction elements of the exterior wall envelope, including aprons, panels and spandrels panels, aprons and spandrel walls shall not be limited in thickness, provided that such plastics and their assemblies conform to the applicable requirements of Chapter 26 and are constructed of *approved* weather-resistant materials of adequate strength to resist the wind loads for cladding specified in Chapter 16. Plastic spandrel walls shall also comply with the applicable requirements of section 715.5. Light transmitting plastic wall panels shall comply with Section 2607.

Commenter's Reason: This public comment is simply to delete confusing and incorrect language. This public comment addressed the other reasons the IBC-FS Committee voted for Disapproval by removing other language presented in the original proposal.

The terms plastic panels, plastic aprons and plastic spandrel walls are not defined in the IBC, so this proposal deletes the confusing language that states the terms are defined.

The IBC typically does not use language "as defined in this code".

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal simply clarifies the section for better use and understanding.

FS110-18

FS111-18

IBC: 1403.12

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Building Code

Revise as follows

1403.12 Polypropylene siding. *Polypropylene siding* shall be certified and labeled as conforming to the requirements of ASTM D7254 and those of Section 1403.12.1 or 1403.12.2 by an approved quality control agency. *Polypropylene siding* shall be limited to buildings of Type VB construction and shall be installed in accordance with the requirements of Section 1404.18 and ~~in accordance with~~ the manufacturer's instructions. *Polypropylene siding* shall be secured to the building so as to provide weather protection for the *exterior walls* of the building.

Reason: This proposal limits the use of Polypropylene siding to only buildings of Type VB construction and adds back language that was inadvertently removed during the last code cycle. Polypropylene siding is permitted in the code by section 1403.12, which requires it to meet ASTM D7254. The fire test in ASTM D7254 is ASTM E84 and polypropylene siding typically materials melt and fall to the floor of the tunnel during the test before the flame reaches the test specimen, which means that the flame spread index determined is not a valid test result.

Polypropylene siding is a product with very poor fire performance, something that has been demonstrated time after time. For example, the heat release rate of the polypropylene material typically used for polypropylene siding is about twice as high as that of typical wood siding and over twice as high as that of vinyl siding. The heat released by a material used in the outside of a building is an indication of the radiated heat to a nearby building.

Siding tests using ASTM E1354 fire test:

Wood (cedar) siding: peak heat release rate 309 kW/m - effective heat of combustion: 13 MJ/kg

Polypropylene siding 1: peak heat release rate 546 kW/m - effective heat of combustion: 25 MJ/kg

Polypropylene siding 2: peak heat release rate 878 kW/m - effective heat of combustion: 32 MJ/kg

Material tests using ASTM E1354 fire test:

Vinyl (PVC): peak heat release rate 190 kW/m - effective heat of combustion: 9 MJ/kg

For that reason, the use of this material has been limited to Type VB construction since it was first allowed into the IBC. When polypropylene siding burns it releases much more heat than any other siding material permitted by the code.

The difference between Type VB construction and no limits on the Type of construction, allows construction with greater heights, more stories above grade plane and larger allowable areas as well as allowing in buildings of Types I through IV construction. The text proposed to be added by this proposal was deleted at the last cycle with the rationale that this section simply addresses wind speeds. However, the permission for using polypropylene siding in any type of construction applies to the entire chapter.

Note also that the fire separation distance for polypropylene siding is 10 feet (as opposed to 5 feet for other materials) due to its poorer fire performance.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal is one in a series of related proposals intended to address different technical changes to Chapter 14. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The FCAC analyzed several fatal fires related to exterior façade/curtain wall fires in the development of these new code requirements. The intent of these proposals is to provide a reasonable set of code requirements to ensure fire safety and weather protection for buildings that utilize combustible materials and/or assemblies for the building exterior wall envelope.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal corrects the removal of the limitation to Type VB buildings that was inadvertently removed from the code the last cycle.

FS111-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee indicated cladding is already addressed in Section 1405, and there is no data that it would be safe in Type V construction. The currently language has been vetted and was overwhelmingly approved in the last code change cycle. (Vote 10-4)

Assembly Action:

None

FS111-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Submitted.

Commenter's Reason: Committee statement: The committee indicated cladding is already addressed in Section 1405, and there is no data that it would be safe in Type V construction. The currently language has been vetted and was overwhelmingly approved in the last code change cycle. (Vote 10-4)

Three items are of interest there:

(1) Section 1405 applies only to buildings of Types I through IV construction.

(2) The committee stated that they had no information that PP siding was safe in type V construction. This is exactly what the proposal seeks to address. Restricting PP siding to Type VB will address the committee's concerns about the safety of this material. That is the reason that PP siding was restricted to Type VB construction when introduced in the IBC in the first place.

(3) The current language was vetted by the structural committee and not by the fire safety committee, which clearly had some significant reservations (note the multiple opponents to the action). The original restriction to Type VB construction was located in the section on wind requirements.

The proposed change was intended to place the restriction on PP siding application where it belongs, in a section dealing with fire safety.

Note that ASTM D7254 (which is what PP siding needs to conform to) requires testing of polypropylene to ASTM E84 (Steiner tunnel) and section 803.9 of the IBC does not allow polypropylene interior finish to be tested in accordance with ASTM E84. Thus means that polypropylene siding (meeting the requirements of ASTM D7254) would not be allowed as an interior finish material because the fire test is inappropriate for it.

In summary: a material that is known to exhibit very poor fire performance is being permitted in any type of construction based on a fire test requirement that is inappropriate (as evidenced by the prohibition to its use in a different section of the code) and based on the fact that a manufacturer showed a test result on a product for a section that applies to Types I-IV construction but not to Type V construction and with the background that the technical committee stated that its safety in Type V construction is not known.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal corrects the removal of the limitation to Type VB buildings that was inadvertently removed from the code the last cycle.

FS111-18

FS149-18

IBC: 1406.10.4.1(New), 1408.10.4.1 (New), 2603.5.5.1 (New), Chapter 35

Proposed Change as Submitted

Proponent: John Harrington, FM Global, representing FM Global (john.harrington@fmglobal.com)

2018 International Building Code

1406.10.4 Full-scale tests. The MCM system shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use.

Add new text as follows

1406.10.4.1 Window protection. Where window openings are provided within the installed wall assembly, they shall be covered as follows:

1. Where the assembly was tested per NFPA 285, provide protection as provided in the actual test.
2. Where the assembly was tested per ANSI/FM 4880, provide minimum 20 ga. (0.03595 in, 0.9 mm) steel flashing around the window opening, fastened at a maximum spacing of 16 in. (406 mm) on center into the wall structure using no. 10 (5 mm) screws.

1408.10.4 Full-scale tests. The HPL system shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the HPL system with the HPL in the minimum and maximum thicknesses intended for use.

1408.10.4.1 Window Protection. Where window openings are provided within the installed wall assembly, they shall be covered as follows:

1. Where the assembly was tested per NFPA 285, provide protection as provided in the actual test.
2. Where the assembly was tested per ANSI/FM 4880, provide minimum 20 ga. (0.03595 in., 0.9 mm) steel flashing around the window opening, fastened at a maximum spacing of 16 inches. (406 mm) on center into the wall structure using minimum no. 10 (5 mm) screws.

2603.5.5 Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.

Exceptions:

1. One-story buildings complying with Section 2603.4.1.4.
2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1-inch (25 mm) thickness of masonry or concrete and meeting one of the following:
 - 2.1. There is no airspace between the insulation and the concrete or masonry.
 - 2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

2603.5.5.1 Window protection. Where window openings are provided within the installed wall assembly, they shall be covered as follows:

1. Where the assembly was tested per NFPA 285, provide protection as provided in the actual test.
2. Where the assembly was tested per ANSI/FM 4880, provide minimum 20 ga. (0.03595 in, 0.9 mm) steel flashing around the window opening, fastened at a maximum spacing of 16 in. (406 mm) on center into the wall structure using no. 10 (5 mm) screws.

Update standard(s) as follows

4880-20152017:

Approval Standard for Class 1 Fire Rating of Building Panels or Interior Finish Materials

Reason: Protection against fire exposure to the wall assembly cross-section around window openings must be provided in the installation to prevent fire spread within the cavity of the wall assembly.

Cost Impact: The code change proposal will increase the cost of construction
Minimal cost increase for additional materials in walls so as to prevent fire spread within the wall cavity.

FS149-18

Public Hearing Results

Errata: Adding Section 1406.10.4.1 was part of the proponent's original submittal.

Add the following text

1406.10.4.1 Window protection.

Where window openings are provided within the installed wall assembly, they shall be covered as follows:

1. Where the assembly was tested per NFPA 285, provide protection as provided in the actual test.

2. Where the assembly was tested per ANSI/FM 4880, provide minimum 20 ga. (0.03595 in. 0.9 mm) steel flashing around the window opening, fastened at a maximum spacing of 16 in. (406 mm) on center into the wall structure using no. 10 (5 mm) screws.

Committee Action:

Disapproved

Committee Reason: The committee disapproved based on the proponent's request, due to the disapproval of FS74.
(Vote 13-0)

Assembly Action:

None

FS149-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Harrington, representing FM Global (john.harrington@fmglobal.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1406.10.4.1 Window protection Where window openings are provided within the installed wall assembly, they shall be covered as follows:

1. Where the assembly was tested per NFPA 285, provide protection as provided in the actual test.
2. Where the assembly was tested per ANSI/FM 4880, provide minimum 20 ga. (0.03595 in. 0.9 mm) steel flashing around the window opening, fastened at a maximum spacing of 16 inches (406 mm) on center into the wall structure using No. 10 (5 mm) screws.

1408.10.4.1 Window protection. Where window openings are provided within the installed wall assembly, they shall be covered as follows:

1. Where the assembly was tested per NFPA 285, provide protection as provided in the actual test.
2. Where the assembly was tested per ANSI/FM 4880, provide minimum 20 ga. (0.03595 in. 0.9 mm) steel flashing around the window opening, fastened at a maximum spacing of 16 inches (406 mm) on center into the wall structure using No. 10 (5 mm) screws.

Commenter's Reason: ANSI/FM 4880 is a consensus fire test that can be used to test fire exposure to the interior or exterior side of exterior walls. Justification for the ASNI/FM 4880 16 ft parallel panel; fire test has been included as part of the FS74 companion proposal. For the needed window protection accompanying the use of either NFPA 285 or ANSI/FM 4880, the windows must be designed prescriptively in accordance with 1406.10.4.1 or 1408.10.4.1. Protection against fire exposure to the wall assembly cross-section around window openings must be provided in the installation to prevent fire spread within the cavity of the wall assembly.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction Minimal cost increase for additional materials in walls so as to prevent fire spread within the wall cavity.

Public Comment 2:

Proponent: Justin Koscher, Polyisocyanurate Insulation Manufacturers Association (jkoscher@pima.org); John Woestman, Kellen Company, representing Extruded Polystyrene Foam Association (jwoestman@kellencompany.org); Jay Crandell, ARES Consulting, representing Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz) requests Disapprove.

Commenter's Reason: Please uphold the unanimous ICC Fire Safety Code Committee action for disapproval. This proposal is similar to proposal number FS74 also submitted by the same proponent. The same rationale for disapproval of FS74 applies here. In short, the proponent fails to provide sufficient supporting evidence and test data to establish that the FM 4880 16-foot Parallel Panel Test (FM 4880 16 PPT) is an equivalent and alternative method to the NFPA 285 test standard.

The proposal itself contains evidence that FM 4880 16 PPT is not equivalent to NFPA 285 because the consensus-version of the FM test standard does not require, or specify, a window opening in the tested assembly. The proponent attempts to correct this deficiency through this proposal. However, the ICC Council Policy No.28-05 (CP28) Section 3.6 Reference Standards relies on consensus standard setting organizations for such modifications. Therefore, the proposal should be rejected because it violates CP28 and attempts to reference a non-consensus version of a test standard.

Furthermore, in June 2018, the NFPA Standards Council approved the NFPA Fire Test Committee's request to establish a new project to evaluate the suitability of the FM 4880 16 PPT as an alternative to NFPA 285, subject to two conditions: (1) window openings or the lack thereof within the FM 4880 16 PPT will need to be addressed; and (2) whether the application of any new document will be mandated by the Codes. Given these developments, the NFPA Fire Test Committee should be allowed to complete its work before ICC voting members give further consideration to this concept. Therefore, the proposal should be disapproved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
None.

FS149-18

FS155-18

IBC: 202, 2603.1.1, Chapter 35, ICC

Proposed Change as Submitted

Proponent: Brian Tollisen, representing ICC Foam Plastic Insulation Standard Committee (Brian.Tollisen@dos.ny.gov)

2018 International Building Code

Add new definition as follows

SPRAY-APPLIED FOAM PLASTIC. Single- and multi-component, spray-applied foam plastic insulation used in nonstructural applications which are installed at locations wherein the material is applied in a liquid or frothed state, permitted to free rise and cure in situ.

Add new text as follows

2603.1.1 Spray-applied foam plastic. Single- and multiple-component spray-applied foam plastic insulation shall comply with the provisions of Section 2603 and ICC 1100-2018.

Add new standard(s) follows

CHAPTER 35 REFERENCED STANDARDS

ICC

International Code Council, Inc.
500 New Jersey Ave NW 6th Floor
Washington DC 20001

1100-2018:

Standard for Spray-applied Foam Plastic Insulation

Reason: The IBC contains requirements for thermal resistance of insulating materials but currently includes limited material standards for certain types of insulating materials. The purpose of this proposal is to introduce a performance standard for spray-applied foam plastic insulation. The standard establishes the minimum physical and performance properties as well as application requirements for spray-applied foam plastic insulations. This standard will benefit Code officials, spray-applied foam plastic insulation manufacturers, design professionals, product testing and certification agencies.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal simply adds a material performance standard to the code that reflects the current industry and construction practices.

Analysis: A review of the standard proposed for inclusion in the code, ICC 1100-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

FS155-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee approved the proposal based on proponent's reason statement. (Vote 13-0).

Assembly Action:

None

FS155-18

Individual Consideration Agenda

Public Comment 1:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standard ICC 1100-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

IBC: , 1507.3.10, 1507.3.10.1, 1507.3.10.2, 1507.3.10.3, 1507.3.10.4

Proposed Change as Submitted

Proponent: Amanda Hickman, The Hickman Group, representing RIMA International (amanda@thehickmangroup.com)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Delete without substitution

~~SECTION 1509 RADIANT BARRIERS INSTALLED ABOVE DECK~~

~~**[BF] 1509.1 General.** A radiant barrier installed above a deck shall comply with Sections 1509.2 through 1509.4.~~

~~**[BF] 1509.2 Fire testing.** Radiant barriers shall be permitted for use above decks where the radiant barrier is covered with an approved roof covering and the system consisting of the radiant barrier and the roof covering complies with the requirements of either FM 4450 or UL 1256.~~

~~**[BF] 1509.3 Installation.** The low emittance surface of the radiant barrier shall face the continuous airspace between the radiant barrier and the roof covering.~~

~~**[BF] 1509.4 Material standards.** A radiant barrier installed above a deck shall comply with ASTM C1313/1313M.~~

Add new text as follows

1507.3.10 Radiant barrier. Where a radiant barrier is installed above a roof deck under clay or concrete tile, it shall comply with Sections 1507.3.10.1 through 1507.3.10.4

1507.3.10.1 Installation. Radiant barriers shall only be installed between a batten and a counter batten. A low-emittance surface of the radiant barrier shall face the airspace between the radiant barrier and roof deck.

1507.3.10.2 Material fire testing. The radiant barrier material shall have a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E84 or UL 723, with test specimen preparation and mounting in accordance with ASTM E2599.

1507.3.10.3 Assembly fire testing. The roof assembly, including the radiant barrier, shall comply with the requirements of a Class A, B, or C roof assembly when classified as required by Section 1505.1.

1507.3.10.4 Material standards. Radiant barrier materials shall comply with ASTM C1313/C1313M.

Reason: This proposal is submitted as a compromise between RIMA International and National Roofing Contractors Association (NRCA). NRCA approached RIMA with an interest to move section 1509 to 1507. The current language in 1509 is adequate; however, in the spirit of consensus, and because radiant barriers are often used in conjunction with concrete or clay tile, the proposed move of the radiant barrier language from 1509 to a new section in section 1507 Clay and Concrete Tile was developed.

The proposed new section 1507.3.10.2 was drafted based on the requirements in Chapter 14 for water resistive barriers: testing the radiant barrier (on its own) to both ASTM E1354 and ASTM E84 test standards. ASTM E2599 test standard is recommended as the test specimen preparation and mounting method since it is specific to radiant barriers (and some other materials); ASTM E2404 is applicable to water resistive barriers.

A fire classification is required for all roof assemblies per Section 1505. Adding the proposed Section 1507.3.10.3 requires assembly testing of the entire roof covering system. Therefore, the addition of the radiant barrier to any roof assembly will result in a fire classification for the roof assembly as required by Section 1505, just like all other roof assemblies.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This will neither increase or decrease construction costs as radiant barriers are not mandatory, the proposal only moves 1509 language to 1507; and the revisions are minor.

Staff Analysis: The referenced standards within this proposal are currently referenced in the I-Codes.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee determined this proposal would not correct the broken text. (Vote 10-3)

Assembly Action:

None

S6-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Amanda Hickman, representing RIMA International (amanda@thehickmangroup.com) requests As Submitted.

Commenter's Reason: This proposal should be approved as submitted because it adds clarity as to when and how radiant barriers can be used in roof assemblies. After many discussions with the National Roofing Contractors Association (NRCA) and others, this was the language that was agreed upon. This language gives the appropriate information for the proposal application and installation of this technology.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This will neither increase or decrease construction costs as radiant barriers are not mandatory, the proposal only moves 1509 language to 1507; and the revisions are minor.

S6-18

S7-18

IBC: 1508.1

Proposed Change as Submitted

Proponent: Bill McHugh, The McHugh Company, representing Chicago Roofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows

[BF] 1508.1 General. The use of above-deck thermal insulation shall be permitted provided that such insulation is covered with an approved roof covering and passes the tests of NFPA 276 or UL 1256 when tested as an assembly.

Exceptions:

1. Foam plastic roof insulation shall conform to the material and installation requirements of Chapter 26 and separated by an assembly having a minimum 30 minute fire-resistance rating.
2. Where a concrete roof deck is used and the above-deck thermal insulation is covered with an approved roof covering.

Reason: The purpose of this proposal is to add safety for when foam plastic insulation is allowed to be used on roof assemblies. Foam plastic insulation is a great product but needs additional protection from fire, especially in roofing configurations. It seems in Chapter 26 that there is an exception that allows foam plastic insulation to be direct applied to wood sheathing but not metal decking. Regardless of roof deck type, it is important to protect the building with a 30 minute fire-resistance rated assembly as a thermal barrier.

Cost Impact: The code change proposal will increase the cost of construction
This proposal will increase the cost of construction by about \$1.00 - \$1.25US per square foot of roofing area.

S7-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee concluded this clarification should be made in Chapter 6, not as proposed. (Vote 13-0)

Assembly Action:

None

S7-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Bill McHugh, representing National Fireproofing Contractors Association (billmchugh-jr@att.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. *Fire-retardant-treated wood* shall be permitted in:
 - 1.1. Nonbearing partitions where the required *fire-resistance rating* is 2 hours or less.
 - 1.2. Nonbearing *exterior walls* where fire-resistance-rated construction is not required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two *stories above grade plane*, *fire-retardant-treated wood* is not permitted in roof construction where the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).
 - 1.4. Balconies, porches, decks and exterior stairways not used as required exits on buildings three *stories* or less above grade plane.
2. Thermal and acoustical insulation, other than foam plastics, having a *flame spread index* of not more than 25.

Exceptions:

1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a *flame spread index* of not more than 100.
 2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a *flame spread index* of not more than 200.
3. Foam plastics in accordance with Chapter 26.
 - 3.1. Where foam plastics are included in a roof assembly, the assembly shall have a fire-resistance rating of not less than 30 minutes.
 4. Roof coverings that have an A, B or C classification.
 5. *Interior floor finish* and floor covering materials installed in accordance with Section 804.
 6. Millwork such as doors, door frames, window sashes and frames.
 7. *Interior wall and ceiling finishes* installed in accordance with Section 803.
 8. *Trim* installed in accordance with Section 806.
 9. Where not installed greater than 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
 10. Finish flooring installed in accordance with Section 805.
 11. Partitions dividing portions of stores, offices or similar places occupied by one tenant only and that do not establish a *corridor* serving an *occupant load* of 30 or more shall be permitted to be constructed of *fire-retardant-treated wood*, 1-hour fire-resistance-rated construction or of wood panels or similar light construction up to 6 feet (1829 mm) in height.
 12. Stages and platforms constructed in accordance with Sections 410.2 and 410.3, respectively.
 13. Combustible *exterior wall coverings*, balconies and similar projections and bay or oriel windows in accordance with Chapter 14 and Section 705.2.3.1.
 14. Blocking such as for handrails, millwork, cabinets and window and door frames.
 15. Light-transmitting plastics as permitted by Chapter 26.
 16. Mastics and caulking materials applied to provide flexible seals between components of *exterior wall* construction.
 17. Exterior plastic veneer installed in accordance with Section 2605.2.
 18. Nailing or furring strips as permitted by Section 803.15.
 19. Heavy timber as permitted by Note c to Table 601 and Sections 602.4.3 and 705.2.3.1.
 20. Aggregates, component materials and admixtures as permitted by Section 703.2.2.
 21. Sprayed fire-resistant materials and intumescent and mastic fire-resistant coatings, determined on the basis of *fire resistance* tests in accordance with Section 703.2 and installed in accordance with Sections 1705.14 and 1705.15, respectively.
 22. Materials used to protect penetrations in fire-resistance-rated assemblies in accordance with Section 714.
 23. Materials used to protect joints in fire-resistance-rated assemblies in accordance with Section 715.
 24. Materials allowed in the concealed spaces of buildings of Types I and II construction in accordance with Section 718.5.
 25. Materials exposed within plenums complying with Section 602 of the International Mechanical Code.
 26. Wall construction of freezers and coolers of less than 1,000 square feet (92.9 m²), in size, lined on both sides with noncombustible materials and the building is protected throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Commenter's Reason: The purpose of this public comment is to address the committee comments that the proposal belonged in Chapter 6 of the IBC.

This proposal brings greater safety to buildings that these foam plastics for roof insulation. While great on thermal resistance, these insulations are flammable when exposed to flame during roof construction or sparks, flame or heat during repairs and even heat transmission from under the decking.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

Foam insulation requiring a fire-resistance-rating of 30 minutes could increase the cost of construction from \$1.00 to \$1.25 square foot. If other types of insulation are selected other than foam plastics, then the increase is much, much less.

Public Comment 2:

Proponent: Mike Fischer, Kellen Company, representing The Polyisocyanurate Insulation Manufacturers Association (mfischer@kellencompany.com); Jay Crandell, P.E., ARES Consulting (jcrandell@aresconsulting.biz); Richard Justin Koscher (jkoscher@pima.org); John Woestman (jwoestman@kellencompany.com); Marcin Pazera (mpazera@pima.org) requests Disapprove.

Commenter's Reason: S7-18 is one of three code proposals (along with FS156-18 and S8-18) that seek to modify the fire testing requirements of the IBC for all foam plastic insulation materials in roof assemblies. All three were recommended for disapproval by the Committee. We request Disapproval by the Public Comment Hearing attendees and the OGCV.

This proposal adds a requirement for foam plastic roof insulation to be separated by an "assembly" having a 30-min fire-resistance rating. IBC Chapter 26 (Section 2603.4) generally requires the use of a thermal barrier with foam plastic insulation so in those assemblies the additional language is unnecessary.

The proposal goes well beyond the requirements of Chapter 26 Section 2603.4.1.5 (1) and (2) by requiring an undefined 30-minute rating for an assembly with foam plastic that passes NFPA 276 or UL1256, or contains wood structural sheathing.

This creates a conflict with IBC Chapter 26 which conflicts with the User Note, "The use of plastics in building construction and components is addressed in Chapter 26". Therefore, in its proposed location and form the proposal would create confusion and potential non-compliance.

The proponent does not provide any supporting information that demonstrates the current approach to assembly fire testing is insufficient.

Additionally, a test method is not specified for the proposed fire-resistance rating, and the charging text requires separation of the foam plastic roof insulation but does not indicate what the separation actually entails.

The International Building Code (IBC) generally requires that a thermal barrier be installed when using foam plastic insulation. However, the IBC includes a number of exemptions to this requirement if products and systems are tested to rigorous fire safety standards. FM 4450 (NFPA 276) has been recognized by the building code for over 30 years as the standard for evaluating the fire performance of insulated roof systems installed on steel roof decks.

The development of FM 4450 was the result of a large industrial fire at the General Motor's factory in Livonia, Michigan. The event exposed the fire risk to roof decks when buildings have large, open interior spaces, such as a warehouse or manufacturing facility. The current version of FM 4450 relies on a calorimeter test that examines whether roof assembly components drip or pool and measures the tested assembly's fuel contribution over the duration of the 30-minute test.

In the 2000's, FM 4450 was reviewed through a consensus development process and published as NFPA 276 standard. Today, FM 4450 (NFPA 276) is referenced in the IBC and used by ISO/IEC 17065 Accredited Product Certification Bodies for evaluation reports. Data from FM Global reveals that over 800 manufacturers use the calorimeter test and approximately 423,000 roof assemblies have been approved using the consensus standard.

The proposal would add material costs, labor and roof assembly weight with no evidence of the added fire safety as alleged by the proponent, and with no evidence of a hazard from the current code requirements. The Committee reason statement for unanimous disapproval indicates they agree that these issues are currently addressed in Chapter 26.

The Polyisocyanurate Insulation Manufacturers Association (PIMA) is the national trade association representing Polyiso insulation manufacturers and suppliers to the Polyiso industry. PIMA advances the use of Polyiso insulation and is one of the nation's foremost industry advocates for energy-efficient practices and policies. In addition, PIMA has been recognized by both the Environmental Protection Agency (EPA) and the Sustainable Building Industries Council for advocacy and products.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The public comment maintains current requirements.

Public Comment 3:

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com) requests Disapprove.

Commenter's Reason: S7-18 is one of three code proposals (along with FS156-18 and S8-18) that seek to modify the fire testing requirements of the IBC for all foam plastic insulation materials in roof assemblies. All three were recommended for disapproval by the Committee. We request disapproval by the Public Comment Hearing attendees and the OGCV.

This proposal adds a requirement for roof assemblies containing foam plastic roof insulation to be separated by an assembly having a 30-min fire-resistance rating. These requirements are currently governed by IBC Section 2603.4.

The proponent does not provide any supporting information that demonstrates the current approach to assembly fire testing is insufficient. There are hundreds of approved roof assemblies containing foam plastic insulation materials including both rigid and spray polyurethane foam applications that meet the current test requirements. While some assemblies might require a thermal barrier to pass NFPA 276, there is no justification for adding in an extra requirement for assemblies that pass without need for thermal barrier protection.

The proposal does not specify a test method for the proposed fire-resistance rating, and as such is incomplete.

The proposal would add material costs, labor and roof assembly weight with no evidence of the added fire safety as alleged by the proponent, and with no evidence of a hazard from the current code requirements. The Committee reason statement for unanimous disapproval indicates they agree that these concerns are appropriately addressed in Chapter 26.

Please vote for disapproval of S7-18.

The ACC s Center for the Polyurethanes Industry (CPI) mission is to promote the growth of the North American polyurethanes industry through effective advocacy demonstrating how polyurethanes deliver sustainable outcomes, and creation of robust safety education and product stewardship programs.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The public comment makes no change to current code.

S7-18

S9-18

IBC: 1508.1

Proposed Change as Submitted

Proponent: Bill McHugh, representing Chicago Roofing Contractors Association (billmchugh-jr@att.net)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows

{BF} 1508.1 General. The use of above-deck thermal insulation shall be permitted provided that such insulation is covered with an approved roof covering and passes the tests of NFPA 276 or UL 1256 when tested as an assembly.

Exceptions:

1. Foam plastic roof insulation shall conform to the material and installation requirements of Chapter 26.
2. Where a concrete or composite metal and concrete roof deck is used and the above-deck thermal insulation is covered with an approved roof covering.

Reason: The purpose of this proposal is to add an option to the allowable exceptions in the code. Currently the exception is limited to concrete roof deck and does not include a composite metal and concrete roof deck.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal does not increase the cost of construction as it provides an alternative to the type of concrete roof deck used for foam plastic insulation.

S9-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee determined the proposed change made an excellent clarification. (Vote 12-1)

Assembly Action:

None

S9-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com) requests Disapprove.

Commenter's Reason: S9-18 seeks to add an additional option for acceptable assemblies that contain above-deck thermal insulation over concrete roof decks.

The proposed language adds composite metal and concrete roof deck, but does not define what is meant by the phrase composite metal. The 2018 IBC provision assumes a concrete deck that is subject to the current code requirements for roofing and structural provisions. Without proper definitions of what types of metals, and what specific types of concrete, are intended to be used, the proposal is incomplete and unenforceable. Please vote for disapproval of S9-18.

The ACC s Center for the Polyurethanes Industry (CPI) mission is to promote the growth of the North American polyurethanes industry through effective advocacy demonstrating how polyurethanes deliver sustainable outcomes, and creation of robust safety education and product stewardship programs.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The Public Comment makes no changes to current code.

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows

[BF] 1705.14 Sprayed fire-resistant materials. *Special inspections* and tests of sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be performed in accordance with Sections 1705.14.1 through 1705.14.6. *Special inspections* shall be based on the fire-resistance design as designated in the *approved construction documents*. The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. *Special inspections* and tests shall be performed in accordance with ASTM XXXX after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, where applicable.

Delete without substitution

~~**[BF] 1705.14.1 Physical and visual tests.** The *special inspections* and tests shall include the following to demonstrate compliance with the listing and the *fire-resistance rating*:~~

- ~~1. Condition of substrates.~~
- ~~2. Thickness of application.~~
- ~~3. Density in pounds per cubic foot (kg/m³).~~
- ~~4. Bond strength adhesion/cohesion.~~
- ~~5. Condition of finished application.~~

~~**[BF] 1705.14.2 Structural member surface conditions.** The surfaces shall be prepared in accordance with the *approved fire-resistance design* and the written instructions of *approved manufacturers*. The prepared surface of structural members to be sprayed shall be inspected by the special inspector before the application of the sprayed fire-resistant material.~~

~~**[BF] 1705.14.3 Application.** The substrate shall have a minimum ambient temperature before and after application as specified in the written instructions of *approved manufacturers*. The area for application shall be ventilated during and after application as required by the written instructions of *approved manufacturers*.~~

~~**[BF] 1705.14.4 Thickness.** Not more than 10 percent of the thickness measurements of the sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be less than the thickness required by the *approved fire-resistance design*, and none shall be less than the minimum allowable thickness required by Section 1705.14.4.1.~~

~~**[BF] 1705.14.4.1 Minimum allowable thickness.** For design thicknesses 1 inch (25 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus 1/4 inch (6.4 mm). For design thicknesses less than 1 inch (25 mm), the minimum allowable individual thickness shall be the design thickness minus 25 percent. Thickness shall be determined in accordance with ASTM E605. Samples of the sprayed fire-resistant materials shall be selected in accordance with Sections 1705.14.4.2 and 1705.14.4.3.~~

~~**[BF] 1705.14.4.2 Floor, roof and wall assemblies.** The thickness of the sprayed fire-resistant material applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E605, making not less than four measurements for each 1,000 square feet (93 m²) of the sprayed area, or portion thereof, in each story.~~

~~**[BF] 1705.14.4.3 Cellular decks.** Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305 mm by 305 mm) in size. Not fewer than four measurements shall be made, located symmetrically within the square area.~~

[BF] 1705.14.4.4 Fluted decks. Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305 mm by 305 mm) in size. Not fewer than four measurements shall be made, located symmetrically within the square area, including one each of the following: valley, crest and sides. The average of the measurements shall be reported.

[BF] 1705.14.4.5 Structural members. The thickness of the sprayed fire-resistant material applied to structural members shall be determined in accordance with ASTM E605. Thickness testing shall be performed on not less than 25 percent of the structural members on each floor.

[BF] 1705.14.4.6 Beams and girders. At beams and girders thickness measurements shall be made at nine locations around the beam or girder at each end of a 12-inch (305 mm) length.

[BF] 1705.14.4.7 Joists and trusses. At joists and trusses, thickness measurements shall be made at seven locations around the joist or truss at each end of a 12-inch (305 mm) length.

[BF] 1705.14.4.8 Wide-flanged columns. At wide-flanged columns, thickness measurements shall be made at 12 locations around the column at each end of a 12-inch (305 mm) length.

[BF] 1705.14.4.9 Hollow structural section and pipe columns. At hollow structural section and pipe columns, thickness measurements shall be made at not fewer than four locations around the column at each end of a 12-inch (305 mm) length.

[BF] 1705.14.5 Density. The density of the sprayed fire-resistant material shall be not less than the density specified in the approved fire-resistance design. Density of the sprayed fire-resistant material shall be determined in accordance with ASTM E605. The test samples for determining the density of the sprayed fire-resistant materials shall be selected as follows:

1. From each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) or portion thereof of the sprayed area in each story.
2. From beams, girders, trusses and columns at the rate of not less than one sample for each type of structural member for each 2,500 square feet (232 m²) of floor area or portion thereof in each story.

[BF] 1705.14.6 Bond strength. The cohesive/adhesive bond strength of the cured sprayed fire-resistant material applied to floor, roof and wall assemblies and structural members shall be not less than 150 pounds per square foot (psf) (7.18 kN/m²). The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E736 by testing in-place samples of the sprayed fire-resistant material selected in accordance with Sections 1705.14.6.1 through 1705.14.6.3.

[BF] 1705.14.6.1 Floor, roof and wall assemblies. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) of the sprayed area, or portion thereof, in each story.

[BF] 1705.14.6.2 Structural members. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from beams, girders, trusses, columns and other structural members at the rate of not less than one sample for each type of structural member for each 2,500 square feet (232 m²) of floor area or portion thereof in each story.

[BF] 1705.14.6.3 Primer, paint and encapsulant bond tests. Bond tests to qualify a primer, paint or encapsulant shall be conducted where the sprayed fire-resistant material is applied to a primed, painted or encapsulated surface for which acceptable bond strength performance between these coatings and the fire-resistant material has not been determined. A bonding agent approved by the SFRM manufacturer shall be applied to a primed, painted or encapsulated surface where the bond strengths are found to be less than required values.

Add new standard(s) follows

CHAPTER 35 REFERENCED STANDARDS

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

Practice for the On-Site Inspection of Installed Fire Resistive Material with Annex and Appendix

Reason: Special inspection for sprayed fire-resistive materials (SFRM) fireproofing has been in the International Building Code for many years. To date, the requirements have been prescriptive and in the IBC, Chapter 17. Over the past few years, the contractors, manufacturers and consultants of SFRM Fireproofing have come together to build an inspection standard at ASTM. The document is the result of the industry efforts to come to consensus with this new standard. We respectfully submit this document for insertion into the 2021 IBC.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The reason the proposal will not increase the cost of construction is that the methods used for inspection are the same as is in Chapter 17 of the IBC currently.

Analysis: A review of the standard proposed for inclusion in the code, ASTM - WK54567-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

S17-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee deemed it inappropriate to reference a draft standard. (Vote 13-0)

Assembly Action:

None

S17-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Bill McHugh, representing National Fireproofing Contractors Association (billmchugh-jr@att.net) requests As Submitted.

Commenter's Reason: The purpose of this public comment is to bring this topic up to the Public Comment Hearing Assembly. We hope that the ASTM Standard for SFRM Inspection is complete by hearing time. If not, we will withdraw the proposal based on the Fire-Safety Committee Action.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This proposal adds a new standard that brings an industry consensus document to this section of the International Building Code.

Staff Analysis: In order for the public comment to be considered, the new standard, ASTM - WK54567-2018, must be complete and readily available prior to October 24, 2018. (Section 3.6 of CP#28)

S17-18

IBC: 1705.15, Chapter 35, ASTM

Proposed Change as Submitted

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows

~~{BF}~~ **1705.15 Mastic and intumescent fire-resistant coatings.** *Special inspections* and tests for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be performed in accordance with ~~AWCI 12-B, Draft ASTM Standard WK54767.~~ *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*.

Add new standard(s) follows

CHAPTER 35 REFERENCED STANDARDS

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

Draft Standard WK54567 - 2018:

Practice for the On-Site Inspection of Installed Fire Resistive Material with Annex and Appendix

Reason: The Intumescent fire-resistant coatings industry - contractors, manufacturers and consultants - worked together at ASTM to build a new consensus standard for special inspection of mastic and intumescent fire-resistant coatings. We respectfully submit this standard for insertion into the International Building Code, Chapter 17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal takes a new standard and improves on existing documents in the code resulting in uniform special inspection of fire-resistant coatings.

Analysis: A review of the standard proposed for inclusion in the code, ASTM - WK54567-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

S18-18

Public Hearing Results

Errata: Standard reference corrected to Draft ASTM Standard WK54767.

Committee Action:

Disapproved

Committee Reason: The committee disapproved based on the action taken on S17. (Vote 13-0)

Assembly Action:

None

S18-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Bill McHugh, representing National Fireproofing Contractors Association (billmchugh-jr@att.net) requests As Submitted.

Commenter's Reason: The purpose of this public comment is to bring this topic up to the Public Comment Hearing Assembly. We hope that the ASTM Standard for IFRM Inspection is complete by hearing time. If not, we will withdraw the proposal based on the Fire-Safety Committee Action.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This proposal adds a new standard that brings an industry consensus document to this section of the International Building Code.

Staff Analysis: In order for the public comment to be considered, the new standard, ASTM - WK54567-2018, must be complete and readily available prior to October 24, 2018. (Section 3.6 of CP#28)

S18-18

S20-18

IBC: 1705.15

Proposed Change as Submitted

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (Bill@mc-hugh.us)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows

{BF} 1705.15 Mastic and intumescent fire-resistant coatings. *Special inspections* and tests for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be performed in accordance with AWCI 12-B. *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*. Additional inspections and tests shall not exceed an additional amount of 10 percent than required in AWCI-12-B.

Reason: The code states that a minimum amount of inspection is to take place but not a maximum amount of inspection. The inspection agency has no limit to the amount of inspection that can be conducted if this is not added to this section on special inspections. The maximum number comes from another standard that has been in the IBC Special Inspection Section for the past code cycles, ASTM E 2174 for Firestop Special Inspection.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal limits the amount of inspection to a reasonable amount of maximum inspection to the code. It changes a variable expense to the building owner into a more fixed cost item.

Staff Analysis: The referenced standard within this proposal, AWCI 12-B, is currently referenced in the I-codes.

S20-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee found the language unclear and confusing. (Vote 13-0)

Assembly Action:

None

S20-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Bill McHugh, representing National Fireproofing Contractors Association (billmchugh-jr@att.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1705.15 Mastic and intumescent fire-resistant coatings. *Special inspections* and tests for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be performed in accordance with AWCI 12-B. *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*. Additional inspections and tests shall not exceed ~~an additional amount of 10 percent than required~~ 110 percent of that specified by the referenced standards in AWCI-12-B.

Commenter's Reason: This public comment is submitted to provide consistency to the spray fire-resistant materials and intumescent fire-resistant materials sections due to S16-18 which was approved by the Fire-Safety Committee in April, Columbus, OH. The percentages in S16 have been moved to S20 as approved by the committee.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This code proposal will not increase the cost of construction. The proposal attempts to contain costs of construction. It is difficult to calculate an exact cost savings due to variability in installation contractors and inspection agencies.

S20-18

S21-18

IBC: 1705.17

Proposed Change as Submitted

Proponent: William Koffel, representing Firestop Contractors International Association (wkoffel@koffel.com)

THIS PROPOSAL WILL BE HEARD BY THE IBC FIRE SAFETY CODE COMMITTEE. SEE THE IBC-FS HEARING AGENDA.

2018 International Building Code

Revise as follows

[BF] 1705.17 Fire-resistant penetrations and joints. In high-rise buildings ~~or~~ in buildings assigned to *Risk Category III or IV, or fire areas containing Group R occupancies with an occupant load greater than 250, special inspections for through-penetrations, membrane penetration firestops, fire-resistant joint systems and perimeter fire barrier systems* that are tested and *listed* in accordance with Sections 714.4.1.2, 714.5.1.2, 715.3 and 715.4 shall be in accordance with Section 1705.17.1 or 1705.17.2.

Reason: Fire resistance rated compartmentation is a critical fire protection feature in many buildings with Group R occupancies. When through penetration firestop systems and fire resistant joint systems are not properly installed, the integrity of the compartmentation is compromised. The existing requirement for special inspections is proposed to be expanded to include larger buildings with Group R occupancies. The occupant load of 250 is consistent with what is used to define Group E occupancies that are Category III. Without this change, the special inspection requirement would only apply to Group R occupancies in high-rise buildings.

Cost Impact: The code change proposal will increase the cost of construction. The addition of this special inspection requirement does increase the cost of construction which will vary based on the quality management system of the firestop contractor.

S21-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee determined the proposal offered a means to improve fire stopping. (Vote 13-0)

Assembly Action:

None

S21-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Margo Thompson, Newport Ventures, representing National Association of Home Builders (mthompson@newportventures.net); Dan Buuck, National Association of Home Builders (dbuuck@nahb.org)requests Disapprove.

Commenter's Reason: The Group E comparison in the reason statement of the proposal is invalid since the 250 person occupant load taken from Risk Category III in IBC Table 1604.5 applies to persons assembled in one room. The ASCE 7 rationale behind the Risk Category III classification added to the 2010 edition of the standard states, "Risk Category III includes buildings and structures that house a large number of persons in one place, such as theaters, lecture halls, and similar assembly uses and buildings with persons having limited mobility or ability to escape to a safe haven in the event of failure, including elementary schools, prisons, and small health-care facilities." Applying the same requirements to Group R occupancies as those listed is overly restrictive.

Risk Categories III and IV pertain to buildings that represent substantial hazard to human life in the event of failure or those designated as essential structures. They include structures associated with utilities required to protect the health and safety of a community, power-generating stations, water-treatment and sewage-treatment plants, structures housing hazardous substances, such as explosives or toxins, which if released in quantity could endanger the surrounding community, and petrochemical process facilities that contain large quantities of H25 or ammonia. Clearly, Group R occupancies do not correlate with either Category III or Category IV.

No documentation has been provided regarding either the number or percent of occurrences of improperly installed firestop penetrations or joint systems or consequences. No documentation has been provided regarding consequences such as increased fire spread due to improperly sealed penetrations.

NFPA data shows that apartment building fires, civilian deaths, and property damage have all steadily declined since 1980. Between 1980 and 2016, there has been a 34% drop in the number of apartment fires, a 70% drop in deaths, and a 79% drop in property damage. <https://www.nfpa.org/News-and-Research/Fire-statistics-and-reports/Fires-by-property-type/Residential/Apartment-structure-fires>

There are already adequate jurisdictional inspections of fire penetrations and joints. Currently, these areas are carefully inspected as part of the regular fire-proofing inspections and additional special inspections are unnecessary.

At occupancies greater than 250 people, this would mean multifamily buildings of approximately 50,000 sf and larger (assumes 250 persons * 200sf/person) and approximately 50-75 units. An analysis of Census data by NAHB showed that the size of multifamily buildings is increasing. Between 2010 and 2015, 48% of the multifamily buildings constructed had more than 50 units. <http://eyeonhousing.org/2015/10/rising-share-of-new-multifamily-units-in-large-buildings/> Thus, this proposal would impact a large number of the multifamily buildings being built. Special inspections for every pipe or conduit would have a significant negative impact on cost. The proponents have provided no quantification of the cost range for a typical building that would be affected.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Average blanket costs per sf are difficult to quantify due to the large number of variables involved such as size of building, type of construction, number of different types of penetrations, etc. However, conversations with several inspectors (members of FCIA) indicated that for a hypothetical 50,000 sf 4-story apartment building with 50-75 units, a minimum cost range would be \$3,00-\$4,00 and could be much higher. Hourly rates of inspectors range from approximately \$100/hour for a qualified/experienced inspector to \$185/hour or more for a Professional Engineer - which many in this field are.

Allowable options for inspections per ASTM E2174 and ASTM E2393 include 1) 10% of each penetration type observed during installation or 2) 2% of each penetration type inspected post-construction via destructive methods. Either method will significantly impact schedule and thereby also increase costs.

IBC: 1003.4, 1003.5, 1003.8 (New), (IFC[BE] 1003.4, 1003.5, 1003.8 (New))

Proposed Change as Submitted

Proponent: Jake Pauls, Jake Pauls Consulting Services, representing Jake Pauls Consulting Services (bldguse@aol.com)

2018 International Building Code

Revise as follows

1003.4 Slip-resistant surface. Circulation paths of the *means of egress* shall have a slip-resistant surface and be securely attached.

Exception: Walking surfaces of showers and bathtubs not required to be accessible are not required to be slip-resistant where grab bars or stanchions complying with Section 1003.8 are provided.

1003.5 Elevation change. Where changes in elevation of less than 12 inches (305 mm) exist in the *means of egress*, sloped surfaces shall be used. Where the slope is greater than one unit vertical in 20 units horizontal (5-percent slope), *ramps* complying with Section 1012 shall be used. Where the difference in elevation is 6 inches (152 mm) or less, the *ramp* shall be equipped with either *handrails* or floor finish materials that contrast with adjacent floor finish materials.

Exceptions:

1. A single step with a maximum riser height of 7 inches (178 mm) is permitted for buildings with occupancies in Groups F, H, R-2, R-3, S and U at exterior doors not required to be *accessible* by Chapter 11.
2. A *stair* with a single riser or with two risers and a tread is permitted at locations not required to be *accessible* by Chapter 11 where the risers and treads comply with Section 1011.5, the minimum depth of the tread is 13 inches (330 mm) and not less than one *handrail* complying with Section 1014 is provided within 30 inches (762 mm) of the centerline of the normal path of egress travel on the *stair*.
3. A step is permitted in *aisles* serving seating that has a difference in elevation less than 12 inches (305 mm) at locations not required to be *accessible* by Chapter 11, provided that the risers and treads comply with Section 1029.14 and the *aisle* is provided with a *handrail* complying with Section 1029.16.
4. Bathtubs required to be accessible and bathtubs with grab bars or stanchions complying with Section 1003.8 are permitted to have step-over bathtub walls.
5. Showers, not required to be accessible are permitted to have curbs 6 inches (152 mm) high maximum where grab bars or stanchions complying with Section 1003.8 are provided.

Throughout a story in a Group I-2 occupancy, any change in elevation in portions of the *means of egress* that serve nonambulatory persons shall be by means of a *ramp* or sloped walkway.

Add new text as follows

1003.8 Stanchions or Grab bars for Bathtubs, Bathtub-Shower Combinations and Showers.

1003.8.1 General. Bathtubs and bathtub-shower combinations not required to be accessible shall provide at least one stanchion complying with 1003.8.2 and one grab bar complying with Section 1003.8.3. Showers not required to be accessible shall provide at least one stanchion or grab bar complying with Section 1003.4. All stanchions and grab bars shall comply with Sections 1003.8.5 through 1003.8.7.

1003.8.2. Stanchion or Grab Bar. A vertical stanchion or grab bar complying with Sections 1003.8.2.1 through 1003.8.2.3 shall be provided.

1003.8.2.1 Approach. The stanchion or grab bar shall be located so that it is usable without any obstruction. An unobstructed clear floor space of 21 inches (535 mm) wide minimum and 21 inches (535 mm) deep minimum, measured from the tub wall shall be provided. The clear floor space shall be located outside the tub and be within 12 inches (305 mm) of the centerline of the stanchion or grab bar measured horizontally.

1003.8.2.2 Length. The stanchion or grab bar shall be 36 inches (914 mm) long minimum and shall extend to a height of 60 inches minimum above the finished floor or bathtub floor, as applicable.

1003.8.2.3 Position. The stanchion or grab bar shall be positioned in accordance with at least one of the following two options:

1. Stanchion or grab bar located inside the bathtub or combination bathtub-shower compartment. The space, measured horizontally from the centerline of the stanchion or grab bar shall be 12 inches (305 mm) maximum to the exterior wall of the bathtub and 6 inches (152 mm) minimum to a shower curtain rod.
2. Stanchion or grab bar located outside the bathtub or combination bathtub-shower compartment. The stanchion or grab bar shall be 6 inches (152 mm) maximum from the outer side of the bathtub wall, measured horizontally.

1003.8.3. Grab Bar. A 24-inch (610 mm) long minimum grab bar shall be provided on the non-entry (long) side of bathtubs and bathtub-shower combinations and shall be positioned in accordance with Sections 1003.8.3.1 or 1003.8.3.2.

1003.8.3.1 Horizontal Position. A grab bar shall be installed in a horizontal position and shall be centered, plus or minus two inches (51 mm), along the length of the bathtub. The grab bar shall be located 8 inches (205 mm) minimum and 10 inches (255 mm) maximum above the bathtub rim measured to the centerline of the grab bar.

1003.8.3.2 Diagonal Position. A grab bar shall be installed in a diagonal position with its higher end 25 inches (635 mm) high minimum and 27 inches (685 mm) high maximum above the bathtub rim. The higher end shall be located no more than 12 inches (305 mm) from the control wall measured horizontally. The lower end shall be 8 inches (203 mm) high minimum and 10 inches high (255 mm) maximum above the bathtub rim.

1003.8.4 Showers. A stanchion or grab bar shall be provided, located either interior to or outside of the shower compartment, within 3 inches (76 mm) of the adjacent face of the opening. The stanchion or grab bar shall be 24 inches (610 mm) long minimum with its lower end 39 inches (991 mm) maximum above the finished floor.

1003.8.5 Other Details. Grab bars and stanchions shall comply with Section 1003.8.5.

1003.8.5.1 Cross Section. Grab bars and stanchions shall be circular in cross section having an outside diameter of 1-1/4 inches (32 mm) minimum and 2 inches (51 mm) maximum.

1003.8.5.2. Spacing. The space between the stanchion or grab bar and adjacent surfaces, including controls or other fixtures, shall be 1-1/2 inches (38 mm) wide minimum.

1003.8.5.3. Surface Hazards. Stanchions, grab bars, and adjacent surfaces shall be free of sharp or abrasive elements. Edges shall be rounded with a minimum radius of 0.25 inch (6 mm).

1003.8.6. Structural Characteristics. Allowable stresses shall not be exceeded for materials used when a vertical or horizontal force of 250 pounds (1112 N) is applied at any point on the grab bar, stanchion, fastener, mounting device, or supporting structure. Grab bars and stanchions shall not rotate within their fittings.

1003.8.7. Design and Installation for Water. Grab bars, stanchions, fasteners, mounting devices, and supporting structure shall be composed of materials and installed to withstand damaging effects of water, including corrosion and other deterioration through their service life.

Reason:

Reason Statement (Justification) for Grab Bars

for Bathtubs, Bathtub-Shower Combinations and Showers (Proposal ID: 1066)

Complying with New Requirements in IBC Section 1003

Proposed by Jake Pauls, BArch, CPE, HonDSc

Introduction

Points of Control. Grab bars, handrails and stanchions are important building components providing—in combination with our hands and our feet—what are called (in ergonomics) “points of control” to maintain balance and aid in ambulation and other movement activities that are crucial to utilizing means of egress for safety generally (in both normal and emergency conditions) and which pose dangers of injurious falls, the leading source of injuries in most countries, including the USA.

A brief digression to explain “stanchions.” You see them routinely on transportation vehicles such as subway trains and city buses. They are the vertical assemblies of graspable tubing that are fixed between ceilings, horizontal handrails just above head height, seats, floors, etc. usually located between seating and passageways or aisles. The term, stanchions is used in ADA requirements for transportation vehicles and for this context Wikipedia has the following description: “On board most buses and trams/subways, vertical supports to provide stability when passengers are standing. They are located throughout most city buses and are connected to seats, floor, roof, etc.” This term is used in contexts similar to those for the “poles” referred to in NFPA’s recent adoption of new requirements for grab bars or poles for new bathtubs, bathtub-shower combinations and showers.

Examples of Points of Control in Specific Contexts. The starred, central cell of Table 1. shows the equity, with points of control— shown in bold italics—achieved with now-proposed grab bars, handrails and stanchions being required, in Section 1003, in the same way that handrails are required for stairs in the rest of the IBC.

Table 1.
Minimum Number of Points of Control Provided
with New (★) or Currently Imposed Rules or Practices

Number of Points of Control Via Hands or Feet	≤1	1	2	3	3-4
Standard walker for older adult with altered gait.					✓
Occupational settings with risk of worker falls from heights. Also, stairs where users can use two handrails simultaneously, one on each side.				✓	
Stairs where users have only a single handrail. <i>Grab bar(s) usable for bathtub/shower entry/egress.</i>			✓ ★		
Bathtubs/showers with slip resistant underfoot surfaces when wet.		✓			
Bathtubs/showers without slip resistant underfoot surfaces when wet, the common condition currently.	✓				

The Problems To Be Solved with A New Requirement for Grab Bars and Stanchions. The central and most important point of this code change proposal is to respond to the relatively high risk of injurious falls when entering and exiting bathing/showering facilities, in all new settings where they occur. Such risks exceed those for stairs on an exposure-adjusted basis. That is, the time during which one is stepping into or out of a bathtub or shower is more risky than a similar stepping behavior on a stair. The former result in about 25 percent of the injuries as do falls on stairs. This is based on about 300,000 US hospital emergency room visits per year for bathtubs and showers versus about 1.2 million US hospital emergency room visits per year for stairs, using comparably serious injury data for 2010 (discussed by Lawrence, et al., 2015 in the journal Injury Prevention). The societal cost of these injuries, plus about two and a half times additional, medically treated injuries, was (for 2010) about 20 billion dollars for US bathtubs and showers and about 93 billion dollars for US stairs with the greatest risk for both being in homes, where bathing/showering is a near daily activity for most people in the US (Lawrence, et al, 2015). (See also the annex to this justification for details of injuries documented by the US Consumer Product Safety Commission, CPSC.)

Table 1 depicts the current inequity as well as the increased equity that will be achieved when bathtubs and showers are subject to the same principle about availability of points of control (usable by ones hands or feet) that are crucial to our stability in utilizing those portions of the means of egress that entail elevation differences, changes of slope, and changes in slip resistance. The current—at best—one point of control provided with typical bathtubs and showers (i.e., one foot in a stable placement on a slip-resistant surface) would be augmented by one point of control available reliably to one hand. This achieves equity of safety with stairs where we can count on one foot planted on a tread and one hand on a handrail. For some situations, involving bathtubs used for immersion bathing (with occupants seated or lying on the bottom of the tub) two points of control, utilizing grab bars, or stanchions—one for each hand—are needed for this equity and, more practically, to accomplish the relatively difficult stand-to-sit and sit-to-stand transfers within the tub.

Size of the Problem with Bathtubs and Showers Compared to Other Large Problems. Figure 1, a pie chart, shows the approximate scales of the nonfatal injury problem for three dangers to building occupants. In the US, the traditional danger of fire-related injuries is far smaller than that from bathing/showering and even smaller in relation to stair-related injuries. Right now, in the I-Codes, the segment for bathing/showering is not addressed while many, many pages of the I-Codes deal with fire-related injury prevention. Again, the proposal for grab bars and other points of control to be provided equitably, will provide a major improvement to injury prevention that, heretofore, has been largely ignored in code development and in practice except in some hotel properties where no more than half of the grab bars or stanchions to be required under the new proposal are provided for bathtubs.

Figure 1.
Comparing three dangers resulting in injuries in buildings

There is an inverse relationship between these epidemiological insights and the extent of coverage of the great dangers of stairs and baths/showers in building codes and housing codes plus leading healthy homes literature.

International Codes, Scientific/Technical/Policy/Managerial Perspectives Precedent Set by NFPA Codes. The foregoing is the philosophical and epidemiological foundation for the proposed addition of requirements for grab bars, and stanchions in Section 1003 of the IBC and, in future or elsewhere, in the I-Codes generally. There is also the precedent taken in NFPA 101 and NFPA 5000 in their 2018 editions where grab bars (alternatively poles which are given the more-technical name “stanchions” in this IBC proposal) were proposed and almost completely adopted (with the exception of health care, discussed below) for new bathtubs and showers in buildings regulated by these codes. The new requirements were mostly noncontroversial and it is hoped that the same will be true with the proposals now submitted to the I-Codes.

The justification for the new requirements far outweigh the opposition to them as the ergonomic, biomechanics, epidemiological, etiological and economic aspects have been carefully considered and addressed to the satisfaction of many people who know building codes and safety standards well and whose votes on the many committees considering the issue attest to the multiple justifications for this new feature of building codes and safety standards.

Parallel Code Development Activity in Canada. A proposal, comparable to what NFPA has adopted, is being addressed by a Grab Bar Task Group for the National Building Code of Canada and, when its next cycle commences, will also be proposed for action by the ICC A117 Committee for a new section, on mainstreamed grab bar and stanchion features for the A117.1 standard. Leaders in the standards and codes field, conversant with the value of grab bars and stanchions have been discussing such mainstreaming since early 2016, at an international meeting of experts on bathing/showering safety held in Toronto and partly available for study in a free streaming video that is available with several other streaming videos addressing points of control, grab bars, cost-benefit issues, etc., that are all listed in the Bibliography provided with this proposal. So a lot of the groundwork has been laid and different perspectives have been elicited and discussed.

Survey of Existing Facilities. Centered on hotels, health care facilities**, airport airline club shower facilities*, and homes, the proponent for this code change has been conducting a personal, opportunity-based survey of bathing/showering facilities worldwide, including the following countries where his work on building use and safety has taken him in recent years or his work is followed by other professionals, including public health authorities.

- Canada**
- USA* **
- UK*
- Sweden**
- Finland
- Netherlands
- Italy
- Singapore*

- Australia**
- New Zealand
- Japan

The survey is documented in many hours of video and thousands of photographs plus many measurements of three-, four-, five-piece bathrooms ranging in size from a few square meters (20 square feet) to spaces big enough to park an automobile, occasionally with tubs and showers almost that big. Generally, the more compact the bathroom, the easier it is to provide the needed points of control—and with very substantial cost savings.

Detailed Justifications for Specific New Sections in IBC 1003.

1003.4 Slip Resistant Surface. Showers and bathtubs are part of the means of egress for a building as they form part of the “occupied portion of a building.” However, recognizing reality, due to the presence of water on standing and walking surfaces in and around showers and bathtubs, it is almost certain that those surfaces are not slip-resistant and thus an exception is needed to cover them. Therefore countermeasures, in the form of grab bars or stanchions are needed to mitigate these serious slip-and-fall risks. Thus, via a new exception, this is one of two scoping requirements triggering the mandatory provision of grab bars or stanchions found in a new section, 1003.8.

1003.5 Elevation Change. Bathtubs and most showers have elevation changes with various step-over and step-on surfaces, often exceeding 5 percent in slope, that greatly heighten the risk of missteps (such as tripping as well as slipping) and loss of balance that can result in injurious falls that are exacerbated by the typically hard, often projecting surfaces that are especially unforgiving if fall-related impacts occur. Grab bars and other points of control, like stanchions, have both prevention and mitigation roles, for such missteps and falls, that parallel what handrails do for stairs to prevent and mitigate missteps and falls. Thus, via a new exception, this is the second of two scoping requirements triggering the mandatory provision of grab bars found in a new section, 1003.8 as is demonstrated in Figure 2.

Figure 2.

Demonstration set up of both conventional grab bars (nominally meeting the length and location criteria of proposed IBC Section 1008) and heavy duty tubing, both horizontal and vertical—that latter being a stanchion (completely meeting the length, location and structural strength requirements of proposed IBC Section 1008)

1003.8.1 General. This sets out the scoping for the new section. In Figure 2, the photograph shows a demonstration bathtub-shower combination with a redundant set of both conventional (vertical and diagonal) grab bars and a vertical, floor-to-ceiling pole—technically termed a stanchion, the latter easily meeting the 250-pound structural load criterion. So does the full-length horizontal bar (a tube) at the back of the bathtub.

Section 1003.8.1 sets up a structure for the requirements; first addressed in 1003.8.2 for bathtubs and bathtub-shower combinations which require a vertical point of control for ambulatory entry to and egress from the bathtub that typically involves stepping over the bathtub wall and dealing with different, perhaps wet surfaces inside the tub and on the floor outside the tub. For some tubs there will also be an elevation difference between the tub bottom and the floor outside the tub that can be an additional danger. These are important ergonomic or biomechanics considerations for reasonably safe bathing and showering that will significantly reduce the large toll of falls and other injury events involving bathtubs and showers (as described for a few hundred cases in the Annexes accompanying this Reason statement).

Addressed second in 1003.8.1 is the need for a horizontal or diagonal point of control on the non-egress side of a bathtub that is covered by 1003.8.3. This addresses the need for a point of control that assists people who want to sit or lie down in the tub and have an immersion bath. This involves stand-to-sit and sit-to-stand transfers that will be facilitated with the bilateral support provided, on one side, by the vertical grab bar or stanchion required by 1003.8.2, on the other side, used in conjunction with the horizontal or diagonal grab bar required by 1003.8.3.

Addressed third in 1003.8.1 is ambulatory access into and egress from a stand-alone shower (not combined with a bathtub) addressed in 1003.8.4. While step-over heights are smaller than for bathtubs, there are still dangers in smaller heights of curbs needed for water control as well as in different elevations of the shower pan and the floor outside the shower. Again, a vertical point of control assists with such transfers.

The final scoping feature in 1003.8.1 is its reference to several details of the grab bars or stanchions dealing with their graspability, surroundings, structural characteristics, and long-term serviceability in the wet environment typical for baths and, more so, for showers.

1003.8.2. Stanchion or Grab Bar. This introduces the provision, approach, length, and position requirements for the required vertical point of control, a stanchion or a conventional, wall-mounted grab bar for bathtubs. Vertical grab bars were found to be especially useful in studies performed over the last two decades in Canada. (Bibliography: Items # 5, 23, 24, 29, 30 plus two reports, from 2017, by Novak & King and King & Novak.)

1003.8.2.1 Approach. The unobstructed clear floor space of 21 inches (535 mm) wide minimum and 21 inches (535 mm) deep minimum, measured from the tub wall, is based on the current space requirements of Section R307, including Figure R307, in the International Residential Code. Along with the 12-inch (305 mm) maximum horizontal distance between the point of control and the edge of the clear floor space, this provides reachability to the grab bar or stanchion for a user approaching, or stepping from a bathtub in a bathroom where there are other fixtures such as a water closet or lavatory.

1003.8.2.2 Length. The minimum length of 36 inches (914 mm) for the vertical grab bar or stanchion and minimum height of 60 inches serves ambulatory transfers by adults and children and provides a vertical point of control that extends low enough to serve bathers (children as well as adults) sitting or crouching in the bathtub.

1003.8.2.3 Position. The two options cover vertical, conventional, wall-mounted grab bars as well as stanchions (secured in place between, for example, the ceiling and the floor or the rim (top) of the tub wall) that can be located anywhere as they are not fastened to a wall, which for this requirement usually means one of the two end walls (control end wall and had end wall) for many bathtubs. (See Figure 2 above.) Note that, for option 1, a grab bar on an end wall, there is an important requirement to keep the grab bar at least 6 inches (horizontally) from shower curtain attachments so that there is no interference, from a grab bar, to the sealing of a shower curtain against a wall to prevent water from a shower getting on the floor outside the bathtub. Note that option 2 permits placing a stanchion outside the bathtub, within six inches of the outside bathtub wall; such a stanchion can serve stand-to-sit and sit-to-stand transfer functions for users of a water closet adjacent to the bathtub (as shown in Figure 2). This is a bonus benefit of such stanchions which, in this proposal, are already sufficiently justified for the bathing and showering functions alone. Such a benefit (for many users) will be gained several times a day, as opposed to once per day for a shower or bath and the value of such secondary benefits—to usability and safety. This dual use benefit should be considered in doing a cost impact analysis. The benefit is especially important for older users who are the most impacted, in terms of serious injuries requiring hospital admission, and for whom toileting is essential, unlike showering or bathing which can be avoided more often.

1003.8.3. Grab Bar. This addresses the need for a point of control, on the non-egress, long side side of the bathtub where there is usually a wall (except in the case of a free-standing tub. This assists people, after they have stepped into the tub and who want to sit or lie down in the tub for an immersion bath. Note that while useful for stand-to-sit and sit-to-stand transfers, this horizontal or diagonal point of control will not be very useful for ambulatory transfers to and from a bathtub as a person has to lean precariously, threatening balance, over the width of the tub to reach the point of control on the non-egress side. Such transfers rely on the vertical point of control required by 1003.8.2.

1003.8.3.1. This does not limit compliance to a conventional wall-mounted grab bar. See Figure 2 for a nonconventional point of control, in effect a stanchion, in a horizontal orientation, secured by end walls, and extending the full length of the bathtub thus providing extra usability to bathers (as well as serving as a longer rack for towels, laundry, etc.). For free-standing tubs, with no adjacent walls, the requirements permit other solutions for the horizontal grab bar, for example, a conventional grab bar mounted on a surround often provided for most new stand-alone tubs.

1003.8.3.2 Diagonal Position. The stated dimensions for this diagonal grab bar will result in an approximate 45-degree inclination of this point of control that combines versatility with height as well as horizontal reach. Of all of the point-of-control positioning options, this one will almost invariably require a backing wall and this one places the greatest demand on structural backing—in terms of its size in the wall—for the fastening, typically with screws, of conventional grab bars. Keep in mind that the diagonal grab bar is an option and there are less-costly ways of complying with 1003.8.3.

1003.8.4 Showers. The requirement is intended to serve entering and egressing users regardless of whether the point of control is located inside or outside the shower enclosure or compartment. For example, fixing a point of control inside a shower is often problematic due to the nature of shower enclosures/compartment and of shower pans, both of which are subject to important waterproofing requirements. Here a stanchion, fastened to the room floor and ceiling and located *just outside the entrance to a shower* can be a good solution. This is especially true for increasingly used fixed, sliding or pivoting glass screens, for water control (in place of a shower curtain) on the open side of showers. The floor and ceiling take the usage loads on the stanchion whereas a conventional grab bar relies on a wall or wall-like feature.

1003.8.5 Other Details. Related mostly to effective and safe graspability with one or both hands, these are largely based on requirements of ICC A117.1.

1003.8.5.1 Cross Section. Unlike ICC A117.1 only circular is addressed. This reflects the overwhelming provision of circular-section grab bars and stanchions in practice. Anyone wanting more flexibility with cross section could introduce, via an amendment to the proposal, a separate provision for noncircular sections also complying with ICC A117.1. The rationale for not including noncircular sections here is the overwhelming advantage of circular sections for hand approach from any direction, an important aspect of the more varied uses of points of control for bathing and showering facilities than is the case for handrails for stairs. Also, even for stairs, a large proportion of the railings installed—of decorative rather than reasonably functional, circular cross section—do not function sufficiently well for even the more-limited biomechanics of stair handrail use.

1003.8.5.2. Spacing. The 1.5 inches (38 mm) wide minimum space might not be adequate with some plumbing controls (e.g., water temperature), but it is a good starting point for adequate clearance.

1003.8.5.3. Surface Hazards. Impact against surfaces, including controls and spouts, in bathing and showering facilities is a major source injuries and the requirement are justified.

1003.8.6. Structural Characteristics. The minimum vertical or horizontal force of 250 pounds (1112 N)—applied at any point on the grab bar, stanchion, fastener, mounting device, or supporting structure—is commonly used in the US. There is a need for this to be maintained and confirmed through the life of the grab bars. (Canada has a somewhat higher load requirement, 290 pounds). The requirement that points of control will not rotate within their fittings is reasonable as it increases the effectiveness of a user's grasp and the users' stability generally.

1003.8.7. Design and Installation for Water. This is a relatively new requirement but it is very much needed, based on the proponent's checking of fixing quality of many grab bars in hotels around the world. *Many grab bars are not designed, installed and maintained for water!* Water might not only corrode the critical attachment screws of conventional, wall-mounted grab bars; water also causes deterioration of the backing materials for some badly installed and maintained grab bars. This one, relatively new requirement warrants extra explanation—which follows here.

Problems Found in the Field with Conventional Grab Bars

During the course of his opportunity-based survey of grab bars provided for bathrooms in hotel guest rooms, the proponent of this code change has found two problems with many installations.

The first, affecting over 50 percent of the surveyed bathtub-shower combinations in hotels, comes from placement of vertical grab bars underneath—and within a few inches horizontally of the end bracket for shower curtains. This makes sealing the shower curtain against the end wall of the bathtub-shower combination very difficult so that the danger of water getting outside the bathtub, on the adjacent floor is heightened unreasonably and needlessly. The proposed section 1003.8.2.1 addresses this problem in its last sentence, "Such grab bar shall be located a maximum of 12 inches (305 mm), measured horizontally, inside of the exterior approach side of the bathtub or bathtub-shower combination and no closer than 6 inches (150 mm), measured horizontally, to the end fixing of any shower curtain rod."

A much more worrying problem is found with a smaller percentage of conventional, wall-mounted grab bar installations, specifically grab bars which have cover plates over the screw plate onto which the tube of the grab bar is welded. There is invariably a space between the hole in the cover plate through which the tubing (grasped) portion of the grab bar passes and the tubing itself. Water can easily enter here and get trapped by the cover plate thus creating a pool of water and debris (hair, shampoo residue, etc.) from the showering process. Figure 3 provides an example photographed on the wall of a bathtub-shower combination in a hotel guest bathroom.

Figure 3. Corrosion behind grab bar cover plate

Aside from the hygiene problem here, there is a greatly heightened risk of two structural problems. One is water intrusion into the wall, around the fixing screws—typically two or three for each end of the grab bar, causing deterioration of the backing material so the screws become loose enough to be extractable with ones fingers. The second problem is equally worrisome, especially as the quality of the steel used in (off-shore) grab bars is relatively poor in terms of corrosion of the screws and, less often, the mounting plates. The worst case seen recently had the heads of all the screws holding a grab bar so corroded that their heads were completely deteriorated and the grab bar could be pulled away from the walls with little force by one hand—clearly far, far less than the stipulated load of 250 pounds that codes in the US stipulate for structural strength. The proponent has many photographs of these problems as well as a few videos showing how loose the grab bars have become due to corrosion as well as backing deterioration from water. One such photograph is provided in Figure 3; it is not the worst situation seen in the field.

Clearly such examples need to be addressed in several ways including stronger inspection by authorities and improved management of facilities. Improved design and manufacture of conventional grab bars would help too but, until that occurs, this proposal offers the pole options as well as mounting locations that keep the important “points of control” in relatively dry locations—for example at the exterior of a shower enclosure or outside of a shower curtain for tubs and showers—but still near enough to the entrance to be usable from both outside and inside the space where water sprays, deflects and flows freely.

Annexes

Annex 1: Representative sample of narratives of actual bathtub/shower-related injuries that led to US hospital emergency room (ER) visits and, for about one in ten of such visits, also led to hospital admission covered by **Annex 2**, (plus an additional 30 percent who went directly to hospital admission without an ER visit) in 2010. These are collected and published by the US Consumer Product Safety Commission (CPSC) National Electronic Injury Surveillance System (NEISS) and many more can be downloaded from the CPSC/NEISS Web site, <https://www.cpsc.gov/Research--Statistics/NEISS-Injury-Data>. Accessed January 8, 2018.

Annex 1: US CPSC NEISS: First 112 Sample Narratives (of 6,946 cases) for Product Code 0611 Injuries

in 2010 - ER released w/wo treatment (Product Code 611 covers bathtubs or showers including fixtures or accessories; excluding enclosures, faucets, spigots and towel racks)

41 YOM FRACTURED A RIB BY SLIPPING IN THE BATHTUB & FALLING AGAINST THE TOILET AT HOME.

53 YOF SUSTAINED A CONTUSION OF A SHIN BY BUMPING IT WHILE SHOWERING AT HOME.

18 YOF SPRAINED HER LOWER BACK BY FALLING IN THE SHOWER AT SCHOOL.

02 YOF SUSTAINED A LACERATION OF THE CHIN BY FALLING IN THE BATHTUB AT HOME.

18 YOF SUSTAINED A HEAD INJURY BY FALLING IN A SHOWER AT HOME.

80 YOM DISLOCATED A HIP BY LIFTING LEG IN SHOWER.

86 YOF SUSTAINED A LACERATION OF THE SCALP BY TRIPPING ON A RUG IN THE SHOWER AT HOME.

71 YOF SUSTAINED A HEAD INJURY BY FALLING FROM TOILET AGAINST THE BATHTUB AT HOME.

68 YOF SPRAINED AN ANKLE BY FALLING IN A SHOWER.

47 YOF FRACTURED A KNEE BY FALLING IN THE SHOWER AT HOME.

02 YOF SUSTAINED A LACERATION OF THE CHIN BY FALLING IN THE BATHTUB.

22 YOM SPRAINED A FOOT WHILE STEPPING OUT OF A SHOWER AT JAIL.

23 YOF SUSTAINED A CONTUSION OF A FOOT BY TRIPPING ON A RUG & STRIKING AGAINST A TUB AT HOME.

40 YOM SUSTAINED A LACERATION OF THE NOSE FROM BEING STRUCK BY THE SHOWER HEAD IN THE SHOWER AT HOME.

21 MOM RUPTURED AN EAR DRUM WITH A COTTON-TIPPED SWAB WHILE BATHING IN TUB AT HOME.

48 YOF SUSTAINED A CONTUSION OF THE NECK BY FALLING IN THE BATHTUB AT HOME.

04 YOF SLIPPED IN BATHTUB FELL AND INJURED FACE DX/ FACIAL LAC L KNEE STR

10 YOF FELL OUT OF SHOWER AND INJURED L KNEE. HAS ABRASION TO KNEE ALSO

80 YOF FELL IN SHOWER AT HOME HIT HEAD. DX/ HEAD INJURY

94 YOM SLIPPED AND FELL IN SHOWER AND HIT FACE ON FLOOR. DX/ FACIAL FX

55 YOM SLL LEG HEMATOMA

72 YOF CAUGHT FOOT IN TUB, INJURING LOWER LEG. NOW HAS HEMATOMA AND INCREASING PAIN.

22 YOF AT HOME FAINTED WHILE IN SHOWER AND FELL CUTTING FOREHEAD.

26 YOF SLIPPED AND FELL IN TUB DX: KNEE STRAIN

90 YOF GETTING OUT OF SHOWER WITH WALKER SLIPPED ON THE FLOOR AND HIT HEAD DX/ SCALP ABRASION

30 YOM SLIPPED AND FELL INTO TUB DX: CONTUSION TO BACK

51 YOF SLIPPED IN TUB AND HIT HEAD DX/ SCALP LAC

60 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO COCCYX

44 YOM FELL AND HIT ABDOMEN ON BATHTUB AT HOME. DX/ ABDOMINAL CONTUSION

04 YOM WITH CUT TO FACE FELL IN TUB DX: LACERATION TO FACE

51 YOF AT HOME FELL AT 5PM WHEN LOST BALANCE AND HIT L SIDE OF RIBS ON BATHTUB.

33 YOF SLIPPED AND FELL IN TUB DX: HEAD LACERATION

23 MOM FELL IN BATHTUB AT HOME AND HIT CHIN CAUSING LACERATION.

62 YOM WITH BACK PAIN FELL INTO TUB DX; CONTUSION TO LOWER BACK

63 YOF FELL INTO BATHTUB / NO INJURIES OR COMPLAINTS

54 YOM SLIPPED AND FELL IN TUB DX: RIB FRACTURE

02 YOM SLIPPED IN TUB AT HOME AND INJURED FACE DX/ CHIN LAC

25 YOF WITH CHEST PAIN AFTER FALL INTO TUB DX: CONTUSION TO CHEST

84 YOM FELL OUT OF SHOWER ON TO THE FLOOR AT HOME HIT HEAD DX/ HEAD INJURY

85 YOF SLIPPED AND FELL IN TUB AND HIT HEAD AT HOME DX/ HEAD INJURY

06 YOM AT HM WAS TAKING A BATH & SWIMMING IN TUB WHEN HE STRUCK HIS HEAD AGAINST FAUCET CAUSING HEAD LACERATION.

28 YOM AT HOME FELL IN SHOWER. WAS RESPONSIVE PER EMS.

26 YOF SLIPPED / FELL IN THE SHOWER DX: R EAR LAC. / HEAD & R SHOULDER CONTUSION

36 YOF THIS AM SLIPPED WHILE TRYING TO GET OUT OF BATHTUB AND LANDED ON BUTTOCKS.

28 YOF RIPPED FINGER NAIL OFF WHEN SLIPPED IN THE SHOWER AND THE NAIL BENT BACKWARDS.

26 YOF INJURED KNEE STEPPING OUT OF SHOWER DX/ RIGHT KNEE SPRAIN

50 YOM FELL IN BATHTUB AND HIT CHEST DX/ RIB FX

83 YOM CUT SCROTUM FELL IN TUB DX: LACERATION TO SCROTUM

71 YOF FELL OUT OF BATHTUB AT HOME AND HIT HEAD ON THE FLOOR DX/ HEAD INJURY

89 YOF FELL IN TUB HITTING HEAD DX: CLOSED HEAD INJURY

69 YOF WAS IN SHOWER AND FELL BACKWARDS STRIKING HER BACK.

08 YOF AT HOME LACERATED FACE ABOVE R ORBITAL. HIT HER HEAD ON SOAP DISH WHILE SHOWERING. NO LOC.

40 YOM SLIPPED AND FELL IN SHOWER AND INJURED CHEST. DX/ RIB FX

17 YOF FELL IN TUB HURT NECK DX: NECK STRAIN

23 YOM INJURED LOWER BACK BENDING OVER IN SHOWER AT HOME DX/ LUMBAR STRAIN

83 YOF FELL IN THE TUB AT ASSISTED LIVING AND INJURED SHOULDER DX/ RT SHOULDER CONTUSION

02 YOM HIT FACE ON BATHTUB AT HOME DX/ FACIAL LAC

74 YOM FELL AND HIT HEAD IN TUB DX: CONTUSION TO HEAD

85 YOF SLIPPED AND FELL GETTING OUT OF TUB DX: CONTUSION TO HIP

58 YOF SLIPPED AND FELL INTO TUB HIT HEAD DX: CLOSED HEAD INJURY

13 MOM AT HOME FELL IN BATHTUB AND HIT FOREHEAD AND MOUTH.

06 YOM SLIPPED IN BATHTUB AND HIT HEAD DX/ HEAD CONTUSION

78 YOM SLIPPED AND FELL IN TUB DX: LACERATION TO HEAD

08 YOM SLIPPED IN TUB TWISTED ANKLE DX: ANKLE STRAIN

51 YOF HIT HEAD ON SOAP DISH IN SHOWER 2 TIMES THIS WEEK HAS HEADACHE DX/ CONCUSSION

51 YOF SLIPPED IN SHOWER AND INJURED KNEE AT HOME DX/ RIGHT KNEE CONTUSION

83 YOM SLIPPED AND FELL IN THE SHOWER LAST NIGHT AND INJURED BACK DX/ BACK PAIN

31 YOM HIT EYE WITH TOWEL WHILE GETTING OUT OF THE SHOWER AT HOME DX/ RIGHT EYE CORNEAL ABRASION

24 YOF FELL GETTING OUT OF SHOWER HIT HEAD DX/ SCALP LAC

48 YOF SLIPPED IN SHOWER HIT HEAD + LOC DX/ HEAD INJURY

11 YOM SLIPPED IN SHOWER AND INJURED LEG. DX/ LEFT LEG CONTUSION

30 YOF SLIPPED AND FELL INTO TUB DX: CONTUSION TO HIP

18 MOM FELL IN TUB DX: LACERATION TO FACE

46 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO LOWER BACK

30 YOM CUT HAND ON BROKEN SOAP DISH AT HOME. DX// RIGHT HAND LAC

70 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO CHEST

31 YOM CUT THUMB ON SHOWER DRAIN THIS AM.

62 YOF SLIPPED IN THE SHOWER AND FELL ON THE FLOOR AT HOME DX/ LEFT WRIST SPRAIN

67 YOM FELL GETTING OUT OF SHOWER HIT HEAD ON TUB AT HOME DX/ SCALP CONTUSION

45 YOF PASSED OUT IN SHOWER AT GROUP HOME HIT HEAD. DX/ HEAD INJURY

04 YOF FELL IN BATHTUB AND HIT MOUTH DX/ LIP LAC

43 YOM SLIPPED IN BATHTUB AND INJURED KNEE DX/ LEFT KNEE CONTUSION

15 YOM TAKING SHOWER AND SHOWER DOOR SHATTERED AND PT FEET WERE CUT WITH THE GLASS AT HOME DX/ BILAT FOOT LAC

73 YOF AT 9AM TODAY WAS GETTING OUT OF TUB AND SLIPPED AND BUMPED L RIBS ON THE TUB. C/O RIB PAIN.

87 YOF BENT DOWN TO PUT SCALE AWAY FELL AND HIT INTO TUB AT HOME DX/ LEFT HIP CONTUSION22 YOM FELL IN TUB AT HOME AND INJURED CHEST DX/ RIB FX

40 YOF SLIPPED GETTING OUT OF BATHTUB AND INJURED LOWER BACK DX/ LOW BACK PAIN

34 YOM FELL AND HIT TUB DX: SHOULDER STRAIN

70 YOF SLIPPED FELL HIT CHEST ON SIDE OF TUB DX: CONTUSION TO CHEST

89 YOF SLIPPED AND FELL IN THE SHOWER LAST NIGHT AT NURSING HOME INJURED CHEST DX/ CHEST CONTUSION

44 YOM FELL IN TUB AND HIT CHEST DX.CHEST CONTUSION

36 YOF SLIPPED AND FELL IN TUB DX: LACERATION TO FACE

56 YOM CUT WRIST ON BROKEN SHOWER KNOB AT HOME DX/ LEFT WRIST LAC

88 YOF FELL AT HOME IN SHOWER AND HIT HEAD ON TUB DX/ SCALP CONTUSION

51 YOM SLIPPED AND FELL IN TUB DX: NECK STRAIN

23 YOM FELL IN BATH TUB AND INJURED CHEST DX/ CHEST CONTUSION

59 YOM FELL IN SHOWER AND INJURED SHOULDER DX/ LEFT SHOULDER FX
46 YOM HAD FALL HIT TUB DX: CONTUSION TO FACE
78 YOF FELL AT HOME AND HIT FACE ON BATHTUB DX/ FACIAL CONTUSION
29YOF WITH BACK PAIN AFTER FALL IN TUB DX: LOW BACK STRAIN
31 YOF FELL GETTING OUT OF TUB AT HOME INJURED FLANK DX/ FLANK CONTUSION
72 YOF AT HOME FELL WHEN SLIPPED ON URINE IN BATHROOM AND HIT HEAD ON SIDE OF BATH TUB.
19 YOF SLIPPED AND FELL INTO TUB DX: CONTUSION TO LOWER BACK
08 YOM FELL IN THE SHOWER AT HOME AND HIT EAR DX/ LEFT EAR LAC
62 YOM SLIPPED / FELL IN THE SHOWER. DX: RIB CONTUSION
09 YOF FELL IN TUB AND HIT LIP. DX/ LIP LAC
56 YOF WITH SHOULDER PAIN AFTER USING BATHBRUSH IN SHOWER DX: SHOULDER STRAIN
75 YOF AT HOME FELL OFF HASSECK APPROX 30 MIN AGO HITTING HEAD AND L ARM ON BATHTUB. DENIES LOC.
62 YOF SLIPPED IN TUB HITTING FOOT DX: CONTUSION TO FOOT
04 YOM SLIPPED IN THE BATHTUB AND HIT CHIN DX/ CHIN LAC
34 YOM FELL IN THE SHOWER AT HOME INJURED BACK DX/ BACK SPRAIN
25 YOF + ETOH BAL 313 FELL IN SHOWER AND HIT HEAD DX/ HEAD CONTUSION

Annex 2: US CPSC NEISS: First 48 Sample Narratives (of 630 cases) for Product Code 0611 Injuries in 2010 - ER treated & Then Admitted to Hospital (Product Code 611 covers bathtubs or showers including fixtures or accessories; excluding enclosures, faucets, spigots and towel racks)

89 YOF GETTING OUT OF THE SHOWER THE NEXT THING SHE KNEW SHE WAS ON THE FLOOR WITH HEAD AND SHOULDER INJURY; SHOULDER AND HEAD CONTUSION
69 YOM WAS WASHING HIMSELF IN SHOWER, FELL ONTO BLUNT PART OF BATHTUB, IMMEDIATELY HAD PAIN & TROUBLE BREATHING. DX - MULTIPLE RIB FXS
56 YOF SLIPPED IN THE SHOWER AND FELL FORWARD HITTING HER FACE & INJURING HER RT ARM- DX- MECHANICAL FALL W/ FRACTURE RT SHOULDER
78 YOF FAMILY FOUND HER ON THE FLOOR BETWEEN TOILET AND BATHTUB, SHE STATED SHE PASSED OUT WHEN SHE WAS IN SHOWER; SHOULDER INJURY
47 YOM HAD A WET SHEETROCK FALL ON HEAD WHILE IN SHOWER, +LOC, WAS CONFUSED. DX - BLUNT HEAD TRAUMA W/BRIEF LOC
62 YOM HAD A SYNCOPAL TODAY AT HOME IN THE SHOWER INJURING EYE AREA- DX- LACERATION TO FACE(EYE)
78 YOF PRESENT TO ER FROM HOME WHEN SHE WAS TAKING A BATH AND COLLAPSED - DX- CARDIAC ARREST, RESUSCITAED
43 YOM PRESENT TO ER AFTER HE WAS IN THE BATHTUB AND SLIP AND FELL GETTING OUT HITTING HEAD ON FLOOR- DX- BLUNT HEAD TRAUMA
81 YOM PRESENT TO ER AFTER A FALL IN THE SHOWER AT HOME TODAY INJURING THE HEAD AREA- DX- BLUNT HEAD TRAUMA
41 YOM FELL OUT OF SHOWER AT ASSISTED LIVING HOME YESTERDAY ONTO RT SIDE C/O RT HIP & RT LEG PAIN. DX - RT HIP FRACTURE

Bibliography:

Bibliography for Jake Pauls Proposal for IBC Section 1003 on Grab Bars for Bathtubs, Bathtub-Shower Combinations and Showers

Approximately 50 internationally-produced scientific and technical references, on bathing/showering safety, were compiled by the proponent, in 2016, for an American Public Health Association (APHA) draft policy highlighting, especially two Canadian research studies that also are addressed in video presentations by Principal Investigators (Dr. Nancy Edwards, Dr. Alison Novak) for the research and posted, for free streaming viewing at, <https://vimeo.com/164239941> Accessed January 8, 2018. Additional videos covering technical aspects of bathing and showering safety (including cost impact and benefit issues*) are found at the following links (all of which are available, with descriptions, at www.bldguse.com, the proponent's Professional Practice Website, Accessed January 8, 2018.).

Accessed January 8, 2018. (In referring to sit-to-stand transfers, as from a toilet, this article uses the term, “transfer poles,” to describe the configuration and location of “poles” referred to in the code change proposal.)

Cost Impact: The code change proposal will increase the cost of construction

The code change proposal will increase the cost of construction, but that increased cost pales in comparison to the benefits of enhanced usability and reduction of fall injuries.

The additional material in the form of conventional grab bars or poles plus their fixings is about 50 dollars per grab bar or pole (using *retail* prices for the components confirmed as recently as 2017) and with a conventional three-fixture bathroom with a bathtub there would be a need for two such grab bars or poles or one of each. Labor to install these would be about one hour for each. Thus an overall, installed cost is on the order of \$200 per bathroom. The service life would be on the order of two or more decades.

Against this added cost of an installed single grab bar or two per bathroom there are the ongoing benefits of enhanced normal (non-injury) uses which, for a typical US household for a 20-year period, for example, number about 7,000 per person or on the order of 20,000 per household. Those enhanced uses, with grab bars, have an economic value that is larger than the benefit of averted injuries from falls.

Currently without grab bars, our bathtubs and showers are the site of injuries serious enough to require professional medical attention at a rate, annually (using 2010 data) of about 1 million per 110 billion uses or about one in 110,000 uses. Every one of those non-injury uses has a value. By comparison, for stairs this ratio is about one professionally treated fall injury for every million flight uses in home settings and one such injury for every ten million flight uses in public settings where, under the IBC and more-detailed inspection procedures, stairs are nearly one order of magnitude safer than those nominally constructed under the IRC. See the video presentation by Jake Pauls to the April 2017 meeting, "The Impact of Building Codes and Standards in Public Health and Safety," held in Melbourne, Australia, in connection with the 15th World Congress on Public Health. The streaming video containing this presentation, which includes the "Injury Pyramids" used for the above stair safety calculation, is available freely at <https://vimeo.com/239276202> (as listed in the first part of the Bibliography accompanying this proposal) accessed Jan 8, 2018.

The injuries-averted benefit, over twenty years, has a value, in 2010 dollars, about 6.5 times greater than the installation cost, based on the very reasonable assumption that half the falls are averted with the specified grab bars or poles. For the vertical poles that also enhance and make safer the use of toilets that, being adjacent to a bathtub, can serve stand-to-sit and sit-to-stand transfers for toileting, this benefit increases by about 35 percent to nearly 9 times greater than the installation cost. These projections are based on the injury economic data provided by the 2015 paper in the respected journal, *Injury Prevention*, by Lawrence, Spicer and Miller (see Bibliography for details).

The bottom line is that the benefits of both enhanced normal uses, in the tens of thousands per household over a 20-year period, combined with the benefit of averted injuries, is on the order of at least 20 or more times the cost of providing the grab bars, especially if they take the form of vertical poles serving bathtub-shower combination users as well as toilet users in a three-piece bathroom provision that is very common in homes and hotels, for example. For hotels, while the lavatory sink(s) may be in a separate space, the toilet and bathtub-shower combination are usually close together so that a single pole can serve transfers for both. Thus the cost impact of grab bar or pole installations is very small in relation to the benefits and that cost of installation is very small in relation to the overall price of a dwelling unit or hotel guest room for example.

Finally, the choice of residential settings for the foregoing benefit-cost analyses, reflects the greater attention such occupancies often receive in code change deliberations. Healthcare occupancies could also have been chosen for analyses as estimates of fall-related injuries to patients are that about "one-third of reportable falls with injuries in hospitalized older adults are linked to bathroom use" (quoted from reference identified as number 47 in the Bibliography for this proposal). Notably, in the recent NFPA deliberations on installation of grab bars, only healthcare occupancies were not included due to healthcare industry and healthcare fire protection engineering consultants' opposition based on the claim that patients in healthcare were not permitted to use bathrooms without supervision. The personal, post-fall (with closed-head injuries) experience recently by the proponent of this code change in three hospitals in Sweden, Australia and the USA, seriously questions this industry claim as well as the implicit assumption that bathrooms in healthcare provide reasonable safety from falls suffered in the course of toileting as well as bathing. Too often, the wheeled stand (with the vertical pole holding fluid being administered intravenously) is the most reliable "point of control" such patients have between their beds and toileting/bathing facilities either in the patient bedrooms or "down the hall."

E1-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There was an issue with the location in the code. Historically showers and tubs have not been considered part of the circulation path for means of egress as indicated in this proposal. The proposal should not include exceptions for slip resistance or stepping over the tub edge or shower threshold. It was suggested that perhaps a better place for a requirement for grab bars would be Section 1209 with the other interior wall requirements for toilet and bathing rooms.

From a scoping perspective, apartments and condominium already have Type A and Type B requirements for blocking for the future installation of grab bars, and these requirements may conflict with that. In nursing homes and hospitals these grab bars may conflict with the space needed for mobility equipment and transfers. In Accessible units, the vertical station would be an obstruction for transfer to the tub, and the grab bar requirements are not coordinated with ICC A117.1. It was suggested that the non-accessible bathrooms in hotels may be type of facility to start with to reduce slip and fall issues with grab bars at the tubs and showers.

Technical issues - What is the justification for the grab bar locations and lengths? How would the vertical station work with shower/bathtub doors or curtains? How would the ends of the vertical station attach to the floors, tub edge or ceiling? What happens at larger showers, gang showers, or showers with glass or no walls on some sides? (Vote 14-0)

Assembly Action:

None

E1-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jake Pauls, representing Jake Pauls Consulting Services (bldguse@aol.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1209.4 Grab bars for bathtubs, bathtub-shower combinations and showers. At bathtubs and bathtub-shower combinations where grab bars complying with ICC A117.1 are not provided, a vertical grab bar complying with Section 1209.4.1 and a grab bar complying with Section 1209.4.2 shall be provided. At showers where grab bars complying with ICC A117.1 are not provided, a vertical grab bar complying with Section 1209.4.3 shall be provided. All grab bars required by this section shall comply with Sections 1209.4.4 through 1209.4.8. Nonconventional grab bars, such as stanchions, shall be permitted.

Exceptions:

- 1. Group I-2 occupancy where care recipient usage of bathing and showering facilities are assisted by staff.**
- 2. Group 1-3 occupancy where bathing and showering facilities serve inmates or detainees.**

1209.4.1 Vertical grab bar. A vertical grab bar shall complying with Sections 1209.4.1.1 through 1209.4.1.3.

1209.4.1.1 Approach An unobstructed clear floor space of 21 inches (535 mm) minimum in width and 21 inches (535 mm) minimum in depth, adjacent to the tub wall shall be provided. The clear floor space shall be located outside the tub and be within 12 inches (305 mm) of the center line of the vertical grab bar measured horizontally.

1209.4.1.2 Length The vertical grab bar shall be 36 inches (914 mm) minimum in length and with its upper end 60 inches (1525 mm) minimum above the floor.

1209.4.1.3 Position The vertical grab bar shall be positioned in accordance with one of the following:

1. Where the vertical grab bar is located inside the bathtub footprint, the center line of the vertical grab bar shall be 12 inches (305 mm) maximum from exterior wall of the bathtub and no closer than 6 inches (150 mm) to any shower curtain rod attachment.
2. Where the vertical grab bar is located outside the bathtub footprint, the center line of the vertical grab bar shall be 6 inches (152 mm) maximum from the exterior wall of the bathtub.
3. The vertical grab bar's lower attachment is on the rim of the bathtub.

1209.4.2 Rear wall grab bar. A grab bar shall be provided on the back wall of the bathtub or bathtub-shower combination and shall be positioned in accordance with Section 1209.4.2.1 or 1209.4.2.2.

1209.4.2.1 Horizontal Position The horizontal grab bar shall be located 8 inches (205 mm) minimum and 10 inches (255 mm) maximum above the rim of the bathtub. The grab bar shall be 24 inches (610 mm) minimum in length and extend to be 24 inches (610 mm) maximum from the head end wall and 12 inches (305 mm) maximum from the control end wall.

1209.4.2.2 Diagonal Position The diagonal grab bar shall be located with the lower end 8 inches (205 mm) minimum and 10 inches (255 mm) maximum above the rim of the bathtub and the higher end 25 inches (635 mm) minimum and 27 inches (685 mm) maximum above the bathtub rim. The grab bar shall be 24 inches (610 mm) minimum in length and extend to be 24 inches (610 mm) maximum from the head end wall and 12 inches (305 mm) maximum from the control end wall.

1209.4.3 Showers A vertical grab bar shall be provided to either side of the opening to the shower and located with the center line within 3 inches (76 mm) of the interior or exterior of the shower threshold, measured horizontally. The grab bar shall be 24 inches (610 mm) minimum in length with the lower end 39 inches (991 mm) maximum above the floor and the higher end a minimum of 61 inches (1550 mm) above the floor.

1209.4.4 Cross Section. Grab bars shall have a circular cross section with an outside diameter of 1-1/4 inches (32 mm) minimum and 2 inches (51 mm) maximum.

1209.4.5 Spacing The space between the grab bar and any adjacent surfaces or projecting objects shall be 1-1/2 inches (38 mm) minimum.

1209.4.6 Surface Hazards Grab bars and any walls or other surfaces adjacent to grab bars shall be free of sharp or abrasive elements. Edges shall be rounded with a minimum radius of 0.25 inch (6 mm).

1209.4.7 Structural Characteristics Allowable stresses shall not be exceeded for materials used when a vertical or horizontal force of 250 pounds (1112 N) is applied at any point on the grab bar, fastener, mounting device, or supporting structure. Grab bars shall not rotate within their fittings.

1209.4.8 Design and Installation for Water Grab bars, fasteners, mounting devices, and supporting structure shall be designed and installed to resist the damaging effects of water.

Commenter's Reason: (1) Committee Comments. First, I thank the IBC Egress Committee and staff for pointing out the preferred location in the IBC for a set of requirements on improved safety for bath and shower facilities. Especially appreciated was ICC Staff opining that a relocation of the proposed requirements to Section 1209 would be in order and facilitating my comment. My public comment accomplishes this preferred positioning of the requirements mostly as originally proposed with some edits and deletions described here.

(2) The matter of the original proposals suggested exception for "slip resistance" has been addressed completely. There is no reference to "slip resistant" or "means of egress" (Sections 1003.4 and 1003.5) in the re-positioned requirement.

(3) On blocking requirements, my testimony on the IRC and IBC proposals, made clear that blocking was not an effective solution or even a path to the solution. As a member of the ICC/ANSI A117 Committee, I intend to introduce a new requirement for mainstreamed grab bar (and stanchion) installations provided for the general population based on my proposals for the IBC and the already-adopted requirements, I had proposed a few years ago, to NFPA 101 and 5000. As part of that effort, the whole issue of blocking—the projected benefits of it and where it needs to go—will be addressed.

(4) Also, in relation to A117.1, the A117 Committee is between cycles and has not met during the time frame of my bath/shower safety proposals to both NFPA and ICC. However, three leading members of the Committee, beyond myself have been consulted throughout the last few years on the evidential bases for, and content of, new requirements for mainstreaming grab bars and stanchions. This has also been done with a dedicated Task Group on Grab Bars that has been considering parallel proposals (one from me and an earlier one from another top expert on falls in Canada) for changes to the National Building Code of Canada (NBCC). ICC committee criticism of my not consulting with other bodies

(more a matter of the IRC plumbing committee's criticism than the ICC Egress committee) is thus missing a lot of the collaboration with which I have approached this topic in recent years. (See my many video programs on bathroom safety posted at www.bldguse.com; they include a wide range of usability and safety professionals from both the USA and Canada.)

(5) Here I note the IRC Plumbing Committee's criticism that I had not worked with those involved with some plumbing standards committees whose work on the safety issues is not visible to me. Moreover, it is ironic that the IRC Plumbing Committee recommended that the issue of grab bars was not for the plumbing section of the IRC, but Chapter 3 on planning, something I can only pursue during 2019 within Group B hearings. This public comment on the IBC proposal is a precursor to a proposal for next year's Group B proposal for IRC's Chapter 3.

(6) Responding to the IBC Egress Committee Reason, the suggestion about restricting or prioritizing a requirement on grab bars to hotels misses the point that the vast majority of bath/shower-related injuries occur in non-hotel contexts. The suggestion also implies that too much faith is placed on the benefit, to safety, of being familiar with the bath/shower facility to reduce the risk of injurious falls. There is no good evidence supporting this and much evidence against it (just as the argument fails in relation to stairway safety). Here I need to disclose that, as an occupant of hotel guest rooms about 40 percent of the nights in a year, I would like to see all hotel rooms equipped with grab bars to the same extent as my home. My home installation, using stanchions, meets the proposed IBC requirements. No hotel I have stayed in around the world has provided safety to the level achievable with the proposed IBC requirements. Even the best of these hotels would get no better than a 40-percent grade in my experience, providing no more than 40 percent of what is now proposed for IBC Section 1209. A typical hotel installation, especially for the few hotel chains (including the largest) providing grab bars, consists of only a single grab bar serving either—not both—the in-tub bather or the shower taker. Research and experience show that each user group has different transfer needs; in-tub bathers need the vertical bar for stepping in and out (as do shower takers) but also need a second bar, positioned horizontally or diagonally, at the non-access side of the tub, to move into and out of a sitting position safely. Older, in-tub bathers will especially appreciate having bilateral support from the combination of (1) a non-access side grab bar and (2) an access side vertical grab bar, especially a stanchion mounted above or near the tub wall, about half-way along the tub wall length.

(7) Technical Issues Noted in the IBC Egress Committee Reason. The justifications for the "grab bar locations and lengths are based on the research literature, all listed in my proposal, especially the biomechanics studies performed over the last twenty years, largely in Canada. As these were done with bathtub entry and egress, I have augmented the findings with some observations of stanchion use in relation to human anthropometrics (ergonomics) where it is clear that people prefer to use vertical, conventional grab bars and stanchions at chest-to-eye height for best biomechanical advantage. Thus 60-inch to 63-inch top-end heights are specified for grab bar lengths when used in vertical orientation. Such heights, along with minimum lengths, are tempered by consideration of children's ergonomics, e.g., with handrails, a topic where I am a published authority based on decades of work. Vertical is the most effective orientation (according to extensive research with adult entry/exit of bathtubs used for showering).

(8) The Committee's question about how a vertical, conventional grab bar or stanchion relates to "shower/bathtub doors or curtains" has been considered extensively, especially in relation to the grab bar being placed where it is at least six inches from shower curtain rod fixing which is generally more or less over the front wall of the tub. This is also where fixed enclosures or doors are also generally located. The latter, doors, are either sliding or swinging and the latter sometimes swing both outward and inward. The Code cannot cover every detail and some intelligence should be exercised in the relatively extensive work required for enclosure installation to avoid interference between fixed and movable enclosure panels. Moreover, regarding the use of stanchions, such vertical grab bars can be located independent (structurally and spatially) of walls, for both tubs and showers; they can be positioned a few inches outside of enclosure panels and clear of any door swing and/or shower curtains. In addition to being very helpful in entry and egress from the facility the vertical stanchions provide a full-height backrest when standing on one foot and attempting to dry the other. (An example installation, shown in Figure 2 of my original proposal Reason Statement, utilizes the tub wall for a stanchion lower support.)

(9) The penultimate question in the Committee Reason asks about how the ends of the "vertical station" (sic), i.e., the stanchion is attached to the tub wall. It sits in a recess on the base plate (which is under a cover plate) which is held by industrial (automotive grade, for example) adhesive that can be removed with no damage to the tub wall but which, while held by the adhesive, has several times the shear area provided by conventional grab bar fixing with three screws at each end which are prone to corrosion and backing deterioration due to water entry into walls. The stanchion not only meets the load requirements, applied laterally in the test, of the ICC and NFPA codes (250 pounds) but the more stringent, higher-load requirements of the National Building Code of Canada (NBCC). At the ceiling, the vertical stanchion is also held with a small plate—matching the one on the tub wall) adhered to a solid ceiling. For other ceilings, this could be duplicated structurally, with a ceiling-mounted, nominal 1 by 6 piece of lumber, painted to match or complement the ceiling (e.g., a suspended ceiling) and distributing its almost exclusively horizontal load over many, many times the area of even the bottom fixing plate and also transmitting loads to the walls on either side of the typically small residential bathroom (60 inches across the short dimension based on a standard tub length).

(10) The bathroom installation shown in Figure 2 is in a rental apartment and no damaging hole is made in any wall or other surface holding both the vertical and horizontal stanchion elements in place to required strength standards of 250 pounds (or even 300 pounds in the case of the NBCC). In short the solution and answer to the Committee question is "Quite Easily Done" especially as many residential bathrooms have relatively low ceiling heights (by code) so that the vertical stanchion, resting on the tub wall only needs about a 66-inch length in the installation shown in Figure 2.

(11) The Committee's final question, a compound one, is relatively easy to answer in that there are solutions, in provision of useful "points of control," that are provided independent of the existence of walls or the size of the space. Taking "gang showers" first, it is assumed that such showers are designed with floor finishes that are slip resistant with water and soap contamination (to meet current IBC and NFPA requirements—the latter specifying "slip resistant under foreseeable conditions"). A single vertical, conventional grab bar or stanchion would meet the literal text proposed for the IBC, at the entry/egress point for the shower, presumably where there is a boundary between wet and dry conditions, e.g., a water dam or threshold to step over. Provision of additional points of control is beyond the proposed Code focus on safety of entry and egress.

(12) Regarding the second part to the Committee's final question, about glass walls or no walls, any glass wall has to meet stringent load human impact load requirements. While perhaps being comparable to loads on a glass-mounted grab bar, this does not mean that attachment to a glass panel is the only solution. It is increasingly common in hotel (and maybe other) renovations, for a bathtub, bounded by three walls, to be replaced with a walk-in shower of the same plan dimensions and either a half-length, heavy glass panel, at the shower head end of the space or some combination of fixed, hinged, and/or sliding, heavy glass panel(s)—the latter generally being superior in stopping adjacent floors from getting wet and slippery. In the typical small guest room bathroom in a hotel, there will also be a water closet adjacent to the shower. A single stanchion placed outside of the shower enclosure and a few inches clear of any permanent or hinged panel opening, and mounted between floor and ceiling serves both shower and toilet users with a highly effective point of control for transfers to and from both facilities. Note that the need to provide some lateral support for the top of the fixed glass panel, even with suspended ceilings, can serve adequately to brace the top of the stanchion for the lateral loads typically imposed predominantly on such a point of control.

(13) Thus the renovation of either hotel or dwelling unit bathtubs with dedicated showers would not only trigger a need (at least per NFPA codes) for a new stanchion or conventional grab bar, it would facilitate its installation as the ceiling structure needed for lateral support of both the glass wall and the stanchion is best done at the same time. I have a growing library of photographs of the many hotel rooms now being seen in Europe and North America of this situation.

(14) Finally, with dwelling units (and future IRC changes), we will need to address freestanding bathtubs returning after decades of bathtubs being tied to walls. The proposed IBC requirements do not explicitly cover this, except for vertical stanchions on a bathtub's access side. Other requirements are still tied to walls. So, as it is not a common issue in IBC installations, the topic of free-standing bathtubs is deferred to an IRC proposal in 2019. The creative skills of residential bathroom designers will have to be applied to making sure that such free-standing tubs are reasonably safe and usable by the majority of the population which is not only living longer but is losing mobility performance rapidly.

(15) Bottom line, my original proposal and the now to be relocated text in Section 1209, deal realistically with a major injury problem. Based on research evidence as well as extensive field experience I gain in my frequent international travel, this proposal is my small contribution to making the "International Codes" truly international in scope and justification. Proposal E1-2018, revised by this public comment, effectively addresses a major fall-injury problem costing tens of billions of dollars annually in societal injury costs in the US. Thank you to all making this possible in ICC's code development process.

(16) Postscript about Reason Statement. I am leaving my original proposal Reason Statement untouched from what was submitted in January. This means that "poles" are still referred to in some places where, now, the preferred standard term is "stanchions," for which a definition has been proposed for NFPA codes, as follows: "A fixed, generally upright bar or pole used as a support when grasped by a hand." Stanchions have a long history in transportation vehicles, dating back at least as long as conventional grab bars.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost impact originally submitted with the proposal is unchanged by this public comment which simply moves the core of the requirement to a more-appropriate section and the cost impact topic apparently was not an explicit issue in the Committee reason for disapproval.

E2-18

IBC: 1003.4.1 (New), Chapter 35, (IFC[BE] 1003.4.1, Chapter 80)

Proposed Change as Submitted

Proponent: Bill Griese, Tile Council of North America, representing Tile Council of North America (bgriese@tileusa.com); Todd Scharich, American Society of Concrete Contractors, representing American Society of Concrete Contractors (TScharich@ASCCONLINE.ORG); Charles Muehlbauer, Natural Stone Institute, representing Natural Stone Institute (Charles@naturalstoneinstitute.org); Katelyn Simpson, representing TCNA Laboratory (ksimpson@tileusa.com); Jennifer Ann Faller, representing Concrete Polishing Council (CPC) (concreteinsite@gmail.com); Mark Fowler, representing National Terrazzo & Mosaic Association (mark@ntma.com)

2018 International Building Code

1003.4 Slip-resistant surface. Circulation paths of the *means of egress* shall have a slip-resistant surface and be securely attached.

Add new text as follows

1003.4.1 Hard surface flooring. Hard surface flooring shall be slip-resistant in accordance with ANSI A326.3.

Add new standard(s) follows

ANSI

American National Standards
Institute
25 West 43rd Street, Fourth Floor
New York NY 10036
US

A326.3-18:

Test Method for Measuring Dynamic Coefficient of Friction for Hard Surface Floor Materials

Reason: Currently, Section 1003.4 requires that circulation path surfaces of the means of egress be “slip-resistant” with no method of measurement, quantitative threshold, or general principles to help the specifier, end-user and code official. Given the Code’s lack of criteria for “slip-resistant,” materials are sometimes being inappropriately specified, and accidents occur in areas of the means of egress. This can be especially dangerous for emergency responders who are entering a building for the first time, potentially under conditions with water and limited visibility (smoke). The purpose of this revision is to provide slip resistance criteria for hard surface flooring used in interior circulation paths. The proposed reference standard, ANSI A326.3, sets forth a quantitative minimum threshold, means of measurement, and general principles regarding slip resistance for hard surface flooring and is widely specified for ceramic tile, polished concrete, terrazzo, and natural stone. This would provide clarity, safety, and transparency with no increased cost of construction.

This proposal is being submitted by Tile Council of North America (TCNA), Natural Stone Institute, American Society of Concrete Contractors (ASCC), Concrete Polishing Council (CPC), and National Terrazzo and Mosaic Association (NTMA), with the support of many other organizations.

Previously, slip resistance for ceramic tile was standardized solely by ANSI A137.1 American National Standard Specifications for Ceramic Tile. In 2012, a proposal (S222-12) was approved which removed ANSI A137.1 from Section 2103 of the Code (previously, Section 2103.6) in an effort to consolidate masonry-based specification references. An unintended consequence of this change was that the Code was subsequently left with no slip resistance criteria for ceramic tile, much less stone, terrazzo, or concrete.

In 2015, a proposal (E3-15) was made to reintroduce the slip resistance provisions of ANSI A137.1 into the Code. Given that these provisions were being widely adopted and specified for flooring types beyond just ceramic tile, the scope of the proposal included other hard surface flooring types with the support of each respective industry. The proposal was met with positive feedback from the Means of Egress Committee, but was ultimately disapproved since the proposed reference standard was limited to ceramic tile. At the time, the Committee encouraged the proponents to collaborate on a stand-alone slip resistance specification which covered all hard surface flooring types and return in 2018 with a proposal.

Today, this work has been done for all hard surface flooring and is standardized in ANSI A326.3, including in the standard test sample size and testing in as-is conditions or under cleaned conditions. This standard is widely understood for hard surface flooring and specified throughout the architectural community with hard surface manufacturers/suppliers/installers regularly providing the information needed by code officials as part of standard product submittals and information. Revising Section 1003.4 to reference ANSI A326.3 for hard surface flooring would clear-up ambiguity around the requirement for “slip-resistant” circulation path surfaces, facilitate increased safety and ease-of-specification, and codify the slip resistance standard which is most predominately used today for hard surface flooring.

ANSI ASC A108, the committee which developed ANSI A326.3, represents a broad range of stakeholders, including the Construction Specifications Institute (CSI), Natural Stone Institute, National Association of Homebuilders (NAHB), Underwriter Laboratories (UL), National Tile Contractors Association (NTCA), Tile Council of North America (TCNA), and 58 additional stakeholders (for a total of 64).

A copy of ANSI A326.3 has been attached to this proposal and is also easily accessible for free online via www.TCNAtile.com.

Bibliography: [TCNA Tile Initiative] [Research Supporting an American National Standard for Slip Resistance] [Eric Astrachan] [2016] [Pages 2 - 9] [http://www.tcnatile.com/images/pdfs/Rsch_suptng_ANSI_std_slip_resist_TCNA_TI_Mar-2016.pdf]

[Slip and Fall Study Report: Enhancing Floor Safety Through Slip Resistance Testing, Maintenance Protocols and Risk Awareness] [CNA Financial Corporation] [2017]

[http://www.tcnatile.com/images/pdfs/CNA_Risk_Control_Slip_and_Fall_Report_Final.pdf]

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Hard surface flooring that meets or exceeds the criteria of the ANSI A326.3 standard is not different in price from hard surface flooring that is below the threshold criteria.

Analysis: A review of the standard proposed for inclusion in the code, ANSI A326.3-18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

E2-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The referenced standard contains proprietary testing equipment. While this test can be performed consistently in a laboratory, it does not seem to be useable for concrete surfaces poured in the field. There were concerns for who would do field inspection, what information should be on the box of products that had been tested, how this would work for sloped surfaces, what slip resistance would be acceptable. This is proposed for all hard surface floors – perhaps it should only be required for higher risk areas. (Vote: 12-1)

Assembly Action:

None

E2-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Bill Griese, representing Tile Council of North America (bgriese@tileusa.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1003.4.1 Hard Interior hard surface flooring. ~~Hard surface flooring—Ceramic tile, terrazzo, natural stone, and polished concrete flooring used for circulation paths for the means of egress within the building shall be slip-resistant in accordance with ANSI A326.3. Conformance to ANSI A326.3 shall be indicated on product packaging, in product literature, on the construction documents, or by special inspection after flooring installation.~~

Commenter's Reason: In response to points raised by the Committee as reasoning for disapproval, further clarification and/or proposed modifications are provided as follows:

To address committee reason #1 (claim that the referenced standard contains proprietary testing equipment):

- Suggestions of ANSI A326.3 test equipment propriety are misguided and should be disregarded. The specified device is not patented, its design specifications are not copyrighted, and it was developed based on globally collaborative research of well-understood concepts relating to human ambulation and DCOF.
- There is clear precedent within the Code regarding reference standards which acknowledge specific testing devices. For example, UL 723 and ASTM E84, commonly known as the 'Steiner Tunnel' tests for surface burning characteristics, are widely adopted, well-understood and oriented around a specific testing device.
- In fact, unlike the Steiner Tunnel for UL 723 and ASTM E84, the specified DCOF testing device for ANSI A326.3 is not exclusively requisite to the standard as provisions for device equivalency are clearly indicated within the criteria of the standard.

To address committee reason #2 (concern regarding mechanisms for conformance communication, especially where product packaging or literature has been discarded or where flooring is manufactured in situ, as is the case for terrazzo or polished concrete):

- The proposal has been modified to specify acceptable means of ANSI A326.3 conformance indication, including declaration on product packaging, within product literature, within project documentation or per special inspection.

To address committee reason #3 (concern regarding whether or not the referenced standard, which is intended for interior flooring, would be applicable to all hard surfaces, as well as all circulation paths of the means of egress, including exit discharges to public ways which could consist of non-interior circulation paths):

- The proposal has been modified to specify the hard surface flooring types which are applicable--ceramic tile, terrazzo, natural stone, and polished concrete. These are the four flooring types for which there is broad industry adoption of ANSI A326.3, and listing them more accurately captures the original intent of the proposal.
- Additionally, the proposal has been modified to limit the applicability of ANSI A326.3 to interior walking surfaces of the means of egress. Limiting this subsection of slip resistant circulation paths to building interiors facilitates better alignment with the referenced standard.

To address committee reason #4 (concern regarding how the referenced standard could be applicable to sloped surfaces):

- It should be understood that a minimum DCOF value is not appropriate for such applications. Safety on ramps is a function of the ramp angle, cautionary marking, and the expected activity.

This proposal is about safety, first and foremost. Though it doesn't address every type of flooring, circulation path, or means of egress scenario, it establishes clear thresholds where possible, which in turn is a step forward in the realm of safety. Its approval with these modifications would clear-up a number of ambiguities pertaining to slip resistance and introduce a vastly improved way of specifying circulation paths, especially those involving flooring types for which slip resistance is of particular importance.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Hard surface flooring that meets or exceeds ANSI A326.3 is not different in price from hard surface flooring that does not.

E2-18

E13-18

IBC: 1006.2.2, (IFC[BE] 1006.2.2)

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows

1006.2.2 Egress based on use. The numbers, types and locations of *exits* or access to *exits* shall be provided in the uses described in Sections 1006.2.2.1 through 1006.2.2.6.

Reason: The subsections of 1006.2.2 includes not only the number of exits and exit access doorways, but also requirements regarding the exit and exit access doors, types of exit access, and their locations. This provides clarity in the scoping of this section.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal is a clarification reminder of the scope of requirements included in the identified sections.

E13-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This addition provides clarity for the scoping of this section. (Vote: 13-1)

Assembly Action:

None

E13-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1006.2.2 Egress based on use. The numbers, configuration and types and locations of components of exits or access to *exits* shall be provided in the uses described in Sections 1006.2.2.1 through 1006.2.2.6.

Commenter's Reason: The original proposal has merit, however the terminology is not consistent with Chapter 10 verbiage. Typically, Section 1006 addresses the required numbers of exits or exit access doorways. Section 1006.2.2 is titled Egress based on use and prescribes various means of egress design requirements for specified uses. The original proposal sought to clarify that fact. This public comment simply replaces some of the terminology with language typically used in Chapter 10. The word location has been replaced with the word configuration. Section 1007 deals with this issue and is titled Exit and exit access doorway configuration. This places the requirements in context and will assist in user comprehension. Also, the word types has been appropriately expanded to state types of components. Means of egress components are identified throughout Chapter 10 and several of these components are referenced in Section 1006.2.2. Approval of this public comment will provide more technically accurate verbiage thereby increasing user understanding and uniformity in the application of these provisions.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The public comment is editorial and will not affect the cost of design or construction.

E13-18

E15-18 Part I

PART 1 - IBC: 1006.2.2.2; (IFC[BE] 1006.2.2)

PART 2 - IMC: 1105.10 [BE] (New)

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

THIS IS A TWO PART CODE CHANGE. PART I WILL BE HEARD BY THE MEANS OF EGRESS COMMITTEE. PART II WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER OF THESE COMMITTEES.

2018 International Building Code

Revise as follows

1006.2.2.2 Refrigeration machinery rooms. Machinery rooms larger than 1,000 square feet (93 m²) shall have not less than two *exits* or *exit access doorways*. Where two *exit access doorways* are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. *Exit access doorways* shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an *exit* or *exit access doorway*. An increase in *exit access* travel distance is permitted in accordance with Section 1017.1.

Exit and *exit access doorways* shall swing in the direction of egress travel and shall be equipped with panic hardware, regardless of the *occupant load* served. *Exit* and *exit access doorways* shall be tight fitting and self-closing.

Reason: It is appropriate for refrigeration machinery rooms to have panic hardware on means of egress doors to protect occupants because of the risk of a rapid release of hazardous or asphyxiant gases. The need for rapid escape from refrigeration machinery rooms is not unlike what is needed for Group H Occupancies, which are required by Section 1010.1.10 to have panic hardware on all swinging doors. Likewise, IAR 2 includes this requirement for ammonia refrigeration machinery rooms.

It is also recommended that this section be duplicated in the IMC to ensure that the requirements are not overlooked by machinery room designers. The requirement in the IBC is not readily found as a refrigeration machinery room requirement since it is isolated in the means of egress chapter.

Cost Impact: The code change proposal will increase the cost of construction

For machinery rooms that would not already have been provided with panic hardware on means of egress doors, the requirement to have panic hardware will constitute an increased cost.

E15-18 Part I

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Adding panic hardware to refrigeration machinery rooms will improve safety for these rooms. There should be a public comment to add this to the list for panic hardware in Section 1010.1.10. (Vote: 14-0)

Assembly Action:

None

E15-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1010.1.10.1 Refrigeration machinery room Swinging doors in refrigeration machinery rooms, where required by Section 1006.2.2.2, shall not be provided with a latch or lock other than panic hardware or fire exit hardware.

Commenter's Reason: The formatting is to be consistent with E64-18 for panic hardware in electrical rooms. Panic hardware for electrical rooms in Section 1010.1.10 was moved into a new subsection. The new requirement for panic hardware in refrigeration machinery rooms should be addressed the same and included in Section 1010.10. This public comment is submitted by the ICC BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions there of. In 2017 and 2018 the BCAC has held 5 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes and public comments. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The modification is a pointer from the panic hardware section to the new section approved by the committee. The original proposal would add panic hardware in these spaces.

Public Comment 2:

Proponent: Timothy Pate, representing Colorado Chapter Code Change Committee (tpate@broomfield.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Section 1010.1.9.4, Item 2.
2. Doors provided with *panic hardware* or *fire exit hardware* and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Section 1010.1.9.9 or ~~1010.1.9.10~~ 1010.1.9.10.

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or *exit access* doors, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

Refrigeration machinery rooms larger than 1,000 square feet (93 m²) shall have not less than two exits or exit access doorways that swing in the direction of egress travel and are equipped with panic hardware or fire exit hardware.

Commenter's Reason: This proposed modification is to add a additional language in the code section that lists where you need panic hardware so code users will know that the requirement for panic hardware was added in the section for refrigeration machinery rooms.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is to add language in separate section as a reminder of the new language in the original section

E15-18 Part I

E15-18 Part II

IMC: 1105.10 [BE]

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2018 International Mechanical Code

Add new text as follows

1105.10 [BE] Means of egress. Machinery rooms larger than 1,000 square feet (93 m²) shall have not less than two exits or exit access doorways. Where two exit access doorways are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an exit or exit access doorway. An increase in exit access travel distance is permitted in accordance with Section 1017.1.

Exit and exit access doorways shall swing in the direction of egress travel and shall be equipped with panic hardware, regardless of the occupant load served. Exit and exit access doorways shall be tight fitting and self-closing.

Reason:

Cost Impact: The code change proposal will increase the cost of construction

IBC: SECTION 1006.3, 1006.3.1, 1019.3 (IFC[BE] 1006.3, 1006.3.1, 1019.3)

Proposed Change as Submitted

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Building Code

SECTION 1006 NUMBER OF EXITS AND EXIT ACCESS DOORWAYS

1006.1 General. The number of *exits* or *exit access doorways* required within the *means of egress* system shall comply with the provisions of Section 1006.2 for spaces, including *mezzanines*, and Section 1006.3 for *stories* or occupied roofs.

Revise as follows

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. ~~Where stairways serve more than one story, only the occupant load of each story considered individually shall be used in calculating the required number of exits or access to exits serving that story.~~

Add new text as follows

1006.3.1 Occupant load. Where stairways serve more than one story, or more than one story and an occupied roof, only the occupant load of each story or occupied roof, considered individually, shall be used in when calculating the required number of exits or access to exits serving that story.

Revise as follows

~~**1006.3.1-1006.3.2 Adjacent story-Path of egress travel.**~~ The path of egress travel to an *exit* shall not pass through more than one adjacent *story*.

Exception: The path of egress travel to an *exit* shall be permitted to pass through more than one adjacent *story* in any of the following:

1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and *ramps* connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.
2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.
3. Exit access stairways and ramps within an atrium comply with the provisions of Section 404.
4. Exit access stairways and *ramps* in open parking garages that serve only the parking garage.
- ~~5.4~~ Exit access stairways and *ramps* serving *open-air assembly seating* complying with the exit access travel distance requirements of Section 1029.7.
- ~~6.5~~ Exit access stairways and *ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.
7. Exterior exit access stairways and ramps between occupied roofs.

~~**1006.3.2**~~**1006.3.3 Egress based on occupant load.** Each *story* and occupied roof shall have the minimum number of separate and distinct *exits*, or access to *exits*, as specified in Table 1006.3.2. A single *exit* or access to a single *exit* shall be permitted in accordance with Section 1006.3.3. The required number of *exits*, or *exit access stairways* or *ramps* providing access to *exits*, from any *story* or occupied roof shall be maintained until arrival at the *exit discharge* or a *public way*.

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions *listed* in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. *Exit access stairways and ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit access stairways and ramps* connecting four stories or less serving and contained within an individual *dwelling unit or sleeping unit or live/work unit*.
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways and ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway or ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways and ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways and ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways and ramps* serving *smoke-protected or open-air assembly seating* complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways and ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.
9. Exterior exit access stairways or ramps between occupied roofs.

Reason: The title of this section includes stories and occupied roof, but the section gives no guidance regarding the occupied roof. This change will clarify the application of the provisions to an occupied roof and another story. As has been the practice, the occupant load of each story or with this change, the occupant load of the roof (which isn't a story) will be used to determine the required occupant load for the stair serving it.

In addition, the two exceptions will recognize an exit access stairway located in an atrium and an exit access stairway serving an occupied roof to pass through more than one story. This change will make it clear that a stair in an atrium that is NOT part of the means of egress is always acceptable and not limited to the one adjacent story criteria.

Cost Impact: The code change proposal will decrease the cost of construction. This change will simplify design decisions, review and approval of projects, reducing the cost of construction.

E18-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 1006.3.1 Occupant load. Where stairways serve more than one story, or more than one story and an occupied roof, only the occupant load of each story or occupied roof, considered individually, shall be used when calculating the required number of exits or access to exits serving that story.

1006.3.2 Path of egress travel. The path of egress travel to an exit shall not pass through more than one adjacent story.

Exception: The path of egress travel to an exit shall be permitted to pass through more than one adjacent story in any of the following:

In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.

Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.

Exit access stairways and ramps within an atrium comply with the provisions of Section 404.

Exit access stairways and ramps in open parking garages that serve only the parking garage.

Exit access stairways and ramps serving open-air assembly seating complying with the exit access travel distance requirements of Section 1029.7.

Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.

~~Exterior~~ Exit access stairways and ramps between serving occupied roofs.

1019.3 Occupancies other than Groups I-2 and I-3.

In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions *listed* in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. *Exit access stairways* and *ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit access stairways* and *ramps* connecting four stories or less serving and contained within an individual *dwelling unit* or *sleeping unit* or *live/work unit*.
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways* and *ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway* or *ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways* and *ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways* and *ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways* and *ramps* serving *smoke-protected* or *open-air assembly seating* complying with the *exit access travel distance* requirements of Section 1029.7.
8. *Exit access stairways* and *ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.
9. ~~Exterior~~ Exit access stairways or ramps between serving occupied roofs.

Committee Reason: The modification to Section 1006.3.1 is an editorial correction for better English. The modification to Section 1006.3.2 will allow for the exit access stairways to move down from the occupied roof and into the building for means of egress from the roof. As a new exception, the exit access travel distance, not the number of stories, will be the limiting factor. Without the modification, Section 1006.3.2 Exception 7 would only be applicable if there were multiple roofs and it would limit the application to exterior exit access stairways.

This proposal separates out occupied roofs into a new Section 1006.3.1 which will clarify how egress is addressed for occupied roofs. There was no discussion on the new Exception 3 for Section 1006.3.2. (Vote: 9-5)

Individual Consideration Agenda

Public Comment 1:

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

SECTION 1006 NUMBER OF EXITS AND EXIT ACCESS DOORWAYS

1006.1 General. The number of *exits* or *exit access doorways* required within the *means of egress* system shall comply with the provisions of Section 1006.2 for spaces, including *mezzanines*, and Section 1006.3 for *stories* or occupied roofs.

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section.

1006.3.1 Occupant load. Where stairways serve more than one story, or more than one story and an occupied roof, only the occupant load of each story or occupied roof, considered individually, shall be used when calculating the required number of exits or access to exits serving that story.

1006.3.2 Path of egress travel. The path of egress travel to an *exit* shall not pass through more than one adjacent *story*.

Exception: The path of egress travel to an *exit* shall be permitted to pass through more than one adjacent *story* in any of the following:

1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and *ramps* connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.
2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.
3. Exit access stairways and ramps within an atrium comply with the provisions of Section 404.
4. Exit access stairways and *ramps* in open parking garages that serve only the parking garage.
5. Exit access stairways and *ramps* serving *open-air assembly seating* complying with the exit access travel distance requirements of Section 1029.7.
6. Exit access stairways and *ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.
7. ~~Exit access stairways and ramps serving occupied roofs.~~

1006.3.3 Egress based on occupant load. Each *story* and occupied roof shall have the minimum number of separate and distinct *exits*, or access to *exits*, as specified in Table 1006.3.2. A single *exit* or access to a single *exit* shall be permitted in accordance with Section 1006.3.3. The required number of *exits*, or *exit access stairways* or *ramps* providing access to *exits*, from any story or occupied roof shall be maintained until arrival at the *exit discharge* or a *public way*.

1019.3 Occupancies other than Groups I-2 and I-3. In other than Group I-2 and I-3 occupancies, floor openings containing *exit access stairways* or *ramps* that do not comply with one of the conditions *listed* in this section shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

1. *Exit access stairways and ramps* that serve or atmospherically communicate between only two stories. Such interconnected stories shall not be open to other stories.
2. In Group R-1, R-2 or R-3 occupancies, *exit access stairways and ramps* connecting four stories or less serving and contained within an individual *dwelling unit or sleeping unit or live/work unit*.
3. *Exit access stairways* serving and contained within a Group R-3 congregate residence or a Group R-4 facility are not required to be enclosed.
4. *Exit access stairways and ramps* in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the *stairway or ramp* and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. *Exit access stairways and ramps* within an *atrium* complying with the provisions of Section 404.
6. *Exit access stairways and ramps* in *open parking garages* that serve only the parking garage.
7. *Exit access stairways and ramps* serving *smoke-protected or open-air assembly seating* complying with the *exit access* travel distance requirements of Section 1029.7.
8. *Exit access stairways and ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.
9. ~~*Exit access stairways or ramps serving occupied roofs.*~~

Commenter's Reason: We have no objection to the new Exception 3 in Section 1006.3.2, and we agree with the grammatical edit to Section 1006.3.1. This public comment preserves those two features of the original code change proposal. However, we do not agree with the as-modified version of 1006.3.2.

The floor modification to Section 1006.3.2, changing "exterior exit access stairways or ramps between occupied roofs" to "exit access stairways and ramps serving occupied roofs" [emphasis ours] is flawed as it overly-broadened the scope of the original exception, and violated the intent of the charging language in 1006.3.2.

Section 1006.3.2 (in the new numbering scheme) essentially requires two enclosed exits be available in the adjacent story below, if a story is using an exit access stairway as its second means of egress. This principle has been debated in several cycles, and has been upheld by the membership despite several attempts to delete the requirement.

The as-modified exception will allow an occupied roof to be served only by one vertical exit enclosure, along with an unenclosed exit access stairway. For an office building, the unenclosed exit access stairway can pass through an unlimited number of stories. (An unlimited open exit access stairway is allowed in an M Occupancy, but a roof deck is not likely.) In the vast majority of cases, it is unlikely the exit travel distance down the unenclosed exit access stairway will be limited because exit travel distance is measured to the nearest exit—which will likely be the vertical exit enclosure.

Should this exception survive in the as-modified form, the next logical step would be deletion of the entire section in the next cycle. If an unoccupied roof is allowed to have one enclosed stair and one unenclosed stair as its means of egress, why require two enclosed stairs for any story? We believe this is a dangerous precedent to set, and ask for the membership's support in preventing any erosion of the principle stated above.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Corrects an egress issue created by a floor modification. There should be no impact on the cost of construction from the original proposal.

Public Comment 2:

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com) requests As Submitted.

Commenter's Reason: As originally submitted I was simply trying to clarify in Sections 1006.3.2, exception 7 that if there were more than one occupied roof on a building that an exterior exit access stairways could be used for exit access off the roof(s). The modification, while originally seeming to be simple, complicated the exception by allowing the exit access stair from a roof to go any number of stories down through the building and not be limited by the "one adjacent story" limitation in the charging language since this is an exception.

That was not my intent and I do not believe it should be a part of this code change. Therefore I ask that the membership disapprove the change As Modified and instead approve it As Submitted.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

By not accepting the modification, the cost of construction will not be affected.

Public Comment 3:

Proponent: Jonathan Siu, City of Seattle Department of Construction and Inspections, representing City of Seattle Department of Construction and Inspections (jon.siu@seattle.gov) requests As Submitted.

Commenter's Reason: This public comment requests the proposal be returned to its originally-proposed text. Our main concern relates to the changes made by the Means of Egress Committee in Exception 7 to 1006.3.2 and Exception 9 to Section 1019.3. We fully support all of the language the proponent originally submitted. We do not support the Committee-approved floor modification submitted at the Committee Action Hearings in Columbus.

Once we had a chance to fully evaluate the effects of the modification introduced on the floor in Columbus and subsequently approved by the Committee, it became obvious to us that the modified text in the exceptions is not in keeping with the intent of the charging language in Section 1006.3.2, and sets a dangerous precedent.

The charging language in Section 1006.3.2 (using the numbering system proposed by this code change proposal) was originally introduced to prevent situations shown in Figure 1 below. This figure illustrates a multi-story building that has one (enclosed) interior exit stair and one (unenclosed) exit access stairway. Prior to the introduction of the code text in 1006.3.2, the code would have allowed this situation in a B or M occupancy. (Recall that in a B or M Occupancy, an unenclosed exit access stairway is not limited in height.)

Fig. 1 – IBC Sec. 1006.3.2 prevents this configuration

Section 1006.3.2 essentially requires a path of egress to transition from an unenclosed exit access stairway to an interior exit stair within one story. Note that this principle of transitioning from an unenclosed exit access stairway to an (enclosed) interior exit stair in the adjacent story below was cited in the reason statement for Code Change Proposal E27-15, and was upheld by the Means of Egress Committee in Columbus in their disapproval of Code Change Proposal E20-18 by a 14-0 vote. The reason they gave for disapproval was, "The exceptions that permit the travel on exit access stairways to go more than one story were carefully considered. This should not be extended to stairways with draft curtains or atriums. This is too great of an opportunity for smoke migration within high rise buildings."

However, this proposal with the floor modification approved by the Committee would allow a similar, dangerous situation for a roof deck, as shown in Figure 2. This figure depicts a multi-story building with an occupied roof. All stories have access to the two interior exit stairs. The occupied roof is served by an interior exit stair (on the right), and an unenclosed exit access stairway. Because the modification introduced on the floor at the Committee Action Hearings in Columbus exempts stairs serving an occupied roof from the shall not pass through more than one adjacent story restriction, this means that the unenclosed exit access stairway is not required to transition to the enclosed exit stair on the left of the figure at the uppermost story. That is, the exit access stair could be isolated from the second enclosed exit stair. This is a dangerous precedent to set, as one could argue if an unenclosed exit access stairway of unlimited height (in a B or M occupancy) is allowed to be the second means of egress for an occupied roof, why should there be any restriction on using the same arrangement for a story?

Fig. 2 - E18-18 As Modified – Occupied Roof Served by Exit Access Stairway

This is not a hypothetical issue, as we in Seattle have recently seen several applications for high rise office building tenants sporting unenclosed convenience stairs extending as many as 10 or 12 stories through the building. In those buildings, it can easily be conceived that the convenience stairs would become the only second means of egress for all the stories they serve. Extending the concept of unenclosed stairs serving an occupied roof to these stories would be done in a heartbeat, if this as-modified proposal were to survive.

This public comment returns to the originally proposed text of Section 1006.3.2, Exception 7, and Section 1019.3, Exception 9, and keeps them in alignment. We believe the proponent of the original code change had a legitimate issue that is addressed with his proposed language. There are cases of buildings with multiple roof levels with roof decks (Figure 3), or roofs with multiple levels of roof decks (Figure 4) where an exterior stair connecting the occupied roofs need not count toward the one adjacent story, as smoke will not accumulate at those levels.

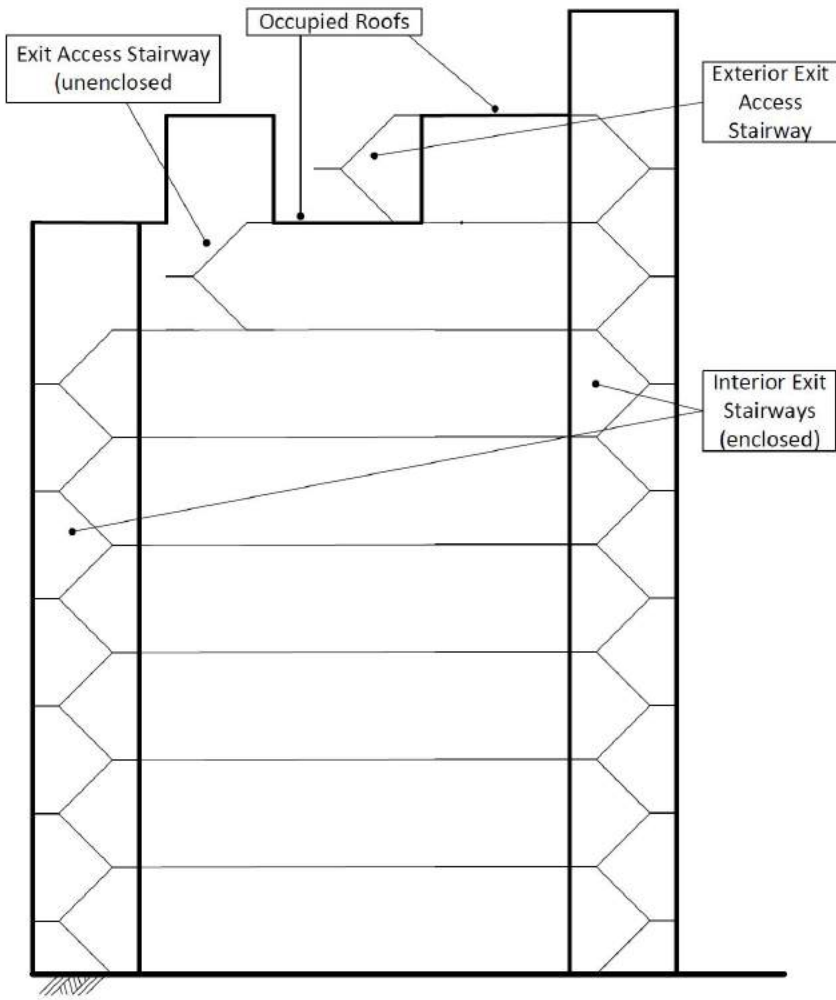

Fig. 3 - E18-18 As Submitted – Decks on Different Roof Levels

Fig. 4 - E18-18 As Submitted – Decks on Same Roof Level

We urge the ICC Governmental Voting Representatives to continue your support of the current requirements, and support this proposal As Submitted (AS). The current As Modified (AM) status cannot be allowed to carry into the 2021 IBC.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Since this public comment returns the substantive portions of the proposal to its As Submitted status, the cost impact statement is unchanged from the statement submitted with the original code change proposal: "This change will simplify design decisions, review and approval of projects, reducing the cost of construction."

E18-18

E20-18

IBC: 1006.3.1, (IFC[BE] 1006.3.1)

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. Where *stairways* serve more than one *story*, only the *occupant load* of each *story* considered individually shall be used in calculating the required number of *exits* or access to *exits* serving that *story*.

Delete without substitution

~~**1006.3.1 Adjacent story.** The path of egress travel to an *exit* shall not pass through more than one adjacent *story*.~~

~~**Exception:** The path of egress travel to an *exit* shall be permitted to pass through more than one adjacent *story* in any of the following:~~

- ~~1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.~~
- ~~2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.~~
- ~~3. Exit access stairways and ramps in open parking garages that serve only the parking garage.~~
- ~~4. Exit access stairways and ramps serving open air assembly seating complying with the exit access travel distance requirements of Section 1029.7.~~
- ~~5. Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.~~

Reason: The current list of exceptions allows for exit access stairways within 5 of the 8 options to use travel distance without a story limitation (individual dwelling units (#2), Group R-3 and R-4 congregate residences (#3), open parking garages (#6), open air seating (#7) and balconies (#8)). The 3 options currently limited to one story are the 2 story configuration (#1), water curtains around stairways opening (#4) and atriums (#5). These exceptions were added to the code by E27-15.

Travel distance, rather than stories should be the controlling factor. There would be no impact on two story configurations. Deletion of the requirement would allow for exit access travel distance to be measured down the open exit access stairway, regardless of the number of stories. This would now include open exit access stairways that use water curtains around stairways opening (#4) and atriums with smoke protection (#5). With the removal of the limitation for one story, none of the exceptions are needed.

This would be consistent with the BCAC proposal to revise measurement for travel distance along open exit access stairways in atriums.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will decrease the cost of construction

This will reduce the cost in those situations where an enclosure would have been required for the stairway in buildings with more than two stories.

E20-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The exceptions that permit the travel on exit access stairways to go more than one story were carefully considered. This should not be extended to stairways with draft curtains or atriums. This is too great of an opportunity for smoke migration within high rise buildings. (Vote: 14-0)

Assembly Action:

None

E20-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Sarah Rice, representing Himself (srice@preview-group.com); Stephen Thomas, Colorado Code Consulting, LLC (sthomas@coloradocode.net); Wayne Jewell (wayne.jewell@greenoaktwp.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1006.3.1 Adjacent story. The path of egress travel to an *exit* shall not pass through more than one adjacent *story*.

~~Exception~~Exceptions:

1. The path of egress travel to an *exit* shall be permitted to pass through more than one adjacent *story* in any of the following:

~~1.1.1.~~In Group R-1, R-2 or R-3 occupancies, exit access stairways and *ramps* connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.

~~2.1.2.~~Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.

~~3.1.3.~~Exit access stairways and *ramps* in open parking garages that serve only the parking garage.

~~4.1.4.~~Exit access stairways and *ramps* serving *open-air assembly seating* complying with the exit access travel distance requirements of Section 1029.7.

~~5.1.5.~~Exit access stairways and *ramps* between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, *places of religious worship*, auditoriums and sports facilities.

2. The path of egress travel shall be permitted to pass through not more than three stories where not less than two exits can be entered within the exit access travel distances specified in Section 1017.2.

Commenter's Reason: The one story limitation for egress to an exit via an exit access stair/ramp was introduced in the 2012 IBC via Code Change E5-09/10, from the ICC Code Technology Committee. As the concept of allowing access to another exit via an exit access stair was previously limited to 2 stories in the 2009 IBC, it was consistent to incorporate that limitation. But as communities have fully embraced and adopted the 2012, 2015 and now the 2018 IBC and the design community is looking to utilize this design options, the constraints of trying to fully use the 1-story limitation are becoming visible. This is confirmed by the submittal of the code change itself - in that it has been brought forth by the ICC Building Code Action Committee (BCAC) which is comprised of a very knowledgeable group of enforcement official, industry representatives and code uses.

We the proponents agree with the BCAC that the 1-story limitation is too restrictive, but we feel that not having a limitation is too extreme. Our proposed modification seeks to allow the use of exit access stairs/ramps to access an exit on another story with 1) a three (3) story limit, and 2) a requirement that at least 2 exits be located within the exit access travel distances specified in Section 1017.

We reviewed the code related provisions to the location of exits (i.e., exit access travel distance), the enclosure of exits (i.e., fire rating) and for the protection methods required of exit access stairs in Section 1019.1 (i.e., configuration limits, draft curtains and closely spaced sprinklers). As the overarching requirement associated with the means of egress for a building is that an occupant can get to a protected location in the exit access travel distances in Section 1017, we examined how it can be complied with when both a horizontal and vertical path is available. We feel that the protection

method afforded a 3-story exit access stair using Item 4 in Section 1019.1 combined with the mandate that an occupant must be able to reach a minimum of 2 exits within the exit access travel distance specified in Section 1017 affords the intended safety to the building occupants and ask that you support this modification.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The implementation of the concept outlined in this proposal will not increase the cost of construction, but may decrease the cost of construction.

E21-18

IBC: 1006.3.1, (IFC[BE] 1006.3.1)

Proposed Change as Submitted

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com); Douglas Evans, representing DHE FPE LLC (dhefpe@gmail.com)

2018 International Building Code

Delete and substitute as follows

~~**1006.3.1 Adjacent story.** The path of egress travel to an exit shall not pass through more than one adjacent story.~~

~~**Exception:** The path of egress travel to an exit shall be permitted to pass through more than one adjacent story in any of the following:~~

- ~~1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit, sleeping unit or live/work unit.~~
- ~~2. Exit access stairways serving and contained within a Group R-3 congregated residence or a Group R-4 facility.~~
- ~~3. Exit access stairways and ramps in open parking garages that serve only the parking garage.~~
- ~~4. Exit access stairways and ramps serving open air assembly seating complying with the exit access travel distance requirements of Section 1029.7.~~
- ~~5. Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.~~

1006.3.1 Access to exits at other levels. In other than Group I-2 and I-3 occupancies, access to exits at other building levels utilizing unenclosed exit access stairways and ramps shall be permitted. Such exit access stairways and ramps shall comply with one or more of the conditions listed in Section 1019.3. Regardless of the number of stories permitted to be served by the unenclosed exit access stairway or ramp, the exit access travel distance to the entrance to an exit shall not exceed the limitations set forth in Section 1017.2.

Reason:

This was the original intent of the ICC Code Technology Committee proposal E5-09/10 that was approved for the 2015 edition of the IBC. The logic was to allow the long established vertical opening exceptions to stand on their own merit. If these specific conditions have been deemed to provide acceptable fire migration limits, it stands to reason that exit access travel distance may occur within those tenable environments.

However, a separate proposal overlaid the E5 provisions in Section 1006.3 by limiting path of egress travel to an exit only from an adjacent level. This effectively rendered the CTC methodology as moot.

Realizing that the single adjacent story provision was overly restrictive and did not recognize former exit access provisions, five exceptions to the adjacent story requirement were created for the 2018 edition based on the conditions contained in Section 1019.3. Inexplicably, only five of the eight conditions were referenced.

This proposal completes the correction by eliminating the base restriction and the five accompanying exceptions. In doing so, it returns to the original CTC methodology and recognizes all empirical Section 1019.3 fire migration scenarios that have been contained in the IBC and legacy codes for decades. Additionally, it describes the procedure for determining how to access exits at other stories by way of exit access stairways or ramps. Approval of this proposal will allow for the more flexible design of the exit access portion of the means of egress system and achieve more consistent interpretations of the provision.

Cost Impact: The code change proposal will decrease the cost of construction. The proposal will allow for access to exits by unenclosed exit access stairways in atriums and buildings with specifically protected vertical openings.

Staff Note: Section 1006.3.1 was added to the 2018 IBC by code proposal E27-15.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The exceptions that permit the travel on exit access stairways to go more than one story were carefully considered. This should not be extended to stairways with draft curtains or atriums as permitted in Section 1019. This is too great of an opportunity for smoke migration within high rise buildings. The additional language adds no additional information. Disapproval would be consistent with the committee action on E20. (Vote: 14-0)

Assembly Action:

None

E21-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gregory Keith, representing DHE FPE LLC (grkeith@mac.com); Douglas Harold Evans, DHE FPE LLC, representing DHE FPE LLC (dhefpe@gmail.com)requests As Submitted.

Commenter's Reason: Item E21-18 was intended to clarify provisions for access to exits at other levels and to make those provisions consistent with Section 1019.3 that permits unenclosed exit access stairways and ramps. The committee disapproved the proposal citing that Section 1019.3, Conditions 4 and 5 were potentially unsafe. In the committee's reason statement they noted that, "This should not be extended to stairways with draft curtains or atriums as permitted in Section 1019. This is too great of an opportunity for smoke migration in high rise buildings." The fact of the matter is that all of the conditions listed in Section 1019.3 have been long recognized as providing acceptable levels of control of smoke migration. Indeed, Conditions 4 and 5 were provisions that were permitted by all of the legacy codes for numerous decades. To now arbitrarily question their efficacy is inappropriate. There has been no life loss history resulting from the design conditions in question. Additionally, the committee should be reminded that the proposal limits occupant exposure within those areas based on the allowable travel distance. Regardless of the smoke migration potential, a given occupant will be limited to less than two minutes of travel time based on the permitted exit access travel distance. The committee thinking is also inconsistent in that they regard access to an exit within an atrium as a risk, yet at Item E96-18 they voted to retain Exception 2 to Section 1023.2 which permits an unenclosed stairway within an atrium (high rise or otherwise) to serve as a formal exit.

The concept of accessing exits at other building levels by way of exit access stairways was formalized in the International Code Council, Code Technology Committee's proposal E5-09/10. That proposal recognized that there were a number of currently permitted design conditions that allowed for vertical openings greater than a simple adjacent story. All of the conditions cited at Section 1019.3 are frequently utilized in building design and have been empirically validated for decades. The premise of the CTC Means of Egress Committee was that if a given opening was currently permitted based on fire and smoke migration concerns, it should be safe to allow for exit access travel in such areas within applicable exit access travel distance limitations.

The ICC Building Code Action Committee agrees with this approach. They submitted two proposals (E19-18 and E20-18) which accomplished essentially the same technical end as E21-18. The committee disapproved both of those proposals citing the same smoke development concerns. This public comment supports Item E21-18. E21 is preferred because it states the prescribed design conditions associated with the use of exit access stairways to access exits at other building levels so as to enhance user comprehension and uniformity of application. Included is the requirement that such exit access stairway or ramp meets one of the specific conditions detailed at Section 1019.3. Also, it stipulates that exit access travel on such stairways or ramps shall not exceed the limitations of Section 1017.2.

This concept has been well studied and supported by the ICC CTC and BCAC for almost a decade. This public comment will cause that vision to finally become reality. The lack of pertinent life loss history indicates that access to exits at other building levels in accordance with this public comment will be safe for building occupants.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This proposal will allow for access to exits by unenclosed exit access stairways and ramps in atriums and buildings with specifically protected vertical openings.

IBC: SECTION TABLE 1006.3.2, TABLE 1006.3.3(1), TABLE 1006.3.3(2), (IFC[BE] TABLE 1006.3.2, TABLE 1006.3.3(1), TABLE 1006.3.3(2))

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows

SECTION 1006 NUMBER OF EXITS AND EXIT ACCESS DOORWAYS

1006.3 Egress from stories or occupied roofs. The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. Where *stairways* serve more than one *story*, only the *occupant load* of each *story* considered individually shall be used in calculating the required number of *exits* or access to *exits* serving that *story*.

1006.3.2 Egress based on occupant load. Each *story* and occupied roof shall have the minimum number of separate and distinct *exits*, or access to *exits*, as specified in Table 1006.3.2. A single *exit* or access to a single *exit* shall be permitted in accordance with Section 1006.3.3. The required number of *exits*, or *exit access stairways* or *ramps* providing access to *exits*, from any *story* or occupied roof shall be maintained until arrival at the *exit discharge* or a *public way*.

**TABLE 1006.3.2
MINIMUM NUMBER OF EXITS OR ACCESS TO EXITS PER STORY OR OCCUPIED ROOF**

OCCUPIED LOAD PER STORY	MINIMUM NUMBER OF EXITS OR ACCESS TO EXITS FROM PER STORY <u>OR OCCUPIED ROOF</u>
1-500	2
501-1,000	3
More than 1,000	4

1006.3.3 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or occupied roof where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and common path of egress travel distance do not exceed the values in Table 1006.3.3(1) or 1006.3.3(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
 - 5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
 - 5.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved independent exits*.

TABLE 1006.3.3(1)
STORIES AND OCCUPIED ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY AND OCCUPIED ROOF	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane	R-2 ^{a, b}	4 dwelling units	125 feet
<u>Occupied roof over the first, second or third story above grade plane</u>	R-2 ^{a, b}	NA	<u>125 feet</u>
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 3048 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. This table is used for R-2 occupancies consisting of *dwelling units*. For R-2 occupancies consisting of *sleeping units*, use Table 1006.3.3(2).

TABLE 1006.3.3(2)
STORIES AND OCCUPIED ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIED ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIED ROOF	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)
<u>First story above or below grade plane and occupied roofs over the first story above grade plane</u>	A, B ^b , E F ^b , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2 ^{a, c}	10	75
	S ^{b, d}	29	75
<u>Second story above grade plane and occupied roof over the second story above grade plane</u>	B, F, M, S ^d	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or on the roof of such buildings shall have a maximum *exit access* travel distance of 100 feet.
- c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.3(1).
- d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

Reason: This is part of a series of 3 proposals dealing with occupied roofs. See BCAC proposals to the definition of penthouse and Section 1009.

The change to the title and heading in Table 1006.3.2 is for consistency with the text.

The proposed modifications to Section 1006 includes adding 'occupied roofs' to Table 1006.3.3(1) to clarify the conditions in which one exit or access to one exit is allowed for Group R-2 occupancies. The tables are modified to clarify that the occupied roofs are allowed 'over the allowable stories.'

Similarly this proposal adds 'occupied roofs' to Table 1006.3.3(2) to clarify the conditions in which one exit or access to one exit is allowed for the other occupancies. The table was also modified to clarify that the occupied roofs are allowed 'over the allowable stories.' A proposed modification to footnote b of the table clarifies that the allowable increase in exit access travel distance from 75 feet to 100 feet for properly sprinklered Group B, F and S occupancies also includes the roof area for these uses.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal provides clarification to a subject that was not previously addressed. The changes to the single occupant tables could allow for one exit stairway from an occupied roof instead of two.

E22-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Where an occupied roof can have a single exit is an issue that needs to be addressed, however, in Table 1006.3.3(1) and 1006.3.3(2) the proposal would allow a single exit roof over what was previously allowed as a single exit story. The roof should be treated as a story and limited as such for a single exit - match the current allowed height rather than exceed the current height limits. (Vote: 9-5)

Assembly Action:

None

E22-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

**TABLE 1006.3.3(1)
STORIES AND OCCUPIED ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES**

STORY AND OCCUPIED ROOF	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE
Basement, first, or second or third story above grade plane	R-2 ^{a, b}	4 dwelling units	125 feet
Occupied roof over the first, second or third story above grade plane	R-2 ^{a, b}	NA	125 feet
Fourth <u>story above grade plane and higher</u>	NP	NA	NA
<u>Occupied roof over third story above grade plane and higher</u>	<u>NP</u>	<u>NA</u>	<u>NA</u>

For SI:

1 foot = 3048 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.

b. This table is used for R-2 occupancies consisting of *dwelling units*. For R-2 occupancies consisting of *sleeping units*, use Table 1006.3.3(2).

**TABLE 1006.3.3(2)
STORIES AND OCCUPIED ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES**

STORY AND OCCUPIED ROOF	OCCUPANCY	MAXIMUM OCCUPANT	LOAD PER STORY AND OCCUPIED ROOF
First story above or below grade plane and occupied roofs over the first story above grade plane	A, B ^b , E F ^b , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2 ^{a, c}	10	75
	S ^{b, d}	29	75
Second story above grade plane and occupied roof over the second story above grade plane	B, F, M, S ^d	29	75
Third story above grade plane and higher	NP	NA	NA

For SI:

1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.

b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or on the occupied roof of such buildings shall have a maximum *exit access* travel distance of 100 feet.

c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.3(1).

d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

Commenter's Reason: Per Section 1006.3, and occupied roof is treated as a story for purposes of means of egress. The change to Table 1006.3.2 is needed for consistency with that text.

The revisions for the single exit tables is to clarify where a single exit is permitted from an occupied roof. The original proposal allowed for a single exit roof over any single exit story. The modification would allow for a single exit roof above a single story building since that is the same vertical travel distance as permitted for a basement. The upper limit for two and three story buildings has been revised to only allow for a single exit roof at the same height as currently permitted for a single exit story.

The revisions to the footnotes under Table 1006.3.3(2) is for consistent language.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This proposal provides clarification to a subject that was not previously addressed. The changes to the single occupant tables could allow for one exit stairway from an occupied roof instead of two.

E24-18

IBC: 1006.3.3, TABLE 1006.3.3(1), TABLE 1006.3.3(2), (IFC[BE] 1006.3.3, TABLE 1006.3.3(1), TABLE 1006.3.3(2))

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows

1006.3.3 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or occupied roof where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and ~~common path of egress~~ exit access travel distance do not exceed the values in Table 1006.3.3(1) or 1006.3.3(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
 - 5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
 - 5.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved independent exits*.

**TABLE 1006.3.3(1)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES**

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM COMMON PATH OF EGRESS- <u>EXIT ACCESS</u> TRAVEL DISTANCE
Basement, first, second or third story above grade plane	R-2 ^{a, b}	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 3048 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. This table is used for R-2 occupancies consisting of *dwelling units*. For R-2 occupancies consisting of *sleeping units*, use Table 1006.3.3(2).

**TABLE 1006.3.3(2)
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES**

STORY	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY	MAXIMUM COMMON PATH OF EGRESS EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane	A, B ^b , E F ^b , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2 ^{a, c}	10	75
	S ^{b, d}	29	75
Second story above grade plane	B, F, M, S ^d	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall have a maximum *exit access* travel distance of 100 feet.
- c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.3(1).
- d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

Reason: There is a conflict in terminology used for single exit criteria for stories/buildings in the IBC Section/Tables 1006.3.3 and IEBC Section/Tables 805.3.1.1. The intent of this proposal is a clarification, without technical revisions. Below is the definition for common path of egress travel and exit access and a graphic from the IBC commentary illustrating the terms. Single exit stories/buildings cannot have a common path of egress travel since two exits are not required. The correct term is “exit access travel distance”. This would match the terminology in the column headings for single exit tables with the footnotes for the single exit tables in the IBC and the table heading and footnotes in the IEBC.

If you look at the history for the single exit tables, until the reorganization that combined single exit spaces and stories, the term used was ‘exit access travel distance.’

With the text incorrectly used in IBC Section 1006.3.3, it could be interpreted that the travel distance has to be to a place where there are two exits - which is on the ground floor - regardless if the stairway is an exit access or exit stairway. Exit access travel distance should stop at the door to the exit stairway.

COMMON PATH OF EGRESS TRAVEL. That portion of the *exit access* travel distance measured from the most remote point within a *story* to that point where the occupants have separate access to two *exits* or *exit access* doorways.

EXIT ACCESS. That portion of a *means of egress* system that leads from any occupied portion of a building or structure to an *exit*.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

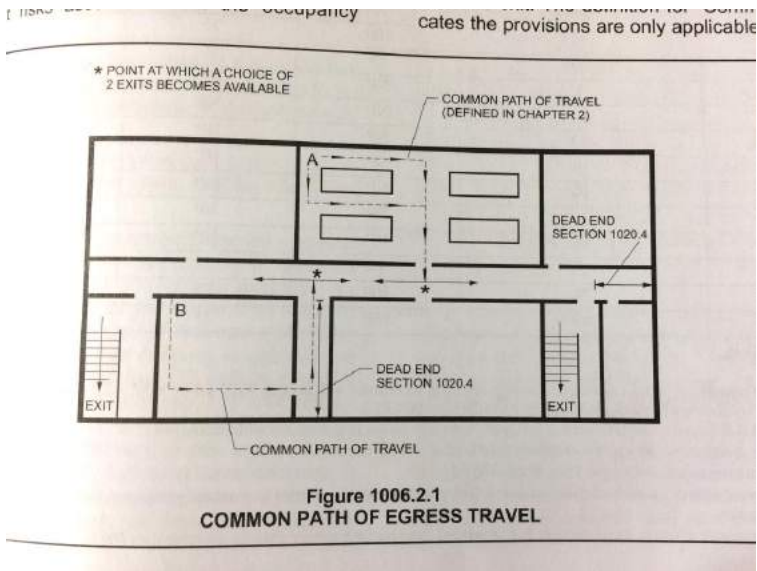

Figure 1006.2.1 from IBC Commentary

Cost Impact: The code change proposal will not increase or decrease the cost of construction
As the proposal essentially provides clarification to a subject that has created confusion.

E24-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This is a good clarification for a point that has been confusing users of the codes. "Common path of travel" is not the correct term for single exit conditions - it is for two exit conditions. "Exit access" is the correct term for single exit buildings and stories. This will coordinate the terminology in the table with the current footnotes and similar sections in the IEBC. (Vote: 11-3)

Assembly Action:

None

E24-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com) requests Disapprove.

Commenter's Reason: IBC common path of egress travel provisions have evolved over many code development cycles. Those provisions are currently comprehensive, understandable and uniformly applied. E24-18 which was approved by a vote of 11-3 represents a technical departure from current provisions. In the published reason statement justifying approval, the committee stated, "This is a good clarification for a point that has been confusing users of the codes." Perceived confusion results when current requirements are compared to former legacy code provisions. The reason statement continues, "Common path of travel is not the correct term for single exit conditions--it is for two exit conditions. Exit access is the correct term for single exit buildings and stories."

Presently, Section 1006.3.3 text and tables reference common path of egress travel as a qualifying criterion for the determination of multi-exit stories. Section 1006.3.3 establishes the single exit design condition as the default. Proposal E24-18 substitutes the term exit access travel distance in lieu of common path of egress travel for the previously stated reason. The proposal and its logic are severely flawed. In the published justification for approval the initial submittal states, "Single exit stories/buildings cannot have a common path of egress travel since two exits are not required." This statement is in direct contravention with the definition of common path of egress travel. That definition states, "That portion of exit access travel distance measured for the most remote point of each room, area or space to that point where the occupants have separate and distinct access to two exits or exit access doorways." By definition, all travel within a story served by a single exit is common path of egress travel as two exits are not available.

Section 1006 establishes the provisions for the determination of the required number of exits or exit access doorways from various building areas. As previously stated, the default is a single exit/exit access doorway design condition. A second exit is required when either of two considerations is exceeded. Those issues are occupant load and common path of egress travel. Specifically, when the common path of egress travel is exceeded (that is, occupants do not have separate and distinct access to two exits or exit access doorways) a second exit/exit access doorway becomes required. Accordingly, common path of egress travel is the correct term when referencing areas served by a single exit. Where E24 utilizes the term exit access travel distance, it should be noted that the definition of common path of egress travel states that common path of egress travel is that portion of exit access travel distance..... The specific term is appropriate.

Approval of E24-18 will create confusion among code practitioners. Table 1006.2.1 provides criteria for the determination of a second required exit/exit access doorway from individual rooms, areas or spaces. Those criteria are occupant load and common path of egress travel. Using a different criterion in Tables 1006.3.3.1 and 1006.3.3.2 for the determination of a second required exit from a given story begs the question: Why are there different terms used within the same section? The answer is that they should not be different.

There is no confusion if the code practitioner reads the definition of Section 202 and determines the applicable technical requirements of Section 1006. All provisions are in technical context. Approval of E24-18 will create confusion as opposed to providing clarification as hoped. The published reason statement also stated, "This will coordinate the terminology in the table with the current footnotes and similar sections in the IEBC." That coordination should occur as errata to current footnote and IEBC provisions so that they correctly reference common path of egress travel requirements in accordance with fundamental IBC provisions.

Approval of this public comment for disapproval of E24-18 will maintain current logical and understandable provisions for the determination of second exits from given building stories.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Approval of this public comment will retain current code provisions.

E24-18

E30-18

IBC: 1009.2.1, (IFC[BE] 1009.2.1)

Proposed Change as Submitted

Proponent: Micah Chappell, representing City of Seattle (micah.chappell@seattle.gov)

2018 International Building Code

Revise as follows

1009.2.1 Elevators required. In buildings where a required *accessible floor or occupied roof* is four or more stories above or below a *level of exit discharge*, not less than one required *accessible means of egress* shall be an elevator complying with Section 1009.4.

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *ramp* conforming to the provisions of Section 1012.

Reason: The code recognizes that there are practical limits to complete reliance on assisted evacuation of building occupants by fire personnel because of the limited availability of trained personnel or special devices. As a result, current ICC language requires an elevator be part of the accessible means of egress starting with the 4th story above the level of exit discharge (See 1009.2.1). Occupied roofs at the same level do not currently have this same requirement. The vertical travel distance encountered by a fire fighter performing an assisted rescue is the same whether the occupants are on an occupied roof on the 4th floor above the level of exit discharge or whether they are on the floor of the 4th story above the level of exit discharge within the building. As occupied roofs become more popular this becomes more of an issue for building departments around the country.

Occupied roofs at four or more stories above the level of exit discharge should be treated like occupied floors at the same level in the building. The occupant loads and hazards are similar between occupied roofs and occupied floors, the benefits to occupants and fire personnel from an elevator with emergency back-up power are similar, and a similar approach has been taken in other sections of the building code (see IBC Chapter 10 1006.3, 1006.3.2, and 1006.3.3). The 2018 IBC 1104.4 also requires at least one accessible route to each accessible story, mezzanine and occupied roof in multilevel buildings and facilities. If the requirements for an accessible route to the accessible level treat the occupied roof and accessible floor in the same manner, it is logical to conclude that the same level of protection for the accessible means of egress from an occupied roof should be required.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal clarifies the current intent of the accessible means of egress provisions of IBC 1009.2.1. The added language clarifies that an area of refuge and emergency power/legally required standby power must be provided per IBC 1009.4 for an occupied roof that is four or more stories above the level of exit discharge.

No fiscal impact.

E30-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This tells you when standby power is required for an elevator for building with an occupied roof. Occupied roofs are not currently addressed. The vertical distance for assisted rescue for a roof on the top of a 4 story building is the same as a 5th floor, so standby power should be required. Separate provisions for the occupied roof, to avoid confusion over if the occupied roof is a story, floor or level, would make this cleaner. There is an question with the current exception for horizontal exits as an alternative for standby power being permitted on lower floors, which would not be buildable on the roof. Occupied roofs, by being open to the outside air, may be safer than the floor with horizontal exits. See E29-18. (Vote: 8-7)

E30-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Micah Chappell, representing Seattle Department of Construction and Inspection (micah.chappell@seattle.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1009.2.1 Elevators required. In buildings where a required *accessible* floor or occupied roof is four or more stories above or below a *level of exit discharge*, not less than one required *accessible means of egress* shall be an elevator complying with Section 1009.4.

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors or occupied roof provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *ramp* conforming to the provisions of Section 1012.

Commenter's Reason: Original proposal was approved by Committee. See 2018 Committee Action Hearing for original reason statement.

This modification coordinates the charging language change approved at the CAH with Exception 1.

Exception 1 acknowledges that a building that is fully sprinklered and a horizontal exit provides an acceptable level of protection. That level of protection is also achieved with an occupied roof meeting these criteria thus the exception should apply.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No fiscal impact.

Public Comment 2:

Proponent: Micah Chappell, representing Seattle Department of Construction and Inspection (micah.chappell@seattle.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1009.2.1 Elevators required. In buildings where a required *accessible* floor or occupied roof is four or more stories above or below a *level of exit discharge*, not less than one required *accessible means of egress* shall be an elevator complying with Section 1009.4.

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors or occupied roof provided with a *ramp* conforming to the provisions of Section 1012.

Commenter's Reason: Original proposal was approved by Committee. See 2018 Committee Action Hearing for original reason statement.

This modification coordinates the charging language change approved at the CAH with Exception 2.

Exception 2 applies where sprinklers are provided, and the ramp provides an adequate route down for assisted rescue. That level of protection is also achieved with an occupied roof meeting these criteria thus the exception should apply.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No fiscal impact.

Public Comment 3:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1009.2.1 Elevators required. In buildings where a required *accessible* floor ~~or occupied roof~~ is four or more stories above or below a *level of exit discharge or where an accessible occupied roof is above a story that is three or more stories above the level of exit discharge*, not less than one required *accessible means of egress* shall be an elevator complying with Section 1009.4.

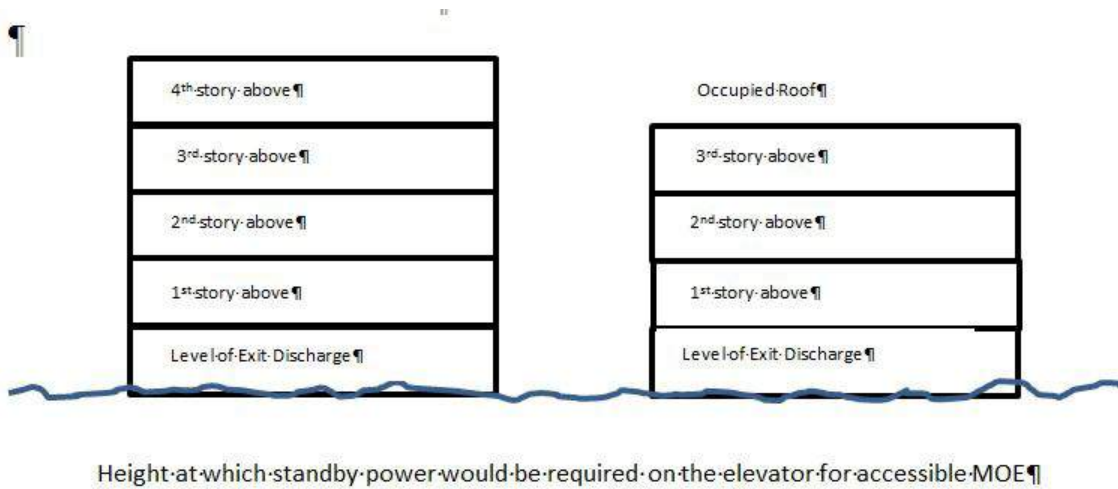

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *ramp* conforming to the provisions of Section 1012.

Commenter's Reason: The new language is confusing. An occupied roof is not a story. Therefore, to be clear, the requirement for an occupied roof should be dealt with separately. It is not the intent of this public comment to change to result of what was voted approved by the MOE Code Development Committee.

It is important to point out that the original change said that there was no fiscal impact. Since the occupied roof is not considered a story, with the 2018 text, it could have been interpreted that standby power was not required to an occupied roof on a 5 story building. Therefore, this does have a significant cost for a 4 story building that decides to have an occupied roof.

The result will be as follows:

This public comment is submitted by the ICC BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions there of. In 2017 and 2018 the BCAC has held 5 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes and public comments. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This modification is a clarification of requirements, and will not change the requirement of the approved change. However, the original proposal claimed that there was no fiscal impact. Depending on how an occupied roof was interpreted, this could have significant fiscal impact by requiring standby power to the elevator in a 4 story building with an occupied roof.

Public Comment 4:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1009.2.1 Elevators required. In buildings where a required *accessible* floor or occupied roof is four or more stories above or below a *level of exit discharge*, not less than one required *accessible means of egress* shall be an elevator complying with Section 1009.4.

Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *ramp* conforming to the provisions of Section 1012.
3. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required for an occupied roof where the floors below are provided with a horizontal exit and located at or above the level of exit discharge.

Commenter's Reason: It is important to note that Section 1009.2.1 is for where an elevator is required for exiting, it is not the requirement for an accessible route to the roof (Section 1104.4). This requirement results in standby power to the elevator for fire department assisted rescue.

A building 5 stories or taller can use a horizontal exit so that the floors do not have to have standby power to the elevator. Protection for occupants is by moving from one smoke compartment to another. An occupied roof cannot provide a horizontal exit, but it is open to the outside air - which offers an equivalent or safer level of protection for occupants. The intent of the new exception 3 is that if someone has horizontal exits and a sprinkler system in the floors below the occupied roof, having an occupied roof would not then also trigger standby power. Very often the occupied roof area is smaller than the area of the floor below. Requiring standby power is a significant cost impact on a building. An example of application might be a 4 story or taller hospital that has a helicopter landing pad on the roof.

This will not change the original proposal, which will require standby power in a 4 story building with an occupied roof where the building does not have both sprinklers and horizontal exits.

The following is a diagram for illustration of this exception.

This public comment is submitted by the ICC BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 and 2018 the BCAC has held 5 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes and public comments. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. With the currently approved original proposal in place, this would be a cost savings for building with horizontal exits by not also requiring standby power to the elevator for just the occupied roof.

E30-18

E31-18

IBC: 1009.2.2 (New), (IFC[BE] 1009.2.2 (New))

Proposed Change as Submitted

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Building Code

Add new text as follows

1009.2.2 Separation of means of egress. Where more than one accessible means of egress is required, the entrance to at least two of the exits, stairways or elevators serving as part of the accessible means of egress shall be separated by a distance not less than 30 feet (9144 mm).

Reason: Because the elevator can serve as a component of the accessible means of egress, a standard core design with stairways at the opposite sides of the core and elevators in the middle will not allow a traditional remoteness application for the accessible means of egress. However, some separation should be required so that the possibility of a single event preventing egress is limited. The language is similar to that in Section 403.5.1 for remoteness of interior exit stairways in high rise buildings. In the case where multiple accessible means of egress are provided, the separation would apply to at least two of them.

Cost Impact: The code change proposal will increase the cost of construction. The possibility exists that some building configurations will need to be revised to accommodate this remoteness. In reality, it is unlikely that any measureable increase will exist for most buildings.

E31-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The 30 feet separation, where an elevator is required as one of the accessible means of egress may be too tough for small buildings. Section 403.5.1 was referenced for justification, but it is different - it allows for ¼ as well as 30 feet and it measures to the shafts instead of the entrances. In addition, this could be read as requiring elevators to be at least 30 feet apart. Two accessible means of egress next to each other would not meet the current criteria for independent means of egress, so this is already adequately addressed. (Vote: 8-5)

Assembly Action:

None

E31-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1009.2.2 Separation of means of egress. Where more than one accessible means of egress is required, the entrance to at least two of the exits, stairways or elevators serving as part of the accessible means of egress shall be separated by a distance that is not less than one-quarter of the length of the maximum overall diagonal of the building or area served, measured in a straight line between them; or, a minimum of 30 feet (9144 mm); whichever is less.

Commenter's Reason: The committee felt that the measurement based on a diagonal as well as a fixed dimension would be more appropriate and that the 30 feet separation could be onerous for small floor plate floors. The proposal addresses both of those by including the 1/4 diagonal criteria as well as the 30 feet but then allowing the lesser of the two to be used. This would address the condition where a core of the building has two stairways very near to one another and the elevators located between them. It is important that we have something in the code to address this separation. Right now there is nothing that prevents two elevators, side by side in teh same shat, from being used as both accessible means of egress. This addresses that need.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The net effect may increase costs. In most cases there will be no increase in cost but it would be foolish to expect there not being some condition, somewhere that would need to be adjusted to accommodate this criteria for separation.

E31-18

E32-18

IBC: 1009.4, 1009.4.3 (New), (IFC[BE] 1009.4, 1009.4.3)

Proposed Change as Submitted

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)

2018 International Building Code

Revise as follows

1009.4 Elevators. In order to be considered part of an *accessible means of egress*, an elevator shall comply with Sections 1009.4.1 and ~~1009.4.2~~ through 1009.4.3.

Add new text as follows

1009.4.3 Location. Where multiple elevators serve as more than one of the accessible means of egress, the elevators serving as different accessible means of egress must be provided with separate operating systems in accordance with Section 3003 and be located in separate elevator banks.

Reason: The provisions for elevators as accessible means of egress were written assuming only one group of elevators in a building. The second means of egress would always be a stairway. Literally, there is no limitation of how many elevators can be used to fulfil the requirement in Section 1009.1 for multiple accessible means of egress. It is reasonable to require some separation between elevators if the option selected is to use elevators for all the accessible means of egress. These elevators should not be in the same bank of elevators, but somewhere else in the building. This is a viable option in large building with banks of elevator spaced throughout the building.

Cost Impact: The code change proposal will increase the cost of construction. In the rare situation where multiple elevators are used, the increased cost would be that for the separation between hoistways.

E32-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The phrase ‘operating systems’ could be read to require a separate power source and standby power. This could conflict with the requirements for Occupant Evacuation Elevators. The term ‘banks’ is not currently defined – so this could be read differently than the intent of the proposal to use elevators in different part of the building rather than banks of elevators facing each other. There is no technical justification or identified issues to require this additional language. (Vote: 11-3)

Assembly Action:

None

E32-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1009.4 Elevators. In order to be considered part of an *accessible means of egress*, an elevator shall comply with Sections 1009.4.1 through 1009.4.3.

1009.4.3 Location. Where multiple elevators serve as ~~two or more~~ ~~than one~~ of the accessible means of egress, the elevators serving as different accessible means of egress ~~shall~~ ~~must~~ be provided in separate elevator banks, provided with separate ~~operating systems fire detection devices~~ in accordance with Section ~~3003~~ ~~and be located in separate~~ elevator banks ~~907.3.3~~.

Commenter's Reason: The committee felt that the language was overly complicated. Unfortunately the term "elevator bank" is not defined in the code, although it is used frequently. The language was changed from a reference to the emergency operating systems to instead rely on the smoke detector provided at the elevator lobby. Because one bank of elevator could be across the lobby from another, the reference would limit this to conditions where a multiple banks of elevators are provided or where a bank of passenger elevators and a separate service elevator are intended as the accessible means of egress.

There is no requirement that more than one levator be provided as part of the accessible means of egress. Certainly an elevator and a stairway could be used. This provision would only apply where elevators and not stairways are intended. It is a safety measure to prevent the condition where two elevators could be used, both within the same hoistway. There is nothing within the code to prohibit this currently. We need something to address that flaw.

This is offered as an alternative to E31.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. It is exceedingly unlikely that elevators will be used as the only accessible means of egress within a building. However, if such a condition would be created, this proposal would increase the cost by requiring a separation of elevators.

E32-18

E33-18

IBC:1009.6.2, (IFC[BE] 1009.6.2)

Proposed Change as Submitted

Proponent: Eirene Knott, BRR Architecture, representing Metropolitan Kansas City Chapter of the ICC
(Eirene.Knott@brrarch.com)

2018 International Building Code

Revise as follows

1009.6.2 Stairway or elevator access. Every required *area of refuge* shall have direct access to a *stairway* complying with Sections 1009.3 and 1023 or an elevator complying with Section 1009.4.

Exception: An interior area of refuge at the level of exit discharge that provides direct access to an exterior exit door.

Reason: While the code provides clear direction that areas of refuge in a multi story building must have direct access to an elevator or stairway, it is not clear on what qualifies as an interior area of refuge in a single story building. The purpose of this code change is to provide clear direction in the code that an interior area of refuge is permitted in a single story building, or in a multi-story building on the level of exit discharge, without a stairway or elevator which provides immediate access to the exterior of the building.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. If the code will now allow for an interior area of refuge in a single story building or on the level of exit discharge in a multi-story building, rather than require an exterior area of refuge in either situation, this may actually reduce the cost of construction as the exterior wall would no longer need to have a fire resistance rating.

E33-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: An interior area of refuge should be at a discoverable location, so having an area of refuge at a back door is not a good idea. You can do an exterior area of assisted rescue at the grade level back exit, which is preferred. (Vote: 13-1)

Assembly Action:

None

E33-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Eirene Knott, BRR Architecture, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com) requests As Submitted.

Commenter's Reason: The committee said that an interior area of refuge should be at a discoverable location. IBC Section 1009.9 and 1111.3 Item 3 require areas of refuge to be signed on the outside of the door leading to that area. That makes the area of refuge 'discoverable' by the occupants. The fire and safety plans in IFC 404.2.1 Item 4 and 404.2.2 Item 4.4.1 make sure the fire department knows where these areas are located. Currently the text does not address an area of refuge in a single story building at the second exit. It only addresses areas of refuge on upper floors. The proposed text fixes that technical glitch.

The image below represents what this proposed code change is attempting to allow, an interior area of refuge with direct access to the exterior of the building.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

If the code will now allow for an interior area of refuge in a single story building or on the level of exit discharge in a multi-story building, rather than require an exterior area of refuge in either situation, this may actually reduce the cost of construction as the exterior wall would no longer need to have a fire resistance rating in non-sprinklered buildings.

E33-18

IBC: 1010.1, 1020.1 (New), 1024.1, 1026.1, 1027.1, 1028.4, 1028.4.1, 1028.4.2, 1029(New), (IFC[BE] 1010.1, 1020.1 (New), 1024.1, 1026.1, 1027.1, 1028.4, 1028.4.1, 1028.4.2, 1029(New))

Proposed Change as Submitted

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com)

2018 International Building Code

Revise as follows

1010.1 ~~Doors~~General. ~~Means of egress doors shall meet the requirements of this section. Doors, gates and turnstiles~~ serving a *means of egress* system shall meet the applicable requirements of this section and Section 1022.2. Doors provided for egress purposes in numbers greater than required by this code shall meet the requirements of this section. *Means of egress* doors shall be readily distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Mirrors or similar reflecting materials shall not be used on *means of egress* doors. *Means of egress* doors shall not be concealed by curtains, drapes, decorations or similar materials.

Add new text as follows

1020.1 General. Corridors serving as an exit access component in a means of egress system shall comply with the requirements of this section.

Revise as follows

1024.1 ~~Exit passageways~~General. Exit passageways serving as an exit component in a *means of egress* system shall comply with the requirements of this section. An *exit passageway* shall not be used for any purpose other than as a *means of egress* and a *circulation path*.

1026.1 ~~Horizontal exits~~General. Horizontal *exits* serving as an exit in a *means of egress* system shall comply with the requirements of this section. A *horizontal exit* shall not serve as the only exit from a portion of a building, and where two or more *exits* are required, not more than one-half of the total number of *exits* or total exit minimum width or required capacity shall be horizontal *exits*.

Exceptions:

1. Horizontal *exits* are permitted to comprise two-thirds of the required *exits* from any building or floor area for occupancies in Group I-2.
2. Horizontal *exits* are permitted to comprise 100 percent of the *exits* required for occupancies in Group I-3. Not less than 6 square feet (0.6 m²) of *accessible* space per occupant shall be provided on each side of the *horizontal exit* for the total number of people in adjoining compartments.

1027.1 ~~Exterior exit stairways and ramps~~General. Exterior *exit stairways* and *ramps* serving as an ~~element of exit~~ component in a required means of egress system shall comply with the requirements of this section.

Add new text as follows

1029 EGRESS COURTS

Revise as follows

~~1028.4~~1029.1 Egress courtsGeneral. ~~Egress courts serving as a portion of the an exit discharge component in the means of egress system shall comply with the requirements of Sections 1028.4.1 and 1028.4.2 in this section.~~

~~1028.4.1~~1029.2 Width or capacity. The required capacity of *egress courts* shall be determined as specified in Section 1005.1, but the minimum width shall be not less than 44 inches (1118 mm), except as specified herein. *Egress courts* serving Group R-3 and U occupancies shall be not less than 36 inches (914 mm) in width. The required capacity and width of *egress courts* shall be unobstructed to a height of 7 feet (2134 mm). The width of the *egress court* shall be not less than the required capacity.

Exception: Encroachments complying with Section 1005.7.

1028.4.21029.3 Construction and openings. Where an *egress court* serving a building or portion thereof is less than 10 feet (3048 mm) in width, the *egress court* walls shall have not less than 1-hour *fire-resistance-rated* construction for a distance of 10 feet (3048 mm) above the floor of the *egress court*. Openings within such walls shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.

Exceptions:

1. *Egress courts* serving an *occupant load* of less than 10.
2. *Egress courts* serving Group R-3.

Reason: This is a series of editorial revisions intended to formalize the charging language of several sections within Chapter 10. The International Building Code is a so-called model code. Once adopted by a given political subdivision it becomes law. Having proper enabling or charging provisions for various technical requirements is legally necessary. Presently, Section 1020 for corridors contains no charging language. A general section has been created using the same format as is currently used in Section 1018 for aisles and Section 1019 for exit access stairways and ramps.

Section 1010.1 has been improved by adding the "General" section title to be consistent with other means of egress component sections. Additionally, the first and second sentences of Section 1010.1 are redundant. The first sentence has been deleted. The second sentence now clarifies that the section is applicable to gates and turnstiles consistent with the Section 1010 heading.

The titles of Sections 1024.1, 1026.1 and 1027.1 have been changed to "General" to be consistent with other means of egress component sections.

Lastly, egress courts are a means of egress component. In the Chapter 10 format, individual means of egress components have their own section. Currently, egress court provisions are located in Section 1028.4 within the exit discharge section. This proposal simply relocates the egress court technical provisions to a new Section 1029 so as to be consistent with other Chapter 10 provisions.

This proposal establishes the proper legal charging language for lacking sections. In doing so, it provides consistency within the various Chapter 10 means of egress component sections. Some practitioners are given to assigning an importance factor between different terms and formats. Approval of this proposal will clarify these important means of egress provisions.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal is essentially editorial.

E38-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 1010.1 Doors General. ~~Means of egress doors shall meet the requirements of this section. Doors, gates and turnstiles serving a means of egress system shall meet the applicable requirements of this section and Section 1022.2. Doors provided for egress purposes in numbers greater than required by this code shall meet the requirements of this section.~~

Means of egress doors shall be readily distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Mirrors or similar reflecting materials shall not be used on means of egress doors. Means of egress doors shall not be concealed by curtains, drapes, decorations or similar materials.

Committee Reason: The modification was to remove the change to Section 1010.1 from the proposal. The changes in E37-18 addressed this in a more comprehensive manner.

The revised language is consistent with the remainder of the sections in the code. There was concern about pulling Egress Courts out of the section for exit discharge without a general statement for this means of egress part as indicated in Sections 1003.1, 1014.1 and 1020.1. (Vote: 10-4)

Assembly Action:

None

E38-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

1028.1 General. The exit discharge shall comply with Sections 1028 and 1029 and the applicable requirements of Sections 1003 through 1015.

Commenter's Reason: A committee comment was, "There was concern about pulling Egress Courts out of the section for exit discharge without a general statement for this means of egress part as indicated in Sections 1003.1, 1014.1 and 1020.1." This public comment creates appropriate charging language and cross references at Section 1028.1 so as to be consistent with other means of egress parts sections.

Approval of this public comment will clarify E38-18 in accordance with committee comments.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment is editorial in nature.

Public Comment 2:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

~~1029~~ EGRESS COURTS

~~1029.1-1028.4~~ General Egress courts. ~~Egress courts serving as an a portion of the exit discharge component in the means of egress system shall comply with the requirements in this section of Sections 1028.4.1 and 1028.4.2.~~

~~1029.2-1028.4.1~~ Width or capacity. The required capacity of *egress courts* shall be determined as specified in Section 1005.1, but the minimum width shall be not less than 44 inches (1118 mm), except as specified herein. *Egress courts* serving Group R-3 and U occupancies shall be not less than 36 inches (914 mm) in width. The required capacity and width

of egress courts shall be unobstructed to a height of 7 feet (2134 mm).
The width of the egress court shall be not less than the required capacity.

Exception: Encroachments complying with Section 1005.7.

~~1029.3-1028.4.2~~ Construction and openings. Where an egress court serving a building or portion thereof is less than 10 feet (3048 mm) in width, the egress court walls shall have not less than 1-hour fire-resistance-rated construction for a distance of 10 feet (3048 mm) above the floor of the egress court. Openings within such walls shall be protected by opening protectives having a fire protection rating of not less than $\frac{3}{4}$ hour.

Exceptions:

1. Egress courts serving an occupant load of less than 10.
2. Egress courts serving Group R-3.

Commenter's Reason: This proposal is to move the requirements for egress courts back into its current position as a part of Section 1028. Splitting exit discharge into 2 sections is adding confusion for users. Also, the scoping language for exit discharge in more than one section was not proposed - so this could be a conflict with the format of Chapter 10 in the scoping for general, exit access and exit language in Sections 1003.1, 1016.1 and 1022.1.

This public comment is submitted by the ICC BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 and 2018 the BCAC has held 5 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes and public comments. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This modification is returning existing text to its original location. There are no changes in requirements.

E38-18

E39-18

IBC: 1010.1.1, (IFC[BE] 1010.1.1)

Proposed Change as Submitted

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear opening width of 32 inches (813 mm). The clear opening width of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear opening width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a minimum clear opening width of 32 inches (813 mm). In Group I-2, doors serving as *means of egress* doors where used for the movement of beds shall provide a minimum clear opening width of 41¹/₂ inches (1054 mm). ~~The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal.~~ The minimum clear opening height of doors shall be not less than 80 inches (2032 mm).

Exceptions:

1. In Group R-2 and R-3 *dwelling and sleeping units* that are not required to be an Accessible unit, Type A unit or Type B unit, the minimum ~~and maximum~~ width shall not apply to door openings that are not part of the required *means of egress*.
2. In Group I-3, door openings to resident *sleeping units* that are not required to be an Accessible unit shall have a minimum clear opening width of 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m²) in area shall not be limited by the minimum clear opening width.
4. The maximum width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.
5. The maximum width of door leaves in *power-operated doors* that comply with Section 1010.1.4.2 shall not be limited.
6. Door openings within a *dwelling unit* or *sleeping unit* shall have a minimum clear opening height of 78 inches (1981 mm).
7. In *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, exterior door openings other than the required *exit* door shall have a minimum clear opening height of 76 inches (1930 mm).
8. In Groups I-1, R-2, R-3 and R-4, in *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, the minimum clear opening widths shall not apply to interior egress doors.
9. Door openings required to be *accessible* within *Type B units* intended for user passage shall have a minimum clear opening width of 31.75 inches (806 mm).
10. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m²) in area shall have a maximum width of 60 inches (1524 mm) nominal.
11. The minimum clear opening width shall not apply to doors for nonaccessible shower or sauna compartments.
12. The minimum clear opening width shall not apply to the doors for nonaccessible toilet stalls.

Reason: This proposal deletes the 48" maximum width requirements for swinging doors.

From the IBC Commentary: The maximum width for a means of egress door leaf in a swinging door is 48 inches (1219 mm) because larger doors are difficult to handle and are of sizes that typically are not fire tested.

We somewhat agree with this statement in the IBC Commentary. However, it is the width plus the height and the construction of the door (i.e. weight) which results in a door which may be difficult to open and / or close. Our perspective is the performance requirements in IBC Section 1010.1.3 Door Opening Force and the Chapter 11 Accessibility requirements effectively result in the design and installation of appropriately-sized doors. Regarding fire tested doors (i.e. fire-rated doors) – the solution is simple – install fire-rated doors which meet the existing door opening force requirements of the IBC.

The revision in the 1st exception correlates with the proposed deleted text in the charging paragraph.

The revision in the 4th exception clarifies the exception.

From a different perspective, NFPA 101 has not had a requirement for maximum swinging door leaf width since the 1997 edition, stating there is insufficient reason to limit the maximum width of a door leaf provided the door is maintained in good working order. In addition, there is a trend in health-care occupancies for wider doorways to accommodate patient and equipment movement needs.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. We see no cost implications for the vast majority of buildings. However, this proposal may allow the use of a single door – that meets all IBC operational force requirements – where today the 48” width limit results in two doors in an opening. In these rare situations, the cost of construction may be reduced.

E39-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee agreed that there is no longer a need to regulate the maximum size of a door. The maximum size of a door is adequately addressed by the force requirements, closing speed and fire door testing. It was suggested that the maximum door size in Exception 10 should be deleted as part of a public comment for consistency. (Vote: 13-1)

Assembly Action:

None

E39-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Keith Pardoe, representing Pardoe Consulting, LLC (kpardoe@pardoeconsultingllc.com) requests Disapprove.

Commenter's Reason: I recommend the committee disapprove this proposal for the following reasons:

1) The proposal does not offer any technical justification that would compel this change to be approved. There are several reasons, as to why the 48-inch limitation be retained. First, the maximum size of fire rated swinging doors is 48 inches, and hardware components such as fire exit hardware are ONLY listed for use on doors up to 48 inches in width. In the case of fire rated doors, wide doors are more likely to fail fire door testing than doors of ordinary width (e.g., 36 inch-wide doors). In fact, some narrow (less than 32 inch-wide) steel stiffened doors have failed fire door tests due to their increased rigidity. Second, swinging doors are subject to encroachment limitations, wider doors are more likely to encroach on the path of egress. And, lastly, wider doors are less likely to comply with the opening forces in section 1010.1.3.

2) There are special circumstances where swinging doors, that are not in a required means of egress, are wider than 48 inches. For example, aluminum swinging doors in a car dealership showroom are usually 60-inches wide (or wider), but these doors are ONLY used for moving vehicles into or out of the showroom floor. In other words, these doors are NOT required or used for egress purposes. And, there are other special circumstances where wider doors of other construction might be needed; they are NOT in the required means of egress.

3) The proposal does not cite any technical justification for permitting doors in R-2 and R-3 occupancies to have wider doors.

4) The insertion of the word "maximum" as an adjective in item (4) is unnecessary and does not improve the section.

5) The reasoning statement is more a statement of opinion than fact. No technical justification is offered for removing the 48 inch-wide limitation for swinging doors. When wider door opening are needed, we simply use a pair of swinging doors, which can provide nearly 96 inches of clear opening width.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproving this proposal will not have a cost impact.

E39-18

E40-18

IBC: 1010.1.1 (IFC[BE] 1010.1.1)

Proposed Change as Submitted

Proponent: Eirene Knott, BRR Architecture, representing Metropolitan Kansas City Chapter of the ICC (Eirene.Knott@brrarch.com)

2018 International Building Code

Revise as follows

1010.1.1 Size of doors. The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear opening width of 32 inches (813 mm). The clear opening width of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear opening width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a minimum clear opening width of 32 inches (813 mm). In Group I-2, doors serving as *means of egress* doors where used for the movement of beds shall provide a minimum clear opening width of 41¹/₂ inches (1054 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. The minimum clear opening height of doors shall be not less than 80 inches (2032 mm).

Exceptions:

1. In Group R-2 and R-3 *dwelling and sleeping units* that are not required to be an Accessible unit, Type A unit or Type B unit, the minimum and maximum width shall not apply to door openings that are not part of the required *means of egress*.
2. In Group I-3, door openings to resident *sleeping units* that are not required to be an Accessible unit shall have a minimum clear opening width of 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m²) in area shall not be limited by the minimum clear opening width.
4. The width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.
5. The maximum width of door leaves in *power-operated doors* that comply with Section 1010.1.4.2 shall not be limited.
6. Door openings within a *dwelling unit* or *sleeping unit* shall have a minimum clear opening height of 78 inches (1981 mm).
7. In *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, exterior door openings other than the required *exit* door shall have a minimum clear opening height of 76 inches (1930 mm).
8. In Groups I-1, R-2, R-3 and R-4, in *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, the minimum clear opening widths shall not apply to interior egress doors.
9. Door openings required to be *accessible* within *Type B units* intended for user passage shall have a minimum clear opening width of 31.75 inches (806 mm).
10. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m²) in area shall have a maximum width of 60 inches (1524 mm) nominal.
11. The minimum clear opening width shall not apply to doors for nonaccessible shower or sauna compartments.
12. The minimum clear opening width shall not apply to the doors for nonaccessible toilet stalls.
13. The minimum clear opening width shall not apply to the doors for nonaccessible dressing, fitting or changing rooms.

Reason: In the 2015/2016/2017 code development cycle, two changes, E47 and F243, were approved which added language in this section to allow for doors serving non-accessible saunas, shower compartments and toilet stalls to be less than 32 inches. The doors serving dressing/fitting/changing rooms serve the same purpose as these doors, which is to provide for access into and out of the room. If accessible dressing/fitting/changing rooms are provided per IBC 1109.12.1, the remaining dressing/fitting/changing rooms would meet the same requirements as those non-accessible sauna, shower compartment and toilet stall doors.

Cost Impact: The code change proposal will decrease the cost of construction. This proposal may decrease the cost of construction if a smaller door is permitted as less materials will be required.

E40-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This exception could be misapplied to the main door of a large dressing room, such as that used for a bridal fitting room where there would be multiple occupants. It was suggested to limit this to single-user dressing rooms. There should be a minimum size to forestall any size door being permitted. The term 'changing' rooms is not consistent with Section 1109.12.1 for accessibility requirements. (Vote: 9-5)

Assembly Action:

None

E40-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

The required capacity of each door opening shall be sufficient for the *occupant load* thereof and shall provide a minimum clear opening width of 32 inches (813 mm). The clear opening width of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear opening width of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a minimum clear opening width of 32 inches (813 mm). In Group I-2, doors serving as *means of egress* doors where used for the movement of beds shall provide a minimum clear opening width of 41½ inches (1054 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. The minimum clear opening height of doors shall be not less than 80 inches (2032 mm);

Exceptions:

1. In Group R-2 and R-3 *dwelling and sleeping units* that are not required to be an Accessible unit, Type A unit or Type B unit, the minimum and maximum width shall not apply to door openings that are not part of the required *means of egress*.
2. In Group I-3, door openings to resident *sleeping units* that are not required to be an *Accessible unit* shall have a minimum clear opening width of 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m²) in area shall not be limited by the minimum clear opening width.
4. The width of door leaves in revolving doors that comply with Section 1010.1.4.1 shall not be limited.
5. The maximum width of door leaves in *power-operated doors* that comply with Section 1010.1.4.2 shall not be limited.
6. Door openings within a *dwelling unit* or *sleeping unit* shall have a minimum clear opening height of 78 inches (1981 mm).
7. In *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, exterior door openings other than the required *exit door* shall have a minimum clear opening height of 76 inches (1930 mm).
8. In Groups I-1, R-2, R-3 and R-4, in *dwelling and sleeping units* that are not required to be Accessible, Type A or Type B units, the minimum clear opening widths shall not apply to interior egress doors.
9. Door openings required to be *accessible* within *Type B units* intended for user passage shall have a minimum clear opening width of 31.75 inches (806 mm).
10. Doors to walk-in freezers and coolers less than 1,000 square feet (93 m²) in area shall have a maximum width of 60 inches (1524 mm) nominal.
11. ~~The minimum clear opening width shall not apply to doors for nonaccessible shower or sauna compartments.~~
12. ~~The minimum clear opening width shall not apply to the doors for nonaccessible toilet stalls.~~
13. ~~The minimum clear opening width shall not apply to the doors for nonaccessible Doors serving nonaccessible single user shower or sauna compartments, toilet stalls or dressing, fitting or changing rooms shall have a minimum clear opening width of 20 inches (508 mm).~~

Commenter's Reason: The committee disapproved this code change as they felt that the original language was not specific enough to apply only to a single user dressing, fitting or changing room. There was discussion about bridal party changing rooms as an example. The committee also wanted the laundry list shortened so I have attempted to combine the last three items into one exception to address doors serving single user toilet rooms, shower or sauna compartments as well as the fitting, dressing or changing rooms. This code change is intended to allow for the reduction in door size serving individual compartments for these specific applications. It is not necessary to provide a 32 inch clear width on a non-accessible compartment that is intended to be used by one person.

I did research to determine if 20 inches would address doors serving these types of individual uses. On average, a door for a single user toilet compartment is 24 inches in width. Most fitting room doors are 32 inches in width. Most individual use saunas utilize a 24 inch door and most commercial showers utilize a minimum door of 22 inches. In an effort to cover all of these door sizes, I chose 20 inches as a minimum.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. If approved, this has the potential to decrease the cost of construction as smaller doors would be permitted.

E40-18

E41-18

IBC: 1010.1.1.1, (IFC[BE] 1010.1.1.1)

Proposed Change as Submitted

Proponent: John Woestman, representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows

1010.1.1.1 Projections into clear ~~width~~ opening. There shall not be projections into the required clear opening width lower than 34 inches (864 mm) above the floor or ground. Projections into the clear opening width between 34 inches (864 mm) and 80 inches (2032 mm) above the floor or ground shall not exceed 4 inches (102 mm).

Exception: Door closers, overhead door stops, power door operators, and electromagnetic door ~~stops~~ locks shall be permitted to be 78 inches (1980 mm) minimum above the floor.

Reason: Clarifying the “door stops” in the exception are overhead door stops. Also, proposing to include in the exception door operational hardware which is commonly installed and may project into the opening at the top of the doorway. And, it seems appropriate to revise the title of Section 1010.1.1.1.

Below are several pictures which illustrate these hardware items.

Overhead door stop.

Power door operator.
Photo courtesy [domakaba](#)

Power door operators (left doors), door closer (right door).
Photo courtesy Hager Companies

Electromagnetic door lock (top-left corner of doorway) and door closer.
Photo courtesy Allegion

Cost Impact: The code change proposal will not increase or decrease the cost of construction. No cost implications identified with this proposal. This allows additional door operation with no increase in code requirements.

E41-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal adds common use terminology for door hardware and clarifies allowances for other types of doors. (Vote: 14-0)

Assembly Action:

None

E41-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Keith Pardoe, representing Pardoe Consulting, LLC (kpardoe@pardoeconsultingllc.com) requests Disapprove.

Commenter's Reason: I recommend the committee disapprove this proposal for the following reasons:

- 1) The existing section is concerned with ensuring door openings provide sufficient clear opening width for egress purposes. The second statement in 1010.1.1.1 recognizes that certain arrangements of hardware could reduce the clear opening width.
- 2) The assertion in the reason statement that "...the 'door stops' in the exception are overhead stops" is incorrect. Doors with a nominal height of 80 inches have a actual clear opening height that is reduced by two elements; the height of the integral door stop of the frame, and the thickness of any floor covering material passing through the door opening. In the case of standard hollow metal door frames, the height of the integral door stop is 5/8-inch. And, when the door frame is aluminum, the height of the integral door stop is 1/2-inch. The exception refers to the integral door stops of the frames, it does not refer to overhead stops that are types of door hardware components.
- 3) Regarding the application of door closers, as covered in the exception, it is referring to the use of parallel arm brackets that are attached to the soffit of door frames—the soffit of a door frame is the raised flat surface between the door rabbet and the non-door rabbet of the frame. For this reason, the application of a parallel arm bracket in combination with the thickness of the floor covering material can reduce the clear opening height dimension of a door by 1 to 2 inches; ergo, the 78-inch exception for door closers and [the frame's integral] door stops.
- 4) The proposal does not include technical justification for adding the other hardware items to the exceptions.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Disapproving this proposal will not have a cost impact.

E41-18

E42-18

IBC: 1010.1.2, 1010.1.2.1, (IFC[BE] 1010.1.2, 1010.1.2.1)

Proposed Change as Submitted

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows

1010.1.2 ~~Door swing.~~Egress door types. Egress doors shall be of the ~~pivoted or side-hinged swinging type door, pivoted door, or balanced door types.~~

Exceptions:

1. Private garages, office areas, factory and storage areas with an *occupant load* of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single *dwelling unit* in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1010.1.4.1.
6. In other than Group H occupancies, special purpose horizontal sliding, accordion or folding door assemblies complying with Section 1010.1.4.3.
7. Power-operated doors in accordance with Section 1010.1.4.2.
8. Doors serving a bathroom within an individual *sleeping unit* in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a *means of egress* from spaces with an *occupant load* of 10 or less.

1010.1.2.1 Direction of swing. ~~Pivot or side~~Side-hinged swinging doors, pivoted doors, and balanced doors shall swing in the direction of egress travel where serving a room or area containing an *occupant load* of 50 or more persons or a Group H occupancy.

Reason: Updating 1010.1.2 to add balanced doors to the other common types of swinging doors allowed and used in the means of egress. Also revising the title of the section. Requirements for panic hardware on balanced doors is addressed in 1010.1.10.2 (text pasted below) - thus it can be assumed the intent of the code is that balanced doors are OK for doors in the means of egress.

Also, revising 1010.1.2.1 for consistency.

2018 IBC 1010.1.10.2 Balanced doors. If *balanced doors* are used and *panic hardware* is required, the *panic hardware* shall be the push-pad type and the pad shall not extend more than one-half the width of the door measured from the latch side

Several pictures below illustrate these types of doors.

Side-hinged door.
Photo courtesy Allegion

Pivoted door
Photo courtesy Allegion

Balanced door.
Photo courtesy C. R. Laurence

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Proposal updates code technically to more closely match types of doors being installed in the means of egress.

E42-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal specifically addresses balanced doors as a type of swinging door, which is consistent with the intent of the provisions. (Vote: 14-0)

Assembly Action:

None

E42-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Keith Pardoe, representing Pardoe Consulting, LLC (kpardoe@pardoeconsultingllc.com) requests Disapprove.

Commenter's Reason: I recommend the committee disapprove this proposal for the following reasons:

- 1) The proposed seems to distinguish balanced doors, which are a type of pivoted door, from other types of pivoted doors. It is a distinction without a difference. Balanced doors are hung on top and bottom center pivots that are inset from the "hinge" edge the doors. Generally, balanced doors are a minimum of 42 inches in width so that they provide the *required minimum width* when opened to 90 degrees. The offset pivot point of balanced doors allow doors to open and close more easily by leveraging the building stack pressure against the surface of the doors.
- 2) The reason statement in the proposal seems to imply that balanced doors are not permitted to be used in the means of egress, which is not the case. Balanced doors have been in use in high-rise buildings for decades.
- 3) The proposal does not cite any confusion from AHJs, architects, building owners, or the door industry regarding the use of balanced doors in the means of egress that would be resolved by the committee's approval of this proposal.
- 4) Regarding the proposal's cross reference to 1010.1.10.2, the reason the length of panic hardware devices is restricted to "...not more than one-half the width of the door measured from the latch side" is that body of the device could reduce the clear opening width of the opening. However, this condition was remedied in section 1010.1.1.1 Projections into Clear Width when the following provision was added to the code: "Projections into the clear opening width between 34 inches (864 mm) and 80 inches (2032 mm) above the floor or ground shall not exceed 4 inches (102 mm)." Most panic hardware devices are installed between 39 to 41 inches above the floor to the centerline of the actuating push pad or crossbar, and they do not project more than 4 inches into the clear opening width. In fact, the 4-inch projection was specifically allowed for the application of panic hardware and fire exit hardware devices to all types of swinging doors.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this proposal will not have a cost impact.

E42-18

E44-18

IBC: 1010.1.3, (IFC[BE] 1010.1.3)

Proposed Change as Submitted

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Delete and substitute as follows

~~**1010.1.3 Door opening force.** The force for pushing or pulling open interior swinging egress doors, other than fire doors, shall not exceed 5 pounds (22 N). These forces do not apply to the force required to retract latch bolts or disengage other devices that hold the door in a closed position. For other swinging doors, as well as sliding and folding doors, the door latch shall release when subjected to a 15-pound (67 N) force. The door shall be set in motion when subjected to a 30-pound (133 N) force. The door shall swing to a full open position when subjected to a 15-pound (67 N) force.~~

1010.1.3 Forces to unlatch and open doors. The forces to unlatch and to open doors shall comply with the following:

1. Where door hardware operates by push or pull, the operational force to unlatch the door shall not exceed 15 pounds (66.7N). Where door hardware operates by rotation, the operational force to unlatch the door shall not exceed 28 inch-pounds (315 N-cm).
2. For manual interior swinging egress doors other than doors required to be fire rated, the force for pushing or pulling open the door shall not exceed 5 pounds (22 N).
3. For other swinging, sliding, or folding doors, and doors required to be fire-resistance-rated, the door shall require not more than a 30-pound (133 N) force to be set in motion and shall move to a full-open position when subjected to not more than a 15-pound (67 N) force.

Reason: Updating and clarifying the maximum forces allowed to unlatch and open doors and correlating requirements with A117.1.

Item 1: The current IBC requirements in 1010.1.3 for maximum unlatching forces could be considered somewhat ambiguous. The proposed requirements in Item 1 are consistent with the requirements in the latest edition of A117.1, Section 404.2.6 and consistent with other ANSI standards for door hardware operational forces.

Items 2 and 3: The revisions in Items 2 and 3 are intended to clarify existing requirements in 1010.1.3.

Item 2 is based on the first sentence of 1010.1.3. Item 3 is based on the last two sentences of 1010.1.3.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal clarifies this section of the code, and correlates the code requirements to current accessibility requirements and to current requirements in several ANSI standards for door hardware.

E44-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This updates and clarifies the requirements for door force and unlatching. This would coordinate with the 2017 edition of ICC A117.1. (Vote: 14-0)

Assembly Action:

None

E44-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Keith Pardoe, representing Pardoe Consulting, LLC (kpardoe@pardoeconsultingllc.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1010.1.3 Forces to unlatch and open doors. The forces to unlatch and to open doors shall comply with the following:

1. Where door hardware operates by push or pull, the operational force to unlatch the door shall not exceed 15 pounds (66.7N).
2. Where door hardware operates by rotation, the operational force to unlatch the door shall not exceed 28 inch-pounds (315 N-cm).

The forces to open doors shall comply with the following:

- ~~2-1.~~ For ~~manual~~ interior swinging egress doors that are manually operated, other than doors required to be fire rated, the force for pushing or pulling open the door shall not exceed 5 pounds (22 N).
- ~~3-2.~~ For other swinging doors, sliding doors, or folding doors, and doors required to be fire-resistance-rated-fire rated, the door shall require not more than a 30-pound (133 N) force to be set in motion and shall move to a full-open position when subjected to not more than a 15-pound (67 N) force.

Commenter's Reason: I recommend the committee consider revising this section, as shown above, for the following reasons:

This section addresses operating forces that are applied to A) release (unlatch) latching door hardware devices, and B) move door leaves to their full open position. Accordingly, it makes sense to separate these forces into subsections.

The existing language for this section focused on the requirements on interior doors. By striking out the phrase "...interior swinging..." the revised section now applies to all doors in the means egress, including exterior doors. The proposed revision clarifies that "interior" swinging doors, that are manually operated, are subject to the 5 lbf opening force—except for fire-rated doors.

In item (3) there is a reference to "...fire-resistance-rated doors..." Doors are fire protection-rated, not fire resistance-rated. The above-proposed revision resolves this issue by referencing "fire rated" doors.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal clarifies this section of the code, and correlates the code requirements to current accessibility requirements and to current requirements in several ANSI standards for door hardware

E49-18

IBC: 202 (New), 1010.1.4.6 (New), (IFC[BE] 202 (New), 1010.1.4.6(New))

Proposed Change as Submitted

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Add new definition as follows

CONTROL VESTIBULE. A space with door locking arrangements of interlocked doors in series such that while one door of the control vestibule is open, the other door in series is temporarily locked.

Add new text as follows

1010.1.4.6 Control vestibule. Where doors in the means of egress are configured as a control vestibule, the door locking system shall provide for emergency egress and shall be subject to approval by the building official. A control vestibule in the means of egress shall comply with all of the following.

1. An approved override shall be provided on the egress side of each door of a control vestibule.
2. An approved override shall be provided on the ingress side of the outer door of a control vestibule.
3. Upon activation of the automatic sprinkler system or automatic fire detection system, the interlock function of the door locking system shall deactivate.
4. Upon loss of power to the interlock function of the doors, the interlock function of the door locking system shall deactivate.
5. The egress path from any point shall not pass through more than one control vestibule unless approved by the code official.
6. The door locking system units shall be listed in accordance with UL 294.

Reason: We are proposing a definition for “control vestibule” and proposing detailed requirements for control vestibules.

The significant difference between doors in series in the means of egress (i.e. one after the other) and doors in the means of egress configured as a control vestibule is the doors of a control vestibule are interlocked such that when one door of a control vestibule is open, the other door in series in the control vestibule is temporarily locked; and conversely, in the means of egress when all doors of a control vestibule are closed, any door may be opened.

Control vestibules are most commonly configured as a space with two doors in series. But, some control vestibules are configured with more than one inner door and / or more than one outer door. For example, where a control vestibule is required to help keep clean rooms clean, there may be inner doors from three different clean rooms opening into the control vestibule, and one outer door for leaving the control vestibule in the direction of egress.

The proposed requirements for control vestibules are for these reasons:

Item 1: A requirement to address the potential situation where one of the doors on the control vestibule is held open (example: a person faints in the outer doorway), other occupants may need to be able to egress through the control vestibule, especially in emergency situations. It is common the activation of an override would set off an alarm, and / or the activation of an override without a valid reason results in disciplinary action (i.e. employee gets fired).

Item 2: In the event the inner door of a control vestibule is held open (example: a person faints at the inner door), an override allows access into the control vestibule. The required override on the ingress side of the outer door allows for emergency access into the control vestibule, if needed. This override commonly requires a higher level of authorization for use and / or is provided for responding emergency crews.

Items 3 and 4: Requires the interlock function to be disabled in the event of fire, actuation of the fire detection system, or power loss to the interlock system rendering the control vestibule equivalent to two doors in the means of egress allowing unobstructed egress.

Item 5: Requires that egressing through the control vestibule involves no more than two doors, unless approved by the code official. While not common, there are situations where more than one control vestibule may be needed in the means of egress.

Item 6: Requires the units of the control vestibule locking system to be listed in accordance with UL 294, the same standard required for units for other electrical locking system units.

Together, the definition and proposed requirements provide for egress and emergency egress where control vestibules are installed.

Note: a control vestibule is different than a sallyport, which is defined in the IBC and permitted in Group I-3 occupancies. Group I-3 includes correction centers, detention centers, jails, prisons, and similar uses. A sallyport is a security vestibule which prevents unobstructed passage. A control vestibule is intended to allow unobstructed passage, but prevents more than one door of doors in series to be open at the same time.

Cost Impact: The code change proposal will decrease the cost of construction. Control vestibules are currently not addressed in the code. Where control vestibules are constructed, these requirements may include some locking requirements and interconnectedness currently not incorporated into some control vestibules.

E49-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: These provisions could conflict with sallyports for Group I-3. While this is needed for certain situations, as written this could be used in all occupancies for all doors – this should have limited application. Item #3 talks about the sprinkler system – is the intent to only allow this in sprinklered buildings, or is only where a sprinkler system is provided? The word ‘emergency’ is not needed. (Vote: 10-4)

Assembly Action:

None

E49-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

1010.1.4.6 Control vestibule. Control vestibules shall be permitted in Groups B, F, H, I-1, I-2, M, and S. Where doors in the means of egress are configured as a control vestibule, the door locking system shall provide for emergency egress and shall be subject to approval by the building official. The control vestibule shall comply with all of the following unless otherwise approved based on occupancy and use. A control vestibule in the means of egress shall comply with all of the following.

1. An approved override shall be provided on the egress side of each door of a control vestibule.
2. An approved override shall be provided on the ingress side of the outer door of a control vestibule.
3. Upon activation of the ~~Where an~~ automatic sprinkler system or automatic fire detection system is provided, upon activation of such system the interlock function of the door locking system shall deactivate.
4. Upon loss of power to the interlock function of the doors, the interlock function of the door locking system shall deactivate.
5. The egress path from any point shall not pass through more than one control vestibule unless approved by the code official.
6. The door locking system units shall be listed in accordance with UL 294.

Commenter's Reason: To address the committee concern with occupancy groups where control vestibules may be installed. Proposing control vestibules to be permitted Group B for banks and laboratories. Group F for factories. Group H for operations where contamination or atmospheric control is vital. Groups I-1 and I-2 to facilitate patient care and patient security. Group M for sales rooms for jewelry, gems, drugs, and similar highly valuable items. Group S for storage of valuables.

To address the committee concern with activation of automatic sprinkler system or automatic fire detection system in Item 3 where one or both of these systems are provided.

And, to address concerns from stakeholders regarding needed flexibility, proposing revision to the charging language. For example, where casinos count money, accepted industry practices may not incorporate all of the requirements of Items 1 through 5 but may incorporate significant other security and safety provisions.

Note: a control vestibule is different than a sallyport, which is defined in the IBC and permitted in Group I-3 occupancies. Group I-3 includes correction centers, detention centers, jails, prisons, and similar uses. A sallyport is a security vestibule which prevents unobstructed passage. A control vestibule is intended to allow unobstructed passage, but prevents more than one door of doors in series to be open at the same time.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Control vestibules are currently not addressed in the code. Today, alternative means and methods is the path to allowing control vestibules to be incorporated into buildings.

Where control vestibules are constructed, these requirements may include some locking requirements and interconnectedness currently not incorporated into some control vestibules.

Public Comment 2:

Proponent: Keith Pardoe, representing Pardoe Consulting, LLC (kpardoe@pardoeconsultingllc.com) requests Disapprove.

Commenter's Reason: I recommend the committee disapprove this proposal for the following reasons:

1) The proposal seeks to create a new type of special locking arrangement for control vestibules, but it neglects to recognize that where such specialized door systems are used they are not the sole means of egress from the controlled space. In other words, a control vestibule serves as the primary entry/exit point for the controlled space—for security and/or environmental control purposes—but they are not sole means of egress, typically. Other exit access doors or exit doors (e.g., stair tower doors) might be equipped with delayed egress locking systems or some form or alarmed exiting system (that permits free egress, but sounds an alarm) that are otherwise restricted (by the owner) to use in emergencies only.

2) The proposal neglects to recognize the security protocols instituted by the facility that might require persons entering these spaces to present some form of credential (e.g., proximity card, keypad, etc.) to enter such controlled spaces. Nor, does the proposal recognize that the persons occupying these spaces are trained and authorized to perform work in whatever conditions are within these spaces. In other words, only persons who are trained, authorized, and familiar with all safety protocols, including how to exit under emergency conditions, are permitted in these spaces; the general public cannot unknowingly wander into these spaces.

3) Each of the door assemblies used as part of a control vestibule system are already required to comply with one of the following sections: 1010.1.9.7, 1010.1.9.8, 1010.1.9.9, and 1010.1.10. Where these doors are required to be fire rated, they are tied into other building systems. The difference in this case is that the doors are designed to work in sequence as a system. Each control vestibule arrangement is unique to the nature of the controlled space to which it serves, and persons using these spaces. The prescribed conditions in the proposal might not be sufficient for certain applications, and might cause breaches in the facility's protocols in other cases.

4) The proposal does not limit the application of control vestibules to only certain occupancy groups, instead it places the responsibility for determining where such special locking arrangements might be used on the shoulders of the building code officials. Because control vestibules are a special locking arrangement, the code should restrict their use to specific occupancy groups.

5) The proposal does not include technical justification for adding this type of special locking arrangement to the code at this time. Nor, does the proposal cite specific points of confusion from building code officials or owners.

In my opinion, this proposal premature and needs further work before it can be considered appropriate to add to the code. Currently, when such specialized systems are used, they are reviewed and approved by the applicable building code officials on a case by case basis. For this reason alone, it is unnecessary for the code to address such specialized systems.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproving this proposal will not have a cost impact.

E49-18

E51-18

IBC: 1010.1.9 (New), (IFC[BE] 1010.1.9 (New))

Proposed Change as Submitted

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new text as follows

1010.1.9 Vestibules. Where required by a compliance path of the International Energy Conservation Code, building entrances shall be provided with vestibules.

Reason: The IECC requires vestibules to be provided at building entrances in all climate zones other than 1 and 2. In the design of buildings this can be a significant feature of entrances. The requirement can be overlooked by designers if they focus on the IBC during initial design and then are perhaps surprised by the requirement when adding the IECC to their construction documents. This proposal provides a direct reference to the compliance paths in the IECC for vestibules.

The proposal puts the reference for vestibules in Chapter 10 after the section for door arrangements (Section 1010.1.8). Since Section 1010.1.8 addresses doors in a series, this is the most logical place for designers to understand that a vestibule may be required by the IECC.

The BCAC developed this proposal with the SEHPCAC. This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This requirement already exists in the IECC. Inclusions in the IBC doesn't result in any construction not already anticipated.

E51-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This pointer for vestibules is not needed in IBC in areas where the Energy codes are adopted because it is already covered in the Energy Code. The term 'vestibule' could be confused with stairway vestibules. (Vote: 12-2)

Assembly Action:

None

E51-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1010.1.9 Vestibules. ~~Where in jurisdictions that have adopted the International Energy Conservation Code, where required by a compliance path of the International Energy Conservation Code,~~ building entrances shall be provided with vestibules.

Commenter's Reason: Unlike the IBC, the requirement in the IECC is a mandate for a building to have vestibules at most entrance doors. If a designer is unaware of this requirement, adding a vestibule, or in some cases several vestibules, into the design of a building after it has been through plan review can be a cause some major revisions to the building configuration.

The language being proposed is not in any way intended to mandate that a community must use the *International Energy Conservation Code* (IECC), but rather it is intended to give designers in those communities where the IECC is adopted, that vestibules may be required. The text below indicates the extent of the requirement.

C402.5.7 Vestibules. *Building entrances shall be protected with an enclosed vestibule, with all doors opening into and out of the vestibule equipped with self-closing devices. Vestibules shall be designed so that in passing through the vestibule it is not necessary for the interior and exterior doors to open at the same time. The installation of one or more revolving doors in the building entrance shall not eliminate the requirement that a vestibule be provided on any doors adjacent to revolving doors.*

Exceptions: *Vestibules are not required for the following:*

- 1. Buildings in Climate Zones 1 and 2.*
- 2. Doors not intended to be used by the public, such as doors to mechanical or electrical equipment rooms, or intended solely for employee use.*
- 3. Doors opening directly from a sleeping unit or dwelling unit.*
- 4. Doors that open directly from a space less than 3,000 square feet (298 m²) in area.*
- 5. Revolving doors.*
- 6. Doors used primarily to facilitate vehicular movement or material handling and adjacent personnel doors.*
- 7. Doors that have an air curtain with a velocity of not less than 6.56 feet per second (2 m/s) at the floor that have been tested in accordance with ANSI/AMCA 220 and installed in accordance with the manufacturer's instructions. Manual or automatic controls shall be provided that will operate the air curtain with the opening and closing of the door. Air curtains and their controls shall comply with Section C408.2.3*

In addition, the requirement in the IECC for vestibules is mirrored in ANSI/ASHRAE/IESNA 90.1, which is one of the compliance means the IECC allows for a commercial building (IECC - Commercial Provisions, Section C401.2)

With regard to the comment made by the IBC General Code Development Committee that “The term ‘vestibule’ could be confused with stairway vestibules.” As the term is not defined in any of the I-Codes, we must refer to the generally accepted term. The Merriam Webster dictionary defines a vestibule as “An antechamber, hall, or lobby next to the outer door of a building.” The term “vestibule,” while used in IBC Section 1028.1 is not always and only associated with a space into which an exit stair discharges, there are many architectural spaces in a building that are generically called vestibules.

This change will provide one additional aspect of coordination of the ICC model codes package for use by all designers and building officials where appropriate. We urge your overturning the Code Committee’s recommendation and approve this change.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This requirement already exists in the IECC. Inclusions in the IBC doesn t result in any construction not already anticipated.

Public Comment 2:

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com)requests As Submitted.

Commenter's Reason: This is a necessary correlation between two codes. The vestibule is a building requirement based on specific conditions cited within the IECC. It is a necessary building component. Referring to another code for this is no different that referring to the IPC for plumbing fixture requirements. Given the choice between copying the requirements from the IECC or referencing the code, this is the superior option.

There should be no confusion regarding what type of vestibule this is because it is clearly described in the IECC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is a pointer to a code requirement that is often missed by designers and does not change any existing requirement.

Public Comment 3:

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)requests As Submitted.

Commenter's Reason: There really should not be any confusion on this topic as there are no requirements in the 2018 IBC that mandate the installation of vestibules - of any kind. The incorporation of vestibules is solely a designer’s choice. But WHEN a designer chooses to incorporate vestibules into a building, there are regulations, but only two; one that has its basis in the accessibility of doors in series and one for exit stairways that discharge into a vestibule which then leads to the exterior:

- 1010.1.8 Door arrangement; which mandates a there be minimum distance between doors when located in series – an enclosure often called out on plans as a “vestibule.”
- Section 1028.1, Exception 2 Exit discharge; which mandates the construction and size of a vestibule when an exit stair discharges into it.

Unlike the IBC, the requirement in the IECC is a mandate for a building to have vestibules at all entrance doors. Sadly in many cases, it is only after a set of plans has been submitted to the community for review (and who has adopted the IECC) does a designer find out that their building is required have vestibules at the entrance doors. Adding a vestibule, or in some cases several vestibules, into the design of a building after it has been through plan review can be a considerable chore on the part of designer, often forcing them to make some major revisions to the building configuration. Even worse is when the plan review fails to catch the need for a vestibule and the error it attempted to be corrected in the field.

The language being proposed is not in any way intended to mandate that a community must use the *International Energy Conservation Code* (IECC), but rather it is intended to give designers in those communities where the IECC is adopted, and in some cases the AHJ, a reminder that if the IECC has been adopted, then vestibules may be required. The need for this “pointer” to the IECC may not be so important if the IECC only required a single vestibule at the main entry door to a building, but for those of you who may not be familiar with the requirements of the 2018 IECC, the requirement is for a vestibule at **all** “building entrances,” not just for the “main” entry door (IECC – Commercial Provisions, Section C402.5.7). Simply put - the requirement for a vestibule is applicable to any door in a building that is an “entrance,” including those doors that are used as a delivery entrance, the staff/employee entrance, and even to those that are just convenience entry points into a building.

C402.5.7 Vestibules. *Building entrances shall be protected with an enclosed vestibule, with all doors opening into and out of the vestibule equipped with self-closing devices. Vestibules shall be designed so that in passing through the vestibule it is not necessary for the interior and exterior doors to open at the same time. The installation of one or more revolving doors in*

the building entrance shall not eliminate the requirement that a vestibule be provided on any doors adjacent to revolving doors.

Exceptions: Vestibules are not required for the following:

1. *Buildings in Climate Zones 1 and 2.*
2. *Doors not intended to be used by the public, such as doors to mechanical or electrical equipment rooms, or intended solely for employee use.*
3. *Doors opening directly from a sleeping unit or dwelling unit.*
4. *Doors that open directly from a space less than 3,000 square feet (298 m²) in area.*
5. *Revolving doors.*
6. *Doors used primarily to facilitate vehicular movement or material handling and adjacent personnel doors.*
7. *Doors that have an air curtain with a velocity of not less than 6.56 feet per second (2 m/s) at the floor that have been tested in accordance with ANSI/AMCA 220 and installed in accordance with the manufacturer's instructions. Manual or automatic controls shall be provided that will operate the air curtain with the opening and closing of the door. Air curtains and their controls shall comply with Section C408.2.3*

In addition, the requirement in the IECC for vestibules is mirrored in ANSI/ASHRAE/IESNA 90.1, which is one of the compliance means the IECC allows for a commercial building (IECC – Commercial Provisions, Section C401.2)

With regard to the comment made by the IBC General Code Development Committee that “The term ‘vestibule’ could be confused with stairway vestibules.” We do not disagree that the term “vestibule” is used in the IBC, but as the term is not defined in any of the I-Codes, we must refer to the generally accepted term, as specified in Chapter 2 of each I-Code. The Merriam Webster dictionary defines a vestibule as “An antechamber, hall, or lobby next to the outer door of a building.” The term “vestibule,” while used in IBC Section 1028.1 is not always and only associated with a space into which an exit stair discharges, there are many architectural spaces in a building that are generically called vestibules.

The AIA firmly believes that implementation of the criteria in the IECC is paramount to good design. Several of the Institutes’ policies call for increased energy efficiencies through the application of “Comprehensive, Coordinated and Contemporary Codes.” This change will provide one additional aspect of coordination of the ICC model codes package for use by all designers and building officials where appropriate. We urge your overturning the Code Committee’s recommendation and approve this change.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. If the design fails to include a vestibule it is a costly matter to add it at plan review. If plan review fails to catch the need for a vestibule, it is costly to try to resolve it in the field. If neither the design or the review catches the omission, then the loss is even larger to the building owner who now must pay for the energy loss attributed to a feature that should have been integrated into the building.

E51-18

E52-18

IBC: 1010.1.9.4, (IFC[BE] 1010.1.9.4)

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows

1010.1.9.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In Group I-1 Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by clinical staff at all times or clinical staff have the codes or other means necessary to operate the locks at all times.
- ~~3.2.~~ In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
 - ~~3.1.2.1.~~The locking device is readily distinguishable as locked.
 - ~~3.2.2.2.~~A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
 - ~~3.3.2.3.~~The use of the key-operated locking device is revocable by the *building official* for due cause.
4. ~~3.~~Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
5. ~~4.~~Doors from individual *dwelling* or *sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
6. ~~5.~~*Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
7. ~~6.~~Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the building from the roof.

Reason: This manual locking provision recognizes what is currently permitted under the Federal Standards and Centers for Medicaid and Medicare Services enforcement rules where the restraint of patients is allowed for the safety of the patient and/or the public (K222). This may be needed as part of the progression of treatment for patients. This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls

Cost Impact: The code change proposal will not increase or decrease the cost of construction As a permitted condition the cost impact only occurs if the option is exercised.

E52-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The new Item 2 address security and dementia wandering issues for care recipients in assisted living, hospitals and nursing facilities where this is needed. It was suggested to provide a public comment to have keys for 'all' clinical staff. (Vote: 13-1)

Assembly Action:

None

E52-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1010.1.9.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In Group I-1 Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
 - 3.1. The locking device is readily distinguishable as locked.
 - 3.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
 - 3.3. The use of the key-operated locking device is revocable by the *building official* for due cause.
4. Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
5. Doors from individual *dwelling or sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
6. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the building from the roof.

Commenter's Reason: This proposal is in response to suggestion from the Means of Egress Code Development Committee to ensure that all clinical staff will have keys.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal is in response to suggestion from the Means of Egress Code Development Committee to ensure that all clinical staff will have keys.

Public Comment 2:

Proponent: Crystal Sujeski, representing Crystal Sujeski (crystal.sujeski@fire.ca.gov) requests Disapprove.

Commenter's Reason: Allowing locking of doors in I-1 condition 2 and I-2 occupancies without increasing safe guards for fire and life safety protections in chapter 4 has unintended consequences. When you lock persons in a space they are retrained, this creates an I-3 environment. Other safe guards should be considered before allowing any staff to detain any persons. Also, who is the decision maker of what is a security threat?
Further study and correlation with I-3 regulations should be considered before approval for these occupancies.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The net effect will not increase or decrease the cost of construction.

E52-18

E53-18

IBC: 1010.1.9.4, 1010.1.10, (IFC[BE] 1010.1.9.4, 1010.1.10); IFC 1031.8

Proposed Change as Submitted

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows

1010.1.9.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
 - 2.1. The locking device is readily distinguishable as locked.
 - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
 - 2.3. The use of the key-operated locking device is revocable by the *building official* for due cause.
3. Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
4. Doors from individual *dwelling* or *sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
6. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the building from the roof.
7. Other than egress courts, where occupants must egress from an exterior space through the building for means of egress, exit access doors shall be permitted to be equipped with an approved locking device where installed and operated in accordance with all of the following:
 - 7.1. The maximum occupant load shall be posted where required by Section 1004.9. Such sign shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the exit access doorways.
 - 7.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required exit access door on the exterior side.
 - 7.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.
 - 7.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m²) sq. ft. in area, shall be provided at each exit access door to determine if there are occupants using the outdoor area.
 - 7.5. A readily visible durable sign shall be posted on the interior side on or adjacent to each locked required exit access door serving the exterior area stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED. The letters on the sign shall be not less than 1" high on a contrasting background.
8. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual dwelling or sleeping units.
9. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet or less, serving a private office space.

1.

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

- 1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Section 1010.1.9.4, Item 2.
- 2. Doors provided with *panic hardware* or *fire exit hardware* and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Section 1010.1.9.9 or 1010.1.9.10.
- 3. Exit access doors serving occupied exterior areas shall be permitted to be locked in accordance with Section 1010.1.9.4, Item 7.

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or *exit access doors*, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

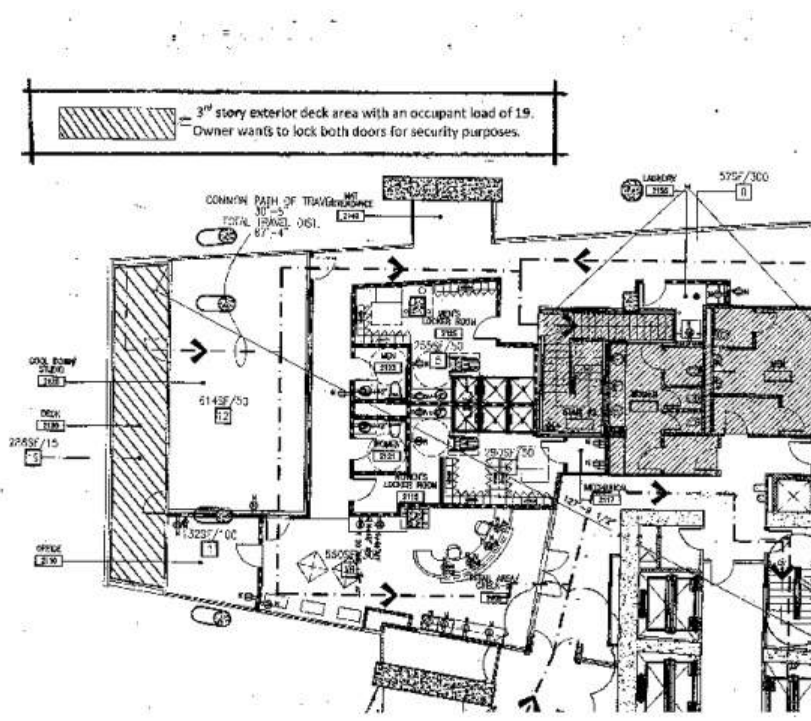

2018 International Fire Code

1031.8 Inspection, testing and maintenance. Two-way communication systems ~~for areas of refuge~~ shall be inspected and tested on a yearly basis to verify that all components are operational. Where required, the tests shall be conducted in the presence of the *fire code official*. Records of inspection, testing and maintenance shall be maintained.

Reason: IBC Section 1004.7 requires an unobstructed path of egress from outdoor areas where single or multiple paths of egress travel are required to pass back through the building. Currently egress doors serving outdoor areas are not permitted to have locks. For security purposes, building owners and tenants install locks on required egress doors from these areas in violation of the code. Many building officials and fire officials allow locks and latches on doors serving the outdoor areas using the modification provisions of Sections 104.10 & 104.11. Since installation of locks on egress doors occurs on a regular basis it makes sense to provide a safe, reasonable and consistent standard to follow for the safety of people occupying outdoor areas who must re-enter the building for egress.

Additional safety is provided by requiring a two-way communication system, allowing occupants to call for help if the egress door is accidentally locked. Two-way communication system requirements are currently found in IBC Section 1009.8.1 & 1009.8.2.

The sketch below illustrates an occupied exterior deck where occupants must egress through the building to reach the exit discharge. The deck shown is on the 3rd story of the building where the installation of an exterior stairway is not practical. The owner has requested to install security locks on the exit access doors but IBC Section 1004.5 clearly requires that occupants be able to egress from the deck at all times. This proposal would allow the doors to be locked if the specified safety measures are met.

IFC Section 1030.8 - If this proposal passes, the two-way communication system needs to be tested and maintained. The IFC language is currently only for systems in areas of refuge.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. It is hard to say if this code change will increase or decrease the cost of construction. Compliance with the proposed conditions of approval (2-way communication device, vision glass, signage, etc) would increase costs but many of these improvements are being required as a result of alternate means and methods of construction requirements that occur when violations are discovered by Fire Prevention Officers after the C of O is issued. In those cases the cost to make these improvements will be higher than if they had been made during the initial construction of the building.

E53-18

Public Hearing Results

Errata: Items 7, 8 and 9 are all new text and should be underlined.

Committee Action:

Disapproved

Committee Reason: There should be a maximum occupant load for where this should be permitted as an option. It was suggested that an over ride should be available to unlock the doors, but other committee members felt that this would be a security issues for buildings where someone could use this to break into a building during off hours. (Vote: 10-4)

Assembly Action:

None

E53-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov); Jonathan Siu (jon.siu@seattle.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1010.1.9.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
 - 2.1. The locking device is readily distinguishable as locked.
 - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
 - 2.3. The use of the key-operated locking device is revocable by the *building official* for due cause.
3. Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
4. Doors from individual *dwelling* or *sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
6. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the building from the roof.
7. Other than egress courts, where occupants must egress from an exterior space through the building for means of egress, exit access doors shall be permitted to be equipped with an approved locking device where installed and operated in accordance with all of the following:
 - 7.1. The maximum occupant load shall be posted where required by Section 1004.9. Such sign shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the exit access doorways.
 - 7.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required exit access door on the exterior side.
 - 7.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking ~~device~~ device.
 - 7.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m²) sq. ft. in area, shall be provided at each exit access door to determine if there are occupants using the outdoor area.
 - 7.5. A readily visible durable sign shall be posted on the interior side on or adjacent to each locked required exit access door serving the exterior area stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED. The letters on the sign shall be not less than 1 "high on a contrasting background.
 - 7.6. The occupant load of the occupied exterior area shall not exceed 300 in accordance with Section 1004.
8. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual dwelling or sleeping units.
9. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet or less, serving a private office space.

Commenter's Reason: Outdoor occupied areas where occupants must re-enter the building to egress are considered by the current code to be the same as any room inside the building which means that unobstructed egress must be available from the outdoor area at-all-times. There currently are no exceptions to this rule but it is not unusual for these doors to have locks placed on them for security purposes after the C of O is issued. Locking these doors creates the potential for people to get locked out with no way to safely egress through the building in an emergency until rescued.

Most of the violations we find take place on upper level decks and occupied roofs where there isn't access to an exterior stair. We also find locks on doors serving grade-level outdoor areas where one or more of the required exit doors go through the building. It's understandable why owners put locks on these exterior required egress doors but we know it's not allowed in the current code and most owners do not get a permit to install the locks. When a permit is issued locks for these egress doors are typically approved as an alternate using most or all of the requirements in this proposal so it's clear that this exception is needed in the code.

At the Committee Action Hearings in Columbus, the Means of Egress Committee agreed that this change was needed in the code but had reservations about approving it without limiting the occupant load of the exterior area. This public comment modifies the original proposal to limit the occupant load of the outdoor area to 300 or less which is the same as Section 1010.1.9.4, #2 for Group A occupancies. This constitutes the "baby steps" that was suggested by one of the Committee members.

The remainder of the proposal is unchanged.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

It is hard to say if this code change will increase or decrease the cost of construction. Compliance with the proposed

conditions of approval (2-way communication device, vision glass, signage, etc) would increase costs but many of these improvements are being required as a result of alternate means and methods of construction requirements that occur when violations are discovered by Fire Prevention Officers after the C of O is issued. In those cases the cost to make these improvements will be higher then if they had been made during the initial construction of the building.

E53-18

E58-18

IBC: 1010.1.9.8, 1010.1.10, (IFC[BE] 1010.1.9.8, 1010.1.10)

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows

1010.1.9.8 Delayed egress. Delayed egress locking systems shall be permitted to be installed on doors serving the following occupancies in buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approved automatic smoke or heat detection system* installed in accordance with Section 907.

1. Group B, F, I, M, R, S and U occupancies.
2. Group E classrooms with an *occupant load* of less than 50.

Exception: ~~Delayed~~

3. In a courthouse, delayed egress locking systems shall be permitted to be installed on exit or exit access doors, other than the main exit or exit access door, serving a Group A-3 courtroom in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Section 1010.1.9.4, Item 2.
2. Doors provided with *panic hardware* or *fire exit hardware* and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Section 1010.1.9.9 or 1010.1.9.10.
3. Courtrooms shall be permitted to be locked in accordance with Section 1010.1.9.8, Item 3.

Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or *exit access* doors, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.

Reason: This is only a format issue resulting from the multiple changes last cycle to the delayed egress locks - E66-15 AMPC1, E68-15 AM/AMPC1, E69-15 AS. The allowance for courtrooms, while logical, is out of place as an exception to Items 1 and 2 in Section 1010.1.9.8.

Correlation with Section 1010.1.9.8 in Section 1010.1.10 is needed because this is Group A where panic hardware is otherwise required.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a format revision with no change to technical criteria.

E58-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While it is appropriate to make the exception a third item, courtrooms are found in both office buildings (Group B) and courthouses (Group A-3). The proposal should be brought back with a public comment to address this issue. (Vote 13-1)

Assembly Action:

None

E58-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1010.1.9.8 Delayed egress. Delayed egress locking systems shall be permitted to be installed on doors serving the following occupancies in buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approved automatic smoke or heat detection system* installed in accordance with Section 907.

1. Group B, F, I, M, R, S and U occupancies.
2. Group E classrooms with an *occupant load* of less than 50.
3. In ~~a courthouse~~ courtrooms in Group A-3 and B occupancies, delayed egress locking systems shall be permitted to be installed on exit or *exit access* doors, other than the main exit or *exit access* door, ~~servicing a Group A-3 courtroom~~ in buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Commenter's Reason: This allowance is already permitted with the current text. The original proposal was editorial only.

The modification is because courtrooms can occur in government office buildings, such as traffic court. The same security concerns exist in all courtrooms, so it appropriate to include these facilities in the proposal. Unlike Section 1010.1.9.8, the new language in 1010.1.10 is a reference only, so no further revisions are needed.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is a format revision with no change to technical criteria.

Public Comment 2:

Proponent: Crystal Sujeski, representing Crystal Sujeski (crystal.sujeski@fire.ca.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1010.1.9.8 Delayed egress. Delayed egress locking systems shall be permitted to be installed on doors serving the following occupancies in buildings that are equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or an *approved automatic smoke or heat detection system* installed in accordance with Section 907.

1. Group B, F, I, M, R, S and U occupancies..
2. Group E classrooms with an occupant load of less than 50.
3. In a ~~courthouse~~ Group A courthouses and court services within a Group B occupancy, delayed egress locking systems shall be permitted to be installed on exit or *exit* access doors, other than the main exit or exit access door, ~~serving a Group A-3 courtroom in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.~~

Commenter's Reason: The following modification has been proposed to E58-18 to clarify that courtrooms are not a B occupancy but there can be court services within a B occupancy building and shall be permitted to have delayed egress.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There will no cost effect

E58-18

E60-18

IBC: 1010.1.9.8.1, Chapter 35, (IFC[BE] 1010.1.9.8.1, Chapter 80)

Proposed Change as Submitted

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows

1010.1.9.8.1 Delayed egress locking system. The delayed egress locking system shall be installed and operated in accordance with all of the following:

1. The delay electronics of the delayed egress locking system shall deactivate upon actuation of the *automatic sprinkler system* or *automatic fire detection system*, allowing immediate free egress.
2. The delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.
3. The delayed egress locking system shall have the capability of being deactivated at the *fire command center* and other *approved* locations.
4. An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.

Exception: Where *approved*, a delay of not more than 30 seconds is permitted on a delayed egress door.

5. The egress path from any point shall not pass through more than one delayed egress locking system.

Exceptions:

1. In Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds.
 2. In Group I-1 or I-4 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds and the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:
 - 6.1. For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
 - 6.2. For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.
 - 6.3. The sign shall comply with the visual character requirements in ICC A117.1.

Exception: Where *approved*, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.

7. Emergency lighting shall be provided on the egress side of the door.
8. The delayed egress locking system units shall be *listed* in accordance with UL 294.
9. The delayed egress locking system shall comply with ANSI/BHMA A156.24.

Add new standard(s) follows

BHMA

Builders Hardware Manufacturers'
Association
355 Lexington Avenue, 15th Floor
New York NY 10017-6603
US

ANSI/BHMA A156.24-2018:

Delayed Egress Locking Systems

Reason: Delayed egress locking systems are a device, or a combination of devices, arranged to be locked in the direction of egress travel, and are intended to temporarily delay the egress of occupants.

Over the last two cycles of the IBC, delayed egress locking systems have been permitted in new occupancy groups and in some instances more than one delayed egress locking system is permitted in the egress path. These provisions were allowed in light of the increased need for security in E and I occupancies, as well as courtroom buildings.

In addition to the increase in allowed application of delayed egress, since 2012 the Code has evolved to recognize use of a 'delayed egress locking system' which is comprised of not just mechanical but electro-mechanical and electro-magnetic locking systems.

In light of the increased occupancy group allowance and application of more than one delayed egress locking system in the path of egress, requiring compliance to BHMA A156.24 Delayed Egress Locking Systems helps assure these locking systems will function reliably and as intended by the Code.

Cost Impact: The code change proposal will increase the cost of construction. Requiring delayed egress door locking hardware to comply with ANSI/BHMA A156.24 could be expected to increase the cost of the door hardware. But, recall that delayed egress locking systems are entirely optional (shall be permitted) and are not required by the IBC. Thus, the cost of construction may increase only where delayed egress locking systems are desired.

Also, many delayed egress door locking products are currently on the market today. Currently, the UL online certification directory for "Special Locking Arrangements" contains 23 unique files (23 manufacturers) in category code FWAX - Special Locking Arrangements - with over 100 product models listed for these applications. UL category FWAX includes many products for delayed egress door locking applications.

Analysis: A review of the standard proposed for inclusion in the code, ANSI/BMHA A156.24-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

E60-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved because the requirements delayed egress locking system should be in the code, not in a referenced standard. (Vote 9-5)

Assembly Action:

None

E60-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests As Submitted.

Commenter's Reason: Addressing the committee reason for disapproval: we agree, requirements for delayed egress locking systems should be in the code. And they are. The proposed reference standard complements code requirements with technical requirements for operational testing, durability, and reliability to help ensure these delayed egress locking systems perform as expected.

Over the last two cycles of the IBC, delayed egress locking systems have been permitted in new occupancy groups and in some instances more than one delayed egress locking system is permitted in the egress path. These provisions were allowed in light of the increased need for security in E and I occupancies, as well as courtroom buildings. In addition to the increase in allowed application of delayed egress, since 2012 the Code has evolved to recognize use of a 'delayed egress locking system' which is comprised of not just mechanical but electro-mechanical and electromagnetic locking systems.

Requiring compliance to BHMA A156.24 Delayed Egress Locking Systems helps assure these locking systems will function reliably and as intended by the Code.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Requiring delayed egress door locking hardware to comply with ANSI/BHMA A156.24 could be expected to increase the cost of the door hardware. But, recall that delayed egress locking systems are entirely optional (shall be permitted) and are not required by the IBC. Thus, the cost of construction may increase only where delayed egress locking systems are desired. Also, many delayed egress door locking products are currently on the market today. Currently, the UL online certification directory for Special Locking Arrangements contains 23 unique files (23 manufacturers) in category code FWAX Special Locking Arrangements with over 100 product models listed for these applications. UL category FWAX includes many products for delayed egress door locking applications.

E60-18

E62-18

IBC: 1010.1.9.12, (IFC[BE] 1010.1.9.12)

Proposed Change as Submitted

Proponent: John Woestman, Kellen Co., representing Builders Hardware Manufacturers Association (BHMA)
(jwoestman@kellencompany.com)

2018 International Building Code

Revise as follows

1010.1.9.12 Stairway doors. Interior *stairway means of egress* doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. *Stairway* discharge doors shall be openable from the egress side and shall only be locked from the opposite side.
2. This section shall not apply to doors arranged in accordance with Section 403.5.3.
3. *Stairway* exit doors are permitted to be locked from the side opposite the egress side, provided that they are openable from the egress side and capable of being unlocked simultaneously without unlatching upon a signal from the *fire command center*, if present, or a signal by emergency personnel from a single location inside the main entrance to the building. The door locking system units shall be listed in accordance with UL 294.
4. *Stairway exit* doors shall be openable from the egress side and shall only be locked from the opposite side in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single *exit stairway* where permitted in Section 1006.3.3.
5. *Stairway* exit doors shall be openable from the egress side and shall only be locked from the opposite side in Group R-2 occupancies where the only interior access to the *dwelling unit* is from a single exit *stairway* where permitted in Section 1006.3.3.

Reason: Locks which are capable of being unlocked upon a signal from the fire command center (if present) or by a signal by emergency personnel from a single location inside the main entrance to the building would have to be electrified locks controlled by an electrical locking system. Consistent with other electrical locks and locking systems in the means of egress in Sections 1010.1.9.7 through 1010.1.9.10 (controlled egress doors, delayed egress doors, and electrically locked egress doors), it is appropriate to require these locking system units installed on stairway doors to be listed in accordance with UL 294.

Cost Impact: The code change proposal will increase the cost of construction

Explanation: The same locking devices available and used for the locks in Sections 1010.1.9.7 through 1010.1.9.10 (controlled egress doors, delayed egress doors, and electrically locked egress doors) would likely be used for stairway doors. These locks and locking systems are currently required by the code to be listed in accordance with UL 294 which does add to the cost of the product. However, Exception 3, where the new requirement is proposed is a "shall be permitted" provision, and only where this exception is voluntarily implemented would the potential cost increase be realized.

E62-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There has been no justification, data or issue identified that would require UL listing for these stairway doors. These type of doors unlock with the loss of power. Adding the UL listing would increase the cost. (Vote 13-1)

Assembly Action:

None

E62-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests As Submitted.

Commenter's Reason: Section 1010.1.9.12 requires interior stairway means of egress doors to be openable from both sides without the use of a key or special knowledge or effort to facilitate entrance into the stairway, and to facilitate leaving the stairway, should that be necessary during egress.

Exception 3 allows these stairways doors to be electrically locked from the stairway side (the side opposite egress) but must be unlockable electrically from the fire command center or by emergency personnel. Thus, the reliable operation of these electrical locks may be very important in egress situations.

Consistent with the current requirements for all electrical locking systems in the means of egress (see Sections 1010.1.9.7, 1010.1.9.8, 1010.1.9.9, and 1010.1.9.10), this proposal recommends requiring these electrical locking system units to be listed to UL 294

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction
Explanation: The same locking devices available and used for the locks in Sections 1010.1.9.7 through 1010.1.9.10 (controlled egress doors, delayed egress doors, and electrically locked egress doors) would likely be used for stairway egress doors. These locks and locking systems are currently required by the code to be listed in accordance with UL 294 which does add to the cost of the product. However, Exception 3, where the new requirement is proposed is a shall be permitted provision, and only where this exception is voluntarily implemented would the potential cost increase be realized.

IBC: 1010.1.10, 1010.1.10.1 (New), (IFC[BE] 1010.1.10, 1010.1.10.1 (New))

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows

1010.1.10 Panic and fire exit hardware. Swinging doors serving a Group H occupancy and swinging doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

Exceptions:

1. A main exit of a Group A occupancy shall be permitted to have locking devices in accordance with Section 1010.1.9.4, Item 2.
2. Doors provided with *panic hardware* or *fire exit hardware* and serving a Group A or E occupancy shall be permitted to be electrically locked in accordance with Section 1010.1.9.9 or 1010.1.9.10.

~~Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or exit access doors, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.~~

Add new text as follows

1010.1.10.1 Rooms with electrical equipment. Exit or exit access doors serving transformer vaults, rooms designated for batteries or energy storage systems, or modular data centers shall be equipped with panic hardware or fire exit hardware. Where rooms contain electrical rooms with equipment rated 800 amperes or more that contain overcurrent devices, switching devices or control devices and where the exit or exit access door is less than 25 feet from the equipment working space, shall be equipped with panic hardware or fire exit hardware. The doors shall swing in the direction of egress travel.

Reason: The current requirements in the International Building Code are not in alignment with the requirements in NFPA 70, the National Electrical Code. Section 110.26(C)(3) requires where there are exit or exit access doors serving a room with electrical equipment rated 800 amperes or more those doors shall be equipped with listed panic hardware. Equipment rated 1200 amperes or more is used to determine the number and locations of exits or exit access doorways, which is addressed in Section 1006.2.2. Also, NFPA 70 for transformer vaults (in Sections

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction Chapter 27 of the IBC already requires electrical installations to comply with the provisions of NFPA 70. This proposal aligns the requirements in the IBC with NFPA 70.

E64-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 1010.1.10.1 Rooms with electrical equipment. Exit or exit access doors serving transformer vaults, rooms designated for batteries or energy storage systems, or modular data centers shall be equipped with panic hardware or fire exit hardware. Where rooms contain electrical rooms with equipment rated 800 amperes or more that contain overcurrent devices, switching devices or control devices and where the exit or exit access door is less than 25 feet from the equipment working space, shall be equipped with panic hardware or fire exit hardware. The doors shall swing in the direction of egress travel.

Committee Reason: By adding travel distance, the modification did add a missing part for coordination with the National Electrical Code. However, there is concern on if 'equipment work space' would be understood and how the distance should be measured.

This proposal would coordinate with the committee action on E17-18. The terms for what types of rooms are addressed is in the National Electrical Code, so which rooms should be understood. It was suggested that perhaps the NEC references in E17-18 should also be added into this section in a public comment. (Vote 10-3)

Assembly Action:

None

E64-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

1010.1.10.1 Rooms with electrical equipment. Exit or exit access doors serving transformer vaults, rooms designated for batteries or energy storage systems, or modular data centers shall be equipped with panic hardware or fire exit hardware. ~~Where rooms contain~~ Rooms containing electrical rooms with equipment rated 800 amperes or more and that contain overcurrent devices, switching devices or control devices and where the exit or exit access door is less than 25 feet from the equipment working space as required by NFPA 70, ~~shall be equipped with such doors shall not be provided with a latch or lock other than~~ panic hardware or fire exit hardware. The doors shall swing in the direction of egress travel.

Commenter's Reason: The change at the beginning of the sentence is editorial for better english. To assist the code user regarding the specific requirements for "working space", a further modification is proposed to reference NFPA 70, which contains those requirements. Also, clarification is proposed to ensure that no latch or lock is to be provided, other than the panic or fire exit hardware.

To coordinate with E17-18 it is the intent of the BCAC to direct the code user to the new requirements in Section 1006.2.2.4 for electrical rooms. The new Section 1006.2.2.4 directs the code user to the specific sections in NFPA 70 for the working space requirements, including the definition of these spaces. However, reference to this section cannot be made at this time because the section does not exist in the 2018 code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Chapter 27 of the IBC already requires electrical installations to comply with the provisions of NFPA 70. This proposal aligns the requirements in the IBC with NFPA 70. Also, the clarification will assist the code user in locating the specific requirements.

E64-18

E67-18

IBC: 1011.5.5, (IFC[BE] 1011.5.5)

Proposed Change as Submitted

Proponent: David Cooper, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)

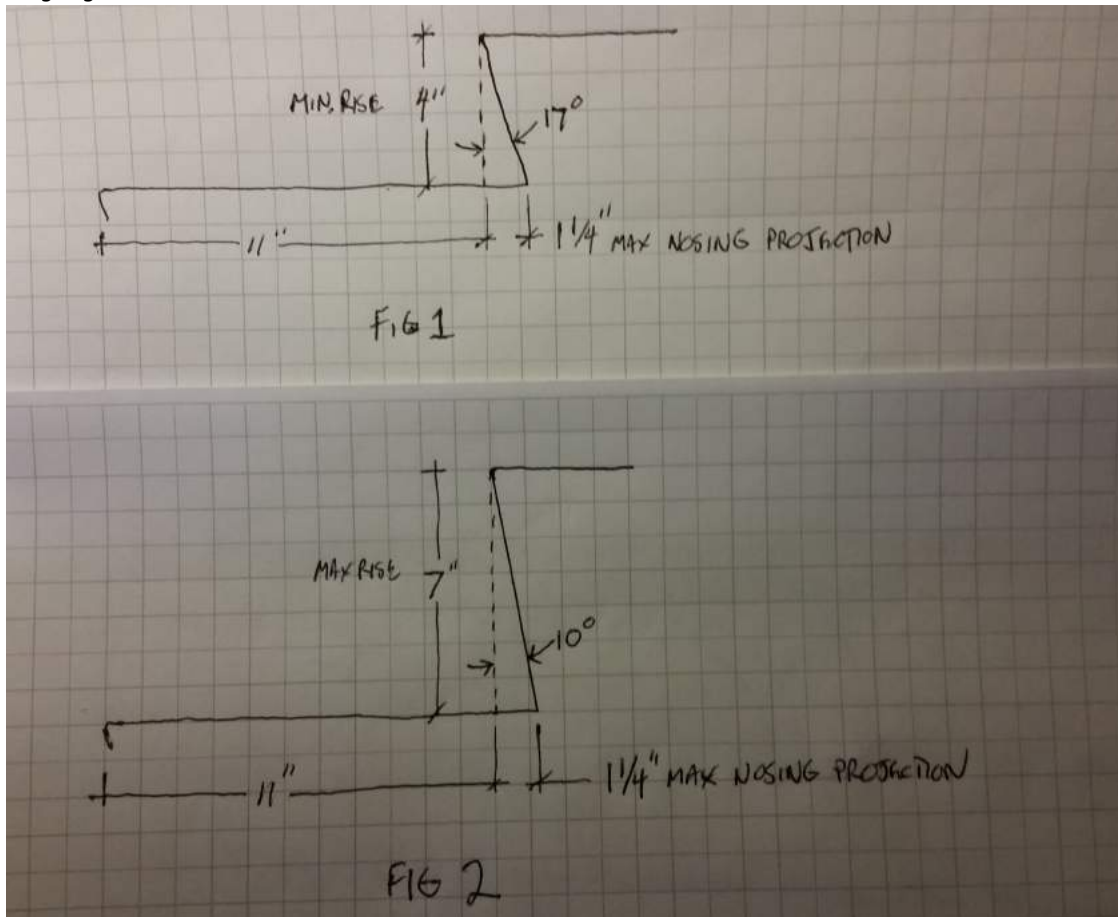

2018 International Building Code

Revise as follows

1011.5.5 Nosing and riser profile. *Nosings* shall have a curvature or bevel of not less than $\frac{1}{16}$ inch (1.6 mm) but not more than $\frac{9}{16}$ inch (14.3 mm) from the foremost projection of the tread. Risers shall be solid and vertical or sloped under the tread above from the underside of the *nosing* above ~~at an angle not more than 30 degrees (0.52 rad) from the vertical provided the nosing projection is in accordance with Section 1011.5.5.1.~~

1011.5.5.1 Nosing projection size. The leading edge (nosings) of treads shall project not more than $1\frac{1}{4}$ inches (32 mm) beyond the tread below.

Reason: Figure 1 illustrates the sloped riser angle at the minimum riser height and maximum nosing projection. Figure 2 illustrates the sloped riser angle at the maximum riser height and maximum nosing projection. The current language is confusing because it is impossible to slope the riser anywhere close to 30 degrees without greatly exceeding the maximum nosing projection. The proposed change correlates an appropriate limit and clarifies widely misunderstood code language.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal only clarifies the intent of the code and does not change materials or methods.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal did not consider the idea of a compound slope for the riser. The original intent of the 30 degrees is to avoid a toe catch on the underside of the tread. There was no data provided on this being an issue. (Vote 14-0)

Assembly Action:

None

E67-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Cooper, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1011.5.5 Nosing and riser profile. *Nosings* shall have a curvature or bevel of not less than $\frac{1}{16}$ inch (1.6 mm) but not more than $\frac{9}{16}$ inch (14.3 mm) from the foremost projection of the tread. Risers shall be solid and vertical or sloped under the tread above from the underside of the *nosing* above at an angle not more than 30 degrees (0.52 rad) from the vertical provided the nosing projection is in accordance with Section 1011.5.5.1.

1011.5.5.1 Nosing projection size. The leading edge (nosings) of treads shall project not more than $1\frac{1}{4}$ inches (32 mm) beyond the tread below.

Commenter's Reason: This public comment addresses both the committee's concern and the intent of the proponent. The text deleted from the original proposal has been returned due to the concern for an angular limit on risers with compound slopes however the added text needs to remain.

If the face of the riser is angled at 30 degrees under the tread above unabated, especially at lower riser heights it can create a wedge for the toe of the shoe. I have listed the referenced section, **1011.5.5.1 Nosing projection size**, without change to aid understanding. By referencing this section it clarifies that the maximum projection of the nosing over the tread below is not to be exceeded regardless of the angle of the riser.

We request your approval of this public comment to clarify the code and resolve a common misunderstanding.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal only clarifies the code and will not affect labor or materials related to the cost of construction.

E67-18

E69-18

IBC: 1011.6, (IFC[BE] 1011.6)

Proposed Change as Submitted

Proponent: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)

2018 International Building Code

Revise as follows

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. Where wheelchair spaces are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

Exception-Exceptions:

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.
2. At intermediate landings of curved stairways the landing depth shall be measured along the walkline radius between the nosings of the flights adjoining the landing.

Reason: Similar to a straight run stairway with a landing separating two flights aligned in a straight line the paths of travel on the stairway shown in figure 1 is a continuum. This new exception provides needed specification of where to regulate the landing depth. Due to the tapered shape of the landing similar to the treads of the adjoining flights it makes sense to regulate the depth like the treads at the walklines of the flights. This proposal will provide for consistent interpretation and enforcement.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Although the size of these landings are currently open to wide interpretation we feel that this change will not change the cost of construction.

E69-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: It is not clear how you would establish a walk line on a curved stairway. The current language for walk lines is only applicable to winder treads. The proposed language is a requirement, not an exception. (Vote 13-1)

Assembly Action:

None

E69-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Cooper, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. Where wheelchair spaces are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

~~Exception:~~ Exceptions

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.
2. Where curved stairways of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower flight at the landing nosing and the intersection of the walkline of the upper flight at the nosing of the lowest tread of the upper flight.

Commenter's Reason: The committee's misinformed and unfounded reason for disapproval cites that walkline as in section **1011.4 Walkline** is only related to winders and not curved stairways. This is simply incorrect. The IBC definition of **Winder** is, *A tread with nonparallel edges.*

In fact this means that the treads in a curved stairway with edges that are not parallel are winder treads and are regulated for depth at the *walkline*. Furthermore the code recognizes this in the first sentence of the Curved stairway section

"1011.9 Curved stairways. *Curved stairways with winder treads shall have...*"

None of the committee recognized or corrected this misinformation that clearly influenced their discussion and vote.

I have taken the time to rewrite the language to more clearly identify this as an exception to measuring landing depth parallel to the direction of travel as stated in the requirement. This exception further provides needed direction as to where the measurement should be taken on the "pie" shaped landing. Currently where to measure the depth is open to wide interpretation. Winder tread depth is regulated at the walkline so it only seems logical to regulate the landing depth of curved stairways of constant radius between the intersections of the nosings and the walklines of the flights.

I urge you to approve this needed change to allow for consistent interpretation and enforcement of curved stairway landing depth.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Certain unnecessary costs arising from rebuilding non-compliant stair structures will be eliminated.

E69-18

E70-18

IBC: 1011.6, (IFC[BE] 1011.6)

Proposed Change as Submitted

Proponent: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)

2018 International Building Code

Revise as follows

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. Where wheelchair spaces are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

Exception-Exceptions:

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.
2. The landing at stairway turns of 90 degrees (1.57 rad) or more shall not be required to provide a minimum depth in accordance with this section where the corner of the landing on the outside of the turn in plan has been truncated and the area of the landing provided is not less than that described by an arc with a radius equal to the width of the flight served.
