Reason: This proposal simply reiterates the interpretation found in the IBC commentary for more than a decade that has aptly provided guidance to the fact that landings of stairways need not be rectilinear in shape. Truncating the outside corner by rounding or beveling in plan without reduction of the effective width in the path of travel can actually improve compliant use of handrails when continuous handrails are optionally provided at landings by eliminating the need to unnaturally stray from the travel path into the corner to maintain a continuous grip on the handrail. A proposal with similar intent failed in the last cycle because the text was interpreted to allow a wall niche to be added to a landing to meet the minimum area requirement. This proposal clearly describes the condition under which the corner of a landing may be truncated in plan. In this proposal the turn is described as a turn in the “stairway”. By definition landings and flights of stairs compose stairways and thus the term “stairway turns” is appropriate.

Example of 90 degree stairway turn with minimum landing size.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal clarifies the code text to comply with the the most common interpretation and will not increase construction costs.

E70-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The new exception 2 is a run on sentence that should be simplified. The phrase "direction of travel" is confusing. The new exception is not needed as this landing shape can be done with current language. Stairway landing commonly have standpipes in the corner without any issues. The proposal does not address what do you do if there turn is less than 90 degrees. (Vote 14-0)

Assembly Action:

None

E70-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. Where wheelchair spaces are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

Exceptions:

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.
2. ~~The Where a landing at stairway turns of 90 degrees (1.57 rad) or more shall not be required to provide a minimum, the minimum landing depth in accordance with this section where the corner of the landing on the outside of the turn in plan has been truncated and the area of shall not be required where~~ the landing provided is not less than that described by an arc with a radius equal to the width of the flight served.

Commenter's Reason: The committee rightly suggested that this exception should be rewritten to clearly state what is intended. As noted in the original supporting statement, the commentary on Section 1011.6 specifically states: *It is not the intent of this section to require that a stairway landing be shaped as a square or rectangle. A landing turning the stairway 90 degrees (1.57 rad) or more with a curved or segmented outside periphery would be permitted, as long as the landing provides an area described by an arc with a radius equal to the actual stairway width [see Commentary Figure 1011.6(3)]. In this case, the space necessary for means of egress will be available.*

The proposed modification will clarify that the landing may be configured to provide the minimum width on a landing by the arc at the minimum width of the stair. Figure 1011.6(3) describes a "reversing run stairway" which is reflected in the proposed code text.

We urge the membership to approve this change as modified by this proposal in order to make the code and the commentary clear.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The revised language will clarify how a landing can be configured as discussed in the ICC Commentary on this section of the code. The clarity in the code will simplify design and review and save time and money in the process.

Public Comment 2:

Proponent: William Warlick, representing Salt Lake City Building Services requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. Where wheelchair spaces are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

Exceptions:

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1029.
2. The landing at stairway turns of 90 degrees (1.57 rad) or more shall not be required to provide a minimum depth in accordance with this section where the corner of the landing on the outside of the turn in plan has been truncated and, provided the area of the landing provided is not less than that described by an arc with a radius equal to truncated area falls outside an arc whose radius equals the width of the flight served and which starts the depth of one tread beyond the riser.

Commenter's Reason: We are writing in support of the general intent of code change proposal E70-18. In addition, we offer an amendment that clarifies language and offers a more restrictive view of the minimum landing area. We believe this code change would be useful, for example, to allow standpipes, as required in 905.4, to be placed in the outside corners of landings (a common practice that is commonly allowed). The language is clarified by focusing the definition on limiting the area that may be "truncated" from the basic rectangular landing defined in 1011.6.

The more restrictive view of the minimum landing area is offered because we feel there is a need for a greater dimension in the direction of travel on a stair flight to provide adequate room on the landing for changing gait and changing direction. So, we add to the 'arc'-defined floor plan an area equal to the another stair tread. We took the dimension of handrail extensions (1014.6) as a model to define this floor space. The figure shows the area outside the arc which may be truncated.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Clarification - no cost impact.

E71-18

IBC: 1011.11, (IFC[BE] 1011.11)

Proposed Change as Submitted

Proponent: Don Birdsall, LIFT-U Division of Hogan Mfg., Inc., representing LIFT-U Division of Hogan Mfg., Inc. (donbirdsall@hoganmfg.com)

2018 International Building Code

Revise as follows

1011.11 Handrails. *Flights of stairways* shall have *handrails* on each side and shall comply with Section 1014. Where glass is used to provide the *handrail*, the *handrail* shall comply with Section 2407.

Exceptions:

1. *Flights of stairways* within *dwelling units* and *flights of spiral stairways* are permitted to have a *handrail* on one side only.
2. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require *handrails*.
3. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require *handrails*.
4. Changes in room elevations of three or fewer risers within *dwelling units* and *sleeping units* in Group R-2 and R-3 do not require handrails.
5. Where a platform lift in the park position is accessed by a stairway with two or fewer risers, handrails are not required where handholds are provided that comply with the following:
 - 5.1 Handholds are provided on each side of the top landing.
 - 5.2. Handholds are provided vertically or horizontally with gripping surfaces 34 inches (864mm) high minimum and 42 inches (1066 mm) high maximum above the bottom landing.
 - 5.3. Handholds shall comply with the graspability provisions for handrails and have a length of not less than 4.5 inches (144 mm).

Reason: The primary intent of this new exception is to provide a safe alternative for a limited situation at platform lifts used to access small raised areas. Because of the movement of the lift, standard set handrails will not work. However, typically these lifts are surrounded by short walls that can serve as handholds for someone to grab to stop a possible fall. This condition frequently exists when a wheelchair lift is installed in a courtroom to provide access to the witness stand and judges' bench. The lift platform is the floor of the Witness Stand. The platform at the entrance to the Witness Stand is commonly parked at a height requiring a step to enter. The Witness Stand is surrounded by millwork low walls. A similar condition can exist in government meeting rooms, churches, and academic buildings. Section 1011.11 requires two handrails starting at a one riser stairway. The addition of handrails interferes with the vertical travel of the platform lift. The judges' bench and often the witness stand are required to be elevated for safety and court function. A platform lift is required to make these areas accessible by both the ADA and the IBC.

This additional exception provides and describes handholds for this limited situation that assist the person walking up and down the steps and do not interfere with the platform lift operation for persons with mobility issues.

Video of situation: <https://hoganmfg.sharefile.com/d-s7519e8a5a7148c48>

Bibliography: International Building Code 2015
ASME A18.1 Safety Standard for Platform Lifts and Stairway Chairlifts, 2014 Edition

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This revision will have minimal to no impact on the cost of the project and will allow access to the Justice System for all users - motion impaired and ambulatory. A barrier removal facilitation change.

E71-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal would be a compromise between accessibility and stairway safety requirements for this condition. However, there was a concern about the understanding of the terms “parked position” and “handhold”. What is the length and location of the handhold? It was suggested that “creates a stairway” would be more understandable than “accessed by a stairway.” (Vote 11-3)

Assembly Action:

None

E71-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Don Birdsall, representing LIFT-U Division of Hogan Mfg., Inc. (donbirdsall@hoganmfg.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1011.11 Handrails. *Flights of stairways shall have handrails on each side and shall comply with Section 1014. Where glass is used to provide the handrail, the handrail shall comply with Section 2407.*

Exceptions:

1. Flights of stairways within dwelling units and flights of spiral stairways are permitted to have a handrail on one side only.
2. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require *handrails*.
3. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require *handrails*.
4. Changes in room elevations of three or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require *handrails*.
5. Where a platform lift is in a stationary position and the floor of the platform lift serves as the upper landing of a stairway, handrails shall not be required on the stairway, provided that all of the following criteria are met:
 - 5.1. The stairway contains no more than two risers.
 - 5.2. A handhold, positioned horizontally or vertically, is located on one side of the stairway adjacent to the top landing.
 - 5.3. The handhold is located not less than 34 inches (864 mm) and not more than 42 inches (1066 mm) above the bottom landing of the stairway.
 - 5.4. The handhold gripping surface complies with Section 1014.3, and is not less than 4.5 inches (144 mm) in length.

Commenter's Reason: The Committee agreed that this proposal was reasonable, but need a few clarifications. The revised language clarifies the configuration where the exception would be applicable and better defines where the handhold should be placed.

The reference back to Section 1014.3 specifies the graspability requirements used for handrails to ensure safe use.

Bibliography: ASME A18.1 Safety Standard for Platform Lifts and Stairway Chairlifts, 2014 Edition
International Building Code 2015

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This revision will allow a handhold for this application that costs no more than a handrail and will permit the use of the wheelchair lift without interference.

E76-18

IBC: 1014.1, 1014.9(New), (IFC[BE] 1014.1, 1014.9(New))

Proposed Change as Submitted

Proponent: Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov)

2018 International Building Code

Revise as follows

1014.1 Where required. *Handrails serving flights of stairways, ramps, stepped aisles and ramped aisles shall be adequate in strength and attachment in accordance with Section 1607.8. Handrails required for flights of stairways by Section 1011.11 shall comply with Sections 1014.2 through 1014.9-1014.10. Handrails required for ramps by Section 1012.8 shall comply with Sections 1014.2 through 1014.8. Handrails for stepped aisles and ramped aisles required by Section 1029.16 shall comply with Sections 1014.2 through 1014.8.*

Add new text as follows

1014.9 Reach range. Handrails on the side of stairways shall be located not more than 12 inches (305 mm) laterally outward from the edge of stairway treads.

Revise as follows

~~1014.9-1014.10 Intermediate handrails.~~ *Stairways shall have intermediate handrails located in such a manner that all portions of the stairway minimum width or required capacity are within 30 inches (762 mm) of a handrail. On monumental stairs, handrails shall be located along the most direct path of egress travel.*

Reason: Recently I reviewed a stairway design that included a bicycle runnel. Runnels are typically a 15" to 20" wide sloped track that allows a rider to push a bicycle along the side of the stairway while traversing up or down. Currently the code does not limit the maximum distance that a handrail may be located from the edge of the stair treads. The 12" limitation was chosen to allow enough room for runnels while maintaining a comfortable distance for pedestrians to reach the handrail.

SDR - BIKE RUNNEL AND HANDRAIL EXHIBIT
GGLO, 02/23/2017

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change will not affect the cost of construction one way or the other because no additional materials or labor are needed to make the installation.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: If this is just an issue for people carrying bikes down a stairway safely, perhaps this should be limited to exterior stairways only. Any protrusion that moves farther out than the handrail could be a hazard to the pedestrian on the stairways. (Vote 14-0)

Assembly Action:

None

E76-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1014.9 Reach range. ~~Handrails~~ The inner edge of handrails on the side of stairways shall be located not more than 12 inches (305 mm) laterally outward from the ~~further than the outer edge of stairway treads.~~

Commenter's Reason: During testimony it was discussed that, for safety reasons, the handrail should not be located too far from the side of the stairway. Curiously, no language exists to address what should be provided as a side reach to the handrails. The revised language is consistent with the information provided during testimony.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
The proposed language is only a clarification of the intent.

E76-18

E79-18

IBC: 1015.4, (IFC[BE] 1015.4)

Proposed Change as Submitted

Proponent: David Cooper, Stair Manufacturing and Design Consultants, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)

2018 International Building Code

Revise as follows

1015.4 Opening limitations. Required *guards* shall not have openings that allow passage of a sphere 4 inches (102 mm) in diameter from the walking surface to the required *guard* height.

Exceptions:

1. From a height of 36 inches (914 mm) to 42 inches (1067 mm), *guards* shall not have openings that allow passage of a sphere $4\frac{3}{8}$ inches (111 mm) in diameter.
2. The triangular openings at the open sides of a stair, formed by the riser, tread and bottom rail shall not allow passage of a sphere 6 inches (152 mm) in diameter.
3. At elevated walking surfaces for access to and use of electrical, mechanical or plumbing systems or equipment, *guards* shall not have openings that allow passage of a sphere 21 inches (533 mm) in diameter.
4. In areas that are not open to the public within occupancies in Group I-3, F, H or S, and for *alternating tread devices* and ships ladders, *guards* shall not have openings that allow passage of a sphere 21 inches (533 mm) in diameter.
5. In assembly seating areas, *guards* required at the end of *aisles* in accordance with Section 1029.17.4 shall not have openings that allow passage of a sphere 4 inches (102 mm) in diameter up to a height of 26 inches (660 mm). From a height of 26 inches (660 mm) to 42 inches (1067 mm) above the adjacent walking surfaces, *guards* shall not have openings that allow passage of a sphere 8 inches (203 mm) in diameter.
6. ~~Within individual dwelling units and sleeping units in Group R-2 and R-3 occupancies, guards~~ Guards on the open sides of *stairs* shall not have openings that allow passage of a sphere $4\frac{3}{8}$ (111 mm) inches in diameter.

Reason: The $4\frac{3}{8}$ inch sphere rule for guards on stairs has been working well without issue and has proven to be effective in both IBC residential applications and IRC applications, where the susceptible, very- young-children, are far more prevalent than in commercial and public places. A 4" sphere rule requirement for stair guards is an unnecessary and excessive regulation. This change will increase the sphere rule limitation to $4\frac{3}{8}$ inches for all stair guards but will not affect other required guards.

Cost Impact: The code change proposal will decrease the cost of construction. Fewer balusters or less in-fill material will reduce both material and fabrication costs.

E79-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The original justification for this 4-3/8" was for residential tread sizes. While there were studies showing this spacing would address safety concerns, allowing the 4-3/8" openings for all occupancies seems too broad. (Vote 10-3)

Assembly Action:

None

E79-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Cooper, representing Stairbuilders and Manufacturers Association (SMA) (coderep@stairways.org)requests As Submitted.

Commenter's Reason: I must emphasize that this proposal does not affect all openings as the committee's reason for disapproval indicates. This only changes the openings in stair guards in occupancies other than within dwelling units where it is already allowed. This is an area of the code that could be simplified for enforcement. The issue of infants on public and commercial stairways is far less than that in the home where a 4 3/8 inch sphere rule has been the norm for many years in both the IBC and IRC. The 4 3/8 inch sphere rule was adopted because infants are not left alone on stairways and was justified by the work of the Climbable Guard Study Group of the CTC after 3 years devoted to the topics related to guard safety one of which was fall through accidents.

Bibliography: Review of Fall Safety of Children Between the Ages of 18 Months and 4 Years In Relation to Guards and Climbing in the Built Environment, 3720.001_20071204R20080506; Alan Hedge, Ph.D.; Thomas Kenney, P.E.; Phillip Davis, December 4, 2007; Prepared for the the National Ornamental and Miscellaneous Metals Association with peer review

<https://www.stairways.org/resources/Documents/NOMMA%20Final%20Report%2020080506R.pdf>

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction Fewer balusters in stair guards will save labor and materials.

E79-18

E81-18

IBC: 1015.8, (IFC[BE] 1015.8)

Proposed Change as Submitted

Proponent: Jim Tidwell, Tidwell Code Consulting, representing Self (jimtidwell@tccfire.com); Jim Graham, Self, representing National Association for Child Window Safety (jgraham@childwindowsafety.org)

2018 International Building Code

Revise as follows

1015.8 Window openings. 1015.8 Window openings. Windows in Group R-2 and R-3 buildings including dwelling units, where the top of the sill of an operable window opening is located ~~less than 36 inches above the finished floor and~~ more than 72 inches (1829 mm) above the finished grade or other surface below on the exterior of the building, shall comply with one of the following:

1. Operable windows where the top of the sill of the opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below and that are provided with window fall prevention devices that comply with ASTM F2006.
2. Operable windows where the openings will not allow a 4-inch-diameter (102 mm) sphere to pass through the opening when the window is in its largest opened position.
3. Operable windows where the openings are provided with window fall prevention devices that comply with ASTM F2090.
4. Operable windows that are provided with window opening control devices that comply with Section 1015.8.1. .

Exception: Windows over counters, plumbing fixtures or doors.

Reason: This code change is intended to address the ongoing problem of children climbing onto and falling from windows. According to a report published in the Journal Pediatrics®, Official Journal of the American Academy of Pediatrics, "From 1990 through 2008, an estimated 98,415 children (95% CI: 82 416– 114 414 children) were treated in US hospital EDs for injuries attributable to a fall from a window, with an average of 5,180 patients (95% CI: 4828 -5531 patients) per year." This report is the most recent, comprehensive study to date on the problem.

There is a viable, inexpensive solution to this problem that has proven effective in the largest city in the United States, New York City. In the mid 1970's, New York City implemented a program they called "Children Can't Fly" in an effort to reduce injuries resulting from window falls. A center piece of that effort was a Local Law requiring window guards in every building with three or more apartments where children under 10 resided. Since then, injuries and deaths from window falls have been dramatically reduced. According to Barbara Barlow, MD, Chief of Pediatric Surgery, Harlem Hospital Center, "The 96% decrease in accidental falls from windows since 1979 demonstrates that the "Children Can't Fly" program in New York City has almost eliminated accidental falls from windows in our hospital population" [quote from report titled "Ten years of experience with falls from a height in children, Barlow B, Niemirska M, Gandhi R, Leblanc W (1983)].

Note that the New York City statute does not stipulate a minimum sill height, as they recognized the fact that children climb on windows; furniture placed near a window can provide a means to climb to the window; and children are inherently curious and will explore areas, such as windows, that have proven dangerous when not properly protected by child window fall protection devices. Using a sill height as a threshold to require fall protection is fallacious because the fall protection is necessary for climbing, exploring children, not just a child who happens to trip and fall near a window.

Also, New York City did not accept limiting devices as a solution. There is another proposal to address this issue separately.

This proposal is simple and straightforward. It removes the reference to a minimum sill height measured inside the room. The current 36" threshold isn't high enough to prevent many children from accidentally falling from a window even if the child is at floor level. For children climbing on the window or adjacent furniture (a significant portion of the problem), any sill height is simply a way around solving the problem, and will not have the desired effect.

Approving this code change will undoubtedly save thousands of children from serious injuries or death at a very low cost.

Cost Impact: The code change proposal will increase the cost of construction. Increased cost include the addition fall protection for windows not currently required to be equipped with such protection.

E81-18

Public Hearing Results

Errata: The exception is applicable to the entire section, not just Item 4.

Committee Action:

Disapproved

Committee Reason: While preventing falls for children is important, this proposal is too far reaching. This requirement for guards would conflict with emergency escape and rescue opening requirements. Window openings are not more hazardous than drop offs protected by guards – there needs to be some minimum height proposed. No limit on the bottom height of the window is too extensive – as written this would apply to windows at all heights. The fall statistics are based on building stock, not where the new limits are in place. The exception should be addressed in a more comprehensive manner. (Vote 12-2)

Assembly Action:

None

E81-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jim Tidwell, representing Self (jimtidwell@tccfire.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

1015.8 Window openings. Windows in Group R-2 and R-3 buildings including *dwelling units*, where the top of the sill of an operable window opening is located ~~less than 36 inches above the finished floor and~~ more than 72 inches (1829 mm) above the finished grade or other surface below on the exterior of the building, shall comply with one of the following:

1. Operable windows where the top of the sill of the opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below and that are provided with window fall prevention devices that comply with ASTM F2006.
2. Operable windows where the openings will not allow a 4-inch-diameter (102 mm) sphere to pass through the opening when the window is in its largest opened position.
3. Operable windows where the openings are provided with window fall prevention devices that comply with ASTM F2090.
4. Operable windows that are provided with window opening control devices that comply with Section 1015.8.1.

Commenter's Reason: This public comment is intended to address some of the concerns from the committee. One concern was that the exception was counter to the intent of the change, as children can easily climb on counters and fixtures to get to windows; we agree, and have removed the exception. Another concern was windows that are high on a wall that no one can reach. Our position is that, if a window is so high on a wall that no one can reach it, it should be inoperable; however, if an adult can reach a window, a child can reach that same window by climbing on furniture, toys, or other devices. Operable windows that expose children to falls should be protected with passive window fall protection. The original code change with this comment is intended to address the ongoing problem of children climbing onto and falling from windows.

According to a report published in the Journal Pediatrics®, Official Journal of the American Academy of Pediatrics, "From 1990 through 2008, an estimated 98,415 children (95% CI: 82 416– 114 414 children) were treated in US hospital EDs for injuries attributable to a fall from a window, with an average of 5,180 patients (95% CI: 4828 –5531 patients) per year." This report is the most recent, comprehensive study to date on the problem.

There is a viable, inexpensive solution to this problem that has proven effective in the largest city in the United States, New York City. In the mid 1970's, New York City implemented a program they called "Children Can't Fly" in an effort to reduce injuries resulting from window falls. A center piece of that effort was a Local Law requiring window guards in every building with three or more apartments where children under 10 resided. Since then, injuries and deaths from window falls have been dramatically reduced. According to Barbara Barlow, MD, Chief of Pediatric Surgery, Harlem Hospital Center, "The 96% decrease in accidental falls from windows since 1979 demonstrates that the "Children Can't Fly" program in New York City has almost eliminated accidental falls from windows in our hospital population" [quote from report titled "Ten years of experience with falls from a height in children, Barlow B, Niemirska M, Gandhi R, Leblanc W (1983)].

Note that the New York City statute does not stipulate a minimum sill height, as they recognized the fact that children climb on windows; furniture placed near a window can provide a means to climb to the window; and children are inherently curious and will explore areas, such as windows, that have proven dangerous when not properly protected by child window fall protection devices. Using a sill height as a threshold to require fall protection is fallacious because the fall protection is necessary for climbing, exploring children, not just a child who happens to trip and fall near a window. The sill height threshold is a significant loophole in the regulations intended to prevent injuries to children falling from windows.

Also, New York City did not accept limiting devices as a solution. There is another proposal to address this issue separately.

This proposal is simple and straightforward. It removes the reference to a minimum sill height measured inside the room. The current 36" threshold isn't high enough to prevent many children from accidentally falling from a window even if the child is at floor level. For children climbing on the window or adjacent furniture (a significant portion of the problem), any sill height is simply a way around solving the problem, and will not have the desired effect.

Approving this code change will undoubtedly save thousands of children from serious injuries or death at a very low cost.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost of adding fall protection to windows that present a risk to children is very minor, and will likely be recouped by savings in medical treatment of children who will be prevented from falling from open windows.

Public Comment 2:

Proponent: Jan Berichon, Randall Children's Hospital, representing selfrequests As Submitted.

Commenter's Reason: I support changing the ICC code changes proposed in E81 and E-82 . The code changes that have been submitted to improve child window safety fix loopholes that result in child window falls. This is a companion comment to E-82.

Working in a children s hospital, all too often we treat children that have fallen from windows and see the devastating injuries or deaths repeated year after year.

I support adding passive window fall protection for windows, regardless of sill height, with protection in place that is not easily overridden. Children climb and are innovative, they find ways to access windows by moving items to climb to a window or as a child I worked with recently, climbed up the wall using a nearby built in floor to ceiling cabinet to access the higher window and fell - minimum height requirements will make little to no difference- if a window is accessible by an adult, a child would be able to access the window as well. Children imitate adults.

Improving this code change will prevent thousands of children from serious injury or death. Thank you for your consideration.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost of this code change would minimally increase the initial construction cost, however installation of child window fall prevention screens will decrease overall future costs of replacement screens while decreasing medical costs for the treatment of injuries or deaths prevented from potential window falls.

Public Comment 3:

Proponent: Lisa Dau, Keiki Injury Prevention Coalition, representing Keiki Injury Prevention Coalition (lisa.dau@kapiolani.org)requests As Submitted.

Commenter's Reason: I am wrtng to you in expressing my support to the proposed changes to codes E81-18 relating to child window safety and window fall prevention for children.

I believe there is a gap in the current ICC code that falls short on protection of our children from window falls. This code change addresses the problem of children climbing onto and falling from window. Children climb on window sills, especcally when furniture is place near windows. Children are curious and do not know the dangers of climbing. Regardless of the sill height, if an adult can reach a window opeining, so can a child.

I support the proposed ICC changes to E81-18, these changes will prevent serious injuries and deaths of young children from window falls

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The change proposal will increase the cost of the construction, however the added cost for fall protection and prevention to windows that present a risk to children is very minimal as compared the the devastating cost of the death a child, or the high cost of medical and mental health care, that could be easily prevention by supporting this proposed change.

Public Comment 4:

Proponent: Jim Graham, representing National Association for Child Window Safety (jgraham@childwindowsafety.org) requests As Submitted.

Commenter's Reason: The New York City code referenced no sill height and they had a 96% decrease in window falls. The 96% decrease in accidental falls from windows since 1979 demonstrates that the "Children Can't Fly" program in New York City has almost eliminated accidental falls from windows in our hospital population" [quote from report titled "Ten years of experience with falls from a height in children, Barlow B, Niemirska M, Gandhi R, Leblanc W (1983)]. Note that the New York City statute does not stipulate a minimum sill height, as they recognized the fact that children climb on windows; climb on furniture, and climb on beds near windows. It has been proven that even 12 and 13 month old babies are capable of climbing on the average couch or bed; and children are inherently curious and anxious to explore their world. From those pieces of furniture, found in every home, they have easy access to windows even higher than 36 inches.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The code change proposal will modestly increase the cost of construction. Benefit/Cost analysis has demonstrated that very quickly that modest increase in cost will be returned in property management savings. That B/C analysis demonstrated that in multi-unit affordable housing it saved up to 98% of window maintenance cost. And does not include savings on insurance costs due to lessening the exposure due to liability concerns.

Public Comment 5:

Proponent: Wayne Parsons, Wayne Parsons Law Office, representing Wayne Parsons Law Office (wparsons@hawaii.rr.com) requests As Submitted.

Commenter's Reason: I submit this comment in support of proposed ICC code change proposals E81-18 and E82-18 which seek to close loopholes in ICC 1015.8 - Window Openings. I am a lawyer who has spent the last few years studying the issues surrounding child window falls. I was involved in engineering and safety investigations surrounding the death of a 5-year-old boy who fell to his death through a window in a new home. Eighteen other children fell from windows in that same project over a over a three year period. The window fall protection system utilized was a window-opening limiting device (WOLD) also sometimes referred to as a "vent stop". It became apparent to all sides of the case (Plaintiffs, property managers, developer and the U.S. Government) that WOLDS do not work and can be easily defeated by a child. Flimsy window screens used throughout the projects easily popped out when even light pressure was applied. The existing ICC Code has a loophole that allows unsafe fall protection devices to be installed in vulnerable windows. Another loophole that must be corrected or more lives will be lost is the sill height limitation that excludes many windows through which young children will fall from any fall protection requirements. I support the Public Comments submitted by Jim Tidwell, and encourage passage of his proposed amendments to ICC 1015.8 Window Opening:

To require that all operable windows in residential occupancies have passive barriers - either window screens or window guards - that meet the ASTM standards for fall protection. (Public Comment E81-18).

To remove any reference to sill height (Public Comment E82-18).

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Effective window fall protection devices such as window bars or safety screens cost more than ineffective window opening limiter devices (WOLDS). However the life cycle costs of safety screens dramatically reduce the cost of ownership over time, as well as reducing injury and deaths to children. The screens are made of stainless steel and do not need to be replaced. The initial costs are only incrementally greater than the flimsy aluminum or plastic screens that are normally used. By significantly increasing the life of the screen, the owner will save money over time. And no one would advocate accepting the death of a child in exchange for the increased cost of the screen, would they?

Public Comment 6:

Proponent: Jeff Inks, representing Window and Door Manufacturers Association (jinks@wdma.com) requests Disapprove.

Commenter's Reason: WDMA supports the Committee's action to disapprove this proposal. We agree that the proposed amendment is far too broad in scope, making the requirement applicable to all operable windows with sills higher than 72 inches above the exterior finished grade or surface without justification. This would apply to all of those windows regardless of size, dimensions, or height above the floor, e.g., operable windows installed over a fixed or stationary window, windows of all operability types that are installed four, five, six feet or more above the floor, operable clerestories, small bathroom windows, or any number of other windows where fall protection has never been needed. The New York City ordinance cited as justification for this amendment is far more limited in scope than this proposal. Specifically, it requires guards in just those operable windows in rental apartments where children 10 years old or younger reside, prohibits installation of them on windows required for emergency escape and rescue, and does not

require them for privately own apartments and condos.

In addition, as the Committee pointed out, the fall statistics cited in the proposal are based on building stock that predates the current requirements. There has not been adequate substantiation to show that the current requirements are deficient or inadequate to justify the significant increased construction costs that would result from requiring window fall protection devices where they are not needed.

For these and other reasons, WDMA urges the Committee's disapproval be upheld.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

N/A

Public Comment 7:

Proponent: Janice Yglesias, representing American Architectural Manufacturers Association (jyglesias@aamanet.org) requests Disapprove.

Commenter's Reason: E81-18 effectively results in numerous applications unnecessarily requiring window fall protection such as operable windows installed over fixed windows or in other likely unreachable locations high in the wall. The change also disregards the critical need to strike a balance between window fall protection and emergency escape and rescue. The work done by New York City in the 1970's, which is referenced as justification for this code change, was important but does not apply to openings required for emergency escape and rescue and it pre-dates development of the consensus-based ASTM F2006 and F2090 standards which are now widely used in compliance with the current code language in most states across the country. Therefore, AAMA urges disapproval of this proposal.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Additional costs will be required to add window opening control devices in numerous applications unnecessarily requiring window fall protection such as operable windows installed over fixed windows or in other likely unreachable locations high in the wall.

E81-18

E82-18

IBC: 1015.8, 1015.8.1, (IFC[BE] 1015.8, 1015.8.1)

Proposed Change as Submitted

Proponent: Jim Tidwell, Tidwell Code Consulting, representing Self (jimtidwell@tccfire.com); Jim Graham, Self, representing National Association for Child Window Safety (jgraham@childwindowsafety.org)

2018 International Building Code

Revise as follows

1015.8 Window openings. Windows in Group R-2 and R-3 buildings including *dwelling units*, where the top of the sill of an operable window opening is located less than 36 inches above the finished floor and more than 72 inches (1829 mm) above the finished grade or other surface below on the exterior of the building, shall comply with one of the following:

- ~~1. Operable windows where the top of the sill of the opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below and that are provided with window fall prevention devices that comply with ASTM F2006.~~
- ~~2.1. Operable windows where the openings will not allow a 4-inch-diameter (102 mm) sphere to pass through the opening when the window is in its largest opened position.~~
- ~~3. Operable windows where the openings are provided with window fall prevention devices that comply with ASTM F2090.~~
- ~~4. Operable windows that are provided with window opening control devices that comply with Section 1015.8.1.~~
2. Operable windows equipped with corrosion resistant screen capable of withstanding a minimum force of 60 pounds (27 kg) as a concentrated load applied to the center of the screen.
3. Operable windows equipped with barriers with openings that do not allow the passage of a sphere 4 inches (102 mm) in diameter and are capable of withstanding a minimum force of 60 pounds (27 kg) as a concentrated load applied at an location on the barrier.

Delete and substitute as follows

~~**1015.8.1 Window opening control devices.** Window opening control devices shall comply with ASTM F2090. The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by Section 1030.2.~~

1015.8.1 Operation during emergencies. Windows provided for emergency escape and rescue shall comply with Section 1015.8 and Section 1030.2 for operation during emergencies.

Reason: This code change is intended to address the ongoing problem of children climbing onto and falling from windows. According to a report published in the Journal Pediatrics®, Official Journal of the American Academy of Pediatrics, "From 1990 through 2008, an estimated 98,415 children (95% CI: 82 416– 114 414 children) were treated in US hospital EDs for injuries attributable to a fall from a window, with an average of 5,180 patients (95% CI: 4828 –5531 patients) per year." This report is the most recent, comprehensive study to date on the problem. There is a viable, inexpensive solution to this problem that has proven effective in the largest city in the United States, New York City. In the mid 1970's, New York City implemented a program they called "Children Can't Fly" in an effort to reduce injuries resulting from window falls. A center piece of that effort was a Local Law requiring window guards in every building with three or more apartments where children under 10 resided. Since then, injuries and deaths from window falls have been dramatically reduced. According to Barbara Barlow, MD, Chief of Pediatric Surgery, Harlem Hospital Center, "The 96% decrease in accidental falls from windows since 1979 demonstrates that the "Children Can't Fly" program in New York City has almost eliminated accidental falls from windows in our hospital population" [quote from report titled "Ten years of experience with falls from a height in children, Barlow B, Niemirska M, Gandhi R, Leblanc W (1983)].

Note that the New York City statute does not stipulate a minimum sill height, as they recognized the fact that children climb on windows; furniture placed near a window can provide a means to climb to the window; and children are inherently curious and will explore areas, such as windows, that have proven dangerous when not properly protected by child window fall protection devices. Using a sill height as a threshold to require fall protection is fallacious because the fall protection is necessary for climbing, exploring children, not just a child who happens to trip and fall near a window.

Also, New York City did not accept limiting devices as a solution. While those devices meet the criteria of ASTM standards, it is widely recognized that the devices are easily and regularly defeated by occupants in need of ventilation, especially during warm weather. When engaged, the limiting devices only allow the window to be opened four inches; however, they

are intentionally constructed to allow an adult to easily override the safety feature to fully open the window, thus exposing the child to the fall risk they're intended to address. There is no available data to indicate these devices are having the intended effect, thus the need for a passive physical barrier that allows the window to open to provide necessary ventilation in a space. Allowing these devices in lieu of a physical barrier as described in this proposal places those with the greatest need - the lower socioeconomic strata of our society who depend upon natural ventilation for comfort in warm weather - at the greatest risk.

This proposal is simple and straightforward. It will require all operable windows in residential occupancies to have passive barriers - either window screens or window guards - that meet the ASTM standards for fall protection (60 lbs. concentrated load). It does not recognize limiting devices, as these have shown to be easily overridden, and of limited value.

There is another proposal that addresses the sill height.

Approving this code change will undoubtedly save thousands of children from serious injuries or death at a very low cost.

Cost Impact: The code change proposal will increase the cost of construction
Potential increase in cost due to the difference in the cost of guards or screens in lieu of vent stops.

E82-18

Public Hearing Results

Errata: Current items 3 and 4 should have been shown as struck out.

Committee Action:

Disapproved

Committee Reason: There was no justification for removal of the current options for fall prevention devices. This proposal would conflict with the EERO requirements. The references to ASTM F2006 and F2090 should not be deleted from this section – they serve different purposes. The two new alternatives for window protection are overly prescriptive. The new #3 is a reduction in safely – screen should not be relied on and 60 pounds force is less than that required for guards. Regarding proposed Section 1015.8.1. The reference back to Section 1015.8 is confusing. The reference to Section 1030.2 is incorrect – Section 1030.2 is emergency escape and rescue opening size – Section 1030.1.1 is the reference to ASTM F2090. (Vote 14-0)

Assembly Action:

None

E82-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jim Tidwell, representing Self (jimtidwell@tccfire.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1015.8 Window openings. Windows in Group R-2 and R-3 buildings including *dwelling units*, where the top of the sill of an operable window opening is located less than 36 inches above the finished floor and more than 72 inches (1829 mm) above the finished grade or other surface below on the exterior of the building, shall comply with one of the following:

1. Operable windows where the ~~openings-top of the sill of the opening is located more than 75 feet (22860 mm) above the finished grade or other surface below shall be provided with one of the following:~~
 - 1.1. Corrosion resistant screens that comply with ASTM F2006.
 - 1.2. Barriers that do not allow the passage of a 4-inch diameter (102 mm) sphere and that comply with ASTM F2006.
 - 1.3. A window design that will not allow a 4-inch diameter (102 mm) sphere to pass through the opening when the window is in its largest opened position.
2. Operable windows ~~equipped with corrosion resistant screen capable of withstanding a minimum force of 60 pounds (27 kg) as a concentrated load applied to the center of the screen where the top of the sill of the opening is located 75 feet (22860 mm) or less above the finished grade or floor surface below shall be provided with one of the following:~~
 - 2.1. Corrosion resistant screens that comply with ASTM F2090.
 - 2.2. Barriers that do not allow the passage of a 4-inch diameter (102 mm) sphere and that comply with ASTM F2090.
 - 2.3. A window design that will not allow a 4-inch diameter (102 mm) sphere to pass through the opening when the window is in its largest opened position.
3. ~~Operable windows equipped with barriers with openings that do not allow the passage of a sphere 4 inches (102 mm) in diameter and are capable of withstanding a minimum force of 60 pounds (27 kg) as a concentrated load applied at an location on the barrier.~~

1015.8.1 ~~Operation during emergencies.~~Emergency Escape and Rescue. Windows ~~provided~~required for emergency escape and rescue shall comply with Section ~~1015.8 and Section 1030.2 for operation during emergencies.~~ 1030.

Commenter's Reason: This public comment revises the original submittal to address committee concerns that the ASTM standard was being omitted, and that the emergency rescue and escape provisions weren't clearly required. This is a companion comment to E-81.

The original code change and this comment are intended to address the ongoing problem of children climbing onto and falling from windows. According to a report published in the Journal Pediatrics®, Official Journal of the American Academy of Pediatrics, “From 1990 through 2008, an estimated 98,415 children (95% CI: 82 416– 114 414 children) were treated in US hospital EDs for injuries attributable to a fall from a window, with an average of 5,180 patients (95% CI: 4828 –5531 patients) per year.” This report is the most recent, comprehensive study to date on the problem. Unfortunately, earlier efforts to resolve this issue in the IBC left a loophole whereby the window opening limitations can be easily overridden. This override was included in response to concerns about conflicts with the criteria for emergency escape and rescue windows, so we’ve clarified in this code change that those criteria apply.

There is a viable, inexpensive solution to the problem that has proven effective in the largest city in the United States, New York City. In the mid 1970’s, New York City implemented a program they called “Children Can’t Fly” in an effort to reduce injuries resulting from window falls. A center piece of that effort was a Local Law requiring window guards in every building with three or more apartments where children under 10 resided. Since then, injuries and deaths from window falls have been dramatically reduced. According to Barbara Barlow, MD, Chief of Pediatric Surgery, Harlem Hospital Center, “The 96% decrease in accidental falls from windows since 1979 demonstrates that the “Children Can’t Fly” program in New York City has almost eliminated accidental falls from windows in our hospital population” [quote from report titled “Ten years of experience with falls from a height in children, Barlow B, Niemirska M, Gandhi R, Leblanc W (1983)].

Note that the New York City statute does not stipulate a minimum sill height, as they recognized the fact that children climb on windows; furniture placed near a window can provide a means to climb to the window; and children are inherently curious and will explore areas, such as windows, that have proven dangerous when not properly protected by child window fall protection devices. Using a sill height as a threshold to require fall protection is fallacious because the fall protection is necessary for climbing, exploring children, not just a child who happens to trip and fall near a window.

Also, New York City did not accept limiting devices as a solution (this is the previously mentioned loophole in the IBC). While those devices meet the criteria of ASTM standards, it is widely recognized that the devices are easily and regularly defeated by occupants in need of ventilation, especially during warm weather. When engaged, the limiting devices only allow the window to be opened four inches; however, they are intentionally constructed to allow an adult to easily override the safety feature to fully open the window, thus exposing the child to the fall risk they’re intended to address. There is no available data to indicate these devices are having the intended effect, thus the need for a passive physical barrier that allows the window to open to provide necessary ventilation in a space. Allowing these devices in lieu of a physical barrier as described in this proposal places those with the greatest need – the lower socioeconomic strata of our society who depend upon natural ventilation for comfort in warm weather – at the greatest risk.

This proposal is simple and straightforward. It will require all operable windows in residential occupancies to have passive barriers – either window screens or window guards – that meet the ASTM standards for fall protection. It does not recognize limiting devices, as these have shown to be easily overridden, and of limited value.

Approval of this change will undoubtedly save thousands of injuries to children, and give the jurisdictions using the IBC similar protection for their children as the local law in New York City.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. While documentation exists that at least one of the compliant solutions will result in a lower life cycle cost to windows, the initial installation of fall prevention devices will slightly increase the cost of construction.

Public Comment 2:

Proponent: Jan Berichon, representing self (jbericho@lhs.org)requests As Submitted.

Commenter's Reason: The code changes that have been submitted to improve child safety fix loopholes that result in child window falls. This is a companion comment to E-81

I’ve heard many heartbreaking stories over the past several years while working in a children’s hospital from families whose child fell from a window. Some of these falls are a result of having window opening limiting devices installed only to have someone override the product for ventilation resulting in a young child falling from the window. Some have thought they could override the device for just a few minutes while cleaning a room or cooking, only to have a child unexpectedly enter the room and fall. Others have thought they could override the device while the child was sleeping to cool the home, only to have the child awaken and fall. Window falls happen quickly and unexpectedly often while caregivers are in the same room.

Specialized, passive barriers such as child window fall prevention guards or robust child safety screens are designed for window fall prevention are now available. These are not typical insect screens, they allow windows to be fully opened for ventilation as intended while protecting children from falls. These products DO meet emergency escape and rescue requirements. They DO NOT conflict with emergency escape or rescue requirements.

Many homes and apartments, especially for higher risk populations with limited resources and/or living in affordable housing most often rely on window ventilation. Most often these families do not have access to air conditioning making it

unlikely that window openings will be kept at less than 4”.

Expecting families to limit window openings to less than 4” for ventilation in the heat is not realistic or a healthy option. This can and does cause other health risks. Passive barriers would allow windows to open fully for necessary ventilation as intended while protecting children at the same time.

These proposal changes will save thousands of children from injuries (or death) and decrease overall lifelong medical cost required to support a child throughout their life after a devastating window fall.

This code change will undoubtedly save thousands of children from serious injury or death. Thank you for your time and consideration of protecting our children from such a preventable tragedy as a window fall.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost of this code change will slightly increase initial construction costs, however the installation of passive window fall prevention barriers such as the robust, child window fall prevention screens will decrease costs of medical treatment incurred following a child falling from a window and will save thousands of children from injury or death as a result of a window fall. This will also decrease the need to repeatedly replace typical insect screens.

Public Comment 3:

Proponent: Lisa Dau, representing Keiki Injury Prevention Coalition requests As Submitted.

Commenter's Reason: I am writing to you in expressing my support to the proposed changes to codes E82-18 relating to child window safety and window fall prevention for children.

I support the proposed ICC changes to E82-18, these changes will prevent serious injuries and deaths of young children from window falls by disallowing the use of window fall opening devices or vent stops. These devices fall short for window fall protection by allowing any user to easily override it's use thereby creating an unsafe environment for children near windows.

The proposed code changes would require all operable windows to be equipped with passive restraint devices that cannot be over-ridden. These changes fix the gap in the current code that allows devices that don't work, or can be over-ridden.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The code changes will increase the cost of construction, however the cost is minimal compared to the extreme cost of the death or injury of a child falling out of a window that could easily, and affordably, be prevented.

Public Comment 4:

Proponent: Jim Graham, representing National Association for Child Window Safety (jgraham@childwindowsafety.org) requests As Submitted.

Commenter's Reason: The original code change and this comment are intended to address the problem of children climbing onto and falling from windows. According to a report published in the Journal Pediatrics, Official Journal of the American Academy of Pediatrics, From 1990 through 2008, an estimated 98,415 children (95% CI: 82 416 114 414 children) were treated in US hospital EDs for injuries attributable to a fall from a window, with an average of 5,180 patients (95% CI: 4828 5531 patients) per year. What was not addressed in the American Academy of Pediatrics report was consideration of the cost to children in later life from traumatic Brain Injury. Osha now requires that any adult worker who is working six feet or more above grade SHALL be equipped with Passive restraints from falls. It is the contention of many that small children and babies deserve at minimum that same protection. The AAP report is the most recent, comprehensive study to date on the problem. Unfortunately, earlier efforts to resolve this issue in the IBC left a serious loophole whereby the window opening limitations can be easily overridden. This concern has been dismissed by several State Fire Marshals during legislation actions in those states. Concerns regarding about egress and ingress from windows equipped with child safety screens by Firefighter have been dismissed by State Fire Marshals. New York City has proven that installing passive guards to windows will cause a decrease in window falls by 96%.

New York City did not accept limiting devices as a solution (this is the previously mentioned loophole in the IBC). While those devices meet ASTM standards, most serious people recognize that any window that can be opened will be opened especially during warm weather. There is a reasonable expectation that any child will be safe in its own home, and others have testified to that fact in many legal actions that resulted from adults defeating window limiters followed by a child fall. When engaged, the limiting devices only allow the window to be opened four inches; however desiring ventilation windows will be opened by adults and without some passive barrier children WILL be in danger and experience window falls. This particularly true for poor people with limited resources to spend for air-conditioning. Allowing window limiter devices rather than of a physical barrier does place those with the greatest need - poor people, at the greatest risk. This proposal is simple and straightforward. It will require all operable windows in residential occupancies to have passive barriers - either child safety window screens or window guards meeting ASTM standards for fall protection. It specifically does not recognize limiting devices, as these have shown to be easily overridden. Approval of this change

will undoubtedly come sooner or later. Please do not allow a "Loophole" in the previous good work of this Council to continue to endanger thousands of children. Give the jurisdictions adopting the IBC, similar protection for their children as the Military of the United States is now providing for military families as well as local law in New York City.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The code change proposal will modestly increase the cost of construction. Benefit/Cost analysis has demonstrated that very quickly that modest increase in cost will be returned in property management savings. That B/C analysis demonstrated that in multi-unit affordable housing it saved up to 98% of window maintenance cost. And does not include savings on insurance costs due to lessening the exposure due to liability concerns.

Public Comment 5:

Proponent: Brian Houlihan, representing National Association for Child Window Safety (brianlh@mchsi.com) requests As Submitted.

Commenter's Reason: I support this proposal as submitted by the National Association for Child Window Safety, James Graham, and Jim Tidwell to require passive barriers to prevent children from falling from windows and removing the loopholes that allow gadgets that prevent the normal use of the window.

Bibliography: <http://nebula.wsimg.com/2b4c64e9569d2c263a7a76a0a82e3d1d?AccessKeyId=F48BDA22447117F51206&disposition=0&alloworigin=1>

Page three of the attached link demonstrates the benefit cost study with the window safety screens. This study was done by the National Association for Child Window Safety.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Although the initial construction cost will increase, a benefit cost study analysis on at least one of the passive barriers, the safety screens, proves a net cost savings in approximately five years when used in rental housing units.

Public Comment 6:

Proponent: Wayne Parsons, representing Wayne Parsons Law Office (wparsons@hawaii.rr.com) requests As Submitted.

Commenter's Reason: I submit this comment in support of proposed ICC code change proposal E82-18 which seeks to close a loophole in ICC 1015.8 - Window Openings that eliminates window fall protection devices on windows that children can and will fall out of, based upon sill height.

I support the Public Comments submitted by Jim Tidwell, and encourage passage of his proposed amendments to ICC 1015.8 Window Opening:

The loophole will be corrected by removing any reference to sill height (Public Comment E82-18). To suggest that no 5-year-old can climb up on a window sill that is 45-inches or 55-inches from the floor shows a lack of understanding of the capabilities of children. Setting any sill height limitation in the code suggests that a few children being seriously injured or dying is acceptable. Certainly no one would take such a position.

Despite parents' best efforts to restrict access to windows, 5-year-old boys and girls will get to the windows, and fall out, unless effective "passive" window fall protection devices are installed. Death and serious injury to children will and does occur because windows are unprotected. The existing code language, that this proposal attempts to fix, leaves many windows that children can get to, unprotected. OSHA requires effective passive fall protection devices to protect construction workers. That OSHA protection increases the cost of construction. Why wouldn't the ICC do the same for children?

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. More windows will require fall protection under this proposal. That is offset by a reduction in the death and permanent injury to children. Would anyone argue that the death of a child is worth a few dollars of savings in the cost of a home?

Public Comment 7:

Proponent: Jeff Inks, representing Window and Door Manufacturers Association (jinks@wdma.com) requests Disapprove.

Commenter's Reason: WDMA strongly supports the Committee's sound disapproval of this proposal. Eliminating requirements that window fall prevention devices must meet appropriate ASTM standards, and then replace those standards with only one or two criterion of the many requirements (performance, labeling, safety information, etc.) in the ASTM standards is a significant reduction in safety.

Both ASTM F2006 and ASTM F2090 are well reasoned, scientifically based sets of performance and testing requirements for window fall protection devices. They have been developed and are maintained by industry and safety experts, including the Consumer Product Safety Commission (CPSC), under ASTM's consensus process, and they are recommended by the National Safety Council. The proposed, lesser requirements, skirt most of what is required by the

F2006 and F2090 standards accordingly, and among other significant concerns, there are no provisions for how compliance is to be demonstrated or affirmed. This would place an undue burden on code officials to determine compliance as opposed to the current status where code officials can rely on labeling to the ASTM F2006 or F2090 standards as a means of determining compliance. In sum, no sound justification or other reasoning has been provided to show the standards or the IBC provisions that require them are deficient or inadequate.

In addition, there is significant concern that the proposed amendments will impede emergency escape and rescue as there are no provisions that the proposed corrosion resistant screens or barriers installed over required emergency escape and rescue windows be releasable as required by ASTM F2090, and that also in doing so, they do not reduce the minimum net clear opening area that is required for emergency escape and rescue openings by IBC section 1030.2. The proposed amendment to section 1015.8.1 simply point back to 1015.8, and IBC section 1030.2 only provides requirements for minimum egress opening dimensions. There is nothing about operation of the screens or barriers in case of emergency.

Furthermore, substantiation for the proposed amendment appears to rely heavily on the cited New York City ordinance, yet that ordinance was established well before the development of the existing ASTM standards and IBC provisions requiring them. It is also not as broad in scope, prohibits installation of guards on windows required for emergency escape and rescue, and requires guards to be approved by the NYC Health Department.

For these and other reasons, WDMA strongly urges the Committee's disapproval be upheld.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

NA

Public Comment 8:

Proponent: Janice Yglesias, representing American Architectural Manufacturers Association (jyglesias@aamanet.org) requests Disapprove.

Commenter's Reason: E82-18 seeks to replace a collection of comprehensive window fall prevention device requirements included in the consensus-based ASTM F2006 and F2090 standards with a single, poorly-defined criterion. This approach grossly over-simplifies the issue and, beyond circumventing the extensive vetting inherent to the consensus-based standards development process, it places the burden of performance verification with the code official.

Furthermore, this proposal eliminates Window Opening Control Devices (WOCD's) as a viable means of window fall prevention and limits the options to a screen, a window guard or a permanently limited opening, which are not compliant options for openings required for emergency escape and rescue. The ASTM F2006 and F2090 standards define criteria for window fall prevention devices that balance limiting a window opening to less than four inches, with the need to release such a device for egress, either through two independent actions or one dual action. By prescribing compliant devices, this proposed code change runs counter to the development of codes and standards that allow for more compliant devices to offer consumers more choices.

The work done by New York City in the 1970's, which is referenced as justification for this code change, was important but does not apply to openings required for emergency escape and rescue and it pre-dates development of the consensus-based ASTM F2006 and F2090 standards which are now widely used in compliance with the current code language in most states across the country. An additional shortcoming related to emergency escape and rescue requirements is that the proposed revisions to 1015.8.1 addressing "operation during emergencies" point back to 1015.8 which does not include provisions for emergency escape and rescue and also points to 1030.2 which only outlines minimum sizes for emergency escape and rescue openings resulting in insufficient guidance.

In addition, this proposal has the potential to create confusion among homeowners between an insect screen, which is designed to keep insects out, and a fall prevention screen, which is a wholly different product. This confusion between window screen products is potentially dangerous and could lead a consumer to incorrectly believe that an insect screen serves the purpose of a fall prevention device.

For these reasons, AAMA urges disapproval of this proposal.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction Potential increase in cost due to the difference in the cost of guards or screens in lieu of vent stops.

E82-18

E86-18

IBC: 1017.3, (IFC[BE] 1017.3)

Proposed Change as Submitted

Proponent: John Terry, self, representing self (John.Terry@dca.nj.gov)

2018 International Building Code

Revise as follows

SECTION 1017 EXIT ACCESS TRAVEL DISTANCE

1017.3 Measurement. *Exit access* travel distance shall be measured from the most remote point of each room, area or space along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit. Where more than one means of egress is required, exit access travel distance shall be measured to the nearest exit.

Exception: In open parking garages, *exit access* travel distance is permitted to be measured to the closest riser of an *exit access* stairway or the closest slope of an *exit access* ramp.

Reason: The text of this section is too subtle where it is stated that travel distance is measured to “an” exit. The added language makes clear the intent of the requirement.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposed change merely clarifies the intent of the current text and therefore has no impact on cost.

E86-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 1017.3 Measurement. Exit access travel distance shall be measured from the most remote point of each room, area or space along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit. Where more than one ~~means of egress~~ exit is required, exit access travel distance shall be measured to the nearest exit.

Exception: In open parking garages, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.

Committee Reason: The modification is for consistency within the sentence and the rest of Chapter 10. The code change will clarify that travel distance is to only one exit, not both. (Vote 14-0)

Assembly Action:

None

E86-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

1017.3 Measurement. *Exit access* travel distance shall be measured from the most remote point of each room, area or space along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to ~~an exit. Where more than one exit is required,~~ exit access travel distance shall be measured to the nearest exit.

Exception: In open parking garages, *exit access* travel distance is permitted to be measured to the closest riser of an *exit access stairway* or the closest slope of an *exit access* ramp.

Commenter's Reason: The modification to the original proposal would be an issue for 2nd floors with open stairways or mezzanines – this is ‘access to an exit’ from that level. By combining the new sentence with the existing text, it clears this up in one sentence.

This public comment is submitted by the ICC BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions there of. In 2017 and 2018 the BCAC has held 5 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes and public comments. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed change merely clarifies the intent of the current text and therefore has no impact on cost.

E86-18

E90-18

IBC: TABLE 1020.2, (IFC[BE] TABLE 1020.2)

Proposed Change as Submitted

Proponent: Homer Maiel, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com)

2018 International Building Code

Revise as follows

**TABLE 1020.2
MINIMUM CORRIDOR WIDTH**

OCCUPANCY	MINIMUM WIDTH (inches)
Any facility not <i>listed</i> in this table	44
Access to and utilization of mechanical, plumbing or electrical systems or equipment	24 <u>36</u>
With an <i>occupant load</i> of less than 50	36
Within a <i>dwelling unit</i>	36
In Group E with a <i>corridor</i> having an <i>occupant load</i> of 100 or more	72
In corridors and areas serving stretcher traffic in ambulatory care facilities	72
Group I-2 in areas where required for bed movement	96

For SI: 1 inch = 25.4 mm.

Reason: In order to be consistent with Section 306.2 of IMC and Section 1010.1.1 of IBC, this change is warranted.

Cost Impact: The code change proposal will increase the cost of construction. The change of corridor and door widths will increase the cost of construction.

E90-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The current text is to allow for access to something like a plumbing chase or around mechanical equipment. Aisles reference corridor widths in Section 1018.5. There is an allowance in the IMC for dwelling units for a 24" wide corridor, so the revision would be a conflict. (Vote 12-2)

Assembly Action:

None

E90-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Homer Maiel, PE, CBO, representing ICC Tri-Chapter (Peninsula, East Bay, Monterey Bay) (hmaiel@gmail.com) requests As Submitted.

Commenter's Reason: In Columbus, there was a misunderstanding on the part of some committee members that question whether this change will have any effect on residential occupancies. This Table is only addressing corridor widths. urge to support approved as submitted.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The change of corridor and door width will increase the cost of construction.

E90-18

E92-18

IBC: 1020.5 (IFC[BE] 1020.5)

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Building Code

Revise as follows

1020.5 Air movement in corridors. Corridors shall not serve as supply, return, exhaust, relief or ventilation air ducts.
Exceptions:

1. Use of a *corridor* as a source of makeup air for exhaust systems in rooms that open directly onto such corridors, including toilet rooms, bathrooms, dressing rooms, smoking lounges and janitor closets, shall be permitted, provided that each such *corridor* is directly supplied with outdoor air at a rate greater than the rate of makeup air taken from the corridor.
2. Where located within a *dwelling unit*, the use of *corridors* for conveying return air shall not be prohibited.
3. Where located within tenant spaces of 1,000 square feet (93 m²) or less in area, utilization of *corridors* for conveying return air is permitted.
4. ~~Incidental air movement from pressurized rooms within health care facilities, provided that the corridor is not the primary source of supply or return to the room.~~ Transfer air movement required to maintain pressurization difference within health care facilities in accordance with Section 407.1 of the International Mechanical Code.

Reason: This is a clarification for when the corridor can be used for air movement. ASHREA 170 was added in IMC which clarifies which rooms are pressurized. This makes that connection in the codes. This is intended to cover transfer air for both positive and negative charged rooms. We thought 'transfer' was a more descriptive word for the air movement. This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. ASHREA 170 is already required in the IMC for pressurized rooms, so there are no changes to construction requirements.

E92-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal clarifies the intent by actually describing what incidental air movement is. There needs to be a public comment to coordinate this section with IMC 601.2. Rather than the IMC reference to Section 407.1 which then references ASHRAE 170, perhaps a straight reference to ASHRAE 170 would be more direct. (Vote 12-2)

Assembly Action:

None

Staff Analysis: This change will also apply to IMC Section 601.2.

E92-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1020.5 Air movement in corridors. Corridors shall not serve as supply, return, exhaust, relief or ventilation air ducts.
Exceptions:

1. Use of a *corridor* as a source of makeup air for exhaust systems in rooms that open directly onto such corridors, including toilet rooms, bathrooms, dressing rooms, smoking lounges and janitor closets, shall be permitted, provided that each such *corridor* is directly supplied with outdoor air at a rate greater than the rate of makeup air taken from the corridor.
2. Where located within a *dwelling unit*, the use of *corridors* for conveying return air shall not be prohibited.
3. Where located within tenant spaces of 1,000 square feet (93 m²) or less in area, utilization of *corridors* for conveying return air is permitted.
4. Transfer air movement required to maintain pressurization difference within health care facilities in accordance with ~~Section 407.1 of the International Mechanical Code.~~ ASHRAE 170.

Commenter's Reason: This proposal was intended as a clarification. A reference to ASHRAE 170 directly provides the same information as stated in IMC Section 407.1.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is already required in the IMC, so there would be no cost increase.

E92-18

E96-18

IBC: 1023.2, (IFC[BE] 1023.2)

Proposed Change as Submitted

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com); Douglas Evans, representing DHE FPE LLC (dhefpe@gmail.com)

2018 International Building Code

Revise as follows

1023.2 Construction. Enclosures for interior exit *stairways* and *ramps* shall be constructed as *fire barriers* in accordance with Section 707 or *horizontal assemblies* constructed in accordance with Section 711, or both. *Interior exit stairway* and *ramp* enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit *stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. *Interior exit stairways* and *ramps* shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours.

Exceptions-Exception:

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. ~~*Interior exit stairways* within an atrium enclosed in accordance with Section 404.6.~~

Reason:

Exception 2 to interior exit stairway enclosure construction within an atrium space was introduced in the 2015 Edition of the IBC. The proponent's published reason statement contended that the inherent one-hour atrium enclosure protection and required smoke control was equivalent to a one-hour interior exit stairway enclosure. Although equivalency to a one-hour enclosure can be debated, exit stairways serving four or more stories are required to be of 2-hour fire resistance-rated construction. The atrium enclosure protection is also exempted on three levels (404.6 Exception 3), which allows these stairs open to those levels.

This provision is also philosophically flawed on many levels. Interior exit stairway enclosures are to be used for no purpose other than as a means of egress. Opening and penetration protection requirements are intended to limit exposure of the enclosure.

The plural in Exception 2 (stairways) allows all required exits to be through the atrium. The current exception allows occupants unlimited egress travel distance down unenclosed stairways even if the stairs are within the smoke plume. Furthermore, compliance with Section 909 is typically reliant on fans, dampers, secondary power supplies and the ever changing fuel loading on the atrium floor. In high-rise buildings, such stairways are required to be within smokeproof enclosures.

Allowing unlimited travel distance on an unenclosed stairway is technically and philosophically inconsistent with the exit access travel distance limitations stated at Section 404.9. Those provisions allow for a maximum of 200 feet of travel at other than the level of exit discharge. The *IBC Code and Commentary, Volume I* states, "Since smoke is being drawn into the atrium, the time allotted to reach an exit through the atrium is limited." It would seem logical that that same thinking would apply to an unenclosed interior exit stairway.

Additionally, Section 905.4 requires a standpipe hose connection for each story in every required interior exit stairway since these enclosures provide a protected space for fire department operations. Obviously, there is no passive standpipe hose connection protection in an unenclosed interior exit stairway.

Traditionally, exit access stairways within atrium spaces have been allowed to be unenclosed (Section 1019.3, Condition 5). However, exit access travel distance limitations in Section 1017.2 apply. In fact, Table 1017.2 Footnote a, references Section 404.9 travel distance limitations through an atrium space. This minimally creates confusion, if not a contradiction.

This proposal restores the original ICC Code Technology Committee philosophy that interior exit stairways always be enclosed with no exceptions. Removal of the current exception ensures a protected path of means of egress travel for building occupants between the exit access and exit discharge portions of the means of egress system.

Cost Impact: The code change proposal will increase the cost of construction

Approval of this proposal will increase the cost of construction only in buildings having an atrium where an unenclosed interior exit stairway is desired. If the building otherwise has the required number of exits, such a stairway would be regarded as an exit access stairway and there would be no cost impact.

E96-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is currently permitted. Additional protection items for exit stairways within an atrium was added by G35-18. There is no history of problems with exit stairways within atriums, so there is no reason to eliminate the option.

A portion of the committee felt that smoke protected atriums do not offer the same level of protection as an exit enclosure. If both exit stairways are within atriums this could be a serious issue. There was also a concern that there is no limit on the travel distance on an exit stairway in an atrium. (Vote 8-7)

Assembly Action:

None

E96-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gregory Keith, representing DHE FPE LLC (grkeith@mac.com); Douglas Harold Evans, DHE FPE LLC, representing DHE FPE LLC (dhefpe@gmail.com) requests As Submitted.

Commenter's Reason: Code change proposal E96-18 attempted to remove Exception 2 of Section 1023.2. That exception was introduced into the 2015 Edition of the IBC. Section 1023 provides the requirements for interior exit stairways and ramps. By definition, exterior exit stairways and ramps are exit components. Components in the exit portion of the means of egress system are regarded as providing a highly protected environment for occupants as they egress a building. Typically, interior exit stairways and ramps are one- or two hour-rated assemblies with restricted opening protection. For this reason, occupants may travel unlimited distances in such exit components. Exception 2 permits an unenclosed stairway within an atrium to qualify as an interior exit stairway (exit component). Such a design is problematic. Clearly, occupants have no passive fire resistance-rated protection normally associated with exit components. The assumption is that the smoke control required within an atrium space will provide equivalent protection. Typically, atrium spaces employ the exhaust method of smoke control. This technique causes generated smoke to be exhausted vertically up through the atrium and exhausted from the top of the space. This could prove to compromise the exit path. Fundamentally, the provision violates numerous philosophical principals. One, an exit is to be used for no other purpose than a means of egress. The atrium is a fully functional area with associated fuel loads. And one, an exit is required to lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway. The unenclosed stairway would typically terminate within the lowest level of the atrium space. And one, Section 404.9.3 limits exit access travel distance within an atrium at other than the level of exit discharge to 200 feet. The allowance for unlimited travel distance on an unenclosed atrium stairway is in contravention with the fundamental atrium travel protection requirements. And one, the fire service typically uses enclosed interior exit stairways as staging areas and protected access to required standpipes. This ability is lost with an unenclosed stairway.

At the committee hearings in Columbus, Ohio, Item E96-18 proved to be very contentious. The committee vote was 7 to 7. The Chair voted against the proposal because it was felt that the provision should not be removed from the code based on the Chair's vote. In the committee's reason statement for disapproval of Item E96-18 it was stated that additional protective measures had been introduced with the approval of Item G35-18. In fact, none of those requirements address any of the concerns identified in the previous paragraph. That same reason statement noted that, A portion of the committee felt the smoke protected atriums do not offer the same level of protection as an exit enclosure. Additionally stated, There was also a concern that there is no limit on the travel distance on an exit stairway in an atrium. (Vote 8-7) If you believe that an unenclosed stairway within an atrium provides the same degree of occupant protection as a fire resistance-rated enclosure with commensurate opening and penetration protection, please do not support this public comment. If you believe that an exit component should provide for a reliably safe path of travel to the exterior of the building, please break the stalemate by supporting this public comment. Approval of this public comment will restore the appropriate level of occupant safety normally associated with an exit component.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Approval of this public comment will increase the cost of construction only in buildings having an atrium where an unenclosed interior exit stairway is desired. If the building otherwise has the required number of exits, such a stairway would be regarded as an exit access stairway and there would be no cost impact.

E96-18

E106-18

IBC: 1029.16, 1029.16.1, (IFC[BE] 1029.16. 1029.16.1)

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows

1029.16 Handrails. Ramped *aisles* having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and stepped *aisles* shall be provided with *handrails* in compliance with Section 1014 located either at one or both sides of the *aisle* or within the *aisle* width. Where the stepped aisle have seating on one side and the aisle width is 74 inches (1880 mm) or greater, two handrails are required. Where two handrails are required, one of the handrails shall be within 30 inches horizontally of the end of the aisle accessways.

Exceptions:

1. *Handrails* are not required for ramped *aisles* with seating on both sides.
2. *Handrails* are not required where, at the side of the *aisle*, there is a *guard* with a top surface that complies with the graspability requirements of *handrails* in accordance with Section 1014.3.
3. *Handrail* extensions are not required at the top and bottom of stepped *aisles* and ramped *aisles* to permit crossovers within the *aisles*.

1029.16.1 Discontinuous handrails. Where there is seating on both sides of the *aisle*, the mid-*aisle handrails* shall be ~~discontinuous with discontinuous. Where the stepped aisle is required to have two handrails, handrails not located on a guard or wall shall be discontinuous.~~ The gaps or breaks at intervals ~~shall not exceeding~~ exceed five rows to facilitate access to seating and to permit crossing from one side of the *aisle* to the other. These gaps or breaks shall have a clear width of not less than 22 inches (559 mm) and not greater than 36 inches (914 mm), measured horizontally, and the mid-*aisle handrail* shall have rounded terminations or bends.

1029.16.2 Handrail termination. *Handrails* located on the side of stepped *aisles* shall return to a wall, *guard* or the walking surface or shall be continuous to the *handrail* of an adjacent stepped *aisle flight*.

1029.16.3 Mid-aisle termination. Mid-*aisle handrails* shall not extend beyond the lowest riser and shall terminate within 18 inches (381 mm), measured horizontally, from the lowest riser. *Handrail* extensions are not required.

Exception: Mid-*aisle handrails* shall be permitted to extend beyond the lowest riser where the *handrail* extensions do not obstruct the width of the cross *aisle*.

Reason: The social stairway is a new style being used in common areas of schools and multi-assembly buildings. It appears to fall somewhere between stairways and assembly seating. If this is considered a stairway next to platforms, the general requirement for handrails on both sides of the stairway prevents access to the platforms (Example 4). Considering this configuration as assembly seating would require one handrail with current text. This proposal considers this arrangement as a type of assembly seating. The width would have to be determined using both the general circulation number from the upper/lower floor and the seating in accordance with Section 1029.6.1, which requires extra width if a handrail is not with 30". By considering this assembly seating, accessible wheelchairs spaces would already be addressed. Drop offs along the top would have to meet guard provisions.

To address occupant safety, this proposal will require a mid-*aisle handrail* on wide stepped *aisles* in addition to the handrail on the wall. The reasoning for 74" was that we did not want either side of the handrails to create a width that was not readily useable (30" + 44" = 74"). The second handrail being within 30" of the edge of the platform allows flexibility in handrail placement, but still keeps the handrail within reach of persons moving off the platforms. Where there is not a cross *aisle*, the handrail would still have to have handrail extensions at the top and bottom, as well as meet all the other handrail provisions in Section 1014 and 1029.6. This 2nd handrails would typically not show up in stadium seating where *aisles* are typically less wide than specified here.

As you can see in the examples provided: Example 1 has two handrails, but with one on the far side of the platform. Example 4 a 2nd handrail blocks access to the platforms, so people either climb up the platforms, or go under the handrail. In example 2 and 3 a handrail is only provided on one side of the stairway, regardless of width. None of these configuration would address stairway safety and access to the platforms. Example 3 has an example handrail drawn in red of what these requirements would add.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Figure 1

Figure 2

Figure 3

Figure 4

Cost Impact: The code change proposal will increase the cost of construction. In some situations, this could require a 2nd handrail for occupant safe egress on the stairways.

E106-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is used in a variety of school environments so addressing this issue is needed. The handrail adjacent to this stairway seating arrangement should be the same as required for stepped aisles. Where the 2nd handrail is located needs to be clarified. There was a question on what was meant by the “handrail not located on a guard”. Perhaps a definition of “stepped aisle” is needed. There were a couple of grammar errors that need to be fixed. (Vote 9-5)

Assembly Action:

None

E106-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1029.16 Handrails. Ramped *aisles* having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and stepped *aisles* shall be provided with *handrails* in compliance with Section 1014 located either at one or both sides of the *aisle* or within the *aisle* width. Where the stepped aisle have seating on one side and the aisle width is 74 inches (1880 mm) or greater, two handrails are required. Where two handrails are required, one of the handrails shall be within 30 inches horizontally of the ~~end of the stepped aisle accessways.~~

Exceptions:

1. *Handrails* are not required for ramped *aisles* with seating on both sides.
2. *Handrails* are not required where, at the side of the aisle, there is a *guard* with a top surface that complies with the graspability requirements of *handrails* in accordance with Section 1014.3.
3. *Handrail* extensions are not required at the top and bottom of stepped *aisles* and ramped *aisles* to permit crossovers within the *aisles*.

Commenter's Reason: The committee expressed a concern that guard and stepped aisle may not be understood. That is unlikely. A guard at the side of a stair is certainly something that has been provided as a part of the code for a long time. The only real concern was the language about how the location of the second handrail should be measured. That has been modified to address that concern.

This is a code change that needs to be addressed. The current provisions of the code do not address what to do for these types of stairways that are located all over the country; with more popping up everyday.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. As noted in the original proposal the cost will be increased where a second handrail is required.

Public Comment 2:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1029.16 Handrails. Ramped *aisles* having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and stepped *aisles* shall be provided with *handrails* in compliance with Section 1014 located either at one or both sides of the *aisle* or within the *aisle* width. Where the stepped aisle ~~have~~ has seating on one side and the aisle width is 74 inches (1880 mm) or greater, two handrails are required. Where two handrails are required, one of the handrails shall be within

30 inches horizontally of the ~~end side of the tiered floor adjacent to the stepped aisle accessways.~~

Exceptions:

1. *Handrails* are not required for ramped *aisles* with seating on both sides.
2. *Handrails* are not required where, at the side of the aisle, there is a *guard* with a top surface that complies with the graspability requirements of *handrails* in accordance with Section 1014.3.
3. *Handrail* extensions are not required at the top and bottom of stepped *aisles* and ramped *aisles* to permit crossovers within the *aisles*.

1029.16.1 Discontinuous handrails. Where there is seating on both sides of the aisle, the mid-aisle *handrails* shall be discontinuous. Where the stepped aisle is required to have two handrails, ~~handrails not located on a guard or wall the mid-aisle handrails~~ shall be discontinuous. The gaps or breaks at intervals shall not ~~exceed five~~ exceed five rows to facilitate access to seating and to permit crossing from one side of the *aisle* to the other. These gaps or breaks shall have a clear width of not less than 22 inches (559 mm) and not greater than 36 inches (914 mm), measured horizontally, and the mid-aisle *handrail* shall have rounded terminations or bends.

1029.16.2 Handrail termination. *Handrails* located on the side of stepped *aisles* shall return to a wall, *guard* or the walking surface or shall be continuous to the *handrail* of an adjacent stepped *aisle flight*.

1029.16.3 Mid-aisle termination. Mid-aisle *handrails* shall not extend beyond the lowest riser and shall terminate within 18 inches (381 mm), measured horizontally, from the lowest riser. *Handrail* extensions are not required.

Exception: Mid-aisle *handrails* shall be permitted to extend beyond the lowest riser where the *handrail* extensions do not obstruct the width of the cross *aisle*.

Commenter's Reason: This new style of assembly seating is very common in schools and libraries. It is an important safety issue that needs to be addressed. It is hoped that these tweaks with clarify the requirements so this can be added to the code.

To address the committee's concerns:

The new text in Section 1029.16 and 1029.16.1 will allow for the mid aisle handrail to be the same as for stepped aisles. The term tiered floors will be understood because it is already used in Section 1029.5. The 74 was chosen as the point where a 2nd handrail in the width of the stepped aisle would still allow for movement up and down on each side of the handrail.

The end of the aisle accessways was chosen because the tiered platforms do not always contain seats to measure from. Since the seating areas at stepped aisles are tiered platforms (with or without seats), this may be clearer.

Handrails are permitted on the wall or as the top rail of a guard in Section 1029.16. Since the discontinuous handrail could be either at the edge of the seating platforms or in the stepped aisle, mid-aisle handrail is current language that is easier to understand.

Stepped aisles is not defined for assembly seating, but is clearly understood in the context of Section 1029. Aisle is a defined term.

The grammatical error mentioned by the committee of exceeding to exceed in Section 1029.16.1 was addressed as an editorial correction to the original proposal by ICC staff.

What we want to see:

This is why we do not want continuous handrails where you want someone to access seating. This is a safety issue for when someone tries to climb up or down the tiers or goes over or under the handrail to access the seating areas. Discontinuous handrails already have requirements for maximum number of rows and maximum breaks that have worked with typical assembly seating for many decades.

This is what we do not want to see when you want access to seating.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. In some situations, this could require a 2nd handrail for occupant safe egress on the stairways.

E106-18

E107-18

IBC: SECTION 1030.1, (IFC[BE] 1030.1)

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

SECTION 1030 EMERGENCY ESCAPE AND RESCUE

Revise as follows

1030.1 General. ~~Where required.~~ In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one *exit* or *access* to only one *exit* as permitted by Tables 1006.3.3(1) and 1006.3.3(2).
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth story above *grade plane* shall have not fewer than one ~~exterior~~ *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, ~~an emergency escape and rescue opening~~ *opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an exit door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior ~~exit~~ *egress balcony* that opens to a *public way*.
3. ~~Basements without habitable spaces used only to house mechanical equipment~~ and having not more than 200 square feet (18.6 m²) in floor area shall not be required to have *emergency escape and rescue openings*.
4. Storm shelters are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
- 4-5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:
 - 4-15.1. One *means of egress* and one *emergency escape and rescue opening*.
 - 4-25.2. Two *means of egress*.

Reason: This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

IBC

- The definition includes 'exterior', so it does not need to be repeated in the text.
- It was decided not to add the IRC defined 'habitable attic'. If added to the IBC, would the IBC also have to pick up the definition and the number of stories below the habitable attic space? (the IRC definition says this is not a story).
- IBC Exception 2 – change to correct term for 'exterior egress balcony'
- IBC Exception 3 – coordination with IRC, limit is just size without additional criteria for habitable.
- Add storm shelter exception to IBC. Reference ICC 500 so that the escape openings provided are what is specified for storm shelters.

There will be a similar proposal for the IRC in Group B.

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of

Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a coordination item for exceptions for EEROs already permitted between the codes.

E107-18

Public Hearing Results

Errata: The errata was the addition of Section 1030.1 Exception 4.

Committee Action:

As Modified

Committee Modification: 1030.1 Where required. In addition to the means of egress required by this chapter, emergency escape and rescue openings shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one exit or access to only one exit as permitted by Tables 1006.3.3(1) and 1006.3.3(2).
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth story above grade plane shall have not fewer than one emergency escape and rescue opening in accordance with this section. Where basements contain one or more sleeping rooms, an emergency escape and rescue opening shall be required in each sleeping room, but shall not be required in adjoining areas of the basement. Such openings shall open directly into a public way or to a yard or court that opens to a public way.

Exceptions:

1. Basements with a ceiling height of less than 80 inches (2032 mm) shall not be required to have emergency escape and rescue openings.
2. Emergency escape and rescue openings are not required from basements or sleeping rooms that have an exit door or exit access door that opens directly into a public way or to a yard, court or exterior egress balcony that opens to a public way.
3. Basements ~~without habitable space used only to house mechanical equipment~~ and having not more than 200 square feet (18.6 m²) in floor area shall not be required to have emergency escape and rescue openings.
4. Storm shelters are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual dwelling and sleeping units in Groups R-2 and R-3, where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in basements shall not be required to have emergency escape and rescue openings provided that the basement has one of the following:
 - 5.1. One means of egress and one emergency escape and rescue opening.
 - 5.2. Two means of egress.

Committee Reason: The modification restores Exception 3 to its original language. The revised language would require a EERO in a non-habitable basement that had other than mechanical equipment. This proposed exception works for single family homes, not is not great for Group R-2 occupancies. This is a good coordination between the IBC and IRC requirements for emergency escape and rescue openings and also cleans up some of the language. The addition for coordination with storm shelters (see published errata) is needed. (Vote 14-0)

Assembly Action:

None

E107-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gregory Keith, representing The Boeing Company (grkeith@mac.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1030.1 General. Emergency escape and rescue openings shall comply with the requirements of this section.

~~1030.1~~ **1030.2 Where required.** In addition to the *means of egress* required by this chapter, *emergency escape and*

rescue openings shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one *exit* or *access* to only one *exit* as permitted by Tables 1006.3.3(1) and 1006.3.3(2).
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth story above *grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an exit door or *exit access* door that opens directly into a *public way* or to a yard, court or exterior egress balcony that opens to a *public way*.
3. *Basements* without habitable space and having not more than 200 square feet (18.6 m²) in floor area shall not be required to have *emergency escape and rescue openings*.
4. Storm shelters are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the basement has one of the following:
 - 5.1. One *means of egress* and one *emergency escape and rescue opening*.
 - 5.2. Two *means of egress*.

Commenter's Reason: The ICC Building Code Action Committee submitted a series of proposals intended to clarify and coordinate Chapter 10 emergency escape and rescue opening provisions. The first in the series (E107-18) inadvertently removed necessary charging language from Section 1030. This public comment corrects that oversight. No technical changes are proposed. Inclusion of appropriate charging language is consistent with Item E38-18 which editorially corrected other Chapter 10 charging language provisions. Having proper enabling or charging provisions for various technical requirements is legally necessary for a model code adopted by a given political subdivision.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This public comment is editorial in nature.

E107-18

E108-18

IBC: 1030.1.1, (IFC[BE] 1030.1.1)

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Revise as follows

1030.1.1 Operational constraints and opening control devices. *Emergency escape and rescue openings* shall be operational from inside the room without the use of keys or tools. Window-opening control devices ~~complying with ASTM F2090 shall be permitted for use on windows serving as a required~~ *emergency escape and rescue opening shall comply with ASTM F2090.*

Reason: This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B.

IBC - Last sentence reworded as a requirement to be consistent with IRC

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a coordination item for requirements for EEROs already permitted between the codes.

E108-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There is an errata to the IRC to Section R310.1.1. This will make the current language in the IRC and IBC match, so this revision is not necessary. (Vote 14-0)

Assembly Action:

None

Staff Analysis: The code language in IRC 2018 is as follows:

R310.1.1 Operational constraints and opening control devices. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys, tools or special knowledge. Window opening control devices on windows serving as a required emergency escape and rescue opening shall comply with ASTM F2090.

E108-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1030.1.1 Operational constraints and opening control devices. *Emergency escape and rescue openings* shall be operational from inside the room without the use of keys or tools. Window-opening control devices on windows serving as a required *emergency escape and rescue opening* shall comply with ~~ASTM F2090~~ Section 1015.8.

Commenter's Reason: The BCAC requested that this proposal be disapproved because there was a possibility that there was errata to the IRC that would make these sections the same. That was not the case. However, not all emergency escape and rescue openings (EEROs) are required to have a window opening control device that complies with ASTM F2090. The proposed revision will coordinate with Sections 1015.8. Section 1015.8 contains requirements other than compliance with the ASTM standard. The BCAC will provide coordinating proposals for EEROs for IRC in Group B.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The standards are already included in Section 1015.8, so there is no change to requirements that would increase costs.

E108-18

E109-18

IBC: 1030.2, 1030.2.1, 1030.3, (IFC[BE] 1030.2, 1030.2.1, 1030.3)

Proposed Change as Submitted

Proponent: Ed Kulik, Chair, representing ICC Building Code Action Committee (bcac@iccsafe.org)

2018 International Building Code

Add new text as follows

1030.2 Emergency escape and rescue openings. Emergency escape and rescue openings shall have minimum dimensions in accordance with Section 1030.2.1 through 1030.2.3.

Revise as follows

~~1030.2.1~~**1030.2.1 Minimum size.** *Emergency escape and rescue openings shall have a minimum net clear opening of 5.7 square feet (0.53 m²).*

Exception: The minimum net clear opening for *grade-floor emergency escape and rescue openings* shall be 5 square feet (0.46 m²).

~~1030.2.1~~**1030.2.2 Minimum dimensions.** The minimum net clear opening height dimension shall be 24 inches (610 mm). The minimum net clear opening width dimension shall be 20 inches (508 mm). The net clear opening dimensions shall be the result of normal operation of the opening.

~~1030.3~~**1030.2.3 Maximum height from floor.** ~~Emergency~~ Where a window is provided as the emergency escape and rescue openings, such window shall have the bottom of the clear opening not greater than 44 inches (1118 mm) measured from the floor.

Reason: This is one of a series of 11 proposals to coordinate the Emergency Escape and Rescue Openings (EERO) technical criteria in the IBC and IRC. Please see the proposal for the definition of Emergency Escape and Rescue Openings for additional information. Due to the code development schedule the proposals for IBC will be proposed in Group A and the proposals for IRC will be proposed in Group B. This proposal deals with Minimum size, dimensions and height.

IBC 310.3 - revise to coordinate language and organization with the IRC.

There will be a similar proposal to Group B for IRC:

This proposal is submitted by the ICC Building Code Action Committee (BCAC). BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open meetings. In addition, there were numerous Working Group meetings and conference calls for the current code development cycle, which included members of the committee as well as any interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a coordination item for requirements for EEROs already permitted between the codes.

E109-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The change in the text to Section 1030.2.3 appears to be mandating a window. There is no sill height given for other openings. Emergency escape and rescue openings can be doors or other acceptable openings. (Vote 13-1)

Assembly Action:

None

E109-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests As Submitted.

Commenter's Reason: One of the points of the 11 changes proposed for emergency escape and rescue opening (EERO) is that they can be doors or windows. The committee approved 9 of those changes during the code change hearings in April. This proposal is an important piece for coordination of the IRC and IBC requirements for EEROs. To address the committee's concerns - The threshold on doors is addressed in Section 1010. Section 1030.2.3 does not mandate windows, but says if window option is chosen, then there is maximum height of the bottom edge so that people can crawl out.

A complete version on what this section would look like if all 11 proposals passed was in the reason statement of G5-18. The following is the section related to door and window sizes. Section 1030.3 was approved in code change E110-18.

1030.2 Emergency escape and rescue openings. Emergency escape and rescue opening shall have minimum dimensions in accordance with Section 1030.2.1 through 1030.2.3.

1030.2.1 Minimum size. *Emergency escape and rescue openings* shall have a minimum net clear opening of 5.7 square feet (0.53 m²).

Exception: The minimum net clear opening for *grade-floor emergency escape and rescue openings* shall be 5 square feet (0.46 m²).

1030.2.2 Minimum dimensions. The minimum net clear opening height dimension shall be 24 inches (610 mm). The minimum net clear opening width dimension shall be 20 inches (508 mm). The net clear opening dimensions shall be the result of normal operation of the opening.

1030.2.3 Maximum height from floor. Where a window is provided as the *Emergency escape and rescue openings*, such window shall have the bottom of the clear opening not greater than 44 inches (1118 mm) measured from the floor.

1030.3 Emergency escape and rescue doors. Where a door is provided as the required emergency escape and rescue opening, it shall be a swinging door or a sliding door.

The BCAC will provide coordinating proposals for EEROs for IRC in Group B.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is a coordination item for requirements for EEROs already permitted between the codes.

E109-18

E115-18

IBC: 1105.1, 1105.1.1, Table TABLE 1105.1.1

Proposed Change as Submitted

Proponent: Joseph Hetzel, Thomas Associates, Inc., representing American Association of Automatic Door Manufacturers (jhetzel@thomasamc.com)

2018 International Building Code

Revise as follows

1105.1 Public entrances. In addition to *accessible* entrances required by Sections ~~1105.1.1~~1105.1.2 through ~~1105.1.7~~1105.1.8, at least 60 percent of all *public entrances* shall be *accessible*.

Exceptions:

1. An *accessible* entrance is not required to areas not required to be *accessible*.
2. Loading and *service entrances* that are not the only entrance to a tenant space.

Add new text as follows

1105.1.1 Automatic doors. In facilities with the occupancies and building occupant loads indicated in Table 1105.1.1, at least one accessible exterior public entrance shall be either a full power-operated door or a low-energy power-operated door.

**TABLE 1105.1.1
PUBLIC ENTRANCE WITH POWER-OPERATED DOOR**

<u>OCCUPANCY</u>	<u>BUILDING OCCUPANT LOAD GREATER THAN</u>
<u>A-1, A-2, A-3, A-4</u>	<u>300</u>
<u>B, M, R-1</u>	<u>500</u>

- Reason:**
1. Enhances accessibility. It is widely accepted that automatic doors in general enhance overall accessibility, by accommodating a wide array of conditions people have that qualify them to need accessibility at facility entrances. This accommodates a wide variety of accessibility needs that manual doors being installed today cannot encompass.
 2. Considers "transient" use. The Table directly addresses people who infrequently use public entrances so that they would need no special knowledge, skill or tool to enter a facility. All occupancies included in the Table experience such "transient" use.
 3. Addresses a public need. The occupancies cited are associated with a serious existing need for automatic doors. The safety of both use and moving people in and out of buildings in those occupancies by using only manually operated doors is a major concern particularly in emergency situations.
 4. Focuses on public entrances. The Table applies where the public is most likely to access facilities. Regarding which public entrance to choose for an automatic door if multiple entrances are accessible, this is left to the building designer on which would be best but the requirement of "at least one" door allows the designer to consider all entrances if feasible.
 5. Occupancies involved are those most applicable to the public. The population requiring accessibility commonly needs accommodations to enter assembly, business, mercantile, and hotel/motel facilities as part of their everyday life. No code requirement for automatic doors means an increased safety risk and a decreased accessibility convenience.
 6. Brings completion to accessible entrance provisions. The Table is needed in Section 1105, where accessible entrances are governed.
 7. No disproportional economic burden. The thresholds have been chosen so as not to be a requirement for smaller occupancies such as small assembly facilities or strip mall businesses.

8. Addresses statistical need for accessibility. The thresholds also assume that a minimum of 2% of the population will be in need of accessibility at any given time for the specified occupancies. For an occupant load of 300, this means that at least six people will have the need that an automatic door will provide. The anticipated accessibility need should exceed this estimate a large enough percentage of time to constitute a critical mass of facilities needing power-operated doors when meeting the established thresholds.

9. Enhances public safety. Automatic doors are regulated by ANSI/BHMA safety standards intended to prevent people from coming in contact with moving doors. Facilities employing automatic doors are required to abide by these requirements, which affords protection to anyone - including children, the elderly, and/or those with accessibility needs - in the vicinity of moving doors while minimizing or preventing operational problems. Automatic doors are thus far safer in the marketplace than manually operated doors.

10. Favorably increases facility usage. Those with accessibility needs are less likely to choose to use a facility without an automatic door, therefore resulting in reduced institutional, social, and economic benefits to entities operating within a facility.

11. Occupant load thresholds have related code precedence. The justification of minimum occupant load uses Risk Category and minimum number of exits as starting points, since these are the only locations in the Code with occupancy thresholds to consider. Risk Category and minimum number of exits share a common concern with automatic doors because the threshold numbers represent a critical mass of people above which a unique set of code requirements need to apply. Following is an explanation of how the threshold numbers have been arrived at for each occupancy in the Table.

o Group A: Also from Table 1604.5, Risk Category III. The scope of public assemblies is an occupant load greater than 300.

o Groups B, M and R-1: From Table 1006.3.1, minimum number of exits or access to exits per story. Table 1006.3.1 states that three exits or exit access doorways shall be provided from any space with an occupant load of 501 to 1000, and four shall be provided with an occupant load greater than 1000. The proposed Table would set a threshold of three exits or exit access doorways, in a given story with a public entrance, to require an automatic door at that public entrance. R-1 is the applicable Group R occupancy because hotels and motels should be encompassed by the Table where the threshold occupant load would be appropriate for those structures.

12. Alleviates concerns about maximum manual force required to operate an entrance door. Although the IBC regulates this maximum force, any type of force needed to operate a manual door is a concern for the accessibility community. Automatic doors would require no force to operate.

13. Alleviates concerns about manual force variations. Wind pressures, internal building stack pressures, and/or increasing hardware friction are common concerns and affect manual operation of entrance doors all throughout the country. This concern is removed since automatic doors require no force to operate.

14. More than a "best practice" requirement. The requirement is a need, as opposed to a "best practice", because automatic doors encourage people to use facilities, are safer, and more efficiently move people in and out of buildings. It is widely known that people - particularly children, the elderly, and/or those with accessibility needs - have great difficulty, or find it impossible, to open entrance doors because of stack pressures, door configurations, door friction, wind, or door weight.

Cost Impact: The code change proposal will increase the cost of construction. The increased construction cost will be outweighed by the benefits provided to the public as outlined in our reasoning statement.

E115-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Having one automatic door on these types of facilities would address the needs of person with mobility impairments or persons with not enough strength to open exterior doors. The use group and occupant loads are appropriate levels for application. (Vote 13-0)

Assembly Action:

None

E115-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Micah Chappell, Seattle Department of Construction and Inspections, representing Seattle Department of Construction and Inspection (micah.chappell@seattle.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1105.1.1 Automatic doors. In facilities with the occupancies and building occupant loads indicated in Table 1105.1.1, ~~at least one accessible exterior public entrance shall~~ public entrances that are required to be accessible shall have one door be either a full power-operated door or a low-energy power-operated door. Where the public entrance includes a vestibule, at least one door into and one door out of the vestibule shall meet the requirements of this section.

Commenter's Reason: The original proposal provides additional easy if ingress and egress and was a good start in getting automatic doors installed at one required accessible entrance, but seemed to indicate that if you had a bank of doors at the required public entrance, that all of those doors needed to be automatic. We also added to the proposal that all public entrances that are required to be accessible provide one automatic door, considering if you had a large facility, the accessible public entrances could be a significant distance apart making access to an automatic door more difficult. Additionally the proposal did not address what needed to be installed when the accessible public entrance has a vestibule with doors arranged in series.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal will cause a minor increase in construction cost for the occupancy classifications that are required to meet this standard.

Public Comment 2:

Proponent: Micah Chappell, representing Seattle Department of Construction and Inspection (micah.chappell@seattle.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

TABLE 1105.1.1^a
PUBLIC ENTRANCE WITH POWER-OPERATED DOOR

OCCUPANCY	BUILDING OCCUPANT LOAD GREATER THAN
A-1, A-2, A-3, A-4	300
B, M, R-1	500

a. In mixed-use facilities, when the total sum of the building occupant load is greater than those listed, the most restrictive building occupant load shall apply.

Commenter's Reason: The table did not address mixed-use facilities when applying this section and the proposed footnote provides a definitive path for the Code Official. An example of why this footnote for mixed-use facilities is needed would be if you had both a M occupancy and an A-3 occupancy. The M occupancy has an occupant load of 350 and the A-2 occupancy has an occupant load of 250, individually they do not exceed the requirements of the table so the

requirements would not apply, but the total sum of the building occupant load would exceed the limits of the table. So as this example shows the original proposal did not provide guidance on how to apply the section to mixed-use facilities. We believe the footnote addresses this issue.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal will cause a minor increase the cost of construction.

Public Comment 3:

Proponent: Lee Kranz, representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1105.1.1 Automatic doors. In facilities with the occupancies and building occupant loads indicated in Table 1105.1.1, at least one accessible exterior public entrance shall have at least one door be either a full power-operated door or a low-energy power-operated door. Where the public entrance includes a vestibule, at least one door into and one door out of the vestibule shall meet the requirements of this section.

Commenter's Reason: This public comment is intended to address a potentially confusing aspect of the original proposal related to the number of door requiring the automatic opening device. This change will make it clear that only one of the doors into the building requires automatic opening when a bank of doors are provided.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost will be higher because more doors will be required to have automatic opening devices.

Staff Analysis: The 2017 ICC A117.1 includes the following language for automatic door openers on vestibules.

404.3.2 Vestibules. Where an entrance includes a vestibule, at least one exterior door or gate and one interior door or gate in the vestibule shall have the same type of automatic door or gate opener.

E115-18

E117-18

IBC: 1106.2

Proposed Change as Submitted

Proponent: Jim Safranek, representing Safranek Group LLC

2018 International Building Code

Revise as follows

1106.2 Groups I-1, R-1, R-2, R-3 and R-4. Accessible parking spaces shall be provided in Group I-1, R-1, R-2, R-3 and R-4 occupancies in accordance with Items 1 through 4 as applicable.

1. In Group R-2, R-3 and R-4 occupancies that are required to have *Accessible, Type A or Type B dwelling units or sleeping units*, at least 2 percent, but not less than one, of each type of parking space provided shall be *accessible*.
2. In Group I-1 and R-1 occupancies, *accessible* parking shall be provided in accordance with Table 1106.1.
3. Where at least one parking space is provided for each *dwelling unit or sleeping unit*, in addition to the accessible parking in Items 1 and 2, and at least one *accessible* parking space shall be provided for each *Accessible and Type A unit*.
4. Where parking is provided within or beneath a building, *accessible* parking spaces shall be provided within or beneath the building.

Reason: Purpose: To clarify whether the number of parking space required by item 3 of section 1106.2 are in addition to the minimum required number of accessible parking spaces or are included as part of the minimum required number of accessible parking spaces.

Reason and Substantiation: For groups I-1, R-1, R-2, R-3 and R-4 the required minimum number of accessible parking spaces is either 2% (Group R-2, R-3 and R-4) or per Table 1106.1 (Group I-1 and R-1). Additionally, item 3 in section 1106.2 states, "Where a parking space is provided for each dwelling unit or sleeping unit, at least one accessible parking space shall be provided for each Accessible and Type 'A' unit.". Item 3 does not appear to clarify whether the required parking spaces for Accessible and Type 'A' units are included among the required minimum number of accessible spaces (either 2% of provided parking spaces or per Table 1106.1), or, are in addition to the required minimum number of accessible spaces.

For example, given a Group R-2 apartment project with 250 parking stalls for 250 units (1 parking stall per unit), where 5 of the units are Type 'A' units and the remaining units are Type 'B' units and there are 5 accessible parking spaces provided. Do the requirements of Section 1106.2, item 3 mean the following:

1. that a minimum of 5 accessible parking spaces will be required ($250 \times 2\% = 5$, per section 1106.2, item 1) and this also corresponds to the minimum number of required and provided Type 'A' units (1106.2, item 3)?
2. or, that in addition to the minimum required accessible parking spaces (5) (section 1106.2, item 1), 5 additional parking spaces will be required for each of the provided Type 'A' units (per section 1106.2, item 3), resulting in a total of 10 accessible parking spaces?

The proposed additional language to item 3 of section 1106.2 seeks to clarify its intent.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Whether or not the code change proposal will increase or decrease the cost of construction depends upon how jurisdictions have been interpreting item 3 of section 1106.2.

If jurisdictions have been interpreting that accessible parking spaces required by item 1 of section 1106.2 do not include the accessible parking spaces required by item 3 of section 1106.2 (which must be also be additionally provided), this will not increase construction costs. The reason for this is that the jurisdiction's interpretation of items 1 and 3 of section 1106.2 is consistent with the code change proposal, that reflects the intent of the code.

If jurisdictions have been interpreting that accessible parking spaces required by item 1 of section 1106.2 include the accessible parking spaces required by item 3 of section 1106.2, this will increase construction costs. The reason for this is that the jurisdiction's interpretation of items 1 and 3 of section 1106.2 is not consistent with the code change proposal and additional accessible parking spaces and their accompanying accessible access aisles and accessible routes will be required.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While this item does need to be clarified, this is not the right direction to go for this calculation. The proposed language for Item 3 is effectively doubling up requirements for parking for Groups I-1 and R. The intent is to comply with the most restrictive of the 2010 ADA and the Fair Housing requirements, so this calculation should be the opposite of what is indicated. (Vote 14-0)

Assembly Action:

None

E117-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

1106.2 Groups I-1, R-1, R-2, R-3 and R-4. *Accessible* parking spaces shall be provided in Group I-1, R-1, R-2, R-3 and R-4 occupancies in accordance with Items 1 through 4 as applicable.

1. In Group R-2, R-3 and R-4 occupancies that are required to have *Accessible, Type A or Type B dwelling units or sleeping units*, at least 2 percent, but not less than one, of each type of parking space provided shall be *accessible*.
2. In Group I-1 and R-1 occupancies, *accessible* parking shall be provided in accordance with Table 1106.1.
3. Where at least one parking space is provided for each *dwelling unit or sleeping unit*, ~~in addition to the accessible parking in Items 1 and 2, and~~ at least one *accessible* parking space shall be provided for each *Accessible* and Type A unit or the number of accessible parking spaces indicated in Items 1 and 2, whichever is greater.
4. Where parking is provided within or beneath a building, *accessible* parking spaces shall be provided within or beneath the building.

Commenter's Reason: The language is not clear as to if Item 3 is in addition to Item 1 and 2 or considered separately as a worst case. The committee voted to disapprove that this was additive. This should be cleared up.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. If this is cleared up, this could possibly reduce the total number of accessible parking spaces required.

E117-18

E126-18

IBC: 1107.7.2

Proposed Change as Submitted

Proponent: Jim Safranek, representing Safranek Group LLC

2018 International Building Code

Revise as follows

1107.7.2 Multistory units. *A multistory dwelling unit or sleeping unit that is not provided with elevator service is not required to be a Type A unit or a Type B unit. Where a multistory unit is provided with external elevator service to only one floor, the floor provided with elevator service shall be the primary entry to the unit, shall comply with the requirements for a Type A units or Type B unit, where applicable and, where provided within the unit, a living area, a kitchen and a toilet facility shall be provided on that floor.*

Reason: Purpose: One type of Group R-2 multi-family residential project seen in several areas of the United States are apartment buildings consisting solely of multiple, stacked, two-level multistory dwelling units (upper units placed above lower units) using a common-use building stair to access the upper units, instead of using a common-use elevator. For this type of building, per section 1107.7.2 of the 2018 IBC, the individual multistory dwelling units are not required to be Type 'B' units. Therefore, an apartment project consisting solely of a building (or buildings) containing these type of units would not have any Type 'B' units and initially would appear to be exempt from any accessibility requirements. However, section 1107.6.2.2.1 of the 2018 IBC would require that a Type 'A' unit be provided, regardless of the fact that the project did not contain any Type 'B' units. The result of this is a project that did not contain any Type 'B' units and initially appeared to be exempt from any accessibility requirements would be required to provide Type 'A' units and all common-use areas that were initially exempt from accessibility requirements would now be required to comply with applicable accessibility requirements. The purpose of this proposal is to clarify the requirements for Type 'A' units for Group R-2 projects consisting solely of multistory dwelling units without elevator service.

Reason and Substantiation: Where Exception 1 of section 1107.6.2.2.1 permits the number of Type 'A' units to be reduced per section 1107.7, subsection 1107.7.1 (Structures without elevator service), does not address the possibility of multi-level dwelling units in a structure without elevator service. The result of this is that the requirements found in section 1107.7.1 and its subsections, 1107.7.1.1 and 1107.7.1.2 yield units that are classified as Type 'B' units. Additionally, section 1107.7.2 (Multistory units) does identify that a multistory dwelling or sleeping unit not provided with elevator service is not required to be a Type 'B' unit, which mirrors the requirements found in the Fair Housing Act. Section 1107.7.2 also states that a multistory unit with an external elevator service to one floor is required to have the floor of that unit meet Type 'B' requirements. Unfortunately, section 1107.7.2 does not have language such as that found in section 1107.7.1 ("The number of Type 'A' units shall be determined in accordance with Section 1107.6.2.2.1.") stating how the number of Type 'A' units are determined where multi-level dwelling units occur. Given the lack of any specific requirement clarifying how Type 'A' units are determined for multistory units, the general requirement found in section 1107.6.2.2.1 is then applicable and all multistory units, regardless of whether they have a floor required to comply with Type 'B' requirements, or not (in the case of multistory units without elevator service) are utilized when determining the number of Type 'A' units for a project. This will result in all projects with multistory units being required to have Type 'A' units.

For any Group R-2 project (except those with certain grade conditions and those with nonelevator buildings where certain design flood elevation conditions exist) Type 'B' units will always occur and Type 'A' units will always be required. Given this, it appears overly restrictive that the International Building Code (IBC) require that Type 'A' units and their corresponding accessible common-use areas be provided where Type 'B' units and accessible common-use areas are not required, as is the case for R-2 projects that consist solely of stacked multistory dwelling units without any type of elevator service. Additionally, this requirement for Type 'A' units where Type 'B' units are not provided, greatly exceeds the accessibility requirements found in the Fair Housing Act (FHA). For a project consisting solely of multistory dwelling units without elevator service, the multistory dwelling units as well as their accompanying common-use areas would not be required to comply with the accessibility requirements found in the FHA. While some accessibility requirements found in the IBC and its accompanying accessibility standard ICC A117.1 exceed the requirements found in the FHA, in this circumstance, the IBC would greatly exceed the FHA requirements.

The proposed addition to section 1107.7.2 attempts to address this issue by eliminating the requirement for Type 'A' units at Group R-2 projects where only multistory dwelling units without any type of elevator service are provided.

Cost Impact: The code change proposal will decrease the cost of construction for multi-family residential projects that consist solely of multistory dwelling units, there will be a reduction in costs where Type 'A' units and accessible common-use areas are not required.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This code change would be a reduction in the number of Type A units required. This allowance would conflict with what is required in Section 1107.7.1.1. (Vote 14-0)

Assembly Action:

None

E126-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com) requests As Submitted.

Commenter's Reason: The committee reason for disapproval had two points.

1) This code change would be a reduction in the number of Type A units required.

True, but in minimal situations - This allowance would only be applicable in multi-story townhouses. Type B units are not required in townhouses without elevators because it was considered cost prohibitive to ask for elevators or platform lifts in individual townhouses. It seem appropriate to make this same allowance for Type A units. The definition for multi-story dwelling unit would not let this exception be applies to single story units over a garage - there has to be living space on two or more floors - so for a townhouse with a garage underneath, this would apply for a 3 story unit. Type A units would still be required in apartment building with 20 or more units. With the new sizes in 2017 ICC A117.1 for Accessible and Type A units, there may also be additional costs due to increase in size of turning spaces in each room.

2) This allowance would conflict with what is required in Section 1107.7.1.1.

False - Section 1107.7.1.1 is applicable to single story units in a multi-story building. This allowance would not be a conflict.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. If these units are exempted in townhouses, this would be a cost savings by not requiring private elevators or platform lifts for access.

E126-18

WUIC3-18

IWUIC: 503.2

Proposed Change as Submitted

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Wildland-Urban Interface Code

Revise as follows

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on ~~all sides~~ the front and back faces either with the ~~extended~~ ASTM E84 (UL 723) test or ASTM E 2768, ~~except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of $\frac{3}{8}$ inch (3.2 mm). Materials that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723, extended for a test period of 30 minutes, or with ASTM E 2768~~E2768, and shall comply with the following:
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding ~~25~~ and shall not show evidence of progressive combustion following the extended 30-minute test.25.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than 10¹/₂ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test. This shall be considered evidence of no significant progressive combustion.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A "Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results.

Exception: ~~Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.~~
2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Reason: This proposal makes 4 changes, discussed below:
First:

It makes no sense to test "all sides" of a product when it becomes physically impossible to distinguish between the ends and no ASTM E84 specimen (which is 24 feet long by 2 feet wide) can be obtained from the ends. When a specimen is presented for testing, if all sides look the same, a lab can't tell which is a second side. Testing front and back is feasible but other sides are not (because the maximum ASTM E84 thickness is 4 inches). In order to test a "2 by 4" specimen a simple calculation is that you would have to cut it into 864 pieces that are 2 x 4, and 4 inches thick, and somehow fasten them together: that is obviously ridiculous. It makes perfect sense to test the front and the back sides to ensure that the same fire performance is present on each side and that requirement is proposed to be retained.

Second:

The requirement to test with a rip or gap is not contained in either ASTM E84 or ASTM E2768 and is simply supposed to differentiate between fire retardant treated wood materials and coated materials. However, there is evidence that impregnation with fire retardant (as for fire retardant treated wood or FRTW) is not a guarantee that the additive penetrates uniformly throughout the wood and yet FRTW is not required to be tested on more than one side or with a gap or rip. That makes no sense. In fact, also, some coated products will be able to meet the requirements with the gap or rip so nothing is gained by adding that requirement. If there is concern about the implications of using coated wood products exceptions can (and should) be placed where the use of coated products is inappropriate, especially as decking materials.

Third:

ASTM E2768 was developed by ASTM E05 (committee on fire standards) specifically for the purpose of giving instructions on how to conduct ASTM E84 when extended to 30 minutes. In fact ASTM E84 states that materials required to be tested to meet the extended ASTM E84 to a 30-minute duration are covered by ASTM E2768. No other standard or code requirement explains how to test for "significant progressive combustion".

ASTM E2768 contains a section that explains how to assess the pass/fail criteria and it states as follows under "conditions of classification":

13.1 The test method has the following conditions of classification for a material or product to be classified as meeting the requirements of this standard:

13.1.1 The flame spread index shall be 25 or less as determined for the initial 10 min test period,

13.1.2 The flame front shall not progress more than 10.5 ft (3.2 m) beyond the centerline of the burners at any time during the 30 min test period. This is considered evidence of no significant progressive combustion in this test method.

13.2 For materials or products that are not homogeneous or symmetrical about their longitudinal axis, only surfaces that have been individually tested shall be eligible to be classified and reported as meeting the conditions of classification of this standard.

Consequently, the changes proposed to items 1.1 and 1.2 are consistent with the statements in ASTM E84 and ASTM E2768.

Fourth:

The exception is proposed to be eliminated because it is unnecessary if the requirement to test with a rip or gap is deleted.

A report on ASTM E2768 tests conducted by a fire test lab (QAI) is attached and it shows that when the flame front does not progress more than 10.5 ft beyond the centerline of the burners this is considered evidence of no significant progressive combustion. Also, no rip or gap used, because that is not what is required by ASTM E2768. Two pages of a similar report (title page and page 7) from another fire test lab (Intertek) also shows that the same criterion is used for both issues.

Cost Impact: The code change proposal will decrease the cost of construction This will eliminate unnecessary testing that represents a barrier without adding fire safety.

WUIC3-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the proposed revisions to the testing requirements do not match the original intent of the section. The change from testing on all sides to just the front and back faces is an unacceptable reduction in requirements and does not represent actual use and exposure of different types of materials and the cutting of these products during installation. (Vote: 12-2)

Assembly Action:

None

WUIC3-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Tim Earl, representing GBH International (tearl@gbhinternational.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Wildland-Urban Interface Code

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on all sides with the extended ASTM E84 (UL 723) test or ASTM E 2768, except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of $\frac{1}{8}$ inch (3.2 mm). Materials that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E 2768, comply with the following:
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding 25 and shall not show evidence of progressive combustion following the extended 30-minute test.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than $10\frac{1}{2}$ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute ~~test~~ test. This shall be considered evidence of no significant progressive combustion.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A "Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results.

Exception: Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.
2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Commenter's Reason: There is disagreement over whether all sides of these products need to be tested, and the committee disapproved the original code change for that reason.

However, during ASTM E84 task group meetings, all commercial test labs present agreed that their interpretation of "significant progressive combustion" is the flame front progressing more than 10 1/2 feet beyond the centerline of the burner at any time during the extended 30-minute test.

Because the assessment of "significant progressive combustion" is an important point that needs clarification, this Public Comment retains only that portion of the original code proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal simply adds language to explicitly state how labs are currently assessing the absence of "significant progressive combustion." It has no cost impact.

Public Comment 2:

Proponent: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Wildland-Urban Interface Code

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on all sides with the extended ASTM E84 (UL 723) test or ASTM E 2768, except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of 1/8 inch (3.2 mm). Materials that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E 2768, comply with the following:
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding 25 and shall not show evidence of progressive combustion following the extended 30-minute test.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than 10¹/₂ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test. This shall constitute evidence of no progressive combustion following the extended 30-minute test, as required in Item 1.1.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A " Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results.

Exception: Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Commenter's Reason: This public comment simply changes nothing more in the existing code than adding the clarification that, if the flame front does not progress beyond 10.5 feet that is evidence of no progressive combustion as required by 1.1. The logic goes as follows:

1. ASTM E84 is a 10-minute test and not a 30-minute test.

2. ASTM E84 states that, when the test is conducted for 30 minutes (meaning the extended ASTM E84 test , for an additional 20 minutes), it is conducted in accordance with ASTM E2768.

3. ASTM E2768 is the 30-minute test method, and it states, as shown below, that when the flame front does not progress more than 10.5 feet beyond the centerline of the burners that is considered evidence of no significant progressive combustion.

4. All fire testing labs have used this concept for many years and they present the results of the extended ASTM E84 test with two results: flame spread index (after 10 minutes) and maximum flame front (after 30 minutes).

This public comment makes no changes to the required rip or gap or to the requirement for testing all sides as shown in the code at present.

ASTM E84 explicitly states that the extended test to 30 minutes is to be conducted in accordance with ASTM E2768. ASTM E2768 was developed by ASTM E05 (committee on fire standards) specifically for the purpose of giving instructions on how to conduct ASTM E84 when extended to 30 minutes. In fact ASTM E84 states that materials required to be tested to meet the extended ASTM E84 to a 30-minute duration are covered by ASTM E2768. No other standard or code requirement explains how to test for significant progressive combustion .

ASTM E2768 contains a section that explains how to assess the pass/fail criteria and it states as follows under conditions of classification :

13.1 The test method has the following conditions of classification for a material or product to be classified as meeting the requirements of this standard:

13.1.1 The flame spread index shall be 25 or less as determined for the initial 10 min test period,

13.1.2 The flame front shall not progress more than 10.5 ft (3.2 m) beyond the centerline of the burners at any time during the 30 min test period. This is considered evidence of no significant progressive combustion in this test method.

13.2 For materials or products that are not homogeneous or symmetrical about their longitudinal axis, only surfaces that have been individually tested shall be eligible to be classified and reported as meeting the conditions of classification of this standard.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction This will result in a recognition of the unnecessary additional requirement, which is not used by any fire testing lab.

WUIC3-18

WUIC4-18

IWUIC: 503.2

Proposed Change as Submitted

Proponent: Thomas Meyers, Building Intuition, LLC, representing Self (codeconsultant@gmail.com)

2018 International Wildland-Urban Interface Code

Revise as follows

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on all sides with the extended ASTM E84 (UL 723) test or ASTM E 2768, except panel products shall be permitted to test only the front and back faces. Panel products shall be tested with a ripped or cut longitudinal gap of $\frac{1}{8}$ inch (3.2 mm). Materials that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E 2768, comply with the following:
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding 25 and shall not show evidence of progressive combustion following the extended 30-minute test.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than $10\frac{1}{2}$ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A "~~Test~~"Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire ~~Testing~~"Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results.

~~**Exception:** Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.~~

2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Reason: Recent cladding fires involving metal composite materials (MCM's), such as the Grenfell Tower in London, raises questions about the validity of allowing materials to be evaluated contrary to actual end use conditions. MCM's are frequently installed with exposed cores at joints, intersections, and corners. The effect of the exposed core on potential ignition and fire spread should be part of the testing evaluation as it realistically represents actual construction practices.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. No cost change anticipated for existing, compliant products. Additional costs applied to certain products requiring retesting may occur at manufacturer discretion.

WUIC4-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the deletion of the exception did not address the difference between materials and an assembly and did not agree with the resulting requirement that all products have to be tested ripped or gaped. (Vote: 12-2)

Assembly Action:

None

WUIC4-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Thomas Meyers, Building Intuition, LLC, representing Self (codeconsultant@gmail.com) requests As Submitted.

Commenter's Reason: The original change is intended to address metal composite materials (MCM s), particularly those that use thin metal covering over combustible core materials. Installation of these materials frequently results in exposed core materials at corners, fenestration openings, panel seams, and architectural reveals. Exposed cores at electrical outlet boxes were believed to be the origin of large scale cladding fires in the Middle East. It seems intuitive that one would want to ensure the performance of the plastic core materials when MCM's are installed in areas with wildland-urban interface. Elimination of this exception would force testing of the panel material with some of the combustible core exposed.

During testimony, the committee seemed confused by testimony implying that elimination of this section would affect other materials. The exception is clearly for metal clad materials with combustible cores, most commonly known as MCM s. Regardless, the fire performance of any exterior cladding material using a combustible core should be properly verified and tested as-installed to ensure the performance needed to protect the community and its building infrastructure.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Materials that have already been appropriately and successfully tested will remain available for installation. The effect of this code change will only be on materials that previously took advantage of the exception.

WUIC5-18

IWUIC: 503.2

Proposed Change as Submitted

Proponent: Tim Earl, GBH International, representing self (tearl@gbhinternational.com)

2018 International Wildland-Urban Interface Code

Revise as follows

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on ~~all sides~~ the front and back faces either with the extended ASTM E84 (UL 723) test, extended for a test period of 30 minutes, or ASTM E 2768, except panel products shall be permitted to test only the front and back faces, with ASTM E2768. Panel products shall be tested with a ripped or cut longitudinal gap of $\frac{1}{8}$ inch (3.2 mm). Materials ~~that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E 2768, shall~~ comply with the following:
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding ~~25 and shall not show evidence of progressive combustion following the extended 30-minute test.~~25.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than $10\frac{1}{2}$ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test. This shall be considered evidence of no significant progressive combustion.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A "Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results.

Exception: Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Reason: It makes no sense to test "all sides" of a product when it becomes physically impossible to distinguish between the ends and no ASTM E84 specimen (which is 24 feet long by 2 feet wide) can be obtained from the ends. When a specimen is presented for testing, if all sides look the same, a lab can't tell which is a second side. Testing front and back is feasible but other sides are not (because the maximum ASTM E84 thickness is 4 inches). In order to test a "2 by 4" specimen a simple calculation is that you would have to cut it into 864 pieces that are 2 x 4, and 4 inches thick, and somehow fasten them together: that is obviously ridiculous. It makes perfect sense to test the front and the back sides to ensure that the same fire performance is present on each side and that requirement is proposed to be retained. ASTM E2768 was developed by ASTM E05 (committee on fire standards) specifically for the purpose of giving instructions on how to conduct ASTM E84 when extended to 30 minutes. In fact ASTM E84 states that materials required to be tested to meet the extended ASTM E84 to a 30-minute duration are covered by ASTM E2768. ASTM E2768 contains a section that explains how to assess the pass/fail criteria and it states as follows under "conditions of classification":

13.1 The test method has the following conditions of classification for a material or product to be classified as meeting the requirements of this standard:

13.1.1 The flame spread index shall be 25 or less as determined for the initial 10 min test period,

13.1.2 The flame front shall not progress more than 10.5 ft (3.2 m) beyond the centerline of the burners at any time during the 30 min test period. This is considered evidence of no significant progressive combustion in this test method.

13.2 For materials or products that are not homogeneous or symmetrical about their longitudinal axis, only surfaces that have been individually tested shall be eligible to be classified and reported as meeting the conditions of classification of this standard.

Consequently, the changes proposed to items 1.1 and 1.2 are consistent with the statements in ASTM E84 and ASTM E2768.

No other standard contains information on how to assess "no significant progressive combustion".

Cost Impact: The code change proposal will decrease the cost of construction. This will reduce the amount of testing required by eliminating unnecessary tests on all sides of homogeneous wood specimens.

WUIC5-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee did not agree with the change from testing on all sides to just the front and back faces. It was stated that the section description needs to address the requirements for the material ends and sides. (Vote: 13-1)

Assembly Action:

None

WUIC5-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Wildland-Urban Interface Code

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the following:

1. Material shall be tested on all sides with the extended ASTM E84 (UL 723) test or ASTM E 2768, except panel products shall be permitted to test only the front and back faces. ~~Panel products shall be tested with a ripped or cut longitudinal gap of $\frac{3}{8}$ inch (3.2 mm).~~ Materials that, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E 2768, comply with the following:
 - 1.1. Flame spread. Material shall exhibit a flame spread index not exceeding 25 and shall not show evidence of progressive combustion following the extended 30-minute test.
 - 1.2. Flame front. Material shall exhibit a flame front that does not progress more than 10 $\frac{1}{2}$ feet (3200 mm) beyond the centerline of the burner at any time during the extended 30-minute test.
 - 1.3. Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. Materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in the following standards, as applicable to the materials and the conditions of use:
 - 1.3.1. Method A " Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing "in ASTM D 2898, for fire-retardant-treated wood, wood-plastic composite and plastic lumber materials.
 - 1.3.2. ASTM D 7032 for wood-plastic composite materials.
 - 1.3.3. ASTM D 6662 for plastic lumber materials.
 - 1.4. Identification. Materials shall bear identification showing the fire test results-

Exception: ~~Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap~~
2. Noncombustible material. Material that complies with the requirements for *noncombustible* materials in Section 202.
3. Fire-retardant-treated wood. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
4. Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes that comply with the requirements of Section 1505.6 of the International Building Code and classified as Class A roof assemblies as required in Section 1505.2 of the International Building Code.

Commenter's Reason: This public comment makes two (associated) changes to existing code language:

1. It eliminates the requirement for the "rip or gap" because the product should be tested as it will be used and not altered.

2. It eliminates the exception, which is unnecessary since it simply exempts some products from having to be tested with a "rip or gap" and become meaningless if that requirement disappears.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This will prevent unnecessary testing of products in a manner different from the way they are being used.

WUIC5-18

F4-18 Part I

IFC: 202 (New)

Proposed Change as Submitted

Proponent: Dave Frable, U.S. General Services Administration, representing U.S. General Services Administration

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IBC-FS COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

Add new definition as follows

LIFE SAFETY SYSTEMS. Systems, devices, and equipment that enhance or facilitates evacuation, smoke control, compartmentation, and/or isolation.

Reason: The intent of this code change proposal is to define the term “life safety system”. The subject term is used in the title of IFC Chapter 9, Fire Protection and Life Safety Systems and throughout Chapter 9 but is not defined. In addition, the term “fire protection system” is defined; however, “life safety system is not.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a definition and will not affect the cost of construction.

F4-18 Part I

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval is based upon the proponent's published reason. This is also consistent with the action taken on Part II by the IBC Fire Safety Committee. (Vote: 14-0)

Assembly Action:

None

F4-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org) requests Disapprove.

Commenter's Reason: A definition is needed for life safety systems, but this definition uses terms that do not correlate well within the IBC and IFC. One example is how "compartmentation" is used in the definition. Compartmentation is used in the IBC and IFC, but in different chapters. Where Ch. 9 has life safety systems in the title, the only reference for compartments, more specifically smoke compartments comes from Ch 4 (422.3) of the IBC and the construction requirements are in Ch. 7. A user of the code will see that Ch. 9 is the chapter for life safety systems and not find all of the requirements correlated.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. While there is value in this definition, it will blur passive, active and life safety system requirements and the application of the code.

F4-18 Part I

Proposed Change as Submitted

Proponent: Matthew Dobson, Vinyl Siding Institute, representing Suburban Exterior Fire Work Group (mdobson@vinylsiding.org); Richard Swan, International Association of Fire Fighters, representing International Association of Fire Fighters (rswan@iaff.org)

2018 International Fire Code

Revise as follows

SECTION 304 COMBUSTIBLE WASTE AND LANDSCAPING MATERIAL

Add new text as follows

304.4 Mulch. Combustible landscaping mulch shall not be placed within 3 feet of combustible walls, roofs, or other combustible components of Group R buildings of Type V construction.

Reason: Over the past code cycles there has been concern over smoker habits, combustible mulch, and the potential hazard they pose with combustion of exterior walls. The Suburban Exterior Fire Work Group, a group of fire service members, UL fire fighter safety institute, and other material stakeholders has been focused on this issue over the past 18 months.

The problem identified is the spread of fire from the exterior into to the unprotected attic space and then spreading quickly to other parts of the building.

The group has taken a 3 prong approach to address the issue:

1. Regulate the human risk by prohibiting smoking near exterior doors.
2. Remove combustible material/mulch from near the outside of combustible wall assemblies.
3. Create a block to slow down any fires that occur in the above described setting.

Over the decade, fire departments in the Washington, DC region have been confronted with structure fires which have demonstrated a consistent pattern of starting on the outside. These fires have the potential for rapid loss of structural integrity and catastrophic collapse before occupants are alerted. As attention has grown locally, it is apparent that this type of fire is becoming common on a national basis.

These fires tend to follow a distinct pattern. These fires start at a low point on the exterior and spread vertically along the exterior wall producing flammable gases, which are readily admitted into the attic area through ventilation soffits. If not cooled, these heated gases accumulate and combust, creating rapidly spreading fire conditions in the attic area, often without occupant awareness. The unchecked fire often results in full roof involvement, creating a dangerous and difficult situation for occupants and fire fighters.

The group examined a number of structure fires which have exhibited the pattern described above. There is agreement over 3 common aspects. First, these fires often result from careless smoking habits. Second, when the smoking materials are not properly disposed of, they often come into contact with combustible materials adjacent to a building and, very commonly, this is mulch. And, last, the combustible exterior wall is a factor in the the growth of these fires into the attic space.

The careless smoker is an impediment to effective fire prevention efforts. The fire service has consistently provided data that shows smoking is the leading cause of fatal fires in the United States. Public fire and life safety efforts have been reasonably effective at communicating the message to not smoke in bed, and various medical organizations have demonstrated the health risk associated with "second hand" smoke. We now see that people are routinely smoking outside, at or near the entrance to a building, which increases the possibility of an accidental ignition of outside combustibles. If one were to chronicle the actions of today's smoker, it would likely show the last action they take when exiting a building is to "light up." When returning inside, they often drop the cigarette near the entrance. Many smokers seem to believe that dropping a match or cigarette onto the ground or into a flower pot is an effective method of extinguishment, however, this behavior often places the smoking material directly into the mulch, initiating the low fire described earlier.

Mulch has become a common exterior decorative material which aids in suppressing weed growth while enhancing a building's curb appeal. However, most mulch is a dead organic material, comprised of chipped wood, tree bark or pine needles. Mulch is most effective when it is maintained in a moist state, however it can dry out very quickly and become a readily ignitable fuel source. Because of its relatively small mass in comparison to its surface area, when ignited, it will progress and sustain open flame.

The group discussed a method in which to proceed, the interest being to address, in the quickest manner, industrial and social changes which could reduce the possibility of a fire on the outside of a building. Each aspect presents unique challenges for fire prevention efforts:

1. Changing the behavior of the smoker is an ongoing and difficult challenge, especially as social pressures have resulted in regulatory changes to require people to smoke outside of a building. Further development of the "fire safe" cigarette, by way of testing using mulch, could be deemed too costly for the industry, and would have no effect on improper disposal of matches. Thus, the quickest and most practical strategy for this aspect of the problem is to expand public fire and life safety education to focus on the hazards of improper disposal of smoking materials, coupled with enforcement of applicable requirements for regulation of smoking and disposal of products. However, in this age of "information overflow" it is questionable if this would result in widespread behavioral changes for smokers.
2. Regulating the use and placement of mulch, that the study group believes could have the quickest and most significant impact toward reducing the exterior fire problem, while additional strategies to address the other problems noted are pursued.

The use of wood and wood related mulch for building decoration is purely optional. It is not a required construction component under current building codes. Therefore, regulations to curtail its use or require that it be separated from a building's combustible exterior are reasonable and could be codified on a national basis. On a large scale, the mere action of creating separation of combustible materials has been a wildland fire tactic for years. Several states and local jurisdictions have already employed this theory by either recommending or requiring that wood-based mulch be separated from exterior combustible walls:

1. The Virginia Department of Forestry recommends to "provide a minimum of an 18 inch clearance between landscaping mulch beds and combustible building materials" and to "ensure proper clearance to electric devices, such as decorative lights, by following the manufacturer's instructions;"
2. In Raleigh, NC, following a disastrous fire in a multi-family building, the city passed a pine straw mulch ordinance that bans the use of pine straw as ground cover within 10 feet of multi-family dwellings. The ordinance exempts 1 and 2-family dwellings, however, the city strongly encourages these homeowners to comply with the pine straw restrictions;
3. The Commonwealth of Massachusetts prohibits the new application of mulch within 18 inches around combustible exteriors of buildings, such as wood or vinyl but not brick or concrete. Residential buildings with six units or less are exempted from this regulation, but it is recommended that all homeowners adopt these safety practices. The regulation applies to all other buildings including commercial properties.
4. Ventura County, CA prohibits mulch and wood chips within the required "defensible space" zone (which ranges from 0' to 30' from the exterior of a building).

This small sampling of jurisdictions has produced enough evidence to lead the study group to suggest the possible introduction of a code proposal to require separation, or non-application, of wood-based mulch in proximity to combustible exterior walls.

The proposed protected soffit approach will require a form of blocking outside of exterior doorways and garage doors. These proposed material have been required in North Carolina for over 5 years and are accepted to provide some form of blocking that will slow down the movement of fire from the outside to the attic space, effectively helping to address the issue and allow fire service more time put out the fire.

We think this approach is effective, efficient, and cost effective.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change should not impact the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the definition of mulch varies by location. They also had concerns with the distance requirement, occupancy group and the difficulty with enforcement. (Vote: 13-1)

Assembly Action:

None

F8-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Matthew Dobson, representing Suburban Exterior Fire Work Group (mdobson@vinylsiding.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

Add new definition as follows:

COMBUSTIBLE LANDSCAPING MULCH. A layer of combustible material applied to the exterior ground surface for the conservation of soil moisture, improving fertility and health of the soil, reducing weed growth and enhancing the visual appeal of the area.

304 COMBUSTIBLE WASTE AND LANDSCAPING MATERIAL

304.4 Combustible Landscaping Mulch. Combustible landscaping mulch adjacent to buildings of Type V construction shall not be placed within 3 feet of combustible ~~walls~~ exterior wall coverings, decks, roofs, or other combustible components of Group R buildings of Type V construction.

Commenter's Reason: The committee seemed interested in this change but was concerned because there was no definition for mulch, needed a better justification for 3-foot distance, wanted to include all occupants groups, and questioned how enforcement would occur.

This comment has addressed the concerns of the fire code committee.

The issue of concern is mulch fires, generally started by discarded cigarettes, starting on the outside of buildings and growing and moving up into the attic space causing major fires.

In a recent report from NFPA on Virginia, the leading cause of fire fatalities in 2018 so far is improperly discarded cigarettes. This change will help address parts of this problem. Also, a recent report out of Alberta, indicates similarly that poor disposal of smoking materials caused a majority of serious fires in 2018.

In a review of current mulch regulations in place from Massachusetts to North Carolina, the average distance to keep mulch away from buildings is three feet. The proposal would require mulch be at least three feet from exterior combustible components of Type V construction.

Enforcement can easily become a part of the inspections now conducted on exterior fire safety features and Chapter 1 provides adequate information on how to regulate and enforce this requirement.

These requirements can be easily incorporated in the initial development plans and building plans which in many cases include landscaping plans.

Here are some additional examples of why this requirement is necessary.

- A mulch fire in Massachusetts occurred in May 2015 in a large Arlington apartment complex. One man died in the fire started by smoking materials discarded in a mulch bed, which spread to a car, then to the building. Thirty-six apartments and six cars were destroyed. The building had no sprinklers, and the estimated dollar loss was \$6.7 million.
- In April 2012, improperly discarded smoking materials ignited mulch outside an assisted living center in Braintree. The fire forced many older adults to evacuate in the early morning hours. Several suffered smoke inhalation injuries.
- In May 2008, a cigarette ignited a mulch fire at a Peabody apartment complex. It caused \$6.7 million in damage to the building, displaced 750 people temporarily and 36 permanently.

Here are some examples of currently in place ordinance and information:

10.14.10.4.1 Mulch shall not be newly applied within 18 inches of any combustible portion of any building [See Figure 10.14.10.4.1(a)]. Exception: Any building, regardless of the existence of fire separations, containing six dwelling units or less.

10.14.10.4.2 Mulch as used here shall mean any type of forest material that is produced for the purpose spreading or application over the surface of the soil as a protective cover, to retain moisture, reduce erosion, provide nutrients, suppress weed growth, seed germination and for general landscaping purposes.

Figure 10.14.10.4.1(a)

The state of Massachusetts does not allow mulch within 18 of combustible portion of buildings.

Raleigh, NC/Durham here is a photo of what would not be allowed according to an ordinance in North Carolina.

Carrboro, NC - here is excerpted text from Carrboro, NC.

Section 12-17 Mulch Piles and Pine Straw (Amend. 11/18/08)

(a) No person may cause, suffer, or permit any mulch pile to be created or maintained on any premises if such mulch pile (i) is larger than eight feet in height, or (ii) covers more than 400 square feet of ground area.

(b) Any mulch pile for which a permit is required under Section 105.6.47 (i.e. one comprising 200 cubic feet or more) shall be separated from any other mulch pile for which such a permit is required by a distance of at least fifty feet. In addition, each such pile must be accessible by an approved fire apparatus access road capable of withstanding the imposed loads of a fire truck (60,000 lbs.) and have an all-weather driving surface.

(c) No pine straw or any other decorative ground cover or material with a fire rate of spread more than 12 inches per minute shall be placed, kept, or stored within ten feet of any building with combustible exterior construction and/or combustible doors, windows or other openings. This subsection shall apply to all buildings with combustible exterior construction in existence upon the effective date hereof, upon thirty (30) days notice hereof, and to all new construction with combustible exteriors.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

It is hard to estimate the increase or decrease in cost. In the short term there may be some increase depending on what the building owner decides to use instead of combustible mulch. Longer term the maintenance costs may go down as less mulch may be used.

F13-18

IFC: 310.9

Proposed Change as Submitted

Proponent: Matthew Dobson, Vinyl Siding Institute, representing Suburban Exterior Fire Work Group (mdobson@vinylsiding.org); Richard Swan, representing International Association of Fire Fighters (rswan@iaff.org)

2018 International Fire Code

Add new text as follows

310.9 Group R. Smoking shall be prohibited within 25 feet of any exterior door of Group R buildings of Type V construction.

Reason: Over the past code cycles there has been concern over smoker habits, combustible mulch, and the potential hazard they pose with combustion of exterior walls. The Suburban Exterior Fire Work Group, a group of fire service members, UL fire fighter safety institute, and other material stakeholders has been focused on this issue over the past 18 months.

The problem identified is the spread of fire from the exterior into to the unprotected attic space and then spreading quickly to other parts of the building.

The group has taken a 3 prong approach to address the issue:

1. Regulate the human risk by prohibiting smoking near exterior doors.
2. Remove combustible material/mulch from near the outside of combustible wall assemblies.
3. Create a block to slow down any fires that occur in the above described setting.

The proposed protected soffit approach, contained in a proposal for the IBC, will require a form of blocking outside of exterior doorways and garage doors in the soffit area. These proposed material have been required in North Carolina for over 5 years and are accepted to provide some form of blocking that will slow down the movement of fire from the outside to the attic space, effectively helping to address the issue and allow fire service more time put out the fire. Testing on these protected soffits are currently underway to show the effectiveness of these assemblies both vented and unvented.

Over the decade, fire departments in the Washington, DC region have been confronted with structure fires which have demonstrated a consistent pattern of starting on the outside. These fires have the potential for rapid loss of structural integrity and catastrophic collapse before occupants are alerted. As attention has grown locally, it is apparent that this type of fire is becoming common on a national basis.

These fires tend to follow a distinct pattern. These fires start at a low point on the exterior and spread vertically along the exterior wall producing flammable gases, which are readily admitted into the attic area through ventilation soffits. If not cooled, these heated gases accumulate and combust, creating rapidly spreading fire conditions in the attic area, often without occupant awareness. The unchecked fire often results in full roof involvement, creating a dangerous and difficult situation for occupants and fire fighters.

The group examined a number of structure fires which have exhibited the pattern described above. There is agreement over 3 common aspects. First, these fires often result from careless smoking habits. Second, when the smoking materials are not properly disposed of, they often come into contact with combustible materials adjacent to a building and, very commonly, this is mulch. And, last, the combustible exterior wall is a factor in the the growth of these fires into the attic space.

The careless smoker is an impediment to effective fire prevention efforts. The fire service has consistently provided data that shows smoking is the leading cause of fatal fires in the United States. Public fire and life safety efforts have been reasonably effective at communicating the message to not smoke in bed, and various medical organizations have demonstrated the health risk associated with "second hand" smoke. We now see that people are routinely smoking outside, at or near the entrance to a building, which increases the possibility of an accidental ignition of outside combustibles. If one were to chronicle the actions of today's smoker, it would likely show the last action they take when exiting a building is to "light up." When returning inside, they often drop the cigarette near the entrance. Many smokers seem to believe that dropping a match or cigarette onto the ground or into a flower pot is an effective method of extinguishment, however, this behavior often places the smoking material directly into the mulch, initiating the low fire described earlier.

Mulch has become a common exterior decorative material which aids in suppressing weed growth while enhancing a building's curb appeal. However, most mulch is a dead organic material, comprised of chipped wood, tree bark or pine needles. Mulch is most effective when it is maintained in a moist state, however it can dry out very quickly and become a readily ignitable fuel source. Because of its relatively small mass in comparison to its surface area, when ignited, it will progress and sustain open flame.

The group discussed a method in which to proceed, the interest being to address, in the quickest manner, industrial and social changes which could reduce the possibility of a fire on the outside of a building. Each aspect presents unique challenges for fire prevention efforts:

1. Changing the behavior of the smoker is an ongoing and difficult challenge, especially as social pressures have resulted in regulatory changes to require people to smoke outside of a building. Further development of the "fire safe" cigarette, by way of testing using mulch, could be deemed too costly for the industry, and would have no effect on improper disposal of matches. Thus, the quickest and most practical strategy for this aspect of the problem is to expand public fire and life safety education to focus on the hazards of improper disposal of smoking materials, coupled with enforcement of applicable requirements for regulation of smoking and disposal of products. However, in this age of "information overflow" it is questionable if this would result in widespread behavioral changes for smokers;
2. Regulating the use and placement of mulch, that the study group believes could have the quickest and most significant impact toward reducing the exterior fire problem, while additional strategies to address the other problems noted are pursued.

The use of wood and wood related mulch for building decoration is purely optional. It is not a required construction component under current building codes. Therefore, regulations to curtail its use or require that it be separated from a building's combustible exterior are reasonable and could be codified on a national basis. On a large scale, the mere action of creating separation of combustible materials has been a wildland fire tactic for years. Several states and local jurisdictions have already employed this theory by either recommending or requiring that wood-based mulch be separated from exterior combustible walls:

1. The Virginia Department of Forestry recommends to "provide a minimum of an 18 inch clearance between landscaping mulch beds and combustible building materials" and to "ensure proper clearance to electric devices, such as decorative lights, by following the manufacturer's instructions;"
2. In Raleigh, NC, following a disastrous fire in a multi-family building, the city passed a pine straw mulch ordinance that bans the use of pine straw as ground cover within 10 feet of multi-family dwellings. The ordinance exempts 1 and 2-family dwellings, however, the city strongly encourages these homeowners to comply with the pine straw restrictions;
3. The Commonwealth of Massachusetts prohibits the new application of mulch within 18 inches around combustible exteriors of buildings, such as wood or vinyl but not brick or concrete. Residential buildings with six units or less are exempted from this regulation, but it is recommended that all homeowners adopt these safety practices. The regulation applies to all other buildings including commercial properties.
4. Ventura County, CA prohibits mulch and wood chips within the required "defensible space" zone (which ranges from 0' to 30' from the exterior of a building).

This small sampling of jurisdictions has produced enough evidence for a code proposal to require separation, or non-application, of wood-based mulch in proximity to combustible exterior walls.

We think this approach is effective, efficient, and cost effective.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change is intended to modify human behavior and will not impact the cost of construction.

F13-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that, similar to F8-18, they had concerns with the distance requirement, occupancy group and the difficulty with enforcement. (Vote: 14-0)

Assembly Action:

None

F13-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Matthew Dobson, representing Suburban Exterior Fire Work Group (mdobson@vinylsiding.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

310.9 ~~Group R~~ Type V construction. Smoking shall be prohibited within 25 feet of any exterior door of ~~Group R~~ buildings of Type V construction.

Commenter's Reason: The fire code committee noted their reason for disapproval was that it needed more reason for the 25 foot, it wanted the occupancy provision removed as it should apply to all occupancies, and it was concerned about enforcement of the rule.

This substantiation and modification to language have addressed the committee concerns.

This change would apply to all types of occupancies of Type V construction.

It s worth also noting that In a recent report from NFPA on Virginia, the leading cause of fire fatalities in 2018 so far is improperly discarded cigarettes. This change will help address parts of this problem. Also, a recent report out of Alberta, indicates similarly that poor disposal of smoking materials caused a majority of serious fires in 2018.

In a review of the fire code, the 25-foot distance has precedence and is appropriate. In the International Fire Code a 25-foot distance for smoking distance and recreational fires are specifically regulated in the following sections:

- 307.4.2 Location of recreational fires to buildings and combustible material
- 3703 smoking near combustible fibers section
- 5003.7.1 smoking near hazardous materials
- 5706.2.8 Smoking near flammable and combustible liquids
- 6107.2 Smoking LP filling operations

These current similar rules are in place.

Current enforcement of this new regulation would be handled similarly to how the above existing regulations are enforced. Also, building owners could create enforcement tools through signage, lease agreements, and other forms of occupant education.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This regulation will impact human behavior and will not have an impact on the cost of construction.

F13-18

F17-18

IFC: 315.3.2, 1031.2, 3311.3

Proposed Change as Submitted

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows

315.3.2 Means of egress. Combustible materials shall not be stored in *exits, fire-resistance-rated corridors or enclosures for stairways and ramps*. Combustible materials in the means of egress during construction, demolition, remodeling or alterations shall comply with Section 3311.3.

1031.2 Reliability. Required *exit accesses, exits and exit discharges* shall be continuously maintained free from obstructions or impediments to full instant use in the case of fire or other emergency where the building area served by the *means of egress* is occupied. An *exit, fire-resistance-rated corridor or exit passageway* shall not be used for any purpose that interferes with a *means of egress*.

3311.3 Storage. Combustible materials associated with construction, demolition, remodeling or alterations to an occupied structure shall not be stored in *exits, fire-resistance-rated corridors, enclosures for stairways and ramps, or exit access corridors serving an occupant load of 30 or more*.

Exceptions:

1. Where the only occupants are construction workers.
2. Combustible materials that are temporarily accumulated to support work being performed when workers are present.

Reason: This proposal is intended to correct an anomaly that occurred when two unrelated proposals by different submitters collided in impact when the 2012 codes were printed and causes some to believe fire-resistance-rated corridors are not "exits".

I had submitted a proposal that included modifying then Section 1030.2, (now 1031.2), by taking language that existed in other portions of Chapter 10 and adding them to 1030.2 since the requirements were ones that not only applied at the time of construction, but must be maintained for the life of the building or structure. (Proposal F172-09/10 attached).

The International Fire Code Development Committee approved the proposal.

The main premise was protecting "exits" and including existing language that stated "An exit or exit passageway shall not be used for any purpose other than as a means of egress."

At the time my proposal was submitted and approved the definition of exit in the code was:

"EXIT. *That portion of a means of egress system which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel between the exit access and the exit discharge . Exits include exterior exit doors at the level of exit discharge , vertical exit enclosures , exit passageways , exterior exit stairways , exterior exit ramps and horizontal exits.*

That definition included fire-resistance-rated corridors by virtue of the first sentence and represented what historically was considered an exit.

Unfortunately during that cycle a separate proposal in front of another committee included a proposal that changed the definition of an exit to:

"EXIT. *That portion of a means of egress system between the exit access and the exit discharge or public way. Exit components include exterior exit doors at the level of exit discharge, interior exit stairways, interior exit ramps, exit passageways, exterior exit stairways and exterior exit ramps and horizontal exits."*

The definition currently reads:

"[BE] EXIT. *That portion of a means of egress system between the exit access and the exit discharge or public way. Exit components include exterior exit doors at the level of exit discharge, interior exit stairways and ramps, exit passageways, exterior exit stairways and ramps and horizontal exits.*

[BE] EXIT ACCESS. That portion of a means of egress system that leads from any occupied portion of a building or structure to an exit."

Because of the new definition and some language in the commentary generically referring to corridors as exit access, it is no longer clear if a fire-resistance-rated corridor is included in the two fire code sections addressing exits as intended by the proposal approved by the committee. The need to protect a fire-resistant-rated corridor is as important as protecting an exit passageway and other types of exits as documented by the following section:

"[BE] 1020.6 Corridor continuity. *Fire-resistance-rated corridors shall be continuous from the point of entry to an exit, and shall not be interrupted by intervening rooms. Where the path of egress travel within a fire-resistance-rated corridor to the exit includes travel along unenclosed exit access stairways or ramps, the fire-resistance-rating shall be continuous for the length of the stairway or ramp and for the length of the connecting corridor on the adjacent floor leading to the exit.*

Exceptions:

1. *Foyers, lobbies or reception rooms constructed as required for corridors shall not be construed as intervening rooms.*
2. *Enclosed elevator lobbies as permitted by Item 1 of Section 1016.2 shall not be construed as intervening rooms."*

By adding the wording "fire-resistance-rated corridor" to the two sections in this proposal the intent of the committee approval of F172-09/10 will be met.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Since this proposal addresses a topic that deals with maintenance of a exit path during day to day activities, it does not impact the cost of construction.

Analysis: Note that this proposal includes sections that are part of an errata to the 2018 IFC. Section 315.3.2 the second sentence is new and Section 3311.3 is a new section to the 2018 that was inadvertently missed during publication.

F17-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that there are issues regarding the definition and interpretation of combustible storage, temporary vs. permanent, and rooms that are open to the corridor. (Vote: 9-5)

Assembly Action:

None

F17-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)requests As Submitted.

Commenter's Reason: The reason for disapproval was as follows:

"The committee stated that there are issues regarding the definition and interpretation of combustible storage, temporary vs. permanent, and rooms that are open to the corridor. (Vote: 9-5)"

The issues are perplexing because this concepts was already approved via F151-09/10 and did not occur because of a unrelated proposal in front of another committee changing the definition of exit.

Combustible Storage is currently part of the code and currently applied to other fire-resistance rated egress components without difficulties.

Similarly there are no problems being raised about temporary versus permanent with those means of egress components.

And rooms permitted to be open to corridors are specific activities that do not include storage. Specifically Section 1020.6 Corridor Continuity, Exception 1. Foyers, lobbies or reception rooms constructed as required for corridors shall not be construed as intervening rooms.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This proposal does not involve construction activities. It regulates use of spaces already constructed.

F18-18

IFC: 315.8 (New); IBC: [F] 307.1, [F]307.4

Proposed Change as Submitted

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Tesla, USA (rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Add new text as follows

315.8 Used or Off Specification Lithium-Ion Batteries. The storage of used or off specification lithium-ion batteries shall comply with the following as appropriate:

1. Gathering locations in occupancies other than those involving Mercantile occupancy battery recycling activities shall comply with Section 315.8.1.
2. Mercantile occupancy battery sale recycling activities shall comply with Section 315.8.2.
3. Indoor collection and storage activities exceeding the limitations of Sections 315.8.1 or Section 315.8.2 occurring in mixed occupancy buildings shall comply with Section 315.8.3.
4. Indoor storage and recycling activities in detached buildings shall comply with Section 315.8.4.
5. Outdoor storage shall comply with Section 315.8.5.

315.8.1 Gathering locations. Indoor storage of used and off specification lithium-ion batteries being gathered for shipment to recycling facilities shall be in rooms or spaces protected by an automatic sprinkler system complying with Section 903.3.1.1. Batteries quantities shall not exceed one cubic ft. (0.03 m³) per fire area, and the batteries shall be stored in open top noncombustible containers spaced a minimum 3 ft. (914 mm) from combustible materials and a minimum 10 feet (3048 mm) from exits from the room, space or building.

315.8.2 Mercantile battery sale recycling locations. Rooms or spaces associated with mercantile battery sale recycling activities shall not exceed 100 sq. ft. in size. The rooms or spaces shall be separated from the remainder of the building areas by two-hour fire barriers constructed in accordance with Section 707 of the International Building Code and two-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate. The room or space shall be protected by a radiant-energy detection system installed in accordance with NFPA 72 and shall be protected by an automatic sprinkler system designed and installed in accordance with Section 903.3.1.1.

315.8.3 Indoor storage in mixed occupancies. Mixed occupancy indoor storage and recycling activities not meeting the limitations of Section 315.8.1 or Section 315.8.2 shall be classified as a Group H-2 occupancy and shall be in rooms or spaces not exceeding 5000 sq. ft. (464 m²) in area separated from the remainder of the building areas by three-hour fire barriers constructed in accordance with Section 707 of the International Building Code and three-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate.

Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³) with a 5 foot separation to the next pile. Piles shall not be located within 10 feet of exits from the room, space or building.

315.8.3.1 Prevention and Mitigation. Occupancies storing used or off specification lithium-ion batteries shall have a plan approved by the fire code official that provides for the prevention of fire incidents and includes early detection mitigation measures.

315.8.3.2 Fire detection. The room or space shall be protected by a radiant-energy detection system installed in accordance with Section 907.

315.8.3.3 Fire suppression. The building the battery storage is located in shall be provided with an automatic fire suppression system installed in accordance with Section 903.1.1. The Group H-2 battery storage room or space shall be protected by a NFPA 15 water spray automatic suppression system installed in accordance with Section 904.12 with a density based on large scale fire testing complying with Section 1206.2.11.

315.8.3.4 Explosion protection. Explosion protection shall be installed in accordance with Section 911.

315.8.4 Detached buildings. Indoor storage and recycling activities shall be permitted in Group H-2 detached buildings located more than 100 feet (30.5 M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards. The storage shall comply with the following:

1. Individual rooms or areas inside the building shall not exceed 7,000 sq ft (650 m²) and shall be are separated from other areas by three hour fire barriers constructed in accordance with Section 707 of the International Building Code and three-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate.
2. The building shall be protected by a radiant-energy detection system installed in accordance with Section 907.
3. Any area containing lithium-ion batteries shall be protected by a NFPA 15 water spray automatic suppression system installed in accordance with Section 904.12 with a density based on large scale fire testing complying with Section 1206.2.11.
4. Explosion protection shall be installed in accordance with Section 911.
5. Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³) with a 5 foot separation to other piles, walls, appliances and equipment. Piles shall not be located within 10 feet of exits from the room, space or building. There shall be no more than 64 piles per room or space.
6. A plan approved by the fire code official that provides for the prevention of fire incidents and includes early detection mitigation measures.

315.8.5 Outdoor storage. Outdoor storage shall comply with the following:

1. Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³).
2. Piles located outdoors shall be separated by a minimum 100 feet (30.5 M) from the following exposures:
 - 2.1 Lot lines
 - 2.2 Public ways
 - 2.3 Buildings
 - 2.4 Stored combustible materials
 - 2.5 Hazardous materials
 - 2.6 High-piled stock
 - 2.7 Other exposure hazards

Exception: Clearances are permitted to be reduced to 3 ft. (914 mm) when a 3-hour free standing fire barrier, suitable for exterior use, and extending 15 ft. (1.5 m) above and extending 15 ft (1.5 m) beyond the physical boundary of the pile is provided to protect the exposure.

2018 International Building Code

[F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in *control areas* complying with Section 414, based on the maximum allowable quantity limits for *control areas* set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the International Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the International Fire Code.

Revise as follows

{F} 307.4 High-hazard Group H-2. Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning shall be classified as Group H-2. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or combustible liquids that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103.4 kPa).

Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.

Cryogenic fluids, flammable.

Flammable gases.

Organic peroxides, Class I.

Oxidizers, Class 3, that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103 kPa).

Pyrophoric liquids, solids and gases, nondetonable.

Storage of used or off specification lithium-ion batteries in mixed use or detached buildings shall be in accordance with Section 315.8 of the International Fire Code.

Unstable (reactive) materials, Class 3, nondetonable.

Water-reactive materials, Class 3.

Reason: Lithium-ion batteries have significant fire and explosion hazards and there have been some serious fires and explosions associated with storage of used batteries in recycling and disposal facilities, including a serious event in Hilden Germany that seriously injured three fire fighters.

This proposal adds requirements for protecting storage of lithium-ion batteries being stored on premise prior to sending to recycling or disposal facilities, and for storage at recycling or disposal facilities. The requirements are broken down to address those with a small collection area, mercantile occupancies that have collection areas for returned batteries, storage at recycling or disposal facilities in mixed use buildings and storage at recycling or disposal facilities in detached buildings. The hazard is addressed by adding requirements for fire protection features, amounts that can be present, and fire-resistant construction separation. The larger areas permitted for storage at recycling or disposal facilities in mixed use and detached buildings will be classified as an H-2 Group. The outdoor storage setback requirements are consistent with setback requirements for outdoor electrochemical energy storage system installations.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. However this will limit the facilities where used or off specification lithium-ion batteries can be stored.

F18-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that there are issues with the package and container types, thermal runaway, ignition potential, unlimited area buildings, the relation to IBC incidental use and gathering areas to occupancy group. (Vote: 13-1)

Assembly Action:

None

F18-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O Brian, FCAC, representing FCAC (fcac@iccsafe.org) ; Robert Davidson, Davidson Code Concepts, LLC, representing Tesla USA/PRBA (rjd@davidsoncodeconcepts.com) requests As Modified by This Public Comment requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

OFF SPECIFICATION BATTERY OR CELL .

A cell or battery that has been tested during the manufacturing quality control process and found not to be within the manufacturer's designed set of criteria for its intended use.

315.8 Used or Off Specification ~~Lithium-Ion Batteries or cells.~~ ~~The Areas associated with the collection or storage of used or off specification lithium-ion batteries or cells shall comply with the following as appropriate provisions of this section and Chapter 32 as applicable.~~

Exceptions:

- ~~1. Gathering locations in occupancies other than those involving Mercantile occupancy battery recycling activities shall comply with Section 315.8.1.~~
- ~~2. Mercantile occupancy battery sale recycling activities shall comply with Section 315.8.2.~~
- ~~3. Indoor collection and storage activities exceeding the limitations of Sections 315.8.1 or Section 315.8.2 occurring in mixed occupancy buildings shall comply with Section 315.8.3.~~
- ~~4. Indoor storage and recycling activities in detached buildings shall comply with Section 315.8.4.~~
- ~~5. Outdoor storage shall comply with Section 315.8.5.~~
1. Areas within a facility that are operated in accordance with procedures that provide for the state of charge of the lithium-ion batteries and cells to be thirty percent or less. The procedures shall be approved by the fire code official.
2. When fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the batteries in storage will be limited to the design area of an automatic sprinkler system installed in accordance with Section 903.3.1.1 and will not adversely impact occupant egress from the building or adversely impact adjacent stored materials or the building structure. The test report shall be provided to the fire code official for review and approval in accordance with Section 104.7.2

**Table 315.8
Collection and Storage Requirements**

Occupancy Type/Location of the Area	Requirements
<u>Collection locations; any occupancy</u>	<u>Section 315.8.1</u>
<u>Mercantile, vehicle repair, aircraft repair and laboratory battery collection and storage locations</u>	<u>Sections 315.8.1 and 315.8.2</u>
<u>Any storage area exceeding the limitations of Section 315.8.1 or 315.8.2 that is located inside a building</u>	<u>Section 315.8.3</u>
<u>Any storage area outside a building</u>	<u>Section 315.8.4</u>

315.8.1 Gathering Collection locations; any occupancy. ~~Indoor storage of used and off-specification lithium-ion batteries being gathered for shipment to recycling facilities shall be in rooms or spaces protected by an automatic sprinkler system complying with Section 903.3.1.1. Batteries quantities~~ All areas located indoors in any occupancy where used batteries are collected from employees or the public shall be provided with open top noncombustible containers or containers approved for battery collection activities. Containers shall not exceed one cubic ft. (0.03 m³) per fire area, and the batteries shall be stored in open top noncombustible containers spaced in size. Containers shall have a minimum 3 ft. (914 mm) of open space from other battery collection containers and combustible materials and shall be located a minimum 10-5 feet (3,048-1,524 mm) from exits from the room, space or building. Where combustible materials are located within the space between collection containers, the containers shall be spaced a minimum 10 feet (3,048 mm) apart.

315.8.2 Mercantile battery sale recycling, vehicle repair, aircraft repair and laboratory occupancy battery collection and storage locations. Batteries collected and stored at mercantile, vehicle repair, aircraft repair or laboratory occupancies other than those in collection containers complying with Section 315.8.1 shall be stored in accordance with one or more of the following methods. Battery terminals shall be protected either through battery design methods or a protective packaging method to prevent short circuit of the battery.

1. In rooms or spaces not exceeding 200 sq. ft. (18.58 m²) in gross floor area ~~Rooms or spaces associated with mercantile battery sale recycling activities shall not exceed 100 sq. ft. in size.~~ The rooms or spaces shall be separated from the remainder of the building areas by ~~two-hour~~ fire barriers with a fire resistance rating of two hours constructed in accordance with Section 707 of the International Building Code and ~~two-hour~~ horizontal assemblies with a fire resistance rating of two hours constructed in accordance with Section 711 of the International Building Code, as appropriate. The room or space shall be protected by a radiant-energy detection system installed in accordance with NFPA 72 and ~~shall be protected by an automatic sprinkler system designed and installed in accordance with Section 903.3.1.1.~~
2. In approved prefabricated portable buildings or containers not exceeding 200 sq. ft. (18.58 m²) in gross floor area that are constructed with two-hour fire-resistance ratings and provided with radiant-energy detection system installed in accordance with NFPA 72 and an approved automatic fire suppression system.
3. In metal drums with batteries separated from each other by vermiculite or other approved material, or in containers approved for battery collection and storage activities. Each area containing such metal drums or approved containers shall not exceed 200 sq. ft. (18.58 m²) in area and shall be separated from other battery storage areas by a minimum of 10 feet (3,048 mm). The collection and storage area shall be protected by a radiant-energy detection system installed in accordance with NFPA 72.
4. In containers approved for use in transportation that will prevent an event from propagating beyond the container. Each area containing the approved transportation containers shall not exceed 200 sq. ft. (18.58 m²) in area and shall be separated from other battery storage areas by a minimum of 10 feet (3,048 mm). The storage area shall be protected by a radiant-energy detection system installed in accordance with NFPA 72.
5. Indoor storage areas meeting the provisions of Section 315.8.3.

315.8.3 Indoor storage in mixed occupancies. ~~Mixed-occupancy indoor storage and recycling activities~~ Indoor storage involving used or off-specification lithium-ion or lithium metal batteries or cells not meeting the limitations of Section 315.8.1 or Section 315.8.2 shall comply with Sections 315.8.3.1 through 315.8.3.4 and shall be classified as a Group H-2 occupancy and 3 occupancy. The battery storage shall be in rooms or spaces not exceeding 5000 sq. ft. (464 m²) in area separated from the remainder other areas of the building areas by three-hour fire barriers constructed with a fire resistance rating of three-hours in accordance with Section 707 of the International Building Code and three-hour horizontal assemblies constructed with a fire resistance rating of three-hours in accordance with Section 711 of the International Building Code, as appropriate. Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³) with a 5-foot separation to the next pile. Piles ~~Batteries and cells shall not be located within 10 feet (3,048 mm) of exits from the room, space or building or space in which they are stored.~~

315.8.3.1 Prevention and Mitigation. ~~Occupancies storing used or off-specification lithium-ion batteries shall have a plan approved by the fire code official. A plan that provides for the prevention of fire incidents and includes early detection mitigation measures shall be provided to the fire code official for approval.~~

315.8.3.2 Fire detection. The room or space shall be protected by a radiant-energy detection system installed in accordance with Section 907.

315.8.3.3 Fire suppression. The building the battery storage is located in shall be provided with an automatic fire suppression system installed in accordance with Section 903.1.1. The Group H-2-3 battery or cell storage room or space shall be protected by a NFPA 15 water spray automatic suppression system installed in accordance with Section 904.12 with a density based on large scale fire testing complying with Section 1206.2.11.

315.8.3.4 Explosion protection. ~~Explosion protection.~~ The rooms and spaces occupied for the battery or cell storage shall be provided with explosion protection installed in accordance with Section 911.

315.8.4 Detached buildings. ~~Indoor storage and recycling activities shall be permitted in Group H-2 detached buildings located more than 100 feet (30.5 M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards. The storage shall comply with the following:~~

- ~~1. Individual rooms or areas inside the building shall not exceed 7,000 sq ft (650 m²) and shall be separated from other areas by three-hour fire barriers constructed in accordance with Section 707 of the International Building Code and three-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate.~~
- ~~2. The building shall be protected by a radiant-energy detection system installed in accordance with Section 907.~~
- ~~3. Any area containing lithium-ion batteries shall be protected by a NFPA 15 water spray automatic suppression system installed in accordance with Section 904.12 with a density based on large-scale fire testing complying with Section 1206.2.11.~~
- ~~4. Explosion protection shall be installed in accordance with Section 911.~~
- ~~5. Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³) with a 5-foot separation to other piles, walls, appliances and equipment. Piles shall not be located within 10 feet of exits from the room, space or building. There shall be no more than 64 piles per room or space.~~
- ~~6. A plan approved by the fire code official that provides for the prevention of fire incidents and includes early detection mitigation measures.~~

315.8.54 Outdoor storage location. Outdoor storage shall comply with the following:

1. Individual pile sizes shall be limited to sixty-four cubic ft. (1.81 m³) 200 square feet (18.58 m²) in area separated from other piles by 10 feet (3,048 mm).
2. Piles located outdoors shall be separated by a minimum 100-20 feet (30.5 M-914 mm) from the following exposures:
 - 2.1. Lot lines
 - 2.2. Public ways
 - 2.3. Buildings
 - 2.4. ~~Stored combustible materials~~ Other storage
 - 2.5. Hazardous materials
 - 2.6. ~~High-piled stock~~
 - 2.7-2.6 Other exposure hazards

Exception: Clearances are permitted to be reduced to not less than 3 ft. (914 mm) when a 3-hour free standing fire barrier, suitable for exterior use, and extending 15 ft. (1.5 m) above and extending 15 ft. (1.5 m) beyond the physical boundary of the pile is provided to protect the exposure.

2018 International Building Code

[F] 307.1 High-hazard Group H. High-hazard Group H occupancy includes, among others, the use of a building or structure, or a portion thereof, that involves the manufacturing, processing, generation or storage of materials that constitute a physical or health hazard in quantities in excess of those allowed in *control areas* complying with Section 414, based on the maximum allowable quantity limits for *control areas* set forth in Tables 307.1(1) and 307.1(2). Hazardous occupancies are classified in Groups H-1, H-2, H-3, H-4 and H-5 and shall be in accordance with this section, the requirements of Section 415 and the International Fire Code. Hazardous materials stored, or used on top of roofs or canopies, shall be classified as outdoor storage or use and shall comply with the International Fire Code.

307.4 High-hazard Group H-2. Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning shall be classified as Group H-2. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or combustible liquids that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103.4 kPa).

Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.

Cryogenic fluids, flammable.

Flammable gases.

Organic peroxides, Class I.

Oxidizers, Class 3, that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103 kPa).

Pyrophoric liquids, solids and gases, nondetonable.

~~Storage of used or off specification lithium ion batteries in mixed use or detached buildings shall be in accordance with Section 315.8 of the International Fire Code.~~

Unstable (reactive) materials, Class 3, nondetonable.

Water-reactive materials, Class 3.

[F] 307.5 High-hazard Group H-3. Buildings and structures containing materials that readily support combustion or that pose a physical hazard shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or combustible liquids that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less.

Combustible fibers, other than densely packed baled cotton, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.

Consumer fireworks, 1.4G (Class C, Common)

Cryogenic fluids, oxidizing

Flammable solids

Organic peroxides, Class II and III

Oxidizers, Class 2

Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less

Oxidizing gases

Storage or recycling of used or off specification lithium batteries or cells in buildings as required by Section 315.8 of the International Fire Code.

Unstable (reactive) materials, Class 2

Water-reactive materials, Class 2

Commenter's Reason: The fire code committee disapproved F18-18 upon the submitters request.

The original proposal was submitted based upon language submitted during the NFPA 855 Energy Storage Systems standard draft work. Subsequent to submittal and posting, industry members were reached out to for review and comment. The industry identified that as proposed the language would prohibit, (shut down), many battery collection and recycling efforts currently in place including those required by law.

The battery industry formed their own code committee to work with the FCAC work group to come up with language that would provide the necessary level of protection that recognized existing industry initiatives. As result a number of floor modifications were developed, reviewed and supported by FCAC and requested to be considered by the IFC code hearing committee. Unfortunately the chair did not accept the floor modifications and as a result the proponent asked for disapproval to provide for a comprehensive public comment to be brought forth.

The first suggested modification is to add a definition for off specification batteries and cells to clarify that the intent is to apply the requirements to those batteries or cells that do not pass quality control testing during the manufacturing process and are stored for recycling or destruction.

Section 318.8 has been modified to clarify application of the requirements; include all types of batteries; use an easier to apply table format for application of the following sections; and to add two exceptions to application of the new requirements. The first exception recognizes a state of charge of 30% or less as an acceptable safety level. This level of

energy is recognized by the FAA for shipping of batteries and there is extensive data and testing information available. The second exception recognizes the use of laboratory testing to determine appropriate sprinkler density levels confirming fire event confinement, a concept already embraced for the installation of energy storage systems.

Section 318.1 has been modified to clarify that it applies to gathering activities. This is typically a box located in any occupancy where the public and/or employees deposit used batteries, including from home. They batteries are of mixed chemistry and typically in the smaller formats such as used for cameras, wireless phones, remotes, etc. The distance between collection containers has been modified to recognize that in some cases a clear space can be maintained, but that in others the space may have other combustible commodities located there such as in a retail establishment and in those cases the distance has been doubled since the intent is eliminate propagation from collection box to collection box.

Section 318.8.2 has been modified to recognize that there are a number of occupancies wherein larger format used batteries may be stored. The square footage limitation of 100 square feet has been enlarged to 200 square feet to recognize added space is necessary for storing large format batteries such as those for EVs. Three additional recognized methods of protected storage have been added with the same 200 square foot limitation to add options for facilities to apply. And a fifth option was added to simply go to the higher level protection found in Section 318.8.3 for H-3 indoor storage.

Section 318.8.3 has been modified to simply apply to indoor storage of amounts greater than that permitted by Sections 318.8.1 or 318.8.2. Whether or not it is a mixed use is covered by the IBC. The section was clarified to apply only to lithium batteries or cells and the group designation was changed to H-3 instead of H-2. (see later explanation below). The square foot limitation was eliminated based upon the high hazard group designation and the following protection levels that are required to be provided for. The remaining changes were format/editorial in nature.

Section 318.8.4 was deleted as no longer necessary due to the reformatting of Section 318.8.3. Those requirements now apply whether the indoor storage is in a dedicated building or a mixed use building.

Section 315.8.5 (now Section 318.8.4) was modified to only apply to lithium batteries and cells; eliminate the cubic foot limitation, simplify the exposure hazard listing and to modify the distance between piles to match distances already embraced by the IFC for hazardous materials.

The occupancy group designation proposal of H-2 in the IBC was changed to a H-3. The reason is twofold, first, H-2 is for materials that present a deflagration hazard in their natural state, not those that may produce combustible gases or vapors when burning. Something many products do. Secondly, many existing buildings and storage activities already exceed the H-2 area limitations, by applying H-3 instead there is still a high level of fire protection required with limitations in size by all but the Type 1A construction types. A facility can use Type 1A to obtain an unlimited area which is reasonable based upon the other protection features these new provisions will require.

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

However, this will limit the facilities where used or off specification lithium-ion batteries can be stored.

Public Comment 2:

Proponent: Lynne M. Kilpatrick, Sunnyvale Department of Public Safety, representing California Fire Chiefs Association requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

105.6.27 Lithium batteries, used. An operational permit is required to collect or store more than 1,000 pounds (454 kg) of used lithium batteries.

315.8 Used lithium battery storage and handling. The storage and handling of used lithium ion and lithium metal

batteries or cells in quantities exceeding 1,000 pounds (454 kg) shall comply with Sections 315.8.1 through 315.8.10, and Chapter 32 where applicable.

315.8.1 Permits. Permits shall be required as set forth in Section 105.6.

315.8.2 Maximum quantity in a fire area. The aggregate quantity of used lithium batteries stored and handled in a single fire area shall not exceed 9,000 pounds (4086 kg).

315.8.3 Construction requirements. *Fire areas* shall be separated by *fire barriers* having a fire-resistance rating of not less than 2-hours constructed in accordance with Section 707 of the *International Building Code* and *horizontal assemblies* constructed in accordance with Section 711 of the *International Building Code*.

315.8.4 Number of fire areas. The maximum number of fire areas within a building shall be four.

315.8.5 Group H, Division 2 occupancy. Storage and handling of more than 9,000 pounds (4086 kg) of lithium batteries within a single fire area shall be within an approved Group H, Division 2 occupancy constructed in accordance with the *International Building Code* and protected throughout with approved automatic smoke detection and radiant-energy detection systems.

315.8.6 Automatic sprinkler system. Buildings containing *fire areas* used for lithium battery storage or handling shall be equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1. The design of the sprinkler system within each fire area shall not be less than Ordinary Hazard Group 2 with a design area of 3,000 square feet (278.7 m²). Where the storage arrangement is required by other provisions of this code to be provided with a higher level of sprinkler system protection, the higher level of sprinkler system protection shall be provided.

315.8.7 Automatic smoke detection. An approved automatic smoke detection system that activates an approved occupant notification system shall be provided throughout each *fire area* in accordance with Section 907.

315.8.8 Radiant energy detection. An approved radiant-energy detection system that activates an approved occupant notification system shall be installed throughout each *fire area* in accordance with Section 907.

315.8.9 Collection containers. Containers used to collect or store lithium batteries shall be noncombustible and have an individual capacity not exceeding 30 gallons (113.6 L), or be approved for transportation in accordance with the Department of Transportation (DOTn) regulations.

315.8.10 Storage configuration. Lithium batteries shall be considered a high-hazard commodity in accordance with Chapter 32 and where applicable, lithium battery storage shall comply with Chapter 32 in addition to Section 315.8.

2018 International Building Code

[F] 307.4 High-hazard Group H-2. Buildings and structures containing materials that pose a deflagration hazard or a hazard from accelerated burning shall be classified as Group H-2. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or combustible liquids that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103.4 kPa).

Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.

Cryogenic fluids, flammable.

Flammable gases.

Organic peroxides, Class I.

Oxidizers, Class 3, that are used or stored in normally open containers or systems, or in closed containers or systems pressurized at more than 15 pounds per square inch gauge (103 kPa).

Pyrophoric liquids, solids and gases, nondetonable.

Storage of used of lithium ion and lithium metal batteries or cells in accordance with Section 315.8 of the International Fire Code.

Unstable (reactive) materials, Class 3, nondetonable.

Water-reactive materials, Class 3.

Commenter's Reason: This proposal is a complete replacement of code proposal F18-18 as it is our position that the

original proposal's broad scope and intent to regulate every lithium ion and lithium metal battery collection location is unnecessary and not supported by fire loss data.

The technical provisions presented here are based on controls currently implemented at a major US company's lithium battery collection and recycling site. These controls, along with operational changes, were established after several fires at the site and have served to provide early warning and reasonable and adequate control of battery fires since their implementation.

A concept similar to the storage of hazardous materials within control areas is being introduced here by requiring used lithium battery storage and handling within designated fire areas protected by smoke detection, radiant-energy detection (e.g. UV/IR) and an Ordinary Hazard Group 2 automatic sprinkler system. In our opinion, the Ordinary Hazard Group 2 sprinkler design is justified until such time that additional large-scale testing takes place or data supporting a more rigorous means of fire protection is justified and accepted by the membership.

Section 315.8 allows up to 1,000 pounds (approximately 1/2 pallet) of lithium batteries before requiring additional controls. By setting the threshold quantity at 1,000 pounds, this section is intended to apply to locations where battery collection is a primary activity which is where additional fire and life safety controls are warranted. The 1,000-pound threshold is based on pre-2018 IFC regulations of energized lithium battery systems. Although that threshold was revised to 20 kWh in the 2018 IFC, the 1,000 pound-threshold, which is approximately equivalent to 20 kWh, is utilized for ease of enforcement.

Section 315.8.1 requires compliance with operational permits in accordance with Section 105.6 permit and a new permit (Section 105.6.27) is proposed to be added as a part of this public comment where used lithium battery storage or handling exceeds 1,000 pounds.

Section 315.8.2 establishes a maximum quantity of lithium batteries allowed within each designated fire area in the building. The maximum quantity proposed is 9,000 pounds, which is approximately 4 pallets. This 9,000-pound limit roughly correlates to the 600-kWh quantity that is currently allowed in Section 1206.2.9 for energized lithium battery systems before a Group H occupancy is required.

Section 315.8.3 requires that fire areas be separated from additional fire areas by fire barriers having not less than 2-hour fire resistance rating. The 2-hour fire resistance rating is proposed since it is the current protection required to separate a Group H2 occupancy from a B occupancy.

Section 315.8.4 limits the number of fire areas allowed in a building to four and is based on the control area approach to compartmentalizing hazardous materials in Chapter 50.

Section 315.8.5 mandates that where more than 9,000 pounds per fire area, or more than four fire areas are needed indoors, a Group H, Division 2 occupancy is required.

Sections 315.8.6-315.8.8 require that each fire area be protected by an approved smoke detection system, an approved radiant energy (e.g. UV/IR) detection system and an approved automatic sprinkler system having a minimum design standard of that required in Group H occupancies. The lithium battery fires we have experienced to date have tended to be very smoky fires and the smoke detection system coupled with the UV/IR flame detection system both serve as early warning systems to initiate the earliest possible response.

Section 315.8.9 requires containers to be either DOT approved for transportation of batteries or noncombustible with an individual capacity limited to 30 gallons.

Section 315.8.10 mandates that lithium batteries be treated as a high hazard commodity and where such storage is over 6 feet on racks must also comply with Chapter 32 provisions for high-piled combustible storage.

IBC Section 307.4 simply provides the appropriate link to the IFC and acknowledges that the IBC is where occupancy classifications are established.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal will increase the cost of construction only where lithium battery quantities exceed 1,000 pounds.

Public Comment 3:

Proponent: Kevin Callahan, CompTIA, representing Director, Computing Technology Industry Association requests Disapprove.

Commenter's Reason: On behalf of the Computing Technology Industry Association (CompTIA), we respectfully submit these comments in opposition to Code Proposal F18-18. CompTIA is a non-profit trade association serving as the voice of the information technology industry. With approximately 2,000 member companies, 3,000 academic and training partners

and nearly 2 million IT certifications issued, CompTIA is dedicated to advancing industry growth through educational programs, market research, networking events, professional certifications and public policy advocacy.

Last month, CompTIA submitted a letter to the Fire Code Action Committee (FCAC) with our initial comments on the proposed code amendments. The letter, which is attached for your reference, highlights our concerns regarding the overly restrictive regulations that are neither practical nor substantiated by data. Equally troubling is the lack of meaningful dialogue with relevant stakeholders that has taken place during the course of the preparation and review of this proposal. For these reasons and others cited in the letter, CompTIA requested the FCAC to deny or postpone action on the code amendments.

In June, the FCAC approved F18-18 without addressing the concerns raised in our earlier letter. As such, we continue to have the same misgivings regarding the proposed code amendments. We ask the ICC to deny or postpone Code Proposal F18-18, and instead allow for a more open and transparent process to create practical, meaningful regulations for the safe storage of used batteries.

Thank you for your consideration of our comments.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. However, this will limit the facilities where used or off-specification lithium-ion batteries can be stored, increasing costs to businesses of all sizes.

F18-18

F21-18

IFC: SECTION 320, 320.1

Proposed Change as Submitted

Proponent: Marcelo Hirschler, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Add new text as follows

SECTION 320 ARTIFICIAL DECORATIVE VEGETATION

320.1 General. Artificial decorative vegetation placed outdoors, either within 30 feet (9140 mm) of a building, or on an occupied roof of a building, shall comply with Sections 807.4.1 and 807.4.2

Reason: There is abundant evidence that combustible materials outdoors can cause severe fires that can spread to a nearby building. One example is artificial decorative vegetation. The recent fire at the Cosmopolitan Hotel in Las Vegas (which involved unregulated decorative vegetation) has demonstrated that combustible materials in occupiable roofs can also cause significant fire damage. The distance of 30 feet was chosen because it is considered the distance beyond which accessory structures in wildland areas cease being a serious fire safety concern. The fire testing recommended (807.4.1) is the same as for indoor artificial vegetation, namely either NFPA 701 (test methods 1 or 2, as appropriate, based on the type of material) or NFPA 289, with a 20 kW ignition source. The additional requirement (807.4.2) is that no unlisted electrical wiring or lighting is permitted on the decorative vegetation item.

Cost Impact: The code change proposal will increase the cost of construction. Artificial decorative vegetation used outdoors near a building or on a roof will have to be fire tested.

F21-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the requirement would be difficult to enforce and does not include other elements. (Vote: 13-1)

Assembly Action:

None

F21-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

SECTION 320 ARTIFICIAL ~~DECORATIVE-COMBUSTIBLE~~ VEGETATION ON ROOFS AND NEAR BUILDINGS

320.1 General. Artificial ~~decorative vegetation placed~~ combustible vegetation exceeding 6 feet (1830 mm) in height installed outdoors, either within 30-3 feet (9140-914 mm) of a building, or on an occupied the roof of a building, shall comply with Sections ~~be labeled as having complied with Section 807.4.1. The placement of the vegetation shall also comply with Sections 806.3 and 807.4.2.~~

Exception: Where there is no opening within 5 feet (1524 mm) of the combustible vegetation.

Commenter's Reason: This public comment addresses several issues raised during the committee action hearing, as follows.

1. A much lower distance is used (3 feet), which ensures that this will not apply to distant vegetation.
2. A size limitation has been placed on the vegetation (more than 6 feet), which ensures that it will not apply to small items.
3. It is made clear that this applies to installations, and not to items on castors or items brought to the site for a specific event. Note that installations of over 6 feet in height will be something that has a considerable source of fire.
4. The concept of occupied roof has been deleted, so it applies to all roofs because the potential for damage is the same whether or not people are present.
5. A requirement for placing a label on the vegetation will make it easier to enforce. The label refers only to the fire test contained in chapter 8 and the requirement for the label will make it easier for enforcers.
6. Requirements to meet the same other issues as vegetation placed indoors has been added as a separate sentence, without information being required on the label.
7. An exception has been added to ensure that it does not apply if there are no nearby openings.

The type of construction is not being proposed as an exception because the danger is associated with the penetration via openings (which can exist for all types of construction) or with fire exposure by people and other combustibles in the proximity of the vegetation.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction Very large combustible artificial vegetation will have to be fire tested when placed close to a building.

F21-18

F22-18

IFC: 105.6.1 (New), 202(New), 301.2, 302.1, 320 (New), Chapter 80

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows

105.6.1 Additive Manufacturing. An operational permit is required to conduct additive manufacturing operations as covered in Section 320.3.

3D PRINTER. A machine used in the additive manufacturing process for fabricating objects through the deposition of a material using a print head, nozzle, or another printer technology.

ADDITIVE MANUFACTURING. A process of joining materials to make objects from 3D model data, usually layer upon layer, sometimes referred to as 3D printing. The Code recognizes two types of additive manufacturing:

Revise as follows

301.2 Permits. Permits shall be required as set forth in Section 105.6 for the activities or uses regulated by Sections 306, 307, 308, ~~315~~ and ~~315~~320.

302.1 Definitions. The following terms are defined in Chapter 2:

3D PRINTER.

ADDITIVE MANUFACTURING.

BONFIRE.

HI-BOY.

HIGH-VOLTAGE TRANSMISSION LINE.

OPEN BURNING.

PORTABLE OUTDOOR FIREPLACE.

POWERED INDUSTRIAL TRUCK.

RECREATIONAL FIRE.

SKY LANTERN.

Add new text as follows

SECTION 320 ADDITIVE MANUFACTURING (3D PRINTING)

320.1 General. Additive manufacturing equipment and operations shall comply with Section 320.

320.1.1 Scope. Additive manufacturing shall comply with one of the following:

1. Non-industrial additive manufacturing shall comply with Section 320.2.
2. Industrial additive manufacturing shall comply with Section 320.3.

320.2 Non-industrial additive manufacturing. Non-industrial additive manufacturing equipment and operations shall

comply with Section 320.2.1 through 320.2.5.

320.2.1 Industrial manufacturing. Non-industrial additive manufacturing equipment and operations shall comply with Section 320.2. Additive manufacturing equipment and operations that do not comply with 320.2.1 through 320.2.5 shall comply with Section 320.3.

320.2.2 Listing. 3D printers used in non-industrial additive manufacturing shall be listed and labeled in accordance with UL 60950-1 or UL 62368-1. The listing shall also verify:

1. The 3D printers are self-contained and do not utilize ancillary equipment, other than pre-packaged production materials.
2. The operation of the 3D printers will not create a hazardous (classified) environment outside of the unit's outer enclosure as defined in NFPA 70, Article 500.
3. The 3D printers are only intended for use with maximum 30 liter prepackaged production materials, which are investigated with the 3D printer and identified in the manufacturer's instruction.

320.2.3 Installation, operation and maintenance. 3D printers shall be installed, operated and maintained in accordance with this Code, the listing and the manufacturer's instructions.

320.2.4 Installation limitations. Non-industrial additive manufacturing shall be limited to installations and operations that comply with all of the following:

1. Do not utilize external dust collection systems.
2. Do not utilize external inert gas supplies for creating an inert environment.
3. Do not utilize automated external powder feed or sieve features.
4. Do not utilize hazardous materials in excess of the maximum allowable quantities regulated by Chapter 50.

320.2.5 Occupancies. Non-industrial additive manufacturing shall be permitted in all occupancy groups.

320.3 Industrial additive manufacturing. Industrial additive manufacturing equipment and operations shall comply with Section 320.3.1 through 320.3.9.

320.3.1 Additive manufacturing operations and equipment. Additive manufacturing operations and equipment that do not comply with Section 320.2 shall comply with Section 320.3.

320.3.2 Permits required. Permits shall be obtained from the fire code official in accordance with Section 105.6 prior to engaging in industrial additive manufacturing operations.

320.3.3 Listing. 3D printers used in industrial additive manufacturing shall be listed and labeled in accordance with UL 2011 or approved for the application based on a field evaluation conducted by an approved agency.

320.3.4 Installation, operation and maintenance. Industrial additive manufacturing equipment shall be installed, operated and maintained in accordance with this code, the manufacturer's instructions and where applicable the listing.

320.3.5 Combustible dusts and metals. Industrial additive manufacturing operations that use or generate combustible dust or combustible metals shall comply with Chapter 22, Chapter 50 and this section.

320.3.5.1 Powder evaluation. Printing powders used in industrial additive manufacturing operations shall be tested for combustibility in accordance with NFPA 484 or 654 as applicable. A copy of test reports shall be provided to the fire code official upon request.

320.3.5.2 Combustible (non-metallic) dusts. Industrial additive manufacturing that uses combustible (non-metallic) dusts shall comply with NFPA 654.

320.3.5.3 Combustible metals. Industrial additive manufacturing operations that use combustible metals shall also comply with NFPA 484.

320.3.5.4 Ancillary equipment. Ancillary equipment provided for recycling, sieving, vacuuming or handling combustible powders shall be designed and approved for such use.

320.3.6 Hazardous materials. Industrial additive manufacturing operations that use hazardous materials exceeding the maximum allowable quantities shall comply with Chapter 50.

320.3.7 Technical assistance. Where required by the fire code official, a report evaluating the acceptability of technologies, processes, products, facilities, materials and uses associated with the operation shall be provided in accordance with 104.7.2 and approved.

320.3.8 Performance based design alternative. Where approved by the fire code official, buildings and facilities where industrial additive manufacturing is performed shall be permitted to comply with the performance based design options in Section 5001.3 as an alternative to compliance with the other requirements set forth in this Section.

320.2.9 Occupancies. Industrial additive manufacturing shall only be conducted in the occupancy groups associated with manufacturing operation, and permitted by the Chapter 50 maximum allowable quantity tables. Where approved, the requirements in Section 320.3.6 shall be permitted to provide the technical basis for determining compliance with Table 5003.1.1(1), footnote q.

Add new standard(s) follows

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

2011-06:

Factory Automation Equipment
60950-1—14:

Information Technology Equipment - Safety Requirements
62368-1—14:

Audio/video, Information and Communication Technology Equipment - Safety Requirements

Reason: The use of additive manufacturing, often referred to as 3D printing, is becoming more prevalent in industrial and non-industrial applications. This proposal introduces basic safety requirements for these operations.

Non-industrial additive manufacturing - 3D printers are available for less than \$500

and are being used in classrooms, offices and businesses for producing customized

products and prototypes. Section 320.2 establishes basic safety requirements for

this self-contained equipment, which includes pre-packaged production materials. The product listing is being relied upon to verify that the equipment operates safely and does not create a hazardous (classified) area outside of the unit.

Industrial use additive manufacturing - Section 320.3 covers 3D additive manufacturing operations, which includes all operations that aren't covered by Section 320.2. These are typically industrial operations using external powder feed supplies, dust collection systems and/or inert gas supplies. Some of the requirements for industrial operations are as follows:

320.3.3 requires the industrial 3D printer to be listed to UL 2011, but includes an option for non-listed equipment to be approved based on a field evaluation.

320.3.6 was added due to the new unique challenges some jurisdictions may face in approving industrial additive manufacturing operations. Among other resources they can use is a risk assessment conducted in accordance with the UL 3400 Outline of Investigation for Additive Manufacturing Facility Safety Management, which is applicable where parts are manufactured using powder-based additive manufacturing techniques.

This section also includes a pointer to the Section 5001.3 performance based design option, which has been used in some industrial additive manufacturing operations.

An operational permit is required for industrial additive operations.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will increase the cost of construction

There is no significant cost increase for non-industrial additive manufacturing covered by Section 320.2, unless the price of listed equipment is higher than non-listed equipment. There are increased costs for industrial additive manufacturing operations that might be related to obtaining listed equipment, and the operational permit fees.

Analysis: A review of the standard proposed for inclusion in the code, UL 2011-06, UL 60950-1-14, and UL 62368-1—14, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

F22-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

ADDITIVE MANUFACTURING. A process of joining materials to make objects from 3D model data, usually layer upon layer, sometimes referred to as 3D printing. The Code recognizes two types of additive manufacturing:

Industrial additive manufacturing. 3D printing that uses equipment external to the 3D printer for feed of powders or dust collection operations that typically utilize combustible powders or metals, an inert gas supply, a combustible dust collection system, or that create a hazardous (classified) location area or zone outside of the equipment.

Non-industrial additive manufacturing. 3D printing which exclusively uses self-contained 3D printing equipment without external powder supply, dust collection system, or inert gas supply operations that do create a hazardous (classified) location area outside of the equipment, and do not utilize an inert gas supply or a combustible dust collection system.

320.1.2-3 Installation, operation and maintenance. 3D printers and associated additive manufacturing equipment shall be installed, operated and maintained in accordance with this Code, the listing and the manufacturer's instructions.

320.1.3 Production materials. Only the production materials listed for use with the equipment and included in the manufacturer's instructions shall be used.

320.2 Non-industrial additive manufacturing. Non-industrial additive manufacturing equipment and operations shall comply with Section 320.2.1 through 320.2.5. Additive manufacturing equipment and operations that do not comply with Section 320.2 shall comply with Section 320.3.

320.2.1 Industrial manufacturing. ~~Non-industrial additive manufacturing equipment and operations shall comply with Section 320.2. Additive manufacturing equipment and operations that do not comply with 320.2.1 through 320.2.5 shall comply with Section 320.3.~~

320.2.21 Listing. 3D printers used in non-industrial additive manufacturing shall be listed and labeled in accordance with UL 60950-1 ~~or~~ UL 62368-1 or UL 2011. The listing shall also verify:

1. The 3D printers are self-contained and ~~do not utilize ancillary equipment, other than~~ utilize maximum 30 liter pre-packaged production materials.
2. The operation of the 3D printers ~~will~~ shall not create a hazardous (classified) ~~environment electrical area or zone~~ outside of the unit's.
3. If any hazardous (classified) electrical area or zone exists inside of the unit's outer enclosure as defined in NFPA 70, Article 500.3, the area shall be protected by intrinsically safe electrical construction or other acceptable protection methods.
4. The 3D printers shall not utilize inert gas or an external combustible dust collection system. ~~The 3D printers are only intended for use with maximum 30 liter prepackaged production materials, which are investigated with the 3D printer and identified in the manufacturer's instruction.~~

320.2.4 Installation limitations. ~~Non-industrial additive manufacturing shall be limited to installations and operations that comply with all of the following:~~

1. ~~Do not utilize external dust collection systems.~~

2. Do not utilize external inert gas supplies for creating an inert environment.
3. Do not utilize automated external powder feed or sieve features.
4. Do not utilize hazardous materials in excess of the maximum allowable quantities regulated by Chapter 50.

320.2.52 Occupancies. Non-industrial additive manufacturing shall be permitted in all occupancy groups.

320.3 Industrial additive manufacturing. Industrial additive manufacturing equipment and operations shall comply with Section 320.3.1 through 320.3.912.

~~**320.3.1 Additive manufacturing operations and equipment.** Additive manufacturing operations and equipment that do not comply with Section 320.2 shall comply with Section 320.3.~~

320.3.21 Permits required. Permits shall be obtained from the fire code official in accordance with Section 105.6 prior to engaging in industrial additive manufacturing operations.

320.3.32 Listing. 3D printers used in industrial additive manufacturing shall be listed and labeled in accordance with UL 2011 or approved for the application based on a field evaluation conducted by an approved agency.

~~**320.3.4 Installation, operation and maintenance.** Industrial additive manufacturing equipment shall be installed, operated and maintained in accordance with this code, the manufacturer's instructions and where applicable the listing.~~

320.3.53 Combustible dusts and metals. Industrial additive manufacturing operations that use or generate store, use or produce combustible dust or combustible metals shall, combustible particulate solids or combustible metals shall comply with Chapter 22, ~~Chapter 50~~ and this section.

~~**320.3.5.14 Powder evaluation.** Printing powders used in industrial additive manufacturing operations shall be tested for combustibility in accordance with NFPA 484 or ~~654~~ NFPA 652 as applicable. A copy of test reports shall be provided to the fire code official upon request.~~

320.3.5.2 Combustible (non-metallic) dusts. Industrial additive manufacturing ~~that uses~~ operations that store, use or produce combustible (non-metallic) dusts shall comply with NFPA 654.

320.3.5.36 Combustible metals. Industrial additive manufacturing operations that store or use combustible metals shall ~~also~~ comply with NFPA 484.

320.3.5.47 Ancillary equipment. Ancillary equipment provided for recycling, sieving, vacuuming or handling combustible powders shall be designed and approved for such use.

320.3.68 Hazardous materials. Industrial additive manufacturing operations that store or use hazardous materials exceeding the maximum allowable ~~quantities~~ quantity limits shall comply with Chapter 50.

320.3.9 Inert Gas. Additive manufacturing processes that utilize inert gases shall comply with Chapter 53. Ventilation or gas detection shall be provided in accordance with Section 5307.

320.3.710 Technical assistance. Where required by the fire code official, a report evaluating the acceptability of technologies, processes, products, facilities, materials and uses associated with the operation shall be provided in accordance with 104.7.2 and approved.

~~**320.3.811 Performance based design alternative.** Where approved by the fire code official, buildings and facilities where industrial additive manufacturing is performed shall be permitted to comply with the performance based design options in Section 5001.3 as an alternative to compliance with the other requirements set forth in this Section.~~

~~**320.23.912 Occupancies.** Industrial additive manufacturing shall only be conducted in the occupancy groups associated with manufacturing operation, and permitted by the Chapter 50 maximum allowable quantity tables. Where approved, the requirements in Section 320.3.6 shall be permitted to provide the technical basis for determining compliance with Table 5003.1.1(1), footnote q.~~

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the

current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at:

<https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The IFC committee supported the inclusion of additive manufacturing (AM) requirements in the code, but had concerns with some of the proposed language, which has been addressed with this public comment. Highlights of the changes include:

The definitions of non-industrial and industrial additive manufacturing were revised to clarify the type of operations covered by each of them.

Common requirements for "Installation, operation and maintenance" and "Production materials" were move to Section 320.1 from Sections 320.2 and 320.3.

Non-industrial additive manufacturing requirements were revised to clarify they do not include equipment that has the potential to produce a hazardous (classified) location electrical area or zone outside the 3D printer enclosure, which could lead to a potential combustible dust or vapor explosion. The typical cord connected desktop 3D printers used in personal and professional (non-industrial) applications today are not covered by operational permits and are intended for use in ordinary electrical locations.

Industrial additive manufacturing requirements were revised to improve readability, correct references, and address the safety of inert gas used in the production process.

Unnecessary cross references and duplicative requirements were removed.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Potential cost increases since these operations were previously not regulated in the IFC.

F22-18

F23-18

IFC: SECTION 320, 320.1, 320.2, 320.3, 320.4, 320.5, 320.6

Proposed Change as Submitted

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Add new text as follows

SECTION 320 OUTDOOR FURNITURE AFFIXED OUTSIDE BUILDINGS

320.1 General. Outdoor furniture, such as benches, that are affixed outside buildings, shall be considered storage and shall comply with section 315 and this section.

Exception: Outdoor furniture placed beneath overhead projections from buildings where automatic sprinklers are installed under such projections in accordance with Section 315.4.1.

320.2 Distance from buildings. Furniture placed outdoors shall not be affixed within 5 feet (1524 mm) of any building, except if it is labeled as having complied with any one of Sections 320.3 through 320.6.

320.3 Traditional materials. The furniture shall be constructed entirely of wood, identified for outdoor use, and non-combustible materials, complying with Section 703.5.1 of the International Building Code.

320.4 Plastic composites. The furniture shall be constructed entirely of materials that meet all the requirements for plastic composite deck boards, in accordance with section 2612 of the International Building Code.

320.5 Heat release. The furniture shall be constructed entirely of materials intended for outdoor use that exhibit a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation.

320.6 Full scale testing. The furniture shall be constructed entirely of materials intended for outdoor use and the entire item of furniture shall exhibit a maximum rate of heat release not exceeding 100 kW when tested in accordance with NFPA 289, using the 20 kW ignition source.

Reason: Section 315 of the IFC addresses storage, including, particularly, storage beneath overhead projections from buildings (Section 315.4.1). However, storage is defined as something intended for future use. The IFC code does not make it clear whether items placed permanently (for example by being secured or screwed in place) near a building (or against a building) for their immediate use are necessarily considered to be “stored” and whether the storage section applies.

It has been found that when plastic benches are attached to buildings and placed underneath overhead projections, they can result in severe fires that can destroy the overhang and then continue to destroy the building itself. ATF conducted tests on several plastic lumber benches simulating an actual incident. In the incident, a plastic lumber bench attached to a brick wall, from the outside, at a school and under an overhang, was ignited with a small ignition source (child's coat) and the entire school was destroyed soon after ignition. Tests conducted by GBH International showed that a Southern Yellow Pine (standard park bench lumber) would have performed much better and that even some plastic lumber materials could have done much better. The maximum heat release rate of plastic lumber bench ignited in this type of scenario is very high and can be above 4 MW, while the wood bench did not ignite the overhang. An attached set of pictures and information shows key results.

It is interesting that the IFC does an excellent job in regulating garbage cans and laundry carts placed near buildings (even if they are not secured in place) but it does not regulate park benches, or other park furniture.

It has been explained that the practice of placing park benches under an overhang is a common feature in areas where rain is frequent, for protection.

The code proposal would allow benches, or other outdoor furniture, constructed of wood or of non-combustible materials without further requirements (traditional materials).

If plastic benches (or plastic composite benches) are proposed to be placed near buildings, the proposal states that they need to comply with one of the following: (a) the same requirements as plastic composites used for deck boards (i.e. section 2612 of the IBC), (b) the same heat release results from ASTM E1354 that materials used for garbage cans or

laundry carts are required to meet (i.e. section 304.3 or 318.1) or the same heat release results as decorative materials (i.e. section 807.3) or foam plastic exhibit booths (i.e. section 807.5.1) are required to meet.

At the same time the code proposal clarifies that combustible products placed for immediate use outside buildings must comply with the same storage requirements as those stored for future use, in section 315. This means that if the furniture is placed beneath overhead projections, automatic sprinklers must be installed under such projections, per 315.4.1, as shown below.

315.4.1 Storage beneath overhead projections from buildings. Where buildings are protected by an automatic sprinkler system, the outdoor storage, display and handling of combustible materials under eaves, canopies or other projections or overhangs are prohibited except where automatic sprinklers are installed under such eaves, canopies or other projections or overhangs.

Cost Impact: The code change proposal will increase the cost of construction. This code proposal will require that outdoor furniture affixed near a building must have improved fire performance, which will improve fire safety.

F23-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the requirements should not be conditional on if the furniture is affixed due to inconsistency. In addition there is no criteria provided for the distance of 5 feet, the type of exterior wall is not addressed and the heat release requirement does not take into account the type of furniture material. (Vote: 14-0)

Assembly Action:

None

F23-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Marcelo Hirschler, representing GBH International (mmh@gbhint.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

SECTION 320 ~~OUTDOOR FURNITURE AFFIXED OUTSIDE BUILDINGS~~

320.1 General. ~~Outdoor furniture, such as benches, that are affixed outside buildings, shall be considered storage and shall comply with section 315 and this section.~~

Exception: ~~Outdoor furniture placed beneath overhead projections from buildings where automatic sprinklers are installed under such projections in accordance with Section 315.4.1.~~

320.1 General Furniture, such as benches, placed outside buildings under a combustible exterior projection shall comply with Section 320.2 and any one of Sections 320.3, 320.4, 320.5 or 320.6.

Exception: Where automatic sprinklers in accordance with Section 315.4.1 are installed under the exterior projection.

320.2 Distance from buildings. ~~Furniture placed outdoors shall not be affixed placed outdoors within 5-2 feet (1524 mm610 mm) of any building, except if unless it is labeled as having complied with any one of Sections 320.3 through 320.6.~~

320.3 Traditional materials. ~~The furniture shall be constructed entirely of wood, identified for outdoor use, and non-combustible noncombustible materials, complying with Section with Section 703.5.1 of the International Building Code, or of wood.~~

320.4 Plastic ~~composites~~ composite materials. The furniture shall be constructed entirely of plastic composite materials that meet all the requirements for plastic composite deck boards, in accordance with section 2612 of the International Building Code.

320.5 Heat release. ~~The As an alternate to the requirements in Sections 320.3, 320.4 and 320.6, the furniture shall be permitted to be constructed entirely of materials intended for outdoor use that exhibit a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation.~~

320.6 Full scale testing. ~~The furniture shall As an alternate to the requirements in Sections 320.3, 320.4 and 320.5, the furniture shall be permitted to be constructed entirely of materials intended for outdoor use and such that the entire item of furniture shall exhibit exhibits a maximum rate of heat release not exceeding 100 kW when tested in accordance with NFPA 289, using the 20 kW ignition source.~~

Commenter's Reason: The public comment addresses all comments received during the hearings and the committee concerns, as follows.

1. The requirement that the furniture be affixed was eliminated.

2. The requirement is restricted to furniture within 2 feet of a building and under a combustible exterior projection.
3. The type of construction has not been amended because the incident inspiring this code proposal occurred with benches placed against a brick wall and yet the entire building was destroyed, starting with burning the combustible exterior projection. (see attached image)
4. All references to storage have been eliminated.
5. The section on traditional materials was revised to clarify that only noncombustible materials need to comply with the noncombustibility test in 703.5.1.
6. The section on plastic composite materials was revised to clarify that it applies only to plastic composite materials.
7. The sections on heat release testing (320.5 and 320.6) were revised to clarify that they alternate options to the requirements in sections 320.3 and 320.4, which apply, respectively, to wood (and noncombustible materials) and to plastic composite materials.
8. The exception for areas protected by sprinklers is retained.
9. The requirement that the materials be intended for outdoor use is being deleted because it would be difficult to enforce and it is not a safety issue.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This code proposal will require that outdoor furniture placed near a building must have improved fire performance, which will improve fire safety.

F23-18

F26-18

IFC: 403.3.2, 403.8.1.1.2, 403.8.2.2, 403.8.3.1, 403.10.3.1.1

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows

403.3.2 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include all of the following in addition to the requirements of Section 404:

1. Locations of ~~patients-care recipients~~ who are rendered incapable of self-preservation.
2. Maximum number of ~~patients-care recipients~~ rendered incapable of self-preservation.
3. Area and extent of each ambulatory care facility.
4. ~~Location of adjacent smoke compartments or refuge areas, where required.~~
5. ~~Path of travel to adjacent smoke compartments.~~
6. Location of any special locking, ~~delayed egress or access control~~ arrangements.

403.8.1.1.2 Fire safety plans-plan. A copy of the fire safety plan shall be maintained at the facility at all times. ~~Plans~~ The plan shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of ~~resident-care recipient~~ sleeping rooms.
2. Location of special locking or egress control arrangements.

403.8.2.2 Fire safety plans-plan. A copy of the plan shall be maintained at the facility at all times. ~~Plans~~ The plan shall include all of the following in addition to the requirements of Section 404.2.2:

1. Location and number of ~~patient-care recipients~~ sleeping rooms and operating rooms.
2. ~~Location of adjacent smoke compartments or refuge areas.~~
3. ~~Path of travel to adjacent smoke compartments.~~
4. Location of special locking, ~~delayed egress or access control~~ arrangements.
5. ~~Location of elevators utilized for patient movement in accordance with the fire safety plan, where provided.~~

Add new text as follows

403.8.3.1 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of cells.
2. Location of special locking arrangements.

Revise as follows

403.10.3.1.1 Fire safety plans. A copy of the fire safety plan shall be maintained at the facility at all times. ~~Plans~~ The plan shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of ~~resident-care recipient~~ sleeping rooms.
2. Location of special locking ~~or egress control~~ arrangements.

Reason: This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what these changes will look like if all pass.

Group I-1, Condition 2 includes smoke compartments. When looking at adding smoke compartments, refuge area and path of travel, it was noted that this is already stated in 404.2.1 Item 1 and 404.2.2 Items 2.2 and 4.5. Therefore it is proposed to remove from Ambulatory care and Group I-2. Assisted evacuation is addressed in 404.2.1 Item 4 and 404.2.2 Item 2.3.

All patients and residents have been changed to care recipients to be consistent with the definitions for these types of facilities.

Last cycle there was a lot of work on the different locking systems. There should be a consistent and generic reference for these locking systems – “location of special locking arrangements”. This will eliminate a laundry list and improve coordination over time as locking arrangements for ingress and egress are added.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at:

<https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. These are operational requirements for emergency responders, resident and staff safety and therefore will not affect the cost of construction.

F26-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 403.8.2.2 Fire safety plan. A copy of the plan shall be maintained at the facility at all times. The plan shall include all of the following in addition to the requirements of Section 404.2.2:

1. Location and number of care recipients sleeping rooms and operating rooms.
2. Location of special locking ~~control~~ arrangements.

Committee Reason: This proposal addresses the correct terminology "care recipient" versus "patient." In addition this proposal removes duplicative language that is already provided in Section 404 for smoke compartments. Section 403.8.2.2 was modified to remove "control" from item 4 to be consistent with the revisions in sections 403.3.2 and 403.10.3.1.1. (Vote: 14-0)

Assembly Action:

None

F26-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

403.8.1.1.2 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of care recipient sleeping rooms.
2. Location of special locking ~~or egress control~~ arrangements.

Commenter's Reason: This additional modification is for consistency with the modification to the proposal and the original proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The modification is for terminology and will not change any building construction requirements.

F26-18

F28-18

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org); Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Delete without substitution

~~**403.3.4 Emergency evacuation drills.** Emergency evacuation drills shall comply with Section 405.~~

~~**Exception:** The movement of patients to safe areas or to the exterior of the building is not required.~~

~~**403.8.1.6 Resident participation in drills.** Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.~~

Revise as follows

403.8.2.3 Emergency evacuation drills. Emergency evacuation drills shall comply with Section 405.

~~**Exceptions**~~ **Exception:**

- ~~1. The movement of patients to safe areas or to the exterior of the building is not required.~~
- ~~2. Where emergency evacuation drills are conducted after visiting hours or where patients or residents are expected to be asleep, a coded announcement shall be an acceptable alternative to audible alarms.~~

Delete without substitution

~~**403.10.3.6 Resident participation in drills.** Emergency evacuation drills shall involve the actual evacuation of residents to a selected assembly point and shall provide residents with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.~~

~~**Exception:** Actual exiting from emergency escape and rescue windows shall not be required. Opening the emergency escape and rescue window and signaling for help shall be an acceptable alternative.~~

Revise as follows

405.1 General. Emergency fire and evacuation drills complying with Sections 405.2 through 405.9 shall be conducted not less than annually where fire safety and evacuation plans are required by Section 403 or where required by the *fire code official*. Drills shall be designed in cooperation with the local authorities.

Add new text as follows

405.2 Occupant participation. Emergency fire and evacuation drills shall involve the actual evacuation of occupants to a selected assembly point and shall provide occupants with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exceptions:

1. In Ambulatory Care Facilities and Group I-2 the movement of care recipients to a safe area or to the exterior of the building is not required.
2. In Group I-1, Condition 2 the assembly point for residents is permitted to be within an adjacent smoke compartment.
3. In Group R-4, actual exiting from emergency escape and rescue openings shall not be required. Opening the emergency escape and rescue opening and signaling for help shall be an acceptable alternative.
4. In Group I-3, Conditions 2 through 5 where a defend-in-place response is permitted, the assembly point for detainees is permitted to be within an adjacent smoke compartment.
5. In Group I-3, Conditions 2 through 5, movement of detainees is not required to an assembly point is not required where there are security concerns.

Reason: This is a series of proposal to coordinate the fire safety, evacuation and lock down plans between Groups I-1, I-2, I-3, R-4 and ambulatory care facilities. The FCAC and Healthcare committees worked together to address all situations where a staged evacuation or defend-in-place is utilized. See the proposal to IFC Section 403.3 for information on what these changes will look like if all pass.

The requirements for drills in Section 405 never really say where you move to during a drill. It is only implied in IFC 405.8 when it mentions accountability at assembly points.

How to leave and get to an assembly point is stated for Group I-1 and R-4, but does not recognize the new requirements for smoke compartments in Group I-1, Condition 2. It is implied by the exceptions in ambulatory care and Group I-2 that drills are for moving to smoke compartments by having exception for movement of patients in beds. This should be stated at the beginning of the drill requirements for all facilities.

The exceptions for drills should be in the drill section specifically. The exceptions could stay in the specific requirements, but only if Section 405 included a description of what was supposed to happen for drills, otherwise the reference to Section 405 does not make sense.

Exception 4 and 5 are in recognition of detainee participation in drills for jails.

Note: If both exceptions to 403.8.2.3 are removed (exception 1 is addressed under a different proposal), the whole section is redundant text and should be removed.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Committee on Healthcare (CHC).

The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at:

<https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. These are operational requirements for emergency responders, resident and staff safety and will not affect the cost of construction.

F28-18

Public Hearing Results

Errata:

405.2 Occupant participation. Emergency fire and evacuation drills shall involve the actual evacuation of occupants to a selected assembly point and shall provide occupants with experience in exiting through all required exits. All required exits shall be used during emergency evacuation drills.

Exceptions:

1. In Ambulatory Care Facilities and Group I-2 the movement of care recipients to a safe area or to the exterior of the building is not required.
2. In Group I-1, Condition 2 the assembly point for residents is permitted to be within an adjacent smoke compartment.
3. In Group R-4, actual exiting from emergency escape and rescue openings shall not be required. Opening the emergency escape and rescue opening and signaling for help shall be an acceptable alternative.
4. In Group I-3, Conditions 2 through 5 where a defend-in-place response is permitted, the assembly point for detainees is permitted to be within an adjacent smoke compartment.
5. In Group I-3, Conditions 2 through 5, movement of detainees is not required to an assembly point ~~is not required~~ where there are security concerns.

Committee Action:

Disapproved

Committee Reason: This was disapproved as it was felt that Section 405.2 as proposed would apply too broadly to all occupancies and requires all available exits to be used during drills which is seen as excessive. In addition, the term "patient" needs to be revised to "care recipients." (Vote: 14-0)

Assembly Action:

None

F28-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

403.8.2.3 Emergency evacuation drills. Emergency evacuation drills shall comply with Section 405.

Exception: Where emergency evacuation drills are conducted after visiting hours or where ~~patients or residents~~ care recipients are expected to be asleep, a coded announcement shall be an acceptable alternative to audible alarms.

405.2 Occupant participation. Emergency fire and evacuation drills shall involve the actual evacuation of occupants to a selected assembly point and shall provide occupants with experience in exiting through ~~all~~ required exits. ~~All required exits shall be used during emergency evacuation drills.~~

Exceptions:

1. In Ambulatory Care Facilities and Group I-2 the movement of care recipients to a safe area or to the exterior of the building is not required.
2. In Group I-1, Condition 2 the assembly point for residents is permitted to be within an adjacent smoke compartment.
3. In Group R-4, actual exiting from emergency escape and rescue openings shall not be required. Opening the emergency escape and rescue opening and signaling for help shall be an acceptable alternative.
4. In Group I-3, Conditions 2 through 5 where a defend-in-place response is permitted, the assembly point for detainees is permitted to be within an adjacent smoke compartment.
5. In Group I-3, Conditions 2 through 5, movement of detainees is not required to an assembly point is not required where there are security concerns.

Commenter's Reason: The proposed deletion to Section 405.2 was a recommendation by the Fire Code Development Committee. This was originally copied from 2018 IFC Section 403.8.1.6 and 403.10.3.6. However, which exits are used should be decided on a case by case basis depending on the drill and the facility.

The modification to Section 403.8.2.3 is for consistency in terminology in the provisions

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

These are operational requirements for emergency responders, resident and staff safety and will not affect construction costs. The modification to 403.8.2.3 is terminology only. The modification to 405.2 is operational. Neither modification will change any building construction requirements.

F28-18

F37-18

IFC: 404.1

Proposed Change as Submitted

Proponent: Joe McElvaney, self, representing Self (joemcelvaney@gmail.com)

2018 International Fire Code

Revise as follows

404.1 General. ~~Where required by Section 403, fire~~ Fire safety, evacuation and lockdown plans shall comply with Sections 404.2 through 404.4.1.

Reason: As currently written section 404 would only apply to those occupancies in section 403 to have fire safety, evacuation and/or lockdown plans.

However section 403 does not required any occupancies to have a lockdown plan.

Plus if an owner wishes to have a fire safety, evacuation plan and/or lockdownplan, it would make sense to use the same requirement/format for those occupancies as outline in section 404

Cost Impact: The code change proposal will increase the cost of construction

This code change will increase the cost of construction, by requiring all occupancies that are required or not required to have a fire safety, evacuation and/or lockdown plan to use the same outline/format as called out in IFC section 404.

F37-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This was disapproved with concern that it will apply the lockdown provisions where they were not intended. Currently the lockdown section applies where lockdown plans are formed but are not required. (Vote: 12-2)

Assembly Action:

None

F37-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Marc Sampson, representing selfrequests As Submitted.

Commenter's Reason: As currently written in the 2018 IFC, section 404.1 points back to section 403 for when to use section 404 for fire safety, evacuation and/or lock-down plans, however there are no requirements for lock-downs in section 403. Thus the code user can never get back to contents of section 404 for a lock down plan.

This code change removes the reference to Section 403 and allows lock-down plans to be developed per section 404.

To address the committee's concern that lock-down provisions would be applied where not intended, as previously stated there are no requirements for lock-downs in section 403.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction Based on proponent original code change content

F37-18

F38-18

IFC: 404.2.2

Proposed Change as Submitted

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com); William Kramer, School District of Philadelphia, representing School District of Philadelphia (wkramer@philasd.org)

2018 International Fire Code

Revise as follows

404.2.2 Fire safety plans. Fire safety plans shall include the following:

1. The procedure for reporting a fire or other emergency.
2. The life safety strategy including the following:
 - 2.1. Procedures for notifying occupants, including areas with a private mode alarm system.
 - 2.2. Procedures for occupants under a defend-in-place response.
 - 2.3. Procedures for evacuating occupants, including those who need evacuation assistance.
3. Site plans indicating the following:
 - 3.1. The occupancy assembly point.
 - 3.2. The locations of fire hydrants.
 - 3.3. The normal routes of fire department vehicle access.
4. Floor plans identifying the locations of the following:
 - 4.1. Exits.
 - 4.2. Primary evacuation routes.
 - 4.3. Secondary evacuation routes.
 - 4.4. Accessible egress routes.
 - 4.4.1. Areas of refuge.
 - 4.4.2. Exterior areas for assisted rescue.
 - 4.5. Refuge areas associated with *smoke barriers* and *horizontal exits*.
 - 4.6. Manual fire alarm boxes.
 - 4.7. Portable fire extinguishers.
 - 4.8. Occupant-use hose stations.
 - 4.9. Fire alarm annunciators and controls.
5. A list of major fire hazards associated with the normal use and occupancy of the premises, including maintenance and housekeeping procedures.
6. Identification and assignment of personnel responsible for maintenance of systems and equipment installed to prevent or control fires.
7. Identification and assignment of personnel responsible for maintenance, housekeeping and controlling fuel hazard sources.
8. Exterior doors shall be identified on plans with the exposure side alphabetical prefix that coincides with the National Incident Management System exterior Incident command system (ICS) division designation coupled with sequential numeric door number assignments.

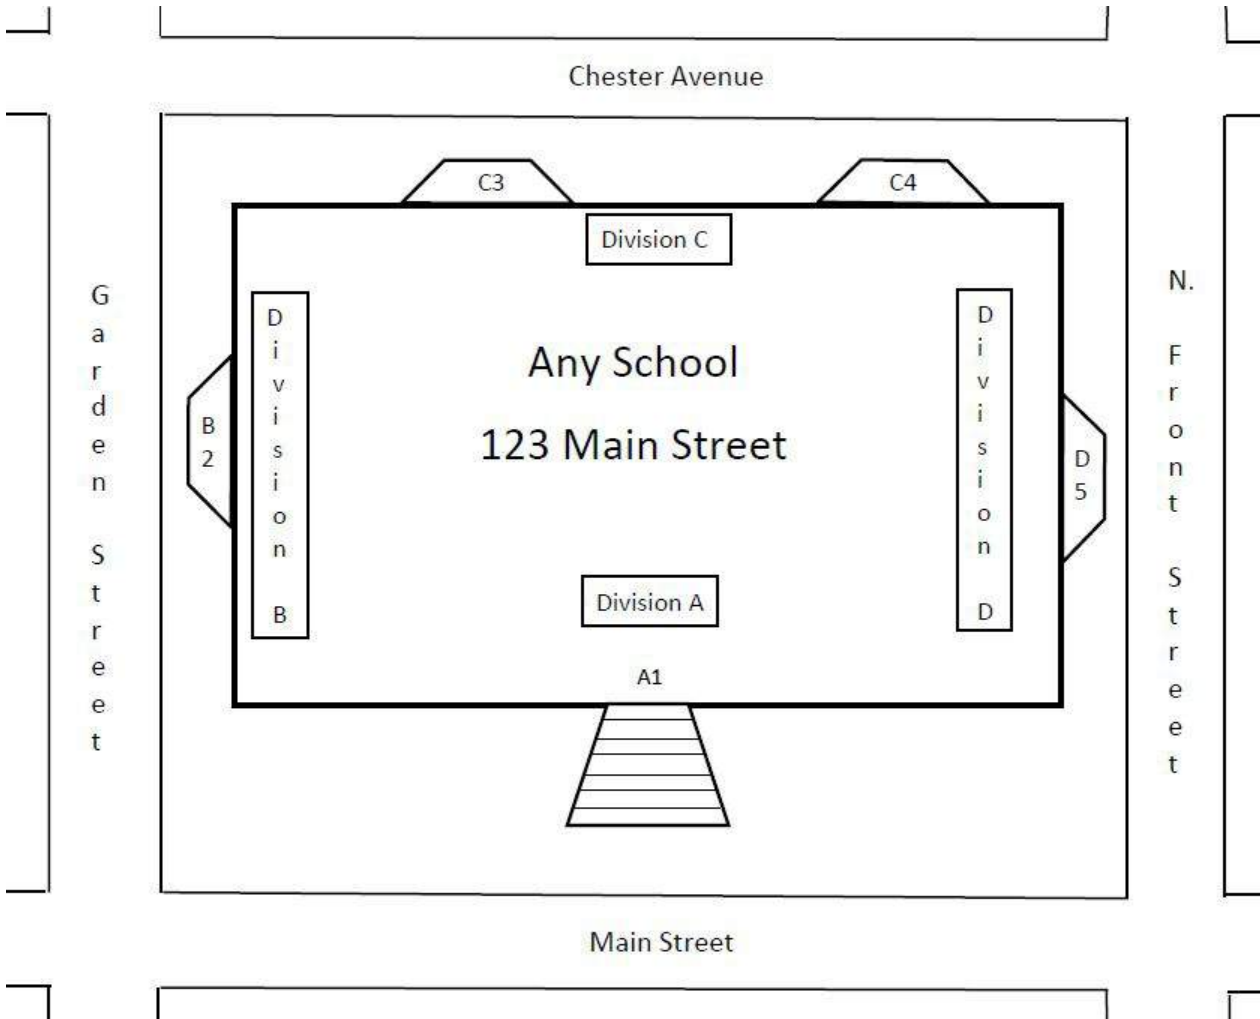

Reason: The IFC does not include recommendations for exterior door numbering that is in compliance with incident management procedures. Due to the lack this being addressed in the IFC for emergency planning purposes a number of agencies have developed recommendations that are not in compliance with NIMS. The most common recommendation starts with the main entrance door being labeled as 1, and then sequentially clockwise around the building. In an emergency situation, especially one that requires mutual aid, it is imperative that we know where our assignments are. In addition, should we run into an emergency inside a building we need to be able to quickly identify where the person in need is located. By failing to utilize the geographic locations of ICS we have failed to ensure a quick, effective and safe response.

A simple fix is to require that a prefix be utilized that coincides with the exterior ICS division designations. Therefore, the main entrance would be Door A1. From a response perspective if I am responding to an active shooter situation, or other emergency, in a school and I am ordered to report to Door 4, I have no idea where that is. However, if I am ordered to report to Door C4 I know it is in the rear of the building. Likewise, if I am an officer in need of assistance from inside a

building and can see an exit door that is labeled from the inside, if it is Door 5, no one except those familiar with the building will know where that is. If however, that same door is labeled D5, everyone knows it is on the right side of the building.

The adoption of a nationwide system of managing incidents and events starts with the basic knowledge that everyone is speaking the same language. That starts with the geographic divisions of an incident. Therefore, the simple addition of adding a prefix and number for exterior doors of a building and requiring them to be labeled inside and outside, is paramount for officer and occupant safety. I am requesting that the ICC consider adding these requirements to the IFC.

This proposal adds a requirement that in preparing fire safety plans the exterior doors be designated and indicated utilizing alphanumeric designations coinciding with the ICS division side and the sequential door number.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal has no impact on the cost of construction. It has a minimal cost impact on the preparation of fire safety plans.

F38-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved based on the need for more specific information such as stroke size for the identification. Also, there was concern that, as written, this proposal only addresses the plans and not the building itself. (Vote: 10-4)

Assembly Action:

None

F38-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)requests As Submitted.

Commenter's Reason: The committees disapproval was as follows:
The proposal was disapproved based on the need for more specific information such as stroke size for the identification. Also, there was concern that, as written, this proposal only addresses the plans and not the building itself. (Vote: 10-4)

The reasons centered around the fact that the proposal does not call for marking of doors to correspond to the NIMS division designations.

That omission was intentional because requiring address posting or door numbering has always been controversial and because in this case it is unnecessary. The marking would be optional, but if marking occurs it should meet the needs of emergency responders. Currently with no guidance marking occurs with no relation to the NIMS training utilized by emergency responders.

The proposal is that the emergency plans utilize this numbering scheme for recognition by emergency responders. NIMS ICS training is mandatory for all active emergency service personnel which includes recognition of alphabetical division designations. This occurs at emergency scenes whether or not a building even has an emergency action plan. When you couple a door number with a division designation the emergency responder simply counts doors from one edge of the division side to the other.

The other benefit of not requiring the doors to be marked, the renumbering designation occurs on paper. Not replacing existing markings other than those cases where confusing designations and marking have already occurred and those locations should make the minimal expenditure to renumber their doors.

Facility staff involved in emergency response should also be receiving NIMS training which means they should have no difficulty understanding and applying this requirement.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal has no impact on the cost of construction. It has a minimal cost impact on the preparation of fire safety plans.

F38-18

F43-18

IFC: 508.1.6; IBC: 911.1.6

Proposed Change as Submitted

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org)

2018 International Fire Code

Revise as follows

508.1.6 Required features. The *fire command center* shall comply with NFPA 72 and shall contain the following features:

1. The emergency voice/alarm communication system control unit.
2. The fire department communications system.
3. Fire detection and alarm system annunciator.
4. Annunciator unit visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air distribution systems.
6. The fire fighter's control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking *interior exit stairway* doors simultaneously.
8. Sprinkler valve and water-flow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. Fire pump status indicators.
12. Schematic building plans indicating the typical floor plan and detailing the building core, *means of egress, fire protection systems, fire-fighter air-replenishment systems, fire-fighting equipment and fire department access, and the location of fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions.*
13. An *approved* Building Information Card that includes, but is not limited to, all of the following information:
 - 13.1. General building information that includes: property name, address, the number of floors in the building above and below grade, use and occupancy classification (for mixed uses, identify the different types of occupancies on each floor) and the estimated building population during the day, night and weekend;
 - 13.2. Building emergency contact information that includes: a list of the building's emergency contacts including but not limited to building manager, building engineer and their respective work phone number, cell phone number and e-mail address;
 - 13.3. Building construction information that includes: the type of building construction including but not limited to floors, walls, columns and roof assembly;
 - 13.4. *Exit access stairway* and *exit stairway* information that includes: number of *exit access stairways* and *exit stairways* in building; each *exit access stairway* and *exit stairway* designation and floors served; location where each *exit access stairway* and *exit stairway* discharges, *interior exit stairways* that are pressurized; *exit stairways* provided with emergency lighting; each *exit stairway* that allows reentry; *exit stairways* providing roof access; elevator information that includes: number of elevator banks, elevator bank designation, elevator car numbers and respective floors that they serve; location of elevator machine rooms, control rooms and control spaces; location of sky lobby; and location of freight elevator banks;
 - 13.5. Building services and system information that includes: location of mechanical rooms, location of building management system, location and capacity of all fuel oil tanks, location of emergency generator and location of natural gas service;
 - 13.6. *Fire protection system* information that includes: location of standpipes, location of fire pump room, location of fire department connections, floors protected by automatic sprinklers and location of different types of *automatic sprinkler systems* installed including but not limited to dry, wet and pre-action;
 - 13.7. Hazardous material information that includes: location and quantity of hazardous material.
14. Work table.
15. Generator supervision devices, manual start and transfer features.
16. Public address system, where specifically required by other sections of this code.
17. Elevator fire recall switch in accordance with ASME A17.1/CSA B44.
18. Elevator emergency or standby power selector switch(es) (labelled "elevator emergency power"), where emergency or standby building power is provided and the emergency or standby building power is provided not sufficient to operate all elevators and associated equipment simultaneously.

2018 International Building Code

[F] 911.1.6 Required features. The fire command center shall comply with NFPA 72 and shall contain all of the following features:

1. The emergency voice/alarm communication system control unit.
2. The fire department communications system.
3. Fire detection and alarm system annunciator.
4. Annunciator unit visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air distribution systems.
6. The fire fighter's control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking *interior exit stairway* doors simultaneously.
8. Sprinkler valve and waterflow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. Fire pump status indicators.
12. Schematic building plans indicating the typical floor plan and detailing the building core, *means of egress*, fire protection systems, fire fighter air replenishment system, fire-fighting equipment and fire department access and the location of *fire walls, fire barriers, fire partitions, smoke barriers* and smoke partitions.
13. An *approved* Building Information Card that contains, but is not limited to, the following information:
 - 13.1. General building information that includes: property name, address, the number of floors in the building above and below grade, use and occupancy classification (for mixed uses, identify the different types of occupancies on each floor), and the estimated building population during the day, night and weekend.
 - 13.2. Building emergency contact information that includes: a list of the building's emergency contacts including but not limited to building manager and building engineer and their respective work phone number, cell phone number, e-mail address.
 - 13.3. Building construction information that includes: the type of building construction including but not limited to floors, walls, columns, and roof assembly.
 - 13.4. *Exit access* and *exit stairway* information that includes: number of *exit access* and *exit stairways* in the building, each *exit access* and *exit stairway* designation and floors served, location where each *exit access* and *exit stairway* discharges, *interior exit stairways* that are pressurized, *exit stairways* provided with emergency lighting, each *exit stairway* that allows reentry, *exit stairways* providing roof access; elevator information that includes: number of elevator banks, elevator bank designation, elevator car numbers and respective floors that they serve; location of elevator machine rooms, control rooms and control spaces; location of sky lobby, location of freight elevator banks.
 - 13.5. Building services and system information that includes: location of mechanical rooms, location of building management system, location and capacity of all fuel oil tanks, location of emergency generator, location of natural gas service.
 - 13.6. Fire protection system information that includes: location of standpipes, location of fire pump room, location of fire department connections, floors protected by automatic sprinklers, location of different types of *automatic sprinkler systems* installed including, but not limited to, dry, wet and pre-action.
 - 13.7 Hazardous material information that includes: location of hazardous material, quantity of hazardous material.
14. Work table.
15. Generator supervision devices, manual start and transfer features.
16. Public address system, where specifically required by other sections of this code.
17. Elevator fire recall switch in accordance with ASME A17.1/BSA 44.
18. Elevator emergency or standby power selector switch(es) (labelled "elevator emergency power"), where emergency or standby building power is provided and the emergency or standby building power is provided not sufficient to operate all elevators and associated equipment simultaneously.

Reason: To clarify that no switch is needed if the emergency or standby power is sufficient to operate all elevators and associated equipment simultaneously.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
To change to cost since it is a clarification

Public Hearing Results

Errata: [F] 911.1.6 Required features. The fire command center shall comply with NFPA 72 and shall contain all of the following features:
(Items 1-17 unchanged)

18. Elevator emergency or standby power selector switch(es) (labelled "elevator emergency power"), where emergency or standby building power is ~~provided,~~ provided and the emergency or standby building power is not sufficient to operate all elevators and associated equipment simultaneously.

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved as more justification was needed from the proponent and specifically there was concern with how this would work with Occupant evacuation elevators (OEE) since those elevators would need to be available during an entire event. (Vote: 13-1)

Assembly Action:

None

F43-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org) requests As Submitted.

Commenter's Reason: Request approval as submitted. This change was submitted by NEII but was also reviewed by the ASME Code Coordination committee which includes members from ICC and NFPA. This proposal will clarify when a switch is required for emergency or standby power and its operation.

The current language requires a selector switch anytime emergency or standby power is provided. The purpose of the switch is to allow the firefighter to select which elevator or elevators receive the emergency or standby power. In some cases, the emergency or standby power is sufficient to power all of the elevators at once; therefore, there is no need for a selector switch. In fact, requiring the switch when none is needed may create confusion in an emergency. The proposed language would clarify that the switch is only required when the emergency or standby power is insufficient to power all elevators at one time.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This change would reduce the cost of construction because the selector switch would not be required when emergency or standby power is sufficient to power all elevators at once.

F43-18

F47-18

IFC: 510.1.1, 510.1.1.1

Proposed Change as Submitted

Proponent: Adria Reinertson, Riverside County Fire Department, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)

2018 International Fire Code

Add new text as follows

510.1.1 Building conduit and pathway survivability. All new buildings shall be constructed with not less than a two-inch (2") dedicated conduit raceway or other method approved by the fire code official for future expandability, or the installation of an Emergency Responder Radio Coverage System. The raceway shall meet pathway survivability requirements in NFPA 1221 and shall be installed from the lowest floor level to the roof.

510.1.1.1 Identification. The raceway and junction boxes shall be labeled "Emergency Responder Radio Coverage System use only".

Reason: Communications are key to a successful response to an emergency incident. When emergency responder radio coverage systems are installed in a new building they are tested and approved for the conditions present at the time. Often times, as additional buildings and infrastructure are built in the immediate and adjacent vicinity, the original radio coverage system will no longer function as approved due to interference, etc. This proposal requires a dedicated raceway to be installed at time of construction to allow for future expandability and/ or the installation of a radio coverage system. This proposal would allow for easy expansion and/or installations without the additional cost of invasive retrofits to the original system.

Cost Impact: The code change proposal will increase the cost of construction. This code change will increase the cost of construction, however, it will greatly reduce the cost of future installations and/or retrofits for expandability.

F47-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved as this requirement seemed excessive and would apply to all buildings regardless of size or features. In addition, it was noted that perhaps Section 510.5.1.1 dealing with installation may be a better location for such a requirements. Also, NFPA 1221 does not establish when pathway survivability is required and a sprinklered building is already considered to have level 1 pathway survivability. Therefore a level of protection is already provided in many buildings without conduit. (Vote 13-1)

Assembly Action:

None

F47-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Adria Reinertson, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

510.1.1 510.5.3 Building conduit and pathway survivability. All new buildings shall be constructed with not less than a two-inch (2") dedicated conduit raceway or other method approved by the fire code official for future expandability, or the installation of an Emergency Responder Radio Coverage System. The raceway shall meet pathway survivability requirements in NFPA 1221 and shall be installed from the lowest floor level to the roof.

510.1.1.1 510.5.3.1 Identification. The raceway and junction boxes shall be labeled "Emergency Responder Radio Coverage System use only".

Commenter's Reason: The installation requirements for an Emergency Responder Radio Coverage System can be expensive and obtrusive, if installed after the building construction has been completed. This proposal provides for the basic pathway to be pre-installed, to reduce time and cost of installing an Emergency Responder Radio Coverage System by installing the initial pathway in the building.

The installation requirements are found in Section 510 and related requirement are in NFPA 1221. NFPA 1221 requires communications and signal circuits to be identified. NFPA 1221 has the following requirements:

5.5.5.3 Communications and signal circuits shall be identified by the use of a distinctive color on covers or doors.

5.5.5.4 The words "emergency communication-signal circuit" shall be clearly marked on all terminal and junction locations to prevent unintentional interference.

This Public Comment moves the proposed sections into the installation requirements section as recommended comments from the Code Development Committee. This proposal brings the communication and signaling circuit identification requirement into the International Fire Code.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This code change will increase the cost of construction due to the requirement to install conduit for future use, however, it will greatly reduce the cost of future installations and/or retrofits for expandability.

F47-18

F49-18

IFC: 202 (New), 510.4.1

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Fire Code

Add new definition as follows

CRITICAL AREAS. Areas that are designated for emergency responder radio coverage including exit stairs, exit passageways, elevator lobbies, fire protection equipment room and control valve locations, fire command centers and other areas identified by the fire code official.

Revise as follows

510.4.1 Emergency responder communication enhancement system signal strength. The building shall be considered to have acceptable emergency responder communications enhancement system coverage when signal strength measurements in 95 percent of all areas and 99 percent in critical areas on each floor of the building meet the signal strength requirements in Sections 510.4.1.1 through 510.4.1.3.

Reason: This is one of 10 proposals being submitted as a package relating to technical changes proposed for Section 510. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals. This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal clarifies existing requirements within the 2018 edition of Section 510 through a reference to NFPA 1221 by placing the language related to 99% in critical areas within the technical provisions of 510.4.1. Covering critical areas of a building is vital to the operations of public safety responders. A definition for "critical areas" has been included under a separate proposal and includes such areas as exit stairways, elevator lobbies, fire pump rooms, etc.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is already required in NFPA 1221 already requires this. Section 510.4.2 requires compliance with NFPA 1221.

F49-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based upon concern that requiring 99 percent will do little to improve the performance from the current criteria of 95%. In addition the definition uses the term "other areas" and it is unclear as to how those areas will be determined. (Vote 11-3)

Assembly Action:

None

F49-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

510.4.1 Emergency responder communication enhancement system signal strength. The building shall be considered to have acceptable emergency responder communications enhancement system coverage when signal strength measurements in 95 percent of all areas and 99 percent in ~~critical areas~~ areas designated as critical areas by the fire code official on each floor of the building meet the signal strength requirements in Sections 510.4.1.1 through 510.4.1.3.

CRITICAL AREAS. Areas that are designated for the highest level of emergency responder radio coverage including but not limited to areas such as exit stairs, exit passageways, elevator lobbies, fire protection equipment room and control valve locations, fire command centers ~~and other areas identified by the fire code official.~~

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at:

<https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal clarifies existing requirements within the 2018 edition of Section 510 through a reference to NFPA 1221 by placing the language related to 99% in critical areas within the technical provisions of 510.4.1. Covering critical areas of a building is vital to the operations of public safety responders. A definition for "critical areas" has been included to clarify what is intended by that term. As the definition notes critical areas include such areas as exit stairways, elevator lobbies, fire pump rooms and fire command centers.

New information: The committee stated that this change proposal would impose new/higher requirements of 99% coverage for critical areas. This public comment is not adding new or higher requirements. Rather it is simply eliminating a technical difference with current requirements in the 2016 and soon to be published 2019 edition of NFPA 1221 for critical areas. NFPA 1221 is referenced standard in the IFC and the intent is to harmonize the technical requirements between the IFC and NFPA 1221

This public comment retains the definition for critical areas. The definition provides a simple explanation for areas that are typically designated as "critical" for firefighter emergency communication to both transmit and receive emergency messages on their portable radios.

Critical areas are absolutely necessary to have 99% RF coverage for firefighter/emergency responder safety in these very specific areas within the building. These are areas where firefighters typically: manage operations (fire command centers), use to reach fire locations, stage for suppression operations, use to access and rescue trapped occupants or monitor/control critical fire protection systems.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of

construction

This is already required in NFPA 1221. Section 510.4.2 requires compliance with NFPA 1221.

IFC: 603.3, 603.3.1, 603.3.1.1 (New), 603.3.2, 603.3.2.1, 603.3.2.2, 603.3.2.3, 603.3.2.4, 603.3.2.5, 603.3.2.6, 603.3.2.7, 603.3.3, Chapter 80

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows

603.3 Fuel oil storage systems. Fuel oil storage systems for building heating systems shall be installed and maintained in accordance with this code. ~~Fuel-oil Tanks and fuel-oil~~ piping systems shall be installed in accordance with Chapter 13 of the International Mechanical Code.

603.3.1 Fuel oil storage in outside, above-ground tanks. Where connected to a fuel-oil piping system, the maximum amount of fuel oil storage allowed outside above ground without additional protection shall be 660 gallons (2498 L). The storage of fuel oil above ground in quantities exceeding 660 gallons (2498 L) shall comply with NFPA 31.

Add new text as follows

603.3.1.1 Approval. Outside Fuel oil storage tanks shall be in accordance with UL142 or UL 2085.

Revise as follows

603.3.2 Fuel oil storage inside buildings. Fuel oil storage inside buildings shall comply with Sections 603.3.2.1 through 603.3.2.5 or Chapter 57: of this code.

Add new text as follows

603.3.2.1 Approval. Inside Fuel oil storage tanks shall be in accordance with UL 80, UL 142, UL 443, or UL 2085.

Revise as follows

~~603.3.2~~**603.3.2.2 Quantity limits.** One or more fuel oil storage tanks containing Class II or III *combustible liquid* shall be permitted in a building. The aggregate capacity of all tanks shall not exceed the following:

1. 660 gallons (2498 L) in unsprinklered buildings, where stored in a tank complying with UL 80, UL 142, UL 443, or UL 2085.
2. 1,320 gallons (4996 L) in buildings equipped with an *automatic sprinkler* system in accordance with Section 903.3.1.1, where stored in a tank complying with UL 142.
3. 3,000 gallons (11 356 L) in buildings equipped with an automatic sprinkler system in accordance with Section 903.3.1.1, where stored in protected above-ground tanks complying with UL 2085 and Section 5704.2.9.7 ~~and the room is protected by an automatic sprinkler system in accordance with Section 903.3.1.1 of this code.~~

603.3.2.2 Restricted use and connection. Tanks installed in accordance with Section 603.3.2 shall be used only to supply fuel oil to fuel-burning equipment, generators or fire pumps installed in accordance with Section 603.3.2.4. Connections between tanks and equipment supplied by such tanks shall be made using closed piping ~~systems~~systems in accordance with the International Mechanical Code.

603.3.2.3 Applicability of maximum allowable quantity and control area requirements. The quantity of *combustible liquid* stored in tanks complying with Section 603.3.2 shall not be counted towards the maximum allowable quantity set forth in Table 5003.1.1(1), and such tanks shall not be required to be located in a *control area*.

603.3.2.4 Installation. Tanks and piping systems shall be installed in accordance with Section 915 and Chapter 13, both of the International Mechanical Code, as applicable.

603.3.2.5 Separation. Rooms containing fuel oil tanks for internal combustion engines shall be separated from the remainder of the building by *fire barriers, horizontal assemblies,* or both, with a minimum 1-hour fire-resistance rating with 1-hour fire-protection-rated *opening protectives* constructed in accordance with the International Building Code.

Exception: Rooms containing protected above-ground tanks complying with Section 5704.2.9.7 of this code shall not be required to be separated from surrounding areas.

603.3.2.6 Spill containment. Tanks exceeding ~~55-60~~ gallon (~~208-227~~ L) capacity or an aggregate capacity of 1,000 gallons (3785 L) that are not provided with integral secondary containment shall be provided with spill containment sized to contain a release from the largest tank.

603.3.2.7 Tanks in basements. Tanks in *basements* shall be in accordance with UL 80 and shall be located not more than two stories below grade plane.

603.3.3 ~~Underground storage of fuel oil.~~Fuel oil storage in underground tanks. The storage of fuel oil in underground storage tanks shall comply with UL 58 or UL 1316 and installed in accordance with NFPA 31.

Add new standard(s) follows

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

443-06:

Steel Auxiliary Tanks for Oil-Burner Fuel (with revisions through March 8, 2013)

Reason: This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal provides the following clarity:

1. The scope of these sections is for fuel oil storage systems for building heating systems, not for generators or fire pumps.
2. These sections cover both installation and maintenance.
3. Both tanks and fuel oil piping systems are covered in Chapter 13 of the IMC.
4. Identifies what standards that the fuel oil storage tanks located outside, inside, and underground are required to comply.
5. Adds UL 443, UL 58, and UL 1316 as additional alternative standards for tanks to comply.
6. Correlates in Section 603.3.2.6 the technical requirements with the definitions of containers (a vessel of 60 gallons or less) and tanks (a vessel more than 60 gallons).

CONTAINER. A vessel of 60 gallons (227 L) or less in capacity used for transporting or storing hazardous materials. Pipes, piping systems, engines and engine fuel tanks are not considered to be containers.

TANK. A vessel containing more than 60 gallons (227 L).

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Clarifies existing requirements, and provides additional alternative compliance paths for the tanks.

Analysis: A review of the standard proposed for inclusion in the code, UL 443-06 with revisions through March 8, 2013, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 603.3 Fuel oil storage systems. Fuel oil storage systems ~~for building heating systems~~ shall be installed and maintained in accordance with this code. Tanks and fuel-oil piping systems shall be installed in accordance with Chapter 13 of the International Mechanical Code.

603.3.1.1 Approval. Outside Fuel oil storage tanks shall be in accordance with UL142, ~~or~~ UL 2085., or UL 80.

603.3.2.7 Tanks in basements. Tanks in basements shall be ~~in accordance with UL 80~~ and shall be located not more than two stories below grade plane.

Committee Reason: This proposal was approved for a couple reasons. First it provides a more specific reference to Chapter 13 of the IMC for fuel oil piping. Next it references the appropriate referenced standards with regard to underground tanks. The modifications address several issues. The first is the removal of "building heating systems" as this section is intended to be more broadly scoped to other fuel oil applications. The second addressed a standard that was overlooked when assembling the proposal that is appropriate for outside storage tanks UL 80. (Vote: 14-0)

Assembly Action:

None

F63-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeffrey Shapiro, representing STI/SPFA (jeff.shapiro@intlcodeconsultants.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

603.3.2.1 Approval. Inside Fuel oil storage tanks shall be in accordance with UL 80, UL 142, ~~UL 443,~~ or UL 2085.

603.3.2.2 Quantity limits. One or more fuel oil storage tanks containing Class II or III *combustible liquid* shall be permitted in a building. The aggregate capacity of all tanks shall not exceed the following:

1. 660 gallons (2498 L) in unsprinklered buildings, where stored in a tank complying with UL 80, UL 142, ~~UL 443,~~ or UL 2085.
2. 1,320 gallons (4996 L) in buildings equipped with an *automatic sprinkler* system in accordance with Section 903.3.1.1, where stored in a tank complying with UL 142.
3. 3,000 gallons (11 356 L) in buildings equipped with an automatic sprinkler system in accordance with Section 903.3.1.1, where stored in protected above-ground tanks complying with UL 2085 and Section 5704.2.9.7 of this code.

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

~~443-06:~~

Steel Auxiliary Tanks for Oil Burner Fuel (with revisions through March 8, 2013)

Commenter's Reason: To my knowledge, there are no active listings for UL 443, and because I understand that the standard does not include requirements related to tank supports, it does not appear suitable for equivalent recognition to UL 80 or other code-recognized tank construction standards.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Since there are no active product listings for this standard, deleting the reference should have no impact on cost.

F63-18

F64-18

IFC: 603.3.2.1

Proposed Change as Submitted

Proponent: Bob Morgan, Fort Worth Fire Department, representing Fort Worth Fire Department

2018 International Fire Code

Revise as follows

603.3.2.1 Quantity limits. One or more fuel oil storage tanks containing Class II or III *combustible liquid* shall be permitted in a building. The aggregate capacity of all tanks shall not exceed the following:

1. 660 gallons (2498 L) in unsprinklered buildings, where stored in a tank complying with UL 80, UL 142 or UL 2085.
2. 1,320 gallons (4996 L) in buildings equipped with an *automatic sprinkler* system in accordance with Section 903.3.1.1, where stored in a tank complying with UL 142- as a listed secondary containment tank. Secondary containment shall be monitored visually or automatically.
3. 3,000 gallons (11 356 L) where stored in protected above-ground tanks complying with UL 2085 and Section 5704.2.9.7 and the room is protected by an *automatic sprinkler system* in accordance with Section 903.3.1.1. Secondary containment shall be monitored visually or automatically.

Reason: The current allowance of 1,320 gallons in a single wall tank in a non-Group H occupancy area is simply not consistent with historical practice for such installations and is not equivalent to what is required in Chapter 50 relative to maximum allowable quantities, which would normally only allow up to 240 gallons in a fully sprinklered non-Group H occupancy in a use-closed system.

Additionally, the vast majority of these tanks presently installed inside and outside buildings are of the double-wall type for permanent installations.

Primary concern is the exposure of 1,320 gallons of spilled diesel (fuel oil - Class II combustible liquid) inside a building, resulting in much greater involvement in a fire condition than in the vented interstitial space of a double-wall tank.

The double-wall tank provides an added layer of protection at a reasonable cost and is common industry practice currently, especially when located inside a building.

Cost Impact: The code change proposal will increase the cost of construction

The vast majority of fuel tanks associated with generators and fire pumps are of the double-wall type presently; however, being that the code currently allows these to be of the single wall type for the maximum 1,320 gallon designated quantity, the requirement of double-wall would be an increase in the cost of construction as a result.

F64-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal was approved as it was felt necessary that if secondary containment is provided that it needs to be monitored. (Vote: 11-2)

Assembly Action:

None

F64-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeffrey Shapiro, representing STI/SPFA (jeff.shapiro@intlcodeconsultants.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

603.3.2.1 Quantity limits. One or more fuel oil storage tanks containing Class II or III *combustible liquid* shall be permitted in a building. The aggregate capacity of all tanks shall not exceed the following:

1. 660 gallons (2498 L) in unsprinklered buildings, where stored in a tank complying with UL 80, UL 142 or UL 2085.
2. 1,320 gallons (4996 L) in buildings equipped with an *automatic sprinkler* system in accordance with Section 903.3.1.1, where stored in a tank complying with UL 142. The tank shall be listed as a listed secondary containment tank, ~~Secondary, and the secondary~~ and the secondary containment shall be monitored visually or automatically.
3. 3,000 gallons (11 356 L) where stored in protected above-ground tanks complying with UL 2085 and Section 5704.2.9.7 and the room is protected by an *automatic sprinkler system* in accordance with Section 903.3.1.1. ~~Secondary~~The tank shall be listed as a secondary containment tank, as required by UL 2085, and the secondary containment shall be monitored visually or automatically.

Commenter's Reason: The recommended change correlates the sentence structures in Items 2 and 3 for consistency. UL 2085 tanks require secondary containment, but the text in Item 3, as initially approved, could lead to questions since Item 2 clearly requires secondary containment vs. Item 3, which silently relies on someone knowing that UL 2085 requires secondary containment as part of the listing.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The expected cost increase was documented in the original proposal. The public comment is consistent with the original cost statement.

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

603.4 Portable unvented heaters. Portable unvented fuel-fired heating equipment shall be prohibited in occupancies in Groups A, E, I, R-1, R-2, R-3 and R-4 and ambulatory care facilities.

Exceptions:

1. ~~In one- and two-family dwellings portable~~ Portable unvented fuel-fired heaters ~~, where approved and listed in accordance with UL 647 are permitted to be used in one- and two-family dwellings, where operated and maintained in accordance with the manufacturer's instructions.~~
2. Portable outdoor gas-fired heating appliances in accordance with Section 603.4.2.

Revise as follows

603.4.2.1 Location. Portable outdoor gas-fired heating appliances shall be used and located in accordance with Sections 603.4.2.1.1 through 603.4.2.1.4.

603.4.2.1.1 Prohibited locations. The storage or use of portable outdoor gas-fired heating appliances is prohibited in any of the following locations:

1. Inside of any occupancy where connected to the fuel gas container.
2. Inside of tents, canopies and membrane structures.
3. On exterior balconies.

Exception: As allowed permitted in Section 6.22 of NFPA 58 Chapter 61 of this code.

603.4.2.2 Installation-Use and operation. Portable outdoor gas-fired heating appliances shall be ~~installed~~ used and operated in accordance with Sections 603.4.2.2.1 through 603.4.2.2.4.

603.4.2.2.1 Listing and approval. Only *listed and approved* portable outdoor gas-fired heating appliances utilizing a fuel gas container that is integral to the appliance shall be used. Portable outdoor gas-fired heating appliances shall be listed and labeled in accordance with ANSI Z83.26/CSA 2.37 or ANSI Z21.58/CSA 1.6.

603.4.2.2.2 Installation-Use and maintenance. Portable outdoor gas-fired heating appliances shall be ~~installed~~ used and maintained in accordance with the manufacturer's instructions.

Delete without substitution

603.4.2.2.3 Tip-over switch. ~~Portable outdoor gas-fired heating appliances shall be equipped with a tilt or tip-over switch that automatically shuts off the flow of gas if the appliance is tilted more than 15 degrees (0.26 rad) from the vertical.~~

603.4.2.2.4 Guard against contact. ~~The heating element or combustion chamber of portable outdoor gas-fired heating appliances shall be permanently guarded so as to prevent accidental contact by persons or material.~~

Add new standard(s) follows

ANSI

American National Standards
Institute
25 West 43rd Street, 4th Floor
New York NY 10036

ANSI Z83.26/CSA 2.37-2014:

Gas-Fired Outdoor Infrared Patio Heaters

Outdoor Cooking Gas Appliances

Reason: This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

This proposal addresses the following for portable unvented heaters and outdoor gas-fired heating appliances:

1. Replaces "installed" with "used", because these are portable products.
2. For listed portable unvented heaters in one- and two-family dwellings, the fire code official will not be present to approve the use. The requirements have been expanded to also require these heaters to be operated and maintained in accordance with the manufacturer's instructions, which are part of the listing of the heater.
3. Adds specific standards for the portable outdoor gas-fired heating appliances.
4. Removes the tip-over switch requirement (Section 603.4.2.2.3) because this is already a requirement in ANSI Z83.26/CSA 2.37 (Section 5.19). The listing standard includes a performance test to determine.
5. Removes the guard requirement (Section 603.4.2.2.4) because this is already a requirement in ANSI Z83.26/CSA 2.37 (Section 5.14). The listing standard includes requirements addressing accessibility to any heated surface (Section 5.14).

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Clarifies already existing requirements.

Analysis: A review of the standards proposed for inclusion in the code, ANSI Z83.26/CSA 2.37-2014 and ANSI Z21.58/CSA 1.6-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 603.4.2.2.3 Tip-over switch. Portable outdoor gas-fired heating appliances shall be equipped with a tilt or tip-over switch that automatically shuts off the flow of gas if the appliance is tilted more than 15 degrees (0.26 rad) from the vertical.

603.4.2.2.4 Guard against contact. The heating element or combustion chamber of portable outdoor gas-fired heating appliances shall be permanently guarded so as to prevent accidental contact by persons or material.

Committee Reason: This proposal was approved based upon proponents reason. There was some concern that the reference to the standard may lose the provisions related to tip over and therefore the proposal was modified to retain Section 603.4.2.2.3 and 603.4.2.2.4 which are existing IFC sections. Note there was some concern with the reference to a cooking standard (ANSI Z21.58/CSA 1.6-2015: Outdoor Cooking Gas Appliances) within a section focused upon heating requirements. (Vote: 10-3)

Assembly Action:

None

F65-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Bruce Swiecicki, representing National Propane Gas Association (bswiecicki@npga.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

603.4.2.2.1 Listing and approval. Only *listed* and *approved* portable outdoor gas-fired heating appliances utilizing a fuel gas container that is integral to the appliance shall be used. Portable outdoor gas-fired heating appliances shall be listed and labeled in accordance with ANSI Z83.26/CSA 2.37. ~~or Z21.58/CSA 1.6.~~

Commenter's Reason: The modification that was made to F65-18 at the code hearings, which brings back the requirement for a tip-over switch in 603.4.2.2.3, now renders all grills listed and labeled to Z21.58 to be in violation of that section. Grills constructed to ANSI Z21.58 Outdoor Cooking Gas Appliances are required to undergo a tipping test to make sure they don't tip over when the angle of tip is 15 degrees from the vertical. However, grills listed to Z21.58 are not required to have a tip-over switch installed in them. Therefore, this change is needed in order for listed gas-fired grills to continue to be used.

In addition, there are other possibilities for gas-fired heating appliances to be used outdoors. Two additional standards that can be referenced are ANSI Z21.63 Portable Type Gas Camp Heaters and ANSI Z21.103 Unvented Portable Type Gas Camp Heaters for Indoor and Outdoor Use. Both of these standards have tip-over provisions that would allow compliance with 603.4.2.2.3 in the form that it is proposed for modification. However, due to ICC regulations, those standards may not be proposed until the next cycle.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal will not increase or decrease the cost of construction. It is simply not relevant as it is only focused on portable heaters.

Public Comment 2:

Proponent: Bruce Swiecicki, representing National Propane Gas Association (bswiecicki@npga.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

603.4.2.2.3 Tip-over switch. Portable outdoor gas-fired heating appliances shall be equipped with a tilt or tip-over switch that automatically shuts off the flow of gas if before the appliance is tilted more than 15 degrees (0.26 rad) to the

minimum angle of critical balance from the vertical which would result in the appliance tipping over.

Commenter's Reason: The standard that is referenced in 603.4.2.2.1, ANSI Z83.26, as well as ANSI Z21.63 and ANSI Z21.103, have provisions to address tip-over. The provisions in Z83.26 and Z21.103 establish the angle of critical balance, which is defined in those standards as the minimum angle through which a heater must be tipped to cause it to tip over due solely to the force of gravity.

This angle will often exceed 15 degrees from the vertical but even if it is less than that, the important thing is that the tip-over switch will activate before the appliance is tipped to the angle of critical balance. The significance of this proposal is that 15 degrees from the vertical is an arbitrary number and it is more relevant to link tip-over activation to the angle of critical balance.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal will not impact the cost of construction.

F65-18

F67-18

IFC: 603.10, 603.10.1, 603.10.2

Proposed Change as Submitted

Proponent: Richard Boisvert, Brighton Area Fire Authority, representing Michigan Fire Inspector's Society (rboisvert@brightonareafire.com)

2018 International Fire Code

Add new text as follows

603.10 Clothes dryer exhaust ducts. Clothes dryer exhaust ducts shall be in accordance with Sections 603.10.1 and 603.10.2.

603.10.1 Installation. Clothes dryer vent ducts shall be installed and maintained in accordance with the International Mechanical Code and the manufacturer's installation instructions.

603.10.2 Maintenance. The lint trap, mechanical and heating components, and the exhaust duct system of a clothes dryer shall be maintained to prevent the accumulation of lint or debris that prevents the exhaust of air, products of combustion or that creates a fire hazard.

Reason: Th IFC does not specifically address clothes dryer exhaust duct system installation and maintenance. The addition of this section creates a clear code path to ensure these duct systems are maintained to prevent fires.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change will not affect the cost of construction, however, it will require additional maintenance costs to maintain them following installation.

F67-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based upon concerns that the enforcement will be problematic. In addition, there was concern as to determining how often it would need to be inspected. The reference to the manufacturers instructions may be subjective. It was also pointed out that this is not specific to any occupancy and should be narrowed down. There was some support by the committee with some modification to reflect exhaust systems. It was also felt that potentially this could be a necessary tool for enforcement as this is a fire hazard. (Vote: 7-6)

Assembly Action:

None

F67-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

610 CLOTHES DRYER EXHAUST SYSTEMS

~~603.10~~ **610.1 Clothes dryer exhaust duct systems.** Clothes dryer exhaust ducts shall duct systems shall be in accordance with Sections 603.10.1 and 603.10.2.

~~603.10.1~~ **610.1.1 Installation.** Clothes dryer vent ducts shall be installed and maintained in exhaust duct systems shall be installed in accordance with the International Mechanical Code, or the International Fuel Gas Code, and the manufacturer's installation instructions.

~~603.10.2~~ **610.1.2 Maintenance.** The lint trap, mechanical and heating components, and the exhaust duct system of a clothes dryer shall be ~~maintained~~ maintained in accordance with the manufacturer's operating instructions to prevent the accumulation of lint or debris that prevents the exhaust of air, ~~products and products~~ of combustion ~~or that creates a fire hazard.~~

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This modification addresses the concern raised by the Technical Committee. There are many statistics published each year regarding clothes dryer fires, such as NFPA, CPSC, and USFA. There are approximately 15,600 structure fires, 400 injuries, and 15 deaths reported annually as a result of dryer fires. According to the United States Fire Administration, every year clothes dryer fires account for over \$100 million in losses. Also, dryer fires involving commercial dryers have a 78% higher injury rate than residential dryer fire. A majority of dryer fires occur as a result of highly flammable lint getting caught in the dryer's vent and becoming heated to the point of ignition. While many of the statistics address residential applications, there are also some statistics that identify issues in commercial applications, too.

Thus, maintaining of clothes dryers and the clothes dryer exhaust duct systems in any occupancy using clothes dryers is critical to reducing the fire hazard. The Mechanical, Fuel Gas, and Residential Codes require commercial and residential clothes dryers to be listed and labeled, and to be installed in accordance with the manufacturer's installation instructions. The required product testing standards include requirements for specific cleaning and maintenance directions to be part of the manufacturer's installation and use instructions.

The frequency for inspections depends on various factors, such as how often the dryer is used, the geometry of the exhaust duct system, and the age and type of dryer.

The proposal is modified as follows:

1. Establish a new stand-alone section in Chapter 6 for clothes dryer exhaust duct systems, because these potential hazards are present regardless of what the source of power or fuel for drying the clothes.
2. Use the term “exhaust duct system”, which is consistent with the terms used in the Mechanical, Fuel Gas, and Residential codes. These systems include the termination outlet and may include dryer exhaust duct power ventilators, which are also known as booster fans.
3. Expand the installation codes to also include the Fuel Gas Code for the gas-fired clothes dryers.
4. The Mechanical Code does not include maintenance requirements.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change will not affect the cost of construction, however, it will require additional maintenance costs to maintain them following installation.

F67-18

F69-18

IFC: 604.1.1

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Add new text as follows

604.1.1 Healthcare facilities. In Group I-2 facilities, ambulatory care facilities and outpatient clinics, the electrical systems and equipment shall be maintained and tested in accordance with NFPA 99.

Reason: In order to meet federal conditions of participation health care facilities must comply with the electrical systems and equipment must be maintenance and testing requirements listed in NFPA 99, Health Care Facilities Code (K913). This change will align the electrical systems maintenance and testing requirements for Outpatient Clinics, Group B Ambulatory Care and Group I-2 facilities.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change is an operational change regarding maintenance and testing. This will not increase the cost of construction on the healthcare industry.

F69-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This was disapproved as it does not correlate with the essential electrical requirements in chapter 4 of the of the IBC. This reference to NFPA 99 in this proposal has broader application in the IFC which seems beyond the scope of application of this code.. (Vote: 12-2)

Assembly Action:

None

F69-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org)requests As Submitted.

Commenter's Reason: This proposal is intended to reference the maintenance and testing requirements of NFPA 99 and not the new construction requirements. IBC Section 422.6 covers installation according to NFPA 99 for ambulatory care and IBC Section 407.11 covers Group I-2. We want to make systems that are installed according NFPA per IBC are properly maintained. We need this for alignment with CMS conditions of participation in the IFC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This change is an operational change regarding maintenance and testing. This will not increase the cost of construction on the healthcare industry.

F69-18

F76-18

IFC: 605.1.2, Chapter 80

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows

605.1.2 Ammonia refrigeration. Refrigeration systems using ammonia refrigerant and the buildings in which such systems are installed shall comply with IIAR-2 for system design and installation, IIAR 6 for maintenance and inspection, and IIAR-7 for operating procedures. Decommissioning of ammonia refrigeration systems shall comply with IIAR-8.

Update standard(s) as follows

IIAR

International Institute of Ammonia
Refrigeration
1001 N. Fairfax Street, Suite 503
Alexandria VA 22314
US

IIAR – 2-2014:

Safe Design of Closed-circuit Ammonia ~~Refrigerating~~ Refrigeration Systems

IIAR – 8-2015:

Decommissioning of Closed-circuit Ammonia ~~Refrigerating~~ Refrigeration Systems

IIAR 6-2018:

Standard for Inspection, Testing, and Maintenance of Closed-Circuit Ammonia Refrigeration Systems

Reason: IIAR 6 is a newly developed standard, being produced in accordance with ANSI requirements. It will provide comprehensive model regulations for maintenance and inspection of ammonia refrigeration systems and is part of a comprehensive set of IIAR standards for such systems that have been adopted by the IFC, IMC and other model codes. The first public comment period for this document has been completed, and it is anticipated that the document will be finished in time for adoption by the ICC membership in 2018.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. IIAR 6 is a maintenance and inspection standard for existing ammonia refrigeration systems.

Analysis: A review of the standard proposed for inclusion in the code, IIAR 6—2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

F76-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee approved the proposal based upon the need for the maintenance and inspection standard. The proposal also corrects the title to existing standard IAR 2 which is necessary. (Vote: 14-0)

Assembly Action:

None

F76-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com) requests Disapprove.

Commenter's Reason: This public comment is submitted as a contingency in case IAR 6 is not done before the final action hearing, in which case it must be disapproved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Not adopting the standard will not impact construction costs.

Public Comment 2:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standard(s) IAR 6-2018:Standard for Inspection, Testing, and Maintenance of Closed-Circuit Ammonia Refrigeration Systems, must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered. **(CP28) 3.6.3.1.1 Proposed New Standards.** In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

F76-18

F78-18

IFC: 605.1.2, Chapter 80

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows

605.1.2 Ammonia refrigeration. Refrigeration systems using ammonia refrigerant and the buildings in which such systems are installed shall comply with IIAR-2 for system design and installation and IIAR-7 for operating procedures. Decommissioning of ammonia refrigeration systems shall comply with IIAR 8, and engineering practices for existing ammonia refrigeration systems shall be in accordance with IIAR 9.

Add new standard(s) follows

IIAR

International Institute of Ammonia
Refrigeration
1001 N. Fairfax Street, Suite 503
Alexandria VA 22314

IIAR 9-2018:

Standard for Recognized and Generally Accepted Good Engineering Practices (RAGAGEP) for Existing Closed-circuit Ammonia Refrigeration Systems

Reason: IIAR 9 is a newly developed standard, being produced in accordance with ANSI requirements. It will provide comprehensive model regulations for minimum retroactive safety requirements applicable to ammonia refrigeration systems. It is part of a comprehensive set of IIAR standards for such systems that have been adopted by the IFC, IMC and other model codes. It is anticipated that the document will be finished in time for adoption by the ICC membership in 2018.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposed standard does not affect construction. It applies to existing ammonia refrigeration systems.

Analysis: A review of the standard proposed for inclusion in the code, IIAR 9-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

F78-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal was approved as it adds necessary requirements for existing ammonia refrigeration systems through the reference to the new standard IAR9. (Vote: 14-0)

Assembly Action:

None

F78-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com) requests Disapprove.

Commenter's Reason: This public comment is submitted as a contingency in case IAR 9 is not done before the final action hearing, in which case it must be disapproved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Not adopting the standard will not impact construction costs.

Public Comment 2:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standard IAR 9-2018:Standard for Recognized and Generally Accepted Good Engineering Practices (RAGAGEP) for Existing Closed-circuit Ammonia Refrigeration Systems must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

F78-18

IFC: 202, (New), 605.8, 605.8.1, 605.8.1.1 (New), 605.8.1.2 (New), 605.17.1; IMC: [F]1106.5.1

Proposed Change as Submitted

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IMC COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

Add new definition as follows

REFRIGERANT DETECTOR. A device that is capable of sensing the presence of refrigerant vapor.

CHAPTER 6 BUILDING SERVICES AND SYSTEMS

SECTION 605 MECHANICAL REFRIGERATION

[M] 605.1 Scope. Refrigeration systems shall be installed in accordance with the International Mechanical Code.

605.5 Access. Access to refrigeration systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 or 30 pounds (14 kg) of any other group refrigerant shall be provided for the fire department at all times as required by the *fire code official*.

605.6 Testing of equipment. Refrigeration equipment and systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 or 30 pounds (14 kg) of any other group refrigerant shall be subject to periodic testing in accordance with Section 605.6.1. Records of tests shall be maintained. Tests of emergency devices or systems required by this chapter shall be conducted by persons trained and qualified in refrigeration systems.

605.6.1 Periodic testing. The following emergency devices or systems shall be periodically tested in accordance with the manufacturer's instructions and as required by the *fire code official*.

1. Treatment and flaring systems.
2. Valves and appurtenances necessary to the operation of emergency refrigeration control boxes.
3. Fans and associated equipment intended to operate emergency ventilation systems.
4. Detection and alarm systems.

Revise as follows

605.8 Refrigerant detection. Machinery rooms shall be provided with ~~a refrigerant detector~~ one or more refrigerant detectors capable of detecting the specific refrigerant(s) utilized in the machinery room, with an audible and visible alarm. Where ammonia is used as the refrigerant, detection shall comply with IIAR 2. For refrigerants other than ammonia, refrigerant detection shall comply with Section 605.8.1.

605.8.1 Refrigerants other than ammonia.

A detector, or a sampling tube that draws air to a detector, shall be provided at ~~an one or more approved location~~ locations where refrigerant from a leak is expected to accumulate. ~~The system shall be designed to initiate audible and visible alarms inside of and outside each entrance to the refrigerating machinery room and transmit a signal to an approved location where the concentration of refrigerant detected exceeds the lesser of the following:~~

1. ~~The corresponding TLV-TWA values shown in the International Mechanical Code for the refrigerant classification.~~
2. ~~Twenty-five percent of the lower flammable limit (LFL).~~

Detection of a refrigerant concentration exceeding the upper detection limit or 25 percent of the lower flammable limit (LFL), whichever is lower, shall stop refrigerant equipment in the machinery room in accordance with Section 605.9.1. detection, signaling and control circuits shall be supervised. The detection system shall be designed in accordance with Sections 605.8.1.1 and 605.8.1.2.

Add new text as follows

605.8.1.1 Low level response. The system shall be designed to perform the following actions when the concentration of refrigerant detected exceeds the smallest value of Occupational Exposure Limit (OEL) and does not exceed the smallest value of Refrigerant Concentration Level (RCL), as listed in the International Mechanical Code for any refrigerant utilized in the machinery room:

1. Initiate audible and visible alarms inside of and outside each entrance to the refrigerating machinery room and transmit a signal to an approved location.
2. The ventilation system shall provide a flow rate not less than the highest of the following values for any refrigerant utilized in the machinery room: for Group A1 and B1 refrigerants 100% of the normal ventilation quantity, and for Group A2L, A2, A3, B2L, B2, and B3 refrigerants, 50% of the emergency conditions quantity, as required by the International Mechanical Code.
3. After initiation of alarms and ventilation system, it is permissible to utilize automatic reset of alarms and ventilation system after the refrigerant concentration has reduced below the OEL and maintained below the OEL for a minimum of 15 minutes.

605.8.1.2 High level response. The system shall be designed to perform the following actions when the concentration of refrigerant detected exceeds the refrigerant concentration limit (RCL), or 25 percent of the lower flammable limit (LFL), or upper detection limit of the detector, whichever is lower, for any refrigerant utilized in the machinery room:

1. Initiate audible and visible alarms inside of and outside each entrance to the refrigerating machinery room and transmit a signal to an approved location.
2. The ventilation system shall provide a flow rate not less than 100% of the emergency conditions quantity required by the International Mechanical Code.
3. For Group A2L, A2, A3, B2L, B2, and B3 refrigerants, stop refrigerant equipment in the machinery room in accordance with Section 605.9.1.
4. After initiation, alarms and ventilation system shall continue until manually reset at a location within the machinery room.

Delete without substitution

~~**605.17.1 Refrigerant detection system.** The machinery room shall be provided with a refrigerant detection system. The refrigerant detection system shall be in accordance with Section 605.8 and all of the following:~~

- ~~1. The detectors shall activate at or below a refrigerant concentration of 25 percent of the LFL.~~
- ~~2. Upon activation, the detection system shall activate the emergency ventilation system in Section 605.17.3.~~
- ~~3. The detection, signaling and control circuits shall be supervised.~~

2018 International Mechanical Code

Delete and substitute as follows

~~**[F] 1106.5.1 Refrigerant detection system.** The *machinery room* shall be provided with a refrigerant detection system. The *refrigerant* detection system shall be in accordance with Section 605.8 of the International Fire Code and all of the following:~~

- ~~1. The detectors shall activate at or below a refrigerant concentration of 25% of the LFL.~~
- ~~2. Upon activation, the detection system shall activate the emergency ventilation system required by Section 1106.5.2.~~
- ~~3. The detection, signaling and control circuits shall be supervised.~~

~~**1106.5.1 Refrigerant detection system.** The *machinery room* shall be provided with a refrigerant detection system. The *refrigerant* detection system shall be in accordance with Section 605.8 of the International Fire Code.~~

Reason: The proposed code changes include technical content based on ASHRAE Standard 34-2016 with Addendum G and ASHRAE Standard 15-2016 with Addendum H. The revisions in these two ASHRAE addenda are dependent and must be correlated as shown in this code change proposal. Upon publication, these addenda will be incorporated into the 2019

editions of ASHRAE 34 and ASHRAE 15.

There was a considerable amount of industry research into the use of flammable refrigerants that occurred in 2016 and 2017, following the announcement in June 2016 of a collaborative research effort between ASHRAE, AHRI, and US DOE. ASHRAE SSSPC15 relied upon this body of knowledge, extended upon prior ASHRAE research from 2012, in drafting the addenda to the 2016 edition of Standard 15.

The refrigerant safety group classification is an alphabetical/numerical designation that is used to identify both the toxicity and flammability classifications of a given refrigerant. There are two new safety group classifications added to ASHRAE 34: A2L and B2L. Previously 2L was a sub-class of class 2 as an interim measure to implement changes to refrigerant flammability classification into ASHRAE 34 prior to making associated changes to a future edition of ASHRAE 15; but now 2L is a separate class and safety requirements must be revised to distinguish between class 2 and class 2L.

The current definitions of "flammability classification" and "toxicity classification" are improper since both contain mandatory code requirements. The definitions should only define the term, not contain code requirements with the use of the word "shall." The current definition of refrigerant safety classifications is incorrect due to revisions to ASHRAE 34. The attempt to define the technical requirements of flammability are not correct. ASHRAE 34 goes into extensive requirements as to how to test and classify a refrigerant regarding flammability. The code should leave the technical requirements to ASHRAE 34 which is accomplished in Section 1103.1. The definition only has to identify the meanings of the classification categories. These terms used are found in the body of ASHRAE 34. The addition of "refrigerant" to the term "flammability classification" and "toxicity classification" clarify that the definitions only apply to refrigerants. Flammability and toxicity are terms also used in the ventilation sections of the code. These definitions do not apply to the use of those terms in Chapter 5.

(ASHRAE 2016b) ASHRAE Standard 34-2016 "Designation and Safety Classification of Refrigerants" (2016).

(Papas et. al. 2016) Paul Papas, Shiling Zhang, Hai Jiang, Parmesh Verma, Ivan Rydkin, Richard Lord & Larry Burns (2016) Computational fluid dynamics modeling of flammable refrigerant leaks inside machine rooms: Evaluation of ventilation mitigation requirements, Science and Technology for the Built Environment, 22:4, 463-471, DOI:10.1080/23744731.2016.1163240

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This code change proposal addresses a new safety group of refrigerants, with no precedent on the construction costs.

F79-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based upon a request from the proponent that the standard is not yet complete to address this issue. (Vote: 14-0)

Assembly Action:

None

F79-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

REFRIGERANT DETECTOR. A device that is capable of sensing the presence of refrigerant vapor.

CHAPTER 6 BUILDING SERVICES AND SYSTEMS

SECTION 605 MECHANICAL REFRIGERATION

[M] 605.1 Scope. Refrigeration systems shall be installed in accordance with the International Mechanical Code.

605.5 Access. Access to refrigeration systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 or 30 pounds (14 kg) of any other group refrigerant shall be provided for the fire department at all times as required by the *fire code official*.

605.6 Testing of equipment. Refrigeration equipment and systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 or 30 pounds (14 kg) of any other group refrigerant shall be subject to periodic testing in accordance with Section 605.6.1. Records of tests shall be maintained. Tests of emergency devices or systems required by this chapter shall be conducted by persons trained and qualified in refrigeration systems.

605.6.1 Periodic testing. The following emergency devices or systems shall be periodically tested in accordance with the manufacturer's instructions and as required by the *fire code official*.

1. Treatment and flaring systems.
2. Valves and appurtenances necessary to the operation of emergency refrigeration control boxes.
3. Fans and associated equipment intended to operate emergency ventilation systems.
4. Detection and alarm systems.

605.8 Refrigerant detection. Machinery rooms shall be provided with one or more refrigerant detectors capable of detecting the specific refrigerant(s) utilized in the machinery room, with one or more set points that activate responses, with an audible and visible alarm. Where ammonia is used as the refrigerant, detection shall comply with IAR 2. For refrigerants other than ammonia, refrigerant detection shall comply with Section 605.8.1.

605.8.1 Refrigerants other than ammonia. A detector, or a sampling tube that draws air to a detector, shall be provided at one or more approved locations where refrigerant from a leak is expected to accumulate. ~~The detection, signaling and control circuits shall be supervised. The detection system shall be designed in accordance with Sections 605.8.1.1 and 605.8.1 to initiate audible and visible alarms inside and outside of each entrance to the refrigerating~~

machinery room, and transmit a signal to an approved location, where the concentration of refrigerant detected exceeds the lowest value of the occupational exposure limit (OEL) as shown in Table 1103.1 of the International Mechanical Code, corresponding to any refrigerant in the machinery room. For any flammable refrigerants in the machinery room, refrigerant detection shall comply with Section 605.8.2.

~~**605.8.1.1 Low level response.** The system shall be designed to perform the following actions when the concentration of refrigerant detected exceeds the smallest value of Occupational Exposure Limit (OEL) and does not exceed the smallest value of Refrigerant Concentration Level (RCL), as listed in the International Mechanical Code for any refrigerant utilized in the machinery room:~~

- ~~1. Initiate audible and visible alarms inside of and outside each entrance to the refrigerating machinery room and transmit a signal to an approved location.~~
- ~~2. The ventilation system shall provide a flow rate not less than the highest of the following values for any refrigerant utilized in the machinery room: for Group A1 and B1 refrigerants 100% of the normal ventilation quantity, and for Group A2L, A2, A3, B2L, B2, and B3 refrigerants, 50% of the emergency conditions quantity, as required by the International Mechanical Code.~~
- ~~3. After initiation of alarms and ventilation system, it is permissible to utilize automatic reset of alarms and ventilation system after the refrigerant concentration has reduced below the OEL and maintained below the OEL for a minimum of 15 minutes.~~

~~**605.8.1.2 High level response.** The system shall be designed to perform the following actions when the concentration of refrigerant detected exceeds the refrigerant concentration limit (RCL), or 25 percent of the lower flammable limit (LFL), or upper detection limit of the detector, whichever is lower, for any refrigerant utilized in the machinery room:~~

- ~~1. Initiate audible and visible alarms inside of and outside each entrance to the refrigerating machinery room and transmit a signal to an approved location.~~
- ~~2. The ventilation system shall provide a flow rate not less than 100% of the emergency conditions quantity required by the International Mechanical Code.~~
- ~~3. For Group A2L, A2, A3, B2L, B2, and B3 refrigerants, stop refrigerant equipment in the machinery room in accordance with Section 605.9.1.~~
- ~~4. After initiation, alarms and ventilation system shall continue until manually reset at a location within the machinery room.~~

605.8.2 Flammable refrigerants other than ammonia. Detection of a refrigerant concentration exceeding the refrigerant concentration limit (RCL) value as shown in Table 1103.1 of the International Mechanical Code, or twenty-five percent of the lower flammable limit (LFL), or the upper detection limit, whichever is lower, shall stop refrigerant equipment in the machinery room in accordance with Section 605.9.1. The detection, signaling and control circuits shall be supervised. Multi-port type refrigerant detectors shall be prohibited where using any flammable refrigerant. Group A2L and Group B2L refrigerants, other than ammonia, shall comply with Section 605.8.3.

605.8.3 A2L and B2L refrigerants other than ammonia. Refrigerant detectors for Group A2L and Group B2L refrigerants, other than ammonia, shall meet all of the following conditions:

1. A refrigerant detector shall be capable of detecting each of the specific refrigerant designations in the machinery room.

2. The refrigerant detector shall activate responses within a time not to exceed a limit specified in Table 605.8.3, after exposure to a refrigerant concentration exceeding a limit value specified in Table 605.8.3.

3. The refrigerant detector shall have a set point not greater than the applicable occupational exposure limit (OEL) value as specified in Table 1103.1 of the International Mechanical Code. The applicable OEL value shall be the lowest OEL value for any refrigerant designation in the machinery room. Refrigerants that do not have a published OEL value in the International Mechanical Code shall use the values published in ASHRAE 34, or a value determined in accordance with ASHRAE 34 where approved by the fire code official.

4. The refrigerant detector shall have a set point not greater than the applicable refrigerant concentration limit (RCL) value as specified in Table 1103.1 of the International Mechanical Code. The applicable RCL value shall be the lowest RCL value for any refrigerant designation in the machinery room. Refrigerants that do not have a published RCL value in the International Mechanical Code shall use the values published in ASHRAE 34, or a value determined in accordance with ASHRAE 34 where approved by the fire code official.

5. The refrigerant detector shall provide a means for automatic self-testing. In the event of a failure during a refrigerant detector self-test, a trouble alarm signal shall be transmitted to an approved monitored location. The refrigerant detector shall be tested during installation and annually thereafter, or at an interval not exceeding the manufacturer's installation instructions, whichever is more often. Testing shall verify compliance with the alarm set point(s) and response time(s) in accordance with Table 605.8.3.

6. The type of alarm reset for the refrigerant detector shall be in accordance with Table 605.8.3. Manual reset type

alarms shall have the reset located inside the machinery room. Automatic reset type alarms shall not deactivate until after the refrigerant concentration has been reduced below the OEL and maintained below the OEL for not less than 5 minutes.

**Table 605.8.3
ALARMS FOR GROUP A2L AND B2L REFRIGERANTS OTHER THAN AMMONIA**

<u>Limit Value</u>	<u>Response Time</u>	<u>Alarm Type</u>	<u>Alarm Reset Type</u>
<u>Set Point = OEL or less</u>	<u>300 seconds or less</u>	<u>Trouble Alarm</u>	<u>Automatic</u>
<u>Set Point = RCL or less</u>	<u>15 seconds or less</u>	<u>Emergency Alarm</u>	<u>Manual</u>

605.13 Mechanical ventilation exhaust. Exhaust from mechanical ventilation systems serving refrigeration machinery rooms containing flammable, toxic or highly toxic refrigerants, other than ammonia, capable of exceeding 25 percent of the LFL or 50 percent of the IDLH shall be equipped with *approved* treatment systems to reduce the discharge concentrations to those values or lower.

Exception: Refrigeration—Refrigerating systems containing a Group A2L refrigerant and complying with Section ~~605.17~~ 1105.6 of the International Mechanical Code.

2018 International Mechanical Code

~~**1106.5.1 Refrigerant detection system.** The machinery room shall be provided with a refrigerant detection system. The refrigerant detection system shall be in accordance with Section 605.8 of the International Fire Code.~~

Commenter's Reason: ASHRAE SSPC 15 is publishing a modification to ASHRAE Standard 15 that includes new requirements for refrigerant detection for Group A2L refrigerants. The original text of IFC 2018 regarding detectors for Group A2L refrigerants was based on an initial Advisory Public Review (APR) published by ASHRAE in December 2015.

When the ASHRAE SSPC 15 Committee had reviewed all of the comments, they later issued a Publication Public Review (PPR). Through multiple PPRs the detection requirements significantly changed. These proposed modifications are based on the results of input from public comments.

The change will also be consistent with the Public Comment to F79-18, Part II and M88-18. All three of these Public Comments work together in addressing the safety issues when using Group A2L refrigerants.

It is important for the Fire Code to be up-to-date on the use of A2L refrigerants since these refrigerants fall into the category of low global warming potential refrigerants. There will be an increased use of low global warming refrigerants to protect the environment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The change clarifies the detector requirements when using A2L refrigerant in a machinery room. The use of A2L refrigerant remains an option.

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Fire Code

Revise as follows:

[M] 605.16 Electrical equipment. Where *refrigerant* of Groups A2L, A2, A3, B2L, B2 and B3, as defined in the International Mechanical Code, are used, refrigeration machinery rooms shall conform to the Class I, Division 2 hazardous location classification requirements of NFPA 70.

Exceptions:

1. Ammonia machinery rooms that are provided with ventilation in accordance with Section 1106.3 of the International Mechanical Code.
2. Machinery rooms for systems containing Group A2L *refrigerants* that are provided with ventilation in accordance with Section 605.17, or Group B2L refrigerants that are provided with ventilation in accordance with Section 605.17. Sections 605.12.3 and Section 1106.3 of the International Mechanical Code.

[M] 605.17 Special requirements for Group A2L refrigerant machinery rooms. Machinery rooms with systems containing Group A2L refrigerants shall comply with Sections 605.17.1 through 605.17.3. Section 1106.4 of the International Mechanical Code.

Exception: Machinery rooms conforming to the Class 1, Division 2 hazardous location classification requirements of NFPA 70.

Delete without substitution:

~~**[M] 605.17.2 Emergency ventilation system.** An emergency ventilation system shall be provided at the minimum exhaust rate specified in ASHRAE 15 or Table 605.17.2. Shut down of the emergency ventilation system shall be by manual means.~~

**TABLE [M] 605.17.2
MINIMUM EXHAUST RATE**

REFRIGERANT	Q (m ³ /sec)	Q (cfm)
R32	15.4	32,600
R143a	13.6	28,700
R444A	6.46	13,700
R444B	10.6	22,400
R445A	7.83	16,600
R446A	23.9	50,700
R447A	23.8	50,400
R451A	7.04	15,000
R451B	7.05	15,000
R1234yf	7.80	16,600
R1234ze(E)	5.92	12,600

~~**[M] 605.17.3 Emergency ventilation system discharge.** The point of discharge to the atmosphere shall be located outside of the structure at not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or exit.~~

2018 International Mechanical Code

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

Delete and substitute as follows:

~~**FLAMMABILITY CLASSIFICATION.** Refrigerants shall be assigned to one of the three classes—1, 2 or 3—in accordance with ASHRAE 34. For Classes 2 and 3, the heat of *combustion* shall be calculated assuming that *combustion* products are in the gas phase and in their most stable state.~~

~~**Class 1.** Refrigerants that do not show flame propagation when tested in air at 14.7 psia (101 kPa) and 140°F (60°C).~~

~~**Class 2.** Refrigerants having a lower flammability limit (LFL) of more than 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) and a heat of combustion of less than 8169 Btu/lb (19 000 kJ/kg).~~

~~**Class 3.** Refrigerants that are highly flammable, having a LFL of less than or equal to 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) or a heat of combustion greater than or equal to 8169 Btu/lb (19 000 kJ/kg).~~

~~**FLAMMABILITY CLASSIFICATION (REFRIGERANT).** The alphabetical/numerical designation used to identify the flammability of refrigerants. Class 1 indicates a refrigerant with no flame propagation. Class 2L indicates a refrigerant with lower flammability and lower burning velocity. Class 2 indicates a refrigerant with lower flammability. Class 3 indicates a refrigerant with higher flammability.~~

Add new definition as follows:

~~**REFRIGERANT CONCENTRATION LIMIT (REFRIGERANT) (RCL)** The refrigerant concentration limit, in air, intended to reduce the risks of acute toxicity, asphyxiation, and flammability hazards in normally occupied, enclosed spaces.~~

Delete and substitute as follows:

~~**REFRIGERANT SAFETY CLASSIFICATIONS.** Groupings that indicate the toxicity and flammability classes in accordance with Section 1103.1. The classification group is made up of a letter (A or B) that indicates the toxicity class, followed by a number (1, 2 or 3) that indicates the flammability class. Refrigerant blends are similarly classified, based on the compositions at their worst cases of fractionation, as separately determined for toxicity and flammability. In some cases, the worst case of fractionation is the original formulation.~~

~~**Flammability.** See “Flammability classification.”~~

~~**Toxicity.** See “Toxicity classification.”~~

REFRIGERANT SAFETY GROUP CLASSIFICATION. The alphabetical/numerical designation that indicates both toxicity and flammability classifications of refrigerants.

Toxicity. See "Toxicity classification (Refrigerant)."

Flammability. See "Flammability classification (Refrigerant)."

~~**TOXICITY CLASSIFICATION.** Refrigerants shall be classified for toxicity in one of two classes in accordance with ASHRAE 34:~~

~~**Class A.** Refrigerants that have an occupational exposure limit (OEL) of 400 parts per million (ppm) or greater.~~

~~**Class B.** Refrigerants that have an OEL of less than 400 ppm.~~

TOXICITY CLASSIFICATION (REFRIGERANT). An alphabetical designation used to identify the toxicity of refrigerants. Class A indicates a refrigerant with lower toxicity. Class B indicates a refrigerant with higher toxicity.

CHAPTER 11 REFRIGERATION

SECTION 1103 REFRIGERATION SYSTEM CLASSIFICATION

Revise as follows:

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Each refrigerant shall be assigned to one of the following refrigerant safety group classifications: A1, A2L, A2, A3, B1, B2L, B2, or B3. For refrigerants that do not have values in Table 1103.1, the safety group, RCL value, and OEL value shall be determined in accordance with ASHRAE 34 and approved by the code official.

TABLE 1103.1

REFRIGERANT CLASSIFICATION, AMOUNT AND OEL

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. For installations that are entirely outdoors, use 3-1-0.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.
- f. ~~The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~

1106.4 Flammable refrigerants. Where refrigerants of Groups A2L, A2, A3, B2L, B2 and B3 are used in one or more refrigerating systems, the *machinery room* shall conform to the Class 1, Division 2, *hazardous location* classification requirements of NFPA 70.

Exceptions:

1. Ammonia *machinery rooms* that are provided with *ventilation* in accordance with Section 1106.3.
2. ~~*Machinery rooms for systems containing in which the refrigerating system(s) that contain(s) flammable refrigerants utilize only Group A2L refrigerants that refrigerant(s), and are in accordance with Section 1106.5.*~~

1106.5.2 Emergency ventilation system. An emergency ventilation system shall be provided at the minimum exhaust rate specified in ASHRAE ~~15 or Table 1106.5.2-15~~. Shutdown of the emergency ventilation system shall be by manual means.

Delete without substitution:

Reason:

The proposed code changes include technical content based on ASHRAE Standard 34-2016 with Addendum G and ASHRAE Standard 15-2016 with Addendum H. The revisions in these two ASHRAE addenda are dependent and must be correlated as shown in this code change proposal. Upon publication, these addenda will be incorporated into the 2019 editions of ASHRAE 34 and ASHRAE 15.

There was a considerable amount of industry research into the use of flammable refrigerants that occurred in 2016 and 2017, following the announcement in June 2016 of a collaborative research effort between ASHRAE, AHRI, and US DOE. ASHRAE SSPC15 relied upon this body of knowledge, extended upon prior ASHRAE research from 2012, in drafting the addenda to the 2016 edition of Standard 15.

The refrigerant safety group classification is an alphabetical/numerical designation that is used to identify both the toxicity and flammability classifications of a given refrigerant. There are two new safety group classifications added to ASHRAE 34: A2L and B2L. Previously 2L was a sub-class of class 2 as an interim measure to implement changes to refrigerant flammability classification into ASHRAE 34 prior to making associated changes to a future edition of ASHRAE 15; but now 2L is a separate class and safety requirements must be revised to distinguish between class 2 and class 2L.

The current definitions of “flammability classification” and “toxicity classification” are improper since both contain mandatory code requirements. The definitions should only define the term, not contain code requirements with the use of the word “shall.” The current definition of refrigerant safety classifications is incorrect due to revisions to ASHRAE 34. The attempt to define the technical requirements of flammability are not correct. ASHRAE 34 goes into extensive requirements as to how to test and classify a refrigerant regarding flammability. The code should leave the technical requirements to ASHRAE 34 which is accomplished in Section 1103.1. The definition only has to identify the meanings of the classification categories. These terms used are found in the body of ASHRAE 34. The addition of “refrigerant” to the term “flammability classification” and “toxicity classification” clarify that the definitions only apply to refrigerants. Flammability and toxicity are terms also used in the ventilation sections of the code. These definitions do not apply to the use of those terms in Chapter 5.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This code change proposal addresses a new safety group of refrigerants, with no precedent on the construction costs.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Should not remove the exhaust rate table and rely solely on the standards. (Vote 11-0)

Assembly Action:

None

F79-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

605.16 Electrical equipment. Where *refrigerant* of Groups A2L, A2, A3, B2L other than ammonia, B2 and B3, as defined in the International Mechanical Code, are used, refrigeration machinery rooms shall conform to the Class I, Division 2 hazardous location classification requirements of NFPA 70.

Exceptions:

1. Ammonia machinery rooms that are provided with ventilation in accordance with Section 1106.3 of the International Mechanical Code.
2. Machinery rooms for systems containing Group A2L or B2L refrigerants that are provided with ~~ventilation~~ refrigerant detection in accordance with Section 605.17, ~~or Group B2L refrigerants that are provided with 8~~ and ventilation in accordance with ~~Sections~~ Section 605.12.3-13 and Section 1106.3-5 of the International Mechanical Code.

~~**605.17 Special requirements for Group A2L refrigerant machinery rooms.** Machinery rooms with systems containing Group A2L refrigerants shall comply with Section 1106.4 of the International Mechanical Code.~~

~~**Exception:** Machinery rooms conforming to the Class 1, Division 2 hazardous location classification requirements of NFPA 70.~~

2018 International Mechanical Code

SECTION 1106 MACHINERY ROOM, SPECIAL REQUIREMENTS

1106.4 Flammable refrigerants. Where refrigerants of Groups A2L, A2, A3, B2L other than ammonia, B2 and B3 are used in one or more refrigerating systems, the *machinery room* shall conform to the Class 1, Division 2, *hazardous location* classification requirements of NFPA 70.

~~Exceptions~~ **Exception:** ~~1. Ammonia machinery rooms that are provided with ventilation in accordance with Section 1106.3. 2. Machinery rooms in which the refrigerating system(s) that contain(s) flammable refrigerants utilize only Group A2L refrigerant(s) or Group B2L refrigerant(s) other than ammonia, and are in accordance with comply with the ventilation requirements of Section 1106.5.2.~~

1106.5 Special requirements for Group A2L and B2L refrigerant machinery rooms. *Machinery rooms* for systems containing Group A2L or Group B2L refrigerants other than ammonia shall comply with Sections 1106.5.1 through 1106.5.3.

Exception: *Machinery rooms* conforming to the Class I, Division 2, hazardous location classification requirements of NFPA 70 are not required to comply with Sections 1106.5.1 and 1106.5.2.

~~**1106.5.2 Emergency ventilation system.** An emergency ventilation system shall be provided at the minimum exhaust rate specified in ASHRAE 15. Shutdown of the emergency ventilation system shall be by manual means.~~

1106.5.2 Ventilation required. Machinery rooms shall be vented to the outdoors, utilizing ventilation in accordance with Sections 1106.5.3 through 1106.5.8 or ASHRAE 15.

1106.5.3 Alarms. Alarms shall comply with Sections 1106.5.3.1 through 1106.5.3.4.

1106.5.3.1 Annunciation. The alarm shall have visual and audible annunciation inside the machinery room and outside each entrance to the machinery room.

1106.5.3.2 Set point. The refrigerant detector set points shall activate an alarm in accordance with the type of reset in Table 1106.5.3.2. Manual reset type alarms shall have the reset mechanism located inside the machinery room.

**TABLE 1106.5.3.2
VENTILATION FOR GROUP A2L AND B2L REFRIGERANTS OTHER THAN AMMONIA**

Limit Value	Response Time (seconds)	Alarm Type	Alarm Reset Type	Ventilation Rate	Ventilation Reset Type
Set Point ≤ OEL	≤ 300	Trouble Alarm	Automatic	Level 1	Automatic
Set Point ≤ RCL	≤ 15	Emergency Alarm	Manual	Level 2	Manual

1106.5.3.3 Optional setting. Alarms set at levels other than indicated in Table 1106.5.3.2, such as IDLH, and automatic reset alarms are permitted in addition to those required by Section 1106.5.3. The meaning of each alarm shall be clearly marked by signage near the annunciators.

1106.5.3.4 Trouble alarm. In the event of a failure during a refrigerant detector self-test, a trouble alarm signal shall be transmitted to an approved monitored location.

1106.5.4 Mechanical ventilation. Mechanical ventilation shall be in accordance with all of the following:

1. One or more power-driven fans capable of exhausting air from the machinery room shall be provided. Multispeed fans shall be permitted.
2. Electric motors driving fans shall not be placed inside ducts. Fan rotating elements shall be nonferrous or nonsparking, or the casing shall consist of or be lined with such material.
3. Supply make-up air to replace that being exhausted shall be provided. Ducts for supply to and exhaust from the machinery room shall serve no other area. Makeup air supply outlet locations shall be positioned relative to the exhaust air inlet location(s) to prevent short-circuiting.
4. Inlets to the exhaust ducts shall be located in an area where refrigerant from a leak will concentrate, with consideration given to the location of the makeup air supply paths and refrigerating machines, and the density of the refrigerant relative to air.
5. Inlets to exhaust ducts shall be within 1 ft (0.3 m) of the lowest point of the machinery room for refrigerants that are heavier than air, and shall be within 1 ft (0.3 m) of the highest point for refrigerants that are lighter than air.
6. The discharge of the exhaust air shall be to the outdoors in such a manner as not to cause a nuisance or danger.

1106.5.5 Level 1 Ventilation. The refrigerating machinery room mechanical ventilation required by Section 1106.5.4 shall exhaust at an airflow rate not less than shown in Table 1106.5.5. Ventilation reset shall be in accordance with the type of reset in Table 1106.5.3.2. Automatic reset shall not deactivate the ventilation system until after the refrigerant concentration has been reduced below the OEL and maintained below the OEL for not less than 5 minutes.

**TABLE 1106.5.5
Level 1 Ventilation Rate for Class A2L Refrigerants**

Status	Airflow
<u>Operated when occupied, and</u> <u>Operated when activated in accordance with Section 1106.5.2 and Table 1106.5.3.2</u>	The greater of: (a) 0.5 ft ³ /min per ft ² (2.54 L/s per m ²) of <i>machinery room</i> area, or (b) 20 ft ³ /min (9.44 L/s) per person
<u>Operable when occupied</u>	With or without mechanical cooling of the <i>machinery room</i> , the greater of: (a) the airflow rate required to not exceed a temperature rise of 18°F (10°C) above inlet air temperature, or (b) the airflow rate required to not exceed a maximum air temperature of 122°F (50°C) in the <i>machinery room</i>

1106.5.6 Level 2 Ventilation. A part of the *machinery room* mechanical ventilation referred to in Section 1106.5.4 shall exhaust an accumulation of refrigerant resulting from leaks or a rupture of a refrigerating system or portion thereof in the *machinery room*. The refrigerant detector(s) shall activate ventilation at a set point and response time in accordance with Table 1106.5.3.2, and at an airflow rate not less than the value determined in accordance with Section 1106.5.7. Where multiple refrigerant designations are in the *machinery room*, the required airflow shall be evaluated according to each refrigerating system and the highest airflow rate shall apply.

Ventilation reset shall be in accordance with the type of reset in Table 1106.5.3.2. Manual type ventilation reset shall have the reset mechanism located inside the *machinery room*.

1106.5.7 Group A2L ventilation rate. Where required by Section 1106.5.6, the total airflow for Level 2 Ventilation shall be not less than the airflow rate determined by Figure 1106.5.7.

~~1106.5.3~~**1106.5.8 Emergency ventilation system discharge.** The emergency ventilation system point of discharge to the atmosphere shall be located outside of the structure at not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, *ventilation* opening or *exit*.

FIGURE 1106.5.7 (I-P)
Level 2 Ventilation Rate for Group A2L Refrigerants

FIGURE 1106.5.7 (SI)
Level 2 Ventilation Rate for Group A2L Refrigerants

Commenter's Reason: When the ventilation table was added to the 2018 Code, it was based on an initial Advisory Public Review (APR) published by ASHRAE. When the SSPC 15 (ASHRAE 15 Committee) had reviewed all of the comments, they issue a Publication Public Review (PPR). Through multiple PPRs, the ventilation requirements significantly changed. These modifications are based on the results of input from public comments.

The proposed modification will add new ventilation requirements to the code consistent with what will appear in ASHRAE 15. The ventilation requirements are based on the size of the refrigerant charge and the pressure of the refrigerant system. There are two levels of ventilation required. The first level, identified as Level 1, is based on a minor leak in the refrigerant system. Level 1 ventilation also requires the signaling of a trouble alarm.

Since Level 1 Ventilation is based on a minor leak, the alarm is permitted to automatically reset. This allows normal operation in the event of a nuisance alarm.

When there is a significant leak of the refrigerant, Level 2 ventilation is automatically activated. Level 2 ventilation is required when the refrigerant detector reaches a concentration of refrigerant that is at or above the RCL which is 25 percent of the lower flammable limit for A2L refrigerants. The ventilation rate is determined by the value shown on the charts, based on charge size and system pressure. Once Level 2 ventilation is activated, an emergency signal is activated and the alarms (detector) must be manually reset.

The two levels of ventilation are a better method of providing the necessary safety in a machinery room. This prevents a dangerous level of refrigerant from accumulating in the event of a leak.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change clarifies the requirements for ventilation of a machinery room. The use of A2L refrigerant is optional.

F79-18 Part II

F81-18

IFC: 605.12.2, 605.12.2.1, 605.12.4

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (JBEngineer@aol.com)

2018 International Fire Code

Revise as follows

605.12.2 Flammable refrigerants. Systems containing more than 6.6 pounds (3 kg) of ~~flammable Group A2, A3, B2, or B3~~ refrigerants having a density equal to or greater than the density of air shall discharge vapor to the atmosphere only through an *approved* treatment system in accordance with Section 605.12.5 or a flaring system in accordance with Section 605.12.6. Systems containing more than 6.6 pounds (3 kg) of ~~flammable Group A2, A3, B2, or B3~~ refrigerants having a density less than the density of air shall be permitted to discharge vapor to the atmosphere provided that the point of discharge is located outside of the structure at not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or *exit*.

Add new text as follows

605.12.2.1 Group A2L refrigerant. Systems containing more than 6.6 pounds (3 kg) of Group A2L refrigerant shall discharge vapor directly to atmosphere where the fire code official determines, on review of an engineering analysis prepared in accordance with Section 104.7.2, that a fire hazard would not result from atmospheric discharge of Group A2L refrigerant.

Revise as follows

605.12.4 Ammonia and Group B2L refrigerant. Systems containing more than 6.6 pounds (3 kg) of ammonia or Group B2L refrigerant shall discharge vapor to the atmosphere in accordance with one of the following methods:

1. Directly to atmosphere where the *fire code official* determines, on review of an engineering analysis prepared in accordance with Section 104.7.2, that a fire, health or environmental hazard would not result from atmospheric discharge of ammonia or B2L refrigerant.
2. Through an *approved* treatment system in accordance with Section 605.12.5.
3. Through a flaring system in accordance with Section 605.12.6.
4. ~~Through~~ For ammonia, through an *approved* ammonia diffusion system in accordance with Section 605.12.7.
5. By other *approved* means.

Exception: Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.

Reason: ASHRAE 34 changed the grouping of refrigerants adding two new categories, A2L and B2L. These refrigerants are lower flammable refrigerants. The refrigerants do not readily ignite and do not pose the same hazard as A2, A3, B2, and B3 refrigerants. With the addition of these new refrigerants, revisions are necessary to these section. Ammonia is a Group B2L refrigerant, hence, there are already special requirements. The modification will allow other B2L refrigerants to meet the same requirements.

A2L refrigerants have similar flammability characteristics to ammonia. Hence, allowance for the evaluation of ignition should apply similar to ammonia. The text in Section 606.12.3.1 is similar to item 1 in Section 606.12.5. Item 1 of Section 606.12.5 also includes an evaluation of the health or environmental hazard which would not apply to A2L refrigerants.

Cost Impact: The code change proposal will decrease the cost of construction Group A2L refrigerants will be treated similar to ammonia regarding the flammability.

F81-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based upon the action taken on F79-18 Part I which also deals with A2L refrigerants. This may be a viable option but more information is needed. (Vote: 14-0)

Assembly Action:

None

F81-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (JBEngineer@aol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

605.12.2 Flammable refrigerants. Systems containing more than 6.6 pounds (3 kg) of Group A2, A3, B2, or B3 refrigerants having a density equal to or greater than the density of air shall discharge vapor to the atmosphere only through an *approved* treatment system in accordance with Section 605.12.5 or a flaring system in accordance with Section 605.12.6. Systems containing more than 6.6 pounds (3 kg) of Group A2, A3, B2, or B3 refrigerants having a density less than the density of air shall be permitted to discharge vapor to the atmosphere provided that the point of discharge is located outside of the structure at not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or *exit*.

605.12.2.1 Group A2L refrigerant. Systems containing more than 6.6 pounds (3 kg) of Group A2L refrigerant shall discharge vapor directly to atmosphere where the fire code official determines, on review of an ~~engineering~~ analysis prepared in accordance with Section 104.7.2, that a fire hazard would not result from atmospheric discharge of Group A2L refrigerant.

605.12.4 Ammonia and Group B2L refrigerant. Systems containing more than 6.6 pounds (3 kg) of ammonia or Group B2L refrigerant shall discharge vapor to the atmosphere in accordance with one of the following methods:

1. Directly to atmosphere where the *fire code official* determines, on review of an engineering analysis prepared in accordance with Section 104.7.2, that a fire, health or environmental hazard would not result from atmospheric discharge of ammonia or B2L refrigerant.
2. Through an *approved* treatment system in accordance with Section 605.12.5.
3. Through a flaring system in accordance with Section 605.12.6.
4. For ammonia, through an *approved* ammonia diffusion system in accordance with Section 605.12.7.
5. By other *approved* means.

Exception: Ammonia/water absorption systems containing less than 22 pounds (10 kg) of ammonia and for which the ammonia circuit is located entirely outdoors.

Commenter's Reason: This is a companion change to F79-18. The Committee response is not accurate in that F79-18 does not address the discharge of Group A2L or B2L refrigerants. These two class of refrigerants have the flammability properties similar to ammonia, which is a B2L refrigerant. Hence, a separate section is needed to regulate the refrigerants. The requirements for the remaining flammable refrigerants that fall into Group A2, A3, B2, and B3 do not change. The only new requirements are for A2L refrigerants. Engineering was removed as a prefix to analysis since the term is unnecessary with a reference to Section 104.7.2. This will avoid possible confusion.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The discharge of A2L and B2L refrigerants will be properly addressed. The newer discharge requirements are less expensive to install.

F81-18

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows

606.1 General. Elevators and conveying systems required by this code or the International Building Code shall comply with Chapter 30 of the International Building Code and Sections 606.2 through 606.6

Revise as follows

~~606.1~~**606.2 Emergency operation.** Existing elevators with a travel distance of 25 feet (7620 mm) or more shall comply with the requirements in Chapter 11-of this code. New elevators shall be provided with Phase I emergency recall operation and Phase II emergency in-car operation in accordance with ASME A17.1/CSA B44.

~~606.2~~**606.3 Standby power.** In buildings and structures where standby power is required or furnished to operate an elevator, standby power shall be provided in accordance with Section 1203-of this code. Operation of the system shall be in accordance with Sections ~~606.2.1~~606.3.1 through ~~606.2.4~~ 606.3.4.

~~606.2.1~~**606.3.1 Manual transfer.** Standby power shall be manually transferable to all elevators in each bank.

~~606.2.2~~**606.3.2 One elevator.** Where only one elevator is installed, the elevator shall automatically transfer to standby power within 60 seconds after failure of normal power.

~~606.2.3~~**606.3.3 Two or more elevators.** Where two or more elevators are controlled by a common operating system, all elevators shall automatically transfer to standby power within 60 seconds after failure of normal power where the standby power source is of sufficient capacity to operate all elevators at the same time. Where the standby power source is not of sufficient capacity to operate all elevators at the same time, all elevators shall transfer to standby power in sequence, return to the designated landing and disconnect from the standby power source. After all elevators have been returned to the designated level, not less than one elevator shall remain operable from the standby power source.

~~606.2.4~~**606.3.4 Machine room ventilation.** Where standby power is connected to elevators, the machine room ventilation or air conditioning shall be connected to the standby power source.

~~[BE] 606.3~~**606.4 Emergency signs.** An *approved* pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the exit stairways and not to use the elevators in case of fire. The sign shall read: IN FIRE EMERGENCY, DO NOT USE ELEVATOR. USE EXIT STAIRS.

Exceptions:

1. The emergency sign shall not be required for elevators that are part of an accessible *means of egress* complying with Section 1009.4.
2. The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008 of the International Building Code.

Add new text as follows

606.5 Maintenance of elevators. Elevator features and lobbies required by Section 3006 of the International Building Code shall be maintained and in accordance with Sections 606.5.1 thru 606.5.3

Revise as follows

~~606.4~~**606.5.1 Fire service access elevator-elevators and lobbies.** Where fire service access elevators are required by Section 3007 of the International Building Code, the fire service access elevator fire protection and safety features required by Section 3007 of the International Building Code shall be maintained and lobbies shall be maintained free of storage and furniture.

~~606.5~~**606.5.2 Occupant evacuation elevator elevators and lobbies.** Where occupant evacuation elevators are provided in accordance with Section 3008 of the International Building Code, the occupant evacuation elevator fire protection and safety features and lobbies required by Section 3008 of the International Building Code shall be maintained free of storage and furniture.

~~606.6~~**606.5.3 Water protection of hoistway enclosures.** Methods to prevent water from infiltrating into a hoistway enclosure required by Section 3007.3 and Section 3008.3 of the International Building Code shall be maintained.

Add new text as follows

606.6 Elevator keys. All elevators shall be provided with elevator car door and fire-fighter service keys in accordance with Sections 606.6.1 thru 606.6.2.4

Revise as follows

~~606.7~~**606.6.1 Elevator key location.** Keys for the elevator car doors and fire-fighter service keys shall be kept in an *approved* location for immediate use by the fire department.

~~606.8~~**606.6.2 Standardized fire service elevator keys.** Buildings with elevators equipped with Phase I emergency recall, Phase II emergency in-car operation, or a fire service access elevator shall be equipped to operate with a standardized fire service elevator key approved by the *fire code official*.

Exception: The owner shall be permitted to place the building's nonstandardized fire service elevator keys in a key box installed in accordance with Section 506.1.2.

~~606.8.1~~**606.6.2.1 Requirements for standardized fire service elevator keys.** Standardized fire service elevator keys shall comply with all of the following:

1. All fire service elevator keys within the jurisdiction shall be uniform and specific for the jurisdiction. Keys shall be cut to a uniform key code.
2. Fire service elevator keys shall be of a patent-protected design to prevent unauthorized duplication.
3. Fire service elevator keys shall be factory restricted by the manufacturer to prevent the unauthorized distribution of key blanks. Uncut key blanks shall not be permitted to leave the factory.
4. Fire service elevator keys subject to these rules shall be engraved with the words "~~DO~~ DO NOT DUPLICATE."

~~606.8.2~~**606.6.2.2 Access to standardized fire service keys.** Access to standardized fire service elevator keys shall be restricted to the following:

1. Elevator owners or their authorized agents.
2. Elevator contractors.
3. Elevator inspectors of the jurisdiction.
4. *Fire code officials* of the jurisdiction.
5. The fire department and other emergency response agencies designated by the *fire code official*.

~~606.8.3~~**606.6.2.3 Duplication or distribution of keys.** A person shall not duplicate a standardized fire service elevator key or issue, give, or sell a duplicated key unless in accordance with this code.

~~606.8.4~~**606.6.2.4 Responsibility to provide keys.** The building owner shall provide up to three standardized fire service elevator keys where required by the *fire code official*, upon installation of a standardized fire service key switch or switches in the building.

Reason: This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

The new scoping section for elevators correlates Section 606 with Chapter 30 of the International Building Code. Clarity is provided regarding the maintenance of not only the elevator lobbies, but also the fire protection and safety features of the elevator. Clarity is also provided in grouping together the sections for maintenance of elevators and lobbies (the new Section 606.5) and the sections for elevator keys (the new Section 606.6)

It is the intention of F-CAC that this proposal correlate with the B-CAC Proposal being heard by the IBC-E Technical Committee to match the elevator signage requirements for standard and occupant evacuation elevators in both IBC

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal clarifies already existing requirements.

Public Hearing Results

Errata: 606.5.2 Occupant evacuation elevators and lobbies. Where occupant evacuation elevators are provided in accordance with Section 3008 of the International Building Code, the occupant evacuation elevator fire protection and safety features and lobbies required by Section 3008 of the International Building Code shall be maintained ~~and maintained~~ free of storage and furniture.

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved as the IFC does not require elevators and does not address conveying systems. It was also suggested that Section 606.1 be clarified that Sections 606.2 through 606.6 are sections within the IFC not IBC. (Vote: 14-0)

Assembly Action:

None

F84-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

606.1 General. ~~Elevators~~ Where elevators and conveying systems ~~required by this code or the International Building Code are installed, they shall comply with Chapter 30 of the International Building Code and Sections 606.2 through 606.6 of this code.~~

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The modification by this Public Comment addresses the Technical Committee reason for Disapproval. The original proposal is part of a package of Chapter 6 reorganization proposals; this proposal is necessary to coordinate the new section numbers with the other Chapter 6 proposal that were AS or AM by the Technical Committee,

Although the Fire Code requires elevators for accessibility in Section 1009.2.1, the requirements in Chapter 30 of the Building Code and Section 606 of the Fire Code should be enforced, whether elevators are required to be installed or not.

Clarification is proposed to the scoping section of Section 606 to clarify the application of the requirements of Section 606 of the Fire Code and Chapter 30 of the Building Code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal clarifies already existing requirements.

F84-18

F85-18

IFC: 606.6

Proposed Change as Submitted

Proponent: Adria Reinertson, Riverside County Fire Department, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)

2018 International Fire Code

Add new text as follows

606.6 Storage within elevator lobbies. Where hoistway opening protection is required by Section 3006.2 of the International Building code, elevator lobbies shall be maintained free of storage.

Reason: There are existing provisions to prohibit storage of furniture and combustibles in fire service and occupant evacuation elevators. This proposal addresses combustible storage in other elevator lobbies requiring hoistway protection.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal clarifies that storage is not permitted in any protected hoistway and does not have an impact on construction costs.

F85-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved as determining what is considered storage as often these spaces will contain furniture. (Vote: 13-1)

Assembly Action:

None

F85-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Adria Reinertson, representing Riverside County Fire Department, California Fire Chiefs Association (adriar@moval.org)requests As Submitted.

Commenter's Reason:

Section 3006.2 of the International Building Code requires hoistway protection in accordance with IBC Section 3006.3 if a building meets certain criteria, i.e. height, occupancy or lack of fire protection. Two of the methods to protect the hoistway is by use of enclosed elevator lobbies. As mentioned in the original proposal reason statement, there are already provisions in the IFC to eliminate storage and furniture within occupant evacuation elevator and firefighter access elevator lobbies. As there are other required elevator lobbies to protect hoistways, this proposal is attempting to ensure that these elevator lobbies will not be used as overflow storage or staging areas.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal clarifies that storage is not permitted within any protected hoistway and does not have an impact on cost of construction.

F85-18

F86-18

IFC: 606.8, 606.8.1

Proposed Change as Submitted

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org)

2018 International Fire Code

Revise as follows

606.8 Standardized fire service elevator keys. Buildings with elevators equipped with Phase I emergency recall, Phase II emergency in-car operation, or a fire service access elevator shall be equipped to operate with a standardized fire service elevator key approved by the *fire code official* or a standardized key in accordance with ASME A17.1/CSA B44.

Exception: The owner shall be permitted to place the building's nonstandardized fire service elevator keys in a key box installed in accordance with Section 506.1.2.

606.8.1 Requirements for standardized fire service elevator keys. Standardized fire service elevator keys shall comply with all of the following:

1. All fire service elevator keys within the jurisdiction shall be uniform and ~~specific for the jurisdiction.~~ approved in accordance with Section 606.8. Keys shall be cut to a uniform key code.
2. Fire service elevator keys shall be of a patent-protected design to prevent unauthorized duplication.
3. Fire service elevator keys shall be factory restricted by the manufacturer to prevent the unauthorized distribution of key blanks. Uncut key blanks shall not be permitted to leave the factory.
4. Fire service elevator keys subject to these rules shall be engraved with the words "DO NOT DUPLICATE."

Reason: To eliminate a potential conflict with ASME A17.1/CSA B44 and all jurisdictions more flexibility in selection of a standardized keys.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change will not impact cost since it allows more options and eliminates a potential conflict.

F86-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based upon concern that the fire code official could already allow such keys therefore the reference is unnecessary. (Vote: 14-0)

Assembly Action:

None

F86-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Kevin Brinkman, representing National Elevator Industry, Inc. (klbrinkman@neii.org) requests As Submitted.

Commenter's Reason: Request approval as submitted. This proposal was submitted by NEII but is was also reviewed with the ASME Code Coordination committee which includes members from ICC and NFPA. ASME A17.1/CSA B44 requires the use of an FEO-K1 key for operation of all switches for Firefighters Emergency Operation (FEO) on elevators. This requirement to A17.1/B44 was added based on meetings with firefighters and their request to have one unique key. The current language in 606.8.1 requires keys that are "... uniform and specific to a jurisdiction.". The phrase "... specific to a jurisdiction" could be misinterpreted to mean that each jurisdiction must have its own unique key that is different than all other jurisdictions. This interpretation creates a conflict with ASME A17.1/CSA B44. The proposed change would still require the same key to be used throughout the jurisdiction, but would allow that key to be used by other jurisdictions as well, and eliminate the conflict with A17.1/B44. This would increase safety by allowing firefighters called to assist in a neighboring jurisdiction to have the key necessary for operation of the FEO system.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Since this change is to clarify the language and eliminate a potential conflict there is no change in the cost of construction.

F86-18

F87-18

IFC: 606.8.5, 315.3.3

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows

606.8.5 Storage. Furniture, materials or combustible waste shall not be stored in elevator cars or elevator machine rooms.

Exception: Blankets used for protection of elevator cab walls during construction or renovation.

Revise as follows

315.3.3 Equipment rooms. Combustible material shall not be stored in boiler rooms, mechanical rooms, elevator machine rooms, electrical equipment rooms or in *fire command centers* as specified in Section 508.1.5.

Reason: This is one of 17 proposals being submitted as a package relating to technical and organizational changes proposed for Chapter 6. While the Fire Code Committee will consider each proposal independently, the intent is for approval of all proposals in this package which have been submitted as a correlated set of companion code change proposals.

These changes will clarify that elevator cars and machine rooms are not to be used for storage. An exception is provided for blankets that are used for protecting the elevator cab walls.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. These areas are currently not permitted to be used for storage purposes.

F87-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved but was felt to have merit. More language regarding combustibility of furniture needs to be worked into the proposal to make it viable. (Vote: 13-1)

Assembly Action:

None

F87-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

606.8.5 Storage. ~~Furniture, materials or combustible waste shall not be stored~~ Storage is prohibited in elevator cars or elevator machine rooms.

Exception: Exceptions:

1. Blankets used for protection of elevator cab walls during construction or renovation.
2. Materials necessary for the operation and maintenance of the elevator equipment

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at:

<https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This modification addresses the concern raised by the Technical Committee. The new language in 606.8.5 is consistent with requirements for general storage restrictions in Section 315.

Fundamentally, any material should not be stored in either elevator cars or elevator machine rooms, other than (1) the blankets used to protect elevator cab walls during construction or renovation, and (2) materials in the elevator machine room that are necessary for the maintenance and operation of elevator equipment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

These areas are currently not permitted to be used for storage purposes.

F87-18

F91-18

IFC: SECTION 708, 708.1

Proposed Change as Submitted

Proponent: Bill McHugh, The McHugh Company, representing National Fireproofing Contractors Association (billmchugh-jr@att.net)

2018 International Fire Code

Add new text as follows

SECTION 708 SPRAY FIRE-RESISTIVE MATERIALS AND INTUMESCENT FIRE-RESISTIVE COATINGS

708.1 Maintaining Protection. The fire-resistance ratings of building elements, components or assemblies shall be maintained. The materials shall be securely bonded, not exhibit cracks, voids, spalls, delamination or any exposure to the substrate and be in accordance with the permitted fireproofing thicknesses. The materials shall be maintained in accordance with the listing and manufacturers instructions, where known.

Reason: We compliment the work of the Fire Code Action Committee and its successful F-113 proposal that resulted in new sections for maintaining assemblies in the IFC Chapter 7, Fire and Smoke Protection Features. There were several needed sections added to the International Fire Code through the F-113 Proposal. However, there was no section submitted at the time by the industry for sprayed fire-resistive materials (SFRM) or intumescent fire-resistive materials (IFRM) Fireproofing. This proposal adds the section to add a section on maintaining protection of building elements, structural members or assemblies receiving SFRM and IFRM Fireproofing.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This code proposal does not increase the cost of construction because all Fire and Smoke Protection Features are supposed to be maintained currently.

F91-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the new proposed section goes beyond what is expected for an inspection and they had issues with the language, specifically regarding what test method is required, "fireproofing thicknesses" and "where known." (Vote: 12-2)

Assembly Action:

None

F91-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Bill McHugh, representing National Fireproofing Contractors Association (billmchugh-jr@att.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

SECTION 708 SPRAY FIRE-RESISTIVE-RESISTANT MATERIALS AND INTUMESCENT FIRE-RESISTIVE COATINGS-RESISTANT MATERIALS

708.1 Maintaining Protection. ~~The fire resistance ratings of building elements, components or assemblies shall be maintained. The materials shall be securely bonded, not exhibit cracks, voids, spalls, delamination or any exposure to the substrate and be in accordance with the permitted fireproofing thicknesses. The materials shall be maintained in accordance with the listing and manufacturers instructions, where known~~Where required when the building was originally permitted and constructed, spray fire-resistant materials and intumescent fire-resistant materials shall be visually inspected to verify that the materials do not exhibit exposure to the substrate.

Commenter's Reason: The purpose of this public comment is to address the Fire-Safety Committee and Opponent comments during the Committee Action Hearings in Columbus, OH. The proposal complimented the work of the Fire Code Action Committee on Chapter 7 creating separate sections for each type of fire-resistance. The committee felt the proposal was valuable and needed in the International Fire Code as it adds maintenance of spray fire-resistant materials and intumescent fire-resistant materials to the code. However, they thought the language was not concise, clear and might be confusing to those inspecting the materials.

To address the committee concerns, the proposal has been modified to be very specific to the type of materials to be visually inspected and maintained. This public comment brings needed attention to spray fire-resistant and intumescent fire-resistant materials that protect the first item mentioned in 701.2, Structural members.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal only clarifies that spray fire-resistant materials and intumescent fire-resistant materials are to be maintained through mentioning specific materials that protect structural elements listed in 701.2.

Proposed Change as Submitted

Proponent: Ali Fattah, City of San Diego, representing Self

2018 International Fire Code

CHAPTER 8 INTERIOR FINISH, DECORATIVE MATERIALS AND FURNISHINGS

SECTION 801 GENERAL

801.1 Scope. The provisions of this chapter shall govern interior finish, interior trim, furniture, furnishings, decorative materials and decorative vegetation ~~in on the interior and exterior of buildings~~. Existing buildings shall comply with Sections 803 through 808. New buildings shall comply with Sections 804 through ~~808~~809, and Section 803 of the International Building Code.

808 OUTDOOR ARTIFICIAL DECORATIVE VEGETATION

808.1 General. Artificial decorative vegetation placed outdoors, within 30 feet (9140 mm) of a building, or on an occupied roof of a building shall comply with this section.

808.2 Testing. Artificial decorative vegetation shall meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701. Meeting such criteria shall be documented and certified by the manufacturer in an approved manner. Alternatively, the artificial decorative vegetation shall be tested in accordance with NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

808.3 Electrical fixtures and wiring. The use of unlisted electrical wiring and lighting on artificial decorative vegetation shall be prohibited. The use of electrical wiring and lighting on artificial trees constructed entirely of metal shall be prohibited.

808.4 Candles and open flames. Candles and open flames shall not be used on or within 5 feet of artificial decorative vegetation.

808.5 Maintenance. Artificial decorative vegetation shall be tested to demonstrate that the flame propagation performance criterion or the heat release criterion from Section 808.2, as appropriate, remains effective for the period for which the artificial decorative vegetation remains in service, as approved by the fire code official. Materials tested to Chapter 16 of NFPA 701 that retain the flame propagation performance shall be deemed acceptable.

Reason: The proposed code change is in response to the increased use of decorative artificial vegetation on occupied roofs, within interior courts in buildings and outdoor occupancies such as Group A-5 stadiums. In the event that plastics in the decorative combustible vegetation ignites it can spread fire to surrounding buildings and this potential was very visible when artificial palm trees on the pool deck at the Las Vegas Cosmopolitan Hotel ignited in July of 2015. The IBC and IFC presently only specifically regulate decorative artificial vegetation in buildings through the requirements in Section 807.4 that was added in the last code cycle. The hazards are just as important in outdoor occupancies as they are in indoor occupancies.

Occupied roofs typically are classified as Group A-2 or A-3 occupancies and outdoor stadiums are classified as Group A-5 both of which accommodate large numbers of people. Additionally, when placed in close proximity to a building they can spread fire to a building if ignited.

Outdoor use poses weathering problems due to moisture, UV exposure or cleaning chemicals necessary to freshen up the vegetation. As a result, testing is required after weathering conditioning per the requirements of Chapter 16 in NFPA 701. Since there are no specific standards and tests done for this specific type of outdoor plastic compliance with the weathering accelerated weathering testing per ASTM D4329 and ASTM D4587 where fire retardant coating is used is not being required to allow the fire code official flexibility.

Cost Impact: The code change proposal will increase the cost of construction

Artificial decorative vegetation protected with fire retardants need to be tested for outdoor weathering.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that they had multiple issues with the proposal including: concern with the maintenance and enforcement, some of the requirements are electrical in scope, the term "permanent" is not specified, there is no size limit, the distance requirement is too high and no justification was provided, construction types are not included and there is no account for weather conditions. (Vote: 14-0)

Assembly Action:

None

F92-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Ali Fattah, City of San Diego, representing City of San Diego (afattah@sandiego.gov) requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

SECTION 320 ARTIFICIAL COMBUSTIBLE VEGETATION

320.1 Artificial Combustible Vegetation on Roofs and Near Buildings. Artificial combustible vegetation exceeding 6 feet (1828.8 mm) in height and permanently installed outdoors, within 5 feet (1524 mm) of a building or on the roof of a building, shall comply with Section 807.4.1. The placement of artificial combustible vegetation shall also comply with Sections 806.3 and 807.4.2.

Exception: Artificial decorative vegetation located more than 30 feet (9144 mm) from the exterior wall of a building.

Commenter's Reason: This public comment has been submitted to address the constructive feedback offered during the committee Action Hearing. While the Fire Code Committee did not approve the original change several members of the committee and speakers in opposition encouraged submitting a public comment because they found that the hazards of artificial vegetation to be valid.

The proposal has been simplified and references applicable provisions in Section 806 and 807. The original proposal had not intended to change those sections but merely copied their requirements into the proposed new Sections. Several speakers and committee members raised issues with the electrical requirements in Section 807.4.2.

The proposal as revised in this public comment mainly focuses on regulating installations in close proximity to buildings or on the roofs of buildings regardless of whether occupied or not since the intent is structure protection and not occupant protection. This addresses some issues raise by the committee regarding applicability.

A height limit of 6 ft was added below which the proposed regulations will not apply. It seems to be a reasonable height and is representative of most common interior applications. An area limit could not be included since fire testing will be necessary to do so. A request was made to the NFPA Foundation for funding and was not approved so resources do not exist now to address this question.

Terms such as permanent and installed are intended to lead the code user to understand that transient items are not being regulated by the proposed section rather it is large Artificial Combustible Vegetation. This should also address a committee members objection that the original proposal would have regulated table top ornaments.

We reduced the fire separation distance originally included in the proposal to 3 ft for two reasons. The first reason is that the IFC does not restrict the location of such materials wen placed on the interior of a building. Secondly, since exterior applications do not have the benefit of fire sprinkler protection it seems prudent to include some distance. Additionally, the proposal does not differentiate between types of construction or exterior finishes however the 5 ft distance has a rational based on the distance in IBC Table 705.8 when exterior wall openings are first permitted in exterior walls that have unprotected openings in non-sprinklered buildings. We should keep in mind that the materials will be labeled to comply with the requirements for interior installations.

Proponent sympathizes with a comment made by a speaker that spoke to the limited resources Fire Code Officials must enforce the fire code and that the additional regulations proposed will add an additional burden. The regulations are necessary to provide a code section to reference when a violation is found of the section in conjunction with other violations. This is like traffic citations given for mobile phone use while driving where it is less likely for law enforcement to make a traffic stop only for that violation. However, if the violation also includes speeding or other moving violations it can be added to the traffic citation.

Finally, the regulations addressing exterior weathering were removed from the proposal since the NFPA 701 edition that will be adopted by the 2021 IBC will require compliance for outdoor installations. It is expected that the protection will remain for the service life of the material.

Bibliography: Two interesting articles might be useful as references were used in developing the code change. <https://www.nfpa.org/News-and-Research/Publications/NFPA-Journal/2016/May-June-2016/Features/Combustible> and <https://library.ul.com/wp-content/uploads/sites/40/2016/09/10266-Artificial-Trees-White-Paper-FinalR1.pdf>

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This code change will minimally increase the cost of construction by extending the regulation to the exterior of the building. However, materials compliance for interior use may require some modification to address exterior weathering. At present the materials address in this code change are regulated by code officials intermittently and inconsistently and the code change will improve uniformity and consistency of enforcement which will reduce the cost of construction due to increase volume of fabrication. .

Proposed Change as Submitted

Proponent: Ali Fattah, City of San Diego, representing Self

2018 International Building Code

CHAPTER 8 INTERIOR FINISHES AND DECORATIVE MATERIALS

SECTION 801 SCOPE

801.1 Scope. The provisions of this chapter shall govern the use of materials used as *interior finishes, trim* and *decorative materials*.

~~FF~~ **802.3 Decorative materials and trim.** *Decorative materials* and *trim* shall be restricted by combustibility, fire performance or flame propagation performance criteria in accordance with Section 806 for the interior of the building and Section 807 for the exterior of the building.

807 ARTIFICIAL DECORATIVE VEGETATION ON BUILDINGS AND IN OUTDOOR OCCUPANCIES

807.1 General. Fixed artificial decorative vegetation placed in outdoor occupancies or on an occupied roof of a building shall comply with this section.

807.2 Testing. Artificial decorative vegetation shall meet the flame propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701. Meeting such criteria shall be documented and certified by the manufacturer in an approved manner. Alternatively, the artificial decorative vegetation shall be tested in accordance with NFPA 289, using the 20 kW ignition source, and shall have a maximum heat release rate of 100 kW.

807.3 Electrical fixtures and wiring. The use of unlisted electrical wiring and lighting on artificial decorative vegetation shall be prohibited. The use of electrical wiring and lighting on artificial trees constructed entirely of metal shall be prohibited.

807.4 Ignition sources and maintenance. Ignition sources and maintenance of outdoor artificial vegetation shall be in accordance with Section 808.4 and 808.5 of the IFC.

Reason: The proposed code change is in response to the increased use of decorative artificial vegetation on occupied roofs, within interior courts in buildings and outdoor occupancies such as Group A-5 stadiums. In the event that plastics in the decorative combustible vegetation ignites it can spread fire to surrounding buildings and this potential was very visible when artificial palm trees on the pool deck at the Las Vegas Cosmopolitan Hotel ignited in July of 2015. The IBC and IFC presently only specifically regulate decorative artificial vegetation in buildings through the requirements in IFC Section 807.4 that was added in the last code cycle. The hazards are just as important in outdoor occupancies as they are in indoor occupancies.

Occupied roofs typically are classified as Group A-2 or A-3 occupancies and outdoor stadiums are classified as Group A-5 both of which accommodate large numbers of people. Additionally, when placed in close proximity to a building they can spread fire to a building if ignited.

Outdoor use poses weathering problems due to moisture, UV exposure or cleaning chemicals necessary to freshen up the vegetation. As a result, testing is required after weathering conditioning per the requirements of Chapter 16 in NFPA 701. Since there are no specific standards and tests done for this specific type of outdoor plastic compliance with the weathering accelerated weathering testing per ASTM D4329 and ASTM D4587 where fire retardant coating is used is not being required to allow the fire code official flexibility.

Cost Impact: The code change proposal will increase the cost of construction. The proposed code change will require that products utilizing fire retardants to demonstrate the ability to weather in outdoor environments.

F92-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Ali Fattah, City of San Diego, representing City of San Diego requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

SECTION 429 ARTIFICIAL DECORATIVE VEGETATION

429.1 Artificial decorative vegetation. Artificial decorative vegetation exceeding 6 feet (1830 mm) in height and permanently installed outdoors within 5 feet (1524 mm) of a building, or on the roof of a building, shall comply with Section 320.1 of the *International Fire Code*.

Exception: Artificial decorative vegetation located more than 30 feet (9144 mm) from the exterior wall of a building.

Commenter's Reason: This public comment has been submitted to address the constructive feedback offered during the lengthy debate in both the Fire Safety Committee and the Fire Code Committee during the Committee Action Hearing. While the Fire Safety Committee did not approve the original change several members of the committee and speakers in opposition encouraged submitting a public comment because they found that the hazards of artificial vegetation to be valid.

The proposal has been simplified and is proposed to be moved to a new Section in IBC Chapter 4 where we had initially proposed the proposed regulations. ICC staff suggested that the proposal be added to Chapter 8 of the IBC by modifying the scope of the chapter. We repeatedly received comments that code users will not think to go to Chapter 8 that addresses materials within buildings when the proposed regulations are applicable to installations on the exterior of a building. Furthermore, we added further simplification by referencing a proposed Section 320.1 proposed for the the International Fire Code. This will address the majority of the comments we heard.

Additionally, we have limited the scope of the requirement to apply to artificial trees that have a height exceeding 6 ft and when located within 3 feet of a building. This addresses concerns raised by both committees regarding the broadness of the scope and applicability of the regulation.

Using the term permanent addresses cases where the structure used to frame the artificial vegetation is permanently bolted to the building or where it is installed in a large heavy planter that can not be readily moved. We hope that this addresses issues raised regarding architects placing the artificial decorative vegetation on support systems that can be readily moved with casters. Additionally the height limit and using the term permanent should also exclude table ornaments as was raised by a member of the Fire Code Committee.

A height limit of 6 ft was added below which the proposed regulations will not apply. It seems to be a reasonable height and is representative of most common interior applications. Additionally fences having a 6 ft high are exempted from a building permit so this was also used in determining the height limit. An area limit could not be included since fire testing will be necessary to do so. A request was made to the NFPA Foundation for funding and was not approved so resources do not exist now to address this question.

Terms such as permanent and installed are intended to lead the code user to understand that transient items are not being regulated by the proposed section rather it is large Artificial Combustible Vegetation. This should also address a committee members objection that the original proposal would have regulated table top ornaments.

We reduced the fire separation distance originally included in the proposal to 5 ft for two reasons. The first reason is that the IFC does not restrict the location of such materials when placed on the interior of a building. Secondly, since exterior applications do not have the benefit of fire sprinkler protection it seems prudent to include some distance. Additionally, the proposal does not differentiate between types of construction or exterior finishes however the 5 ft distance has a

rational based on the distance in IBC Table 705.8 when exterior wall openings are first permitted in exterior walls on non-sprinkler protected buildings. We should keep in mind that when the proposed section is implemented that the combustible materials will be labeled to comply with the requirements for interior installations.

Finally, the regulations addressing exterior weathering were removed from the proposal since the NFPA 701 edition that will be adopted by the 2021 IBC will require compliance for outdoor installations. It is expected that the protection will remain for the service life of the material.

The proposal references a Section in the IFC and if Part I of this code change or if the public comment to code Change F21-18 are not approved by this membership the correlating committee should not adopt Part II of this code change. We believe that this pointer to the IFC is necessary since our experience has been that these elements may come in during initial construction or as alterations to existing buildings.

While the IBC does not regulate the proximity of live irrigated vegetation to buildings, the proposed code change is necessary due to the demonstrated hazards of fire as we show in the original proposal. A building permit is not required for live vegetation but is required for structures that resist wind and seismic loads and their self weight and to address loads imposed on the supporting structure or foundation.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. We believe that there will be an increase in the cost of construction however since many of the artificial trees have been installed in the interior of a building the same complaint materials are expected to be installed on the exterior. Additionally since these items have not been regulated by the IBC and IFC we have no baseline to compare to since their use has been relatively recent in the past 5 to 10 years. The fire incident we referenced included elements that were constructed under the 2012 IBC/IFC or the prior editions which were developed almost 10 years ago.

F92-18 Part II

F93-18

IFC: 806.1.4 (New), Chapter 80

Proposed Change as Submitted

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Fire Code

Add new text as follows

806.1.4 Fire retardant treatments for natural cut trees. Fire retardant treatments applied to natural cut trees shall be tested by an approved agency and shall comply with one of the following:

1. Both Test Method 1 and Test Method 2 of ASTM E3082.
2. Exhibit a maximum rate of heat release not exceeding 100 kW when applied in accordance with the manufacturer's recommendations and tested in accordance with section 5.5 of NFPA 289.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

E3082-17:

Standard Test Methods for Determining the Effectiveness of Fire Retardant Treatments for Natural Christmas Trees

Reason: It has been found that many treatments are offered for sale that are said to improve the fire performance of natural Christmas trees. The Natural Christmas Tree Association has been very worried for some time about the efficacy of some of these products. It has been found that the use of poorly formulated and untested fire retardant treatments can accelerate the drying out of the Christmas tree and actually worsen the fire danger. The Natural Christmas Tree Association approached both ASTM (committee E05 on fire standards) and individual members off the NFPA Fire Tests committee to develop a test method for assessing whether the treatments offered for sale are actually doing as claimed by manufacturers. The state of California has a fire test that it uses to approve such treatments, based on a small scale fire test, but other states do not.

As a result of these concerns, ASTM has now developed and published ASTM E3082 for that purpose. It contains both a small scale test (Test Method 1) and a full scale test (Test Method 2). In order to comply with the requirements of ASTM E3082 a treatment must comply with both tests, and then it will be said to have "passed" the test. Test Method 1 is similar to the test used by the state of California for its requirements. Test Method 2 is a full scale heat release test largely based on UL Outline of Investigation 2358, "Fire Tests of Pre-Lit Artificial Seasonal Use Trees and Other Seasonal Decorative Items".

NFPA has developed a procedure within NFPA 289 (a heat release test for full scale individual fuel items) to also test Christmas tree treatments. The test in NFPA 289 (section 5.5) is similar (but not identical) to the full scale test in ASTM E3082 (Test Method 2) and does not have pass fail criteria. Therefore the pass fail criteria recommended are those used when testing to NFPA 289 in more than one section of the IFC (807.3, 807.4.1, 807.5.1.1, etc.), which are a heat release rate not exceeding 100 kW.

NFPA statistics show that, between 2011 and 2015, U.S. fire departments responded to an estimated 200 structure fires, per year, caused by Christmas trees resulting in an annual average of 6 deaths, 16 injuries and \$14.8 million in property damage. When comparing Christmas tree fires to other reported home fires, 1 out of every 32 home fires that began with a Christmas tree resulted in a death compared to 1 death out of every 143 reported home fires.

The use of an appropriate fire retardant treatment is a passive means or protection, which adds fire safety to the active means in 806.1.1 and 806.1.3.

Cost Impact: The code change proposal will increase the cost of construction

This will provide added fire safety but it will require manufacturers of fire retardant treatments to conduct some fire testing to demonstrate the effectiveness of their products.

Analysis: A review of the standard proposed for inclusion in the code, ASTM E3082-17 Standard Test Methods for Determining the Effectiveness of Fire Retardant Treatments for Natural Christmas Trees, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

F93-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the proposal has enforcement and misinterpretation issues and there is currently no requirement to have the treatment. It was suggested to add the language of "where applied" to improve the clarity of the requirement. (Vote: 11-3)

Assembly Action:

None

F93-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Tim Earl, representing GBH International (tearl@gbhinternational.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

806.1.4 Fire retardant treatments for natural cut trees. ~~Fire~~ Where fire retardant treatments are applied to natural cut trees shall, the fire retardant treatment shall be tested by an approved agency and shall comply with one of the following:

- ~~1. Both both Test Method 1 and Test Method 2 of ASTM E3082.~~
- ~~2. Exhibit a maximum rate of heat release not exceeding 100 kW when applied in accordance with the manufacturer's recommendations and tested in accordance with section 5.5 of NFPA 289.~~

Commenter's Reason: Both testimony and the committee highlighted that it is important to clarify that this code section only becomes a requirement "where fire retardant treatments are applied" meaning that this does not introduce a requirement that any treatment be applied to natural cut trees. It was also noted that it must be clarified that the requirement applies to the treatment and does not apply to the tree. Therefore, it is the commercial treatment that needs to be tested and not the individual trees.

Also, it was pointed out enforcement would be easier if the packaging for the fire retardant treatment was labeled simply to comply with the ASTM test, which has its own pass-fail criteria.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Manufacturers of fire retardant treatments will need to perform fire tests to prove that their treatments actually increase the fire performance of the trees upon which they are applied.

F93-18

F95-18

IFC: 808.4

Proposed Change as Submitted

Proponent: Misty Guard, representing Bradley Corporation (Misty.Guard@bradleycorp.com)

2018 International Fire Code

Revise as follows

808.4 Combustible lockers. Where lockers constructed of combustible materials are used, the lockers shall be considered to be interior finish and shall comply with ~~Section 803~~Table 803.3.

Exception: Lockers constructed entirely of wood and noncombustible materials shall be permitted to be used wherever interior finish materials are required to meet a Class C classification in accordance with Section 803.1.2.

Reason: The current requirement references all of Section 803, whereas the intent is to apply Table 803.3 for interior finish. Combustible lockers are made of different materials, including wood, ABS, and HDPE. If the material meets the interior finish requirements of Table 803.3 then they should be permitted.

The current Section 803 would appear to apply different requirements for wood, ABS, and HDPE lockers. The exception to allow any wood to be classified as Class C is acceptable. There is an implication that HDPE would be regulated differently than ABS. Section 803.9 could be incorrectly interpreted as applying to HDPE lockers. However, this section was never intended to apply to lockers. The original change adding this section addressed large areas of HDPE panels as an interior finish. No mention was made in the code change of lockers.

HDPE lockers have been installed for the last 25 years, as have ABS lockers. Many fire stations, schools, and health club like the added benefits of HDPE and ABS lockers. From a cleanliness and sanitation standpoints, HDPE and ABS lockers are superior to many metal lockers.

A study was completed by NFPA Research entitled, "Non-Residential Structure Fires That Originated in Lavatories, Locker Rooms or Coat Check Rooms," dated November 2017, authored by Marty Ahrens. The report shows no fire issue with HDPE or ABS lockers. There are no fire deaths reported from fires originating in a locker room. Hence, the perceived fire hazard does not exist with lockers in commercial building that meet the interior finish requirements of Table 803.3. This change is needed for clarification.

Bibliography: Ahrens, M. (2017). Non-Residential Structure Fires that Originated in Lavatories, Locker Rooms or Coat Check Rooms. Quincy, MA: NFPA Research.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The code change proposal will not increase or decrease the cost of construction.

F95-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Building Owners and Managers Association International (jbenigneer@aol.com); Andrew Klein, representing Building Owners and Managers Association International (andrew@asklein.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

808.4 Combustible lockers. Where lockers constructed of combustible materials are used, the lockers shall be considered to be interior finish and shall comply with ~~Table 803.3~~ Section 803.

Exception:Exceptions:

1. Lockers constructed entirely of wood and noncombustible materials shall be permitted to be used wherever interior finish materials are required to meet a Class C classification in accordance with Section 803.1.2..
2. Plastic lockers located in locker rooms shall meet a Class B or C classification in accordance with Section 803.1.2 based on the requirements of Table 803.3.

Commenter's Reason: Locker rooms are a unique location and also where lockers are located. Quite often plastic lockers are installed because of they are a high quality to resist mold growth, corrosion resistance, readily cleanable, and quiet. Locker rooms are often subjected to continuous high humidity, hence, the benefits of plastic lockers. The plastic lockers typically meet the Class C requirements.

When a change was made to regulate lockers in the 2012 edition of the Fire Code, the result was that plastic HDPE lockers were required to meet Class A requirements and be tested to NFPA 286. The same requirements do not apply to ABS or PVC lockers. Plastic lockers are made from all these materials. This results in a prejudicial requirement against HDPE lockers without technical justification. The initial code change on lockers only stated that the can be a significant fire load with plastic lockers. However, no fire load was given, no fire statistics were given, nor were any fire death related to locker fires presented.

Prior to the code change to the Fire Code, lockers in locker rooms were considered the equivalent to furniture. Plastic lockers, including HDPE lockers, have been used and installed for more than 25 years. Interestingly, many HDPE plastic lockers are installed in firehouses and fire stations. Fire statistics from NFPA indicate that plastic lockers have NOT been a fire concern. A copy of the NFPA report is available upon request from JBEngineer@aol.com.

Plastic lockers are often located near plastic shower modules. These plastic shower modules do not have to meet the requirements of NFPA 286. Only one product line in a locker room has been singled out, HDPE plastic lockers. This modification corrects the requirements and treats all plastic locker equally.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction This will revert the requirements for lockers to the 2009 and earlier edition whereby all plastic lockers can be evaluated based on their flame spread and smoke developed rating. A change to the 2012 edition added special requirements for one type of locker which eliminates the lockers from use without any technical justification.

F95-18

F100-18

IFC: 901.4.4, 901.5, 901.5.1, 901.6, 901.8

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows

901.4.4 Additional fire protection systems. In occupancies of a hazardous nature, where special hazards exist in addition to the normal hazards of the occupancy, or where the *fire code official* determines that access for fire apparatus is unduly difficult, the *fire code official* shall have the authority to require additional ~~safeguards. Such safeguards include, but shall not be limited to, the following: automatic fire detection systems, fire alarm systems, automatic fire extinguishing systems, standpipe systems, or portable or fixed extinguishers.~~ Fire protection equipment safeguards and fire protection systems. Fire protection systems required under this section shall be installed in accordance with this code and the applicable referenced standards.

901.5 Installation acceptance testing. ~~Fire detection and alarm systems, emergency alarm systems, gas detection systems, fire extinguishing systems, fire hydrant systems, fire standpipe systems, fire pump systems, private fire service mains and all other fire~~ Fire protection systems and appurtenances thereto shall be subject to acceptance tests as contained in the installation standards and as *approved* by the *fire code official*. The *fire code official* shall be notified before any required acceptance testing.

901.5.1 Occupancy. It shall be unlawful to occupy any portion of a building or structure until the required fire ~~detection, alarm and suppression~~ protection systems have been tested and *approved*.

901.6 Inspection, testing and maintenance. ~~Fire detection and alarm systems, emergency alarm systems, gas detection systems, fire extinguishing systems, mechanical smoke exhaust systems and smoke and heat vents protection systems~~ shall be maintained in an operative condition at all times, and shall be replaced or repaired where defective. Nonrequired *fire protection systems* and equipment shall be inspected, tested and maintained or removed in accordance with Section 901.8.

901.8 Removal of or tampering with equipment. It shall be unlawful for any person to remove, tamper with or otherwise disturb any fire ~~hydrant, fire detection and alarm system, fire suppression system or other fire appliance~~ protection system required by this code except for the purposes of extinguishing fire, training, recharging or making necessary repairs or where *approved* by the *fire code official*.

Reason: Section 901.1 through 901.4.3 uses "Fire Protection System" and the remainder of 901 uses a list of multiple systems, many times leaving out sprinkler systems and other types of systems. This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction Language clarifies and encompasses all systems that meet the definition. No cost involved.

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

901.4.4 Additional fire protection systems. In occupancies of a hazardous nature, where special hazards exist in addition to the normal hazards of the occupancy, or where the *fire code official* determines that access for fire apparatus is unduly difficult, the *fire code official* shall have the authority to require additional safeguards and fire protection systems. Fire protection and life safety systems required under this section shall be installed in accordance with this code and the applicable referenced standards.

901.5 Installation acceptance testing. Fire protection and life safety systems and appurtenances thereto shall be subject to acceptance tests as contained in the installation standards and as *approved* by the *fire code official*. The *fire code official* shall be notified before any required acceptance testing.

901.5.1 Occupancy. It shall be unlawful to occupy any portion of a building or structure until the required fire protection and life safety systems have been tested and *approved*.

901.6 Inspection, testing and maintenance. Fire protection and life safety systems shall be maintained in an operative condition at all times, and shall be replaced or repaired where defective. Nonrequired *fire protection and life safety* systems and equipment shall be inspected, tested and maintained or removed in accordance with Section 901.8.

901.8 Removal of or tampering with equipment. It shall be unlawful for any person to remove, tamper with or otherwise disturb any fire protection and life safety system required by this code except for the purposes of extinguishing fire, training, recharging or making necessary repairs or where *approved* by the *fire code official*.

Commenter's Reason: This correlates the beginning of Ch. 9 to the action on F97-18 by adding in "...and life safety..."

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Correlation.

F100-18

F106-18

IFC: 903.2.7, 903.2.9 (IBC: [F] 903.2.7, [F] 903.2.9)

Proposed Change as Submitted

Proponent: Ellie Klausbruckner, Klausbruckner & Associates Inc., representing Klausbruckner & Associates, Inc. (ek@klausbruckner.com)

2018 International Fire Code

Revise as follows

903.2.7 Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group M *fire area* is located more than three stories above grade plane.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group M occupancy where the area used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m²).

903.2.9 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 *fire area* used for the storage of commercial motor vehicles where the *fire area* exceeds 5,000 square feet (464 m²).
5. A Group S-1 occupancy where the area used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).

Reason: In a lot of retail or storage areas there may be as little as a few upholstered furniture for display or storage. These sections imply if the area of the display or storage of upholstered furniture is even 10 sq ft and this display is located in a very large room/building, that the entire room/building needs to be sprinklered. We do not believe this was the intent of this section.

Cost Impact: The code change proposal will decrease the cost of construction. This is intended to clarify that the area of the upholstered display or storage and not the entire room needs to be considered. A lot of businesses having small number of upholstered furniture will no longer be "lumped" together with facilities that are of actual concern.

F106-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval is based upon the proponent's published reason and that the current language is overly restrictive as written. The addition of "where the area" provides clarification that it is the area used that determines the condition. (Vote: 8-6)

Assembly Action:

None

F106-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

903.2.7 Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group M *fire area* is located more than three stories above grade plane.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. ~~A Group M occupancy where the area used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m²).~~

903.2.7.2 Group M upholstered furniture or mattresses. An *automatic sprinkler system* shall be provided throughout a Group M fire area where the area used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464 m²).

903.2.9 Group S-1. An *automatic sprinkler system* shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 *fire area* exceeds 12,000 square feet (1115 m²).
2. A Group S-1 *fire area* is located more than three stories above grade plane.
3. The combined area of all Group S-1 *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A Group S-1 *fire area* used for the storage of commercial motor vehicles where the *fire area* exceeds 5,000 square feet (464 m²).
5. ~~A Group S-1 occupancy where the area used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232 m²).~~

903.2.9.3 Group S-1 upholstered furniture and mattresses. An *automatic sprinkler system* shall be provided throughout a Group S-1 fire area where the area used for the storage of upholstered furniture exceeds 2,500 square feet (232 m²).

Exception: Self-service storage facilities no greater than one story above grade plane where all storage spaces can be accessed directly from the exterior.

Commenter's Reason: This public comment is intended to correlate the language of F102-18 which was approved by the committee as modified and F106-18 which was approved as submitted by the committee. In a lot of retail or storage areas there may be as little as a few upholstered furniture for display or storage. These sections imply if the area of the display or storage of upholstered furniture is even 10 sq ft and this display is located in a very large room/building, that the entire room/building needs to be sprinklered. We do not believe this was the intent of this section.

This public comment addresses a number of issues dealing with the suppression requirements for spaces containing upholstered furniture or mattresses.

The term Occupancy is replaced with fire area to clarify that the target hazard is the space containing the hazard.

The threshold language has been dropped down to its own subsection to provide for suppression being installed only within the target hazard fire area, not the entire building the fire area may be located within. An exception has been added to the S-1 trigger for one story self-service storage facilities where all storage spaces can be accessed from the exterior.

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

By limiting the fire suppression requirement to the targeted hazard fire area instead of suppressing the whole building, the cost of construction could be reduced in certain situations.

This is intended to clarify that the area of the upholstered display or storage and not the entire room needs to be considered. A lot of businesses having small number of upholstered furniture will no longer be "lumped" together with facilities that are of actual concern.

Public Comment 2:

Proponent: Marcelo Hirschler, GBH International, representing GBH International (mmh@gbhint.com) requests Disapprove.

Commenter's Reason: This proposal is unenforceable since "the area used for the display and sale of upholstered furniture or mattresses" or "the area used for the storage of upholstered furniture or mattresses" can be changed continuously as a function of the number of items available for storage, display or sale. Proposal F102, also accepted by the committee (with modifications) is clear, in that it addresses the "fire area" which is a function of the design of the building and will not depend on the number of items present.

Note that there was significant amount of opposition from the committee (8-6).

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposal F102 is the one that decreases the cost impact. Disapproving this proposal has no effect.

F106-18

F110-18

IFC: 903.2.10, 903.2.11.3 (IBC: [F]903.2.10, [F]903.2.11.3)

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, representing National Fire Sprinkler Association (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

903.2.10 Group S-2 enclosed parking garages. An automatic sprinkler system shall be provided throughout buildings classified as enclosed parking garages in accordance with Section 406.6 of the International Building Code where either where any of the following conditions exists:

1. Where the fire area of the enclosed parking garage in accordance with Section 406.6 of the International Building Code exceeds 12,000 square feet (1115 m²).
2. Where the enclosed parking garage in accordance with Section 406.6 of the International Building Code is located beneath other groups.

Exception: Enclosed parking garages located beneath Group R-3 occupancies.

3. Where the fire area of the open parking garage in accordance with Section 406.5 of the International Building Code exceeds 48,000 square feet (4460 m²).

903.2.11.3 Buildings 55 feet or more in height. An automatic sprinkler system shall be installed throughout buildings that have one or more stories with an occupant load of 30 or more located 55 feet (16 764 mm) or more above the lowest level of fire department vehicle access, measured to the finished floor.

Exception:Exceptions:

~~1.Open parking structures.~~

~~2.Occupancies in Group F-2.~~

Reason: Historically, open parking garages have been considered to have a very low fire risk, which has led to dozens of special allowances for reduced code requirements in these occupancies. Fire tests run decades ago offered some support for this perspective. However, it is common knowledge that much of what makes up a vehicle today is combustible, and bodies and interior components that may previously have been of steel are now primarily plastic, rubber, fiberglass and lightweight metals, facilitating vehicle-to-vehicle fire spread and production of dense combustible smoke layers. Stored energy systems in electric vehicles also increase the fuel load. Nevertheless, the wisdom of exempting open parking garages from many code requirements that would otherwise apply has tended to go unchallenged, lacking sufficient evidence to demonstrate the existence of a problem. That has now changed. An open parking garage fire in Liverpool UK on January 1, 2018 demonstrated the fire risk associated with the new world order of vehicle construction. The concrete building and 1,400 cars were destroyed by a fire that reportedly started in a single vehicle's engine compartment.

The thought that allowing smoke to escape from an open parking garage perimeter will entirely mitigate fire risk is certainly debunked by this incident, and this proposal seeks to recognize that these structures and their contents can present significant challenges to the fire service and result in catastrophic fire losses. The recommended sprinkler threshold based on building height is consistent with the threshold that was established years ago for most occupancies, and the reason for exempting open parking garages is no longer evident. The proposal also provides for an area based threshold, which is very generous compared to other occupancies that might be argued as having similar, or even lesser, fire loads. The recommended value is four times larger than what is applicable to enclosed garages, recognizing that, while there may be some benefit to perimeter openings, the fire service will ultimately be relied on to control these fires if sprinklers are not provided. Therefore, it is appropriate to limit the size of a fire area in these building so that there is a reasonable ability of the fire service to access and extinguish a fire before it becomes uncontrollable.

Cost Impact: The code change proposal will increase the cost of construction
Yes, there is a cost increase.

F110-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 2018 International Building Code

[F] 403.3 Automatic sprinkler system. Buildings and structures shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 and a secondary water supply where required by Section 403.3.3.

Exception: An automatic sprinkler system shall not be required in spaces or areas of:

- ~~1. Open parking garages in accordance with Section 406.5.~~
2. Telecommunications equipment buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided that those spaces or areas are equipped throughout with an automatic fire detection system in accordance with Section 907.2 and are separated from the remainder of the building by not less than 1-hour fire barriers constructed in accordance with Section 707 or not less than 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

2018 International Fire Code

914.3.1 Automatic sprinkler system. Buildings and structures shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 and a secondary water supply where required by Section 914.3.2.

Exception: An automatic sprinkler system shall not be required in spaces or areas of:

- ~~1. Open parking garages in accordance with Section 406.5 of the International Building Code.~~
2. Telecommunications equipment buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided that those spaces or areas are equipped throughout with an automatic fire detection system in accordance with Section 907.2 and are separated from the remainder of the building by not less than 1-hour fire barriers constructed in accordance with Section 707 of the International Building Code or not less than 2-hour horizontal assemblies constructed in accordance with Section 711 of the International Building Code, or both.

Committee Reason: Approval of the modification is based on the need to revise the high-rise sections in order to be consistent with the revision to Section 903.2.11.3. Approval of the proposal is based upon the proponent's published reason. (Vote: 10-4)

Assembly Action:

None

F110-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jonathan Humble, American Iron and Steel Institute, representing American Iron and Steel Institute (jhumble@steel.org)requests Disapprove.

Commenter's Reason: We recommend that this proposal be disapproved because the proposal:

- Lacks technical substantiation to warrant this change, and
- Raises more questions about vehicle fires.

The substantiation of the code change proposals relies heavily on the incident in Merseyside, U.K. Using that information, in conjunction with other information provided to us, we find:

The report [1] by Merseyside Fire & Rescue Service recommends automatic fire sprinklers in combination with adequate floor (parking level tier) drains, but does not address quantity and location of drains necessary to assist in mitigating fires as a result of the spillage and ignition of fuel combined with the water from the automatic fire sprinklers. The code change proposal also recommends sprinkler protection however it does not address the coordination or relationship with drainage.

The report [1] discussed the use of joints for drainage with PVC type pipes as a contributing factor in the spread of fire below the incident floor. In the US such a system is not common in the construction of open parking structures as joints in floors are normally sealed.

Both the report [1] and testimony at the spring code hearing discussed the construction of vehicles in today's market as containing more plastic components which could have contributed to the fire spreading. However, this is merely a general claim. We do not know how many of the plastic parts actually contributed since there are also plastic parts attached to the engine block of vehicles which do not readily combust. Therefore, it is clear that this subject requires further study as to what did or did not contribute to the spread of the fire.

Parking structures in North America continue to have a very low rate of incident as borne out through testimony by the proponent and the many studies conducted from 1972 through 2011 [2,3,4,5].

The proposal's substantiation raises more questions about other circumstances which involve vehicles, such as: surface parking lots, automobile retail establishments, etc. which had not been addressed by this code change submission or any other code change proposals.

All of the above suggest we should not just accept this proposal, but rather consider evaluating this subject further.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This public comment to disapprove will decrease the cost of construction as it will remove the proposed requirement for an automatic fire suppression system for open parking structures.

Public Comment 2:

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Stephen V. Skalko, P.E. & Associates, LLC (svskalko@svskalko-pe.com); Jason Krohn, Precast/Prestressed Concrete Institute, representing Precast/Prestressed Concrete Institute (jkrohn@pci.org); William Hall, Portland Cement Association, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests Disapprove.

Commenter's Reason: The proponent of F110-18 did not provide any technical documentation with the expected robustness needed to make such a drastic change to the building code by requiring open parking garages to be fully sprinklered and therefore should be disapproved. The following points are offered to support this position of Disapproval.

The recent fire loss in an open parking garage, that the Fire Committee found compelling in the Reason Statement of the proponent of F110-18, involves a fire incident that occurred in the UK at the first of 2018. All the details of this incident were not known at the time of the Code Action Hearing (CAH). However, upon review of the final report by the Merseyside Fire and Rescue Service (MFRS), the parking garage in question, referred to as a car park in the UK, had design features that likely contributed to fire spread between floors resulting in a far larger number of vehicles becoming involved than normal for vehicle fire incidences [Merseyside Fire Rescue Service, *Kings Dock Car Park Fire Protection Report*, April 2018, Merseyside, UK].

The following are two of the most notable differences of these design features contributing to the spread of fire in the UK car park incident:

- ○ The car park had a light gauge aluminum drainage tray attached to the underside of each precast floor panel and in line with the joint of the precast floor system. The trays lead to plastic vertical piping to transfer liquids to the building storm water drainage system. The design called for a 1/2-inch gap between floor panels to allow drainage into the aluminum tray below. This gap in the floor joints allowed burning fuel spills from vehicle gas tanks to flow directly to floors below which spread fire to vehicles on other floors.

In the United States the floor joints are not left open. They are typically sealed by a combination backer rod and sealant or covered by the placement of a concrete topping with tooled and sealed joints. This not only minimizes spread of fire to floors below by leaking fuels, but also inhibits the spread of flames from the incident floor to vehicles on floors above.

- ○ The building code requirements in the UK permitted only a 15-minutes structural fire resistance of the precast concrete floors for the Kings Dock car park. The fire exposure from the initial vehicle (and subsequent vehicles) damaged the underside of the floor panels above sufficient enough to permit the fire to extend upward to vehicles on the next parking level.

In the US the typical precast floor systems in open parking garages meets at least a minimum of a 1-hour fire resistance, which increases significantly the ability to prevent fire spread between floors.

A study of car park fires in the UK showed a total 3,096 fire incidences over a twelve-year period [BD2552 *Fire Spread in Car Parks*, Building Research Establishment for Department for Communities and Local Government, December 2010]. The average number of car park fires per year for that period was 258/year. This represents a very low number of incidences per year and thus low risk for fires in car parks. The experience with fire incidences in the US is also very low risk for this building occupancy type.

- ○ The US Fire Administration statistics show an average of over 1.7 million fires [FA-311, *Fire in the United States 1994-2004*, 14th edition, August 2007] for the period from 1999 to 2002. When compared to the average total parking garage fires (1760 incidents) described in an NFPA study of parking garage fires [M. Ahrens, *Structure and Vehicle Fires in General Vehicle Parking Garages*, NFPA, January 2006] represent less than 0.1% of the fire incidences.
- ○ A Parking Market Research Company (PMRC) study [D.F. Denda, *Parking Garage Fires (A Statistical Analysis of Parking Garage Fires in the United States: 1986-1988)*, Parking Market Research Company, April 1992] reached a similar conclusion on such low risk. That study looked at over 4,400 fire incidences for general vehicle parking including garages and surface lots with only 25% of these incidences in parking garages. During that same 3-year period approximately 7 million total fire incidences were reported. The parking garage fires for that 3-year period represent about 0.016% of the total fires.

The car park fire incident in the UK, with the significantly large number of vehicles becoming involved due to mitigating circumstances and design features contributing to fire spread, was an unusual event and is not a sufficient basis to support F110-18. The design practices and features of open parking structures in the US, which minimize fire spread between floors and reasonably withstand the structural impact from fire effects, have been shown to have an excellent record when it comes to fire incidences. Based on open parking garages having a very low risk from vehicle fires in the US, the mandate for sprinkler protection in the IFC is unwarranted.

Recommend DISAPPOVAL of F110-18

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction if F110-18 is approved it will increase the cost of construction of open parking garages. Disapproval will result in no increase in costs.

F110-18

F117-18

IFC: 903.3.1.2 (IBC[F] 903.3.1.2)

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing self (sdigiovanni@clarkcountynv.gov)

2018 International Fire Code

Revise as follows

903.3.1.2 NFPA 13R sprinkler systems. ~~Automatic sprinkler systems in Group R occupancies up to and including four stories in height in buildings not exceeding 60 feet (18 288 mm) in height above grade plane shall be permitted to be installed throughout in accordance with NFPA 13R.~~ The 13R where the Group R occupancy meets all of the following conditions:

1. Four stories or less above grade plane.
2. The floor level of the highest story is 30 feet (9114 mm) or less above the lowest level of fire department vehicle access.
3. The floor level of the lowest story is 30 feet (9114 mm) or less below the lowest level of fire department vehicle access.

~~The number of stories of Group R occupancies constructed in accordance with Sections 510.2 and 510.4 of the International Building Code shall be measured from the horizontal assembly creating separate buildings grade plane.~~

Reason: The recent fires in Group R occupancies, both occupied and under construction, requires revisiting the applicable code requirements.

One major concern is the affect of the recent advent of podium-style buildings, and how the code has changed to allow NFPA 13R sprinkler systems to heights that exceed the original scope of NFPA 13R. The scope of NFPA 13R, 2007 edition, reads "This standard shall cover the design and installation of automatic sprinkler systems for protection against fire hazards in residential occupancies up to and including 4 stories in height". In 2013, the scope of NFPA 13R was changed to read "This standard shall cover the design and installation of automatic sprinkler systems for protection against fire in residential occupancies up to and including four stories in height in buildings not exceeding 60 feet (18 m) in height above grade plane."

This followed a change in the 2009 IBC that greatly expanded the use of the podium concept. After the expansion of the podium concept, the increase in height for NFPA 13R systems was permitted, leading us to where we are today. Today, 5 and 6 story height buildings can be created, where the separate podium building is one or two stories (measured from grade plane) and the other separate building, atop the podium building, is 4 stories as measured from the podium, all protected with NFPA 13R fire sprinklers.

There is a big difference in the protection provided between NFPA 13R and NFPA 13 systems, in the required design density and areas covered by fire sprinklers. Allowing the NFPA 13R sprinkler system for these taller podium style buildings leads to a significant decrease in the protection being provided by automatic fire sprinklers, versus what was required prior to the code changes referenced above.

When determining a suitable trigger for height to propose for this code section, a review of other parts of the code led to the requirements for when standpipe systems are required per Section 905.3.1. Philosophically, standpipe systems would be required where travel distance by responding fire fighters is long enough that hose lines fed directly from fire engines may not reach the fire, so that fire hose would need to be carried into the building, for connection to an outlet that is closer to the fire. The decision to trigger the requirement for a standpipe would represent a recognition of an increased building hazard, which in this can be adapted as a means to determine the break point between allowing a NFPA 13R sprinkler system, and requiring a NFPA 13 sprinkler system.

Cost-wise, the infrastructure, such as main pipe sizes, required to install a standpipe system, would ease the impact of requiring the sprinkler system to be NFPA 13, rather than NFPA 13R. While there would be significant argument that the pipe sizes would all have to be increased in order to change from NFPA 13R to NFPA 13, which would clearly increase costs, this increase is tempered by the fact that the pipe sizes required to comply with the standpipe system are so large that the NFPA 13 sprinkler design can very easily be accommodated with little to no increase in pipe sizing. In other words, by using the same requirement for when a standpipe system is required, the impact of requiring a NFPA 13 system, versus 13R, is substantially reduced.

For this reason, the proposal is to use the trigger for installation of a standpipe system, per existing Section 905.3.1, as the upper limit for permitting the installation of NFPA 13R systems, and by default creating the trigger for switching the sprinkler system to a NFPA 13 sprinkler system in Group R occupancies.

In summary, this proposal intends to address the recent fire history in Group R occupancies, especially those built with the podium concept, and seeks to increase the protection required in these buildings. The proposal utilizes the same trigger for requiring a standpipe system, for the point where the sprinkler system would have to change from NFPA 13R design, to NFPA 13 design. While there is still an increase in cost, this increase is greatly minimized due to the already existing requirement for standpipe systems.

Cost Impact: The code change proposal will increase the cost of construction

This proposal will increase construction costs by requiring NFPA 13 sprinkler systems in some situations where NFPA 13R sprinkler systems are currently permitted. There is no doubt that, due to the difference in water flow required, additional sprinkler requirements, and other requirements in the NFPA standards, that the cost of NFPA 13 sprinkler systems is higher than the cost of NFPA 13R sprinkler systems. Some of this cost is mitigated by aligning the new requirement to the requirement for installing a standpipe system, which already would represent greater flow capacity for the building, ostensibly requiring larger diameter mains already; however, even with this mitigating factor, there is little doubt that this code change would represent an increase in overall construction costs.

F117-18

Public Comment 1:

Proponent: Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); Margo Thompson (mthompson@newportventures.net); John Catlett (jcatlett@boma.org); Jeffrey Hugo, National Fire Sprinkler Association (hugo@nfsa.org); Paula Cino (pcino@nmhc.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

903.3.1.2 NFPA 13R sprinkler systems. *Automatic sprinkler systems* in Group R occupancies up to and including four stories in height above grade plane shall be permitted to be installed throughout in accordance with NFPA 13R ~~where the Group R occupancy meets all of the following conditions:~~

- ~~1. Four stories or less above grade plane.~~
- ~~2. The floor level of the highest story is 30 feet (9114 mm) or less above the lowest level of fire department vehicle access.~~
- ~~3. The floor level of the lowest story is 30 feet (9114 mm) or less below the lowest level of fire department vehicle access.~~

The number of stories of Group R occupancies constructed in accordance with Sections 510.2 and 510.4 of the International Building Code shall be measured from grade plane.

Commenter's Reason: Similar to the original proposal, this public comment limits the overall height of Group R occupancies to four stories above the grade plane, where current code allows up to four stories above the pedestal. This public comment differs from the proposal by removing the 30-foot maximum height allowance for NFPA 13R systems. As stated in the summary of the NFPA Life Safety Sprinkler System Workshop (<https://tinyurl.com/ybysd3wr>), there is no question that NFPA 13R systems have been effective. For that reason, it is unnecessary to lower the threshold for their use to 30 feet, which limits multifamily buildings to 3 stories above grade once the foundation is accounted for. With 66% of the multistory buildings constructed in 2017 being 3 stories or more (https://www.census.gov/construction/chars/pdf/mfb_floors.pdf), the proposal as originally written substantially increases cost for the multifamily building industry.

The 30-foot height limit for requiring a NFPA 13R fire sprinkler system in the original proposal was chosen to correlate with the requirement for standpipes in Section 905.3.1. However, correlating the threshold of 30 feet to the topmost floor starts the requirement for standpipes but it stops the application of NFPA 13R. This means a four-story building over 30 feet would have a standpipe and a NFPA 13 system. While there are potentially increased pipe sizes for the combined standpipe and the NFPA 13 sprinkler system, as explained below *, a manual wet standpipe is permitted for four story buildings. Adding a NFPA 13 system with the standpipe at the fourth floor requires more flow and pressure to the sprinkler system, meaning, in most cases, it adds a standalone fire pump to supply the sprinkler system demand, negating the benefit of having the manual wet standpipe option.

National Multifamily Housing Members estimate that moving from 13R to 13 sprinkler systems would carry an incremental installed cost increase of approximately \$1.00/sq. ft. \$2.00/sq. ft. of overall building area on average across the US. This does not include final cost with markup to the building owner or adding a fire pump to the NFPA 13 system. Greater density and spacing of sprinklers, larger pipe diameter, sprinklers in concealed spaces, and especially, requirements for attic protection (with some exceptions) all contribute to the added cost. Costs associated with requirements for attic protection in 13 systems not only includes the additional sprinklers and piping but also costs associated with increased

hydraulic demand and water supply as well as necessary freeze protection in cold and even moderate climates. Price quotes and completed projects have shown that installing a NFPA 13 system can add approximately 50% to the cost compared to a NFPA 13R system. The extent of these costs are dependent upon regulatory costs, size of the system, available water supply, whether a fire pump is required, etc.

* A four-story residential occupancy protected by a NFPA 13R system also is required to have a Class I standpipe system (IFC 905.3.1). A Class I standpipe can be of several types, such as automatic dry or wet and manual dry or wet (NFPA 14: 5.4.1.1). Typically in a sprinklered building with a standpipe, the systems are combined (NFPA 14: 3.3.15.3 and 7.10.1.3), this means the above ground pipe is used for both purposes: to serve as a single pipe system in stairways to serve standpipe hose connections and to serve the floor fire sprinkler system. A combined sprinkler/standpipe system contains water at all times, but when the manual wet standpipe (NFPA 14: 3.3.15.5) is combined with the sprinkler system, it only has the system demand (flow and pressure) to serve the sprinkler system. The standpipe system demand (flow and pressure) is supplied by the fire department through the fire department connection to serve the standpipe hose outlets. In other words, there is enough flow and pressure from the municipal water supply to provide the sprinkler system demand (NFPA 14: 3.3.18), but not the standpipe system. The standpipe pressure is provided by the fire department during a fire. What is the purpose for using a wet manual systems? It eliminates the need for a fire pump to serve the standpipe only, since the fire department only uses the Class I hose connections, the fire department is allowed per NFPA 14 to provide the pressure. NFPA 14 allows manual wet systems to serve low-and mid-rise buildings but not high-rises. Since this proposal only allows four-stories from grade plane and Chapter 5 doesn't allow any building using NFPA 13R to be over 60 feet in height, there is no potential for misapplication. In fact, the manual wet standpipe combined with the sprinkler system has been allowed by the codes for many years and is typical for most new four-story residential construction.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This public comment will increase construction costs compared to current code by requiring NFPA 13 sprinkler systems in pedestal buildings where NFPA 13R sprinkler systems are currently permitted. However, it will lessen the cost impact to overall construction, including four-story residential buildings, compared to the original proposal. It is estimated that moving from a NFPA 13R to a NFPA 13 sprinkler system would carry an incremental installed cost increase of approximately \$1.00/sq. ft. - \$2.00/sq. ft. of overall building area on average across the US.

Public Comment 2:

Proponent: Tien Peng, representing National Ready Mixed Concrete Association (tpeng@nrmca.org) requests As Submitted.

Commenter's Reason: Under **903.3.1.2 NFPA 13R sprinkler systems**. *Automatic sprinkler systems* in Group R occupancies up to and including **four stories** in height shall be permitted to be installed throughout in accordance with NFPA 13R.

The number of stories used in determining the minimum type of construction for buildings, including pedestal or podium construction should be measured from **the grade plane or lowest level of fire department access** per this proposal to meet the intent of the NFPA sprinkler system designed per 903.3.1.2 for R Occupancies. The trade-off allowing for the number of stories to be counted from the podium continues the increased fire risks and community costs. Examples such as Edgewater, NJ, DaVinci, Los Angeles, College Park, MD, Montrose Fire, Houston, TX all point to the increase risks.

Bibliography: N/A

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Code should be revised in favor of occupant safety even if there is a slight increase in construction costs.

Public Comment 3:

Proponent: Ken Brouillette, City of Seattle Fire Department, representing Seattle Fire Department (ken.brouillette@seattle.gov); Jonathan Siu, City of Seattle Department of Construction and Inspections (jon.siu@seattle.gov) requests Disapprove.

Commenter's Reason:

Brouillette: The appropriate use of NFPA 13R should continue to be developed through the NFPA process and not by ICC. NFPA 13R states, NFPA 13R is appropriate for use as an alternative to NFPA 13 only in those residential occupancies, as defined in this standard, up to and including four aboveground stories in height. It should be noted that model building codes contain special allowances for pedestal or podium-style buildings, which permit the story height for structures above the pedestal to be measured from the top surface of the pedestal, rather than from grade plane, and it is the intent of NFPA 13R to follow this model building code method for determining the number of stories. Accordingly, it is possible for a four-story residential structure to be within the scope of NFPA 13R even when that structure is constructed

on top of a one-story pedestal. However, where this is allowed, model building codes will require the pedestal portion to be constructed using Type I construction, and the pedestal portion will be required to be protected by an NFPA 13 compliant sprinkler system.

NFPA 13R also indicates that the standard is limited to buildings that are 60 ft (18 m) or less in height above grade plane.

The current code language in the 2018 IFC is consistent with the scope of NFPA 13R and should not be changed unless the standard itself has been changed through NFPA .

This code change requirement would be too restrictive as it removes the current allowance for buildings up to 60 feet in height measured from grade plane.

Siu: Our objection to this proposal is that by measuring to lowest fire department vehicle access, it penalizes buildings built on downsloping corner lots. Figure 1 below depicts two identical buildings built side-by-side, fronting on a level street (site plan). Both lots have identical slopes downward from the street (west elevation). Building 2 is built mid-block; Building 1 is built on a street corner. Because lowest fire department vehicle access for the Building 1 is measured from the sloping side street, its measurement datum is lower than the mid-block building, which is measured from the fronting street. Based on the measurements shown in the figure, this proposal would trigger a full NFPA 13 system for the Building 1 whereas the Building 2 could use an NFPA 13-R system, yet in all ways except location, the buildings are identical. Note that it can be argued that Building 1 has better fire department access (two sides) than Building 2. It seems that if Building 2 is considered to be safe, the Building 1 should not be penalized for its corner location.

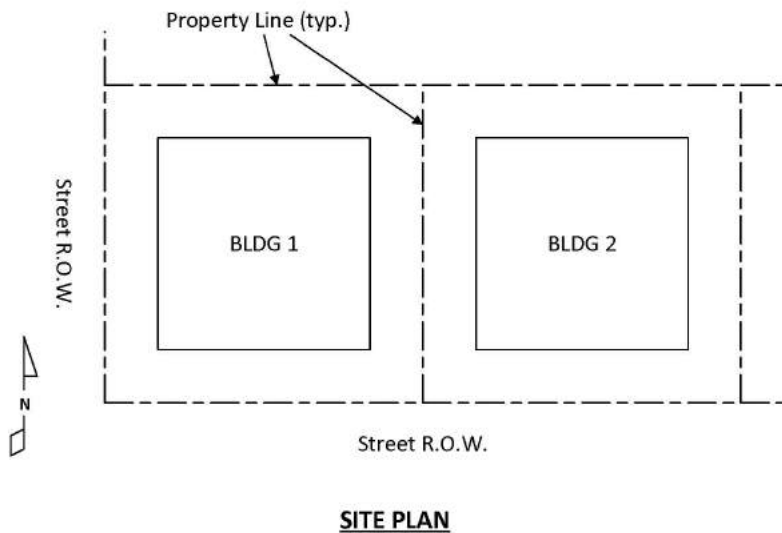

FIG. 1 – F117-18 – CORNER VS MID-BLOCK LOT

Bibliography:

NFPA 13R 2019 Edition (Appendix) (Section A1.1)

A.1.1 NFPA 13R is appropriate for use as an alternative to NFPA 13 only in those residential occupancies, as defined in this standard, up to and including four aboveground stories in height. It should be noted that model building codes contain special allowances for pedestal or podium-style buildings, which permit the story height for structures above the pedestal to be measured from the top surface of the pedestal, rather than from grade plane, and it is the intent of NFPA 13R to follow this model building code method for determining the number of stories. Accordingly, it is possible for a four-story residential structure to be within the scope of NFPA 13R even when that structure is constructed on top of a one-story pedestal.

However, where this is allowed, model building codes will require the pedestal portion to be constructed using Type I construction, and the pedestal portion will be required to be protected by an NFPA 13 compliant sprinkler system.

Regardless of whether a building does or does not involve a pedestal, NFPA 13R systems are always limited to structures that

do not exceed 60 ft (18 m) in height above grade plane. Note that model building codes do not allow building height to be measured from the top of a pedestal. That allowance only applies to determining the number of stories. The 60 ft (18 m) overall height limit is consistent with limits established by model building codes for buildings of Type V construction.

The height of a structure above grade plane is determined by model building codes, which base the height on the average

height of the highest roof surface above grade plane. For further information on the building height story limits, see model building codes.

NFPA 13R 2019 Edition Section 1.1 Scope

1.1* Scope. This standard shall cover the design and installation of automatic sprinkler systems for protection against fire hazards in residential occupancies up to and including four stories in height that are located in buildings not exceeding 60 ft (18 m) in height above grade plane.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Based on the original proponents cost impact statement and if F117-18 is disapproved, then a cost savings would occur by not having to install a NFPA 13 automatic fire sprinkler system and maintaining code compliance with a NFPA 13R system.

F126-18

IFC: 905.3.1 (IBC: [F] 905.3.1)

Proposed Change as Submitted

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows

905.3.1 Height. Class III standpipe systems shall be installed throughout buildings where any of the following conditions exist:

1. Four or more stories are above or below grade plane.
2. The floor level of the highest story is located more than 30 feet (9144 mm) above the lowest level of the fire department vehicle access.
3. The floor level of the lowest story is located more than 30 feet (9144 mm) below the highest level of fire department vehicle access.

Exceptions:

1. Class I standpipes are allowed in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Class I standpipes are allowed in Group B and E occupancies.
3. Class I ~~manual~~ standpipes are allowed in ~~open parking garages where the highest floor is located not more than 150 feet (45 720 mm) above the lowest level of fire department vehicle access.~~ parking garages.
4. ~~Class I manual~~ Semi-automatic dry standpipes are allowed in open parking garages that are subject to freezing temperatures, ~~provided that the hose connections are located as required for Class II standpipes in accordance with Section 905.5.~~ temperatures.

Reason: The purpose of this change is to modify the two exceptions addressing standpipe system installed in open parking garages. The exceptions have been in the IFC/IBC unchanged since the 2000 editions of the codes while the materials in vehicles has changed to add more combustible synthetic material, thinner/lighter metals and a growing increase of alternative fueled vehicles, GH2, CNG, LPG and Lithium-Ion batteries. Electric Vehicle charging stations have been installed within parking garages to encourage their use. Basically, the current requirements for parking garages, open or closed, in the codes are based on old vehicle concepts and studies.

Multi-vehicle large fires can occur and have occurred. As in any multi-story building, effective firefighting actions to protect life and property involved being able to quickly apply water to the fire. The type of fire and danger presented by that fire has increased as the use of alternative fueled vehicles has increased.`

This proposal deletes the options for manual standpipes which as a rule require extra effort on the part of the fire service to get water to upper stories and attempt extinguishment of the fire. In place is allowance for Class I standpipes to be installed an any parking garage. The standpipes are there for firefighter use, in the rare occurrence a parking garage opts to have trained personnel they can add the necessary outlet reducer and hose line.

The proposal also calls for semi-automatic dry systems where subject to freezing temperatures. As part of that change the Class II location requirement was eliminated.

NFPA 14 2016 edition

3.3.17.6 Semiautomatic Dry Standpipe System. *A standpipe system permanently attached to a water supply that is capable of supplying the system demand at all times arranged through the use of a device such as a deluge valve and that requires activation of a remote control device to provide water at hose connections.*

Neither the height of the story the fire is located on or the temperature of the atmosphere impacts the size of the fire and amount of water needed to be rapidly applied. The standpipe systems should meet all the requirements for a semi-automatic dry system which will provide for a more rapid water supply availability.

The fuel loads have changed significantly in parking garages due to modern manufacturing methods and the increased use of alternative fuels. Improvement in the requirements of the codes is necessary to address those changes.

Background material.

<http://www.urbanfiretraining.com/parking-garages.html>

<http://www.firerescuemagazine.com/articles/print/volume-7/issue-2/strategy-and-tactics/fighting-vehicle-fires-in-parking-garages.html>

<http://www.fireengineering.com/ap-news/2018/01/01/parking-garage-fire-destroys-hundreds-of-cars-in-uk.html>

<https://www.youtube.com/watch?v=KVx6avRTNCA>

<https://www.youtube.com/watch?v=HK0U-PKJ1NE>

Cost Impact: The code change proposal will increase the cost of construction. This proposal will increase costs but is balanced with allowance for Class I standpipes in all parking garages and by eliminating the Class II outlet location requirements. The nature of the fuel load has changed within parking structures and fire protection systems need to be improved to deal with the potential fires.

F126-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Daniel E Nichols, representing MTA Metro-North Railroad (rotoray@optonline.net) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

905.3.1 Height. Class III standpipe systems shall be installed throughout buildings where any of the following conditions exist:

1. Four or more stories are above or below grade plane.
2. The floor level of the highest story is located more than 30 feet (9144 mm) above the lowest level of the fire department vehicle access.
3. The floor level of the lowest story is located more than 30 feet (9144 mm) below the highest level of fire department vehicle access.

Exceptions:

1. Class I standpipes are allowed in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Class I standpipes are allowed in Group B and E occupancies.
3. Class I standpipes are allowed in parking garages.
4. ~~Semi-automatic dry standpipes are allowed in open parking garages that are subject to freezing temperatures.~~

Commenter's Reason: IFC 905.3.1 exceptions deal with the Class of standpipes. The original proposal removes the Class I exception for open parking structures when it added in semiautomatic dry, requiring a Class III standpipe in open parking structures. There is no substantiation of why occupant hose stations need to be placed in open parking structures. NFPA 14-2016 does not exempt Class II occupant use hose when a system is semiautomatic dry; Section 5.4.2 states that a semiautomatic dry can be used with a Class II or Class III system.

Besides the reasons for the removal of all occupant use hose in all Group B and E occupancies in the last cycle, the placement of occupant use hose in open parking garages would be an attraction to vandals in an area known for tampering (see reasons for standpipe cap protections) and would be outside the intent of incipient fire control (see reason statement and support for F110-18).

IFC 905.8 already discusses when dry standpipes can and cannot be used; as well as directing the code user to NFPA 14 to select appropriate types of standpipe systems to address the issues. There is no substantiation of why semiautomatic-dry systems need to be added to only open parking structures. The addition of semiautomatic dry will require a suitable water supply, backflow prevention, electronic monitoring, and provisions for heat (in colder climates). The 2018 IFC would allow for manual standpipes, which can be supplied from a fire department pumper attached to a hydrant within 100 feet of the fire department connection.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction This removes the semiautomatic dry requirement and returns to permitted language used in 905.3.1 and 905.8.

F126-18

F128-18

IFC: 905.9 (IBC: [F] 905.9)

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows

905.9 Valve supervision. Valves controlling water supplies shall be supervised in the open position so that a change in the normal position of the valve will generate a supervisory signal at the supervising station required by Section 903.4. Where a fire alarm system is provided, a signal shall be transmitted to the control unit.

Exceptions:

1. Valves to underground key or hub valves in roadway boxes ~~provided by the municipality or public utility~~ do not require supervision.
2. Valves locked in the normal position and inspected as provided in this code in buildings not equipped with a fire alarm system.
3. Control valves and isolation valves for dry manual standpipes are permitted to be locked in the open position.

Reason: In Exception 1, the removal of the supervision requirement for municipal or public utility roadboxes correlates to a similar proposal made to IFC/IBC 903.4. NFPA 24, referenced by the IFC does not require supervision of private main roadboxes. By removing this text, it would apply to be public and private mains.

In Exception 3, the fire department is the water supply for dry manual standpipe systems. Section 5.6.1 of NFPA 14 specifically states electrical supervision for the control valve in a dry manual standpipe system is not required. This may seem to contradict Section 6.3.7.1 of NFPA 14, but a dry manual standpipe system is not connected to an automatic system water supply. Dry manual standpipes are supplied by the fire department and the valve position is controlled by the fire department. Locking the control valve (if provided) for the dry manual system in the open position insures uninterrupted operation when the system is pressurized.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will decrease the cost of construction

This proposal clarifies which valves are required to be electrically supervised and which valves are permitted to be locked. This will provide consistency in the market and eliminate alternate interpretations of the code.

F128-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that there are situations where the proposed exception would not be acceptable. The specific example given was a large building under construction that has commingled parts of the building that have dry or wet standpipes that are used as manual means for fire fighting that would need to be electrically supervised. (Vote: 8-7)

Assembly Action:

None

F128-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org); Stephen DiGiovanni, representing FCAC (sdigiovanni@clarkcountynv.gov); Jeffrey Hugo (hugo@nfsa.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

905.9 Valve supervision. Valves controlling water supplies shall be supervised in the open position so that a change in the normal position of the valve will generate a supervisory signal at the supervising station required by Section 903.4. Where a fire alarm system is provided, a signal shall be transmitted to the control unit.

Exceptions:

1. Valves to underground key or hub valves in roadway boxes do not require supervision.
2. Valves locked in the normal position and inspected as provided in this code in buildings not equipped with a fire alarm system.
3. ~~Control valves and isolation valves for dry manual standpipes are permitted to be locked in the open position.~~

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at:

<https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This proposal originally contained two changes. One change is to revise Exception 1 to no longer qualify the exception only for underground valves that are provided by the public entity This change correlates to another FCAC proposal, F123-18, which was approved by the Fire Code Committee. F123-18 was developed to address the challenges with enforcing the requirement for valve supervision for underground valves on private property. This change to address underground valve supervision is being retained in this public comment.

The second change in the original proposal was to add a third exception to allow valves for dry manual standpipe to be locked, instead of supervised. This part of the proposal received considerable feedback from the Fire Code Committee, and ultimately the original proposal was denied. Please note that this public comment no longer proposes this new exception 3.

As such, this public comment is provided to continue the part of the original proposal that correlates to F123-18, which was approved by the committee, while dropping the third exception proposal, which clearly was not supported by the Fire Code Committee.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code section is not enforceable, so it is assumed that few if any are actually installing the monitoring on underground valves. For those that currently do install the monitoring, this change will decrease the cost of construction.

F128-18

F132-18

IFC: 906.1 (IBC: [F] 906.1)

Proposed Change as Submitted

Proponent: Richard Kluge, Ericsson Inc., representing Alliance for Telecommunications Industry Solutions (richard.kluge@ericsson.com)

2018 International Fire Code

Revise as follows

906.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exceptions:

1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
2. Within 30 feet (9144 mm) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Exception: Portable fire extinguishers are not required at normally unmanned buildings or structures where a portable fire extinguisher suitable to the hazard of the location is provided on the vehicle of visiting personnel.

Reason: The IFC section 906 Commentary repeatedly discusses the use of Portable Fire Extinguishers for incipient fire control to allow for increased time for evacuation, but these benefits are not applicable to unmanned locations. US telecommunication carriers operate a large number of small unmanned equipment facilities. It is not practical to install and maintain Portable Fire Extinguishers in accordance with NFPA 10 at normally unmanned locations as explained below.

Backup generators at remote telecommunications locations provide telecommunications services when commercial ac power fails. These sites may have diesel fuel or liquified propane gas (LPG) stored either indoors or outdoors. Fuel oil, when used, is typically less than 660 gallons in capacity. The sites are normally unmanned. Technicians will travel to the sites only when needed for repairs or maintenance activities. These sites are considered Utility and Miscellaneous Group U occupancies under the IBC. Adherence to the current Section 906 of the IFC requires keeping an extinguisher at the site in compliance with NFPA 10. This requires monthly inspections. For rarely visited remote locations, compliance to NFPA 10 entails a monthly visit for the sole purpose of inspecting the extinguisher, which while possible, is not reasonable. Certain remote and isolated locations are not accessible or impractical to visit during winter months as access is blocked by snow. Furthermore, if there were a fire, the vast majority of the time, there is no one on site to use the extinguisher as the site is not manned. Having a Portable Fire Extinguisher on the technician's vehicle when servicing the site is a more effective alternative to a fixed site-mounted extinguisher. The Portable Fire Extinguisher carried on the vehicle can be inspected and maintained per NFPA 10 and ready for use if necessary.

From the International Building Code Commentary

Per IBC Section 312, Utility and Miscellaneous Group U Commentary: "Structures housing accessory equipment that is part of a utility or communications system are often classified as Group U occupancies when there is no intent that these structures be occupied except for serving and maintaining the equipment within the structure." This language supports an exemption to clearly state the Portable Fire Extinguishers are not required in unmanned or unoccupied Group U structures when visiting personnel have extinguishers available.

Related content from NFPA 76, Standard for Fire Protection of Telecommunications Facilities

NFPA 76, Chapter 11, "Small Unoccupied Structures" applies to small normally unoccupied telecommunications sites including on-grade walk-in cabinets, on-grade huts, cell huts, and controlled environmental vaults. Section 11.2.3 clearly states that portable fire extinguishers shall not be required in these facilities.

Related content from CFR, Subchapter N, Artificial Islands and Fixed Structures on the Outer Continental Shelf

Code of Federal Regulations of the United States of America, Subchapter N, Artificial Islands and Fixed Structures on the Outer Continental Shelf, Part 145 Fire-Fighting Equipment also supports the position that fire extinguishers in unmanned locations are not required. Per the CFR, Subchapter N, Artificial Islands and Fixed Structures on the Outer Continental Shelf, Part 14, fire extinguishers are only required when crews will be working at the site on a 24-hour basis. Continual deployment of Portable Fire Extinguishers at unmanned locations provides no value and is not practical.

Cost Impact: The code change proposal will decrease the cost of construction. The cost of code compliance will decrease if portable fire extinguishers will not be required to be installed and maintained at unmanned locations.

F132-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that: the language needed improvement to be clear, it is in the wrong location, it should focus on Group U telecommunication facilities, needs "where approved" added and it should address other Group U occupancies. (Vote: 14-0)

Assembly Action:

None

F132-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Richard Kluge, Ericsson Inc., representing Alliance for Telecommunications Industry Solutions (richard.kluge@ericsson.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

906.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

Exception: Portable fire extinguishers are not required in unoccupied Group U communication equipment structures.

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exceptions:

1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
2. Within 30 feet (9144 mm) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

~~**Exception:** Portable fire extinguishers are not required at normally unmanned buildings or structures where a portable fire extinguisher suitable to the hazard of the location is provided on the vehicle of visiting personnel.~~

Commenter's Reason: As drafted, the original proposal was not approved by the committee, which questioned its inclusion in the charging statement. After considering several alternative locations for the exception language, such as placing it after item 3 alone, and in two locations after items 3 and 6, it was determined that before item 1 is the logical location for the exception.

There was a suggestion by one committee member to include "where approved" but this text does not seem warranted when the code is the minimum set of requirements for unoccupied facilities. The AHJ can always request a PFE at a group U communications facility if it is deemed necessary, but this would never be the norm.

The committee feedback was divided on whether the exception should be applicable to other utilities. The text proposed focuses on Group U communication facilities and aligns with the IBC wording for such structures.

Bibliography:

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The cost of code compliance will decrease if portable fire extinguishers will not be required to be installed and maintained at unoccupied locations.

Public Comment 2:

Proponent: Steven Rosenstock, representing Edison Electric Institute (srosenstock@eei.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

906.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exceptions:

1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
2. Within 30 feet (9144 mm) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

Exception: Portable fire extinguishers are not required at normally unmanned Group U occupancy buildings or structures where a portable fire extinguisher suitable to the hazard of the location is provided on the vehicle of visiting personnel.

Commenter's Reason: The revised language clearly identifies that this exception is for Group U facilities only.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

This public comment provides a clarification on an exception and will not have any impact on the cost of construction.

Public Comment 3:

Proponent: randy schubert, Ericsson, representing ATIS (randy.schubert@ericsson.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

906.1 Where required. Portable fire extinguishers shall be installed in all of the following locations:

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exceptions:

1. In Group R-2 occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each dwelling unit is provided with a portable fire extinguisher having a minimum rating of 1-A:10-B:C.
 2. In Group E occupancies, portable fire extinguishers shall be required only in locations specified in Items 2 through 6 where each classroom is provided with a portable fire extinguisher having a minimum rating of 2-A:20-B:C.
2. Within 30 feet (9144 mm) distance of travel from commercial cooking equipment and from domestic cooking equipment in Group I-1; I-2, Condition 1; and R-2 college dormitory occupancies.
 3. In areas where flammable or combustible liquids are stored, used or dispensed.

Exception: Portable fire extinguishers are not required in unoccupied Group U communication equipment structures.

4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 3315.1.
5. Where required by the sections indicated in Table 906.1.

Exception: Portable fire extinguishers are not required in unoccupied Group U communication equipment structures.

6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the *fire code official*.

~~**Exception:** Portable fire extinguishers are not required at normally unmanned buildings or structures where a portable fire extinguisher suitable to the hazard of the location is provided on the vehicle of visiting personnel.~~

Commenter's Reason: As drafted, the original proposal was not approved by the committee, which questioned its inclusion in the charging statement. After considering several alternative locations for the exception language, the most applicable locations are placing the statement after items 3 and 5. There was a suggestion by one committee member to include "where approved" but this text does not seem warranted when the code is the minimum set of requirements for unoccupied facilities. The AHJ can always request a PFE at a group U communications facility if it is deemed necessary, but this would never be the norm.

The committee feedback was divided on whether the exception should be applicable to other utilities. The text proposed focuses on Group U communication facilities and aligns with the IBC wording for such structures.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed exception does not impact construction cost.

IFC: 907.2.3, 907.2.3.1 (New), 907.2.3.2 (New) (IBC: [F] 907.2.3, [F]907.2.3.1 (New), [F]907.2.3.2 (New))

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Michael Pallett, Telecor Inc., representing Telecor Incorporated (mpallett@telecor.com)

2018 International Fire Code

Delete and substitute as follows

~~**907.2.3 Group E.** A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. Where *automatic sprinkler systems* or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.~~

Exceptions:

- ~~1. A manual fire alarm system is not required in Group E occupancies with an *occupant load* of 50 or less.~~
- ~~2. Emergency voice/alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual fire alarm system initiates an *approved* occupant notification signal in accordance with Section 907.5.~~
- ~~3. Manual fire alarm boxes are not required in Group E occupancies where all of the following apply:
 - ~~3.1. Interior corridors are protected by smoke detectors.~~
 - ~~3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by *heat detectors* or other *approved* detection devices.~~
 - ~~3.3. Shops and laboratories involving dusts or vapors are protected by *heat detectors* or other *approved* detection devices.~~~~
- ~~4. Manual fire alarm boxes shall not be required in Group E occupancies where all of the following apply:
 - ~~4.1. The building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.~~
 - ~~4.2. The emergency voice/alarm communication system will activate on sprinkler water flow.~~
 - ~~4.3. Manual activation is provided from a normally occupied location.~~~~

~~**907.2.3 Group E.** A manual fire alarm system shall be installed in Group E occupancies with an occupant load greater than 50. Where an automatic sprinkler system or a smoke detector system is installed, such systems shall be connected to the building fire alarm system.~~

Add new text as follows

907.2.3.1 Manual fire alarm boxes. Manual fire alarm boxes shall be provided unless either of the following applies:

1. Interior corridors are protected by smoke detectors; auditoriums, cafeterias, gymnasiums and similar areas are protected by heat detectors or other approved detection devices; and shops and laboratories involving dusts or vapors are protected by heat detectors or other approved detection devices.
2. The building is equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, and occupant notification will activate upon sprinkler waterflow, with manual activation provided at a normally occupied location.

907.2.3.2 Occupant notification. Where the occupant load of the Group E occupancy is greater than 100, the fire alarm system shall initiate one of the following:

1. An occupant notification signal utilizing an emergency voice/alarm communications system complying with Sections 907.5.2.2 and 907.6.
2. An occupant notification signal complying with Section 907.5 and an interconnected in-building mass notification system complying with Sections 907.5.2.2 and installed in accordance with Section 907.6, and NFPA 72.

Reason: Changes proposed for 907.2.3 are intended to:

- a) improve code language clarity by eliminating complex lists of exceptions;

b) permit listed mass notification systems in conjunction with fire alarm systems as an alternative to EVAC for occupant notification.

In North America, the risk of death and serious injury in schools has shifted from fire incidences towards incidences of violence through a combination of reduction of fire deaths and an increase of violence. NFPA 72 2010 formally introduced listed (UL 2572) mass notification systems as an enforceable class of emergency communication system (ECS). Mass notification often utilizes both voice and textual notification and is intended to communicate information about emergencies including but not limited to: fire, human caused events (accidental and intentional), other dangerous situations, accidents, and natural disasters.

As threats to children in schools evolve, in-building mass notification systems (MNS) have and are being professionally developed specifically for educational occupancies. MNS are designed to support multiple situations including: environmental, active shooter, hostage, and weather. MNS may include automatic responses such as: lockdown, partial lockdown with partial evacuation, lockdown acknowledgment and tracking, lockout, reverse evacuation, covert monitoring, and others. EVAC systems do not require a risk analysis because the risk of fire in schools is generally well understood. But MNS (as per NFPA 72) does require formal consideration of the risks above by requiring a specific risk analysis be developed for each school.

This proposal provides an option for listed mass notification systems in combination with fire alarm systems as an alternative to EVAC systems in schools. The relationship between fire alarm and in-building mass notification is well-developed in NFPA 72. Some schools are budget limited and cannot support the purchase of both EVAC and MNS. This proposal is intended to provide choice for jurisdictions considering MNS as an option.

The proposed code includes safeguards to ensure the level of protection of the school is not reduced as compared with EVAC. References to NFPA 72 ensure that MNS systems are listed to UL 2572 or UL 864. Both NFPA 72 and UL 2572 require that listed MNS systems are manufactured to common core F.A. standards including: secondary power, monitoring for integrity, supervisory, trouble, emergency control functions, notification and control circuits, annunciation and zoning, pathway class designation, monitoring for integrity and circuit performance, audible characteristics, system performance and integrity, performance of initiating device circuits (IDCs), notification appliance circuits (NACs), and signaling line circuits (SLCs).

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. There is no cost impact, because the proposal presents MNS/fire alarm as an option, not a requirement. The restructuring of the paragraph maintains the current requirements so there is no additional cost associated with these changes.

When MNS/fire alarm is chosen, there is the additional cost of the MNS system, but also cost reductions from changing EVAC to manual fire alarm and the elimination of P.A. systems that are normally installed in schools.

F138-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that they had concern with the proposed new Section 907.2.3.1 not having a reference to the existing Section 907.2 regarding the requirement to provide not fewer than one manual fire alarm box. Additionally it was noted that the format is cumbersome, hard to read and needs more refinement. (Vote: 14-0)

Assembly Action:

None

F138-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael Pallett, representing Telecor Incorporated (mpallett@telecor.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

907.2.3 Group E. A manual fire alarm system that initiates the occupant notification signal utilizing an emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. Where *automatic sprinkler systems* or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

Exceptions:

1. A manual fire alarm system is not required in Group E occupancies with an *occupant load* of 50 or less.
2. Emergency voice/alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual fire alarm system initiates an *approved* occupant notification signal in accordance with Section 907.5.
3. Manual fire alarm boxes ~~are~~ shall not be required in Group E occupancies where all of the following apply:
 - 3.1. Interior *corridors* are protected by smoke detectors.
 - 3.2. Auditoriums, cafeterias, gymnasiums and similar areas are protected by *heat detectors* or other *approved* detection devices.
 - 3.3. Shops and laboratories involving dusts or vapors are protected by *heat detectors* or other *approved* detection devices.
 - 3.4. Manual activation is provided from a normally occupied location.
4. Manual fire alarm boxes shall not be required in Group E occupancies where all of the following apply:
 - 4.1. The building is equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1.
 - 4.2. The emergency voice/alarm communication system will activate on sprinkler water flow.
 - 4.3. Manual activation is provided from a normally occupied location.
5. In lieu of utilizing an emergency voice/alarm communications system, a listed in-building mass notification system, interconnected in conjunction with a fire alarm system is permitted where all the following apply:
 - 5.1 The fire alarm system and in-building mass notification system are integrated such that their joint operations and capabilities also comply with the emergency voice/alarm communications system requirements of Section 907.5.2.2.
 - 5.2 The in-building mass notification system is installed to the same standards as the fire alarm system in accordance with Section 907.6, and NFPA 72.
 - 5.3 The in-building mass notification system equipment and components are listed to UL 2572 or UL 864.

Commenter's Reason: This public comment is to revise F138-18 according to ICC Committee Action Hearing (CAH), Fire Code Action Committee (FCAC), and AFAA feedback.

F138-18 is important in the recognition of the unified effort it takes to respond to an Active Shooter Event in our K-12 schools. The response goes beyond the Fire Service, involving Police, EMS, local security (often former police), and importantly - school staff.

According to The Police Response to Active Shooter Incidents Published March 2014 by the Police Executive Research Forum:

Remember that on average, it takes police three minutes to arrive on the scene, and another few minutes to locate and stop the shooters. So for at least the first few minutes of an attack, the potential victims are on their own. The major message that we have for civilians is, You are not helpless. What you do matters. And what you do can save your own life and the lives of others. Our research found that many times, active-shooter attacks stopped because potential victims took action to stop the shooter directly, or they made it more difficult for the shooter to find targets.

The IFC 2018 added section 917 Mass Notification Systems, but only for Colleges and Universities. This is as big an issue for K-12 schools as it is for Colleges and Universities. Not only is the population of K-12 more vulnerable, but of the top 8 worst school/collage/university shootings with 10 deaths or more as of June 2018: 5 of 8 were K-12 schools accounting for 77 deaths; Colleges and Universities accounted for 60 deaths. Out of the 24 worst, 13 are K-12 schools.

Fire Emergency Voice Alarm Communication Systems (EVAC) provides only so much support for the first responders, and relatively little support for school administrative staff. Whenever one of these tragedies occurs, a common denominator is that the school staff is always present, and always respond first. Technology is already being deployed to provide functionality such as real time lockdown reporting, emergency covert listening and two-way individual room communications, emergency call buttons, panic buttons, geofenced wireless alerting, and comprehensive remote access. School districts and states are already working with police services to incorporate new emerging technologies into their response plans. Some of these technologies are already required by IFC 2018 in section 404.2.3 Lockdown Plans.

Emerging technologies are being used in response to emergency situations. By specifically requiring a UL 2572/864 listing and NFPA 72 compliance for all emergency communications used in our K-12 schools, F138 will require at a minimum, in-building mass notification technologies used in our schools to be designed, deployed, and maintained to the same level of reliability as other emergency communication equipment such as EVAC.

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows

907.4 Initiating devices. ~~Where manual or automatic alarm initiation is required as part of a fire alarm system, the initiating a fire alarm system is required by another section of this code, occupant notification in accordance with Section 907.5 shall be initiated by one or more of the following. Initiating devices shall be installed in accordance with Sections 907.4.1 through 907.4.3.1.~~

1. Manual fire alarm boxes.
2. Automatic fire detectors.
3. Automatic sprinkler system waterflow devices.
4. Automatic fire-extinguishing systems.

907.5 Occupant notification systems, notification. ~~A fire alarm system shall annunciate at the fire alarm control unit and shall initiate occupant notification upon activation. Occupant notification by fire alarms shall be in accordance with Sections 907.5.1 through 907.5.2.3.3. Where a fire alarm system is required by another section of this code, it shall be activated by:~~

1. ~~Automatic fire detectors.~~
2. ~~Automatic sprinkler system waterflow devices.~~
3. ~~Manual fire alarm boxes.~~
4. ~~Automatic fire-extinguishing systems.~~

Exception: ~~Where notification systems are allowed elsewhere in Section 907 to annunciate at a constantly attended location:~~

~~907.5.2.3.3. Occupant notification by smoke alarms in Groups R-1 and R-2 Occupancies shall comply with Section 907.5.2.1.3.2.~~

Add new text as follows

907.5.1 Alarm activation and annunciation. Upon activation, fire alarm systems shall initiate occupant notification and shall annunciate at the fire alarm control unit, or where allowed elsewhere in Section 907, at a constantly attended location.

907.5.1.1 Presignal feature. ~~A presignal feature shall not only be installed unless provided where approved by the fire code official. Where a presignal feature is provided, a signal approved. The presignal shall be annunciated at an approved at a constantly attended location approved by the fire code official, so that occupant notification can be activated in~~ having the capability to activate the occupant notification system in the event of fire or other emergency.

907.5.2.1.3 Audible signal frequency in Groups R-1 and R-2 sleeping rooms. Audible signal frequency in Groups R-1 and R-2 occupancies shall be in accordance with Sections 907.5.2.1.3.1 and 907.2.1.3.2.

907.5.2.1.3.1 Fire alarm system signal. In sleeping rooms of Groups R-1 and R-2 Occupancies, the audible alarm activated by a fire alarm system shall be a 520 Hz low-frequency signal complying NFPA 72.

907.5.2.1.3.2 Smoke alarm signal in sleeping rooms. In sleeping rooms of Groups R-1 and R-2 Occupancies that are required by Sections 907.2.8 or 907.2.9 to have a fire alarm system, the audible alarm signal activated by single- or multiple-station smoke alarms in the dwelling unit or sleeping unit shall be a 520 Hz signal complying NFPA 72.

Where a sleeping room smoke alarm is unable to produce a 520 Hz signal, the 520 Hz alarm signal shall be provided by a listed notification appliance or a smoke detector with an integral 520 Hz sounder.

Reason: This Proposal seeks to enhance the waking effectiveness of high risk segments of the population in the

International Fire Code (IFC) by requiring a consistent use of the 520 Hz low frequency audible fire alarm signal in new Group R-1 and R-2 occupancies that are required to have a fire alarm system.

This approach is an interim option to get the low frequency signal in buildings where the technology is commercially available and avoids requiring the low frequency signal in buildings where the technology is not currently available in the stream of commerce. The proposal has taken careful consideration to not require the low frequency technology in buildings without a fire alarm system because there are no smoke alarms currently available with an integral sounder capable of producing the low frequency signal. However, it does not prohibit their installation if the product becomes available in the future. The reason the proposal does require the low frequency signal in sleeping areas of buildings with a fire alarm system because there are numerous manufacturers of system connected smoke detectors with an integral sounder that produces the 520 Hz low frequency signal.

Peer-reviewed research has concluded the 520 Hz low frequency is six times more effective than the standard 3 KHz signal at waking high risk segments of the population (people over 65, people who are hard of hearing, school age children and people who are alcohol impaired). The standard 3 KHz audible alarm signal has been used in the majority of fire alarm horns and smoke alarms for the past 30 years.

The reason this Proposal is necessary is because NFPA 72 stipulates both the 520 Hz and 3 KHz signal in the sleeping rooms of hotels, dormitories and apartment building bedrooms when smoke alarms are installed in the sleeping room. Specifically, Chapter 18 of NFPA 72 requires audible notification appliances (horns, speakers or smoke detectors with an integral sounder bases) to produce the 520 HZ low frequency signal in all sleeping rooms of buildings with a protected premises fire alarm system. Whereas Chapter 29 of NFPA 72 only requires smoke alarms to produce the 520 Hz low frequency signal for people with hearing loss or provided voluntarily for those with hearing loss.

The different requirements within NFPA 72 present a life safety issue because the wakening effectiveness of the 520 Hz low frequency is superior to 3 KHz audible alarm signal awakening high risk segments of the population. The low frequency signal needs to be provided in areas intended for sleeping for people over 65, people who are hard of hearing, school age children and people who are alcohol impaired.

There are several product solutions currently available in the market capable of providing the 520 Hz low frequency signal.

1. Fire alarm system horns and horn/strobes
2. Smoke detectors with integral sounder bases
3. Speakers connected to an Emergency Voice Alarm Communication (EVAC) system

Peer-Reviewed Research:

Ian R. Thomas and Dorothy Bruck, *Waking Effectiveness of Alarms for Adults Who Are Hard of Hearing* (Melbourne, Australia: Victoria University), National Fire Protection Association, 2007

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will increase the cost of construction

The code change proposal will increase the cost of construction. The total installation cost will only increase in new R-1 and R-2 occupancies where a fire alarm system is required by Section 907 by requiring the use of the 520 Hz low frequency audible fire alarm signal.

In accordance with the included cost analysis the estimated price increase is \$57 per sleeping room for occupancies that are not required to utilize an emergency voice alarm communication (EVAC) system for occupant notification and approximately \$107 per sleeping room for occupancies that are required to utilize an (EVAC) system for occupant notification.

For non-EVAC systems, the solution utilizes a currently available smoke detector with an integral low frequency sounder base instead of installing a smoke alarm and low frequency horn. For EVAC systems, the solution utilizes a currently available fire alarm system speaker and a smoke detector with an integral low frequency sounder base.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The committee stated that although there are technical issues this is needed due to an aging population and the research shows that low frequency devices are more effective. In addition it was noted that there are devices that are currently available that can meet the requirement. (Vote: 9-5)

Assembly Action:

None

F144-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Thomas Daly, representing The Hospitality Security Consulting Group, LLC (thomas.daly@myhscg.com) requests Disapprove.

Commenter's Reason: This proposal would impose a mandate for buildings for a technology that does not exist. There are no listed and approved smoke alarms available that can produce a 520hz signal when operating on backup power pursuant to Sec. 907.2.10.6.

Until such time as potential devices are designed, tested, listed and approved, this mandate is premature.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No cost impact to delay this proposed code change.

F144-18

F149-18

IFC: 907.5.2.2.5 (IBC: [F] 907.5.2.2.5), 1203.2.4; IBC: 2702.2.4

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Jason Webb, representing Automatic Fire Alarm Association Codes & Standards Committee (jwebb608@gmail.com)

2018 International Fire Code

Revise as follows

907.5.2.2.5 Emergency power. Emergency voice/ alarm communications systems shall be provided with emergency power in accordance with Section 1203. ~~The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.~~

1203.2.4 Emergency voice/alarm communication systems. Emergency power shall be provided for emergency voice/alarm communication systems as required in Section 907.5.2.2.5. ~~The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.~~

2018 International Building Code

~~[F] 2702.2.4 Emergency voice/alarm communication systems.~~ **Voice Alarm Communication Systems.**

Emergency power shall be provided for emergency voice/alarm communication systems as required in Section 907.5.2.2.5. ~~The system shall be capable of powering the required load for a duration of not less than 24 hours, as required in NFPA 72.~~

Reason: This code change is to provide clarification that the standby power for the EVACs system is to be designed to comply with NFPA 72.

We are deleting the reference and code section 1203.2.4. This is causing confusion and the standby power requirements for Fire Alarm systems is clearly outlined in NFPA 72.

This section contradicts itself. NFPA 72 10.6.7.2.1.2 requires secondary power for 24 hours under quiescent load but *also* requires the secondary power to be capable of operating the system for 15 minutes at maximum load after the 24 hours. Deleting the time and simply referencing the standard insures consistency.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will decrease the cost of construction. Depending on interpretation this could reduce the cost of construction. Overall this will provide code clarity and alignment with NFPA 72 and within the IBC-IFC

F149-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 2018 International Fire Code

~~907.5.2.2.5 Standby Emergency power.~~ Emergency voice/ alarm communications systems shall be provided with ~~emergency standby~~ power in accordance with ~~section 1203 NFPA 72.~~

1203.2.4 Emergency voice/alarm communication systems. ~~Emergency Standby~~ power shall be provided for emergency voice/alarm communication systems ~~as required~~ in accordance with NFPA 72.

2018 International Building Code

2702.2.4 Emergency Voice Alarm Communication Systems. ~~Standby Emergency~~ power shall be provided for emergency voice/alarm communication systems ~~as required~~ in accordance with NFPA 72 907.5.2.2.5.

Committee Reason: Approval of the modification is based on the improvement of the language to clarify that the requirements are for standby power. Approval of the proposal is based upon the proponent's published reason that it is appropriate to the leave the requirements in the NFPA 72 referenced standard. (Vote: 14-0)

Assembly Action:

None

F149-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dustin J. Wakefield, PE, LEED AP, Virginia Department of General Services, representing Bureau of Capital Outlay Management requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

907.5.2.2.5 ~~Standby Emergency~~ power. Emergency voice/ alarm communications systems shall be provided with ~~standby power emergency power~~ in accordance with Section ~~1203-2702.2~~ of the International Building Code and NFPA 72.

1203.2.4 Emergency voice/alarm communication systems. ~~Standby power Emergency power~~ shall be provided for emergency voice/alarm communication systems ~~in accordance with~~ in accordance with Section 2702.2 of the International Building Code and NFPA 72.

2018 International Building Code

2702.2.4 Emergency Voice Alarm Communication Systems. ~~Standby Emergency~~ power shall be provided for emergency voice/alarm communication systems ~~in accordance with Section 907.5.2.2.5~~ as required in Section 907.5.2.2.5 and NFPA 72.

Commenter's Reason: An emergency voice/alarm communication system (EVACS) is a critical life safety system that must remain operational during the initial phases of a fire incident. As such, EVACS are considered emergency power loads, which are governed under Article 700 - Emergency Systems - in the NEC. Furthermore, NFPA 72 explicitly states that generators used to provide secondary power for EVACS shall meet the requirements for a Type 10, Class 24, Level 1 system and be installed in accordance with NEC Article 700.

The initial proposed modification to change the language in the code to Standby power is contrary to the referenced standards governing the design and installation of the secondary power supply. It introduces confusion over the type of power system required and may, at times, result in the incorrect classification of a Legally Required or Option Standby Power System per NEC Articles 701 or 702.

It is recommended that the code language be modified as contained herein, and that the term "emergency power" be retained for this critical emergency system in order to avoid confusion and to be consistent with the referenced standards.

Bibliography: There are no applicable external references for this proposed modification.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Since this is solely a terminology issue, there is no anticipated cost impact on the design or construction process.

F149-18

F152-18

IFC: 907.5.2.3.3 (IBC: [F]907.5.2.3.3)

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows

907.5.2.3.3 Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, each *story* that contains *dwelling units* and *sleeping units* shall be provided with the future capability to support visible alarm notification appliances in accordance with Chapter 11 of ICC A117.1. Such capability shall accommodate wired or wireless equipment. The future capability shall include one of the following:

1. The interconnection of the building fire alarm system with the unit smoke alarms.
2. The replacement of audible appliances with combination audible/visible appliances.
3. The future extension of the existing wiring from the unit smoke alarm locations to required locations for visible appliances.

For wired equipment, the fire alarm power supply and circuits shall have not less than 5% excess capacity to accommodate future addition of visible alarm notification appliances, and access to such circuits shall be available on every story. Such circuits shall not be required to be extended beyond a single access point on a story.

Reason: Last cycle, F213-16 was approved with the intent of clarifying and standardizing the capability for future additions of alarm equipment to accommodate changes for units that may need to be converted to accommodate hearing impaired occupants. The question of a reasonable percentage for excess capacity of wired equipment was left unresolved, and I committed to bringing something back to address this so that the fire alarm industry would have a standardized basis for designing excess capacity into systems. The proposed text has been prepared based on what I learned in a discussion with an individual who has been instrumental in the development of ANSI A117.1 regarding the intent of the standard and his experience as an accessibility expert with respect to the relatively low frequency of units being retrofitted for hearing impaired occupants.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The requirement for future expansion capability already exists in this section. I am just trying to quantify the provision, so the cost consequence cannot be accurately assessed, since some installations my previously have provided more expansion capability and others less.

F152-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that they liked the concept of requiring future design capability but the proposed language does not provide the necessary level of information and the wording is incomplete. (Vote: 14-0)

Assembly Action:

None

F152-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

907.5.2.3.3 Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, each story that contains *dwelling units* and *sleeping units* shall be provided with ~~the future~~ the capability to support future visible alarm notification appliances in accordance with Chapter 11 of ICC A117.1. Such capability shall accommodate wired or wireless equipment. ~~The future capability shall include one of the following:~~

- ~~1. The interconnection of the building fire alarm system with the unit smoke alarms.~~
- ~~2. The replacement of audible appliances with combination audible/visible appliances.~~
- ~~3. The future extension of the existing wiring from the unit smoke alarm locations to required locations for visible appliances.~~

~~For wired equipment, the fire alarm power supply and circuits shall have not less than 5% excess capacity to accommodate future addition of visible alarm notification appliances, and access to such circuits shall be available on every story. Such circuits shall not be required to be extended beyond a single access point on a story.~~

907.5.2.3.3.1 Wired equipment. Where wired equipment is used to comply with the future capability required by Section 907.5.2.3.3, the system shall include one of the following capabilities:

1. The replacement of audible appliances with combination audible/visible appliances or additional visible notification appliances. 2. The future extension of the existing wiring from the unit smoke alarm locations to required locations for visible appliances.
2. For wired equipment, the fire alarm power supply and circuits shall have not less than 5% excess capacity to accommodate future addition of visible alarm notification appliances, and a single access point to such circuits shall be available on every story. Such circuits shall not be required to be extended beyond a single access point on a story. The fire alarm system shop drawings required by Section 907.1.2 of the Code shall include the power supply and circuit documentation to accommodate future addition of visible notification appliances

Commenter's Reason:

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at:

<https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The PC is an agreed to compromise by the proponents of F150, F151 and F152. The reason for the PC and all three proposals is they seek to clarify that all dwelling units within apartment buildings are not required to be pre-wired for visible notification appliances. This change is necessary because many designers and code authorities think the word "capability" means that conduit and wiring needed to be installed into each dwelling unit for possible future use.

Note that the way the cdpACCESS displays it appears to be all new text in Section 907.5.2.3.3.1 however much of the text is simply moved from Section 907.5.2.3.3 to new Section 907.5.2.3.3.1 as shown below.

907.5.2.3.3 Group R-2. In Group R-2 occupancies required by Section 907 to have a fire alarm system, each *story* that contains *dwelling units* and *sleeping units* shall be provided with the ~~future~~ capability to support future visible alarm notification appliances in accordance with Chapter 11 of ICC A117.1. Such capability shall accommodate wired or wireless equipment.

907.5.2.3.3.1 Wired equipment. Where wired equipment is used to comply with ~~the~~ future capability required by Section 907.5.2.3.3, the system shall include one of the following capabilities:

~~1. The interconnection of the building fire alarm system with the unit smoke alarms.~~

The replacement of audible appliances with combination audible/visible appliances or additional visible notification appliances.

The future extension of the existing wiring from the unit smoke alarm locations to required locations for visible appliances.

For wired equipment, the fire alarm power supply and circuits shall have not less than 5% excess capacity to

accommodate future addition of visible alarm notification appliances, and a single access point to such circuits shall be available on every story. Such circuits shall not be required to be extended beyond a single access point on a story. The fire alarm system shop drawings required by Section 907.1.2 of the Code shall include the power supply and circuit documentation to accommodate future addition of visible notification appliances.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The requirement for future expansion capability already exists in this section. This proposal and PC quantify the provision, so the cost consequence can be accurately assessed, since some installations previously provided more expansion capability and others less.

F152-18

F153-18

IFC: 907.6.5 (IBC: [F] 907.6.5)

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Richard Roberts, representing Honeywell (richard.roberts@systemsensor.com); Jason Webb, representing Automatic Fire Alarm Association Codes & Standards Committee (jwebb608@gmail.com)

2018 International Fire Code

Revise as follows

907.6.5 ~~Access~~ **Access and visibility.** Access shall be provided to ~~each fire alarm device and notification appliance for devices, notification appliances, and equipment requiring~~ periodic inspection, maintenance and testing. Where devices, notification appliances and equipment are concealed from view, an approved sign or other means to identify their location shall be provided.

Reason: One of the causes of "unwanted alarms" is identified as fire alarm devices that get installed but are not accessible to perform routine inspection, testing and maintenance. Duct mounted smoke detectors; detection in elevator shafts and atrium detection are some of the key areas of concern. During construction and initial testing special equipment is provided to reach these spaces, but when the building is in normal operation these special lifts and appliances are not available. Leaving smoke devices not tested or maintained.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. In 95% of all cases there will be no additional cost to install the fire alarm system and devices when properly designed. In some specific cases it may be more expensive to install the device "correctly" but that is the right way to do it.

F153-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that they had issues with the sign requirements and that it should say "other approved means." Additionally there was confusion about the link between the access and visibility requirements and noted that they are stated as separate requirements. (Vote: 14-0)

Assembly Action:

None

F153-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

907.6.5 Access and visibility. Access shall be provided to fire alarm devices, notification appliances, and equipment requiring periodic inspection, maintenance and testing. ~~Where devices, notification appliances and equipment are concealed from view, an approved sign or other means to identify their location shall be provided.~~

907.6.5.1 Concealed equipment. Fire alarm devices, notification appliances, and equipment shall not be concealed from view unless they are provided with an approved sign indicating their presence and location. The sign shall be in letters 1 inch (25mm) high on a contrasting background and be located in the immediate vicinity of the device, appliance or equipment.

Exception: Where approved signs are not required when the location is indicated on a chart, diagram, plan, or similar document maintained on the premises.

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

The access section isn't new; this language simply adds equipment to the list. Often, one of the most commonly missed items during inspection and testing is power supplies which are commonly placed above drop ceilings, out of view.

The concealed equipment section is new to the code but is necessary to provide the code official with a tool to require the equipment that currently is concealed or is added in concealed locations to be identified. As the use of wireless devices and equipment grows, so will the use of repeaters and similar components which will routinely be mounted in concealed spaces such as above ceilings. This requirement calls for the use of a sign to identify these units, but allows for a plan or diagram in lieu of signs if approved by the fire code official.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

In 95% of all cases there will be no additional cost to install the fire alarm system and devices when properly designed. In some specific cases it may be more expensive to install the device correctly but that is the right way to do it.

F153-18

F158-18

IFC: 907.10, 907.10.1

Proposed Change as Submitted

Proponent: Thomas Daly, representing The Hospitality Security Consulting Group, LLC (Thomas.Daly@myhscg.com)

2018 International Fire Code

Revise as follows

907.10 Smoke alarm maintenance. Smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions. ~~Smoke alarms shall be replaced when they fail to respond to operability tests, or when they exceed 10 years from the date of manufacture, unless an earlier replacement is specified in the manufacturer's published instructions.~~

Add new text as follows

907.10.1 Replacement. Newly installed smoke alarms shall be replaced, deemed construction, when they fail to respond to operability tests, or when they exceed 10 years from the date of manufacture, unless an earlier replacement is specified in the manufacturer's published instructions.

Reason: The proposed changes will clarify the intent of the language by differentiating between maintenance (testing, cleaning, etc) and replacement (construction) and apply the replacement obligation to newly installed smoke alarms, as there is no corresponding language in Chapter 11 making this replacement obligation applicable to existing installations.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposal will likely decrease the cost of operations.

F158-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the new proposed language of "deemed" and "newly installed" makes the new section more confusing and does not add clarity to the existing section requirements. (Vote: 14-0)

Assembly Action:

None

F158-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Thomas Daly, representing The Hospitality Security Consulting Group, LLC (thomas.daly@myhscg.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

907.10 Smoke alarm maintenance. Smoke alarms shall be tested and maintained in accordance with the manufacturer's instructions.

907.10.1 Replacement. Newly installed smoke alarms shall be replaced ~~, deemed construction,~~ when they fail to respond to operability tests, or when they exceed 10 years from the date of manufacture, unless an earlier replacement is specified in ~~the~~ manufacturers published instructions. Replacement is construction.

Commenter's Reason: As this provision in the 2018 IFC was not in Chapter 11, this proposed change clarifies the applicability and indicates the replacement activity is construction, not maintenance.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Given the impact on affected occupancies, including but not limited to, apartments, condominiums, hotels, dormitories, board and care and assisted living the clarification as to intent will dramatically reduce the cost of compliance.

F158-18

F169-18

Liquefied petroleum gas-distribution facilities	—	Not Required	Required
Where explosion hazards exist ^f	Detonation	Required	Not Permitted
	Deflagration	Not Required	Required

- a. See Section 414.1.3.
- b. See the International Fire Code.
- c. As generated during manufacturing or processing.
- d. Storage or use.
- e. In open use or dispensing.
- f. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.
- g. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.
- h. Explosion venting is not required for Group H-5 fabrication areas complying with Section 415.11.1 and the International Fire Code.

Reason: This proposed change brings this table in alignment with the current edition of NFPA 30

Cost Impact: The code change proposal will decrease the cost of construction
Elimination of deflagration venting or deflagration prevention system for enclosures used for open use or dispensing will reduce the cost of construction.

F169-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that they had concerns about the proposed deletion of all Class 1B flammable liquids from the table in relation to NFPA 30. It was noted that in there are class 1B liquids that can also be classified as an unstable reactive. It was suggested that a closer look at NFPA 30 is needed to make sure they are in alignment. (Vote: 13-0)

Assembly Action:

None

F169-18

Individual Consideration Agenda

Unstable (reactive)	4	Required	Not Permitted
	3 Detonable	Required	Not Permitted
	3 Nondetonable	Not Required	Required
Water-reactive liquids and solids	3	Not Required	Required
	2 ^g	Not Required	Required
SPECIAL USES			
Acetylene generator rooms	-	Not Required	Required
Grain processing	-	Not Required	Required
Liquefied petroleum gas-distribution facilities	-	Not Required	Required
Where explosion hazards exist ^f	Detonation	Required	Not Permitted
	Deflagration	Not Required	Required

- a. See Section 414.1.3.
- b. See the International Fire Code.
- c. As generated during manufacturing or processing.
- d. Storage or use.
- e. ~~In open use or dispensing.~~
- e. Where heated above its boiling point.
- f. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.
- g. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.
- h. Explosion venting is not required for Group H-5 fabrication areas complying with Section 415.11.1 and the International Fire Code .

Commenter's Reason: The committee stated their concern was that the original proposal to remove Class IB from the row for Flammable Liquids from Table 911.1 Explosion Control Requirements would also imply that other Class IB liquids that can be classified as an unstable (reactive) material would not need explosion control.

Table 911.1 currently includes a row for all Unstable (reactive) materials. The original proposal did not make any changes

to this row. The definition of Unstable (reactive) material and the various Classifications are currently in the code and no changes are being proposed to those sections.

If there is a 1B flammable liquid that is also an Unstable (reactive) material, then Table 911.1 would still address where explosion control is required.

This modification would address the concerns raised by the committee and the opponents to the original proposal by only requiring explosion control for 1B Flammable Liquids heated above its boiling point. These concerns were based upon the direction that NFPA 30 will be taking with regards to explosion control requirements for flammable and combustible liquids, not the current edition of NFPA 30.

Requirements for Unstable (reactive) materials would remain unchanged.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Elimination of deflagration venting or deflagration prevention systems for enclosures used for open use or dispensing of Class 1B flammable liquids not heated above their boiling point will reduce the cost of construction.

F169-18

F173-18

IFC: 913.2.2 (IBC: [F] 913.2.2)

Proposed Change as Submitted

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscottassoc@gmail.com)

2018 International Fire Code

Revise as follows

913.2.2 Circuits supplying fire pumps. Cables used for survivability of circuits supplying fire pumps shall be protected using one of the following methods:

Exception: Cables, or portions of cables, located within a fire pump room or generator room which is separated from the remainder of the occupancy with fire-resistance-rated construction.

1. Cables used for survivability of required critical circuits shall be *listed* in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than ~~1-hour~~ 2 hours.
2. Electrical circuit protective systems shall have a fire-resistance rating of not less than ~~1-hour~~ 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.
3. Construction having a *fire-resistance rating* of not less than ~~1-hour~~ 2 hours.
4. The cable or raceway is encased in a minimum of 2 inches (50 mm) of concrete.

Reason: Protecting the fire pump power supply is essential, but more critical when the pump is located within the building.

Section 695.6(A)(2)(d) of NFPA 70 requires that the power supply for fire pumps be protected for a minimum of 2 hours when it is routed through the building. The revisions to Items 1, 2 and 3 will correlate this requirement with the National Electrical Code.

The exception is added to clarify that cables located within the fire pump room are not required to be protected, and cables located with the generator room are not required to be protected. The fire-resistance rating is not specified since it could be either 1-hour or 2-hour based on other code sections.

- IBC Section 901.8 requires that the fire pump room be separated by either 1-hour or 2-hour construction depending on whether the building is high-rise or not.
- IFC/IBC Section 903.3.1.1 allows the elimination of sprinklers in the generator room if the generator room is of 2-hour construction and provided with a fire detection system.

Based on the above sections the separation could be 1-hour or 2-hour. It should also be noted that the 2-hour separation for the generator is not required, but rather an option. If the 2-hour separation and detection is not provided, then the room is provided with sprinklers. Additionally, the proposed exception in 913.2.2 would not apply since there is no fire-resistance-rated separation.

Cost Impact: The code change proposal will increase the cost of construction

This may increase the cost of construction if listed cables are used and now must be 2-hour rated. However, Item 4 allows embedding the cables in concrete which would not require 2-hour listed cables.

F173-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that they had issues with the language regarding the inclusion of the generator room into the fire pump room and the 1 hour vs. 2 hour rating requirement. The preference was for proposal F174-18. (Vote: 14-0)

Assembly Action:

None

F173-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Solomon, National Fire Protection Association, representing National Fire Protection Association requests As Submitted.

Commenter's Reason: The original F173-18 proposal does indeed provide correlation with Article 695 of the *National Electrical Code*, and NFPA 20, *Standard for the Installation of Stationary Fire Pumps for Fire Protection*. Specifically, the conductors leading up to the fire pump room per the NEC, have to be rated for 2 hours. The equivalent protection method of burying the conductors under two inches of concrete is also acceptable. In a separate comment we will recommend disapproving companion proposal F174-18, as this proposal does not provide correlation with the NEC as indicated in the reason statement.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This may increase the cost of construction if listed cables are used and now must be 2-hour rated. However, Item 4 allows embedding the cables in concrete which would not require 2-hour listed cables.

F173-18

F174-18

IFC: 913.2.2 (IBC: [F] 913.2.2)

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows

913.2.2 Circuits supplying fire pumps. Cables used for survivability of circuits supplying fire pumps shall be protected using one of the following methods:

1. Cables used for survivability of required critical circuits shall be *listed* in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 1 hour.
2. Electrical circuit protective systems shall have a fire-resistance rating of not less than 1 hour. Electrical circuit protective systems shall be installed in accordance with their listing requirements.
3. Construction having a *fire-resistance rating* of not less than 1 hour.
4. The cable or raceway is encased in a minimum of 2 inches (50 mm) of concrete.

Exception: This section shall not apply to cables, or portions of cables, located within a fire pump room or generator room which is separated from the remainder of the occupancy with fire-resistance-rated construction.

Reason: Protecting the fire pump power supply is essential, but more critical when the pump is located within the building.

Section 695.6(A)(2)(d) of NFPA 70, the National Electrical Code, requires that the power supply for fire pumps be protected for a minimum of 2 hours when it is routed through the building. These revisions will correlate this requirement with the National Electrical Code.

The exception is added to clarify that where the cables are located within the fire pump room are not required to be protected, and cables located with the generator room are not required to be protected. The fire-resistance rating is not specified since it could be either 1-hour or 2-hour based on other code sections.

- IBC Section 901.8 requires that the fire pump room be separated by either 1-hour or 2-hour construction depending on whether the building is high-rise or not.
- IFC/IBC Section 903.3.1.1 allows the elimination of sprinklers in the generator room if the generator room is of 2-hour construction and provided with a fire detection system.

Based on the above sections the separation could be 1-hour or 2-hour. It should also be noted that the 2-hour separation for the generator is not required, but rather an option. If the 2-hour separation and detection is not provided, then the room is provided with sprinklers. Additionally, the proposed exception in 913.2.2 would not apply since there is no fire-resistance-rated separation.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Correlates with the NEC so is simply a clarification.

F174-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval is based upon the proponent's published reason. (Vote: 14-0)

Assembly Action:

None

F174-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Solomon, National Fire Protection Association, representing National Fire Protection Association requests Disapprove.

Commenter's Reason: The reason statement provided for proposal F174-18 indicates the proposal is intended to provide correlation with requirements of the National Electrical Code (NEC). The current language in the proposal conflicts with the requirements of the NEC which requires 2-hour rated conductors outside of the fire pump room. In a separate comment we have recommended approving proposal F173-18 in lieu of F174-18.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
There will be no cost impact since as proposed would have been less restrictive than NFPA 70 would require.

F174-18

F180-18

IFC: 1031.3.1

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Fire Code

Revise as follows

1031.3.1 Group I-2. In Group I-2, the required clear width for *aisles, corridors and ramps* that are part of the required *means of egress* shall comply with Section 407.4.3 of the International Building Code and Section 1020.2. ~~The facility shall have a plan to maintain the required clear width during emergency situations.~~

Exception: In areas required for bed movement, equipment shall be permitted in the required width where all of the following provisions are met:

1. The equipment is low hazard and wheeled.
2. The facility shall have a plan to remove wheeled equipment in order to maintain the required clear width during emergency situations.
3. The equipment does not reduce the effective clear width for the *means of egress* to less than 5 feet (1525 mm).
4. The equipment is limited to:
 - 4.1. Equipment and carts in use.
 - 4.2. Medical emergency equipment.
 - 4.3. Infection control carts.
 - 4.4. Patient lift and transportation equipment.
5. Medical emergency equipment and patient lift and transportation equipment, when not in use, are required to be located on one side of the corridor.
6. The equipment is limited in number to not more than one per patient sleeping room or patient care room within each smoke compartment.

Reason: This clarification of language is required in order to conform with Federal Standards and CMS enforcement rules (K211). The reference to Section 407.4.3 is to point to the fixed furniture requirements for hospitals and nursing homes. This relocated language gives the AHJ enforcement language to ensure that all wheeled equipment that may be occasionally found in hallways, must be included in the facility's emergency plan and must be moved out of the required egress width in the event of an emergency situation. Items that are often found in corridors include crash carts and infection control carts, which are needed to be near the point of use and readily available in typical circumstances, but must be moved out of the corridor during emergencies.

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes*. Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposed language is operational clarification.

F180-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that they had concerns with the new exception provision for a facility to have a plan to remove wheeled equipment in that it could require going into a more hazardous area to remove it and it could be impractical. Additionally a conflict was noted between the new exception and the existing one that would follow it in the list. (Vote: 12-2)

Assembly Action:

None

F180-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1031.3.1 Group I-2. In Group I-2, the required clear width for *aisles, corridors* and *ramps* that are part of the required *means of egress* shall comply with Section 407.4.3 of the International Building Code and Section 1020.2. The facility shall have a plan to maintain the required clear width during emergency situations.

Exception: In areas required for bed movement, equipment shall be permitted in the required width where all of the following provisions are met:

1. The equipment is low hazard and wheeled.
2. ~~The facility shall have a plan to remove wheeled equipment in order to maintain the required clear width during emergency situations.~~
3. The equipment does not reduce the effective clear width for the *means of egress* to less than 5 feet (1525 mm).
4. The equipment is limited to:
 - 4.1. Equipment and carts in use.
 - 4.2. Medical emergency equipment.
 - 4.3. Infection control carts.
 - 4.4. Patient lift and transportation equipment.
5. Medical emergency equipment and patient lift and transportation equipment, when not in use, are required to be located on one side of the corridor.
6. The equipment is limited in number to not more than one per patient sleeping room or patient care room within each smoke compartment.

Commenter's Reason: The committee did not like the wheeled equipment moved to the list in the exception. We have left the language where it currently is. The addition of the reference to Section 407.4.3 in IBC is needed as a pointer to the allowance for fixed furniture.

Also not letting me submit proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal is a pointer with no changes to current requirements.

F180-18

F182-18

IFC: 105.6.47 , 202, 1001.3, 1031.11, 1031.11.1, 1031.11.2

Proposed Change as Submitted

Proponent: Michael O'Brian, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows

105.6.47 Valet trash collection. An operational permit is required to use a valet trash collection service in a Group R-2 Occupancy.

Add new definition as follows

VALET TRASH COLLECTION A service that collects occupant-generated combustible trash or recyclable materials from dwelling units, where the trash is left outside of dwelling units for scheduled pickup.

Add new text as follows

1001.3 Permits. Permits shall be required as forth in Section 105.6 for the activities regulated in 1031.11.

1031.11 Combustible trash in means of egress. Combustible trash or recyclable materials shall not be placed in exits, in enclosures for stairways or ramps, in corridors, in elevator lobbies or on egress balconies except as permitted by one of the following:

1. Combustible trash or recyclable materials associated with construction, demolition, remodeling, or alterations in accordance with Section 3311.3.
2. Combustible trash or recyclable materials in corridors or on egress balconies of Group R-2 Occupancies that is awaiting scheduled valet trash collection in accordance with Sections 1031.11.1 and 1031.11.2.

1031.11.1 Valet Trash collection. Trash or recyclable materials awaiting valet trash collection shall only be placed in a corridor or on an egress balcony within 18 hours of scheduled pickup and shall not obstruct the minimum egress width required by Section 1020.2.

Trash or recyclable materials awaiting valet trash collection shall be placed completely inside of one or more containers with a closed lid that complies with Section 1031.11.2. Additional trash or recyclable material placed outside of compliant containers are prohibited in a corridor or egress balcony.

1031.11.2 Valet trash collection containers. Containers used for valet trash collection shall not exceed a capacity of 2.0 cubic feet (15 gallons, 0.06 cubic meters) and shall be provided with tight-fitting or self-closing lids. Containers and lids shall comply with one of the following:

1. Containers and lids located in an area protected by fire sprinklers shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. The automatic sprinkler system supplying the sprinklers shall be permitted to comply with Section 903.3.1.1 or 903.3.1.2.
2. Containers and lids located in an area that is not protected by fire sprinklers in accordance with Item 1 shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 150 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. Wall and ceiling finishes in the area where valet trash collection containers are placed for pickup shall be noncombustible or shall comply with the requirements of Section 803 for Class B interior finish materials.

Reason: Valet trash collection services have become common in many R-2 occupancies. Occupants receiving this service place trash and recyclables in the corridors outside of their apartments to be picked up by a collection service, which typically comes by on a regular scheduled basis.

Currently, there are no provisions in the IFC that specifically prohibit or regulate the placement of combustible trash or recyclables in common egress areas for pickup by others. Without regulation, the hazard of excessive fire loading or exit obstruction is significant. This proposal seeks to establish reasonable safety precautions to allow this process to be offered, based on:1. An operational permit is required, ensuring that the Fire Code Official is aware that the service is being provided and encouraging code compliance.2. Requires that trash containers not obstruct the minimum required clear width of the means of egress.3. Clarifies that, in general, trash is not allowed to be accumulated in exits, corridors or egress balconies.4. Regulates trash containers and interior finish of the container placement area based on whether fire sprinklers are provided.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: FCAC

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal does not affect construction costs but may increase cost of compliance with the fire code depending upon how the provisions are enforced. However enforcement of these provisions will reduce the risk of fires.

F182-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval is based upon the proponent's published reason. (Vote: 9-5)

Assembly Action:

None

F182-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1031.11 Combustible trash in means of egress. Combustible trash or recyclable materials shall not be placed in exits, in enclosures for stairways or ramps, in corridors, in elevator lobbies or on egress balconies except as permitted by one of the following:

1. Combustible trash or recyclable materials associated with construction, demolition, remodeling, or alterations in accordance with Section 3311.3.
2. Combustible trash or recyclable materials in corridors or on egress balconies of Group R-2 Occupancies that is awaiting scheduled valet trash collection in accordance with Sections 1031.11.1 ~~and through 1031.11.23.~~

1031.11.3 Automatic Sprinkler Protection Valet trash collection shall only be permitted in Group R-2 occupancies protected by an automatic sprinkler system installed throughout the building in accordance with Section 903.3.1.1 or 903.3.1.2.

Commenter's Reason: Valet trash collection being permitted in R-2 corridors is a subject of disagreement among those in fire suppression, fire protection and fire prevention arenas. Corridors historically have been required to be free of obstructions for the use of occupants evacuating the building as well as by firefighters accessing the building and individual units for rescue and firefighting activities. The valet trash proposal introduces a hazard to those critical paths that will provide a fire hazard fuel load, within the path.

This is acknowledged by the criteria within the proposal itself.

Unfortunately, much of the criteria is going to rely on voluntary compliance. Even if a local enforcing agency inspects R-2 occupancies on a cyclical basis, problems presenting fire hazards from non-compliance with the limitations within this proposal can occur weekly. There will be bad actors in the business as well as the good actors.

For that reason this activity should only be permitted in R-2 occupancies where the building is protected by an automatic sprinkler system to provide a level of safety should a fire occur involving the trash located in the critical corridor egress and firefighter access paths.

Note that there is no height limitation for the provision of this service. As written it can occur in a high-rise building and it is well known there are 1000s of residential high-rise buildings that do not have automatic fire suppression systems installed throughout the building. The impact of fire in a high-rise building is well documented as well as the impact of fire within a required means of egress path.

I'll only refer to one such fire that occurred in an unsuppressed residential occupancy on January 9, 2012 in Chicago when a dwelling unit door to a 9th floor corridor was left open as occupants escaped the fire in the dwelling unit, (reportedly intentionally to let a pet escape), resulting in the products of combustion filling the corridor and resulting in the death of a woman who had unknowingly ridden an elevator to the fire floor. Now the code will allow the actual fuel load for a fire to be located in a similar corridor. Possibly subject to a wind driven fire, an event that has turned out deadly for the fire service.

If this proposal is to end up being part of the fire code it must be predicated on the existence of automatic fire suppression throughout the building.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This does not impact the construction cost of buildings. It impacts where a hazardous activity may occur.

Public Comment 2:

Proponent: Kara Gerczynski, Elizabeth Fire Protection District, representing Elizabeth Fire Protection District (kara@elizabethfire.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

1031.11.1 Valet Trash collection. Trash or recyclable materials awaiting valet trash collection shall only be placed in a corridor or on an egress balcony within 18 hours of scheduled pickup and shall not obstruct the minimum egress width required by Section 1020.2.

Trash or recyclable materials awaiting valet trash collection shall be placed completely inside of one or more containers with a ~~closed~~ latching lid that complies with Section 1031.11.2. Additional trash or recyclable material placed outside of compliant containers are prohibited in a corridor or egress balcony.

1031.11.2 Valet trash collection containers. Containers used for valet trash collection shall not exceed a capacity of 2.0 cubic feet (15 gallons, 0.06 cubic meters) and shall be provided with tight-fitting or self-closing latching lids. Containers and lids shall comply with one of the following:

1. Containers and lids located in an area protected by fire sprinklers shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. The lid shall be equipped with a latching device that engages to secure the lid to the container and that can only be released manually. The automatic sprinkler system supplying the sprinklers shall be permitted to comply with Section 903.3.1.1 or 903.3.1.2.
2. Containers and lids located in an area that is not protected by fire sprinklers in accordance with Item 1 shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 150 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. The lid shall be equipped with a latching device that engages to secure the lid to the container and that can only be released manually. Wall and ceiling finishes in the area where valet trash collection containers are placed for pickup shall be noncombustible or shall comply with the requirements of Section 803 for Class B interior finish materials.

Commenter's Reason: The proponent is basing their code change on a container and lid that is entirely of noncombustible materials but has no way to ensure that the lid will remain closed to provide for that noncombustible rating. Providing a latching lid will ensure the following: 1. Trash is limited to what fits inside the container. Limiting the amount of fire load in the corridors. 2. The sprinkler system designed for the corridor will meet the requirements if the trash is secured in the container. If the lid was not secured or partially open, the sprinkler system may not meet the design requirements for light hazard of a corridor. 3. Having a latching lid will help heat sources from entering the container. 4. In the event of a fire, if the containers fall over, trash would not be scattered throughout the corridor. It would also help firefighter safety while they are providing suppression operations in the corridor.

Having a latching lid is the only way to secured combustibles in the container as the proponents of the proposal expect the use of valet trash.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There are no construction costs with the proposed modification to the code proposal.

Public Comment 3:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org); Andrew Klein (andrew@asklein.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

105.6.47 Valet trash collection. An operational permit is required to use a for providers of valet trash collection service in a Group R-2 Occupancy Occupancies.

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This Public Comment addresses an issue that was raised during the Committee Action Hearing to make the valet trash collection permitting requirements more streamlined for jurisdictions who choose to require permits. Many apartments who offer such services contract with a service provider. The revised language makes it clear that operational permits are required for the service provider and not for each individual site serviced within a jurisdiction.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. By clarifying that permits are required of the service provider, this Public Comment lessens the burden on jurisdictions. The decrease in the cost of permitting is transferred as savings to operators of apartment complexes.

Public Comment 4:

Proponent: Andrew Klein, representing Valet Living (andrew@asklein.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1031.11.2 Valet trash collection containers. Containers used for valet trash collection shall not exceed a capacity of 2.0 cubic feet (15 gallons, 0.06 cubic meters) and shall be provided with tight-fitting or self-closing lids. Containers and lids shall comply with one of the following:

1. Containers and lids located on an exterior egress balcony of a building not exceeding three stories above grade plane shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. The egress balcony shall be constructed in accordance with Section 1021.
2. Containers and lids located in an area protected by fire sprinklers shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. The automatic sprinkler system supplying the sprinklers shall be permitted to comply with Section 903.3.1.1 or 903.3.1.2.
23. Containers and lids not located on an exterior egress balcony in accordance with Item 1 or located in an area that is not protected by fire sprinklers in accordance with Item 1-2 shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 150 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation. Containers and lids shall be listed or bear the label of an approved agency that validates compliance with this requirement. Wall and ceiling finishes in the area where valet trash collection containers are placed for pickup shall be noncombustible or shall comply with the requirements of Section 803 for Class B interior finish materials.

Commenter's Reason: The practice of door-side trash collection in apartment communities, commonly referred to as valet trash, began with a single apartment unit in Tampa in 1995 and now extends to 1.5 million residences among more than 5,000 apartment communities in 40 states. The industry has a perfect safety record since inception - no history of life loss or impediment to life safety, resident evacuation building safety, or first responder safety. Fire officials in certain local jurisdictions have questioned whether the service meets the fire code in terms of the combustibility features of Chapter 3 and the egress provisions of Chapter 10, but everyone agrees that the code has only pointers - no definitive answer on the practice or regulation of it. To settle the uneven interpretations and enforcements, the industry joined the FCAC proponent in Columbus in April in support of the F-182-18, which was approved as submitted.

We offer a tweak to what the language that was approved. The requirement that collection containers in non-sprinkled open-air corridors and breezeways be constructed of non-combustible materials or materials that meet an ASTM 1354 peak heat release of 150 kW/m² is excessive in proportionality of risk when applied to certain unsprinkled construction – which was unsprinkled because the life safety risk of the unsprinkled areas was not sufficient to require sprinklers in the building code.

Members of the FCAC offered a compromise of allowing containers meeting an ASTM 1354 peak heat release of 300 kW/m² to be used in unsprinkled open-air corridors and breezeways in buildings of up to three stories in construction. The industry supports this compromise as offered in this public comment.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The net effect of the public comment and overall code change proposal will significantly decrease the cost of construction to the degree that developers can forego the expense and space of trash rooms, chutes and dumpster systems. The cost of non-combustible containers or ones that meet the ASTM 1354 standard at 150 kW/m² are 4.5 times that of those which meet the 300 kW/m² peak heat release rate with no data or testing on whether the more stringent standard, which carries a deleterious fiscal impact on the industry, is proportional to the risk.

Public Comment 5:

Proponent: Brian M. McGraw, P.E., Virginia Department of Fire Programs, State Fire Marshal's Office, representing Virginia State Fire Marshal's Office, Virginia Fire Services Board (brian.mcgraw@vdfp.virginia.gov) requests Disapprove.

Commenter's Reason: The Virginia Fire Services Board opposes Proposal F182-18. This proposal will result in unsafe conditions for building occupants and firefighters. The premise of “valet trash” violates several sections of the current Fire Code, including:

- 304.1: Combustible waste material creating a fire hazard shall not be allowed to accumulate in buildings or structures or upon premises.
- 304.2: Storage of combustible rubbish shall not produce conditions that will create a nuisance or a hazard to the public health, safety or welfare.
- 1031.2: Required exit accesses, exits and exit discharges shall be continuously maintained free from obstructions or impediments to full instant use in the case of fire or other emergency where the building area served by the means of egress is occupied.
- 1031.1: A means of egress shall be free from obstructions that would prevent its use, including the accumulation of snow and ice.
- 1031.6: ... Furnishings, decorations or other objects shall not be placed so as to obstruct exits, access thereto, egress therefrom, or visibility thereof...

The above requirements are longstanding fundamentals of protecting the means of egress and providing for fire safety in buildings. However, because one or more businesses have undertaken business practices that violate current code requirements, the answer is to weaken the requirements, potentially putting occupants and firefighters at risk.

The proposal states that “trash or recyclable materials awaiting valet trash collection shall only be placed in a corridor or on an egress balcony within 18 hours of scheduled pickup and shall not obstruct the minimum egress width required by Section 1020.2”. What happens if the scheduled pickup does not occur? Is the trash or recyclable material allowed to remain in the corridor until the next scheduled pickup? How does the tenant placing their trash or recyclable material in the corridor know what the minimum egress width is? How do you enforce this? Who is responsible for compliance? The valet trash service provider? The building owner? The building manager? The tenant?

The proposal specifies the size and type of container that must be used and that they must be provided with tight-fitting or self-closing lids. However, the proposal does not require the lid to be used. What if the occupant has more trash than will fit in the container? Leave the lid off? Put it next to the container?

There are no restrictions on the type of materials that can be put out. During the Committee Action Hearings, the one service provider that was represented stated that their policies prohibited hazardous materials, flammable liquids, etc. What about the other service providers?

In limited visibility, firefighters follow the wall to find their way. We teach the general public to follow the wall to find their way out in smoke. This proposal allows the introduction of obstructions that will require firefighters and occupant that are attempting to follow the wall to lose contact with the wall.

This proposal fails to address a number of important factors and presents a multitude of enforcement issues and should be disapproved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

This proposal affects the operation of a building after occupancy and, therefore, has no impact on cost of construction.

F185-18

IFC: 1103.7.5.1

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org); Jason Webb, Automatic Fire Alarm Association Codes & Standards Committee, representing Automatic Fire Alarm Association Codes & Standards Committee; Richard Roberts, representing Honeywell (richard.roberts@systemsensor.com)

2018 International Fire Code

Revise as follows

1103.7.5.1 Group R-1 hotel and motel manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in ~~existing~~ the following:

1. Existing Group R-1 hotels and motels more than three stories ~~or in height~~.
2. Existing Group R-1 hotels and motels with more than 20 sleeping units.
3. Existing unsprinklered Group R-1 hotels and motels more than one story in height.

Exceptions:

1. Buildings less than two stories in height where all *sleeping units*, attics and crawl spaces are separated by 1-hour fire-resistance-rated construction and each *sleeping unit* has direct access to a *public way, egress court* or yard.
2. Manual fire alarm boxes are not required throughout the building where the following conditions are met:
 - 2.1. The building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.
 - 2.2. The notification appliances will activate upon sprinkler water flow.
 - 2.3. Not less than one manual fire alarm box is installed at an *approved* location.

Reason: For existing unsprinklered Group R-1 occupancies a fire alarm system would be required if the building is more than one story or has more than 20 sleeping units.

Fires in some older multiple story unsprinklered hotels without fire alarm systems, as was allowed in the IBC/IFC up to 2003, have resulted in multiple fire fatalities and fire injuries, where a fire in on the first-floor envelopes the second story means of egress.

Such fires in two-story motels without automatic sprinkler systems occurred on January 4, 2010 in South Birmingham, AL (4 fatalities on the second floor), on December 14, 2013 in Wausau, WI (20 injuries) and in Point Pleasant Beach, NJ on March 21, 2014 (four fatalities on the second floor).

One additional example of a multiple life-loss fire was the Newport, OR City Center Motel on August 5, 2016, 4 civilian fire deaths and 3 civilian fire injuries. Fire deaths occurred on both the ground floor and the 2nd floor. The fire started on the ground floor. No sprinklers and no reports of a fire alarm system sounding.

These fires resulted in fatalities, as second floor occupants could not escape due to the means of egress being blocked by smoke and flames. In these fires resulting in fatalities, no fire alarm system was in place to provide early warning to occupants.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will increase the cost of construction

This change will impact the cost of construction or operation of a smaller number existing hotels. When you need to add notification (horns and strobes) to these buildings, the cost would be about 350.00 a device installed.

F185-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that the proposed requirements are more restrictive than those for new construction and could result in newly occupied buildings having to add a system after the certificate of occupancy is issued. (Vote: 9-5)

Assembly Action:

None

F185-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org); Kevin Scott, representing FCAC (khscothassoc@gmail.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

1103.7.5.1 Group R-1 hotel and motel manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in existing Group R-1 hotels and motels more than ~~three stories~~ one story in height or with more than 20 *sleeping units*.

Exceptions:

1. ~~Buildings~~ A manual fire alarm system is not required in buildings less than two stories in height where all sleeping units, attics and crawl spaces are separated by 1-hour fire-resistance-rated construction and each sleeping unit has direct access to a public way, egress court or yard.
2. A manual fire alarm system is not required in buildings not more than three stories in height and not more than 20 sleeping units equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
- ~~2-3.~~ Manual fire alarm boxes are not required throughout the building where the following conditions are met:
 - ~~2-1-3.1.~~ The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
 - ~~2-2-3.2.~~ The notification appliances will activate upon sprinkler water flow.
 - ~~2-3-3.3.~~ Not less than one manual fire alarm box is installed at an approved location.

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to firesafety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This public comment continues with the original concept of addressing multi-story, unsprinklered hotels and motels.

The charging statement requires a fire alarm system for existing facilities greater than 1 story. Exception 1 is revised to clarify that it eliminates the entire fire alarm system where each unit has direct egress and 1-hour separation in a 1-story building.

The new Exception 2 eliminates the requirement for a fire alarm system in sprinklered buildings up to 3 stories provided the building contains no more than 20 sleeping units.

Application to existing buildings would be as follows:

Fire Alarm System Required in Existing *SPRINKLERED* Group R-1

Number of Units	1 Story	2 or 3 Stories	3 stories
20 or less	Not required	Not Required	Required ^b
more than 20	Required ^{a,b}	Required ^b	Required ^b

a. Exception 1 could eliminate the fire alarm system for 1-story buildings.

b. Exception 3 would eliminate all but one manual fire alarm box.

Fire Alarm System Required in Existing *NONSPRINKLERED* Group R-1

Number of Units	1 Story	2 or 3 Stories	3 stories
20 or less	Not required	Required	Required
more than 20	Required ^a	Required	Required

a. Exception 1 could eliminate the fire alarm system for 1-story buildings.

Fires in two-story motels without automatic sprinkler systems occurred on January 4, 2010 in South Birmingham, AL (4 fatalities on the second floor), on December 14, 2013 in Wausau, WI (20 injuries) and in Point Pleasant Beach, NJ on March 21, 2014 (four fatalities on the second floor).

One additional example of a multiple life-loss fire was the Newport, OR City Center Motel on August 5, 2016, 4 civilian fire deaths and 3 civilian fire injuries. Fire deaths occurred on both the ground floor and the 2nd floor. The fire started on the ground floor. No sprinklers and no reports of a fire alarm system sounding.

These fires resulted in fatalities, as second floor occupants could not escape due to the means of egress being blocked by smoke and flames. In fires resulting in fatalities, no fire alarm system was in place to provide early warning to occupants.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The code change proposal will increase the onetime cost of ownership. When you need to add notification (horns and strobes) to these buildings, the cost would be about \$350.00 a device installed.

Some hotel chains are already adding fire alarm systems on their own.

1202.1 Definitions. The following terms are defined in Chapter 2:
BATTERY SYSTEM, STATIONARY STORAGE.

BATTERY TYPES.

1. **Lead-acid battery.**

CAPACITOR ARRAY.

CAPACITOR ENERGY STORAGE SYSTEM.

CRITICAL CIRCUIT.

EMERGENCY POWER SYSTEM.

ENERGY MANAGEMENT SYSTEMS.

FUEL CELL POWER SYSTEM, STATIONARY.

PORTABLE GENERATOR.

STANDBY POWER SYSTEM.

STATIONARY BATTERY ARRAY.

Add new text as follows

SECTION 1204 PORTABLE GENERATORS

1204.1 Portable generators. The use, operation, and maintenance of portable generators shall comply with this section.

1204.2 Carbon monoxide mitigation. Portable generators shall be listed and labeled in accordance with the UL 2201 carbon monoxide mitigation requirements.

1204.3 Operation and maintenance. Portable generators shall be operated and maintained in accordance with the manufacturer's instructions.

1204.4 Grounding. Portable generators shall be grounded in accordance with NFPA 70.

1204.5 Operating locations. Portable generators shall be only operated outdoors a minimum of 10 ft. (1524 m) from any building openings such as windows and doors or air intakes. Portable generators shall not be operated within buildings or enclosed areas. Additional separation shall be provided for tents, membrane structures and outdoor assembly events as specified in Chapter 31 of this Code.

1204.6 Cords and wiring. Extension cords and temporary wiring used to connect portable generators shall be in accordance with Section 604 of this code and shall be provided with GFCI protection.

1204.7 Connections to premise wiring. Connections to a premise wiring system shall comply with all of the following:

1. Power shall not be provided in a manner that "back feeds" receptacles or the premise wiring system.
2. Connection to a premise served by commercial power shall be made through a listed transfer switch installed, used and maintained in accordance with NFPA 70.
3. Connections to buildings not served by commercial power shall comply with NFPA 70.

1204.8 Refueling. Portable generators shall not be refueled while operating.

1204.9 Storage and repair. Storage and repair of fuel fired portable generators shall comply with Section 313.

1204.10 Fire extinguisher. One portable fire extinguisher shall be provided in accordance with Section 906 for an Ordinary (Moderate) hazard Class B and Class C fire hazard, and placed in an approved location.

Revise as follows

3106.6.2 Generators-Portable generators. Generators-Portable generators shall comply with Section 1204. Portable generators shall be installed not less than 10 feet (3048 mm) from combustible materials, and shall be isolated from the public by physical guard, fence or enclosure installed not less than 3 feet (914 mm) away from the internal combustion power source.

3107.16 Separation of generators—Portable generator separation. ~~Generators—Portable generators~~ and other internal combustion power sources shall be separated from tents or membrane structures by not less than 20 feet (6096 mm) and shall be isolated from contact with the public by fencing, enclosure or other *approved* means.

Add new text as follows

SECTION 3307 PORTABLE GENERATORS

3307.1 General. Portable generators used at construction and demolition sites shall comply with Section 1204.

Add new standard(s) follows

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

UL 2201-18:

Standard for Tests for Determining Carbon Monoxide (CO) Emission Rate of Portable Generators

Reason: The use of portable generators is unregulated in the IFC, except for Section 313 storage, use and repair requirements and some Chapter 31 setback requirements. These products are frequently used to provide power at special outdoor events, construction sites, and during power outages, which often occur during and following natural disasters. A 2016 Consumer Product Safety Commission (CPSC) staff report https://www.cpsc.gov/s3fs-public/PGMAsummitCPSCstaffpresentation_2.pdf?utm_source=rss&utm_medium=rss&utm_campaign=Portable%20Generator%20Technical%20Reports indicated that in the

9 year period of 2004 through 2012, there were 8,703 CO injuries and 666 fatalities associated with the use of portable generators. The report also indicated that a typical engine powering a 5 kW portable generator emits a weighted average CO rate of nominally 1500 g/hr, compared to an idling mid-size late 1990's vintage cars that emit 2.4 - 5.4 g/hr of CO. This proposal provides basic safety requirements for the use of portable generators, including the following:

1. 1204.2 requires portable generators to be listed and labeled in accordance with UL 2201 carbon monoxide mitigation requirements, which (1) limit the amount of CO produced by a portable generator, and (2) require the portable generator to shutoff in elevated CO environments. These requirements were developed based on an analysis of the CPSC CO incident data, and are complementary, addressing both indoor misuse and outdoor use incidents. In accordance with UL 2201, the CO emission rate shall not exceed 150 g/h, and the generator shall shutoff at any time when there is a peak 400 ppm CO concentration, or the average CO concentration is greater than 150 ppm during a rolling 600 seconds during the test.
2. 1204.5 includes restrictions on locations where portable generators can be operated to minimize the chance of carbon monoxide poisoning and fires.
3. 1204.7 provides guidance on how power from portable generators can be provided to premise wiring systems. Back feeding receptacles is an unsafe practice which can bypass premise overcurrent protection and create a dangerous situation when local commercial power comes back online. It can also endanger utility workers while they repairing power lines, when they are not expecting any power.
4. 1204.10 requires a portable fire extinguisher be provided where portable generators are used. The sizing and rating complies with NFPA 10 for the hazard classification associated with portable generators fueled with a flammable liquid (gasoline). This is consistent with current portable fire extinguisher requirements for mitigation of potential fire hazards.

Cost Impact: The code change proposal will increase the cost of construction. There could be additional expense for providing portable extinguishers, providing grounding per NFPA 70, providing NFPA 70 compliant connections, and UL 2201 compliant portable generators.

Analysis: A review of the standard proposed for inclusion in the code, UL 2201-18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

F193-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved as there were concerns with what separations are appropriate. Discussions surrounded 5 and 10 feet but also concern those may not be correct as well. Also there was concern that the fire extinguisher was not required to have a Class A rating. A reference to NFPA 37 was suggested. (Vote: 9-4)

Assembly Action:

None

F193-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Andrew King, International Association of Fire Chiefs, representing UL LLC (andyk@franklintn.gov); Howard Hopper, representing UL LLC (howard.d.hopper@ul.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

PORTABLE GENERATOR. A mobile internal combustion engine-driven device that provides temporary electrical power. This includes hand portable, wheeled, trailer mounted, and motor vehicle mounted generator sets. It does not include generators in permanent, fixed installations.

1204.1 Portable generators. The use, operation, and maintenance of portable generators shall comply with this section.

1204.2 ~~Carbon monoxide mitigation~~Listing. Portable generators manufactured after January 1, 2021 shall be listed and labeled in accordance with the UL 2201-carbon monoxide mitigation requirements.

1204.5 Operating locations. Portable generators shall be only operated outdoors a minimum of ~~10~~ 5 ft. (1524 ~~mm~~) from any building openings such as windows and doors or air intakes Portable generators shall not be operated within buildings or enclosed areas. Additional separation shall be provided for tents, membrane structures and outdoor assembly events as specified in Chapter 31 of this Code.

1204.10 Fire extinguisher. ~~One A listed~~ portable fire extinguisher complying with Section 906 with a minimum rating of 2-A:20-B:C shall be provided in accordance with Section 906 for an Ordinary (Moderate) hazard Class B and Class C fire hazard, and placed in an approved location not more than 50 feet (15240 mm) from the portable generator.

3106.6.2 ~~Portable generators~~Generators.. ~~Portable generators shall comply with Section 1204. Portable generators shall~~ Generators shall be installed not less than 10 feet (3048 mm) from combustible materials, and shall be isolated from the public by physical guard, fence or enclosure installed not less than 3 feet (914 mm) away from the internal combustion power source. __

3107.16 ~~Portable generator separation~~Separation of generators. ~~Portable generators-Generators~~ and other internal combustion power sources shall be separated from tents or membrane structures by not less than 20 feet (6096 mm) and shall be isolated from contact with the public by fencing, enclosure or other *approved* means.

Commenter's Reason: A few concerns were raised with the original proposal which have been addressed as follows:

There was concern that the definition of portable generator may not adequately identify the type of generators being covered, and to differentiate them from permanently installed fixed generators regulated by NFPA 37. The Portable Generator definition was revised to address these concerns.

The original proposal did not allow existing portable generators not listed to UL 2201 from being used, which was not the intent of the proposal. This was addressed by only requiring UL 2201 listing for portable generators manufactured after January 1, 2021, which will not impact portable generators currently in use or on the market.

There was no disagreement with prohibiting portable generators from being used within buildings or in enclosed spaces, but requiring them to be spaced a minimum 10 ft from windows, doors and air intakes might be problematic based on a buildings location. It was felt that a minimum 5 ft. spacing to windows, doors and air intake openings, combined with UL 2201 listings that significantly limit levels of carbon monoxide in the exhaust provides an acceptable level of safety.

The concern with the portable fire extinguisher not including a Class A rating was addressed with a revision to Section 1204.10. A 50 foot travel distance was also introduced which is consistent with NFPA 10. Specifying that portable extinguishers be provided in an "approved location" was removed since fire code officials are typically not on the job site to approve the portable extinguisher location.

Section 3106.6.2 and 3107.16 reverted to existing language which covered all generators, not just portable generators.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. There could be an additional expense for providing portable extinguishers, providing grounding per NFPA 70, providing NFPA 70 compliant connections, and UL 2201 compliant portable generators.

F193-18

F199-18

IFC: 1204.2.2

Proposed Change as Submitted

Proponent: Joseph Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (JoeCainPE@gmail.com)

2018 International Fire Code

Revise as follows

1204.2.2 Emergency escape and rescue openings. ~~Panels and modules installed on Group R-3 buildings~~ Photovoltaic (PV) panel systems shall not be placed on the portion of a roof that is below an emergency escape and rescue opening. A pathway of not less than 36 inches (914 mm) wide shall be provided to ~~the~~ not fewer than one emergency escape and rescue ~~opening.~~ opening for each sleeping room.

Reason: Section 1204.2.2 was new in the 2018 IFC, as a result of Proposal F-87 Part 1.

"Panels and modules" is a non-specific reference to solar photovoltaic (PV) systems. This incomplete language does not correlate to terms defined in the IBC. "*Photovoltaic panel system*" is a term defined in the IBC and IRC.

As written in the 2018 IFC, this provision applies only to Group R-3 occupancies. However, IBC and IFC Section 1030.1 also require emergency escape and rescue openings for Group R-2 and Group R-4 occupancies, in certain cases. By removing the R-3 buildings, the access pathway requirement is expanding to any occupancy where emergency escape and rescue openings are required. In those cases where a sleeping room has more than one opening that meets the dimensional criteria for an emergency escape and rescue opening, an access pathway is required to not fewer than one emergency escape and rescue opening for each sleeping room. The language "not fewer than one" is consistent with language found in IBC/IFC Section 1030.1.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal clarifies that access pathways are required to emergency escape and rescue openings in any residential occupancy where they are required by IFC Section 1030 and IBC Section 1030. This will neither increase nor decrease the cost of construction.

F199-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved with concern that is difficult to know which emergency escape rescue opening would be needed in a fire and would reduce safety. The removal of Group R-3 was seen as beneficial to apply the provisions more generally. (Vote: 8-5)

Assembly Action:

None

F199-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Joseph H. Cain, Solar Energy Industries Association (SEIA), representing Solar Energy Industries Association (joecainpe@gmail.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1204.2.2 Emergency escape and rescue openings. Photovoltaic (PV) ~~panel systems~~ panels and BIPV modules shall not be placed on the portion of a roof that is below an emergency escape and rescue opening. A pathway of not less than 36 inches (914 mm) wide shall be provided to not fewer than one emergency escape and rescue opening for each sleeping room.

Exception: BIPV systems listed in accordance with Section 690.12(B)(2) of NFPA 70, where the removal or cutting away of portions of the BIPV system during firefighting operations have been determined to not expose a firefighter to electrical shock hazards.

Commenter's Reason: The edit to Photovoltaic (PV) panels and BIPV modules is in response to public testimony during the Committee Action Hearings. These edits are intended to clarify that both roof-mounted PV panel systems and BIPV modules are within the scope of the requirement.

The exception added to this proposal uses language identical to the exception language added in the floor modification to F200-18, which was unanimously Approved as Modified by the IFC Committee.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The public comment and the code change proposal impact only layout of PV system components.

F199-18

F203-18

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

BATTERY TYPES.

Delete without substitution

CAPACITOR ARRAY. An arrangement of individual capacitor modules in close proximity to each other, mounted on storage racks or in cabinets or other enclosures.

CAPACITOR ENERGY STORAGE SYSTEM. A stationary, rechargeable energy storage system consisting of capacitors, chargers, controls and associated electrical equipment designed to provide electrical power to a building or facility. The system is typically used to provide standby or emergency power, an uninterruptable power supply, load shedding, load sharing or similar capabilities.

ENERGY STORAGE MANAGEMENT SYSTEMS. An electronic system that protects ~~stationary energy storage batteries systems~~ from operating outside their safe operating parameters, and ~~generates an alarm and trouble signal for off normal conditions~~; ~~disconnects electrical power to the ESS or places it in a safe condition if potentially hazardous temperatures or other conditions are detected.~~

ENERGY STORAGE SYSTEM (ESS).

One or more devices, assembled together, capable of storing energy in order to supply electrical energy at a future time.

Add new text as follows

ENERGY STORAGE SYSTEM CABINET. A cabinet containing components of the energy storage system that is included in the UL 9540 listing for the system. Personnel are not able to enter the enclosure, other than reaching in to access components for maintenance purposes.

ENERGY STORAGE SYSTEM COMMISSIONING.

A systematic process that provides documented confirmation that an energy storage system functions according to the intended design criteria and complies with applicable code requirements.

ENERGY STORAGE SYSTEM DECOMMISSIONING.

A systematic process that provides documentation and procedures that allow an energy storage system to be safely de-energized, disassembled, readied for shipment or storage, and removed from the premise in accordance with applicable code requirements.

ENERGY STORAGE SYSTEM, ELECTROCHEMICAL.

An energy storage system that stores energy and produces electricity using chemical reactions. It includes, among others, battery ESS and capacitor ESS.

ENERGY STORAGE SYSTEM, MOBILE.

An energy storage system capable of being moved and utilized for temporary energy storage applications, and not installed as fixed or stationary electrical equipment. The system can include integral wheels for transportation, or be loaded on a trailer and unloaded for charging, storage and deployment.

ENERGY STORAGE SYSTEM, STATIONARY.

An energy storage system installed as fixed or stationary electrical equipment in a permanent location.

ENERGY STORAGE SYSTEM, WALK-IN UNIT.

A pre-fabricated building that contains energy storage systems. It includes doors that provide walk-in access for personnel to maintain, test and service the equipment, and is typically used in outdoor and mobile ESS applications.

Delete without substitution

STATIONARY BATTERY ARRAY. An arrangement of individual stationary storage batteries in close proximity to each other, mounted on storage racks or in modules, battery cabinets or other enclosures.

Add new text as follows

105.6.14 Energy storage systems, mobile. An operational permit is required for mobile energy storage systems regulated by Section 1206.

Grain processing	—	Not required	Required
Liquefied petroleum gas distribution facilities	—	Not required	Required
Where explosion hazards exist ^d	Detonation	Required	Not permitted
	Deflagration	Not required	Required

- a. Combustible dusts that are generated during manufacturing or processing. See definition of "Combustible dust" in Chapter 2.
- b. Storage or use.
- c. In open use or dispensing.
- d. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.
- e. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.
- f. Explosion venting is not required for Group H-5 Fabrication Areas complying with Chapter 27 and the International Building Code.
- g. Where explosion control is required in Section 1206.6.

Revise as follows

1201.1 Scope. The provisions of this chapter shall apply to the installation, operation ~~and maintenance, maintenance,~~ repair, retrofitting, testing, commissioning and decommissioning of energy systems used for generating or storing energy. It shall not apply to equipment associated with the generation, control, transformation, transmission, or distribution of energy installations that is under the exclusive control of an electric utility or lawfully designated agency.

1202.1 Definitions. The following terms are defined in Chapter 2:
BATTERY SYSTEM, STATIONARY STORAGE.

BATTERY TYPES.

1. ~~Lead-acid battery.~~

1. CAPACITOR

~~ARRAY.CAPACITOR~~

1. ENERGY STORAGE SYSTEM.

CRITICAL CIRCUIT.

EMERGENCY POWER SYSTEM.

ENERGY STORAGE MANAGEMENT SYSTEMS.

ENERGY STORAGE SYSTEM.

ENERGY STORAGE SYSTEM CABINET.

ENERGY STORAGE SYSTEM COMMISSIONING.

ENERGY STORAGE SYSTEM DECOMMISSIONING.

ENERGY STORAGE SYSTEM, ELECTROCHEMICAL.

ENERGY STORAGE SYSTEM, MOBILE.

ENERGY STORAGE SYSTEM, WALK-IN UNIT.

FUEL CELL POWER SYSTEM, STATIONARY.

STANDBY POWER SYSTEM.~~STATIONARY BATTERY ARRAY.~~

Add new text as follows

1203.2.5 Exhaust ventilation. Standby power shall be provided for mechanical exhaust ventilation systems as required in Section 1206.6.1.2.1. The system shall be capable of powering the required load for a duration of not less than two hours.

1203.2.6 Gas detection systems. Emergency power shall be provided for gas detection systems where required by Sections 1203.2.9 and ~~1203.2.16~~ 1203.2.16. Standby power shall be provided for gas detection systems where required by ~~Section~~ Sections 916.5 and 1206.6.2.2.4.

SECTION 1206 ELECTRICAL ENERGY STORAGE SYSTEMS (ESS)

1206.1 General. The provisions in this section are applicable to stationary and mobile electrical energy storage systems (ESS).

1206.1.1 Scope. ESS having capacities exceeding the values shown in Table 1206.1 shall comply with this section.

1206.1.2 Permits. Permits shall be obtained for ESS as follows:

1. Construction permits shall be obtained for stationary ESS installations and for mobile ESS charging and storage installations covered by 1206.10.1. Permits shall be obtained in accordance with Sections 105.7.7.
2. Operational permits shall be obtained for mobile ESS deployment operations covered by Section 1206.10.3. Permits shall be obtained in accordance with Sections 105.6.14.

**TABLE 1206.1
ENERGY STORAGE SYSTEM (ESS) THRESHOLD QUANTITIES**

TECHNOLOGY	ENERGY CAPACITY ^a
<u>Lead acid batteries, all types</u>	<u>70 KWh (252 Megajoules) ^c</u>
<u>Nickel cadmium batteries (Ni-Cd)</u>	<u>70 KWh (252 Megajoules)</u>
<u>Nickel metal hydride (Ni-MH)</u>	<u>70 KWh (252 Megajoules)</u>
<u>Lithium-ion batteries</u>	<u>20 KWh (72 Megajoules)</u>
<u>Flow batteries ^b</u>	<u>20 KWh (72 Megajoules)</u>
<u>Other battery technologies</u>	<u>10 KWh (36 Megajoules)</u>
<u>Capacitor ESS</u>	<u>3 KWh (10.8 Mega joules)</u>
<u>Other electrochemical ESS technologies</u>	<u>3 KWh (10.8 Mega joules)</u>

a. Energy capacity is the total energy capable of being stored (nameplate rating), not the usable energy rating. For units rated in Amp-Hours, KWh shall equal rated voltage times amp-hour rating divided by 1000.

b. Shall include vanadium, zinc-bromine, polysulfide-bromide, and other flowing electrolyte type technologies.

c. 50 gallons of lead acid battery electrolyte shall be considered equivalent to 70 KWh.

1206.1.3 Construction documents. The following information shall be provided with the permit application:

1. Location and layout diagram of the room or area in which the ESS is to be installed.
2. Details on the hourly fire-resistance ratings of assemblies enclosing the ESS.
3. The quantities and types of ESS to be installed.
4. Manufacturer's specifications, ratings and listings of each ESS.
5. Description of energy (battery) management systems and their operation.
6. Location and content of required signage.
7. Details on fire suppression, smoke or fire detection, thermal management, ventilation, exhaust and deflagration venting systems, if provided.
8. Support arrangement associated with the installation, including any required seismic restraint.
9. A commissioning plan complying with 1206.2.1.
10. A decommissioning plan complying with 1206.2.3.

1206.1.4 Hazard mitigation analysis. A failure modes and effects analysis (FMEA) or other approved hazard mitigation analysis shall be provided in accordance with Section 104.7.2 under any of the following conditions:

1. Where ESS technologies not specifically identified in Table 1206.1 are provided.
2. More than one ESS technology is provided in a room or enclosed area where there is a potential for adverse interaction between technologies.
3. Where allowed as a basis for increasing maximum allowable quantities. See Section 1206.5.2.

1206.1.4.1 Fault condition. The hazard mitigation analysis shall evaluate the consequences of the following failure modes. Only single failure modes shall be considered.

1. A thermal runaway condition in a single ESS rack, module or unit.
2. Failure of any battery (energy) management system.
3. Failure of any required ventilation or exhaust system.
4. Voltage surges on the primary electric supply.
5. Short circuits on the load side of the ESS.
6. Failure of the smoke detection, fire detection, fire suppression, or gas detection system.
7. Required spill neutralization not being provided or failure of a required secondary containment system.

1206.1.4.2 Analysis approval. The fire code official is authorized to approve the hazardous mitigation analysis

provided the consequences of the hazard mitigation analysis demonstrate:

1. Fires will be contained within unoccupied ESS rooms or areas for the minimum duration of the fire-resistance rated separations identified in Section 1206.7.4.
2. Fires in occupied work centers will be detected in time to allow occupants within the room or area to safely evacuate.
3. Toxic and highly toxic gases released during fires will not reach concentrations in excess of IDLH level in the building or adjacent means of egress routes during the time deemed necessary to evacuate occupants from any affected area.
4. Flammable gases released from ESS during charging, discharging and normal operation will not exceed 25 percent of their lower flammability limit (LFL).
5. Flammable gases released from ESS during fire, overcharging and other abnormal conditions will be controlled through the use of ventilation of the gases preventing accumulation or by deflagration venting.

1206.1.4.3 Additional protection measures. Construction, equipment and systems that are required for the ESS to comply with the hazardous mitigation analysis, including but not limited to those specifically described in Section 1206 shall be installed, maintained and tested in accordance with nationally recognized standards and specified design parameters.

1206.1.5 Large scale fire test. Where required elsewhere in Section 1206, large scale fire testing shall be conducted on a representative ESS in accordance with UL 9540A. The testing shall be conducted or witnessed and reported by an approved testing laboratory and show that a fire involving one ESS will not propagate to an adjacent ESS, and where installed within buildings, enclosed areas and walk-in units will be contained within the room, enclosed area or walk-in unit for a duration equal to the fire resistance rating of the room separation specified in Section 1206.7.4. The test report shall be provided to the fire code official for review and approval in accordance with Section 104.7.2.

1206.1.6 Fire remediation. Where a fire or other event has damaged the ESS and ignition or re-ignition of the ESS is possible, the system owner, agent, or lessee shall take the following actions, at their expense, to mitigate the hazard or remove damaged equipment from the premises to a safe location.

1206.1.6.1 Fire mitigation personnel. Where, in the opinion of the fire code official, it is essential for public safety that trained personnel be on site to respond to possible ignition or re-ignition of a damaged ESS, the system owner, agent or lessee shall immediately dispatch one or more fire mitigation personnel to the premise, as required and approved, at their expense. These personnel shall remain on duty continuously after the fire department leaves the premise until the damaged energy storage equipment is removed from the premises, or earlier if the fire code official indicates the public safety hazard has been abated.

1206.1.6.2 Duties. On-duty fire mitigation personnel shall have the following responsibilities:

1. Keep diligent watch for fires, obstructions to means of egress and other hazards.
2. Immediately contact the fire department if their assistance is needed to mitigate any hazards or extinguish fires.
3. Take prompt measures for remediation of hazards in accordance with the decommissioning plan in Section 1206.2.3.
4. Take prompt measures to assist in the evacuation of the public from the structures.

1206.2 Commissioning, decommissioning, operation and maintenance. Commissioning, decommissioning, operation and maintenance shall be conducted in accordance with this section.

1206.2.1 Commissioning. Commissioning of newly installed ESS, and existing ESS that have been retrofitted, replaced or previously decommissioned and are returning to service shall be conducted prior to the ESS being placed in service in accordance with a commissioning plan that has been approved prior to initiating commissioning. The commissioning plan shall include the following:

1. A narrative description of the activities that will be accomplished during each phase of commissioning including the personnel intended to accomplish each of the activities.
2. A listing of the specific ESS and associated components, controls and safety related devices to be tested, a description of the tests to be performed and the functions to be tested.
3. Conditions under which all testing will be performed, which are representative of the conditions during normal operation of the system.
4. Documentation of the owner's project requirements and the basis of design necessary to understand the installation and operation of the ESS.
5. Verification that required equipment and systems are installed in accordance with the approved plans and specifications.
6. Integrated testing for all fire and safety systems.
7. Testing for any required thermal management, ventilation or exhaust systems associated with the ESS installation.
8. Preparation and delivery of operation and maintenance documentation.
9. Training of facility operating and maintenance staff.
10. Identification and documentation of the requirements for maintaining system performance to meet the original design intent during the operation phase.
11. Identification and documentation of personnel who are qualified to service, maintain and decommission the ESS, and respond to incidents involving the ESS, including documentation that such service has been contracted for.
12. A decommissioning plan for removing the ESS from service, and from the facility in which it is located. The plan shall include details on providing a safe, orderly shutdown of energy storage and safety systems with notification to the code officials prior to the actual decommissioning of the system. The decommissioning plan shall include contingencies for removing an intact operational ESS from service, and for removing an ESS from service that has been damaged by a fire or other event.

Exception: Commissioning shall not be required for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC. However a decommissioning plan shall be provided and maintained whenever required by the fire code official.

1206.2.1.1 Initial acceptance testing. During the commissioning process an ESS shall be evaluated for proper operation in accordance with the manufacturer's instructions and the commissioning plan prior to final approval.

1206.2.1.2 Commissioning report. A report describing the results of the system commissioning and including the results of the initial acceptance testing required in Section 1206.2.1.1 shall be provided to code official prior to final inspection and approval and maintained at an approved on-site location.

1206.2.2 Operation and maintenance. An operating and maintenance manual shall be provided to both the ESS owner or their authorized agent and the ESS operator before the ESS is put into operation and shall include the following:

1. Manufacturer's operation manuals and maintenance manuals for the entire ESS or for each component of the system requiring maintenance, that clearly identify the required routine maintenance actions.
2. Name, address and phone number of a service agency that has been contracted to service the ESS and its associated safety systems.
3. Maintenance and calibration information, including wiring diagrams, control drawings, schematics, system programming instructions and control sequence descriptions, for all energy storage control systems.
4. Desired or field-determined control set points that are permanently recorded on control drawings at control devices or, for digital control systems, in system programming instructions.
5. A schedule for inspecting and recalibrating all ESS controls.
6. A service record log form that lists the schedule for all required servicing and maintenance actions and space for logging such actions that are completed over time and retained on site.

The ESS shall be operated and maintained in accordance with the manual and a copy of the manual shall be retained at an approved onsite location.

1206.2.2.1 Ongoing inspection and testing. Systems that monitor and protect the ESS installation shall be inspected and tested in accordance with the manufacturer's instructions and the operating and maintenance manual. Inspection and testing records shall be maintained in the operation and maintenance manual.

1206.2.3 Decommissioning. The code official shall be notified prior to decommissioning of an ESS. Decommissioning shall be performed in accordance with the decommissioning plan that includes the following:

1. A narrative description of the activities to be accomplished for removing the ESS from service, and from the facility in which it is located.
2. A listing of any contingencies for removing an intact operational ESS from service, and for removing an ESS from service that has been damaged by a fire or other event.

1206.3 Equipment. ESS equipment shall be in accordance with Sections 1206.3.1 through 1206.3.9

1206.3.1 Energy storage system listings. ESS shall be listed in accordance with UL 9540.

Exception: Lead-acid and nickel cadmium battery systems installed in facilities under the exclusive control of communications utilities, and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76 are not required to be listed.

1206.3.2 Equipment listing. Chargers, inverters, energy storage management systems shall be covered as part of the UL 9540 listing or shall be listed separately.

1206.3.3 Utility interactive systems. Inverters shall be listed and labeled in accordance with UL 1741. Only inverters listed and labeled for utility interactive system use and identified as interactive shall be allowed to operate in parallel with the electric utility power system to supply power to common loads.

1206.3.4 Energy storage management system. Where required by the ESS listing an approved energy storage management system shall be provided that monitors and balances cell voltages, currents and temperatures within the manufacturer's specifications. The system shall disconnect electrical connections to the ESS or otherwise place it in a safe condition if potentially hazardous temperatures or other conditions such as short circuits, over voltage or under voltage are detected.

1206.3.5 Enclosures. Enclosures of ESS shall be of noncombustible construction.

1206.3.6 Repairs. Repairs of ESS shall only be done by qualified personnel. Repairs with other than identical parts shall be considered retrofitting and comply with Section 1206.3.7. Repairs shall be documented in the service records log.

1206.3.7 Retrofits. Retrofitting of an existing ESS shall comply with the following:

1. A construction permit shall be obtained in accordance with Section 105.7.7.
2. New batteries, battery modules, capacitors and similar ESS components shall be listed in accordance with UL 1973.
3. Battery management and other monitoring systems shall be connected and installed in accordance with the manufacturer's instructions.
4. The overall installation shall continue to comply with UL 9540 listing requirements, where applicable.
5. Systems that have been retrofitted shall be commissioned in accordance with Section 1206.2.1.
6. Retrofits shall be documented in the service records log.

1206.3.7.1 Retrofitting Lead Acid and Nickel Cadmium. Section 1206.3.7 shall not apply to retrofitting of lead acid and nickel cadmium batteries with other lead acid and nickel cadmium batteries at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC.

1206.3.8 Replacements. Replacements of ESS shall be considered new ESS installations and shall comply with the provisions of Section 1206 as applicable to new ESS. The ESS being replaced shall be decommissioned in accordance with Section 1206.2.3.

1206.3.9 Reused and repurposed equipment. Equipment and materials shall only be reused or reinstalled as permitted in Section 104.7.1. Storage batteries previously used in other applications, such as electric vehicle propulsion, shall not be reused in applications regulated by Chapter 12, unless (1) approved by the fire code official and (2) the equipment is refurbished by a battery refurbishing company approved in accordance with UL 1974.

1206.4 General installations requirements. Stationary and mobile ESS shall comply with the requirements of section 1206.4.1 through 1206.4.12.

1206.4.1 Electrical disconnects. Where the ESS disconnecting means is not within sight of the main electrical service disconnecting means, placards or directories shall be installed at the location of the main electrical service disconnecting means indicating the location of stationary storage battery system disconnecting means in accordance with NFPA 70.

Exception: Electrical disconnects for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities and operating at less than 50 VAC and 60 VDC shall be permitted to have electrical disconnects signage in accordance with NFPA 76.

1206.4.2 Working clearances. Access and working space shall be provided and maintained about all electrical equipment to permit ready and safe operation and maintenance of such equipment in accordance with NFPA 70 and the manufacturer's instructions.

1206.4.3 Fire-resistance rated separations. Rooms and other indoor areas containing ESS shall be separated from other areas of the building in accordance with Section 1206.7.4. ESS shall be permitted to be in the same room with the equipment they support.

1206.4.4 Seismic and structural design. Stationary ESS shall comply with the seismic design requirements in Chapter 16 of the International Building Code, and shall not exceed the floor loading limitation of the building.

1206.4.5 Vehicle impact protection. Where ESS are subject to impact by a motor vehicle, including fork lifts, vehicle impact protection shall be provided in accordance with Section 312.

1206.4.6 Combustible storage. Combustible materials shall not be stored in ESS rooms, areas, or walk-in units. Combustible materials in occupied work centers covered by Section 1206.4.10 shall be stored at least 3 feet (914 mm) from ESS cabinets.

1206.4.7 Toxic and highly toxic gases. ESS that have the potential to release toxic and highly toxic gas during charging, discharging and normal use conditions shall be provided with a hazardous exhaust system in accordance with Section 502.8 of the International Mechanical Code.

1206.4.8 Signage. Approved signs shall be provided on or adjacent to all entry doors for ESS rooms or areas and on enclosures of ESS cabinets and walk-in units located outdoors, on rooftops or in open parking garages. Signs designed to meet both the requirements of this section and NFPA 70 shall be permitted. The signage shall include the following or equivalent.

1. "Energy Storage System", "Battery Storage System", "Capacitor Energy Storage System", or the equivalent.
2. The identification of the electrochemical ESS technology present.
3. "Energized electrical circuits"
4. If water reactive electrochemical ESS are present the signage shall include "APPLY NO WATER"
5. Current contact information, including phone number, for personnel authorized to service the equipment and for fire mitigation personnel required by Section 1206.1.6.1.

Exception: Existing electrochemical ESS shall be permitted to include the signage required at the time they were installed.

1206.4.9 Security of installations. Rooms, areas and walk-in units in which electrochemical ESS are located shall be secured against unauthorized entry and safeguarded in an approved manner. Security barriers, fences, landscaping, and other enclosures shall not inhibit the required air flow to or exhaust from the electrochemical ESS and its components.

1206.4.10 Occupied work centers. Electrochemical ESS located in rooms or areas occupied by personnel not directly involved with maintenance, service and testing of the systems shall comply with the following.

1. Electrochemical ESS located in occupied work centers shall be housed in locked noncombustible cabinets or other enclosures to prevent access by unauthorized personnel.
2. Where electrochemical ESS are contained in cabinets in occupied work centers, the cabinets shall be located within 10 feet (3048 mm) of the equipment that they support.
3. Cabinets shall include signage complying with Section 1206.4.8.

1206.4.11 Open rack installations. Where electrochemical ESS are installed in a separate equipment room and only authorized personnel have access to the room, they shall be permitted to be installed on an open rack for ease of maintenance.

1206.4.12 Walk-in units. Walk-in units shall only be entered for inspection, maintenance and repair of ESS units and ancillary equipment, and shall not be occupied for other purposes.

1206.5 Electrochemical ESS Protection. The protection of electrochemical ESS shall be in accordance with Sections

1206.5.1 through 1206.5.8 where required by Section 1206.7 through 1206.10.

1206.5.1 Size and separation. Electrochemical ESS shall be segregated into groups not exceeding 50 KWh (180 Mega joules). Each group shall be separated a minimum three feet (914 mm) from other groups and from walls in the storage room or area. The storage arrangements shall comply with Chapter 10.

Exceptions:

1. Lead acid and nickel cadmium battery systems in facilities under the exclusive control of communications utilities and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76.
2. The fire code official is authorized to approve larger capacities or smaller separation distances based on large scale fire testing complying with Section 1206.1.5.

1206.5.2 Maximum allowable quantities. Fire areas within rooms, areas and walk-in units containing electrochemical ESS shall not exceed the maximum allowable quantities in Table 1206.5.

Exceptions:

1. Where approved by the fire code official, rooms, areas and walk-in units containing electrochemical ESS that exceed the amounts in Table 1206.5 shall be permitted based on a hazardous mitigation analysis in accordance with Section 1206.1.4 and large scale fire testing complying with Section 1206.1.5.
2. Lead-acid and nickel cadmium battery systems installed in facilities under the exclusive control of communications utilities, and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76.
3. Dedicated use buildings in compliance with Section 1206.7.1.

1206.5.2.1 Mixed electrochemical energy systems. Where rooms, areas and walk-in units contain different types of electrochemical energy technologies, the total aggregate quantities of the systems shall be determined based on the sum of percentages of each technology type quantity divided by the maximum allowable quantity of each technology type. The sum of the percentages shall not exceed 100 percent of the maximum allowable quantity.

**TABLE 1206.5
MAXIMUM ALLOWABLE QUANTITIES OF ELECTROCHEMICAL ESS**

TECHNOLOGY	MAXIMUM ALLOWABLE QUANTITIES ^a
STORAGE BATTERIES	
Lead acid, all types	Unlimited
Nickel cadmium (Ni-Cd)	Unlimited
Nickel metal hydride (Ni-MH)	Unlimited
Lithium-ion	600 KWh
Flow batteries ^b	600 KWh
Other battery technologies	200 KWh
CAPACITORS	
All types	20 KWh
OTHER ELECTROCHEMICAL ESS	
All types	20 KWh

a. For electrochemical ESS units rated in Amp-Hours, KWh shall equal rated voltage times the Amp-hour rating divided by 1000.

b. Shall include vanadium, zinc-bromine, polysulfide-bromide, and other flowing electrolyte type technologies.

1206.5.3 Elevation. Electrochemical ESS shall not be located in the following areas:

1. Where the floor is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, or
2. Where the floor is located below the lowest level of exit discharge.

Exceptions:

1. Lead acid and Nickel cadmium battery systems less than 50 VAC and 60 VDC installed in facilities under the exclusive control of communications utilities in accordance with NFPA 76.
2. Where approved, installations shall be permitted in underground vaults complying with NFPA 70, Article 450, Part III.
3. Where approved by the fire code official, installations shall be permitted on higher and lower floors.

1206.5.4 Fire detection. An approved automatic smoke detection system or radiant energy-sensing fire detection system complying with Section 907.2 shall be installed in rooms, indoor areas, and walk-in units containing electrochemical ESS. An approved radiant energy-sensing fire detection system shall be installed to protect open parking garage and rooftop installations. Alarm signals from detection systems shall be transmitted to a central station, proprietary or remote station service in accordance with NFPA 72, or where approved to a constantly attended location.

1206.5.4.1 System status. Where required by the fire code official, visible annunciation shall be provided on cabinet exteriors or in other approved locations to indicate that potentially hazardous conditions associated with the ESS exist.

1206.5.5 Fire suppression systems. Rooms and areas within buildings and walk-in units containing electrochemical ESS shall be protected by an automatic fire suppression system designed and installed in accordance with one of the following:

1. An automatic sprinkler systems designed and installed in accordance with Section 903.3.1.1 with a minimum density of 0.3 gpm/ft.² based on the fire area or 2,500 ft.² design area, whichever is smaller.
2. Where approved, an automatic sprinkler system designed and installed in accordance with Section 903.3.1.1 with a sprinkler hazard classification based on large scale fire testing complying with Section 1206.1.5.
3. The following alternate automatic fire extinguishing systems designed and installed in accordance with Section 904, provided the installation is approved by the fire code official based on large scale fire testing complying with Section 1206.1.5

NFPA 12, Standard on Carbon Dioxide Extinguishing Systems
NFPA 15, Standard for Water Spray Fixed Systems for Fire Protection
NFPA 750, Standard on Water Mist Fire Protection Systems
NFPA 2001, Standard on Clean Agent Fire Extinguishing Systems
NFPA 2010, Standard for Fixed Aerosol Fire-Extinguishing Systems

Exception: Fire suppression systems for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities that operate at less than 50 VAC and 60 VDC shall be provided where required by NFPA 76.

1206.5.5.1 Water reactive systems. Electrochemical ESS that utilize water reactive materials shall be protected by an approved alternative automatic fire-extinguishing system in accordance with Section 904, where the installation is approved by the fire code official based on large scale fire testing complying with Section 1206.1.5.

1206.5.6 Maximum enclosure size. Outdoor walk-in units housing ESS shall not exceed 53 feet by 8 feet by 9.5 feet high. Walk-in units that exceed these dimensions shall be considered indoor installations and comply with the requirements in Section 1206.7.

1206.5.7 Vegetation control. Areas within 10 feet (3 m) on each side of outdoor ESS shall be cleared of combustible vegetation and other combustible growth. Single specimens of trees, shrubbery, or cultivated ground cover such as green grass, ivy, succulents, or similar plants used as ground covers shall be permitted to be exempt provided that they do not form a means of readily transmitting fire.

1206.5.8 Means of egress separation. ESS located outdoors and in open parking garages shall be separated from any means of egress as required by the fire code official to ensure safe egress under fire conditions, but in no case less than 10 feet (3048 mm).

Exception: The fire code official is authorized to approve a reduced separation distance if large scale fire testing complying with Section 1206.1.5 is provided that shows that a fire involving the ESS will not adversely impact occupant egress.

1206.6 Electrochemical ESS technology specific protection. Electrochemical ESS installations shall comply with the requirements of this section in accordance with the applicable requirements of Table 1206.6.

**TABLE 1206.6
ELECTROCHEMICAL ESS TECHNOLOGY SPECIFIC REQUIREMENTS**

COMPLIANCE REQUIRED ^b	BATTERY TECHNOLOGY				OTHER ESS AND BATTERY TECHNOLOGIES ^b	CAPACITOR ESS ^b
	Lead-acid	Ni-Cad and Ni-MH	Lithium-ion	Flow		
1206.6.1 Exhaust ventilation	Yes	Yes	No	Yes	Yes	Yes
1206.6.2 Spill control and neutralization	Yes ^c	Yes ^c	No	Yes	Yes	Yes
1206.6.3 Explosion control	Yes ^a	Yes ^a	Yes	No	Yes	Yes
1206.6.4 Safety caps	Yes	Yes	No	No	Yes	Yes
1206.6.5 Thermal runaway	Yes	Yes	Yes ^d	No	Yes ^d	Yes

a. Not required for lead-acid and nickel cadmium batteries at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC.

b. Protection shall be provided unless documentation acceptable to the fire code official is provided in accordance with Section 104.7.2 that provides justification why the protection is not necessary based on the technology used.

c. Applicable to vented (i.e. flooded) type nickel cadmium and lead acid batteries.

d. The thermal runaway protection is permitted to be part of a battery management system that has been evaluated with the battery as part of the evaluation to UL 1973.

1206.6.1 Exhaust ventilation. Where required by Table 1206.6 or elsewhere in this code, exhaust ventilation of rooms, areas, and walk-in units containing electrochemical ESS shall be provided in accordance with the International Mechanical Code and Section 1206.6.1.1 or 1206.6.1.2.

1206.6.1.1 Ventilation based upon LFL. The exhaust ventilation system shall be designed to limit the maximum concentration of flammable gas to 25 percent of the lower flammable limit (LFL) of the total volume of the room, area, or walk-in unit during the worst-case event of simultaneous charging of batteries at the maximum charge rate, in accordance with nationally recognized standards.

1206.6.1.2 Ventilation based upon exhaust rate. Mechanical exhaust ventilation shall be provided at a rate of not less than 1 ft³/min/ft² (5.1 L/sec/m²) of floor area of the room, area, or walk-in unit. The ventilation shall be either continuous or shall be activated by a gas detection system in accordance with Section 1206.6.1.2.4.

1206.6.1.2.1 Standby power. Mechanical exhaust ventilation shall be provided with a minimum of two hours of standby power in accordance with Section 1203.2.5.

1206.6.1.2.2 Installation instructions. Required mechanical exhaust ventilation systems shall be installed in accordance with the manufacturer's installation instructions and the International Mechanical Code.

1206.6.1.2.3 Supervision. Required mechanical exhaust ventilation systems shall be supervised by an approved central station, proprietary or remote station service in accordance with NFPA 72, or shall initiate an audible and visible signal at an approved constantly attended on-site location.

1206.6.1.2.4 Gas detection system. Where required by Section 1206.6.1.2, rooms, areas, and walk-in units containing ESS shall be protected by an approved continuous gas detection system that complies with Section 916 and with the following:

1. The gas detection system shall be designed to activate the mechanical ventilation system when the level of flammable gas in the room, area, or walk-in unit exceeds 25 percent of the LFL.
2. The mechanical ventilation system shall remain on until the flammable gas detected is less than 25 percent of the LFL.
3. The gas detection system shall be provided with a minimum of 2 hours of standby power in accordance with Section 1203.2.6.
4. Failure of the gas detection system shall annunciate a trouble signal at an approved central station, proprietary or remote station service in accordance with NFPA 72, or shall initiate an audible and visible trouble signal at an approved constantly attended on-site location.

1206.6.2 Spill control and neutralization. Where required by Table 1206.6 or elsewhere in this code, areas containing free-flowing liquid electrolyte or hazardous materials shall be provided with spill control and neutralization in accordance with this section.

1206.6.2.1 Spill control. Spill control shall be provided to prevent the flow of liquid electrolyte or hazardous materials to adjoining rooms or areas. The method shall be capable of containing a spill from the single largest battery or vessel.

1206.6.2.2 Neutralization. An approved method to neutralize spilled liquid electrolyte shall be provided that is capable of neutralizing a spill from the largest battery or vessel to a pH between 5.0 and 9.0.

1206.6.3 Explosion control. Where required by Table 1206.6 or elsewhere in this code, explosion control complying with Section 911 shall be provided for rooms, areas or walk-in units containing electrochemical ESS technologies.

Exceptions:

1. Where approved, explosion control is permitted to be waived by the fire code official based on large scale fire testing complying with Section 1206.1.5 which demonstrates that flammable gases are not liberated from electrochemical ESS cells or modules where tested in accordance with UL 9540A.
2. Where approved, explosion control is permitted to be waived by the fire code official based on documentation provided in accordance with Section 104.7 that demonstrates that the electrochemical ESS technology to be used does not have the potential to release flammable gas concentrations in excess of 25 percent of the LFL anywhere in the room, area, walk-in unit or structure under thermal runaway or other fault conditions.

1206.6.4 Safety caps. Where required by Table 1206.6 or elsewhere in this code, vented batteries and other ESS shall be provided with flame-arresting safety caps.

1206.6.5 Thermal runaway. Where required by Table 1206.6 or elsewhere in this code, batteries and other ESS shall be provided with a listed device or other approved method to prevent, detect and minimize the impact of thermal runaway.

1206.7 Indoor installations. Indoor ESS installations shall be in accordance with Sections 1206.7.1 through 1206.7.4.

1206.7.1 Dedicated use buildings. For the purpose of Table 1206.7 dedicated use ESS buildings shall be classified as Group F-1 occupancies and comply with all the following:

1. The building shall only be used for ESS, electrical energy generation, and other electrical grid related operations.
2. Occupants in the rooms and areas containing ESS are limited to personnel that operate, maintain, service, test and repair the ESS and other energy systems.
3. No other occupancy types shall be permitted in the building.
4. Administrative and support personnel shall be permitted in areas within the buildings that do not contain ESS, provided:

4.1 The areas do not occupy more than 10 percent of the building area of the story in which they are located.

4.2 A means of egress is provided from the incidental use areas to the public way that does not require occupants to traverse through areas containing ESS or other energy system equipment.

1206.7.2 Non-dedicated use buildings. For the purpose of Table 1206.7 non-dedicated use buildings include all buildings that contain ESS and do not comply with Section 1206.7.2 dedicated use building requirements.

**TABLE 1206.7
INDOOR ESS INSTALLATIONS**

COMPLIANCE REQUIRED	DEDICATED USE BUILDINGS ^a	NON-DEDICATED USE BUILDINGS ^b
1206.4 General installation requirements	Yes	Yes
1206.5.1 Size and separation	Yes	Yes
1206.5.2 Maximum allowable quantities	No	Yes
1206.5.3 Elevation	Yes	Yes
1206.5.4 Smoke and automatic fire detection	Yes ^c	Yes
1206.5.5 Fire suppression systems	Yes ^d	Yes
1206.7.3 Dwelling units and sleeping units	NA	Yes
1206.7.4 Fire-resistance rated separations	Yes	Yes
1206.6 Technology specific protection	Yes	Yes

NA = Not allowed.

a. See Section 1206.7.1.

b. See Section 1206.7.2.

c. Where approved by the fire code official, alarm signals are not required to be transmitted to a central station, proprietary or remote station service in accordance with NFPA 72, or a constantly attended location where local fire alarm annunciation is provided and trained personnel are always present.

d. Where approved by the fire code official, fire suppression systems are permitted to be omitted in dedicated use buildings located more than 100 feet (30.5 M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards.

1206.7.3 Dwelling units and sleeping units. ESS shall not be installed in sleeping units or in habitable spaces of dwelling units.

1206.7.4 Fire-resistance rated separations. Rooms and areas containing ESS shall include fire-resistance rated separations as follows:

1. In dedicated use buildings, rooms and areas containing ESS shall be separated from areas in which administrative and support personnel are located.
2. In non-dedicated use buildings, rooms and areas containing ESS shall be separated from other areas in the building.

Separation shall be provided by 2 hour rated fire barriers constructed in accordance with Section 707 of the International Building Code and 2 hour rated horizontal assemblies constructed in accordance with Section 711 of the International Building Code, as appropriate.

1206.8 Outdoor installations. Outdoor installations shall be in accordance with Sections 1206.8.1 through 1206.8.3.

1206.8.1 Remote outdoor installations. For the purpose of Table 1206.8, remote outdoor installations include ESS located more than 100 feet (30.5 M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards.

1206.8.2 Installations near exposures. For the purpose of Table 1206.8, installations near exposures include all outdoor ESS installations that do not comply with Section 1206.8.1 remote outdoor location requirements.

**TABLE 1206.8
OUTDOOR ESS INSTALLATIONS ^a**

COMPLIANCE REQUIRED	REMOTE INSTALLATIONS ^a	INSTALLATIONS NEAR EXPOSURES ^b
<u>1206.4 All ESS installations</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.1 Size and separation</u>	<u>No</u>	<u>Yes ^c</u>
<u>1206.5.2 Maximum allowable quantities</u>	<u>No</u>	<u>Yes</u>
<u>1206.5.4 Smoke and automatic fire detection</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.5 Fire suppression systems</u>	<u>Yes ^d</u>	<u>Yes</u>
<u>1206.5.6 Maximum enclosure size</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.7 Vegetation control</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.5.8 Means of egress separation</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.8.3 Clearance to exposures</u>	<u>Yes</u>	<u>Yes</u>
<u>1206.6 Technology specific protection</u>	<u>Yes</u>	<u>Yes</u>

a. See Section 1206.8.1.

b. See Section 1206.8.2.

c. In outdoor walk-in units, spacing is not required between ESS units and the walls of the enclosure.

d. Where approved by the fire code official, fire suppression systems are permitted to be omitted.

1206.8.3 Clearance to exposures. ESS located outdoors shall be separated by a minimum ten feet (3048 mm) from the following exposures:

1. Lot lines
2. Public ways
3. Buildings
4. Stored combustible materials
5. Hazardous materials
6. High-piled stock
7. Other exposure hazards

Exceptions:

1. Clearances are permitted to be reduced to 3 feet (914 mm) where a 1-hour free standing fire barrier, suitable for exterior use, and extending 5 feet (1.5 m) above and extending 5 feet (1.5 m) beyond the physical boundary of the ESS installation is provided to protect the exposure.
2. Clearances to buildings are permitted to be reduced to 3 feet (914 mm) where noncombustible exterior walls with no openings or combustible overhangs are provided on the wall adjacent to the ESS and the fire-resistance rating of the exterior wall is a minimum 2 hours.
3. Clearances to buildings are permitted to be reduced to 3 feet (914.4 mm) where a weatherproof enclosure constructed of noncombustible materials is provided over the ESS, and it has been demonstrated that a fire within the enclosure will not ignite combustible materials outside the enclosure based on large scale fire testing complying with Section 1206.1.5.

1206.9 Special installations. Rooftop and open parking garage ESS installations shall comply with Sections 1206.9.1 through 1206.9.6.

1206.9.1 Rooftop installations. For the purpose of Table 1206.9, rooftop ESS installations are those located on the roofs of buildings.

1206.9.2 Open parking garage installations. For the purpose of Table 1206.9, open parking garage ESS installations are those located in a structure or portion of a structure that complies with Section 406.5 of the International Building Code.

**TABLE 1206.9
SPECIAL ESS INSTALLATIONS**

COMPLIANCE REQUIRED	ROOFTOPS ^a	OPEN PARKING GARAGES ^b
1206.4 All ESS installations	Yes	Yes
1206.5.1 Size and separation	Yes	Yes
1206.5.2 Maximum allowable quantities	Yes	Yes
1206.5.4 Smoke and automatic fire detection	Yes	Yes
1206.5.6 Maximum enclosure size	Yes	Yes
1206.5.8 Means of egress separation	Yes	Yes
1206.9.3 Clearance to exposures	Yes	Yes
1206.9.4 Fire suppression systems	Yes	Yes
1206.9.5 Rooftop installations	Yes	No
1206.9.6 Open parking garage installations	No	Yes
1206.6 Technology specific protection	Yes	Yes

a. See Section 1206.9.1.

b. See Section 1206.9.2.

1206.9.3 Clearance to exposures. ESS located on rooftops and in open parking garages shall be separated by a minimum ten feet (3048 mm) from the following exposures:

1. Buildings, except the building on which rooftop ESS is mounted
2. Any portion of the building on which a rooftop system is mounted that is elevated above the rooftop on which the system is installed
3. Lot lines
4. Public ways
5. Stored combustible materials
6. Locations where motor vehicles can be parked
7. Hazardous materials
8. Other exposure hazards

Exceptions:

1. Clearances are permitted to be reduced to 3 feet (914 mm) where a 1-hour free standing fire barrier, suitable for exterior use, and extending 5 feet (1.5 m) above and extending 5 feet (1.5 m) beyond the physical boundary of the ESS installation is provided to protect the exposure.
2. Clearances are permitted to be reduced to 3 feet (914.4 mm) where a weatherproof enclosure constructed of noncombustible materials is provided over the ESS and it has been demonstrated that a fire within the enclosure will not ignite combustible materials outside the enclosure based on large scale fire testing complying with Section 1206.1.5.

1206.9.4 Fire suppression systems. ESS located in walk-in units on rooftops or in walk-in units in open parking garages shall be provided with automatic fire suppression systems within the ESS enclosure in accordance with Section 1206.5.5. Areas containing ESS other than walk-in units in open parking structures on levels not open above to the sky shall be provided with an automatic fire suppression system complying with Section 1206.5.5. Exception: A fire suppression system is not required in open parking garages if large scale fire testing complying with Section 1206.1.5 is provided that shows that a fire will not impact the exposures in Section 1206.9.3.

1206.9.5 Rooftop installations. ESS and associated equipment that are located on rooftops and not enclosed by building construction shall comply with the following:

1. Stairway access to the roof for emergency response and fire department personnel shall be provided either through a bulkhead from the interior of the building or a stairway on the exterior of the building.
2. Service walkways at least 5 feet (1524 mm) in width shall be provided for service and emergency personnel from the point of access to the roof to the system.
3. ESS and associated equipment shall be located from the edge of the roof a distance equal to at least the height of the system, equipment, or component but not less than 5 feet (1.5 m).
4. The roofing materials under and within 5 feet (1524 mm) horizontally from an ESS or associated equipment shall be noncombustible or shall have a Class A rating when tested in accordance with ASTM E108 or UL 790.
5. A Class I standpipe outlet shall be installed at an approved location on the roof level of the building or in the stairway bulkhead at the top level.
6. The ESS shall be the minimum of 10 feet from the fire service access point on the roof top.

1206.9.6 Open parking garages. ESS and associated equipment that are located in open parking garages shall comply with all of the following:

1. ESS shall not be located within 50 feet (15,240 mm) of air inlets for building HVAC systems.

Exception: This distance shall be permitted to be reduced to 25 feet (7.620 mm) if the automatic fire alarm system monitoring the radiant-energy sensing detectors de-energizes the ventilation system connected to the air intakes upon detection of fire.

2. ESS shall not be located within 25 feet (7620 mm) of exits leading from the attached building where located on a covered level of the parking structure not directly open to the sky above.
3. An approved fence with a locked gate or other approved barrier shall be provided to keep the general public at least five feet (1024 mm) from the outer enclosure of the ESS.

1206.10 Mobile ESS equipment and operations. Mobile ESS equipment and operations shall comply with Sections 1206.10.1 through 1206.10.7.7

1206.10.1 Charging and storage. For the purpose of Section 1206.10, charging and storage covers the operation where mobile ESS are charged and stored so they are ready for deployment to another site, and where they are charged and stored after a deployment.

1206.10.2 Deployment. For the purpose of Section 1206.10, deployment covers operations where mobile ESS are located at a site other than the charging and storage site and are being used to provide power.

1206.10.3 Permits. Construction and operational permits shall be provided for charging and storage of mobile ESS and operational permits shall be provided for deployment of mobile ESS as required by Section 1206.1.2.

1206.10.4 Construction documents. Construction documents complying with Section 1206.3 shall be provided with the construction permit application for mobile ESS charging and storage locations.

1206.10.4.1 Deployment documents. The following information shall be provided with the operation permit applications for mobile ESS deployments:

1. Relevant information for the mobile ESS equipment and protection measures in the construction documents required by Section 1206.1.3.
2. Location and layout diagram of the area in which the mobile ESS is to be deployed, including a scale diagram of all nearby exposures.
3. Location and content of signage, including no smoking signs.
4. Description of fencing to be provided around the ESS, including locking methods.
5. Details on fire suppression, smoke and automatic fire detection, system monitoring, thermal management, exhaust ventilation, and explosion control, if provided.
6. For deployment, the intended duration of operation, including anticipated connection and disconnection times and dates.
7. Location and description of local staging stops during transit to the deployment site. See Section 1206.10.8.5.
8. Description of the temporary wiring, including connection methods, conductor type and size, and circuit overcurrent protection to be provided.
9. Description of how fire suppression system connections to water supplies or extinguishing agents are to be provided.
10. Contact information for personnel who are responsible for maintaining and servicing the equipment, and responding to emergencies as required by Section 1206.1.6.1.

1206.10.5 Approved locations. Locations where mobile ESS are charged, stored and deployed shall be restricted to the locations established on the construction and operational permits.

1206.10.6 Charging and storage. Installations where mobile ESS are charged and stored shall be treated as permanent ESS indoor or outdoor installations, and shall comply with the following sections, as applicable:

1. Indoor charging and storage shall comply with Section 1206.7.
2. Outdoor charging and storage shall comply with Section 1206.8.
3. Charging and storage on rooftops and in open parking garages shall comply with Section 1206.9.

Exceptions:

1. Electrical connections shall be permitted to be made using temporary wiring complying with the manufacturer's instructions, the UL 9540 listing, and NFPA 70.
2. Fire suppression system connections to the water supply shall be permitted to use approved temporary connections.

1206.10.7 Deployed mobile ESS requirements. Deployed mobile ESS equipment and operations shall comply with this section and Table 1206.10.

1206.10.7.1 Duration. The duration of mobile ESS deployment shall not exceed 30 days.

Exceptions:

1. Mobile ESS deployments that provide power for durations longer than 30 days shall comply with Section 1206.10.7.
2. Mobile ESS deployments shall not exceed 180 days unless additional operational permits are obtained.

1206.10.7.2 Restricted locations. Deployed mobile ESS operations shall not be located indoors, in covered parking garages, on rooftops, below grade, or under building overhangs.

1206.10.7.3 Clearance to exposures. Deployed mobile ESS shall be separated by a minimum 10 feet (3048 mm) from the following exposures:

1. Public ways
2. Buildings
3. Stored combustible materials
4. Hazardous materials
5. High-piled stock
6. Other exposure hazards

Deployed mobile ESS shall be separated by a minimum 50 feet (15.3 M) from public seating areas and from tents, canopies and membrane structures with an occupant load of 30 or more.

1206.10.7.4 Electrical connections. Electrical connections shall be made in accordance with the manufacturer's instructions and the UL 9540 listing. Temporary wiring for electrical power connections shall comply with NFPA 70. Fixed electrical wiring shall not be provided.

1206.10.7.5 Local staging. Mobile ESS in transit from the charging and storage location to the deployment location and back shall not be parked within 100 feet (30,480 mm) of an occupied building for more than one hour during transit, unless specifically approved by the fire code official when the permit is issued.

1206.10.7.6 Fencing. An approved fence with a locked gate or other approved barrier shall be provided to keep the general public at least five feet (1024 mm) from the outer enclosure of a deployed mobile ESS.

**TABLE 1206.10
MOBILE ENERGY STORAGE SYSTEMS (ESS)**

COMPLIANCE REQUIRED	DEPLOYMENT ^a
<u>1206.4 All ESS installations</u>	Yes ^b
<u>1206.5.1 Size and separation</u>	Yes ^c
<u>1206.5.2 Maximum allowable quantities</u>	Yes
<u>1206.5.4 Smoke and automatic fire detection</u>	Yes ^e
<u>1206.5.5 Fire suppression systems</u>	Yes ^d
<u>1206.5.6 Maximum enclosure size</u>	Yes
<u>1206.5.7 Vegetation control</u>	Yes
<u>1206.5.8 Means of egress separation</u>	Yes
<u>1206.6 Technology specific protection</u>	Yes

a. See Section 1206.10.2.

b. Mobile operations on wheeled vehicle or trailers shall not be required to comply with Section 1206.4.4 seismic and structural load requirements.

c. In walk-in units, spacing is not required between ESS units and the walls of the enclosure.

d. Fire suppression system connections to the water supply shall be permitted to use approved temporary connections.

e. Alarm signals are not required to be transmitted to an approved location for mobile ESS deployed 30 days or less.

1206.10.7.7 Smoking. Smoking shall be prohibited within 10 feet (3048 mm) of mobile ESS. Signs shall be posted in accordance with Section 310.

Delete without substitution

~~**1206.1 Scope.** The provisions in this section are applicable to energy storage systems designed to provide electrical power to a building or facility. These systems are used to provide standby or emergency power, an uninterruptable power supply, load shedding, load sharing or similar capabilities.~~

~~**1206.2 Stationary storage battery systems.** Stationary storage battery systems having capacities exceeding the values shown in Table 1206.2 shall comply with Section 1206.2.1 through 1206.2.12.6, as applicable.~~

**TABLE 1206.2
BATTERY STORAGE SYSTEM THRESHOLD QUANTITIES.**

BATTERY TECHNOLOGY	CAPACITY^a
Flow batteries ^b	20 kWh
Lead acid, all types	70 kWh
Lithium, all types	20 kWh
Nickel cadmium (Ni-Cd)	70 kWh
Sodium, all types	20 kWh ^c
Other battery technologies	10 kWh

For SI: 1 kilowatt-hour = 3.6 megajoules.

- a. ~~For batteries rated in amp-hours, kWh shall equal rated voltage times amp-hour rating divided by 1000.~~
- b. ~~Shall include vanadium, zinc-bromine, polysulfide-bromide, and other flowing electrolyte type technologies.~~
- c. ~~70 kWh for sodium-ion technologies.~~

1206.2.1 Permits. Permits shall be obtained for the installation and operation of stationary storage battery systems in accordance with Section 105.7.2.

1206.2.2 Construction documents. The following information shall be provided with the permit application:

1. Location and layout diagram of the room in which the stationary storage battery system is to be installed;
2. Details on hourly fire-resistance-rated assemblies provided;
3. Quantities and types of storage batteries and battery systems;
4. Manufacturer's specifications, ratings and listings of storage batteries and battery systems;
5. Details on energy management systems;
6. Location and content of signage;
7. Details on fire-extinguishing, smoke detection and ventilation systems;
8. Rack storage arrangement, including seismic support criteria.

1206.2.3 Hazard mitigation analysis. A failure modes and effects analysis (FMEA) or other approved hazard mitigation analysis shall be provided in accordance with Section 104.7.2 under any of the following conditions:

1. Battery technologies not specifically identified in Table 1206.2 are provided;
2. More than one stationary storage battery technology is provided in a room or indoor area where there is a potential for adverse interaction between technologies;
3. Where allowed as a basis for increasing maximum allowable quantities in accordance with Section 1206.2.9.

1206.2.3.1 Fault condition. The hazard mitigation analysis shall evaluate the consequences of the following failure modes, and others deemed necessary by the *fire code official*. Only single failure modes shall be considered:

1. Thermal runaway condition in a single-battery storage rack, module or array;
2. Failure of any energy management system;
3. Failure of any required ventilation system;
4. Voltage surges on the primary electric supply;
5. Short circuits on the load side of the stationary battery storage system;
6. Failure of the smoke detection, fire-extinguishing or gas detection system;
7. Spill neutralization not being provided or failure of the secondary containment system;

1206.2.3.2 Analysis approval. The *fire code official* is authorized to approve the hazardous mitigation analysis provided that the hazard mitigation analysis demonstrates all of the following:

1. Fires or explosions will be contained within unoccupied battery storage rooms for the minimum duration of the fire-resistance-rated walls identified in Table 509.1 of the International Building Code;
2. Fires and explosions in battery cabinets in occupied work centers will be detected in time to allow occupants within the room to evacuate safely;
3. Toxic and highly toxic gases released during fires and other fault conditions shall not reach concentrations in excess of Immediately Dangerous to Life or Health (IDLH) levels in the building or adjacent means of egress routes during the time deemed necessary to evacuate from that area;
4. Flammable gases released from batteries during charging, discharging and normal operation shall not exceed 25 percent of their lower flammability limit (LFL);
5. Flammable gases released from batteries during fire, overcharging and other abnormal conditions shall not create an explosion hazard that will injure occupants or emergency responders;

1206.2.3.3 Additional protection measures. Construction, equipment and systems that are required for the stationary storage battery system to comply with the hazardous mitigation analysis, including but not limited to those specifically described in Section 1206.2, shall be installed, maintained and tested in accordance with nationally recognized standards and specified design parameters:

1206.2.4 Seismic and structural design. Stationary storage battery systems shall comply with the seismic design requirements in Chapter 16 of the International Building Code, and shall not exceed the floor-loading limitation of the building:

1206.2.5 Vehicle impact protection. Where stationary storage battery systems are subject to impact by a motor vehicle, including fork lifts, vehicle impact protection shall be provided in accordance with Section 312.

~~**1206.2.6 Combustible storage.** Combustible materials not related to the stationary storage battery system shall not be stored in battery rooms, cabinets or enclosures. Combustible materials in occupied work centers covered by Section 1206.2.8.5 shall not be stored less than 3 feet (915 mm) from battery cabinets.~~

~~**1206.2.7 Testing, maintenance and repair.** Storage batteries and associated equipment and systems shall be tested and maintained in accordance with the manufacturer's instructions. Any storage batteries or system components used to replace existing units shall be compatible with the battery charger, energy management systems, other storage batteries and other safety systems. Introducing other types of storage batteries into the stationary storage battery system or other types of electrolytes into flow battery systems shall be treated as a new installation and require approval by the *fire code official* before the replacements are introduced into service.~~

~~**1206.2.8 Location and construction.** Rooms and areas containing stationary storage battery systems shall be designed, located and constructed in accordance with Sections 1206.2.8.1 through 1206.2.8.7.4.~~

~~**1206.2.8.1 Location.** Stationary storage battery systems shall not be located in areas where the floor is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, or where the floor level is more than 30 feet (9144 mm) below the finished floor of the lowest level of exit discharge.~~

Exceptions:

- ~~1. Lead acid and nickel cadmium stationary storage battery systems.~~
- ~~2. Installations on noncombustible rooftops of buildings exceeding 75 feet (22 860 mm) in height that do not obstruct fire department rooftop operations, where *approved by the fire code official*.~~

~~**1206.2.8.2 Separation.** Rooms containing stationary storage battery systems shall be separated from other areas of the building in accordance with Section 509.1 of the International Building Code. Battery systems shall be allowed to be in the same room with the equipment they support.~~

~~**1206.2.8.3 Stationary battery arrays.** Storage batteries, prepackaged stationary storage battery systems and preengineered stationary storage battery systems shall be segregated into stationary battery arrays not exceeding 50 kWh (180 megajoules) each. Each stationary battery array shall be spaced not less than 3 feet (914 mm) from other stationary battery arrays and from walls in the storage room or area. The storage arrangements shall comply with Chapter 10.~~

Exceptions:

- ~~1. Lead acid and nickel cadmium storage battery arrays.~~
- ~~2. Listed preengineered stationary storage battery systems and prepackaged stationary storage battery systems shall not exceed 250 kWh (900 megajoules) each.~~
- ~~3. The fire code official is authorized to approve listed, preengineered and prepackaged battery arrays with larger capacities or smaller battery array spacing if large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving one array will not propagate to an adjacent array, and be contained within the room for a duration equal to the fire-resistance rating of the room separation specified in Table 509 of the International Building Code.~~

~~**1206.2.8.4 Separate rooms.** Where stationary batteries are installed in a separate equipment room that can be accessed only by authorized personnel, they shall be permitted to be installed on an open rack for ease of maintenance.~~

~~**1206.2.8.5 Occupied work centers.** Where stationary storage batteries are located in an occupied work center, they shall be housed in a noncombustible cabinet or other enclosure to prevent access by unauthorized personnel.~~

~~**1206.2.8.5.1 Cabinets.** Where stationary batteries are contained in cabinets in occupied work centers, the cabinet enclosures shall be located within 10 feet (3048 mm) of the equipment that they support.~~

~~**1206.2.8.6 Signage.** Approved signs shall be provided on doors or in locations near entrances to stationary storage battery system rooms and shall include the following or equivalent:~~

- ~~1. The room contains energized battery systems.~~
- ~~2. The room contains energized electrical circuits.~~
- ~~3. The additional markings required in Section 1206.2.12 for the types of storage batteries contained within the room.~~

Exception: Existing stationary storage battery systems shall be permitted to include the signage required at the time it was installed.

1206.2.8.6.1 Electrical disconnects. Where the stationary storage battery system disconnecting means is not within sight of the main service disconnecting means, placards or directories shall be installed at the location of the main service disconnecting means indicating the location of stationary storage battery system disconnecting means in accordance with NFPA 70.

1206.2.8.6.2 Cabinet signage. Battery storage cabinets provided in occupied work centers in accordance with Section 1206.2.8.5 shall have exterior labels that identify the manufacturer and model number of the system and electrical rating (voltage and current) of the contained battery system. There shall be signs within the cabinet that indicate the relevant electrical and chemical hazards, as required by Section 1206.2.12.

1206.2.8.7 Outdoor installations. Stationary storage battery systems located outdoors shall comply with Sections 1206.2.8.7 through 1206.2.8.7.4, in addition to all applicable requirements of Section 1206.2. Installations in outdoor enclosures or containers that can be occupied for servicing, testing, maintenance and other functions shall be treated as battery storage rooms.

Exception: Stationary battery arrays in noncombustible containers shall not be required to be spaced 3 feet (914 mm) from the container walls.

1206.2.8.7.1 Separation. Stationary storage battery systems located outdoors shall be separated by a minimum 5 feet (1524 mm) from the following:

1. Lot lines.
2. Public ways.
3. Buildings.
4. Stored combustible materials.
5. Hazardous materials.
6. High-piled stock.
7. Other exposure hazards.

Exception: The fire code official is authorized to approve smaller separation distances if large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the system will not adversely impact occupant egress from adjacent buildings, or adversely impact adjacent stored materials or structures.

1206.2.8.7.2 Means of egress. Stationary storage battery systems located outdoors shall be separated from any means of egress as required by the fire code official to ensure safe egress under fire conditions, but not less than 10 feet (3048 mm).

Exception: The fire code official is authorized to approve lesser separation distances if large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the system will not adversely impact occupant egress.

1206.2.8.7.3 Security of outdoor areas. Outdoor areas in which stationary storage battery systems are located shall be secured against unauthorized entry and safeguarded in an approved manner.

1206.2.8.7.4 Walk-in units. Where a stationary storage battery system includes an outer enclosure, the unit shall only be entered for inspection, maintenance and repair of batteries and electronics, and shall not be occupied for other purposes.

1206.2.9 Maximum allowable quantities. Fire areas within buildings containing stationary storage battery systems exceeding the maximum allowable quantities in Table 1206.2.9 shall comply with all applicable Group II occupancy requirements in this code and the International Building Code.

Exception: Where approved by the fire code official, areas containing stationary storage batteries that exceed the amounts in Table 1206.2.9 shall be treated as incidental use areas and not Group II occupancies based on a hazardous mitigation analysis in accordance with Section 1206.2.3 and large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory.

**TABLE 1206.2.9
MAXIMUM ALLOWABLE BATTERY QUANTITIES**

BATTERY TECHNOLOGY	MAXIMUM ALLOWABLE QUANTITIES^a	GROUP H OCCUPANCY
Flow batteries ^b	600 kWh	Group H-2
Lead acid, all types	Unlimited	Not Applicable
Lithium, all types	600 kWh	Group H-2
Nickel cadmium (Ni-Cd)	Unlimited	Not Applicable
Sodium, all types	600 kWh	Group H-2
Other battery technologies	200 kWh	Group H-2 ^c

For SI: 1 kilowatt-hour = 3.6 megajoules.

- a. ~~For batteries rated in amp-hours, Kilowatt-hours (kWh) shall equal rated battery voltage times the amp-hour rating divided by 1,000.~~
- b. ~~Shall include vanadium, zinc-bromine, polysulfide-bromide, and other flowing electrolyte-type technologies.~~
- c. ~~Shall be a Group H-4 occupancy if the fire code official determines that a fire or thermal runaway involving the battery technology does not represent a significant fire hazard.~~

1206.2.9.1 Mixed battery systems. ~~Where areas within buildings contain different types of storage battery technologies, the total aggregate quantities of batteries shall be determined based on the sum of percentages of each battery type quantity divided by the maximum allowable quantity of each battery type. If the sum of the percentages exceeds 100 percent, the area shall be treated as a Group H occupancy in accordance with Table 1206.2.9.~~

1206.2.10 Storage batteries and equipment. ~~The design and installation of storage batteries and related equipment shall comply with Sections 1206.2.10.1 through 1206.2.10.8.~~

1206.2.10.1 Listings. ~~Storage batteries and battery storage systems shall comply with the following:~~

1. ~~Storage batteries shall be listed in accordance with UL 1973.~~
2. ~~Prepackaged and preengineered stationary storage battery systems shall be listed in accordance with UL 9540.~~

Exception: ~~Lead-acid batteries are not required to be listed.~~

1206.2.10.2 Prepackaged and preengineered systems. ~~Prepackaged and preengineered stationary storage battery systems shall be installed in accordance with their listing and the manufacturer's instructions.~~

1206.2.10.3 Energy management system. ~~An approved energy management system shall be provided for battery technologies other than lead-acid and nickel cadmium for monitoring and balancing cell voltages, currents and temperatures within the manufacturer's specifications. The system shall transmit an alarm signal to an approved location if potentially hazardous temperatures or other conditions such as short circuits, over voltage or under voltage are detected.~~

1206.2.10.4 Battery chargers. ~~Battery chargers shall be compatible with the battery chemistry and the manufacturer's electrical ratings and charging specifications. Battery chargers shall be listed and labeled in accordance with UL 1564 or provided as part of a listed preengineered or prepackaged stationary storage battery system.~~

1206.2.10.5 Inverters. ~~Inverters shall be listed and labeled in accordance with UL 1741. Only inverters listed and labeled for utility interactive system use and identified as interactive shall be allowed to operate in parallel with the electric utility power system to supply power to common loads.~~

1206.2.10.6 Safety caps. ~~Vented batteries shall be provided with flame-arresting safety caps.~~

1206.2.10.7 Thermal runaway. ~~Where required by Section 1206.2.12, storage batteries shall be provided with a listed device or other approved method to prevent, detect and control thermal runaway.~~

1206.2.10.8 Toxic and highly toxic gas. ~~Stationary storage battery systems that have the potential to release toxic and highly toxic gas during charging, discharging and normal use conditions shall comply with Chapter 60.~~

1206.2.11 Fire-extinguishing and detection systems. Fire-extinguishing and detection systems shall be provided in accordance with Sections 1206.2.11.1 through 1206.2.11.5.

1206.2.11.1 Fire-extinguishing systems. Rooms containing stationary storage battery systems shall be equipped with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1. Commodity classifications for specific technologies of storage batteries shall be in accordance with Chapter 5 of NFPA 13. If the storage battery types are not addressed in Chapter 5 of NFPA 13, the *fire code official* is authorized to approve the fire-extinguishing system based on full-scale fire and fault condition testing conducted or witnessed and reported by an *approved laboratory*.

Exception: Spaces or areas containing stationary storage battery systems used exclusively for telecommunications equipment in accordance with Section 903.2.

1206.2.11.1.1 Alternative fire-extinguishing systems. Battery systems that utilize water-reactive materials shall be protected by an approved alternative automatic fire-extinguishing system in accordance with Section 904. The system shall be listed for protecting the type, arrangement and quantities of storage batteries in the room. The *fire code official* shall be permitted to approve the alternative fire-extinguishing system based on full-scale fire and fault condition testing conducted or witnessed and reported by an *approved laboratory*.

1206.2.11.2 Smoke detection system. An *approved automatic smoke detection system* shall be installed in rooms containing *stationary storage battery systems* in accordance with Section 907.2.

1206.2.11.3 Ventilation. Where required by Section 1206.2.3 or 1206.2.12, ventilation of rooms containing stationary storage battery systems shall be provided in accordance with the International Mechanical Code and one of the following:

1. The ventilation system shall be designed to limit the maximum concentration of flammable gas to 25 percent of the lower flammability limit, or for hydrogen, 1.0 percent of the total volume of the room.
2. Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute (cfm) per square foot $[0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2)]$ of floor area, but not less than 150 cfm (4 m^3/min).

The exhaust system shall be designed to provide air movement across all parts of the floor for gases having a vapor density greater than air and across all parts of the vault ceiling for gases having a vapor density less than air.

1206.2.11.3.1 Cabinet ventilation. Where cabinets located in occupied spaces contain storage batteries that are required by Section 1206.2.3 or 1206.2.12 to be provided with ventilation, the cabinet shall be provided with ventilation in accordance with Section 1206.2.11.3.

1206.2.11.3.2 Supervision. Required mechanical ventilation systems for rooms and cabinets containing storage batteries shall be supervised by an *approved* central station, proprietary or remote station service or shall initiate an audible and visual signal at an *approved* constantly attended on-site location.

1206.2.11.4 Gas detection system. Where required by Section 1206.2.3 or 1206.2.12, rooms containing stationary storage battery systems shall be protected by a gas detection system complying with Section 916. The gas detection system shall be designed to activate where the level of flammable gas exceeds 25 percent of the lower flammable limit (LFL), or where the level of toxic or highly toxic gas exceeds one-half of the IDLH.

1206.2.11.4.1 System activation. Activation of the gas detection system shall result in all the following:

1. Initiation of distinct audible and visible alarms in the battery storage room.
2. Transmission of an alarm to an approved location.
3. De-energizing of the battery charger.
4. Activation of the mechanical ventilation system, where the system is interlocked with the gas detection system.

Exception: Lead-acid and nickel-cadmium stationary storage battery systems shall not be required to comply with items 1, 2 and 3.

1206.2.11.5 Spill control and neutralization. Where required by Section 1206.2.12, approved methods and materials shall be provided for the control and neutralization of spills of electrolyte or other hazardous materials in areas containing stationary storage batteries as follows:

1. For batteries with free-flowing electrolyte, the method and materials shall be capable of neutralizing a spill of the total capacity from the largest cell or block to a pH between 5.0 and 9.0.
2. For batteries with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.

1206.2.12 Specific battery type requirements. This section includes requirements applicable to specific types of storage batteries. Stationary storage battery systems with more than one type of storage battery shall comply with requirements applicable to each battery type.

1206.2.12.1 Lead-acid storage batteries. Stationary storage battery systems utilizing lead-acid storage batteries shall comply with the following:

1. Ventilation shall be provided in accordance with Section 1206.2.11.3.
2. Spill control and neutralization shall be in accordance with Section 1206.2.11.5.
3. Thermal runaway protection shall be provided for valve-regulated lead-acid (VRLA) storage batteries in accordance with Section 1206.2.10.7.
4. The signage in Section 1206.2.8.6 shall indicate the room contains lead-acid batteries.

1206.3.5.1 Fire-extinguishing systems. Rooms containing capacitor energy storage systems shall be equipped with an automatic sprinkler system installed in accordance with Section 903.3.1.1. Commodity classifications for specific capacitor technologies shall be in accordance with Chapter 5 of NFPA 13. If the capacitor types are not addressed in Chapter 5 of NFPA 13, the fire code official is authorized to approve the automatic sprinkler system based on full-scale fire and fault condition testing conducted by an approved laboratory.

1206.2.12.2 Nickel-cadmium (Ni-Cd) storage batteries. Stationary storage battery systems utilizing nickel-cadmium (Ni-Cd) storage batteries shall comply with the following:

1. Ventilation shall be provided in accordance with Section 1206.2.11.3.
2. Spill control and neutralization shall be in accordance with Section 1206.2.11.5.
3. Thermal runaway protection shall be provided for valve-regulated sealed nickel-cadmium storage batteries in accordance with Section 1206.2.10.7.
4. The signage in Section 1206.2.8.6 shall indicate the room contains nickel-cadmium batteries.

1206.2.12.3 Lithium-ion storage batteries. The signage in Section 1206.2.8.6 shall indicate the type of lithium batteries contained in the room.

1206.3.2.5 Electrical disconnects. Where the capacitor energy storage system disconnecting means is not within sight of the main service disconnecting means, placards or directories shall be installed at the location of the main service disconnecting means identifying the location of the capacitor energy storage system disconnecting means in accordance with NFPA 70.

1206.2.12.4 Sodium-beta storage batteries. Stationary storage battery systems utilizing sodium-beta storage batteries shall comply with the following:

1. Ventilation shall be provided in accordance with Section 1206.2.11.3.
2. The signage in Section 1206.2.8.6 shall indicate the type of sodium batteries in the room and include the instructions, "APPLY NO WATER."

1206.3.2.6 Outdoor installation. Capacitor energy systems located outdoors shall comply with Sections 1206.3.2.6 through 1206.3.2.6.4 in addition to all applicable requirements of Section 1206.3. Installations in outdoor enclosures or containers that can be occupied for servicing, testing, maintenance and other functions shall be treated as capacitor storage rooms.

Exception: Capacitor arrays in noncombustible containers shall not be required to be spaced 3 feet (914 mm) from the container walls.

1206.3.2.6.1 Separation. Capacitor energy systems located outdoors shall be not less than 5 feet (1524 mm) from the following:

1. Lot lines.
2. Public ways.
3. Buildings.
4. Stored combustible materials.
5. Hazardous materials.
6. High-piled stock.
7. Other exposure hazards.

Exception: The fire code official is authorized to approve lesser separation distances if large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the system will not adversely impact occupant egress from adjacent buildings, or adversely impact adjacent stored materials or structures.

1206.2.12.5 Flow storage batteries. Stationary storage battery systems utilizing flow storage batteries shall comply with the following:

1. Ventilation shall be provided in accordance with Section 1206.2.11.3.
2. Spill control and neutralization shall be in accordance with Section 1206.2.11.5.
3. The signage required in Section 1206.2.8.6 shall indicate the type of flow batteries in the room.

1206.3.2.6.3 Security of outdoor areas. Outdoor areas in which capacitor energy storage systems are located shall be secured against unauthorized entry and safeguarded in an approved manner.

1206.3.2.1 Location. Capacitor energy storage systems shall not be located in areas where the floor is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, or where the floor level is more than 30 feet (9144 mm) below the finished floor of the lowest level of exit discharge.

1206.3.4.4 Capacitor chargers. Capacitor chargers shall be compatible with the capacitor manufacturer's electrical ratings and charging specifications. Capacitor chargers shall be listed and labeled in accordance with UL 1564 or provided as part of a listed preengineered or prepackaged capacitor energy storage system.

1206.2.12.6 Other battery technologies. Stationary storage battery systems utilizing battery technologies other than those described in Sections 1206.2.12.1 through 1206.2.12.5 shall comply with the following:

1. Gas detection systems complying with Section 916 shall be provided in accordance with Section 1206.2.11.4 where the batteries have the potential to produce toxic or highly toxic gas in the storage room or cabinet in excess of the permissible exposure limits (PEL) during charging, discharging and normal system operation.
2. Mechanical ventilation shall be provided in accordance with Section 1206.2.11.3.
3. Spill control and neutralization shall be in accordance with Section 1206.2.11.5.
4. In addition to the signage required in Section 1206.2.8.6, the marking shall identify the type of batteries present, describe the potential hazards associated with the battery type, and indicate that the room contains energized electrical circuits.

1206.3.2.2 Separation. Rooms containing capacitor energy storage systems shall be separated from the following occupancies by fire barriers or horizontal assemblies, or both, constructed in accordance with the International Building Code:

1. Group B, F, M, S and U occupancies by 1-hour fire-resistance-rated construction.
2. Group A, E, I and R occupancies by 2-hour fire-resistance-rated construction.

1206.3.2.6.4 Walk-in units. Where a capacitor energy storage system includes an outer enclosure, the unit shall only be entered for inspection, maintenance and repair of batteries and electronics, and shall not be occupied for other purposes.

1206.3.4.1 Listing. Capacitors and capacitor energy storage systems shall comply with the following:

1. Capacitors shall be listed in accordance with UL 1973.
2. Prepackaged and preengineered stationary capacitor energy storage systems shall be listed in accordance with UL 9540.

1206.3.4.5 Toxic and highly toxic gas. ~~Capacitor energy storage systems that have the potential to release toxic and highly toxic materials during charging, discharging and normal use conditions shall comply with Chapter 60.~~

1206.3.5.1.1 Alternative fire extinguishing systems. ~~Capacitor energy storage systems that utilize water-reactive materials shall be protected by an approved alternative automatic fire-extinguishing system in accordance with Section 904. The system shall be listed for protecting the type, arrangement and quantities of capacitors in the room. The fire code official shall be permitted to approve the system based on full-scale fire and fault condition testing conducted by an approved laboratory.~~

1206.3 Capacitor energy storage systems. ~~Capacitor energy storage systems having capacities exceeding 3 kWh (10.8 megajoules) shall comply with Sections 1206.3 through 1206.3.2.6.1.~~

Exception: ~~Capacitors regulated by NFPA 70, Chapter 460, and capacitors included as a component part of other listed electrical equipment are not required to comply with this section.~~

1206.3.2.3 Capacitor arrays. ~~Capacitor energy storage systems shall be segregated into capacitor arrays not exceeding 50 kWh (180 megajoules) each. Each array shall be spaced not less than 3 feet (914 mm) from other arrays and from walls in the storage room or area. The storage arrangements shall comply with Chapter 10.~~

Exception: ~~Capacitor energy storage systems in noncombustible containers located outdoors shall not be required to be spaced 3 feet (914 mm) from the container walls.~~

1206.3.3 Maximum allowable quantities. ~~Fire areas within buildings containing capacitor energy storage systems that exceed 600 kWh of energy capacity shall comply with all applicable Group H occupancy requirements in this code and the International Building Code.~~

1206.3.4.2 Prepackaged and preengineered systems. ~~In addition to other applicable requirements of this code, prepackaged and preengineered capacitor energy storage systems shall be installed in accordance with their listing and the manufacturer's instructions.~~

1206.3.5.3 Ventilation. ~~Where capacitors release flammable gases during normal operating conditions, ventilation of rooms containing capacitor energy storage systems shall be provided in accordance with the International Mechanical Code and one of the following:~~

- ~~1. The ventilation system shall be designed to limit the maximum concentration of flammable gas to 25 percent of the lower flammability limit.~~
- ~~2. Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute (cfm) per square foot [$0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2)$] of floor area, but not less than 150 cfm ($4 \text{ m}^3/\text{min}$).~~

~~The exhaust system shall be designed to provide air movement across all parts of the floor for gases having a vapor density greater than air and across all parts of the ceiling for gases having a vapor density less than air.~~

1206.3.5.3.1 Supervision. ~~Required mechanical ventilation systems for rooms containing capacitor energy storage systems shall be supervised by an approved central station, proprietary or remote station service, or shall initiate an audible and visible signal at an approved, constantly attended on-site location.~~

1206.3.1 Permits. ~~Permits shall be obtained for the installation of capacitor energy storage systems in accordance with Section 105.7.3.~~

1206.3.2.4 Signage. ~~Approved signs shall be provided on doors or in locations adjacent to the entrances to capacitor energy storage system rooms and shall include the following or equivalent verbiage and information:~~

- ~~1. "CAPACITOR ENERGY STORAGE ROOM."~~
- ~~2. "THIS ROOM CONTAINS ENERGIZED ELECTRICAL CIRCUITS."~~
- ~~3. An identification of the type of capacitors present and the potential hazards associated with the capacitor type.~~

1206.3.4.3 Energy management system. ~~An approved energy management system shall be provided for monitoring and balancing capacitor voltages, currents and temperatures within the manufacturer's specifications. The system shall transmit an alarm signal to an approved location if potentially hazardous temperatures or other conditions such as short circuits, over voltage or under voltage are detected.~~

~~**1206.3.5.2 Smoke detection system.** An approved *automatic smoke detection system* shall be installed in rooms containing *capacitor energy storage systems* in accordance with Section 907.2.~~

~~**1206.3.5.4 Spill control and neutralization.** Where capacitors contain liquid electrolyte, *approved methods and materials* shall be provided for the control and neutralization of spills of electrolyte or other hazardous materials in areas containing capacitors as follows:~~

- ~~1. For capacitors with free-flowing electrolyte, the method and materials shall be capable of neutralizing a spill of the total capacity from the largest cell or block to a pH between 5.0 and 9.0.~~
- ~~2. For capacitors with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.~~

~~**1206.3.2.6.2 Means of egress.** *Capacitor energy storage systems* located outdoors shall be separated from any means of egress as required by the fire code official to ensure safe egress under fire conditions, but not less than 10 feet (3048 mm):~~

~~**Exception:** The *fire code official* is authorized to approve lesser separation distances if large-scale fire and fault condition testing conducted or witnessed and reported by an approved testing laboratory is provided showing that a fire involving the system will not adversely impact occupant egress.~~

~~**1206.3.6 Testing, maintenance and repair.** Capacitors and associated equipment and systems shall be tested and maintained in accordance with the manufacturer's instructions. Any capacitors or system components used to replace existing units shall be compatible with the capacitor charger, energy management systems, other capacitors, and other safety systems. Introducing different capacitor technologies into the capacitor energy storage system shall be treated as a new installation and require approval by the *fire code official* before the replacements are introduced into service.~~

~~**1206.3.2 Location and construction.** Rooms and areas containing capacitor energy storage systems shall be designed, located and constructed in accordance with Sections 1206.3.2 through 1206.3.2.5.~~

~~**1206.3.4 Capacitors and equipment.** The design and installation of *capacitor energy storage systems* and related equipment shall comply with Sections 1206.3.4.1 through 1206.3.4.5.~~

~~**1206.3.5 Fire-extinguishing and detection systems.** Fire-extinguishing and smoke detection systems shall be provided in *capacitor energy storage system* rooms in accordance with Sections 1206.3.5.1 through 1206.3.5.2.~~

MATERIAL	CLASS	EXPLOSION CONTROL METHODS	
		Barricade construction	Explosion (deflagration) venting or explosion (deflagration) prevention systems ^b
HAZARD CATEGORY			
Combustible dusts ^c	—	Not Required	Required
Cryogenic flammables	—	Not Required	Required
Explosives	Division 1.1	Required	Not Required
	Division 1.2	Required	Not Required
	Division 1.3	Not Required	Required
	Division 1.4	Not Required	Required
	Division 1.5	Required	Not Required
	Division 1.6	Required	Not Required
Flammable gas	Gaseous	Not Required	Required
	Liquefied	Not Required	Required
Flammable liquid	IA ^d	Not Required	Required
	IB ^e	Not Required	Required
Organic peroxides	U	Required	Not Permitted
	I	Required	Not Permitted
Oxidizer liquids and solids	4	Required	Not Permitted
Pyrophoric gas	—	Not Required	Required
Unstable (reactive)	4	Required	Not Permitted
	3 Detonable	Required	Not Permitted
	3 Nondetonable	Not Required	Required
Water-reactive liquids and solids	3	Not Required	Required
	2 ^g	Not Required	Required
SPECIAL USES			
Acetylene generator rooms	—	Not Required	Required
<u>Electrochemical energy storage systemsⁱ</u>	---	<u>Not Required</u>	<u>Required</u>
Grain processing	—	Not Required	Required
Liquefied petroleum gas-distribution facilities	—	Not Required	Required
Where explosion hazards exist ^f	Detonation	Required	Not Permitted
	Deflagration	Not Required	Required

- a. See Section 414.1.3.
- b. See the International Fire Code .
- c. As generated during manufacturing or processing.
- d. Storage or use.
- e. In open use or dispensing.
- f. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.
- g. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.
- h. Explosion venting is not required for Group H-5 fabrication areas complying with Section 415.11.1 and the International Fire Code .
- i. Where explosion control is required in Section 1206.6 of the International Fire Code.

Reason: The addition of energy storage system (ESS) requirements into the 2018 code was an initial effort to address

safety hazards associated with the increased use of lithium-ion batteries, capacitors and other modern energy storage system (ESS) technologies for an expanded number of grid related energy storage applications. The new requirements were a huge step toward addressing modern ESS technologies and grid based applications. However as written the requirements made it difficult to apply appropriate safety requirements for different installations, each with their own risks and exposures. Case in point, a lead acid battery ESS installation in an unmanned rural telecommunications repeater doesn't present the same risks and exposures as a lithium-ion battery ESS installation in a mixed occupancy high rise in an urban area.

Since the 2018 ESS requirements were developed there has been a lot of work done by private and government stakeholders to enhance ESS installation requirements, including the initial drafting of the NFPA 855 Energy Storage System standard. The Fire Code Action Committee's ESS work group, which includes 45+ code officials, manufacturers, users and industry experts identified several areas in the 2018 code that needed to be addressed to provide requirements that better address the hazards and exposures associated with various types of ESS installations, technologies and operations.

This section rewrite retains many of the basic protection concepts in the 2018 code, but also provide customized requirements for different types of installations and different types of ESS technologies in use today. We chose to replace the section in its entirety, rather than trying to edit existing text. Explanations of some of the more significant changes are included below.

Mobile ESS operations, consisting of lithium-ion batteries on trailers or skids are being deployed to locations to provide a temporary source of power. An operational permit is required for the mobile operations.

Section 1206.1 includes general requirements for all ESS. No significant changes were made to the Construction Document and Hazard Mitigation Analysis requirements.

Section 1206.1.5 - The 2018 code allowed certain variances be allowed based on large scale fire and fault condition testing, but the criteria for conducting such testing was undefined. The UL 9540A Test Method was specifically developed to cover this testing.

Section 1206.1.6 - This section was developed to address fire events involving lithium-ion battery systems, since lithium-ion battery fires have the potential to re-ignite hours or even days after initial extinguishment by the fire department, who cannot remain on scene indefinitely until the fire damaged ESS is safely removed from the premises. The fire remediation requirements, similar to fire watch requirements, make the owner responsible for sending mitigation personnel to the scene take over the remediation process.

Section 1206.2 covers commissioning, decommissioning, maintenance and testing requirements, which are important considerations for providing a safe, code compliant installation.

Section 1206.3 covers the ESS equipment itself, and much of these requirements are unchanged from the 2018 code. New section on repairs, retrofits and replacements were added to address practices to be followed when systems need to be upgraded or serviced.

Section 1206.3.8 allows code officials to regulate installations of repurposed electric vehicle batteries that are converted for ESS use in buildings.

Section 1206.4 includes requirements that need to be met by all ESS installations, and much of these are unchanged from the 2018 requirements. The Walk-in units section, with associated definition, is new and recognizes that ISO type shipping containers are being used to house ESS in various outdoor and mobile applications.

Section 1206.5 describes ESS protection requirements that are only applicable for certain type of installations, such as indoor dedicated use ESS installations, outdoor ESS installations in remote locations, and rooftop installations. Section 1206.5 tells you how to provide a particular type of protection, and tables in Sections 1206.7 through 1206.10 tell you when this protection is required.

1206.5.2 The size and separation protection concept (formerly "arrays") was introduced in the 2018 code. The term array was confusing and has been replaced. A maximum ESS unit size of 50 KWh previously only applied to unlisted ESS, but now all ESS are required to be listed due to the significant fire event that can be produced by 50 KWh of some ESS technologies.

1206.5.3 MAQs amounts are essentially the same as 2018 values. Due to introductions of facilities such as dedicated use ESS (utility size) requirements, and exemptions for increases based on large scale fire testing, it is no longer necessary to reference Group H-2 occupancies.

1206.5.4 Elevation requirements are similar to those in the 2018 IFC, but now restrict below grade installations except in underground vaults or when specifically approved by the code official. This is due to concerns raised by the fire service about responding to ESS fires in below grade locations.

1206.5.5 The previous smoke detection requirements have been modified to allow radiant energy-sensing fire detection as an option.

1206.5.6 The fire suppression requirements in the 2018 code only allowed NFPA 13 systems to be provided to protect ESS, but it was difficult or impossible to determine required design density. These requirements have been updated to specify a minimum 0.3 gpm/ft.² design density, with options for lower densities based on large scale fire testing per UL 9540A. Also an option for providing alternate fire suppression systems has been added, provided they have successfully passed UL 9540A fire testing.

1206.5.7 A maximum enclosure size for walk-in units, corresponding to the largest ISO type containers used for these installations, was established to provide differentiation between a walk-in unit and an inside installation.

1206.5.9 Separation from outdoor means of egress pathways leading to a public way were in the 2018 code.

Section 1206.6 includes electrochemical ESS technology specific protection, in a new table format. Table 1206.6 identifies which technologies need technology specific protection, which may include exhaust ventilation, spill control and neutralization, explosion control, safety caps and thermal runaway.

Section 1206.6.4 (explosion control) addresses a potentially significant hazard. Lithium-ion battery systems and other electrochemical ESS technologies have the potential to rapidly build up potentially explosive atmospheres in the battery or electrochemical ESS room or enclosure under thermal runaway and other conditions which could result in a catastrophic fire and or explosion. To protect against these hazards explosion control in accordance with IFC Section 911 is required for certain battery technologies.

Section 1206.7 covers indoor locations, and identifies two types of indoor installations, dedicated use installations (typical of utility grid related facilities) and non-dedicated use installations (typical of ESS in mixed use buildings or incidental use areas of occupancies). Protection for each installation is commensurate with the related risk and exposures.

Similarly Section 1206.8 covers two types of outdoor installations, remote outdoor installations (more than 100 feet from exposures, and installations near exposures (<100 ft.) more typical of an urban environment.

Section 1206.9 covers two special installations, rooftop ESS and open parking garage ESS.

Section 1206.10 covers two types of mobile ESS installations/operations, charging and storage of the mobile ESS at its home facility when it is not deployed to an event or facility, and deployment of the mobile ESS for temporary energy storage applications, such as providing power at an electric vehicle event. Mobile ESS charging and storage locations are treated the same as a stationary indoor or outdoor installation in accordance with Section 1206.7 or 1206.8, but can include temporary electrical and fire suppression system connections. This provides an acceptable level of protection based on the exposures at the facility, and prevents parties from using an ESS on wheels as a permanent ESS with less than effective protection.

Section 1206.10 also includes requirements for deploying mobile ESS to a facility or event for providing up to 30 days of temporary power (with some exceptions). An operational permit is required for each mobile ESS deployment.

The proposal also eliminated references to providing ESS in incidental use areas. Modern load leveling and peak shaving ESS applications make the 10% floor area limitations of incidental use areas impractical for anticipated installations. However the additional protection in this section, including equivalent Section 1206.7.5 fire-resistance rated separations, should effectively mitigate hazards with providing ESS on floor areas greater than 10% of the total floor area.

To summarize this proposal, developed by a large industry and code official work group, more effectively protects ESS installations based on knowledge gained since last code cycle. It provides protection customized for the types of installations that are being deployed today, instead of using the "one size fits all" type of protection in the 2018 code.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Some of the requirements in this proposal have the potential to increase the cost of providing ESS installations. However some of the provisions in this proposal better address risks and owner/user needs in dedicated use (utility) buildings and outdoor remote installations, and will probably decrease the cost of those installations as compared to installations installed using the 2018 IFC requirements.

Analysis: A review of the standards proposed for inclusion in the code, UL 1974 -17, UL 9540A-17 and NFPA 76-16, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 105.6.14 Energy storage systems, mobile. An operational permit is required for stationary and mobile energy storage systems regulated by Section 1206.

1201.3 Mixed system installation. Where approved, the aggregate nameplate kWh energy of all energy storage systems in a fire area shall not exceed the maximum quantity specified for any of the energy systems in this chapter. Where required by the fire code official, a hazard mitigation analysis shall be provided and approved in accordance with Section 104.7.2 to evaluate any potential adverse interaction between the various energy systems and technologies.

1206.1 General. The provisions in this section are applicable to stationary and mobile electrical energy storage systems (ESS).

Exception: ESS in Group R-3 and R-4 occupancies shall comply with Section 1206.11.

1206.1.2 Permits. Permits shall be obtained for ESS as follows:

1. Construction permits shall be obtained for stationary ESS installations and for mobile ESS charging and storage installations covered by 1206.10.1. Permits shall be obtained in accordance with Sections 105.7.7.

2. Operational permits shall be obtained for stationary ESS installations and for mobile ESS deployment operations covered by Section 1206.10.3. Permits shall be obtained in accordance with Sections 105.6.14.

1206.1.2.1 Communication utilities. Operational permits shall not be required for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC.

TABLE 1206.7

INDOOR ESS INSTALLATIONS

1206.5.4 Smoke and automatic fire detection ^{c, f}

NA = Not allowed.

a. See Section 1206.7.1.

b. See Section 1206.7.2.

c. Where approved by the fire code official, alarm signals are not required to be transmitted to a central station, proprietary or remote station service in accordance with NFPA 72, or a constantly attended location where local fire alarm annunciation is provided and trained personnel are always present.

d. Where approved by the fire code official, fire suppression systems are permitted to be omitted in dedicated use buildings located more than 100 feet (30.5 M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards.

f. Lead-acid and nickel cadmium battery systems installed in Group U buildings and structures less than 1500 ft² (140 m²) under the exclusive control of communications utilities, and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76 are not required to have an approved automatic smoke or fire detection system.

1206.8 Outdoor installations. Outdoor installations shall be in accordance with Sections 1206.8.1 through 1206.8.3. Exterior wall installations for individual ESS units not exceeding 20 kWh shall be in accordance with Section 1206.8.4.

1206.8.4 Exterior wall installations. ESS shall be permitted to be installed outdoors on exterior walls of buildings when all of the following conditions are met:

1. The maximum energy capacity of individual ESS units shall not exceed 20 kWh.

2. The ESS shall comply with applicable requirements in Section 1206.

3. The ESS shall be installed in accordance with the manufacturer's instructions and their listing.

4. Individual ESS units shall be separated from each other by at least three feet (914 mm).

5. The ESS shall be separated from doors, windows, operable openings into buildings, or HVAC inlets by at least five feet (1524 mm).

Exception: Where approved smaller separation distances in items 4 and 5 shall be permitted based on large scale fire testing complying with Section 1206.1.5.

1206.11 ESS in Group R-3 and R-4 Occupancies. ESS in Group R-3 and R-4 occupancies shall be installed and maintained in accordance with Sections 1206.11.1 through 1206.11.9. The temporary use of an owner or occupant's electric powered vehicle as an ESS shall be in accordance with Section 1206.4.10.

1206.11.1 Equipment listings. ESS shall be listed and labeled for residential use in accordance with UL 9540.

Exceptions:

1. Where approved, repurposed unlisted battery systems from electric vehicles are allowed to be installed outdoors or in detached dedicated cabinets located not less than 5 feet (1524 mm) from exterior walls, property lines and public ways.

2. ESS less than 1 kWh (3.6 megajoules).

1206.11.2 Installation. ESS shall be installed in accordance with the manufacturer's instructions and their listing.

1206.11.2.1 Spacing. Individual units shall be separated from each other by at least three feet of spacing unless smaller separation distances are documented to be adequate based on large scale fire testing complying with Section 1206.1.5.

1206.11.3 Location. ESS shall only be installed in the following locations:

1. Detached garages and detached accessory structures.

2. Attached garages separated from the dwelling unit living space and sleeping units in accordance with Section 406.3.2 of the International Building Code.

3. Outdoors on exterior walls located a minimum 3 ft. from doors and windows.

4. Utility closets and storage or utility spaces within dwelling units and sleeping units.

1206.11.4 Energy ratings. Individual ESS units shall have a maximum rating of 20 kWh. The aggregate rating structure shall not exceed:

1. 40 kWh within utility closets and storage or utility spaces.

2. 80 kWh in attached or detached garages and detached accessory structures.

3. 80 kWh on exterior walls.

4. 80 kWh outdoors on the ground.

1206.11.5 Electrical installation. ESS shall be installed in accordance with NFPA 70. Inverters shall be listed and labeled in accordance with UL 1741 or provided as part of the UL 9540 listing. Systems connected to the utility grid shall use inverters listed for utility interaction.

1206.11.6 Fire detection. Rooms and areas within dwellings units, sleeping units and attached garages in which ESS are installed shall be protected by smoke alarms in accordance with Section 907.2.10. A heat detector listed and interconnected to the smoke alarms shall be installed in locations within dwelling units, sleeping units and attached garages where smoke alarms cannot be installed based on their listing.

1206.11.7 Protection from impact. Stationary storage battery systems installed in a location subject to vehicle damage shall be protected by approved barriers. Appliances in garages shall also be installed in accordance with Section 304.3 of the International Mechanical Code.

1206.11.8 Ventilation. Indoor installations of ESS that include batteries that produce hydrogen or other flammable gases during charging shall be provided with ventilation in accordance with Section 1206.6.1.

1206.11.9 Toxic and highly toxic gas. ESS that have the potential to release toxic or highly toxic gas during charging, discharging and normal use conditions shall not be installed within Group R-3 or R-4 occupancies.

1206.11.10 Electric vehicle use. The temporary use of an owner or occupant's electric powered vehicle to power a dwelling unit or sleeping unit while parked in an attached or detached garage or outside shall comply with the vehicle manufacturer's instructions and NFPA 70.

Committee Reason: The proposal was approved as the provisions of the 2018 Section 1206 need refinement and does not offer the flexibility and understanding of the different types of installations in use such as standalone systems or systems within a high rise building. There are a series of modification that work to integrate concepts from other proposals within code change proposal F203-18.

- **Section 1201.3.** - The modification to Section 1201.3 of the 2018 IFC pulls all energy systems together to better determine what can be included in a fire area and appropriately requires the nameplate kWh to determine the size of the systems. This concept is found in code change proposal F190-18.
- **Sections 1206.1.2, 1206.1.2.1.** Section 1206.1.2 of the proposal was revised along with the addition of a new section 1206.1.2.1 allowing the exception from operational permits for the telecommunications utilities. As part of this revision the permit requirements proposed in 105.6.14 were broadened to both mobile and stationary ESS. This is consistent with F204-18 which was written with the intent to be integrated with the revised provisions in Section 1206. This is also appropriate since the telecommunication industry must comply with NFPA 76.
- **Table 1206.7.** This table was modified to include a footnote providing an exception for lead acid and nickel cadmium installations for the communication utilities from smoke and automatic fire detection due to the good safety history and nature of the installations. This modification originates in F208-18 and due to the nature of the revisions to Section 1206 was better addressed in the new format of F203-18.
- **Section 1206.8.4.** The addition of Section 1206.8.4 and associated revisions to proposed Section 1206.8 recognize wall mounted ESS. These provisions were originally proposed in F210-18 and were intended to be integrated into the rewrite of Section 1206.
- **Section 1206.11.** The addition of Section 1206.11 recognizes the use of ESS in a residential setting and provides appropriate requirements for the fire code official. These provisions were originally proposed in code change proposal F211-18 and were intended to be integrated into the rewrite of Section 1206. Note that as part of this modification Section 1206.1 was revised to add a new exception for Group R-3 and R-4 occupancies that comply with new section 1206.11. (Vote: 12-1)

Assembly Action:

None

F203-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1201.1 Scope. The provisions of this chapter shall apply to the installation, operation, maintenance, repair, retrofitting, testing, commissioning and decommissioning of energy systems used for generating or storing energy. It shall not apply to equipment associated with the generation, control, transformation, transmission, or distribution of energy installations that is under the exclusive control of an electric utility or lawfully designated agency, provided that the ESS under the exclusive control of such electric utility or lawfully designated agent provides an equivalent level of safety as required by Section 1206.

Commenter's Reason: The intent of the proposed change is to ensure that all ESS systems enjoy the same level of safety, irrespective of the base code governing its installation.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No cost impact as the proposal simply clarifies the existing scope without adding or subtracting from it.

Public Comment 2:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.5.1 Size and separation. Electrochemical ESS shall be segregated into groups not exceeding ~~50-250~~ 100-900 KWh (~~180-900~~ Mega joules). Each group shall be separated a minimum three feet (914 mm) from other groups and from walls in the storage room or area. The storage arrangements shall comply with Chapter 10.

Exceptions:

1. Lead acid and nickel cadmium battery systems in facilities under the exclusive control of communications utilities and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76.
2. The fire code official is authorized to approve larger capacities or smaller separation distances based on large scale fire testing complying with Section 1206.1.5.

Commenter's Reason: The reduction from 250 to 50 kWh is burdensome to the industry. ESA appreciates the concern for safety but it is unaware of any actual fire that was either initiated or made worse by virtue of the fact that a 250 kWh group was installed vs a 50 kWh group.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. A limitation of 50 kWhs will increase the cost of construction by reducing the amount of ESS that can be installed per sq ft.

Public Comment 3:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

**TABLE 1206.5
MAXIMUM ALLOWABLE QUANTITIES OF ELECTROCHEMICAL ESS**

TECHNOLOGY	MAXIMUM ALLOWABLE QUANTITIES ^a
STORAGE BATTERIES	
Lead acid, all types	Unlimited
Nickel cadmium (Ni-Cd)	Unlimited
Nickel metal hydride (Ni-MH)	Unlimited
Lithium-ion	600 KWh <u>1,000 kWh</u>
Flow batteries ^b	600 KWh
Other battery technologies	200 KWh
CAPACITORS	
All types	20 KWh
OTHER ELECTROCHEMICAL ESS	
All types	20 KWh

a. For electrochemical ESS units rated in Amp-Hours, KWh shall equal rated voltage times the Amp-hour rating divided by 1000

b. Shall include vanadium, zinc-bromine, polysulfide-bromide, and other flowing electrolyte type technologies

Commenter's Reason: Based on industry experience, ESA does not believe the risk of fire increases significantly by allowing the aggregation of 1,000 kWh groups of batteries vis-à-vis 600 kWh groups.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Allowing the aggregation of 1,000 kWh groupings would make the cost of ESS more economical.

Public Comment 4:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.8.1 Remote outdoor installations. For the purpose of Table 1206.8, remote outdoor installations include ESS located more than ~~100-50~~ feet (~~30-15.5-25~~ M) from buildings, lot lines, public ways, stored combustible materials, hazardous materials, high piled stock and other exposure hazards.

Commenter's Reason: ESA members have growing experience with ESS systems and they are unconvinced of any additional safety benefit that would accrue by locating an ESS container 100 ft from exposures rather than 50 ft although the additional expense is significant.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction Doubling the distance from 50 to 100 ft erodes the cost effectiveness of ESS.

Public Comment 5:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

ENERGY STORAGE SYSTEM, MOBILE.

~~An energy storage system capable of being moved and utilized for temporary energy storage applications, and not installed as fixed or stationary electrical equipment. The system can include integral wheels for transportation, or be loaded on a trailer and unloaded for charging, storage and deployment.~~deployed in a deployable enclosure or mounted on a rail car, wheeled trailer, semi-trailer, vehicle or hand-cart, used for microgrid, grid-interactive usage, or other uses such as portable telecommunication facilities. Deployments are considered temporary where used for durations of less than 30 days.

Commenter's Reason: adds clarity for mobile ESS

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No cost impact as it adds no new requirements and is simply a clarification of intent.

Public Comment 6:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.6.1 Exhaust-ventilationVentilation. Where required by Table 1206.6 or elsewhere in this code, ~~exhaust~~ ventilation of rooms, areas, and walk-in units containing electrochemical ESS shall be provided in accordance with the International Mechanical Code and Section 1206.6.1.1 or 1206.6.1.2.

Commenter's Reason: An HVAC unit on a container acts as both a ventilation system, as well as an exhaust system. Separating the functions of ventilation needed during normal use, and exhaust needed during emergency events is not practical in such cases - it's one and the same system.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Editorial only - adds no new requirements

Public Comment 7:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

~~**1206.5.7 Vegetation control.** Areas within 10 feet (3 m) on each side of outdoor ESS shall be cleared of combustible vegetation and other combustible growth. Single specimens of trees, shrubbery, or cultivated ground cover such as green grass, ivy, succulents, or similar plants used as ground covers shall be permitted to be exempt provided that they do not form a means of readily transmitting fire.~~

Commenter's Reason: Walk-in units are constructed of non-combustible materials. This provision seems to be a reach - is it directing the operator to cut the grass around the walk-in unit? as it is currently worded with the allowance of single species trees, etc., it is not clear what is being required.

This provision seems like good practice but would be difficult to enforce.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no impact - grass should be cut anyway -

Public Comment 8:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

ENERGY STORAGE SYSTEM (ESS). One or more devices, assembled together, not used to propel rail or wheeled vehicles, capable of storing energy in order to supply electrical energy at a future time.

Commenter's Reason: This proposal clarifies that the standard is not intended to apply to ESS used for transportation.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal only clarifies the intent. It adds no new requirements and thus does not affect cost.

Public Comment 9:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.5.6 Maximum enclosure size. Outdoor walk-in units housing ESS shall not exceed 53 feet by 8 feet by 9.5 feet high. ~~Walk-in units that exceed these dimensions, not including bolt-on HVAC and related equipment, as approved.~~ Outdoor walk-in units exceeding these limitations shall be considered indoor installations and comply with the requirements in Section 1206.7.

Commenter's Reason: The walk-in enclosure size requirement in this provision was a good faith effort to bound the maximum size but was not based on specific fire safety concerns. Some ESA containers currently in production slightly exceed the maximum size allowed. This proposal would provide flexibility.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Increased flexibility will make ESS installations more economic.

Public Comment 10:

Proponent: Charles Foster, representing Energy Storage Association (cfoster20187@yahoo.com) requests As Modified

by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.9.3 Clearance to exposures. ESS located on rooftops and in open parking garages shall be separated by a minimum ten feet (3048 mm) from the following exposures:

1. Buildings, except the building on which rooftop ESS is mounted
2. Any portion of the building on which a rooftop system is mounted that is elevated above the rooftop on which the system is installed
3. Lot lines
4. Public ways
5. Stored combustible materials
- ~~6. Locations where motor vehicles can be parked~~
7. Hazardous materials
8. Other exposure hazards

Exceptions:

1. Clearances are permitted to be reduced to 3 feet (914 mm) where a 1-hour free standing fire barrier, suitable for exterior use, and extending 5 feet (1.5 m) above and extending 5 feet (1.5 m) beyond the physical boundary of the ESS installation is provided to protect the exposure.
2. Clearances are permitted to be reduced to 3 feet (914.4 mm) where a weatherproof enclosure constructed of noncombustible materials is provided over the ESS and it has been demonstrated that a fire within the enclosure will not ignite combustible materials outside the enclosure based on large scale fire testing complying with Section 1206.1.5.

Commenter's Reason: 10 ft is unwarranted. NFPA 13 Handbook states: Even though there is gasoline in the automobiles, the loss history for these occupancies demonstrates that the fires in standard-type garages are typically limited to one car and do not pose an excessive challenge for the sprinkler system to control. Section 4.4.4.5 of NFPA 13 only requires 5 ft separation (through means of a fence) from parked vehicles).

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This proposal would facilitate ESS installations, driving down cost without increasing risks,

Public Comment 11:

Proponent: Richard Kluge, representing Alliance for Telecommunications Industry Solutions (richard.kluge@ericsson.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

**TABLE 1206.6
ELECTROCHEMICAL ESS TECHNOLOGY SPECIFIC REQUIREMENTS**

COMPLIANCE REQUIRED ^b	BATTERY TECHNOLOGY				OTHER ESS AND BATTERY TECHNOLOGIES ^b	CAPACITOR ESS ^b
	Lead-acid	Ni-Cad and Ni-MH	Lithium-ion	Flow		
1206.6.1 Exhaust ventilation	Yes	Yes	No	Yes	Yes	Yes
1206.6.2 Spill control and neutralization	Yes ^c	Yes ^c	No	Yes	Yes	Yes
1206.6.3Explosion control	Yes ^a	Yes ^a	Yes	No	Yes	Yes
1206.6.4 Safety caps	Yes	Yes	No	No	Yes	Yes
1206.6.5 Thermal runaway	Yes ^d	Yes	Yes ^e	No	Yes ^e	Yes

a. Not required for lead-acid and nickel cadmium batteries at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC.

b. Protection shall be provided unless documentation acceptable to the fire code official is provided in accordance with Section 104.7.2 that provides justification why the protection is not necessary based on the technology used.

c. Applicable to vented (i.e. flooded) type nickel cadmium and lead acid batteries.

d. Not required for vented (i.e. flooded) type lead acid batteries.

e. The thermal runaway protection is permitted to be part of a battery management system that has been evaluated with the battery as part of the evaluation to UL 1973.

Commenter's Reason: Thermal runaway protection is not necessary for flooded lead-acid batteries. This has been consistent in the codes for many cycles, both in the IFC and NFPA 1. The public input to section 1206 made considerable changes and lost this important distinction when developing the table. Adding the footnote will make the table technically correct and reflective of the true risks of each battery chemistry.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The change will clarify that certain battery constructions are not prone to thermal runaway and do not need external thermal runaway controls.

Public Comment 12:

Proponent: Richard Kluge, representing Alliance for Telecommunications Industry Solutions (richard.kluge@ericsson.com)requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.2 Commissioning, decommissioning, operation and maintenance. Commissioning, decommissioning, operation and maintenance shall be conducted in accordance with this section.

Exception: This section shall not apply to lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC. However a decommissioning plan shall be provided and maintained where required by the fire code official.

1206.2.1 Commissioning. Commissioning of newly installed ESS, and existing ESS that have been retrofitted, replaced or previously decommissioned and are returning to service shall be conducted prior to the ESS being placed in service in accordance with a commissioning plan that has been approved prior to initiating commissioning. The commissioning plan shall include the following:

1. A narrative description of the activities that will be accomplished during each phase of commissioning including the personnel intended to accomplish each of the activities.
2. A listing of the specific ESS and associated components, controls and safety related devices to be tested, a description of the tests to be performed and the functions to be tested.
3. Conditions under which all testing will be performed, which are representative of the conditions during normal operation of the system.
4. Documentation of the owner's project requirements and the basis of design necessary to understand the installation and operation of the ESS.
5. Verification that required equipment and systems are installed in accordance with the approved plans and specifications.
6. Integrated testing for all fire and safety systems.
7. Testing for any required thermal management, ventilation or exhaust systems associated with the ESS installation.
8. Preparation and delivery of operation and maintenance documentation.
9. Training of facility operating and maintenance staff.
10. Identification and documentation of the requirements for maintaining system performance to meet the original design intent during the operation phase.
11. Identification and documentation of personnel who are qualified to service, maintain and decommission the ESS, and respond to incidents involving the ESS, including documentation that such service has been contracted for.
12. A decommissioning plan for removing the ESS from service, and from the facility in which it is located. The plan shall include details on providing a safe, orderly shutdown of energy storage and safety systems with notification to the code officials prior to the actual decommissioning of the system. The decommissioning plan shall include contingencies for removing an intact operational ESS from service, and for removing an ESS from service that has been damaged by a fire or other event.

~~**Exception:** Commissioning shall not be required for lead acid and nickel cadmium battery systems at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC. However a decommissioning plan shall be provided and maintained where when required by the fire code official.~~

Commenter's Reason: The exception language for telecommunications installations of lead-acid or nickel-cadmium batteries complying with NFPA 76 is relocated from Section 1206.2 to 1206.2.1 Since the exception addresses both commissioning and decommissioning, this is a better location. Since telecommunications installations with lead-acid or nickel-cadmium batteries complying with NFPA 76 are exempt from commissioning process and most decommissioning processes via the code, there is no reason to require compliance to the operation and maintenance aspects. These installations have been in wide use for many decades and have had an exceptional safety record without the additional code governance.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Relocated text will not affect cost of construction.

Public Comment 13:

Proponent: Richard Kluge, representing Alliance for Telecommunications Industry Solutions (richard.kluge@ericsson.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

**TABLE 1206.6
ELECTROCHEMICAL ESS TECHNOLOGY SPECIFIC REQUIREMENTS**

COMPLIANCE REQUIRED ^b	BATTERY TECHNOLOGY				OTHER ESS AND BATTERY TECHNOLOGIES ^b	CAPACITOR ESS ^b
	Lead-acid	Ni-Cad and Ni-MH	Lithium-ion	Flow		
1206.6.1 Exhaust ventilation	Yes	Yes	No	Yes	Yes	Yes
1206.6.2 Spill control and neutralization	Yes ^c	Yes ^c	No	Yes	Yes	Yes
1206.6.3Explosion control	Yes ^a	Yes ^a	Yes	No	Yes	Yes
1206.6.4 Safety caps	Yes	Yes	No	No	Yes	Yes
1206.6.5 Thermal runaway	Yes	Yes ^d	Yes de	No	Yes de	Yes

a. Not required for lead-acid and nickel cadmium batteries at facilities under the exclusive control of communications utilities that comply with NFPA 76 and operate at less than 50 VAC and 60 VDC.

b. Protection shall be provided unless documentation acceptable to the fire code official is provided in accordance with Section 104.7.2 that provides justification why the protection is not necessary based on the technology used.

c. Applicable to vented (i.e. flooded) type nickel cadmium and lead acid batteries.

d. Not required for vented (i.e. flooded) type nickel cadmium batteries.

e. The thermal runaway protection is permitted to be part of a battery management system that has been evaluated with the battery as part of the evaluation to UL 1973.

Commenter's Reason: Thermal runaway protection is not necessary for flooded nickel-cadmium batteries. This has been consistent in the codes for many cycles, both in the IFC and NFPA 1. The public input to section 1206 made considerable changes and lost this important distinction when developing the table. Adding the footnote will make the table technically correct and reflective of the true risks of each battery chemistry.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
The change will not impact the cost of construction.

Public Comment 14:

Proponent: Steven Rosenstock, representing Edison Electric Institute (srosenstock@eei.org)requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

1206.11.10 Electric vehicle use. The temporary use of an owner or occupant's electric ~~powered vehicle to vehicle to~~ power a dwelling unit or sleeping unit while parked in an attached or detached garage or outside shall comply with ~~the vehicle manufacturer's instructions and~~ NFPA 70.

Commenter's Reason: This proposal makes editorial changes to Section 1206.11.10 regarding electric vehicle use. It will not be possible for a code official to know which electric vehicle will be parked at the building, so it will be impossible to enforce language on complying with vehicle manufacturer instructions (there are over 50 models of EVs available on the market today).

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
As a proposal for a table and a section that is editorial in nature, this will have no impact on construction costs.

Public Comment 15:

Proponent: Philip Undercuffler, representing OutBack Power Technologies (pundercuffler@outbackpower.com)requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.3.7 Retrofits. Retrofitting of an existing ESS shall comply with the following:

1. A construction permit shall be obtained in accordance with Section 105.7.7.
2. New batteries, battery modules, capacitors and similar ESS components shall be listed ~~in accordance with UL 1973.~~
3. Battery management and other monitoring systems shall be connected and installed in accordance with the manufacturer s instructions.
4. The overall installation shall continue to comply with UL 9540 listing requirements, where applicable.
5. Systems that have been retrofitted shall be commissioned in accordance with Section 1206.2.1.
6. Retrofits shall be documented in the service records log.

Commenter's Reason: UL 1973 does not cover all ESS components, nor are all batteries listed to UL 1973; UL 1989 is the relevant standard for VRLA batteries, while flow batteries and other ESS technologies are evaluated to other standards. Any language that would allow only UL 1973 as the only option for retrofit would be too restrictive and eliminate any lead acid battery retrofit, without technical justification or benefit. The key requirement should be that any retrofit of an ESS unit must be with listed product.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed revision would clarify that any retrofit must use listed equipment, but allows the NRTLs and the evaluation process to determine the appropriate standard for each specific piece of equipment. Not all ESS components are within the scope of UL 1973 (although without this modification, forcing equipment to be listed to inappropriate standards would increase the cost)

Public Comment 16:

Proponent: Philip Undercuffler, representing OutBack Power Technologies (pundercuffler@outbackpower.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.5.1 Size and separation. Electrochemical ESS shall be segregated into groups not exceeding 50 KWh (180 Mega joules). Each group shall be separated a minimum three feet (914 mm) from other groups and from walls in the storage room or area. The storage arrangements shall comply with Chapter 10.

Exceptions:

1. Lead acid and nickel cadmium battery systems in facilities under the exclusive control of communications utilities and operating at less than 50 VAC and 60 VDC in accordance with NFPA 76.
2. The fire code official is authorized to approve larger capacities or smaller separation distances based on large scale fire testing complying with Section 1206.1.5.
3. Separation for lead acid battery systems shall not be required where the battery cells have flame retardant casings.

Commenter's Reason: There is no special hazard or risk requiring three foot minimum separation between groups or to walls with lead acid batteries, as was recognized both in Table 1206.5 and with the 2018 and prior versions of the IFC. Table 1206.5 allows an unlimited maximum allowable quantity for lead acid batteries regardless of voltage or application, as the table correctly recognizes that this technology does not present a special fire risk or hazard that has not already been addressed. This recognition is based on a long successful history of safe and reliable operation of hundreds of thousands of systems in a wide range of applications across the US and the world. Lead acid batteries may have their issues, which have been addressed elsewhere within this Code, but they do not have a history of propagating flame from cell to cell or otherwise presenting any hazard that needs mitigation through maintaining special clearances. The proposed requirement for flame retardant casings as a qualification for this exception provides additional assurance to address any unforeseen concerns.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed revision would maintain similar spacing and separation requirements for lead acid batteries as exists in the 2018 IFC. Without this proposed change, construction costs for lead acid battery systems would increase substantially.

Public Comment 17:

Proponent: Philip Undercuffler, representing OutBack Power Technologies (pundercuffler@outbackpower.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

1206.11.1 Equipment listings. ESS shall be listed and labeled ~~for residential use~~ in accordance with UL 9540. ESS listed and labeled solely for utility or commercial use shall not be used for residential applications.

Exceptions:

1. Where approved, repurposed unlisted battery systems from electric vehicles are allowed to be installed outdoors or in detached dedicated cabinets located not less than 5 feet (1524 mm) from exterior walls, property lines and public ways.
2. ESS less than 1 kWh (3.6 megajoules).

Commenter's Reason: Per UL 9540 40.4, energy storage systems are only marked "for residential use" when they are limited to installations only in those locations, in other words it is a restrictive marking. Some UL 9540 listed energy storage systems may have no such restrictions, and can safely be used in any application – residential, commercial, or other. Their use within the capabilities of their certification should not be artificially limited. The proposed modification would achieve the intended result, which is that products whose listing evaluation has determined that they are restricted to specific applications which are not residential may not be used in residential applications.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed revision will not change the listing requirements for ESS -- all ESS must be listed to UL9540. It simply addresses a misunderstanding in the use of the listing mark as applies to products listed for limited applications, if a product is not marked with qualifiers it can be used in the broadest range of applications.

Public Comment 18:

Proponent: Nicholas Frank, Nexceris, representing Nexceris (n.frank@nexceris.com) requests As Submitted.

Commenter's Reason: Within IFC 1206 in section 1206.2.10.1 there is a requirement that a battery system is UL 9540 listed. However, there is no mention of UL 9540A which is a test method that provides valuable test data on the failure mechanisms of a given lithium-ion energy storage system (ESS). This is key information for authorities having jurisdiction (AHJ) when permitting lithium-ion systems. It helps them understand the associated hazards of the systems and the magnitude of failure. This is especially important given the current state of the industry where there is a large range in quality of lithium-ion cells and systems. Some systems are great at dealing with failures and others not designed to deal with failures at all. This information should be readily available during permitting.

It should be mentioned that NFPA 855 requires the UL 9540A test method and incorporating this into IFC 1206 would increase the harmonization of the energy storage system installation standards used in industry.

UL 9540A requires that a battery is overheated until failure at 5°C/minute. During heating, two distinct points of measurement are required at the off-gas event (cell venting) and thermal runaway in Section 6.2.5 and Section 6.2.6, respectively. When the UL 9540A report shows that the off-gas event occurs before thermal runaway, IFC 1206 should require off-gas monitoring. This increases the safety of the lithium-ion battery system by providing a redundant perspective on battery health, an early warning of failure, and the option to provide preventative action of thermal runaway. World class standards organizations have validated these concepts. For the IFC to miss this opportunity would be a disservice to first responders.

To summarize the intent of this public comment, it is to recognize UL 9540A in IFC 1206 as a test method for evaluating the failure mechanisms of lithium-ion battery systems. In addition to recognizing UL 9540A, the IFC to should require off-gas monitoring if the UL 9540A test report states that off-gas events occur prior to thermal runaway.

Bibliography: UL 9540A Test Method: <https://industries.ul.com/energy/battery-and-energy-storage-technology/ul-9540a-test-method>

Published paper on Off-gas Monitoring: Hill, Davion; Gully, Benjamin; Agarwal, Arun; Nourai, Ali; Thrun, Lora; Swartz, Scott; Koslowski, Mark; Cummings, Steve; Butkowski, John; Moore, Brad. (2013). Detection of off gassing from Li-ion batteries. 1-7. 10.1109/EnergyTech.2013.6645307.

Stages of a battery failure explanation: <https://liiontamer.com/lithium-ion-battery-failure-stages/>

Prevention of thermal runaway: <https://www.youtube.com/watch?v=Cx03a8GvrXA>

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction UL 9540A is a test method which will need to be performed by an external laboratory.

Off-gas monitoring adds less than 1% of the total system cost.

Public Comment 19:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standard UL 1974 -17:Evaluation for Re-purposing Batteries, must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

F203-18

F209-18

IFC: 1206.2.11.5

Proposed Change as Submitted

Proponent: Jeffrey Betz, AT&T Corporation, representing AT&T Corporation (jbetz@att.com)

2018 International Fire Code

Revise as follows

1206.2.11.5 Spill control and neutralization. Where required by Section 1206.2.12, approved methods and materials shall be provided for the control and neutralization of spills of electrolyte or other hazardous materials in areas containing stationary storage batteries as follows:

1. For batteries with free-flowing electrolyte, ~~the a method and materials shall be capable of neutralizing of:~~
 - 1.1. Providing spill control to prevent the flow of electrolyte to adjoining areas when rooms or areas are used for the storage of free-flowing electrolyte in individual vessels having a capacity of more than 55 gallons (208 L), or in which the aggregate capacity of multiple vessels exceeds 1,000 gallons (3785 L)
 - 1.2. Neutralizing a spill of the total capacity from the largest individual cell or block to a pH between 5.0 and 9.0.
2. For batteries with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.

Reason: This proposal incorporates and clarifies the code industry's basic quantity requirements for spill control. It further provides the specific requirements of this chapter (12 formerly Section 608) related to vessel and aggregate thresholds currently addressed in the 2015 IFC Section 608 Commentary (2018 IFC 1206.2.11.5 Spill containment and neutralization) and 2015 IFC Code and Commentary Chapter 50 Hazardous Materials Section 5004.2.1 Spill control for hazardous materials liquids.

2015 IFC Commentary - Section 608.5

Batteries that contain a free-flowing liquid electrolyte pose the same containment problems as any other corrosive liquid hazardous material, but the containment and neutralization provisions in this section are performance based and neither specifically require spill control in the form of containment nor a specific method of neutralization. The quantity of neutralization material required to be available would be greater for these less-viscous electrolytes, however, because of their mobility and the rapidity with which they can spread and the potential scope of the spread. See the commentary to Section 5004.2.1 for further discussion of spill control strategies. The exception recognizes the reduced spill control hazard of sealed batteries that contain a higher-viscosity electrolyte.

2015 IFC Commentary - Chapter 50 Hazardous Materials 5004.2.1 Spill control for hazardous material liquids

The requirement for spill control in a room or area is based on two items. The first is that the storage container(s) have a capacity of more than 55 gallons (208 L). The second is that the aggregate capacity of multiple vessels be more than 1,000 gallons (3785 L). The area, once determined to require spill control, must be protected so that the containment area will handle the release from the largest container in the area.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. No additional cost impact, as this clarifies intent of current code.

F209-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved because the volume allowed by this proposal without spill control and secondary containment is excessive. This would change the number from 50 gallons to 1000 gallons. (Vote: 14-0)

Assembly Action:

None

F209-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org); Robert Davidson, Davidson Code Concepts, LLC, representing FCAC (rjd@davidsoncodeconcepts.com); Richard Kluge (richard.kluge@ericsson.com); Jeffrey Betz (jbetz@att.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

1206.2.11.5 Spill control and neutralization. Where required by Section 1206.2.12, approved methods and materials shall be provided for the control and neutralization of spills of electrolyte or other hazardous materials in areas containing stationary storage batteries as follows:

1. For batteries with free-flowing electrolyte, the method and materials shall be capable of neutralizing a spill of the total capacity from the largest cell or block to a pH between 5.0 and 9.0.
2. For batteries with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.

1206.2.11.5.1 Communication Utilities. The requirements of Section 1206.2.11.5 shall only apply when the aggregate capacity of multiple vessels exceeds 1,000 gallons (3785 L) for lead acid and nickel cadmium battery systems operating at less than 50 VAC and 60 VDC that are located at facilities under the exclusive control of communications utilities and those facilities comply with NFPA 76 in addition to applicable requirements of this code.

Commenter's Reason: This public comment incorporates and clarifies the code industry's basic quantity requirements for spill control as it applies to telecommunication utility facilities utilizing lead acid or nickel cadmium batteries. It provides a trigger for when to require spill control measures that corresponds to what is required for high hazard occupancies. In the IFC, you typically must be a high hazard occupancy before there is a requirement for spill control, then you must have individual containers exceeding 55 gallons in capacity or an aggregate amount exceeding 1,000 gallons.

5004.2.2 Secondary containment for hazardous material liquids and solids. *Where required by Table 5004.2.2 buildings, rooms or areas used for the storage of hazardous materials liquids or solids shall be provided with secondary containment in accordance with this section where the capacity of an individual vessel or the aggregate capacity of multiple vessels exceeds both of the following:*

1. *Liquids: Capacity of an individual vessel exceeds 55 gallons (208 L) or the aggregate capacity of multiple vessels exceeds 1,000 gallons (3785 L).*

Since the lead-acid or nickel cadmium batteries regulated by this portion of the code do not exceed 50 gallons of electrolytes individually the 'exceeding 55 gallons' trigger would not come in to play, so only the '1,000-gallon aggregate' threshold is being brought over.

The committee's reason for denial was:

"This proposal was disapproved because the volume allowed by this proposal without spill control and secondary containment is excessive. This would change the number from 50 gallons to 1000 gallons."

This would not be accurate, though the trigger would now be a 1000 gallon aggregate, the change is targeted only to telecommunication utility facilities wherein individual batteries do not exceed 50 gallons. So if a spill was to occur due to the failure of a battery casing the amount would be 50 gallons. You would need the simultaneous failure of 20 batteries to

reach 1000 gallons, an unlikely event. It's important to acknowledge that even if this was a high hazard occupancy, 50 gallon containers would not trigger spill containment until an aggregate of 1000 gallons was reached. In essence, the IFC already has determined the amounts as acceptable.

The suggested language has been restructured to leave the existing language as is and to instead add a section advising when to apply the spill control requirements to a telecommunications utility facility. This would apply only to spaces dedicated to the telecommunications activities, it would not apply in a mixed use occupancy.

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No additional cost impact, as this clarifies intent of current code.

2018 International Fire Code

Revise as follows

CHAPTER ~~22~~ COMBUSTIBLE DUST-PRODUCING OPERATIONS

~~SECTION 2201 GENERAL~~

Delete without substitution

~~**2201.1 Scope.** The equipment, processes and operations involving dust explosion hazards shall comply with the provisions of this code and NFPA 652.~~

~~**2201.2 Permits.** Permits shall be required for *combustible dust* producing operations as set forth in Section 105.6.~~

~~SECTION 2202 DEFINITION~~

~~**2202.1 Definition.** The following term is defined in Chapter 2:
COMBUSTIBLE DUST.~~

~~SECTION 2203 PRECAUTIONS~~

~~**2203.1 Owner responsibility.** The owner or operator of a facility with operations that manufacture, process, blend, convey, repackage, generate or handle potentially combustible dust or combustible particulate solids shall be responsible for compliance with the provisions of this code and NFPA 652.652.~~

~~**2203.2 Dust hazard analysis (DHA).** The requirements of NFPA 652 apply to all new and existing facilities and operations with combustible dust hazard. Existing facilities shall have a dust hazard analysis (DHA) completed in accordance with Section 7.1.2 of NFPA 652.652.
The fire code official shall be authorized to order a dust hazard analysis to occur sooner if a combustible dust hazard has been identified in a facility that has not previously performed an analysis.~~

~~**2203.3 Sources of ignition.** Smoking, the use of heating or other devices employing an open flame, or the use of spark-producing equipment is prohibited in areas where *combustible dust* is generated, stored, manufactured, processed or handled.~~

~~**2203.4 Housekeeping.** Accumulation of *combustible dust* shall be kept to a minimum in the interior of buildings. Accumulated *combustible dust* shall be collected by vacuum cleaning or other means that will not place *combustible dust* into suspension in air. Forced air or similar methods shall not be used to remove dust from surfaces.~~

~~SECTION 2204 ADDITIONAL REQUIREMENTS~~

~~**2204.1 Specific hazards standards.** The industry or commodity specific codes and standards listed in Table 2204.1 shall be complied with based on the identification and evaluation of the specific fire and deflagration hazards that exist at a facility.~~

**TABLE 2204.1
SPECIFIC HAZARDS STANDARDS**

STANDARD	SUBJECT
NFPA 61	Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities
NFPA 69	Standard on Explosion Prevention Systems
NFPA 70	National Electrical Code
NFPA 85	Boiler and Combustion System Hazards Code
NFPA 120	Standard for Fire Prevention and Control in Coal Mines
NFPA 484	Standard for Combustible Metals
NFPA 654	Standard for Prevention of Fire and Dust Explosions from the Manufacturing, Processing and Handling of Combustible Particulate Solids
NFPA 655	Standard for the Prevention of Sulfur Fires and Explosions
NFPA 664	Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities

Add new text as follows

2201.1 Scope. The equipment, processes and operations involving dust explosion hazards and use or handling of combustible dust shall comply with the provisions of this chapter

Exceptions:

1. In an unsprinklered building, dust production or use, including use-open and use-closed systems, where the quantity does not exceed 5 pounds (2.3 kg) or 0.7 cu ft. (0.019822 m³)
2. In a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, dust production or use, including use-open and use-closed systems, where the quantity does not exceed 10 pounds (4.5 kg) or 1.4 cu ft. (0.039644 m³)
3. Storage and use of consumer materials in Group B or R occupancies.
4. Storage and use of commercially packaged materials in Group M occupancies.
5. Materials displayed in original packaging in Group M occupancies and intended as building materials or for personal or household use.
6. Storage of sealed containers of combustible dust at facilities not associated with an operation that uses, handles or generates combustible dust.
7. Materials stored or used in farm buildings or similar occupancies intended for on-premises agricultural purposes.

2201.2 Permits. Permits shall be required for combustible dust-producing operations as set forth in Section 105.6.

2202 DEFINITIONS

2202.1 Definitions. The following terms are defined in Chapter 2:

Dust Collection System

Combustible Dust

2203 DUST EXPLOSION PREVENTION

2203.1 Critical Depth Layer.

The maximum dust layer on all surfaces, including but not limited to walls, ceilings, beams, equipment, furniture, pipes and ducts, shall not exceed the Critical Depth Layer specified in Table 2203.1. The critical depth layer depth is permitted to be adjusted for explosion hazard further evaluated in accordance with one of the following:

1. Section 6.1.1.3 of NFPA 654.
2. Section 4.2.2 of NFPA 664 for wood flour.

Accumulated combustible dust shall be collected by one of the methods listed in 2203.5.

**Table 2203.1
Critical Depth Layer**

Type of Dust	Critical Depth Layer (Inches)
Wood Flour	1/8
All Other Dusts	1/32

For SI: 1 inch = 25.4 mm

2203.2 Dust Producing and Dust Handling Equipment. Dust producing equipment and dust handling equipment, including but not limited to vacuums, dust collection systems, dryers, mixers, blenders, separators, conveyors, storage containers, silos or other similar devices shall be listed and shall be maintained in accordance with the manufacturer's recommended standards.

2203.2.1 Signages and Markings. Signages and markings shall be provided in accordance with Section 2203.2.1.1 through 2203.2.1.3.

2203.2.1.1 Deflagration Vent Discharge Area Markings. Where dust collection systems and other equipment, systems, or systems components are provided with deflagration vents, the area within the deflagration vent's discharge area shall be marked in an approved manner.

2203.2.1.2 Caution Signs.

Signs shall be posted near the dust containing equipment with deflagration vents that reads as follows:

CAUTION: THIS EQUIPMENT CAN CONTAIN EXPLOSIVE DUST.

KEEP OUTSIDE THE MARKED AREA WHILE EQUIPMENT IS OPERATING.

2203.2.1.3 Warning Signs. Where dust collection systems and other equipment, systems, or systems components are provided with deflagration vents, vent closures shall be clearly marked as follows:

WARNING: EXPLOSION RELIEF DEVICE. STAY CLEAR.

2203.3 Dust Collection and Conveying Systems. Dust collection and conveying systems shall be in accordance with Sections 2203.3.1 through 2203.3.3.

2203.3.1 Dust Collection Systems. Dust collection systems shall be designed to collect dust emissions from dust producing equipment at the point of generation. Dust collection systems shall be in accordance with Section 511 of the International Mechanical Code.

Exception: Closed systems using listed equipment and designed in accordance with manufacturer's recommendations and specifications, where cleanouts are provided in accordance with Section 2203.3.3.

Heating, ventilation, and air conditioning (HVAC) systems shall not be used as the means to collect dusts from localized sources.

2203.3.1.1 Location. Dust collectors shall be located outside of buildings.

Exceptions:

1. Dust collectors inside of buildings complying with Section 511 of the International Mechanical Code.
2. Wet-type dust collectors when specifically listed for the type of dust conveyed shall be permitted inside of buildings where in accordance with the manufacturer's instructions and specifications.
3. Dust collectors designed to specific NFPA standards listed in Table 2204.1 for the specific type of dust conveyed.

2203.3.1.2 Minimum Conveying Velocities. The minimum velocities within ducts used as part of the dust collection system shall be in accordance with Table 2203.3.1.2.

**Table 2203.3.1.2
Minimum Conveying Velocities**

Type of Product	Feet Per Minute
Fine light dust, such as cotton, lint, and wood flour (100 mesh and under)	2000 (10 m/s)
Dry dust such as fine rubber molding powder	2500 (13 m/s)
Average dust such as sawdust, grinding dust, coal dust	3500 (18 m/s)
Heavy dust such as metal turnings, including aluminum and magnesium powder	4000 (20 m/s)

2203.3.2 Plastic Ducts and Conveying Systems. Plastic, fiberglass, other nonconductive ducts, duct liners or pipes shall not be used as part of ducts and conveying systems. Ductwork utilizing a combustible lining shall be permitted only in high impact areas and where approved. Flexible hose shall be permitted if designed and installed in accordance with the following requirements:

1. Manufactured of static dissipative construction.
2. Used only for connections and isolation purposes.
3. Limited to 18 inches (457 mm) in length.
4. Properly grounded.

2203.3.3 Cleanouts. Openings shall be provided in enclosed equipment and conveyors to allow access to all parts of the equipment and conveyors to permit inspection, cleaning, maintenance, and the effective use of portable extinguishers or hose streams. Cleanouts for ducts used as part of the dust collection system shall be in accordance with the International Mechanical Code.

2203.4 Sources of Ignition. Sources of Ignition shall be controlled in accordance with Sections 2203.4.1 through 2203.4.9.5.

2203.4.1 Classified Electrical. Classified electrical shall be in accordance with NFPA 70. Electrical motors and electrical components of the equipment shall not be installed in the dust laden air stream unless listed for Class II, Division 1 locations.

2203.4.2 Static Electricity. Bonding and grounding is required to minimize accumulation of static electric charge in the following locations:

1. Dust producing equipment
2. Dust collection system.
3. Pneumatic dust conveying systems conveying combustible dust from one location to another, combustible dust conveyors, piping and conductive components. Conveying systems include transport modes such as railcars, hopper cars, boxcars, tank cars and trucks into which or from which commodities or products are pneumatically conveyed.
4. Conveying systems using metallic piping.

2203.4.3 Hot Works. Hot work and similar spark producing operations shall not be conducted in or adjacent to combustible dust producing areas unless precautions have been taken to provide safety. Hot work shall be permitted only in safe, designated areas in accordance with Chapter 35. Hot work is prohibited on equipment that is operating.

2203.4.3.1 Signs. Conspicuous signs with the following warning shall be posted in the vicinity of combustible dust producing areas or in the vicinity of combustible dust use:
NO WELDING. THE USE OF WELDING OR CUTTING EQUIPMENT IN OR NEAR THIS AREA IS DANGEROUS BECAUSE OF FIRE AND EXPLOSION HAZARDS. WELDING AND CUTTING SHALL BE DONE ONLY UNDER THE SUPERVISION OF THE PERSON IN CHARGE.

2203.4.4 Hot Surfaces and Hot Equipment. In areas where a dust explosion hazard or dust flash fire hazard exists, the temperature of external surfaces, shall be maintained below 80 percent (in degrees Celsius) of the lower of the dust surface ignition temperature or the dust-cloud ignition temperature for worst-case dusts. External surfaces shall include

but not limited to:

1. Compressors.
2. Steam, water or process piping.
3. Ducts.
4. Conveyors.
5. Process equipment.

Where steam pipes or hot surfaces occur in dust producing or dust handling areas, accumulation of dust on the surfaces shall be minimized by an approved method.

Exception:Drying apparatus listed for the intended use and installed in accordance with the manufacturer's instructions.

2203.4.5 Powered Industrial Trucks. Powered industrial trucks used in electrically classified areas shall be listed for such use.

2203.4.6 Smoking Prohibited. Smoking shall be prohibited in or adjacent to dust producing or dust handling areas. "No Smoking" signs complying with Section 310 shall be conspicuously posted in such areas. Smoking shall be permitted only in designated areas.

2203.4.7 Spark Producing Devices. Spark-producing devices shall not be located within 20 feet (6096 mm) of areas requiring classified electrical unless separated by a permanent partition.

2203.4.8 Self-heating materials. Materials in silos and other large storage piles of particulates prone to self-heating shall be in accordance with Section 8.5.11 of NFPA 652.

2203.4.9 Open Flames and Fuel Fired Equipment. Open flames and fuel fired equipment shall be in accordance with Section 2203.4.9.1 through 2203.4.9.5.

2203.4.9.1 Release or Airborne Combustible Dust. Production, maintenance or repair activities that have the potential to release or force combustible dust to become airborne shall not be conducted within 35 feet (11 m) of an open flame or pilot flame.

2203.4.9.2 Space Heaters. Fuel-fired space heaters drawing local ambient air shall not be located within electrically classified areas. Space heating appliances in dust producing or dust handling areas shall be located where not subject to accumulation of deposits of combustible dust.

2203.4.9.3 Equipment Listing. Fuel-fired process equipment shall be listed for its intended use and shall be operated and maintained in accordance with the manufacturer's instructions.

2203.4.9.4 Inspection and Preventative Maintenance. Inspection and maintenance of fuel-fired process equipment shall include verification that significant combustible dust accumulations do not exist within or around the equipment.

2203.4.9.5 Sources of Combustion Air. In Class II electrically classified locations, heating units shall be provided with a source of combustion air ducted directly from the building exterior or from an unclassified location.

2203.5 Housekeeping. Accumulation of combustible dust on surfaces inside buildings shall be maintained below the critical depth layer in Section 2203.1. Pressurized air or similar methods shall not be used to remove dust from surfaces. Accumulated combustible dust shall be collected by one of the following methods:

1. Portable vacuum cleaners listed for use in Class II, Group G, Division 1 atmospheres as defined in NFPA 70.
2. Dust collection systems.
3. Other approved means that will not place combustible dust into suspension in air.

2203.6 Standard Operational Procedures. Dust producing equipment and all associated equipment including dust collection equipment shall be maintained in accordance with the manufacturer's instructions and specifications and applicable codes. The inspection, testing and maintenance program shall include the following, as applicable:

1. Fire and explosion protection and prevention equipment, as applicable, in accordance with the applicable NFPA standards.
2. Dust control equipment.
3. Control of potential ignition sources.
4. Electrical, process and mechanical equipment, including applicable process interlocks.
5. Lubrication of bearings for dust collection, dust handling and dust producing equipment.
6. Additional maintenance in accordance with the manufacturer's instructions and specifications for dust collection, dust handling and dust producing equipment.

1. Records shall be kept of maintenance and repairs performed. The standard operating procedures shall be submitted to the fire code official for review and approval. The written standard operating procedures shall be signed by the person responsible for facility operations.

2203.7 Emergency Response Plan. A written emergency response plan shall be developed for preventing, preparing for and responding to work-related emergencies including but not limited to fire and explosion. The following information shall be developed into the plan:

1. Identification of dust hazards.
2. Identification and location of all utilities to affected areas.
3. Site plans or floor plans locating utility shut-off controls including water, gas and power.
4. Identify the potential for explosion.
5. Identify the location of fire extinguishing equipment compatible with the hazards present.
6. Any additional information required by the fire code official.

2203.8 Training. The plans and procedures required in Sections 2203.5, 2203.6 and 2203.7 shall be approved by the fire code official. The plans and procedures shall be reviewed annually and updated as required by process changes. Initial and annual refresher training shall be provided to employees who are involved in operating, maintaining and supervising facilities that handle combustible dust. Initial and annual refresher training shall include:

1. Workplace hazards.
2. General orientation, plant diagrams and plant safety rules.
3. Process description or flowchart.
4. Equipment operation, safe startup and shutdown, and response to hazard conditions or an incident.
5. The location and use of all related fire and explosion protection and prevention systems.
6. Equipment maintenance requirements and practices, including visual inspections of conveyors and ducts.
7. Housekeeping requirements, including the maintenance of the critical depth layer in Section 2203.1.
8. Emergency response plans as required in Section 2203.7.

The employer shall maintain records of initial and annually training and review.

2204 DUST EXPLOSION SCREENING TESTS

2204.1 Combustibility and Explosivity Tests. Where combustibility or explosivity screening tests are required to analyze the combustible dust as part of compliance with Section 414.1.3 of the International Building Code and Section 104.7 of the this code, it shall be in accordance with Section 5.4 of NFPA 652.

2204.2 Samples. Representative samples for the screening test shall be obtained in accordance with Section 5.5 of NFPA 652.

2205 STANDARDS

2205.1 Specific Hazards Standards. The fire code official is authorized to enforce additional industry or material specific provisions of the codes and standards listed in Table 2205.1 as applicable to prevent and control dust explosions.

**Table 2205.1
Explosion Protection Standards**

<u>Standard</u>	<u>Subject</u>
<u>NFPA 61</u>	<u>Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities</u>
<u>NFPA 69</u>	<u>Standard on Explosion Prevention Systems</u>
<u>NFPA 70</u>	<u>National Electrical Code</u>
<u>NFPA 77</u>	<u>Recommended Practice on Static Electricity</u>
<u>NFPA 85</u>	<u>Boiler and Combustion System Hazards Code</u>
<u>NFPA 120</u>	<u>Standard for Fire Prevention and Control in Coal Mines</u>
<u>NFPA 484</u>	<u>Standard for Combustible Metals</u>
<u>NFPA 652</u>	<u>Standard on the Fundamentals of Combustible Dust</u>
<u>NFPA 654</u>	<u>Standard for Prevention of Fire and Dust Explosions from the Manufacturing, Processing and Handling of Combustible Particulate Solids</u>
<u>NFPA 655</u>	<u>Standard for the Prevention of Sulfur Fires and Explosions</u>
<u>NFPA 664</u>	<u>Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities</u>

2205.1.1 Dust Hazard Analysis. If a dust hazard analysis (DHA) is required by the fire code official to new or existing facilities and operations, it shall be in accordance with NFPA 652. The DHA for existing facilities shall be in accordance with Section 7.1.2 of NFPA 652.

DUST COLLECTION SYSTEM. A combination of equipment designed to contain, capture and collect airborne combustible dusts.

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

77-14:

Recommended Practice on Static Electricity

Reason: Combustible dust continues to be an issue of concern with AHJs. While references to NFPA for unique dust hazards can be useful, the entire protection cannot just evolve around ten different NFPA Standards. It is simply impractical to apply standards and only standards without any additional guidance for code users, especially fire inspectors in their daily work. One of the premises in the IFC development has been that the code should contain information for use in the field, while items for plan review can be referenced to other standards since plan review is normally conducted in the office where the information in the standards is accessible. In the field, the inspector needs information to apply to situation in front of him or her.

Similar concerns arise from application of Flammable Finishes that involve spraying and/or dipping operations using flammable liquids. Except for unique applications, it has not been necessary to analyze the size of the flammable liquids droplets/vapors, flammability of materials, etc. Providing appropriate hazard mitigations, including sources of ignition, exhaust, etc. Chapter 24 addresses concerns for a wide range of flammable liquids without the need for inspectors to delve into 10 different standards. This proposed new chapter 22 takes a similar approach. This code change does not deter from the current Chapter, in that those standards are still imbedded in this new proposed chapter, as appropriate. But the code change provides additional guidelines on how to mitigate dust accumulation and sources of ignition. It also provides guidelines on housekeeping, employee training, operational procedures.

If fire plan reviewer or inspector has additional concerns, it still leaves the door open to requiring additional NFPA Standards and Dust Hazard Analysis. That option is still available with this proposed revision under Section 2205.

Section 2201.1: Exception 1 allows 5 lbs. to address small laboratory type use. Additionally combustible dust has a fire hazard rating of 2 and in some rare cases 3. When comparing to MAQs of other materials with fire hazard rating of 2 typical basic MAQs for these materials are 25 lbs and other materials with fire hazard rating of 3 have typical basic MAQs of 10 lbs. Doubling for a sprinklered building, in Exception 2, also puts things in line with other hazardous materials allowances. The remaining exceptions are listed based on similar exceptions in standards due to lack of major incidences in commonly encountered storage and uses.

Section 2203.1: Collection of accumulated dust is the single most critical method of dust explosion prevention. It is one of the simpler methods of evaluating and addressing prevention. The critical depth layer in Table 2203.1 provides a very general approach for fire inspectors, while Section 2203.1 allows for more complicated analysis by adjusting the critical layer depth and/or determining explosion hazard found in NFPA 654 & 664.

Section 2203.2: It is difficult for an inspector to determine if the equipment is inherently safe and/or the associated electrical has been designed properly unless the equipment is listed. This section also requires maintenance in accordance with manufacturer's instructions. Subsections on markings and signs are provided to avoid injury to personnel if vent panels are dislodged or in the event of an incident.

Section 2203.3.1: Dust collection systems need to draw at the point of generation for maximum efficiency. The exception is included since closed system use of combustible dust where dust is not open to the environment of the room does not need a dust collector. References to mechanical code is provided for location of dust collection system.

Section 2203.3.1.1: The general requirement is to locate the dust collector outside of buildings. Exceptions are added to address 1) IMC allowances, 2) wet-type dust collectors which when designed and installed per manufacturer's cut sheets do not pose an explosion hazard since the dust is wetted and therefore is inherently safer inside the building, and 3) references to the different NFPA standards for specific dusts when the dust and the dust collection is detailed and specific to a particular NFPA standard for mitigation of dust explosion.

Section 2203.3.1.2: Source is from California Mechanical Code Table 505.2. These velocities have been used for decades and provide a minimum velocity to move the various particles. Particles of different types and weights require different velocities to properly move the particles.

Section 2203.3.2: Grounding and bonding is required for ducts and conveyors. Added precautions are used for types of ducts and piping that will be difficult to dissipate static electricity.

Section 2203.3.3: In addition to the cleanouts proposed for the dust collection in the International Mechanical Code, a method is needed to access all parts of a conveying system for cleaning and inspection. Lack of cleanouts was one of issues that resulted in the explosion in the Imperial Sugar Company, Port Wentworth GA.

Section 2203.4.1: Although these requirements already apply, sending the code user, who may otherwise be unfamiliar to the National Electric Code is appropriate.

Section 2203.4.2: To avoid sources of ignition from static discharge, grounding and bonding is required for equipment that come in contact with combustible dust.

Section 2203.4.3: Similar language is used in IFC Section 2403.2.7 for Flammable Finishes. Limiting hot works to designated area is critical to avoid additional sources of ignition within areas where combustible dust is used.

Section 2203.4.4: Avoiding heated surfaces in areas subject to explosion hazard is very important aspect of controlling sources of ignition. Some of the language is from IFC Section 2404.6.1.2 for Flammable Finishes and some is from other standards.

Section 2203.4.5: Similar language in IFC 2403.2.8 for Flammable Finishes.

Section 2203.4.6: Similar language in IFC Section 2403.2.6 for Flammable Finishes.

Section 2203.4.7: Similar language in IFC Section 2403.2.2 for Flammable Finishes.

Section 2203.4.8: This section is derived from and references NFPA 652. It addresses unique and very hazardous condition for self-heating materials.

Section 2203.4.9: Basic safety requirements need to be maintained in the event that open flame or fuel fired equipment is needed as part of the processes. These sections provide guidelines on how to safely use these equipment and reduce the probability of an incident.

Section 2203.5: Basic housekeeping is required to limit the accumulation of dust specified in Section 2203.1.

Section 2203.6: Standard Operational Procedures is the business owner's commitment to maintaining the operations safe and equipment in good working condition.

Section 2203.7: Emergency response plan is important for facilities where the a potential dust explosion exists.

Section 2203.8: Training is important for facilities with potential dust explosion hazards to encourage employees into maintaining safe conditions within the facility. Educating employees in understanding that maintenance and housekeeping are key life safety aspects in a facility is important.

Section 2204: Dust explosion screening tests may be necessary for specific types of dust. This section allows the AHJ to require and sends the user to the appropriate NFPA standard and section.

Section 2205: If unique hazards that are not covered by this chapter come up [e.g. design of large dryers in large agricultural and food processing facilities], this section allows fire code official to use these NFPA Standards for specific hazards. Similar language is existing in the current code.

Dust Collection System: New definition is provided in Chapter 2.

Bibliography: International Fire Code, ICC, Chapter 24.

Also the following referenced NFPA Standards:

NFPA 61: Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities

NFPA 69: Standard on Explosion Prevention Systems

NFPA 77: Recommended Practice on Static Electricity

NFPA 85: Boiler and Combustion System Hazards Code

NFPA 120: Standard for Fire Prevention and Control in Coal Mines

NFPA 484: Standard for Combustible Metals

NFPA 652: Standard on the Fundamentals of Combustible Dust

NFPA 654: Standard for Prevention of Fire and Dust Explosions from the Manufacturing, Processing and Handling of Combustible Particulate Solids

NFPA 655: Standard for the Prevention of Sulfur Fires and Explosions

NFPA 664: Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Please note that the proposal may increase or decrease the cost impact to construction. It highly depends on the type and scale of combustible dust use. In most cases, we believe not applying NFPA 652 for all cases will reduce the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NFPA 77-14 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

F212-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 2201.1 Scope. The equipment, processes and operations involving dust explosion hazards and use or handling of combustible dust shall comply with the provisions of this chapter

Exceptions:

~~1. In an unsprinklered building, dust production or use, including use-open and use-closed systems, where the quantity does not exceed 5 pounds (2.3 kg) or 0.7 cu ft. (0.019822 m³)~~

~~2. In a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, dust production or use, including use-open and use-closed systems, where the quantity does not exceed 10 pounds (4.5 kg) or 1.4 cu ft. (0.039644 m³)~~

3. Storage and use of consumer materials in Group B or R occupancies.

4. Storage and use of commercially packaged materials in Group M occupancies.

5. Materials displayed in original packaging in Group M occupancies and intended as building materials or for personal or household use.

6. Storage of sealed containers of combustible dust at facilities not associated with an operation that uses, handles or generates combustible dust.

7. Materials stored or used in farm buildings or similar occupancies intended for on-premises agricultural purposes.

Committee Reason: This proposal was approved as it provides more flexibility as the provisions provide practical tools to assess dust hazards along with exceptions that provide quick guidance on applicability. The modification removes the first two footnotes from proposed section 2201.1 which sets the scope for the chapter. These two footnotes are removed as they do not have a scientific basis to address based simply on weight and whether or not sprinklers are provided. (Vote: 10-3)

Assembly Action:

None

F212-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org); Kevin Scott, representing FCAC (khscottassoc@gmail.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

2203.1 Critical Depth Layer. _

The maximum dust layer on all surfaces, including but not limited to walls, ceilings, beams, equipment, furniture, pipes and ducts, shall not exceed the Critical Depth Layer specified in Table 2203.1. The critical depth layer ~~depth~~ is permitted to be adjusted for explosion hazard further evaluated in accordance with one of the following:

1. Section 6.1.1.3 of NFPA 654.
2. Section 4.2.2 of NFPA 664 for wood flour.

Accumulated combustible dust shall be collected by one of the methods listed in Section 2203.5.

2203.2 Dust Producing and Dust Handling Equipment. Dust producing equipment and dust handling equipment, including but not limited to vacuums, dust collection systems, dryers, mixers, blenders, separators, conveyors, ~~storage~~

~~containers, silos or other similar devices~~ equipment shall be listed and shall be maintained in accordance with the manufacturer's ~~recommended standards~~ instructions.

2203.2.1 Signages—Signs and Markings. ~~Signages—Signs~~ and markings shall be provided in accordance with Section 2203.2.1.1 through 2203.2.1.3.

2203.2.1.1 Deflagration Vent Discharge Area Markings. Where dust collection systems and other equipment, systems ~~, or systems~~ system components are provided with deflagration vents, the area within the deflagration vent's discharge area shall be marked in an approved manner.

2203.2.1.2 Caution Signs. Signs shall be posted near the dust containing equipment with deflagration vents that reads as follows:
CAUTION—THIS EQUIPMENT CAN CONTAIN EXPLOSIVE DUST.

KEEP OUTSIDE THE MARKED ~~AREA~~ AREAS WHILE EQUIPMENT IS OPERATING.

2203.2.1.3 Warning Signs. Where dust collection systems and other equipment, systems ~~, or systems~~ system components are provided with deflagration vents, vent closures shall be clearly marked as follows:
WARNING

—EXPLOSION RELIEF DEVICE. STAY CLEAR.

2203.3.1 Dust Collection Systems. Dust collection systems shall be designed to collect dust emissions from dust producing equipment at the point of generation. Dust collection systems shall be in accordance with Section 511 of the International Mechanical Code.

Exception:

Closed systems using listed equipment and designed in accordance with manufacturers recommendations and specifications, where cleanouts are provided in accordance with Section 2203.3.3.

Heating, ventilation, and air conditioning (~~HVAC~~) systems shall not be ~~used as the means to collect dusts from localized sources~~ combined or interconnected with dust collection systems.

2203.3.1.1 Location. Dust collectors shall be located outside of buildings.

Exceptions:

1. Dust collectors inside of buildings complying with Section 511 of the International Mechanical Code.
2. Wet-type dust collectors when specifically listed for the type of dust conveyed shall be permitted inside of buildings where in accordance with the manufacturers instructions and specifications.
3. Dust collectors designed to specific NFPA standards listed in Table ~~2204.1~~ 2205.1 for the specific type of dust conveyed.

**Table 2203.3.1.2
Minimum Conveying Velocities**

Type of Product	Feet Per Minute
Fine light dust; such as cotton, lint, and wood flour (100 mesh and under)	2000 (10 m/s)
Dry dust such as fine rubber molding powder	2500 (13 m/s)
Average dust such as sawdust, grinding dust, coal dust	3500 (18 m/s)
Heavy dust such as metal turnings, including aluminum and magnesium powder	4000 (20 m/s)

2203.3.2 Plastic Ducts and Conveying Systems. Plastic, fiberglass, other nonconductive ducts, duct liners or pipes shall not be used as part of ducts and conveying systems. Ductwork utilizing a combustible lining shall be permitted only in high impact areas and where approved. Flexible hose shall be permitted if designed and installed in accordance with the following requirements:

1. Manufactured of static dissipative construction.
2. Used only for ~~connections~~ connection and isolation purposes.

3. Limited to 18 inches (457 mm) in length.
4. Properly grounded.

2203.4.3 Hot Works/Work. Hot work and similar spark producing operations shall not be conducted in or adjacent to combustible dust producing areas unless precautions have been taken to provide safety. Hot work shall be permitted only in safe, designated areas in accordance with Chapter 35. Hot work is prohibited on equipment that is operating.

2203.4.3.1 Signs. Conspicuous signs with the following warning shall be posted in the vicinity of combustible dust producing areas or in the vicinity of combustible dust use:

NO WELDING

~~THE USE OF WELDING OR CUTTING EQUIPMENT IN OR NEAR THIS AREA IS DANGEROUS BECAUSE OF FIRE AND EXPLOSION HAZARDS. WELDING AND CUTTING SHALL BE DONE ONLY UNDER THE SUPERVISION OF THE PERSON IN CHARGE.~~

2203.4.9.1 Release or Airborne Combustible Dust. ~~Production~~ Open flames or pilot flames shall be separated by a minimum of 35 ft (11 m) from production, maintenance or repair activities that ~~have the potential to can~~ release or force cause combustible dust to become airborne ~~shall not be conducted within 35 feet (11 m) of an open flame or pilot flame.~~

2203.4.9.5 Sources of Combustion Air. In Class II electrically classified locations, ~~heating units fuel-fired appliances~~ shall be provided with a source of combustion air ducted directly from the building exterior or from an unclassified location.

2203.6 Standard Operational Procedures. Dust producing equipment and all associated equipment including dust collection equipment shall be maintained in accordance with the manufacturer's instructions and specifications and applicable codes. The inspection, testing and maintenance program shall include the following, as applicable:

1. Fire and explosion protection and prevention equipment, as applicable, in accordance with the applicable NFPA standards.
2. Dust collection and control equipment.
3. Control of potential ignition sources.
4. Electrical, process and mechanical equipment, including applicable process interlocks.
5. Lubrication of bearings for dust collection, dust handling and dust producing equipment.
6. Additional maintenance in accordance with the manufacturers instructions and specifications for dust collection, dust handling and dust producing equipment.

~~Records shall be kept~~ of maintenance and repairs ~~performed~~ shall be maintained. The standard operating procedures shall be submitted to the fire code official for review and approval. The written standard operating procedures shall be signed by the person responsible for facility operations.

2203.7 Safety and Emergency Response Plan. A written safety and emergency response plan shall be developed for preventing, preparing for and responding to work-related emergencies including but not limited to fire and explosion. The following information shall be developed into the plan:

1. Identification of dust hazards.
2. Identification and location of all utilities to affected areas.
3. Site plans or floor plans locating utility shut-off controls including water, gas and power.
4. Identify the potential for explosion.
5. Identify the location of fire extinguishing equipment compatible with the hazards present.
6. Any additional information required by the fire code official.

2203.8 Training. The plans and procedures required in Sections 2203.5, 2203.6 and 2203.7 shall be approved by the fire code official. ~~The plans and procedures shall be reviewed annually and updated as required by process changes.~~ Initial and annual refresher training shall be provided to employees who are involved in operating, maintaining and supervising facilities that handle combustible dust. Initial and annual refresher training shall include:

1. Workplace hazards.
2. General orientation, plant diagrams and plant safety rules.
3. Process description or flowchart.
4. Equipment operation, safe startup and shutdown, and response to hazard conditions or an incident.
5. The location and use of all related fire and explosion protection and prevention systems.
6. Equipment maintenance requirements and practices, including visual inspections of conveyors and ducts.
7. Housekeeping requirements, including the maintenance of the critical depth layer in Section 2203.1.
8. Emergency response plans as required in Section 2203.7.

The employer shall maintain records of initial and annually training and review.

2205.1.1 Dust Hazard Analysis. If a dust hazard analysis (DHA) is required by the fire code official to new or existing facilities and operations, it shall be in accordance with NFPA 652. The ~~DHA for existing dust hazard analysis for existing~~ facilities shall be in accordance with Section 7.1.2 of NFPA 652.

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to firesafety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>
This proposal was Approved as Modified by the committee. This Public Comment merely provides some editorial revisions and clarifications to the Chapter. The revised sections are listed below:

Section 2202.1: editorial

Section 2203.1: editorial

Section 2203.2: two revisions occur to this section. First, containers and silos are removed because storage containers and vessels are not typically listed. Secondly, the section will refer to the manufacturer's instructions. The instructions need to be followed. If they happen refer to a standard, then that standard is followed. However, if they don't reference a standard, the instructions still need to be followed.

Section 2203.2.1: this term is changed to "signs" to be consistent with Section 2203.4.3.1.

Section 2203.2.1.1: editorial

Section 2203.2.1.2: the language on the sign is editorially revised and formatted to match other sections in the code.

Section 2203.2.1.3: editorial and formatting revisions.

Section 2203.3.1: HVAC is deleted. It is not needed, and this is not typical throughout code. Also, it is revised to clarify that the ventilation system and dust collection system are not to be interconnected.

Section 2203.3.1.1: corrected so it references the appropriate table

Table 2203.3.1.2: editorial to be consistent will other items in the table.

Section 2203.3.2: editorial. Section 2203.4: editorial.

Section 2203.4.3: editorial, correct term is hot work.

Section 2203.4.3.1: editorial and formatting.

Section 2203.4.4: editorial.

Section 2203.4.9.1: Section 2203.4 and its subsections regulate "ignition sources", therefore, this section is rewritten to require that the ignition sources are controlled when within 35 ft of potentially hazardous activities. There is no change in intent or application.

Section 2203.4.9.5: This section is revised to state "fuel-fired appliances" rather than heating units. The change to fuel-fired appliances allows it to apply to all appliances, not just heaters.

Section 2203.6: editorial.

Section 2203.7: This section is revised to change the title of the plan to the "Safety and Emergency Response Plan". When the title is simply "emergency response plan", it can be interpreted as FD response. That is not the intended application. Therefore, the title is revised and consistent with the title of Safety and Emergency Response Plan used in Section 5707.3.

Section 2203.8: editorial.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

These revisions are editorial and for clarification.

Public Comment 2:

Proponent: Kevin Scott, representing KH Scott & Associates LLC (khscoassoc@gmail.com) ; Ellie Klausbruckner representing Klausbruckner and Associates (ek@klausbruckner.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

2203.3.2 Plastic Ducts and Conveying Systems. Plastic, fiberglass, other nonconductive ducts, duct liners or pipes shall not be used as part of ducts and conveying systems. Ductwork utilizing a combustible lining shall be permitted only in high impact areas and where approved. Flexible hose shall be permitted if designed and installed in accordance with the following requirements:

1. Manufactured of static dissipative construction.
2. Used only for connections to equipment and isolation purposes.
3. ~~Limited to 18 inches (457 mm) in length.~~
4. Properly grounded.

Commenter's Reason: This proposal was Approved as Modified by the committee. This Public Comment removes the limitation of 18" for flexible hoses.

The limitation on length is dependent on the type of equipment and machinery that is used. Flexible connections are necessary for vibration isolation, such as the connection from the ductwork to the machinery, and operation of moving components on equipment, such as overhead saws, routers and flying saws.

Item 2 is revised to state that flexible hoses can be used for connections to equipment. This clarifies this statement and eliminates the use of flexible hoses to simply make connections between two ends of metallic duct.

Item 3 is deleted removing the length limitation of 18 inches.

The proposed modification allows the use of flexible hoses for making connections to equipment, but they must be properly constructed and grounded.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This revision does not mandate a change. It allows the use of flexible connections for ductwork.

Public Comment 3:

Proponent: Kevin Scott, representing KH Scott & Associates LLC, Inc. (khscoassoc@gmail.com) ; Ellie Klausbruckner representing Klausbruckner and Associates (ek@klausbruckner.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

2203.5 Housekeeping. Accumulation of combustible dust on surfaces inside buildings shall be maintained below the critical depth layer in Section 2203.1. ~~Pressurized air or similar methods shall not be used to remove dust from surfaces.~~ Accumulated combustible dust shall be collected by one of the following methods:

1. Portable vacuum cleaners listed for use in Class II, Group G, Division 1 atmospheres as defined in NFPA 70.
2. ~~Dust collection systems~~ Scoops, brooms, brushes and shovels.
3. Water washdown.
- ~~34.~~ Other approved means that will not place combustible dust into suspension in air.

Use of compressed or pressurized air shall only be permitted where other methods of cleaning have been used and additional cleaning is necessary, or areas to be cleaned cannot be accessed safely. Cleaning with pressurized air must be performed in accordance with NFPA 652, 654 or 664.

Commenter's Reason: This proposal was Approved as Modified by the committee. This Public Comment revises the allowed methods of cleaning dust.

The first modification revises the strict prohibition of compressed air. The sentence prohibiting the use of compressed air is deleted, and the final paragraph is added which provides specific criteria. The NFPA standards allow the use of compressed air, but only after other methods have been used to collect as much dust as possible and failed, or in areas which cannot be safely accessed. Then, air is allowed provided that the dust producing equipment is not operating and ignition sources are controlled or eliminated.

- NFPA 652 Section 8.4.2.6.2 provides specific requirements on the use of compressed air for cleaning.
- NFPA 654 Section 8.2.2.4 provides specific requirements on the use of compressed air for cleaning.
- NFPA 664 Section 11.2.1.1 provides specific requirements on the use of compressed air for cleaning.

This modification will provide consistency with the referenced standards and allows the use of compressed air in a controlled environment. Compressed air will not be the first choice for cleaning, but it can be used as a last resort when it becomes the best choice to clean up the hazard.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

This public comment will not affect construction, this is a maintenance issue. This proposal allows the use of compressed air under specific restrictions.

Staff Analysis: Please note that F213-18 was Approved as Submitted and blended with the AM version of F212-18 would appear as shown below. F213-18 does not have any public comments. This particular PC appears to take a different approach but similar in intent.

2203.5 Housekeeping. Accumulation of combustible dust on surfaces inside buildings shall be maintained below the critical depth layer in Section 2203.1. Pressurized air or similar methods shall not be used to remove dust from surfaces. Accumulated combustible dust shall be collected by one of the following methods:

1. Portable vacuum cleaners listed for use in Class II, Group G, Division 1 atmospheres as defined in NFPA 70.
2. Dust collection systems.
3. Other approved means that will not place combustible dust into suspension in air.

Exception: Forced air or similar methods shall be permitted to remove dust in accordance with NFPA 652, NFPA 654, or NFPA 664

Public Comment 4:

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing American Forest & Paper Association (rjd@davidsoncodeconcepts.com) requests Disapprove.

Commenter's Reason: The American Forest Paper Association (AF PA) has long been involved in the development and implementation of combustible dust standards promulgated by the National Fire Protection Association (NFPA), among other organizations. Relevant NFPA standards have been in existence for years and contain specific, detailed recommendations that are the product of lengthy deliberations by subject matter experts.

The International Fire Code (IFC), in Section 2204, has long recognized the validity of NFPA standards through incorporation by reference. Considering the history of work in this area by NFPA, we are concerned that F212-18 unnecessarily introduces a new set of recommendations into a space that has been fully (and competently) occupied by NFPA for decades and referenced by the IFC.

This creates the risk of inconsistencies between the various standards, leaving fire code officials and affected facilities with less, and not more, clarity regarding the appropriate standard of care that should be exercised when addressing combustible dust hazards. Each NFPA dust related standard has requirements tailored to that industry which on its face precludes a set of generic requirements applicable to all as has been included in F212-18.

In 2018 edition of the IFC, Chapter 22 was updated to bring in the new NFPA 652 standard and correlated the application of NFPA 652 and the various NFPA standards that provide requirements for specific dust producing industries. This work was done in collaboration with the Chemical Safety Board (CSB) which had reached out to the International Code Council to incorporate the new standard and improve the application of the dust hazard requirements.

Based on our review of the proposal, there are numerous instances in which the drafters fail to appreciate and account for pre-existing NFPA requirements as well as the practical implementation of combustible dust controls by fire code officials. For these reasons, we have significant concerns with any proposal to greatly expand the language of IFC Chapter 22 in a manner that does not carefully track NFPA standards and, therefore, urge that F212-18 be disapproved.

Technical issues:

Section 2201.1. Exception

The authors have attempted to carve out exceptions for application of all the chapter s requirements that do not sync with the scoping of the NFPA standards referenced and as written could allow unregulated combustible dust hazards. The relevant NFPA standards have differing scoping requirements and the proposed exemptions were extracted from two of those standards. As written and accepted by the committee the exceptions would have broader application than apparent. Scoping must be all inclusive with each situation analyzed against both NFPA 652 and the relevant material specific standard.

2203 Critical Depth Layer

The language in this section gives the appearance that there are two simple depth layer depths to apply. That would be incorrect, a review of the relevant NFPA standards provide much more information on application and modification of the application of those depths. There are also multiple methods for determining if a hazard exists and there are also criteria that specifically declare a hazard if certain conditions exist. A simple review of NFPA 654 Section 6.1.1.3 along with Section 6.1.3 documents same. The proposal has a reference error for NFPA 664, the reference should be 4.4.2, however the review path starts out at Section 4.4.1 on thru 4.4.2 which will confirm that multiple methods and additional guidance exists for that standard as well. Additionally, the correct term is wood dust, not wood flour. The language states that the sections in NFPA 654 and NFPA 664 "are permitted" to be applied. If the code official decides they are not permitting same, a multitude of options for determining the existence of a dust hazard cannot be applied by the regulated industry. In addition, NFPA 654 and NFPA 664 are not the only dust hazard standards with criteria regarding the critical depth layer. As written, other appropriate standards cannot be applied.

Section 2203.2 Dust Producing and Handling Equipment.

This section states that all listed equipment and similar equipment shall be listed . The term listing in standards and codes parlance implies a 3rd party approval for the specified function. FM or UL does not list approve the majority of the noted equipment and as a result this is a requirement that cannot be complied with, nor is there a need for such listing.

Section 2203.2.1.1 Deflagration Vent Discharge Area Markings.

This section requires that deflagration vent discharge areas be marked approved manner which is not defined nor explained as to what would comply making the requirement subjective. It also misleads the code official into believing that this requirement is all that is necessary when there are detailed provisions contained within dust hazard standards and NFPA 68 requiring analysis of the vent discharge hazards to eliminate hazards to people and/or building exposures.

Section 2303.2.1.2 Caution Signs.

This is an unnecessary and onerous requirement. In Pulp and Paper and Wood Processing facilities and chemical facilities this will require dozens of signs if not up to a hundred signs at some facilities. It is more practical to label each building or enclosure entrance (e.g. wood conveyor tunnel) where combustible dust handling or generating equipment is present with a sign stating for example: Warning: Combustible Dust Hazard Area. Avoid Dispersion of Dust . OR , Warning: Combustible Dust Hazard Area: Follow Safe Work Practices. What defines the marked areas . Is this a hazard zone? There is no defined basis for the delineation of the marked area . NFPA 68 has requirements for establishing a hazard or exclusion zone around vented dust collectors based on the dust Kst and volume of the collector but no other requirements for a marked area exists in NFPA combustible dust documents. Similar to Section 2203.2.1.1 it misleads the code official into believing that this requirement addresses the topic when there is much more detail in the referenced standards.

Section 2203.1.3 Warning Signs.

NFPA 68 Standard on Explosion Protection by Deflagration Venting (2018 Edition) requires a warning sign near vents in paragraph 11.3.4* Vent closures shall be clearly marked as follows: WARNING: Explosion relief device . Stay clear is not a requirement. This is another example of a discrepancy this proposal has with relevant NFPA standards currently

referenced by the IFC and applied against facilities. If a facility currently meets the NFPA 68 warning sign requirement it will be in violation of this proposed language causing unnecessary costs to replace all existing signs.

Section 2201.3.1 Dust Collection Systems.

This section is confusing in that exhaust systems are separate and distinct from heating, ventilation and air conditioning systems. It appears the authors are attempting to draw in a Mechanical Code requirement that is best left to that code since compliance with the IMC is a basic requirement for hazardous exhaust systems. Specifically, both Sections 501.2 and 510.4 of the IMC address the need for an independent exhaust system. This is in Chapter 5 for Exhaust Systems , not Chapter 4 Ventilation systems. This causes unnecessary confusion and again incorporates a topic that is covered in more detail in a related document.

Section 2204.3.1.1 Location.

This section neglects to include any mention of enclosureless dust collectors (EDC). EDC s are allowed per NFPA 654 and 664 if all requirements are met for the installation and should be included in the listing. The pointer to go check the referenced standards for additional permitted systems corroborates the position that the proposed changes to the IFC are inappropriate because the user still must go to the referenced standards to find ALL of the relevant requirements. There are no short cuts to the process and the proposed language is misleading in that manner.

Section 2203.3.1.2 Minimum Conveying Velocities.

The authors state that the velocities utilized come from California s Mechanical Code. That code is based upon the IAPMO Mechanical Code, not the ICC International Mechanical Code. More importantly, the referenced NFPA standards rely upon the American Conference of Governmental Industrial Hygienists Industrial Ventilation Manual for the causing a conflict. For fine Light Dust ACGIH recommends a minimum of 2,500-3,000 fpm, not reduced 2,000 fpm the authors suggest. For Dry Dust, such as fine rubber molding powder ACGIH recommends a minimum of 3,000 fpm, not the reduced number of 2,500 fpm the authors included. So not only does the proposal create conflicts with the referenced NFPA standards on dust hazards, it suggests velocities that are insufficient based upon the ACGIH Industrial Ventilation Manual.

Range of Minimum Duct Design Velocities

Nature of Contaminant	Examples	Design Velocity
Vapors, gases, smoke		Any desired velocity (economic optimum velocity usually 1000–2000 fpm) [5.08–10.16 m/s]
Fumes, metal smokes	Welding	2000–2500 fpm [10.16–12.70 m/s]
Very fine light dust	Cotton lint, wood flour, litho powder	2500–3000 fpm [12.7–15.24 m/s]
Dry dusts and powders	Fine rubber dust, Bakelite molding powder dust, jute lint, cotton dust, shavings (light), soap dust, leather shavings	3000–3500 fpm [15.24–17.78 m/s]
Average industrial dust	Grinding dust, buffing lint (dry), wool jute dust (shaker waste), coffee beans, shoe dust, granite dust, silica flour, general material handling, brick cutting, clay dust, foundry (general), limestone dust, packaging and weighing asbestos dust in textile industries	3500–4000 fpm [17.78–20.32 m/s]
Heavy dusts	Sawdust (heavy and wet), metal turnings, foundry tumbling barrels and shake-out, sand blast dust, wood blocks, hog waste, brass turnings, cast iron boring dust, lead dust	4000–4500 fpm [20.32–22.86 m/s]
Heavy or moist dusts	Lead dusts with small chips, moist cement dust, buffing lint (sticky), quick-lime dust	4500 fpm [22.86 m/s] and up

Table 5-1: From American Conference of Governmental Industrial Hygienists (ACGIH®), Industrial Ventilation: A Manual of Recommended Practice, 29th Edition. Copyright 2016. Reprinted with permission.

Duct Networks 5

Section 2203.3.2 Plastic Ducts and Conveying Systems. Item 1. Manufactured of static dissipative construction.

Static dissipative hoses are required for c dusts with a Minimum Ignition Energy up to 2000 mJ due to the risk of propagating brush discharges. If the c dust MIE is for example 2000 mJ then static dissipative or conductive hose is not required or needed as there is no risk of static ignition. See Britton, Avoiding Static Ignition Hazards in Chemical Operations for additional information. This requirement is overly restrictive as a result.

Section 2303.3.2 Item 3. Limited to 18 inches (457 mm) in length.

There is no requirement in NFPA 77, NFPA 499, NFPA 652, NFPA 654, NFPA 664 that limits the length of flexible conductive hose to 18 inches. It is limited to NFPA 61 for Agricultural and Food Processing Facilities for duct systems. NFPA 61 points to NFPA 654 for pneumatic conveying systems. The authors have combined two distinct systems into one set of requirements inappropriately and in doing so created another conflict in the application of the referenced standards. This is an onerous restriction without a technical basis. The wood products industry use several pieces of equipment that require the use of longer flexible hoses 8-10 feet in length in some cases for flying saws. There is no basis for limiting length if the hose material is conductive with flexible wire inside hose attached to metal on end(s) for bonding and grounding with a resistance of less than 1 million ohms.

Section 2203.3.3 Cleanouts.

This section requires openings in **enclosed equipment and conveyors to allow access to all parts of the equipment and conveyors to permit inspection, cleaning, maintenance, and the effective use of portable extinguishers or hose streams**. Providing access to all enclosed parts of equipment and conveyors is neither practical nor useful. Further, though the authors point to the IMC in the second sentence, they ignore the fact that fire protection for hazardous exhaust systems is covered by the Section 510.8 of the IMC and Duct Cleanouts are covered by Section 510.8.1 of the IMC. Since the proposed language does not match the existing IMC sections, the proposal causes a conflict with the requirements of the IMC.

Section 2203.4.1 Hazardous Area Classification.

This section refers to Classified area classification, the correct terminology from the NEC (NFPA 70) is Hazardous (Classified) Areas. As written the proposed language has a disconnect with the terms of the NEC. The section then goes on to require compliance with Sections 500-506 of NFPA 70. Since this language would apply to combustible dusts, in Chapter 5 of the NEC a combustible dust electrical hazard would be a Class II Location covered by Article 502, Article 504, and Article 506, and Article 506 Zone 20, 21 and 22 Locations for Combustible Dusts or Ignitable Fibers/Flyings. Articles 501, 503 and 506 Zone 0, 1 and 2 Locations would not apply. The NEC reference in the proposed language is incorrect and partially unenforceable. Further, in identifying electrical equipment to listed the language refers to the dust laden air stream. Air stream is not defined, more importantly, that phrase has no relation to the conditions identified in NFPA 70, Article 500, Section (C) Class II Locations, including Subsection (1) Class II, Division 1 and Subsection (2) Class II, Division 2. There is a complete disconnect with the applicable language in the NEC and as written would likely not provide for the appropriate level of protection. This will be misleading to code officials and the regulated facilities.

Section 2203.4.3.1 Signs.

In Pulp and Paper and Wood Processing facilities and chemical facilities this will require dozens of signs, if a hundred or more signs at some facilities. Welding may be needed for repairs anytime where dust handling, generation or storage equipment is present. Safe Work and Hot Work Permits in accordance with Chapter 35 of the IFC addresses the hazards and risks of welding in combustible dust areas. This onerous and costly requirement is not necessary.

Section 2203.4.4 Hot Surfaces and Hot Equipment.

This section has requirements for worst-case dusts. There is no definition of this phrase. As such there is no way for the code official to understand how to apply the phrase and connected requirements and no way for a regulated facility to know what is required for compliance, leaving the language as unenforceable.

Section 2203.4.6 Smoking Prohibited.

Prescribing No Smoking signs in all industrial facilities in or adjacent to dust producing or dust handling areas is overly prescriptive and costly, since many facilities ban smoking completely throughout the facility. This is an onerous requirement. Section 310 would not require all these locations to be posted if the building was posted as No Smoking.

Section 2204.1 Combustibility and Explosivity Tests.

This section refers to when such tests are required by Section 414.1.3 of the IBC and Section 104.7 of the IFC. Neither of those sections requires such tests or provide any guidance on when they should be conducted. Further, Section 414.1.3 of the IBC only applies when a new occupancy is proposed and only to hazardous materials. Combustible dust is not a hazardous material by definition. The language then points directly to Section 5.4 of NFPA 52 which then instructs that the

tests be conducted in accordance with Section 5.5 of that chapter which addresses a sampling plan. (Which means Section 2204.2 simply repeats what Section 5.4 of NFPA 652 tells you to do already.) There is no guidance on when or where such actions are to be taken because the authors have by-passed correct application of NFPA 652. Chapter 5 of NFPA 652 applies Hazard Identification for characterizing properties of combustible dusts as required to support a Dust Hazard Analysis (DHA). Chapter 7 of NFPA 652 addresses Dust Hazard Analysis, but the language does not point the code user to that fact. Based upon Chapter 4 and Chapter 7 of NFPA 652, all new and existing facilities with a potential combustible dust hazard must perform a DHA. The current IFC language provides clear guidance on that topic, this new language does not. As proposed there is no trigger for the information to be submitted in this proposed language.

Section 2205.1 Specific Hazard Standards.

The language in the current code makes it clear that the appropriate referenced standards must be complied with which is the responsibility of the owner or operator. The proposed new language changes that mandate of compliance to The fire code official is authorized. The fire code official is always authorized to apply any part of the fire code, that is covered by Chapter 1. This is a significant change in that now the needed standards will only apply if the fire code official determines they are necessary as compared to the current language that mandates compliance by the facility regardless of action taken by the fire code official. The new language of this entire proposal does not provide enough requirements for a safe facility, the referenced standards must be applied and the language needs to reflect that. This section and Section 2204.1 are fatal flaws for the proposal because they take away the certainty of applying NFPA 652 and the other referenced standards necessary for safe facilities. The Chemical Safety Board expects NFPA 652 and any appropriate standard to be applied in total, as does OSHA and the NFPA 1 Fire Code. The current 2018 edition of the IFC meets those expectations because they are necessary. This proposal returns the IFC to earlier years when thorough compliance was not clearly required.

The relevant NFPA standards properly cover the combustible dust hazard through requirements developed by a broad range of interested parties including enforcers and the regulated industry. The current IFC language correctly ties the fire code to those standards including when and how to apply them. Because of this and the technical problems noted above, the F212-18 proposal should be disapproved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

As written, the proposal can increase the cost of compliance because of the conflicts with the currently referenced standards and with the International Mechanical Code. Ambiguity with the application of the referenced standards can also cause an increase in compliance. By disapproving the proposal the conflicts and ambiguity will be eliminated.

Public Comment 5:

Proponent: David Tyree, American Wood Council, representing American Wood Council (dtyree@awc.org) requests Disapprove.

Commenter's Reason: The International Fire Code (IFC), in Section 2204, has long recognized the validity of NFPA standards through incorporation by reference. In light of the history of work in this area by NFPA, we are concerned that F212-18 would unnecessarily introduce a new set of recommendations into a space that has been fully occupied by NFPA for decades. This creates the risk of inconsistencies between the various standards, leaving fire code officials and affected facilities with less clarity regarding the appropriate standard of care that should be exercised when addressing combustible dust hazards.

Based on our review of the proposal, there are numerous instances in which the proposal fails to appreciate and account for pre-existing NFPA recommendations as well as the practical implementation of combustible dust controls by fire code officials. For these reasons, we have significant concerns with any proposal to greatly expand the scope of IFC Chapter 22 in a manner that does not carefully track NFPA standards and, therefore, urge that F212-18 be disapproved. The International Fire Code (IFC), in Section 2204, has long recognized the validity of NFPA standards through incorporation by reference. In light of the history of work in this area by NFPA, we are concerned that F212-18 would unnecessarily introduce a new set of recommendations into a space that has been fully (and competently) occupied by NFPA for decades. This creates the risk of inconsistencies between the various standards, leaving fire code officials and affected facilities with less clarity regarding the appropriate standard of care that should be exercised when addressing combustible dust hazards.

Our reasons for disapproval by section are as follows:

Section 2203.1 - *The current edition has not been listed, subsequent NFPA 654 and 664 editions will likely have different paragraph numbers than the current edition due to revisions to the edition.*

Section 2203.2 - *FM or UL does not approve the above-noted equipment. There is no listing agency that approves the equipment. This requirement would therefore not be valid and should be removed from the Section.*

Section 2203.2.1.2 - *This is an onerous requirement. In Pulp and Paper and Wood Processing facilities and chemical*

facilities this will require tens if of signs if not up to a hundred signs at some facilities. It is more practical to label each building or enclosure entrance (e.g. wood conveyor tunnel) where combustible dust handling or generating equipment is present with a sign stating for example: Warning: Combustible Dust Hazard Area. Avoid Dispersion of Dust . OR , Warning: Combustible Dust Hazard Area: Follow Safe Work Practices.

The existing text brings up the question of defines marked areas. Is this a hazard zone? There is no defined basis for the delineation of the marked area . NFPA 68 has requirements for establishing a hazard or exclusion zone around vented dust collectors based on the dust Kst and volume of the collector but no other requirements for a marked area exists in NFPA combustible dust documents.

Section 2203.2.1.3 - NFPA 68 Standard on Explosion Protection by Deflagration Venting (2018 Edition) requires a warning sign near vents in paragraph 11.3.4* Vent closures shall be clearly marked as follows:

WARNING: Explosion relief device

Stay clear is not a requirement. This is another example of a discrepancy in the NFPA and the IFCC recommended requirement. If a facility meets the NFPA 68 warning sign requirement it will not meet the specific IFCC venting signage requirement.

Section 2203.3.1.2 - What is the reference for these conveying velocities. The American Conference of Governmental Hygienists Industrial Ventilation Manual (considered the gold standard for industrial ventilation across the US and globe recommends the table inserted). NFPA combustible dust standards have incorporated by reference the ACGIH duct velocity recommendations.

Section 2203.3.2 - Static dissipative hoses are required for c dusts with a Minimum Ignition Energy up to 2000 mj due to the risk of propagating brush discharges. If the c dust MIE is for example 2000 mj then static dissipative or conductive hose is not required or needed as there is no risk of static ignition. See Britton, Avoiding Static Ignition Hazards in Chemical Operations for additional information. There additionally is no basis provided for the hose length restriction in NFPA 652, 654 or 664 standards.

The wood processing industry uses large saws (e.g. flying saws) that move across long section of OSB and plywood that is equipped with 6-10 feet of flexible hose connected to a dust collection system. This would prohibit or limit the use of this equipment and restrict the use of similar dust collection ductwork required for this type equipment.

Section 2203.4.3.1 - As noted earlier in this reason statement, this is a very onerous signage requirement. In Pulp and Paper and Wood Processing facilities and chemical facilities this will require tens of signs if not up to a hundred signs at some facilities. Welding may be needed for repairs anytime c dust handling, generation or storage equipment is present. Safe Work and Hot Work Permits address the hazards and risks of welding in combustible dust areas.

Section 2303.4.4 - What is the definition of worst-case dusts ? It is inappropriate to have a requirement with a nebulous, undefined term.

Section 2203.4.6 - What is the basis for this requirement? Most saws are spark production devices and are allowed in hazardous classified locations. Also classified electrical is an incomplete phrase and is ambiguous? The correct term is hazardous area classification or hazardous area classified equipment.

Section 2203.5 - Compressed air can be used for housecleaning following NFPA 652, 654 and 664.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no increase.

F226-18

IFC: 2311.8

Proposed Change as Submitted

Proponent: Spencer Quong, representing Toyota Motor North America (squong@yahoo.com); Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA (RJD@davidsoncodeconcepts.com)

2018 International Fire Code

Revise as follows

2311.8 Repair garages for vehicles fueled by lighter-than-air fuels. The room, motor vehicle repair booth or motor vehicle repair space containing repair garage activities for the conversion or repair of vehicles that use CNG, LNG, hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.8 through 2311.8.11 in addition to the other requirements of Section 2311. Repair garages for the repair of vehicles that use hydrogen fuel shall be in accordance with this code and NFPA 2.

Exceptions:

1. Repair garages where work is conducted only on vehicles that have been defueled and their systems purged with nitrogen gas, and where standard operating procedures to document and maintain the fueling status throughout repair operations are approved.
2. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance not requiring open flame or welding on the CNG-, LNG-, hydrogen- or other lighter-than-air-fueled motor vehicle.
3. Repair garages for hydrogen-fueled vehicles where work is not performed on the hydrogen storage tank and is limited to the exchange of parts and maintenance not requiring open flame or welding on the hydrogen-fueled vehicle. During the work, the entire hydrogen fuel system shall contain less than 200 cubic feet (5.6 m³) of hydrogen.
4. Repair garages for natural-gas-fueled vehicles where work is not being performed on the fuel storage tank, and is limited to the exchange of parts and maintenance not requiring open flame or welding on the natural-gas-fueled vehicle. During the work, the natural gas, in the vehicle fuel tank shall contain a pressure of not more than 250 psi at 70°F (1724 kPa at 21°C).
5. Where approved by the fire code official, repair garages for hydrogen-fueled vehicles where an analysis has been submitted documenting that a flammable mixture in air will not occur in the room or space if the hydrogen is released from the motor fuel tank.

Reason: The purpose of this proposal is to eliminate the extra protection features for hydrogen motor vehicle repair garages in those cases where an analysis has been performed and submitted documenting that flammable mixture of the hydrogen and air will not occur if the hydrogen is released from its tank.

The application of this exception would be conditioned upon the approval of the fire code official since the necessary analysis, including computer modeling, would be facility specific including the dimensions of the room or space.

Cost Impact: The code change proposal will decrease the cost of construction

This change would decrease the cost of construction in those cases where the application of the analysis exception is approved.

F226-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved with concern that even with analysis the flammable mixture may be to high. The committee would like to see more details on what the analysis includes or possibly a standard that addresses this allowance. (Vote: 13-1)

Assembly Action:

None

F226-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Toyota, USA (rjd@davidsoncodeconcepts.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

2311.8 Repair garages for vehicles fueled by lighter-than-air fuels. The room, motor vehicle repair booth or motor vehicle repair space containing repair garage activities for the conversion or repair of vehicles that use CNG, LNG, hydrogen or other lighter-than-air motor fuels shall be in accordance with Sections 2311.8 through 2311.8.11 in addition to the other requirements of Section 2311. Repair garages for the repair of vehicles that use hydrogen fuel shall be in accordance with this code and NFPA 2.

Exceptions:

1. Repair garages where work is conducted only on vehicles that have been defueled and their systems purged with nitrogen gas, and where standard operating procedures to document and maintain the fueling status throughout repair operations are approved.
2. Repair garages where work is not performed on the fuel system and is limited to exchange of parts and maintenance not requiring open flame or welding on the CNG-, LNG-, hydrogen- or other lighter-than-air-fueled motor vehicle.
3. Repair garages for hydrogen-fueled vehicles where work is not performed on the hydrogen storage tank and is limited to the exchange of parts and maintenance not requiring open flame or welding on the hydrogen-fueled vehicle. During the work, the entire hydrogen fuel system shall contain less than 200 cubic feet (5.6 m³) of hydrogen.
4. Repair garages for natural-gas-fueled vehicles where work is not being performed on the fuel storage tank, and is limited to the exchange of parts and maintenance not requiring open flame or welding on the natural-gas-fueled vehicle. During the work, the natural gas, in the vehicle fuel tank shall contain a pressure of not more than 250 psi at ~~70°F~~ 70 F (1724 kPa at ~~21°C~~ 21 C).
5. Where approved by the fire code official, repair garages for hydrogen-fueled vehicles where an analysis has been submitted documenting that a flammable mixture in air ignition hazard will not occur in the room or space if the hydrogen is released from the motor fuel tank. The analysis shall be in accordance with Section 104.9 of this code. The analysis shall include the following:
 - 5.1. The location of the hydrogen release within the room or space.
 - 5.2. The modeled plume from the leak source to dissipation or exhaust, and shall include the plume concentrations with a detailed explanation of why an ignition would not occur at any point where the concentration is at or above the lower explosive limit (LEL) for hydrogen.

Commenter's Reason: To address the committee concerns the proposal has been modified to identify that the intent is to document that an ignition hazard will not occur, that the submittal must be in accordance with Section 104.9 "Alternative materials, design and methods of construction and equipment" and identifying core information that must be included in the analysis.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction This change would decrease the cost of construction in those cases where the application of the analysis exception is approved.

F229-18

IFC: 2404.3.4

Proposed Change as Submitted

Proponent: Geoffrey Raifsnider, Global Finishing Solutions, representing Self

2018 International Fire Code

Add new text as follows

2404.3.4 Limited Finishing Workstations. A limited finishing workstation shall comply with the applicable provisions of NFPA 33 and Sections 2404.4 through 2404.8.2.

Reason: This proposed addition addresses a common type of spray application enclosure used in the finishing industry that is not currently addressed by the code. NFPA 33 includes definitions and the minimum safety requirements for this type of equipment.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. There is no cost impact due to this change. Equipment is currently built to meet the requirements of NFPA 33.

F229-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved as it conflicts with limited spray area concept. When limited spray area provisions were reviewed the issue of limited finishing workstations was incorporated into that concept. (Vote: 14-0)

Assembly Action:

None

F229-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Geoffrey Raifsnider, representing Self (graifsnider@globalfinishing.com) requests As Submitted.

Commenter's Reason: The committee indicated that this proposal was disapproved as it conflicts with limited spray area concept. They indicated that when previously reviewed the issue of limited finishing workstations were incorporated. However, the current language addresses limited spraying spaces and not enclosed spray finishing. The language in this section is consistent with open spraying as indicated by the electrical wiring section. It also limits the surface area that can be painted

The proposal as originally submitted addresses an enclosed finishing booth which is common in the industry and is not currently addressed by the code. NFPA 33 includes definitions and the minimum safety requirements for this type of equipment.

This proposal does not change the requirements of open spraying covered by section 2404.9 Limited spraying spaces.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no cost impact due to this change. Equipment is currently built to meet the requirements of NFPA 33.

F229-18

F243-18

IFC: 3104.2, 3104.3, 3104.4

Proposed Change as Submitted

Proponent: Thomas Markel, representing Industrial Fabrics Association International - Tent Rental Division; Paul Armstrong, representing IFAI (paul@paulandvauna.com)

2018 International Fire Code

Revise as follows

3104.2 Flame propagation performance treatment. Before a permit is granted, the *owner* or agent shall file with the *fire code official* a certificate ~~executed~~ provided by the product manufacturer certifying the materials have been tested by an approved testing laboratory. The certificate shall indicate that the floor coverings, tents, membrane structures and their appurtenances, which include sidewalls, drops and tarpaulins, are composed of materials meeting the flame propagation performance of Test Method 2 of NFPA 701. Additionally, it shall indicate that the bunting and combustible decorative materials and effects are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2 of NFPA 701, as applicable. Alternatively, the materials shall be treated with a flame retardant in an *approved* manner and meet the flame propagation performance criteria of the applicable test method of NFPA 701. The flame propagation performance criteria shall be effective for the period specified by the permit.

3104.3 Label. Membrane structures or tents shall have a permanently affixed label bearing the identification of size and fabric or material ~~type in addition to information required in Section 3104.4 of this Chapter.~~

3104.4 Certification. An affidavit or affirmation shall be submitted to the fire code official and either a copy retained on the premises on which the tent or air-supported structure is located or label affixed to the tent or air supported structure. The affidavit shall attest to the names and address of the manufacturers of the tent or air-supported structure and either of the following information relative to the flame propagation performance criteria of the fabric:

- ~~1. Names and address of the manufacturers of the tent or air-supported structure.~~
- ~~2. Either with~~ The date the fabric was last treated with flame-retardant solution, the trade name or kind of chemical used in treatment, name of person or firm treating the material and name of testing agency and test standard by which the fabric was tested, or
- 3: trade ~~Trade~~ name or kind of chemical used in ~~treatment.~~ treatment.
- 4: name ~~Name~~ of person or firm treating the ~~material.~~ material and
- 5: name ~~Name~~ of testing agency and test standard by which the fabric was ~~tested.~~ tested, or
2. The material meets NFPA 701 test Method 1 or 2 without treatment.

Reason: Tents and membrane structures have been labeled and certifications provided for decades since the Hartford circus fire. At the time of the fire tent material was a natural fiber and waterproofing was accomplished with a flammable mixture. After the fire a external flame retardant was required to be applied to retard flame spread. The topical application was subject to weather and cleaning and would degrade over time and exposure. Retreatment and retesting was needed for compliance.

With the availability of polyester or PVC based material, that has flame retardant integrated into the raw material before extrusion, external treatment of material is not required. The flame retardant is capable of performing for the life of the material and cannot be washed or weathered away. Also, "field testing" (NFPA 705) the tent or membrane structure by cutting out sections for testing, damages the membrane and degrades the structural integrity of the material increasing the danger to the public for a structural failure.

This code proposal changes three parts of the flame propagation requirement that are interrelated.

Flame propagation (3104.2): Testing agencies have never issue the label or certification of the assembled product, rather they test and document the materials used in assembly. The affixed label and certification provided for permitting have ***always*** been provided by the manufacturer (see attachments). This change to flame propagation corrects the code to what has been the acceptable practice for generations. Further it would be impossible and impractical to enforce the current code; for testing agencies are not capable of producing the label and certification documentation for every tent and sidewall produced by a manufacturer, nor are they able to trace the chain of custody of the materials as the manufacturer's have been doing as evident in both the certifications and labels (see attachments). Therefore this change only brings the code in line with what has been acceptable practice.

Labeling (3104.3): The code is very general and viewing the attached labels, the information presented varies widely. By tying the information required for the label to "match" the certification documentation aids the fire code official to insure the installation matches the permit documents.

Certification (3104.4): This change brings the code requirements of documentation up-to-date with modern tent and membrane structure manufacturing. Rarely is a natural fiber used in new product manufacturing. However, use of older tents made from natural fibers still occurs. The change in certification reflects the modern use of polyester and PVC material (new #3) whose flame retardant is now integrated in the raw polyester or PVC before extruded into material, and therefore cannot be washed or weathered away as the topical application method used on natural fibers.

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 3104.2 Flame propagation performance treatment. Before a permit is granted, the owner or agent shall file with the fire code official a certificate ~~executed~~provided by the product manufacturer certifying the materials have been tested by an approved testing laboratory. The certificate shall indicate that the floor coverings, tents, membrane structures and their appurtenances, which include sidewalls, drops and tarpaulins, are composed of materials meeting the flame propagation performance of Test Method 2 of NFPA 701. Additionally, it shall indicate that the bunting and combustible decorative materials and effects are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2 of NFPA 701, as applicable. Alternatively, the materials shall be treated with a flame retardant in an approved manner and meet the flame propagation performance criteria of the applicable test method of NFPA 701. The flame propagation performance criteria shall be effective for the period specified by the permit.

3104.4 Certification. An affidavit or affirmation shall be submitted to the fire code official and either a copy retained on the premises on which the tent or air-supported structure is located or label affixed to the tent or air supported structure. The affidavit shall attest to the names and address of the manufacturers of the tent or air-supported structure and either of the following information relative to the flame propagation performance criteria of the fabric:

~~1. Names and address of the manufacturers of the tent or air-supported structure.~~

~~1.2. Either with t~~The date the fabric was last treated with flame-retardant solution, the trade name or kind of chemical used in treatment, name of person or firm treating the material and name of testing agency and test standard by which the fabric was tested, or

~~2.3. The material meets NFPA 701 test Method 1 or 2 without treatment.~~

Committee Reason: Approval of the modification is based on the improvement of the language to match the intent of the requirements. Approval of the proposal is based upon the proponent's published reason and that it provides specific guidance on older and newer tents. (Vote: 10-4)

Assembly Action:

None

F243-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Tim Earl, representing GBH International (tearl@gbhinternational.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

3104.3 Label. Membrane structures or tents shall have a permanently affixed label bearing the following information:

1. The identification of size and fabric or material.
2. The names and addresses of the manufacturers of the tent or air-supported structure.
3. Statement that the fabric or material in addition to information required in ~~meets the requirements of~~ Section 3104.2.
4. If treated, the date the fabric or material was last treated with flame-retardant solution, the trade name or kind of chemical used in treatment, name or person or firm treating the fabric or material, and name of testing agency and test standard by which the fabric or material was tested.
5. If not treated, statement that no treatment was applied when the fabric or material met the requirements of Section 3104.2 of this Chapter.

~~**3104.4 Certification Affidavit.** An affidavit or affirmation shall be submitted to the fire code official and either a copy retained on the premises on which the tent or air-supported structure is located or label affixed to the tent or air supported structure. The affidavit shall attest to the names and address of the manufacturers of the tent or air-supported structure and either of the following information relative to the flame propagation performance criteria of the fabric: The affidavit required by Section 3104.2 shall contain all of the information specified in Section 3104.3.~~

- 1- ~~The date the fabric was last treated with flame-retardant solution, the trade name or kind of chemical used in treatment, name of person or firm treating the material and name of testing agency and test standard by which the fabric was tested, or trade name or kind of chemical used in treatment, name of person or firm treating the material and name of testing agency and test standard by which the fabric was tested, or~~
- 2- ~~The material meets NFPA 701 test Method 1 or 2 without treatment~~

Commenter's Reason: This Public Comment cleans up the requirements regarding the required affidavit and label. The intent of the original proposal is preserved, but the Public Comment lists in a more straightforward fashion the information which the affidavit and label must contain.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no additional cost as this is currently what the industry is doing.

Public Comment 2:

Proponent: Marcelo Hirschler, GBH International, representing GBH International (mmh@gbhint.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

3104.3 Label. Membrane structures or tents shall have a permanently affixed label bearing the identification of size and fabric or material in addition to information required in Section 3104.4 of this Chapter.

3104.4 Certification Affidavit. An affidavit ~~or affirmation~~ shall be submitted to the fire code official and ~~either~~ a copy retained on the premises on which the tent or air-supported structure is located ~~or label affixed to the tent or air supported structure~~. The affidavit shall attest to the names and address of ~~the manufacturers~~ the manufacturers of the tent or air-supported structure ~~and either of the following information relative to the flame propagation performance criteria of the fabric, a statement that the fabric or material met the requirements of Section 3104.2 and one of the following:~~

1. ~~The date~~ if the fabric or material was treated, the date that it was last treated with flame-retardant solution, the trade name or kind of chemical used in treatment, name of person or firm treating the material and the name of testing agency and test standard by which the fabric or material was tested, ~~or trade name or kind of chemical used in treatment, name of person or firm treating the material and name of testing agency and test standard by which the fabric was tested, or~~ The material meets NFPA 701 test Method 1 or 2 without treatment.
2. If the fabric or material was not treated, a statement that the fabric or material met the requirements of Section 3104.2 without treatment.

Commenter's Reason: This public comment does the following:

1. It makes no changes to 3104.3, which requires that the label contain all the information in 3104.4.
2. It eliminates the contradictory requirement in 3104.4 that there be either an affidavit or a label. There must be both, as made clear by 3104.3. This does not change the requirements but cleans up a contradiction.
3. It retains all the information required by the proposal but also adds that the affidavit (and the label) must confirm not just that the fabric or material was tested but that it passed the appropriate test, as required by 3104.2. Note that passing NFPA 701 method 1 does not ensure passing NFPA 701 method 2.
4. This public comment does not address 3104.2, which is addressed by an alternate public comment.

The final wording is difficult to read in cdpAccess and it is shown below.

3104.4 Affidavit. An affidavit shall be submitted to the fire code official and a copy retained on the premises on which the tent or air-supported structure is located. The affidavit shall attest to the names and address of the manufacturers of the tent or air-supported structure, a statement that the fabric or material met the requirements of Section 3104.2 and one of the following.

1. If the fabric or material was treated, the date that it was last treated with flame-retardant solution, the trade name or kind of chemical used in treatment, name of person or firm treating the material and the name of testing agency and test standard by which the fabric or material was tested.

2. If the fabric or material was not treated, a statement that the fabric or material met the requirements of Section 3104.2 without treatment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This public comment simply clarifies what is required in the label and the affidavit and clears an inconsistency in the code.

Public Comment 3:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

3104.2 Flame propagation performance treatment. Before a permit is granted, the *owner* or agent shall file with the *fire code official* a certificate provided by the product manufacturer ~~certifying to verify that~~ the materials have been tested ~~and certified~~ by an *approved* testing laboratory. The certificate shall indicate that the floor coverings, tents, membrane structures and their appurtenances, which include sidewalls, drops and tarpaulins, are composed of materials meeting the flame propagation performance of Test Method 2 of NFPA 701. Additionally, it shall indicate that the bunting and combustible decorative materials and effects are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2 of NFPA 701, as applicable. Alternatively, the materials shall be treated with a flame retardant in an *approved* manner and meet the flame propagation performance criteria of the applicable test method of NFPA 701. ~~The certificate shall indicate compliance with the testing requirements of Chapter 16 of NFPA 701.~~ The flame propagation performance criteria shall be effective for the period specified by the permit.

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>
This public comment incorporates into section 3104.2 the changes approved by the committee from proposal F242, which was submitted by FCAC. It also revises the statement of who is responsible for issuing the certificate of testing: the approved testing laboratory tests and certifies and the manufacturer provides the certification to the fire code official. Note that the term "provided" is the preferred term to "issued" as used in F242.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This is simply editorially combining the concepts in F242 and F243. Both proposals were approved by the committee.

F243-18

F245-18

IFC: 105.6, 202, 3101.1, SECTION 3106, 3106.1, 3106.2, 3106.3, 3106.4, 3106.5, 3106.6, 3106.7, 3106.8, 3106.9, 3106.10, 3106.10.1

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (FCAC@iccsafe.org)

2018 International Fire Code

Add new text as follows

105.6 Inflatable Amusement Device. Inflatable Amusement Device. The fire code official is authorized to require an operational permit to operate an inflatable amusement device.

Exception: Operation on private property for an event not open to the public.

Add new definition as follows

INFLATABLE AMUSEMENT DEVICE. A device made of flexible fabric or other combustible materials that is inflated by one or more air-blowers providing internal air pressure to maintain its shape. Such a device is designed for recreational activities that allow occupants to bounce, climb, slide, negotiate an obstacle course or participate in interactive play.

Revise as follows

3101.1 Scope. Tents, temporary special event structures and *membrane structures* shall comply with this chapter. The provisions of Section 3103 are applicable only to temporary tents and membrane structures. The provisions of Sections 3104 and 3106 are applicable to temporary and permanent tents and membrane structures. The provisions of Section 3105 are applicable to temporary special event structures. The provisions of Section 3106 are applicable to inflatable amusement devices. The provisions of Section 3107 are applicable to outdoor assembly events. Other temporary structures shall comply with the International Building Code.

Add new text as follows

SECTION 3106 INFLATABLE AMUSEMENT DEVICES

3106.1 Scope. Inflatable amusement devices shall comply with Sections 3106.2 through 3106.10.1.

3106.2 General. Inflatable amusement devices shall be designed, anchored, operated and maintained in accordance with the manufacturer's instructions. A complete copy of the manufacturer's instructions shall be filed with the operational permit and, where required, available at the site of operation for review.

3106.3 Permit required. Where required by the fire code official, the operation of an inflatable amusement device shall require a permit as set forth in Section 105.6

3106.4 Use period. Inflatable amusement devices shall not be operated for a period of more than 14 consecutive days at a single location.

3106.5 Combustible materials. The fabrics, textiles, containment netting and combustible small mesh materials used in the construction of the inflatable amusement device shall meet the flame propagation criteria of Test Method 2 of NFPA 701.

3106.6 Operation. Inflatable amusement devices shall be operated within the environmental conditions specified in the manufacturer's installation and operating instructions for wind and weather. Operators shall be familiar with the weather and wind conditions that exceed manufacturer's operating limits for an inflatable amusement device. Operators shall evacuate and deflate the device and not resume operations until conditions are within the manufacturer's operating limits.

3106.7 Permanent safety label. Every inflatable amusement device shall display one or more permanent labels demonstrating compliance with the requirements in this section.

3106.8 Required operators. The minimum number of approved operators to safely supervise operation of the device, as required by the manufacturer's instructions for each inflatable amusement device, shall be present at all times when the inflatable amusement device is in use.

3106.9 Electrical equipment and wiring. Electrical equipment, blower motors and temporary wiring for electrical power or lighting shall comply with the applicable provisions of NFPA 70. Extension cords and flexible cords shall be listed and labeled in accordance with UL 817. Electrical equipment, blower-motors and wiring utilized outdoors shall be listed and labeled for outdoor use.

3106.10 Portable generators. Portable generators shall comply with the applicable provisions of NFPA 70 and with the portable generator requirements of this code.

3106.10.1 Portable fire extinguishers. Each generator shall be provided with an approved portable fire extinguisher complying with Section 906 and placed in an approved location.

Reason: This proposal has been prepared through discussions with code officials, industry representatives and other stakeholders. Past events were analyzed related to outdoor “bounce houses” that were uplifted by wind gusts while occupied thereby resulting in injury to children and/or adults that were trapped inside. These new code requirements are simple and intended to improve the authority of code officials to ensure public safety when inflatable amusement devices are used for public gatherings or events.

This proposal introduces basic safety requirements for inflatable amusement devices also known as “bounce houses”. There have been numerous reported incidents of accidents and injuries involving these devices caused by weather events such as sustained or wind gusts and/or improper set-up, anchorage or use where the “bounce house” is uplifted, carried away and/or overturned with children or adults inside.

Chapter Scoping section modified to reference proposed new section.

This new section adds an “optional” operational permit requirement intended to cover public events and excludes operation on private (residential) property.

This section adds basic fire and electrical safety requirements for the construction, placement and operation of portable inflatable amusement devices. The section addresses safety requirements for both outdoor and indoor use of these devices.

A definition for inflatable amusement devices is also included to correlate the type of devices covered by these new IFC code requirements.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal adds requirements for inflatable amusement devices. This use of these devices and the requirements proposed have no relation to building construction or building construction costs.

F245-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee stated that they had issues with the proposal regarding indoor vs. outdoor uses, time period, fire extinguishers, and the location of portable generators. (Vote: 12-2)

Assembly Action:

None

F245-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

105.6 Inflatable Amusement Device. ~~Inflatable Amusement Device. The fire code official is authorized to require an operational permit.~~ An operational permit is required to operate an inflatable amusement device.

Exception: ~~Operation on private property for an event not open to the public.~~

INFLATABLE AMUSEMENT DEVICE. A device made of flexible fabric or other combustible materials that is inflated by one or more air-blowers providing internal air pressure to maintain its shape. Such a device is designed for recreational activities that allow occupants to bounce, climb, slide, negotiate an obstacle course or participate in interactive play.

3101.1 Scope. Tents, temporary special event structures and *membrane structures* shall comply with this chapter. The provisions of Section 3103 are applicable only to temporary tents and membrane structures. The provisions of Sections 3104 and 3106 are applicable to temporary and permanent tents and membrane structures. The provisions of Section 3105 are applicable to temporary special event structures. The provisions of Section 3106 are applicable to inflatable amusement devices. The provisions of Section 3107 are applicable to outdoor assembly events. Other temporary structures shall comply with the International Building Code.

SECTION 3106 INFLATABLE AMUSEMENT DEVICES

3106.1 Scope. Inflatable amusement devices shall comply with Sections 3106.2 through 3106.10.1.

3106.2 General. Inflatable amusement devices shall be designed, anchored, operated and maintained in accordance with the manufacturer's instructions. A complete copy of the manufacturer's instructions shall be filed with the operational permit and, where required, available at the site of operation for review.

3106.3 Permit required. Where required by the fire code official, the operation of an inflatable amusement device shall require a permit as set forth in Section 105.6

3106.4 Use period. ~~Inflatable amusement devices shall not be operated for a period of more than 14 consecutive days at a single location.~~

3106.5 Combustible materials. The fabrics, textiles, containment netting and combustible small mesh materials used in the construction of the inflatable amusement device shall meet the flame propagation criteria of Test Method 2 of NFPA 701.

3106.6 Operation. Inflatable amusement devices shall be operated within the environmental conditions specified in the manufacturer's installation and operating instructions for wind and weather. Operators shall be familiar with the weather and wind conditions that exceed manufacturer's operating limits for an inflatable amusement device. Operators shall evacuate and deflate the device and not resume operations until conditions are within the manufacturer's operating limits.

3106.7 Permanent safety label. Every inflatable amusement device shall display one or more permanent labels

demonstrating compliance with the requirements in this section.

3106.8 Required operators. The minimum number of approved operators to safely supervise operation of the device, as required by the manufacturer's instructions for each inflatable amusement device, shall be present at all times when the inflatable amusement device is in use.

~~**3106.9 Electrical equipment and wiring.** Electrical equipment, blower motors and temporary wiring for electrical power or lighting shall comply with the applicable provisions of NFPA 70. Extension cords and flexible cords shall be listed and labeled in accordance with UL 817. Electrical equipment, blower motors and wiring utilized outdoors shall be listed and labeled for outdoor use.~~

~~**3106.10 Portable generators.** Portable generators shall comply with the applicable provisions of NFPA 70 and with the portable generator requirements of this code.~~

~~**3106.10.1 Portable fire extinguishers.** Each generator shall be provided with an approved portable fire extinguisher complying with Section 906 and placed in an approved location.~~

Commenter's Reason: This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at:

<https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

This public comment introduces basic safety requirements for inflatable amusement devices also known as "bounce houses". There have been numerous reported incidents of accidents and injuries involving these devices caused by weather events such as sustained or wind gusts and/or improper set-up, anchorage or use where the "bounce house" is uplifted, carried away and/or overturned with children or adults inside.

Chapter Scoping section modified to reference proposed new section.

This new section adds an "optional" operational permit requirement intended to cover only outdoor assembly events (definition: **OUTDOOR ASSEMBLY EVENT.** An outdoor gathering of persons for any purpose). The changes to section **106.6 Permits** addresses concerns raised by the IFC Technical Committee.

The deletion of section **3106.4 Use period** in this Public Comment addresses concerns raised by the IFC Technical Committee.

This section adds basic safety requirements for the construction, placement and operation of portable inflatable amusement devices. The section addresses safety requirements for only outdoor use of these devices. Any indoor use would be governed by existing code requirements for interior finish/decorations, fire protection systems, egress, etc.

A definition for inflatable amusement devices is also included to correlate the type of devices covered by these new IFC code requirements.

The deletion of section **3106.9 Electrical equipment and wiring** in this Public Comment addresses concerns raised by the IFC Technical Committee. Electrical safety requirements are covered by IFC Chapter 6 and the NEC.

The deletion of section **3106.10 Portable generators** in this Public Comment addresses concerns raised by the IFC Technical Committee. Portable generator requirements are covered by IFC Chapter 6 and the NEC.

The deletion of section **3106.10.1 Portable Fire Extinguishers** in this Public Comment addresses concerns raised by the IFC Technical Committee. Portable fire extinguisher requirements are covered by IFC Section 906 and NFPA 10 (by reference).

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal adds requirements for inflatable amusement devices. This use of these devices and the requirements proposed have no relation to building construction or building construction costs.

F245-18

F254-18

IFC: 3205.4

Proposed Change as Submitted

Proponent: Mark Chubb, Telgian Corp., representing Telgian Corp. (mchubb@telgian.com)

2018 International Fire Code

Add new text as follows

3205.4 Aisle maintenance. When restocking is not being conducted, aisles shall be kept clear of storage, waste material and debris. Fire department access doors, aisles and *exit* doors shall not be obstructed. During restocking operations using manual stocking methods, a minimum unobstructed aisle width of 24 inches (610 mm) shall be maintained in 48-inch (1219 mm) or smaller aisles, and a minimum unobstructed aisle width of one-half of the required aisle width shall be maintained in aisles greater than 48 inches (1219 mm). During mechanical stocking operations, a minimum unobstructed aisle width of 44 inches (1118 mm) shall be maintained in accordance with Section 3206.10.

Exception: In high-piled combustible storage protected by automatic sprinkler systems designed and installed to deliver 0.60 gpm/sq ft over the most remote 2,000 sq ft and not less than 0.70 gpm/sq ft from the four most demanding sprinklers in accordance with 903.3.1.1, displays and wing stacks not exceeding 48-inches in height provided they do not obstruct or reduce the clear width of the aisle to less than 48-inches.

Reason: The proposed exception recognizes and incorporates language consistent with the provisions of NFPA 13--2016, 20.3.1(13), which represent the most prevalent fire protection design criteria for many big box retail facilities. Extensive large-scale fire testing demonstrates that such displays do not compromise the effectiveness of sprinkler systems to control or extinguish fires in high-piled combustible storage when sprinkler systems satisfy these criteria.

Bibliography: NFPA 13, Standard for the Installation of Sprinkler Systems, 2016 edition. Quincy, MA: National Fire Protection Association.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Although the proposed change will not increase or decrease the cost of construction, it will facilitate operations that increase retail revenue in facilities that satisfy the specified fire protection design criteria.

F254-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 3205.4 Aisle maintenance. When restocking is not being conducted, aisles shall be kept clear of storage, waste material and debris. Fire department access doors, aisles and exit doors shall not be obstructed. During restocking operations using manual stocking methods, a minimum unobstructed aisle width of 24 inches (610 mm) shall be maintained in 48-inch (1219 mm) or smaller aisles, and a minimum unobstructed aisle width of one-half of the required aisle width shall be maintained in aisles greater than 48 inches (1219 mm). During mechanical stocking operations, a minimum unobstructed aisle width of 44 inches (1118 mm) shall be maintained in accordance with Section 3206.10.

Exception: In high-piled ~~single- and double-row rack storage of combustible storage materials~~ protected by automatic sprinkler systems designed and installed ~~to deliver 0.60 gpm/sq ft over the most remote 2,000 sq ft and not less than 0.70 gpm/sq ft from the four most demanding sprinklers in accordance with 903.3.1.1, in accordance with the requirements of NFPA 13 governing the use of k=25.2 (360) sprinklers,~~ displays and wing stacks not exceeding 48-inches in height provided they do not obstruct or reduce the clear width of the aisle to less than 48-inches...

Committee Reason: Approval of the modification is based on the improvement of the language to elaborate that it applies to both single and double row racks and is tied to the performance of the type of fire sprinkler that is being used.. Approval of the proposal is based upon the proponent's published reason and that the addition of the exception provides a method by which the actual use of a aisle can be addressed by a heightened fire sprinkler system design. (Vote: 12-1)

Assembly Action:

None

F254-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Kevin Scott, representing KH Scott and Associates LLC. (khscottassoc@gmail.com) ; Ellie Klausbruckner, representing Klausbruckner and Associates (ek@klausbruckner.com) ; Mark Chubb, representing Telgian Corp. (mchubb@telgian.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

3205.4 Aisle maintenance. When restocking is not being conducted, aisles shall be kept clear of storage, waste material and debris. Fire department access doors, aisles and exit doors shall not be obstructed. During restocking operations using manual stocking methods, a minimum unobstructed aisle width of 24 inches (610 mm) shall be maintained in 48-inch (1219 mm) or smaller aisles, and a minimum unobstructed aisle width of one-half of the required aisle width shall be maintained in aisles greater than 48 inches (1219 mm). During mechanical stocking operations, a minimum unobstructed aisle width of 44 inches (1118 mm) shall be maintained in accordance with Section 3206.10.

Exception: ~~In high-piled single- and double-row rack storage of combustible materials protected by automatic sprinkler systems designed and installed in accordance with the requirements of NFPA 13 governing the use of k=25.2 (360) sprinklers, displays and wing stacks not exceeding 48-inches in height provided they do not obstruct or~~

Displays and wing stacks shall be permitted in aisles provided the following conditions are met:

1. The storage area consists of single-row or double-row racks.
2. The displays and wing stacks are less than 48 inches (1219 mm) in height.
3. The displays and wing stacks do not reduce the clear width of the aisle to less than 48-inches (1219 mm).
4. The storage area is protected by an automatic sprinkler system in accordance with NFPA 13 utilizing extended coverage sprinklers with a nominal K-factor of K=25.2 (360).

Commenter's Reason: This item was Approved as Modified by the committee. This Public Comment accomplishes two goals. 1) The new text becomes a 2nd paragraph rather than an exception. The section already specifies when the aisle width can be reduced for functions such as restocking. So it is not really an exception, it is another situation where the reduced aisle width is allowed.

2) The revision clarifies the requirements based on the design criteria in NFPA 13.

This situation occurs routinely in big box retail facilities. This revision provides the criteria the inspector needs to allow the operation to continue. When the criteria is met, testing has confirmed that the impact is negligible and can be allowed without a negative impact on the fire sprinkler protection.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This is an operational function in these retail facilities. It will not affect construction, but it will allow these displays to occur safely.

F254-18

F262-18 Part I

IFC: Chapter 33

Proposed Change as Submitted

Proponent: Paul Coats, American Wood Council, representing American Wood Council (pcoats@awc.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IBC-G COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

CHAPTER 33 FIRE SAFETY DURING CONSTRUCTION AND DEMOLITION

SECTION 3301 GENERAL

3301.1 Scope. This chapter shall apply to structures in the course of construction, *alteration* or demolition, including those in underground locations. ~~Compliance with NFPA 241 is required for items not specifically addressed herein.~~

3301.2 Purpose. This chapter prescribes minimum safeguards for construction, *alteration* and demolition operations to provide reasonable safety to life and property from fire during such operations.

3302 REQUIREMENTS

3302.1 Requirements. Fire safety during construction and demolition shall be in accordance with Chapter 33 of the International Building Code. Compliance with NFPA 241 is required for items not specifically addressed therein.

Delete without substitution

~~SECTION 3302 DEFINITIONS~~

~~SECTION 3303 TEMPORARY HEATING EQUIPMENT~~

~~SECTION 3304 PRECAUTIONS AGAINST FIRE~~

~~SECTION 3305 FLAMMABLE AND COMBUSTIBLE LIQUIDS~~

~~SECTION 3306 FLAMMABLE GASES~~

~~SECTION 3307 EXPLOSIVE MATERIALS~~

~~SECTION 3308 OWNER'S RESPONSIBILITY FOR FIRE PROTECTION~~

~~SECTION 3309 FIRE REPORTING~~

~~SECTION 3310 ACCESS FOR FIRE FIGHTING~~

~~SECTION 3311 MEANS OF EGRESS~~

~~SECTION 3312 WATER SUPPLY FOR FIRE PROTECTION~~

~~SECTION 3313 STANDPIPES~~

~~SECTION 3314 AUTOMATIC SPRINKLER SYSTEM~~

~~SECTION 3315 PORTABLE FIRE EXTINGUISHERS~~

~~SECTION 3316 MOTORIZED CONSTRUCTION EQUIPMENT~~

SECTION 3317 SAFEGUARDING ROOFING OPERATIONS

Reason: This change takes the current requirements of Chapter 33 of the IFC and incorporates them into Chapter 33 of the IBC. It makes no changes in technical requirements and retains all requirements of both codes. Explanations of each editorial change is given section by section at the end of this reason statement.

The purview of the fire code committee for sections currently under their purview (indicated by an “[F]” before the appropriate sections), and the authority of the fire code official where the fire code official’s approval is currently required, are preserved. The practice of having key fire safety provisions in the IBC that are maintained by the IFC committee and enforced by the fire code official is already established. Many provisions of Chapter 9 do this.

Requirements for fire safety are currently found in both the IBC and the IFC, with considerable overlap. For instance, requirements for fire extinguishers, means of egress, standpipes, sprinkler systems, and water supply are currently in both codes.

Most significant construction fires are the result of noncompliance with current code requirements. The consolidation of these chapters into the IBC will reduce the likelihood of code violations leading to fire, and will be beneficial for several other reasons. First, there are jurisdictions that do not adopt the IFC and the requirements will be more accessible to them. Second, enforcement activities for key provisions such as fire watches, a fire prevention program superintendent and plan, temporary heating equipment safety, cooking areas, rubbish and debris disposal, hot work precautions, roofing precautions, and access for firefighting—all which appear in the IFC but not the IBC—are less likely to be neglected. Third, problems in correlation of overlapping requirements will be eliminated.

Here is a section-by-section explanation of modifications:

Chapter 33 title: changed to reflect the inclusion of IFC fire safety provisions.

3301.1: General: the scope is expanded to include the current scope of the Chapter 33 of the IFC, including required compliance with NFPA 241 for items not specifically addressed.

3301.2: Purpose: the IBC currently has no Purpose section, this is brought over from the IFC and modified to make it clear that fire safety is one purpose among others.

3301.3 Storage and placement: renumbering only.

3302.3 Fire safety during construction: deleted since requiring compliance with Chapter 33 of the IFC is no longer necessary; all the fire safety provisions of Chapter 33 of the IFC are being added here.

3303.7 Fire safety during demolition: deleted since requiring compliance with Chapter 33 of the IFC is no longer necessary; all the fire safety provisions of Chapter 33 of the IFC are being added here.

3309 TEMPORARY HEATING EQUIPMENT: all subsections 3309.1 through 3309.6 are unchanged from parallel provisions in Section 3303 of the IFC, except to add references to the IFC where appropriate.

3310 PRECAUTIONS AGAINST FIRE: all subsections 3310.1 through 3310.8 are unchanged from parallel provisions in Section 3304 of the IFC, except to add reference to the IFC where appropriate and editorial modifications to preserve the authority of the fire code official in subsections 3310.1, 3310.3, 3310.5.2, and 3310.8.

3311 FLAMMABLE AND COMBUSTIBLE LIQUIDS: all subsections 3311.1 through 3311.6 are unchanged from parallel provisions in Section 3305 of the IFC, except to add references to the IFC where appropriate.

3312 FLAMMABLE GASES: all subsections 3312.1 through 3312.2.1 are unchanged from parallel provisions in Section 3306 of the IFC, except to add references to the IFC where appropriate.

3313 EXPLOSIVE MATERIALS: all subsections 3313.1 through 3313.3 are unchanged from parallel provisions in Section 3307 of the IFC, except to add references to the IFC where appropriate, and editorial modifications to preserve the authority of the fire code official in subsection 3313.3.

3314 OWNER'S RESPONSIBILITY FOR FIRE PROTECTION: all subsections 3314.1 through 3314.8 are unchanged from parallel provisions in Section 3308 of the IFC, except to add references to the IFC where appropriate, and editorial modifications to preserve the authority of the fire code official in subsection 3314.3.

3315 FIRE REPORTING: Subsection 3315.1 is unchanged from parallel provisions in Section 3309 of the IFC except to editorial modification to preserve the authority of the fire code official.

3316 ACCESS FOR FIRE FIGHTING: Subsections 3316.1 AND 3316.2 are unchanged from parallel provisions in Section 3310 of the IFC, except to add a reference to the IFC where appropriate in 3316.2 and an editorial modification to preserve the authority of the fire code official in subsection 3316.1.

3317 FIRE EXTINGUISHERS is current IBC Section 3309, which parallel the current provisions of IFC 3315 Portable Fire Extinguishers. The requirements were identical except for minor editorial wording such as "not less than" vs. "not fewer than," and "including, but not limited to" in one of the items. The wording of the IFC was used, and an editorial change was made to 3317.1 to retain the authority of the fire code official in addition to the building official for enforcement, since the same requirement was found in both codes.

(Current IBC subsection 3309.2 Fire hazards was deleted; it is no longer necessary since all fire safety provisions of Chapter 33 of the IFC are being added.)

3318 MEANS OF EGRESS is current IBC Section 3310, which parallels the current provisions of IFC 3311 Means of Egress.

3318.1 Stairways required: renumbered only.

3318.2 Maintenance of means of egress: the requirements of this subsection were essentially the same as IFC Section 3311.2, but the wording differed, especially for the exception. The word "required" in front of means of egress was brought over from the fire code, and the exception was modified to incorporate accessible means of egress, which appeared in the fire code. The revisions were made to incorporate the intent of both codes, which were thought to be the same. Editorial changes were made to retain the authority of the fire code official for approval since similar provisions for temporary means of egress were found in both codes.

3319 STANDPIPES is current IBC Section 3311, which parallel the current provisions of IFC 3313. Subsections 3319.1, 3319.2, and 3319.3 have been renumbered only.

3320 AUTOMATIC SPRINKLER SYSTEM is current IBC Section 3312, which parallel the current provisions of IFC 3314.

3320.1 Completion before occupancy: editorially modified to retain references to code sections in the IBC and IFC as they appear in their respective codes, and to retain the authority of both the building officials and fire code official from the respective codes.

3320.2 Operation of valves: renumbered only. "Shall be permitted" as used by the IBC was retained instead of "shall be allowed" per the IFC.

3321 WATER SUPPLY FOR FIRE PROTECTION is current IBC Section 3313, which parallel the current provisions of IFC 3312.

3321.1 Where required: editorial changes were made to make it clear that approvals are needed from both the building official and the fire code official, since approval is currently required by each code.

3314 FIRE WATCH DURING CONSTRUCTION was deleted since the identical requirement appears in proposed Section 3310.5.1, brought over from the IFC.

3322 MOTORIZED CONSTRUCTION EQUIPMENT is current section 3316 of the IFC.

3322.1 Conditions of use: an editorial change was made in item 4 to retain the authority of the fire code official.

3323 SAFEGUARDING ROOFING OPERATIONS is current section 3317 the IFC. Editorial changes were made to subsections 3323.1 and 3323.1 to make appropriate reference to the IFC for referenced code sections.

Here are the current IFC sections and their corresponding sections in this proposal:

IFC Section 3301: it remains in the IFC.

IFC Section 3302: deleted as unnecessary to follow IBC convention.

IFC 3303: proposed IBC 3309

IFC 3304: proposed IBC 3310

IFC 3305: proposed IBC 3311

IFC 3306: proposed IBC 3312

IFC 3307: proposed IBC 3313

IFC 3308: proposed IBC 3314

IFC 3309: proposed IBC 3315

IFC 3310: proposed IBC 3316

IFC 3311: proposed IBC 3318

IFC 3312: proposed IBC 3321

IFC 3313: proposed IBC 3319

IFC 3314: proposed IBC 3320

IFC 3315: proposed IBC 3317

IFC 3316: proposed IBC 3322

IFC 3317: proposed IBC 3323

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Currently the IBC requires that all the fire safety requirements of Chapter 33 of the IFC be enforced (IBC Section 3302.3). Therefore the moving of these provisions into the IBC will have no effect on the cost of construction.

Analysis: NFPA 56 and NFPA 241 are already referenced in the I-codes. Note that there has been erratum that changed the edition of NFPA 241 referenced in the 2018 IFC to the 2013 edition.

F262-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based upon concern that these provisions are already referenced in the IBC and relocation of requirements is not necessary. In addition this is consistent with the action taken on Part II of this proposal. (Vote: 13-0)

Assembly Action:

None

F262-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Paul Coats, PE, CBO, representing American Wood Council (pcoats@awc.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Building Code

3302.3 Fire safety during construction. Fire safety during construction shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the International Fire Code. Compliance with the fire safety provisions of NFPA 241 is required for items not specifically addressed.

3303.7 Fire safety during demolition. Fire safety during demolition shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the International Fire Code. Compliance with the fire safety provisions of NFPA 241 is required for items not specifically addressed.

Commenter's Reason: The direct reference to NFPA 241, Standard for Safeguarding Construction, Alteration, and Demolition Operations, is retained from the original proposal. Compliance with NFPA 241 is required in the scope of Chapter 33 of the IFC, which is referenced already in these sections. Therefore there is no change in requirements. However, a direct reference to NFPA 241 in the IBC may have benefit for jurisdictions that do not adopt the IFC or are governed by statutes that delineate enforcement responsibilities according to code. This would allow building officials to enforce the provisions of NFPA 241 if necessary.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Compliance with Chapter 33 of the IFC, which in turn requires compliance with NFPA 241 in its scope, is already required by Sections 3302.3 and 3303.7. Therefore there is no change in requirements that would affect the cost of construction.

F262-18 Part I

F262-18 Part II

IBC: Chapter 33, 3301.1, 3301.2, 3302.3, 3303.7, 3309, 3310, 3311, 3312, 3313, 3314, 3315 (New), 3316(New), 322(New), 3323 (New), Chapter 35

Proposed Change as Submitted

Proponent: Paul Coats, American Wood Council, representing American Wood Council (pcoats@awc.org)

2018 International Building Code

Revise as follows

CHAPTER **33 SAFEGUARDS AND FIRE PREVENTION DURING CONSTRUCTION**

SECTION 3301 GENERAL

3301.1 Scope. The provisions of this chapter shall govern safety during construction, alteration, and demolition operations, including structures in underground locations, and the protection of adjacent public and private properties. Compliance with NFPA 241 is required for items not specifically addressed herein.

3301.2 Purpose. This chapter prescribes minimum safeguards for construction, alteration and demolition operations, including minimum safeguards to provide reasonable safety to life and property from fire during such operations.

~~3301.2~~3301.3 Storage and placement. Construction equipment and materials shall be stored and placed so as not to endanger the public, the workers or adjoining property for the duration of the construction project.

SECTION 3302 CONSTRUCTION SAFEGUARDS

~~3302.3 Fire safety during construction.~~ ~~Fire safety during construction shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the International Fire Code.~~

SECTION 3303 DEMOLITION

Delete without substitution

~~3303.7 Fire safety during demolition.~~ ~~Fire safety during demolition shall comply with the applicable requirements of this code and the applicable provisions of Chapter 33 of the International Fire Code.~~

SECTION 3309 TEMPORARY HEATING EQUIPMENT

Add new text as follows

3309.1 Listed. Temporary heating devices shall be listed and labeled. The installation, maintenance and use of temporary heating devices shall be in accordance with the listing and the manufacturer's instructions.

3309.2 Oil-fired heaters. Oil-fired heaters shall comply with Section 603 of the International Fire Code.

3309.3 LP-gas heaters. Fuel supplies for liquefied-petroleum gas-fired heaters shall comply the International Fuel Gas Code and Chapter 61 of the International Fire Code.

3309.4 Refueling. Refueling operations for liquid-fueled equipment or appliances shall be conducted in accordance with Section 5705 of the International Fire Code. The equipment or appliance shall be allowed to cool prior to refueling.

3309.5 Installation. Clearance to combustibles from temporary heating devices shall be maintained in accordance with the labeled equipment. When in operation, temporary heating devices shall be fixed in place and protected from damage, dislodgement or overturning in accordance with the manufacturer's instructions.

3309.6 Supervision. The use of temporary heating devices shall be supervised and maintained only by competent

personnel.

SECTION 3310 PRECAUTIONS AGAINST FIRE

3310.1 Smoking. Smoking shall be prohibited except in areas approved by the fire code official. Signs shall be posted in accordance with Section 310 of the International Fire Code. In areas approved by the fire code official where smoking is permitted, ashtrays approved by the fire code official shall be provided in accordance with Section 310 of the International Fire Code.

3310.2 Combustible debris, rubbish and waste. Combustible debris, rubbish and waste material shall comply with the requirements of Sections 3310.2.1 through 3310.2.4.

3310.2.1 Combustible waste material accumulation. Combustible debris, rubbish and waste material shall not be accumulated within buildings.

3310.2.2 Combustible waste material removal. Combustible debris, rubbish and waste material shall be removed from buildings at the end of each shift of work.

3310.2.3 Rubbish containers. Where rubbish containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m³) are used for temporary storage of combustible debris, rubbish and waste material, they shall have tightfitting or self-closing lids. Such rubbish containers shall be constructed entirely of materials that comply with either of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m² when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m² in the horizontal orientation.

3310.2.4 Spontaneous ignition. Materials susceptible to spontaneous ignition, such as oily rags, shall be stored in a listed disposal container.

3310.3 Burning of combustible debris, rubbish and waste. Combustible debris, rubbish and waste material shall not be disposed of by burning on the site unless approved by the fire code official.

3310.4 Open burning. Open burning shall comply with Section 307 of the International Fire Code.

3310.5 Fire watch. Where required by the fire code official or the prefire plan established in accordance with Section 3314.3, a fire watch shall be provided for building demolition and for building construction that is hazardous in nature, such as temporary heating or hot work.

3310.5.1 Fire watch during construction. Where required by the fire code official, a fire watch shall be provided during nonworking hours for new construction that exceeds 40 feet (12 192 mm) in height above the lowest adjacent grade.

3310.5.2 Fire watch personnel. Trained personnel shall be provided to serve as an on-site fire watch. Fire watch personnel shall be provided with not fewer than one means for notification of the fire department which is acceptable to the fire code official, and the sole duty of such personnel shall be to perform constant patrols and watch for the occurrence of fire. The combination of fire watch duties and site security duties is acceptable. Fire watch personnel shall be trained in the use of portable fire extinguishers.

3310.5.3 Fire watch location and records. The fire watch shall include areas specified by the prefire plan established in accordance with Section 3314.3. The fire watch personnel shall keep a record of all time periods of duty, including a log entry each time the site was patrolled and each time a structure under construction was entered and inspected. The records and log entries shall be made available for review by the fire code official upon request.

3310.6 Cutting and welding. Welding, cutting, open torches and other hot work operations and equipment shall comply with Chapter 35 of the International Fire Code.

3310.7 Electrical. Temporary wiring for electrical power and lighting installations used in connection with the construction, alteration or demolition of buildings, structures, equipment or similar activities shall comply with NFPA 70.

3310.8 Cooking. Cooking shall be prohibited except in designated cooking areas approved by the fire code official. Signs with a minimum letter height of 3 inches (76 mm) and a minimum brush stroke of 1/2 inch (13 mm) shall be posted in

conspicuous locations in designated cooking areas and state:

DESIGNATED COOKING AREA

COOKING OUTSIDE OF A DESIGNATED COOKING

AREA IS PROHIBITED

SECTION 3311 FLAMMABLE AND COMBUSTIBLE LIQUIDS

3311.1 Storage of flammable and combustible liquids. Storage of flammable and combustible liquids shall be in accordance with Section 5704 of the International Fire Code.

3311.2 Class I and Class II liquids. The storage, use and handling of flammable and combustible liquids at construction sites shall be in accordance with Section 5706.2 of the International Fire Code. Ventilation shall be provided for operations involving the application of materials containing flammable solvents.

3311.3 Housekeeping. Flammable and combustible liquid storage areas shall be maintained clear of combustible vegetation and waste materials. Such storage areas shall not be used for the storage of combustible materials.

3311.4 Precautions against fire. Sources of ignition and smoking shall be prohibited in flammable and combustible liquid storage areas. Signs shall be posted in accordance with Section 310 of the International Fire Code.

3311.5 Handling at point of final use. Class I and II liquids shall be kept in safety containers approved by the fire code official.

3311.6 Leakage and spills. Leaking vessels shall be immediately repaired or taken out of service and spills shall be cleaned up and disposed of properly.

SECTION 3312 FLAMMABLE GASES

3312.1 Storage and handling. The storage, use and handling of flammable gases shall comply with Chapter 58 of the International Fire Code.

3312.2 Cleaning with flammable gas. Flammable gases shall not be used to clean or remove debris from piping open to the atmosphere.

3312.2.1 Pipe cleaning and purging. The cleaning and purging of flammable gas piping systems, including cleaning new or existing piping systems, purging piping systems into service and purging piping systems out of service, shall comply with NFPA 56.

Exceptions:

1. Compressed gas piping systems other than fuel gas piping systems where in accordance with Chapter 53 of the International Fire Code.
2. Piping systems regulated by the International Fuel Gas Code.
3. Liquefied petroleum gas systems in accordance with Chapter 61 of the International Fire Code.

SECTION 3313 EXPLOSIVE MATERIALS

3313.1 Storage and handling. Explosive materials shall be stored, used and handled in accordance with Chapter 56 of the International Fire Code.

3313.2 Supervision. Blasting operations shall be conducted in accordance with Chapter 56 of the International Fire Code.

3313.3 Demolition using explosives. Fire hoses approved by the fire code official for use by demolition personnel shall be maintained at the demolition site wherever explosives are used for demolition. Such fire hoses shall be connected to an water supply approved by the fire code official and shall be capable of being brought to bear on post-detonation fires anywhere on the site of the demolition operation.

SECTION 3314 OWNER'S RESPONSIBILITY FOR FIRE PROTECTION

3314.1 Program development and maintenance. The owner or owner's authorized agent shall be responsible for the development, implementation and maintenance of a written plan establishing a fire prevention program at the project site applicable throughout all phases of the construction, repair, alteration or demolition work. The plan shall address the requirements of this chapter and other applicable portions of this code, the duties of staff, and staff training requirements. The plan shall be made available for review by the fire code official upon request.

3314.2 Program superintendent. The owner shall designate a person to be the fire prevention program superintendent who shall be responsible for the fire prevention program and ensure that it is carried out through completion of the project. The fire prevention program superintendent shall have the authority to enforce the provisions of this chapter and other provisions as necessary to secure the intent of this chapter. Where guard service is provided in accordance with NFPA 241, the superintendent shall be responsible for the guard service.

3314.3 Prefire plans. The fire prevention program superintendent shall develop and maintain an prefire plan approved by the fire code official and in cooperation with the fire chief. The fire chief and the fire code official shall be notified of changes affecting the utilization of information contained in such prefire plans.

3314.4 Training. Training of responsible personnel in the use of fire protection equipment shall be the responsibility of the fire prevention program superintendent. Records of training shall be kept and made a part of the written plan for the fire prevention program.

3314.5 Fire protection devices. The fire prevention program superintendent shall determine that all fire protection equipment is maintained and serviced in accordance with this code. The quantity and type of fire protection equipment shall be approved by the fire code official. Fire protection equipment shall be inspected in accordance with the fire protection program.

3314.6 Hot work operations. The fire prevention program superintendent shall be responsible for supervising the permit system for hot work operations in accordance with Chapter 35 of the International Fire Code.

3314.7 Impairment of fire protection systems. Impairments to any fire protection system shall be in accordance with Section 901 of the International Fire Code.

3314.7.1 Smoke detectors and smoke alarms. Smoke detectors and smoke alarms located in an area where airborne construction dust is expected shall be covered to prevent exposure to dust or shall be temporarily removed. Smoke detectors and alarms that were removed shall be replaced upon conclusion of dust-producing work. Smoke detectors and smoke alarms that were covered shall be inspected and cleaned, as necessary, upon conclusion of dust-producing work.

3314.8 Temporary covering of fire protection devices. Coverings placed on or over fire protection devices to protect them from damage during construction processes shall be immediately removed upon the completion of the construction processes in the room or area in which the devices are installed.

SECTION 3315 FIRE REPORTING

3315.1 Emergency telephone. Emergency telephone facilities with ready access shall be provided in an a location approved by the fire code official at the construction site, or an equivalent means of communication approved by the fire code official shall be provided. The street address of the construction site and the emergency telephone number of the fire department shall be posted adjacent to the telephone. Alternatively, where an equivalent means of communication has been approved by the fire code official, the site address and fire department emergency telephone number shall be posted at the main entrance to the site, in guard shacks and in the construction site office.

SECTION 3316 ACCESS FOR FIRE FIGHTING

3316.1 Required access. Vehicle access approved by the fire code official for firefighting shall be provided to all construction or demolition sites. Vehicle access shall be provided to within 100 feet (30 480 mm) of temporary or permanent fire department connections. Vehicle access shall be provided by either temporary or permanent roads, capable of supporting vehicle loading under all weather conditions. Vehicle access shall be maintained until permanent fire\ apparatus access roads are available.

3316.2 Key boxes. Key boxes shall be provided as required by Chapter 5 of the International Fire Code.

SECTION 33093317 FIRE EXTINGUISHERS

~~[F] 3309.13317.1~~ **Where required.** Structures under construction, *alteration* or demolition shall be provided with not fewer than one ~~approved~~ portable fire extinguisher in accordance with Section 906, approved by the building official and the fire code official, and sized for not less than ordinary hazard as follows:

1. At each *stairway* on all floor levels where combustible materials have accumulated.
2. In every storage and construction shed.
3. Additional portable fire extinguishers shall be provided where special hazards exist, such as the storage and use of flammable and combustible liquids.

Delete without substitution

~~[F] 3309.2 Fire hazards.~~ The provisions of this code and the International Fire Code shall be strictly observed to safeguard against all fire hazards attendant upon construction operations.

SECTION 33103318 MEANS OF EGRESS

~~3310.13318.1~~ **Stairways required.** Where building construction exceeds 40 feet (12 192 mm) in height above the lowest level of fire department vehicle access, a temporary or permanent *stairway* shall be provided. As construction progresses, such *stairway* shall be extended to within one floor of the highest point of construction having secured decking or flooring.

~~[F] 3310.23318.2~~ **Maintenance of means of egress.** ~~Means~~ Required means of egress and required accessible *means of egress* shall be maintained at all times during construction, demolition, remodeling or *alterations* and *additions* to any building.

Exception: Existing *means of egress* need not be maintained where ~~approved~~

temporary *means of egress* and temporary accessible means of egress systems and facilities, approved by the building official and the fire code official, are provided.

SECTION 33113319 STANDPIPES

~~[F] 3311.13319.1~~ **Where required.** In buildings required to have standpipes by Section 905.3.1, not fewer than one standpipe shall be provided for use during construction. Such standpipes shall be installed prior to construction exceeding 40 feet (12 192 mm) in height above the lowest level of fire department vehicle access. Such standpipes shall be provided with fire department hose connections at locations adjacent to *stairways* complying with Section ~~3310.1-3318.1~~. As construction progresses, such standpipes shall be extended to within one floor of the highest point of construction having secured decking or flooring.

~~[F] 3311.23319.2~~ **Buildings being demolished.** Where a building is being demolished and a standpipe exists within such a building, such standpipe shall be maintained in an operable condition so as to be available for use by the fire department. Such standpipe shall be demolished with the building but shall not be demolished more than one floor below the floor being demolished.

~~[F] 3311.33319.3~~ **Detailed requirements.** Standpipes shall be installed in accordance with the provisions of Chapter 9.

Exception: Standpipes shall be either temporary or permanent in nature, and with or without a water supply, provided that such standpipes conform to the requirements of Section 905 as to capacity, outlets and materials.

SECTION 33123320 AUTOMATIC SPRINKLER SYSTEM

~~[F] 3312.13320.1~~ **Completion before occupancy.** In buildings where an *automatic sprinkler system* is required by this code or the International Fire Code, it shall be unlawful to occupy any portion of a building or structure until the *automatic sprinkler system* installation has been tested and approved by the building and fire code official, except as provided in Section ~~111.3-111.3~~ of this code or Section 105.3.4 of the International Fire Code.

~~[F] 3312.23320.2~~ **Operation of valves.** Operation of sprinkler control valves shall be permitted only by properly authorized personnel and shall be accompanied by notification of duly designated parties. When the sprinkler protection is being regularly turned off and on to facilitate connection of newly completed segments, the sprinkler control valves shall be checked at the end of each work period to ascertain that protection is in service.

SECTION 33133321 WATER SUPPLY FOR FIRE PROTECTION

~~[F] 3313-13321.1~~ **Where required.** ~~An approved~~ water supply for fire protection, either temporary or permanent, shall be approved by the building official and fire code official and made available as soon as combustible material arrives on the site.

~~SECTION 3314 FIRE WATCH DURING CONSTRUCTION~~

SECTION 3322 MOTORIZED CONSTRUCTION EQUIPMENT

3322.1 Conditions of use. Internal-combustion-powered construction equipment shall be used in accordance with all of the following conditions:

1. Equipment shall be located so that exhausts do not discharge against combustible material.
2. Exhausts shall be piped to the outside of the building.
3. Equipment shall not be refueled while in operation.
4. Fuel for equipment shall be stored in an area outside of the building which is approved by the fire code official.

SECTION 3323 SAFEGUARDING ROOFING OPERATIONS

3323.1 General. Roofing operations utilizing heat-producing systems or other ignition sources shall be conducted in accordance with Sections 3323.2 and 3323.3 and Chapter 35 of the International Fire Code.

3323.2 Asphalt and tar kettles. Asphalt and tar kettles shall be operated in accordance with Section 303 of the International Fire Code.

3323.3 Fire extinguishers for roofing operations. Fire extinguishers shall comply with Section 906. There shall be not less than one multiple-purpose portable fire extinguisher with a minimum 3-A 40-B:C rating on the roof being covered or repaired.

CHAPTER 35 REFERENCED STANDARDS

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

56--17:

Standard for Fire and Explosion Prevention during Cleaning and Purging of Flammable Gas Piping Systems

241--13:

Standard for Safeguarding Construction, Alteration, and Demolition Operations

Reason: This change takes the current requirements of Chapter 33 of the IFC and incorporates them into Chapter 33 of the IBC. It makes no changes in technical requirements and retains all requirements of both codes. Explanations of each editorial change is given section by section at the end of this reason statement.

The purview of the fire code committee for sections currently under their purview (indicated by an "[F]" before the appropriate sections), and the authority of the fire code official where the fire code official's approval is currently required, are preserved. The practice of having key fire safety provisions in the IBC that are maintained by the IFC committee and enforced by the fire code official is already established. Many provisions of Chapter 9 do this.

Requirements for fire safety are currently found in both the IBC and the IFC, with considerable overlap. For instance, requirements for fire extinguishers, means of egress, standpipes, sprinkler systems, and water supply are currently in both codes.

Most significant construction fires are the result of noncompliance with current code requirements. The consolidation of these chapters into the IBC will reduce the likelihood of code violations leading to fire, and will be beneficial for several other reasons. First, there are jurisdictions that do not adopt the IFC and the requirements will be more accessible to them. Second, enforcement activities for key provisions such as fire watches, a fire prevention program superintendent

and plan, temporary heating equipment safety, cooking areas, rubbish and debris disposal, hot work precautions, roofing precautions, and access for firefighting—all which appear in the IFC but not the IBC—are less likely to be neglected. Third, problems in correlation of overlapping requirements will be eliminated.

Here is a section-by-section explanation of modifications:

Chapter 33 title: changed to reflect the inclusion of IFC fire safety provisions.

3301.1: General: the scope is expanded to include the current scope of the Chapter 33 of the IFC, including required compliance with NFPA 241 for items not specifically addressed.

3301.2: Purpose: the IBC currently has no Purpose section, this is brought over from the IFC and modified to make it clear that fire safety is one purpose among others.

3301.3 Storage and placement: renumbering only.

3302.3 Fire safety during construction: deleted since requiring compliance with Chapter 33 of the IFC is no longer necessary; all the fire safety provisions of Chapter 33 of the IFC are being added here.

3303.7 Fire safety during demolition: deleted since requiring compliance with Chapter 33 of the IFC is no longer necessary; all the fire safety provisions of Chapter 33 of the IFC are being added here.

3309 TEMPORARY HEATING EQUIPMENT: all subsections 3309.1 through 3309.6 are unchanged from parallel provisions in Section 3303 of the IFC, except to add references to the IFC where appropriate.

3310 PRECAUTIONS AGAINST FIRE: all subsections 3310.1 through 3310.8 are unchanged from parallel provisions in Section 3304 of the IFC, except to add reference to the IFC where appropriate and editorial modifications to preserve the authority of the fire code official in subsections 3310.1, 3310.3, 3310.5.2, and 3310.8.

3311 FLAMMABLE AND COMBUSTIBLE LIQUIDS: all subsections 3311.1 through 3311.6 are unchanged from parallel provisions in Section 3305 of the IFC, except to add references to the IFC where appropriate.

3312 FLAMMABLE GASES: all subsections 3312.1 through 3312.2.1 are unchanged from parallel provisions in Section 3306 of the IFC, except to add references to the IFC where appropriate.

3313 EXPLOSIVE MATERIALS: all subsections 3313.1 through 3313.3 are unchanged from parallel provisions in Section 3307 of the IFC, except to add references to the IFC where appropriate, and editorial modifications to preserve the authority of the fire code official in subsection 3313.3.

3314 OWNER'S RESPONSIBILITY FOR FIRE PROTECTION: all subsections 3314.1 through 3314.8 are unchanged from parallel provisions in Section 3308 of the IFC, except to add references to the IFC where appropriate, and editorial modifications to preserve the authority of the fire code official in subsection 3314.3.

3315 FIRE REPORTING: Subsection 3315.1 is unchanged from parallel provisions in Section 3309 of the IFC except to editorial modification to preserve the authority of the fire code official.

3316 ACCESS FOR FIRE FIGHTING: Subsections 3316.1 AND 3316.2 are unchanged from parallel provisions in Section 3310 of the IFC, except to add a reference to the IFC where appropriate in 3316.2 and an editorial modification to preserve the authority of the fire code official in subsection 3316.1.

3317 FIRE EXTINGUISHERS is current IBC Section 3309, which parallel the current provisions of IFC 3315 Portable Fire Extinguishers. The requirements were identical except for minor editorial wording such as “not less than” vs. “not fewer than,” and “including, but not limited to” in one of the items. The wording of the IFC was used, and an editorial change was made to 3317.1 to retain the authority of the fire code official in addition to the building official for enforcement, since the same requirement was found in both codes.

(Current IBC subsection 3309.2 Fire hazards was deleted; it is no longer necessary since all fire safety provisions of Chapter 33 of the IFC are being added.)

3318 MEANS OF EGRESS is current IBC Section 3310, which parallels the current provisions of IFC 3311 Means of Egress.

3318.1 Stairways required: renumbered only.

3318.2 Maintenance of means of egress: the requirements of this subsection were essentially the same as IFC Section 3311.2, but the wording differed, especially for the exception. The word "required" in front of means of egress was brought over from the fire code, and the exception was modified to incorporate accessible means of egress, which appeared in the fire code. The revisions were made to incorporate the intent of both codes, which were thought to be the same. Editorial changes were made to retain the authority of the fire code official for approval since similar provisions for temporary means of egress were found in both codes.

3319 STANDPIPES is current IBC Section 3311, which parallel the current provisions of IFC 3313. Subsections 3319.1, 3319.2, and 3319.3 have been renumbered only.

3320 AUTOMATIC SPRINKLER SYSTEM is current IBC Section 3312, which parallel the current provisions of IFC 3314.

3320.1 Completion before occupancy: editorially modified to retain references to code sections in the IBC and IFC as they appear in their respective codes, and to retain the authority of both the building officials and fire code official from the respective codes.

3320.2 Operation of valves: renumbered only. "Shall be permitted" as used by the IBC was retained instead of "shall be allowed" per the IFC.

3321 WATER SUPPLY FOR FIRE PROTECTION is current IBC Section 3313, which parallel the current provisions of IFC 3312.

3321.1 Where required: editorial changes were made to make it clear that approvals are needed from both the building official and the fire code official, since approval is currently required by each code.

3314 FIRE WATCH DURING CONSTRUCTION was deleted since the identical requirement appears in proposed Section 3310.5.1, brought over from the IFC.

3322 MOTORIZED CONSTRUCTION EQUIPMENT is current section 3316 of the IFC.

3322.1 Conditions of use: an editorial change was made in item 4 to retain the authority of the fire code official.

3323 SAFEGUARDING ROOFING OPERATIONS is current section 3317 the IFC. Editorial changes were made to subsections 3323.1 and 3323.1 to make appropriate reference to the IFC for referenced code sections.

Here are the current IFC sections and their corresponding sections in this proposal:

IFC Section 3301: it remains in the IFC.

IFC Section 3302: deleted as unnecessary to follow IBC convention.

IFC 3303: proposed IBC 3309

IFC 3304: proposed IBC 3310

IFC 3305: proposed IBC 3311

IFC 3306: proposed IBC 3312

IFC 3307: proposed IBC 3313

IFC 3308: proposed IBC 3314

IFC 3309: proposed IBC 3315

IFC 3310: proposed IBC 3316

IFC 3311: proposed IBC 3318

IFC 3312: proposed IBC 3321

IFC 3313: proposed IBC 3319

IFC 3314: proposed IBC 3320

IFC 3315: proposed IBC 3317

IFC 3316: proposed IBC 3322

IFC 3317: proposed IBC 3323

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Currently the IBC requires that all the fire safety requirements of Chapter 33 of the IBC be enforced (IBC Section 3302.3). Therefore the moving of these provisions into the IBC will have no effect on the cost of construction.

Analysis: NFPA 56 and NFPA 241 are already referenced in the I-codes. Note that there has been erratum that changed the edition of NFPA 241 referenced in the 2018 IFC to the 2013 edition.

F262-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal would be difficult to enforce and time consuming. Some jurisdictions do not have a fire department. Putting the burden on the owner and the construction manager is the proper way to handle this situation. This complicates and muddies the code and makes the construction manager's job more difficult. (Vote: 14-0)

Assembly Action:

None

F262-18 Part II

Proposed Change as Submitted

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com)

2018 International Fire Code

Revise as follows

SECTION 33083303 OWNER'S RESPONSIBILITY FOR RESPONSIBILITY FOR FIRE PROTECTION

~~3308-1~~**3303.1 Program development and maintenance.** The *owner* or *owner's* authorized agent shall be responsible for the development, implementation and maintenance of a written plan establishing a fire prevention program at the project site applicable throughout all phases of the construction, repair, *alteration* or demolition work. The plan shall address the requirements of this chapter and other applicable portions of this code, the duties of staff, and staff training requirements. The plan shall be made available for review by the *fire code official* upon request.

~~3308-2~~**3303.2 Program superintendent.** The *owner* shall designate a person to be the fire prevention program superintendent who shall be responsible for the fire prevention program and ensure that it is carried out through completion of the project. The fire prevention program superintendent shall have the authority to enforce the provisions of this chapter and other provisions as necessary to secure the intent of this chapter. Where guard service is provided in accordance with NFPA 241, the superintendent shall be responsible for the guard service.

Add new text as follows

3303.3 Daily fire safety inspection. The fire prevention program superintendent shall be responsible for completion of a daily fire safety inspection at the project site. Each day, all building and outdoor areas shall be inspected to ensure compliance with the inspection list in this section. The results of each inspection shall be documented and maintained on site until a certificate of occupancy has been issued. Documentation shall be immediately available on site for presentation to the fire code official upon request.

Failure to properly conduct, document and maintain documentation required by this section shall constitute an unlawful act in accordance with Section 110.1 and shall result in the issuance of a notice of violation in accordance with Section 110.3 to the fire prevention program superintendent. Upon the third offence in any 30-day period, offense, the fire code official is authorized to issue a stop work order shall be issued in accordance with Section 112, and work shall not resume until satisfactory assurances of future compliance have been presented to and approved by the fire code official.

1. Any contractors entering the site to perform hot work each day have been instructed in hot work safety requirements in Chapter 35 and hot work is only performed in areas approved by the fire prevention superintendent.
2. Temporary heating equipment is maintained away from combustible materials in accordance with the equipment manufacturer's instructions.
3. Combustible debris, rubbish and waste material is removed from the building in areas where work is not being performed.
4. Temporary wiring does not have exposed conductors.
5. Flammable liquids and other hazardous materials are stored in locations that have been approved by the fire prevention superintendent when not involved in work that is being performed.
6. Fire apparatus access roads required by Section 3310 are maintained clear of obstructions that reduce the width of the usable roadway to less than 20 feet.
7. Fire hydrants are clearly visible from access roads and are not obstructed.
8. The location of fire department connections to standpipe and in-service sprinkler systems are clearly identifiable from the access road and such connections are not obstructed.
9. Standpipe systems are in service and continuous to the highest work floor, as specified in Section 3313.
10. Portable fire extinguishers are available in locations required by Section 3315 and 3317.3.

~~3308-3~~**3303.4 Prefire plans.** The fire prevention program superintendent shall develop and maintain an *approved* prefire plan in cooperation with the fire chief. The fire chief and the *fire code official* shall be notified of changes affecting the utilization of information contained in such prefire plans.

~~3308-4~~**3303.5 Training.** Training of responsible personnel in the use of fire protection equipment shall be the responsibility of the fire prevention program superintendent. Records of training shall be kept and made a part of the

written plan for the fire prevention program.

3308-53303.6 Fire protection devices. The fire prevention program superintendent shall determine that all fire protection equipment is maintained and serviced in accordance with this code. The quantity and type of fire protection equipment shall be *approved*. Fire protection equipment shall be inspected in accordance with the fire protection program.

3308-63303.7 Hot work operations. The fire prevention program superintendent shall be responsible for supervising the permit system for hot work operations in accordance with Chapter 35.

3308-73303.8 Impairment of fire protection systems. Impairments to any *fire protection system* shall be in accordance with Section 901.

3308-7-13303.8.1 Smoke detectors and smoke alarms. Smoke detectors and smoke alarms located in an area where airborne construction dust is expected shall be covered to prevent exposure to dust or shall be temporarily removed. Smoke detectors and alarms that were removed shall be replaced upon conclusion of dust-producing work. Smoke detectors and smoke alarms that were covered shall be inspected and cleaned, as necessary, upon conclusion of dust-producing work.

3308-83303.9 Temporary covering of fire protection devices. Coverings placed on or over fire protection devices to protect them from damage during construction processes shall be immediately removed upon the completion of the construction processes in the room or area in which the devices are installed.

Reason: The number and magnitude of construction fires in the past few years has been well documented in NFPA loss reports and on national news. Many of these fires are not "accidental," but are instead the result of inexcusable carelessness...failing to follow basic fire safety practices. For some reason, it seems that there has been a loss of attention to fire safety at construction sites. Although major construction fires represent a relatively small percentage of the overall population of buildings under construction at any given time, the consequences of these fires is seeming to impact nearby buildings and neighborhoods with increasing frequency and increasing levels of damage. Contractors are busy trying to stay on schedule. Fire inspectors show up to look at specific inspection tasks, such as sprinkler inspections, without having time to look at construction fire safety concerns. Building inspectors are on tight inspection schedules and may not have time or be trained to look for fire safety concerns. It seems that nobody is focused on construction site fire safety. Ultimately, this responsibility falls on the owner and the fire prevention program superintendent to ensure compliance, and there needs to be a viable way to verify that the responsible parties are doing their code-required jobs.

Hence, this proposal is intended to serve as a hammer to make sure that there is a motivation to pay attention to basic fire safety requirements and to pin this responsibility on the owner and the fire prevention program superintendent. By requiring daily inspections and documentation, any fire or building inspector can simply request to see the checklist when at the site for any reason, and a clear enforcement path is specified when non-compliance is encountered. While it's true that someone could just do the paperwork exercise, the liability associated with fraudulently documenting compliance in the event of an incident would be significant, and presumably, there will be cases where code officials will spot check compliance.

Unfortunately, there is no perfect solution to this issue. But this proposal represents a significant step forward with regard to getting responsible parties to pay attention to a significant and ongoing issue.

This proposal also recommends relocating Section 3308 to Section 3303. This is perhaps the most important part of Chapter 33, and the requirements need to be right up front.

Cost Impact: The code change proposal will increase the cost of construction. The additional time required for personnel to complete the tasks required by this section will increase the cost of construction.

F263-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 3303.3 Daily fire safety inspection. The fire prevention program superintendent shall be responsible for completion of a daily fire safety inspection at the project site. Each day, all building and outdoor areas shall be inspected to ensure compliance with the inspection list in this section. The results of each inspection shall be documented and maintained on site until a certificate of occupancy has been issued. Documentation shall be immediately available on site for presentation to the fire code official upon request.

Failure to properly conduct, document and maintain documentation required by this section shall constitute an unlawful act in accordance with Section 110.1 and shall result in the issuance of a notice of violation in accordance with Section 110.3 to the fire prevention program superintendent. Upon the third ~~offense in any 30-day period,~~ offense, the fire code official is authorized to issue a stop work order ~~shall be issued~~ in accordance with Section 112, and work shall not resume until satisfactory assurances of future compliance have been presented to and approved by the fire code official.

1. Any contractors entering the site to perform hot work each day have been instructed in hot work safety requirements in Chapter 35 and hot work is only performed in areas approved by the fire prevention superintendent.
2. Temporary heating equipment is maintained away from combustible materials in accordance with the equipment manufacturer's instructions.
3. Combustible debris, rubbish and waste material is removed from the building in areas where work is not being performed.
4. Temporary wiring does not have exposed conductors.
5. Flammable liquids and other hazardous materials are stored in locations that have been approved by the fire prevention superintendent when not involved in work that is being performed.
6. Fire apparatus access roads required by Section 3310 are maintained clear of obstructions that reduce the width of the usable roadway to less than 20 feet.
7. Fire hydrants are clearly visible from access roads and are not obstructed.
8. The location of fire department connections to standpipe and in-service sprinkler systems are clearly identifiable from the access road and such connections are not obstructed.
9. Standpipe systems are in service and continuous to the highest work floor, as specified in Section 3313.
10. Portable fire extinguishers are available in locations required by Section 3315 and 3317.3.

Committee Reason: The proposal was approved based upon the need for more tools for the code official to address hazards on construction sites. This provides a daily emphasis on the jobsite that they have a plan in place that needs to be followed. The checklist was felt to be helpful especially for alterations where the building may be occupied. The modification simply provides the authority to the fire code official to issue a stop work order versus it being mandatory after 30 days. This gives more flexibility to address each situation individually. There was some concern that this should be focused upon larger projects. There is a concern with movement of administrative provisions outside of Chapter 1. Some concern that projects may be shutdown based upon paperwork not being complete. There was also a suggestion that this be refined to coordinate the checklist with what is already required in Chapter 33. (Vote: 11-3)

F263-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Catlett, J.D. Catlett Code Consulting, LLC, representing BOMA International (jcatlett@boma.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

3303.3 Daily fire safety inspection. The fire prevention program superintendent shall be responsible for completion of a daily fire safety inspection at the project site. Each day, all building and outdoor areas shall be inspected to ensure compliance with the inspection list in this section. The results of each inspection shall be documented and maintained on site until a certificate of occupancy has been issued. Documentation shall be immediately available on site for presentation to the fire code official upon request.

~~Failure to properly conduct, document and maintain documentation required by this section shall constitute an unlawful act in accordance with Section 110.1 and shall result in the issuance of a notice of violation in accordance with Section 110.3 to the fire prevention program superintendent. Upon the third offense, the fire code official is authorized to issue a stop work order in accordance with Section 112, and work shall not resume until satisfactory assurances of future compliance have been presented to and approved by the fire code official. be subject to actions by the fire code official as provided in Sections 110 and 112.~~

1. Any contractors entering the site to perform hot work each day have been instructed in hot work safety requirements in Chapter 35 and hot work is only performed in areas approved by the fire prevention superintendent.
2. Temporary heating equipment is maintained away from combustible materials in accordance with the equipment manufacturer's instructions.
3. Combustible debris, rubbish and waste material is removed from the building in areas where work is not being performed.
4. Temporary wiring does not have exposed conductors.
5. Flammable liquids and other hazardous materials are stored in locations that have been approved by the fire prevention superintendent when not involved in work that is being performed.
6. Fire apparatus access roads required by Section 3310 are maintained clear of obstructions that reduce the width of the usable roadway to less than 20 feet.
7. Fire hydrants are clearly visible from access roads and are not obstructed.
8. The location of fire department connections to standpipe and in-service sprinkler systems are clearly identifiable from the access road and such connections are not obstructed.
9. Standpipe systems are in service and continuous to the highest work floor, as specified in Section 3313.
10. Portable fire extinguishers are available in locations required by Section 3315 and 3317.3.

Commenter's Reason: BOMA agrees with the intended language that adds the fire safety checklist to the responsibilities of a construction operation. However, administrative provisions should not be part of technical provisions. Sections 110 and 112 provide adequate direction and authority to address violations of the IFC. Additionally, the code should allow the fire official flexibility to gauge the level of violation of this section without direction that three violations constitute actions by the fire code official to stop work. A single violation could be egregious enough to warrant a stop-work order if fire safety violations noted on site constitute an immediate hazard. On the other hand, failing to check a box while it is obvious that onsite fire safety practices are being observed and promoted should not be grounds alone for stopping work.

The provisions as written do not establish a time frame for non-compliance. An example would be if the checklist is regularly completed and site fire safety compliance is obvious, but on three days during a six month period the checklist were not available due to oversight or misplacement by the job superintendent, the project would be subject to a stop-work order. The fire code official should have the flexibility to gauge the over-all compliance when considering stopping work. Although the provisions do not mandate action by the fire code official, an overzealous or new fire code official/fire inspector may cause project disruption without considering all of the elements addressed above.

BOMA feels that steps to insure compliance belong in the administrative provisions of the IFC and that the technical provisions should address desired technical outcomes.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no cost impact as this public comment simply references existing requirements in Chapter 1. The overall code change will increase the cost of construction due to the requirement for daily inspections.

Public Comment 2:

Proponent: William Koffel, representing Self (wkoffel@koffel.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Fire Code

3303.3 Daily fire safety inspection. The fire prevention program superintendent shall be responsible ~~for to verify~~

completion of a daily fire safety inspection at the project site. Each day, all building and outdoor areas shall be inspected to ensure compliance with the inspection list in this section. The results of each inspection shall be documented and maintained on site until a certificate of occupancy has been issued. Documentation shall be immediately available on site for presentation to the fire code official upon request.

Exception: The frequency of inspection are not required to occur daily where the frequency of inspections are performed and documented in accordance with an approved fire prevention program.

~~Failure to properly conduct, document and maintain documentation required by this section shall constitute an unlawful act in accordance with Section 110.1 and shall result in the issuance of a notice of violation in accordance with Section 110.3 to the fire prevention program superintendent. Upon the third offense, the fire code official is authorized to issue a stop work order in accordance with Section 112, and work shall not resume until satisfactory assurances of future compliance have been presented to and approved by the fire code official.~~

1. Any contractors entering the site to perform hot work each day have been instructed in hot work safety requirements in Chapter 35 and hot work is only performed in areas approved by the fire prevention superintendent.
2. Temporary heating equipment is maintained away from combustible materials in accordance with the equipment manufacturer's instructions.
3. Combustible debris, rubbish and waste material is removed from the building in areas where work is not being performed.
4. Temporary wiring does not have exposed conductors.
5. Flammable liquids and other hazardous materials are stored in locations that have been approved by the fire prevention superintendent when not involved in work that is being performed.
6. Fire apparatus access roads required by Section 3310 are maintained clear of obstructions that reduce the width of the usable roadway to less than 20 feet.
7. Fire hydrants are clearly visible from access roads and are not obstructed.
8. The location of fire department connections to standpipe and in-service sprinkler systems are clearly identifiable from the access road and such connections are not obstructed.
9. Standpipe systems are in service and continuous to the highest work floor, as specified in Section 3313.
10. Portable fire extinguishers are available in locations required by Section 3315 and 3317.3.

3303.3.1 Violations. Failure to properly conduct, document and maintain documentation required by Section 3303.3 shall constitute an unlawful act in accordance with Section 110.1 and shall result in the issuance of a notice of violation in accordance with Section 110.3 to the fire prevention program superintendent. Upon the third offense, the fire code official is authorized to issue a stop work order in accordance with Section 112, and work shall not resume until satisfactory assurances of future compliance have been presented to and approved by the fire code official.

Commenter's Reason: The Public Comment accomplishes two objectives:

First, the language as approved by the Committee implies the the fire prevention program superintendent must be the one who performs and documents the inspections. On many construction projects, the actual inspections are delegated to a contractor. The owner, through the fire prevention program superintendent, should be responsible to verify that the inspections are being performed and documented. The proposed language clarifies what is believed to be the intent of the submitter of the proposal.

Secondly, an inspection frequency of daily may not be appropriate in all instances. In most instances the exception is likely to be used to allow inspections to be performed less than daily and that may be appropriate for some construction sites. However, there may be instances in which the fire prevention program will require inspections to be more frequent than daily. By referring to the approved fire prevention program, a dialogue must occur between the owner and the fire official to determine the key components of the fire prevention program and the fire official will approve the program.

Note for clarity of the new exception the second paragraph was moved to a new subsection 3303.3.1.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The impact of the Public Comment language will not increase the cost of construction and in some instances might decrease the cost of construction because it may decrease the frequency of some inspections.

Proposed Change as Submitted

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Revise as follows

3304.5 Fire watch. Where required by the *fire code official* or the ~~pre-fire site safety~~ plan established in accordance with Section ~~3308.3~~3308.1, a fire watch shall be provided for building demolition and for building construction that is hazardous in nature, such as temporary heating or hot work: construction.

3304.5.1 Fire watch during construction. ~~Where required by the fire code official, a~~ fire watch shall be provided during nonworking hours for new construction that exceeds 40 feet (12 192 mm) in height above the lowest adjacent grade at any point along the building perimeter, any new multi-story construction with an aggregate area exceeding 50,000 sq. ft. per story or as required by the fire code official.

3304.5.2 Fire watch personnel. ~~Trained personnel shall be provided to serve as an on-site fire watch. Fire watch personnel shall be provided with not fewer than one approved means for notification of the fire department, and the sole duty of such personnel shall be to perform constant patrols and watch for the occurrence of fire. The combination of fire watch duties and site security duties is acceptable. Fire watch personnel shall be trained in the use of portable fire extinguishers in accordance with this section.~~

Add new text as follows

3304.5.2.1 Duties. The primary duty of fire watch personnel shall be to perform constant patrols and watch for the occurrence of fire. The combination of fire watch duties and site security duties is acceptable.

3304.5.2.2 Training. Personnel shall be trained to serve as an on-site fire watch. Training shall include the use of portable fire extinguishers. Fire extinguishers and fire reporting shall be in accordance with Section 3309.

3304.5.2.3 Means of notification. Fire watch personnel shall be provided with not fewer than one approved means for notifying the fire department.

Revise as follows

3304.5.3 Fire watch location and records. The fire watch shall include areas specified by the ~~pre-fire site safety~~ plan established in accordance with Section 3308.3. ~~The fire watch personnel shall keep a record of all time periods of duty, including a log entry each time the site was patrolled and each time a structure under construction was entered and inspected. The records and log entries shall be made available for review by the fire code official upon request.~~3308.

3304.5.4 Fire Watch Records. Fire watch personnel shall keep a record of all time periods of duty, including the log entry each time the site was patrolled, and each time a structure was entered and inspected. Records shall be made available for review by the fire code official upon request.

3304.8 Cooking. Cooking shall be prohibited except in *approved* designated cooking areas separated from combustible materials by a minimum of ten feet. Signs with a minimum letter height of 3 inches (76 mm) and a minimum brush stroke of 1/2 inch (13 mm) shall be posted in conspicuous locations in designated cooking areas and state:
DESIGNATED COOKING AREA

COOKING OUTSIDE OF A DESIGNATED COOKING AREA IS PROHIBITED

3308.1 Program development and maintenance. The owner or owner's authorized agent shall be responsible for the development, implementation and maintenance of ~~a~~an approved written site safety plan establishing a fire prevention program at the project site applicable throughout all phases of the construction, repair, alteration or demolition work. The plan shall address the requirements of this chapter and other applicable portions of this code, the duties of staff, and staff training requirements. The plan shall be submitted and approved before a building permit is issued. Any changes to the plan shall be made available for review by the fire code official upon request.submitted for approval.

Add new text as follows

3308.1.1 Components of Site Safety Plans. Site Safety Plans shall include the following as applicable:

1. Name and contact information of Site Safety Director
2. Documentation of the training of the Site Safety Director and fire watch personnel
3. Procedures for reporting emergencies
4. Fire Department Vehicle Access routes
5. Location of fire protection equipment including portable fire extinguishers, standpipes, fire department connections and fire hydrants.
6. Smoking and cooking policy, designated areas to be used when approved, and signage locations in accordance with 3304.8.
7. Location and safety considerations for temporary heating equipment
8. Hot work permit plan
9. Plans for control of combustibile waste material
10. Locations and methods for storage and use of flammable and combustibile liquids and other hazardous materials
11. Provisions for site security
12. Changes that affect this plan
13. Other site-specific information required by the Fire Code Official

Revise as follows

3308.2 ~~Program superintendent.~~Site Safety Director. ~~The owner shall designate a person to be the fire prevention program superintendent who~~ site safety director. ~~The site safety director shall be responsible for the fire prevention program and ensure that it is carried out through completion of the project. The fire prevention program superintendent ensuring compliance with the site safety plan. The site safety director shall have the authority to enforce the provisions of this chapter and other provisions as necessary to secure the intent of this chapter. Where guard service is provided in accordance with NFPA 241, the superintendent~~ site safety director shall be responsible for the guard service.

3308.3 ~~Prefire plans.~~Qualifications. ~~The fire prevention program superintendent shall develop and maintain an approved~~ prefire plan in cooperation with the fire chief. The fire chief and the fire code official shall be notified of changes affecting the utilization of information contained in such prefire plans. ~~Site Safety Director shall acquire training specific to their roles and responsibilities. Upon request, the training and qualifications of the Site Safety Director shall be submitted to the Fire Code Official for approval.~~

3308.4 Training. ~~Training of fire watch and other responsible personnel in the use of fire protection equipment shall be the responsibility of the fire prevention program superintendent.~~ site safety director. ~~Records of training shall be kept and made a part of the written plan for the fire prevention program.~~ site safety plan.

3308.5 Fire protection devices. ~~The fire prevention program superintendent shall determine~~ Site Safety Director shall ensure ~~that all fire protection equipment is maintained and serviced in accordance with this code. The quantity and type of fire protection equipment shall be approved. Fire protection equipment shall be inspected in accordance with the fire protection program.~~

3308.5 Fire protection devices. ~~The fire prevention program superintendent shall determine that all fire protection equipment is maintained and serviced in accordance with this code. The quantity and type of fire protection equipment shall be approved. Fire protection equipment shall be inspected in accordance with the fire protection program.~~

3308.6 Hot work operations. ~~The fire prevention program superintendent shall be responsible for supervising the permit system for~~ Site Safety Director shall ensure hot work operations and permit procedures are ~~in accordance with Chapter 35.~~

3308.7 Impairment of fire protection systems. ~~Impairments~~ The Site Safety Director shall ensure impairments to any fire protection system shall be ~~are~~ in accordance with Section 901.

3308.8 Temporary covering of fire protection devices. ~~Coverings placed on or over fire protection devices to protect them from damage during construction processes shall be immediately removed upon the completion of the construction processes in the room or area in which the devices are installed.~~

501.3 Construction documents. ~~Construction documents for proposed fire apparatus access, location of fire lanes, security gates across fire apparatus access roads and construction documents and hydraulic calculations for fire hydrant~~

systems shall be submitted to the fire department for review and approval prior to construction.

Add new text as follows

501.3.1 Site Safety Plan. The owner or owner's authorized agent shall be responsible for the development, implementation and maintenance of an approved written site safety plan in accordance with Section 3308.

SITE SAFETY PLAN

A plan developed to establish a fire prevention program at a construction site.

Reason: Fires in buildings under construction have, unfortunately, become routine. Fire departments across the United States are being stressed beyond their limits by these fires, and communities are being subjected to all of the negative consequences of losing major projects and draining fire protection resources. Virtually every national organization with a stake in this issue are wrestling with solutions. Part of the solution is to provide on-site safety supervision throughout the construction project. This code change will refine and clarify current requirements, and will require that the site safety plans be submitted with other construction documents in order to inform the building officials of their existence and their requirements. Specifically:

3304.5 This section has been reformatted for clarity.

3304.5.1 Makes a fire watch mandatory for buildings above 40 ft. in height or multi-story construction with an aggregate area exceeding 50,000 sq. ft. These buildings are large enough to create a significant loss to a community, endanger firefighters, and consume resources at an extraordinary rate if the building burns.

3304.5.2.1 maintains the requirement that the primary role of fire watch personnel is to watch for fires, but may also serve as security.

3305.2.2 Maintains current requirements for training fire watch personnel

3304.5.2.3 Requires the fire watch person to have a means to notify the fire department.

3304.8 introduces a requirement for separating the construction site from cooking operations.

3308.1 introduces a new requirement for the site safety plan to be submitted for approval before a building permit is issued. This is intended to highlight the importance of having a plan, and getting it into the hands of the inspectors before the building is actually under construction.

3308.1.1 outlines the content required for a site safety plan.

3308.2 simply changes the nomenclature from "fire prevention program superintendent" to "site safety director".

3308.3 requires the site safety director to be trained in the duties of the job

3308.4 updates the verbiage of the existing requirements

3308.5 updates the language and removes an ambivalent requirement for the "quantity and type of fire protection equipment" to be approved; it also removes language about inspecting the equipment because that is deemed to be redundant language

3308.6 inserts a reference to Chapter 35 for hot work and updates the language.

Section 501.3.1 is updated to require a site safety plan and place responsibility on the owner.

Finally, a definition for site safety plan is added.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will increase the cost of construction

it's likely that this code change will have a minimal, but increased cost impact. Many construction sites already comply with these provisions; for those that don't, the cost of added security and development of a site safety plan will be additional costs.

F264-18

Public Hearing Results

Errata:

3304.5.2.2 Training. Personnel shall be trained in to serve as an on-site fire watch. Training shall include the use of portable fire extinguishers. Fire extinguishers and fire reporting shall be in accordance with Section 3309.

3304.5.3 Fire watch location and records. The fire watch shall include areas specified by the prefire site safety plan plan established in accordance with Section 3308.

~~3308.5.4~~ **3304.5.4 Fire Watch Records.** Fire watch personnel shall keep a record of all time periods of duty, including the log entry each time the site was patrolled, and each time a structure was entered and inspected. Records shall be made available for review by the fire code official upon request.

Committee Action:

As Submitted

Committee Reason: This proposal was approved as it was seen a good companion change to code change proposal F263-18. In addition, the term "site safety plan" was seen as better terminology than "pre-fire plan." It was agreed that requiring the site safety plan to be approved by the fire code official is necessary. Allowing security to be used for fire watch was seen as a good use of resources. (Vote: 14-0)

Assembly Action:

None

F264-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Catlett, representing BOMA International (jcatlett@boma.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

3308.1 Program development and maintenance. The owner or owner s authorized agent shall be responsible for the development, implementation and maintenance of an approved written site safety plan establishing a fire prevention program at the project site applicable throughout all phases of the construction, repair, alteration or demolition work. The plan shall address the requirements of this chapter and other applicable portions of this code, the duties of staff, and staff training requirements. The plan shall be submitted and approved before a building permit is issued, Any changes to the plan shall be submitted for approval. Where required by the fire code official, a pre-construction meeting shall be required before construction proceeds beyond the foundation.

Commenter's Reason: The code change adds necessary fire safety protection for construction projects. However, it stops short of one of the most important elements; communication. This public comment adds an important element that many fire code officials may have not considered. Having a pre-construction or post foundation permit conference to discuss the site safety plan allows for the direct communication to lay the ground rules and open communications for all parties to the safe building team. This is not a mandate for departments with limited staffing or resources. However, it brings in a concept found in the IEBC that promotes discussion and understanding of requirements.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction adding a meeting at the fire code officials request will not add to the cost of construction.

Public Comment 2:

Proponent: John Catlett, representing BOMA International (jcatlett@boma.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

3304.5.2 Fire watch personnel. Fire watch personnel shall be provided in accordance with this section. Buildings or campus facilities that employ twenty-four hour security, have an on-site police department, or that maintain an on-site fire department shall be approved by the fire code official where it has been demonstrated that they meet the requirements of this section and are able to perform the functions set out by this code.

Commenter's Reason: As the provisions are currently written, one would believe that the owner or their designee would be required to employ a separate and distinct fire watch or service when construction exceeds the thresholds established. Many large buildings, college and university campuses, large campus type manufacturing facilities, and similar establishments have on site security forces capable of serving as a fire watch. For example, Colonial Williamsburg located in Virginia has a dedicated police force responsible for all of the buildings and facilities that make up Colonial Williamsburg. As part of the site safety plan approval process, the fire code official can evaluate the capabilities of their staff to carry out the requirements of a fire watch and ability to adequately provide coverage. Many large buildings and manufacturing facilities provide the same. The added language provides clarity for these types of special operations without adding the additional cost of an outside fire watch.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The public comment may reduce the cost of construction because it may provide additional persons that can undertake the fire watch from the building or facility without having to pay outside personnel or the fire department.

Public Comment 3:

Proponent: Billie Zidek, APPA, representing APPA requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

3304.5 Fire watch. Where required by the *fire code official* or the site safety plan established in accordance with Section 3308.1, a fire watch shall be provided for building ~~demolition and~~ Type III and V building construction or for building construction that is hazardous in nature, such as temporary heating or hot work.

3304.5.1 Fire watch during construction. A fire watch shall be provided during nonworking hours for ~~new construction~~ construction defined in Section 3304.5 that is new and that exceeds 40 feet (12 192 mm) in height above the lowest adjacent grade at any point along the building perimeter, any new multi-story construction with an aggregate area exceeding 50,000 sq. ft. per story or as required by the fire code official. Unoccupied buildings under renovation or construction that have functioning fire alarm system as approved by the fire code official are exempt from this requirement.

3308.3 Qualifications. The Site Safety Director shall acquire training specific to their roles and responsibilities. Upon request, the training and qualifications of the Site Safety Director shall be submitted to the Fire Code Official ~~for approval~~.

Commenter's Reason: APPA applauds efforts to improve fire safety at the construction site. However, the emphasis for fire watches should be placed on Type III and V buildings and/or those where hot work and temporary heating is part of the construction. We have proposed recommended language in 3304.5.

The language in this proposal as currently written does not address buildings undergoing renovations or construction where existing fire alarm systems are functioning and active. Under such circumstances the need for a fire watch certainly does not exist. We have proposed recommended language in 3304.5.1 that would remove the Fire watch requirement under such conditions.

We also note that Section 3308.3 would require under F264-18 that Fire Code Officials approve the training and qualifications of the Site Safety Director, however, there is no description or explanation of the criteria used by the Fire Code Official to substantiate director training and qualifications. We recommend changes to the language that would still require the director's credentials to be submitted to fire code officials, but not for approval.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. These changes should partially reduce the increase in cost of construction that the original proposal would produce.

Public Comment 4:

Proponent: Tien Peng, representing National Ready Mixed Concrete Association (tpeng@nrmca.org) requests As Submitted.

Commenter's Reason: In a real, unexpected structural fire, at greater risk are people who cannot respond or evacuate in a timely manner people sleeping in their apartment homes, large groups of children, and the elderly. Evacuation of large buildings is more difficult because of lengthier evacuation routes. Further, fires in large buildings may present more difficult fire control problems because of inaccessibility to the more remote interior spaces of these extremely large R-Occupancies.

Even from the American Wood Council's own document, Basic Fire Precautions During Construction of Large Buildings highlight the need for concern: National fire organizations, including US Fire Administration and the National Fire Protection Association have been monitoring losses for construction fires in large buildings for decades. The trend and pattern of these fires is significant since it shows that a greater percentage of them result in large financial losses than fires in completed, occupied buildings.

if they were to follow their own recommendations, The Fire Safety Plan should identify the required security measures, which may include: Employing 24-hour security guards on larger sites with post orders that include recorded rounds, and supported by intrusion detection systems, and Site security cannot be underestimated. Observation of conditions after hours, and especially when there are abnormal weather conditions, is essential in reducing the possibility of fire. In view of the fact that arson is a significant contributor to fire loss on construction sites then security measures become very critical in protecting the site, certainly seems we are all in fact supportive of this proposal.

Bibliography: <https://constructionfiresafety.org/topics/basic-fire-precautions-during-construction-of-large-buildings>

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction Site security in off hours would be a cost but certainly offset by reduced safety risk and theft.

F266-18

IFC: 3308.4

Proposed Change as Submitted

Proponent: Stephen DiGiovanni, representing ICC Ad Hoc Committee on Tall Wood Buildings (TWB) (TWB@iccsafe.org)

2018 International Fire Code

3308.4 Fire safety requirements for buildings of Types IV-A, IV-B, and IV-C construction. Buildings of Types IV-A, IV-B, and IV-C construction designed to be greater than six stories above grade plane shall comply with the following requirements during construction unless otherwise approved by the fire code official.

1. Standpipes shall be provided in accordance with Section 3313.
 2. A water supply for fire department operations, as approved by the fire chief.
 3. Where building construction exceeds six stories above grade plane, at least one layer of noncombustible protection where required by Section 602.4 of the International Building Code shall be installed on all building elements more than 4 floor levels, including mezzanines, below active mass timber construction before erecting additional floor levels.
 4. Where building construction exceeds six stories above grade plane required exterior wall coverings shall be installed on all floor levels more than 4 floor levels, including mezzanines, below active mass timber construction before erecting additional floor level.
- Exception: Shafts and vertical exit enclosures.**

Reason: The Ad Hoc Committee on Tall Wood Buildings (TWB) was created by the ICC Board to explore the science of tall wood buildings and take action on developing code changes for tall wood buildings. The TWB has created several code change proposals with respect to the concept of tall buildings of mass timber and the background information is at the end of this Statement. Within the statement are important links to information, including documents and videos, used in the deliberations which resulted in these proposals.

The TWB has developed a number of proposals to potentially increase the permitted height and area for Type IV structures, specifically mass timber buildings adding additional Types IV-A, IV-B & IV-C. One of the basic requirements incorporated into these proposed increased heights and areas is the added active and passive protection features to these structures.

The goal of this proposal is to provide guidance and requirements for when this combustible building is most vulnerable, while under construction prior to fire protection systems have been installed.

Over the recent years we have experienced a number of fires while combustible buildings have been under construction. It is understood the vast majority of these fires did occur in structures of light-frame structural wood members which present a significant fire hazard when exposed. Even with this fact we cannot simply ignore the potential risk of fire in combustible construction simply due to the size of the timber element and the potentially longer period of time for ignition as the potentially fuel load of a mass timber building can be substantial.

The TWB had a great deal of discussion regarding the proposed requirements regarding water supply to the buildings of combustible construction sites. On one hand, there was a desire to establish a minimum water flow of 250 gpm with a minimum pressure. But the counter discussion identified that these combustible building construction sites may have various degrees of hazards on the site and was not restrictive to just the structure. Mass timber construction typically proceeds with little stored combustible material on the site, mass timber is generally installed as it arrives. Thus, there may be more or fewer site hazards than on a typical construction site utilizing combustible materials. Moreover, protection of the installed material must occur before the project moves above certain specified numbers of levels. This is very different from conventional construction processes.

With this understanding, the TWB is proposing project developers meet and confer with the local fire service to establish the fire department's response needs, in terms of water flow and pressure, for the specific building, while under construction, and job site.

While sub-sections 1 and 2 apply to the delivery of water to the job site, and/or structure, sub-sections 3 and 4 are specific to the passive protection related to the structure. Due to the proposed increased heights and areas, the TWB felt it was important to require interior and exterior passive protection as the construction progressed. This would insure the lower portions of the combustible structure had redundant, active and passive, protection as greater heights were added.

Two figures are shown below to illustrate the requirements of sub-sections 3 and 4 of this proposal. Since both buildings will exceed six-stories, protection must be provided during construction. The solid thick lines indicate building elements that are required to be protected. Solid thin lines indicate elements that are in-place, but are not required to be protected and dashed lines indicate elements that have not yet been placed. Figure 1 is shown to illustrate when protection is first required on a building under construction. When level 6 is the active level of mass timber construction, protection of the building elements and the exterior wall coverings are required before level 7 panels can be placed. In Figure 2, the progress of protection on each successive level is indicated as construction continues. In this example, level 14 is the active level of mass timber construction, so prior to placement of floor panels at level 15, protection is required on level 9.

New paragraph for the reason statement: Two figures are shown below to illustrate the requirements of sub-sections 3 and 4 of this proposal. Since both buildings will exceed six-stories, protection must be provided during construction. The solid thick lines indicate building elements that are required to be protected. Solid lines indicate elements that are in-place, but are not required to be protected and dashed lines indicate elements that have not yet been placed. Figure 1 is shown to indicate when protection is first required to be provided on a building under construction. When level 6 is the active level, protection of the building elements and the exterior wall coverings are required before level 7 panels can be placed. In Figure 2, the progress of protection on each successive level is indicated as construction continues. In this example, level 14 is the active level, so prior to placement of floor panels at level 15, protection is required on level 9.

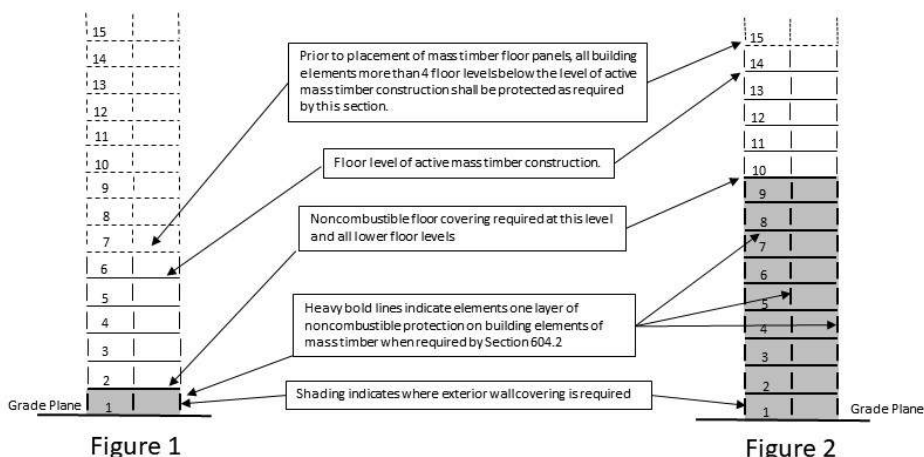

Figure 1

Figure 2

**Examples of Protection During Construction
For Mass Timber Buildings Greater Than
6 Stories Above Grade Plane**

The TWB strongly feels these code change proposals should be adopted as a whole package. By adopting a few of the code change proposals without the complete package potentially ignores the details required to insure these proposed projects are designed, built and maintained properly now and in the future. **Background information:** The ICC Board approved the establishment of an ad hoc committee for tall wood buildings in December of 2015. The purpose of the ad hoc committee is to explore the science of tall wood buildings and to investigate the feasibility and take action on developing code changes for tall wood buildings. The committee is comprised of a balance of stakeholders with additional opportunities for interested parties to participate in the four Work Groups established by the ad hoc committee, namely: Code; Fire; Standards/Definitions; and Structural. For more information, be sure to visit the ICC website <https://www.iccsafe.org/codes-tech-support/cs/icc-ad-hoc-committee-on-tall-wood-buildings/> (link active and up to date as of 12/27/17). As seen in the "Meeting Minutes and Documents" and "Resource Documents" sections of the committee web page, the ad hoc committee reviewed a substantial amount of information in order to provide technical justification for code proposals.

The ad hoc committee developed proposals for the followings code sections. The committee believes this package of code changes will result in regulations that adequately address the fire and life safety issues of tall mass timber buildings.

IBC Code Section	Description
403.3.2	Water supply requirements for fire pumps in high rise buildings of Type IVA and IVB construction.
504.3	Allowable building height (feet) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT construction.
504.4	Allowable building height (stories) for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
506.2	Allowable building area for buildings of Type IVA, IVB and IVC construction. No changes to Type IV HT.
508.4.4.1 509.4.1.1 (new)	Requirements for mass timber building elements serving as fire barriers or horizontal assemblies in buildings of Type IVB or IVC construction.
602.4	Type of Construction requirements for new proposed types of construction: Types IVA, IVB and IVC. No changes to Type IV HT construction. Includes definitions for new terms: Mass timber and Noncombustible protection (mass timber). THIS IS THE KEY CODE CHANGE PROPOSAL WHICH OUTLINES THE CONSTRUCTION REQUIREMENTS FOR THE PROPOSED NEW TYPE OF MASS TIMBER BUILDINGS. THE PROPOSAL ALSO ADDRESSES CONCEALED SPACES, ADHESIVE PERFORMANCE AND EXTERIOR WALL PROTECTION.
703.8 (new)	The performance method to determine the increase to the fire resistance rating provided by noncombustible protection applied to the mass timber building element.
703.9 (new)	Requirements for sealants and adhesives to be placed at abutting edges and intersections of mass timber building elements. The reason statement references a Group B proposal to Chapter 17 for special inspection requirements of sealants and adhesives.
718.2.1	Requirements on the use of mass timber building elements used for Fireblocking.
722.7 (new)	Requirements for the fire resistance rating of mass timber elements, including minimum required protection and gypsum board attachment requirements.
3102	Requirements for membrane structures using Type IV HT construction.
3314.7 (new)	New special precautions during construction of buildings of Types IVA, IVB and IVC construction: Standpipes; Water supply for fire department connections; Noncombustible protection required for mass timber elements as construction height increases.
Appendix	Requirements for walls, floors and roofs of Type IV HT construction in buildings located in Fire Districts.
IFC Code Section	Description
701.6	Requirements which stipulate the owner's responsibility to maintain inventory of all required fire resistance rated construction in buildings of Types IVA and IVB construction. This includes an annual inspection and proper repair where necessary.
Proposed changes to be submitted in 2019 Group B	
IBC Chapter 17	Required special inspections of mass timber construction <ul style="list-style-type: none"> • Structural • Sealants and adhesives (see IBC 703.8)
IBC Chapter 23	An update to referenced standard APA PRG 320 Standard for Performance –rated Cross-laminated Timber which is currently undergoing revision to ensure the adequacy of the adhesives under fire conditions.

In addition, fire tests designed to simulate the three new construction types (Types IVA, IVB and IVC) in the ad hoc committee proposals were conducted at the Alcohol Tobacco and Firearms test lab facility. The TWB was involved in the design of the tests, and many members witnessed the test in person or online. The results of the series of 5 fire tests provide additional support for these proposals, and validate the fire performance for each of the types of construction proposed by the committee. The fire tests consisted of one-bedroom apartments on two levels, with both apartments having a corridor leading to a stair. The purpose of the tests was to address the contribution of mass timber to a fire, the performance of connections, the performance of through-penetration fire stops, and to evaluate conditions for responding fire personnel.

To review a summary of the fire tests, please visit:

<http://bit.ly/ATF-firetestreport>

To watch summary videos of the fire tests, which are accelerated to run in 3 ½ minutes, please visit:

<http://bit.ly/ATF-firetestvideos>

Both of these links were confirmed active on 12/27/17.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

F266-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 3308.4 Fire safety requirements for buildings of Types IV-A, IV-B, and IV-C construction. Buildings of Types IV-A, IV-B, and IV-C construction designed to be greater than six stories above grade plane shall comply with the following requirements during construction unless otherwise approved by the fire code official.

1. Standpipes shall be provided in accordance with Section 3313.
2. A water supply for fire department operations, as approved by the fire chief.
3. Where building construction exceeds six stories above grade plane, at least one layer of noncombustible protection where required by Section 602.4 of the International Building Code shall be installed on all building elements more than 4 floor levels, including mezzanines, below active mass timber construction before erecting additional floor levels.

Exception: Shafts and vertical exit enclosures shall not be considered a part of the active mass timber construction.

4. Where building construction exceeds six stories above grade plane required exterior wall coverings shall be installed on all floor levels more than 4 floor levels, including mezzanines, below active mass timber construction before erecting additional floor level.

Exception: Shafts and vertical exit enclosures shall not be considered a part of the active mass timber construction.

Committee Reason: This proposal was approved as part of the tall wood building proposals and provides the necessary construction fire safety related provisions. The modification merely makes it clear as to how the exceptions are to apply. The intention is that they only affect items 3 and 4. Shafts and vertical exit enclosures are not constructed with CLT and are not considered when reviewing the progress of construction. (Vote: 13-0)

Assembly Action:

None

F266-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen DiGiovanni, representing Ad Hoc Committee for Tall Wood Buildings (sdigiovanni@clarkcountynv.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

3308.4 Fire safety requirements for buildings of Types IV-A, IV-B, and IV-C construction. Buildings of Types IV-A, IV-B, and IV-C construction designed to be greater than six stories above grade plane shall comply with the following requirements during construction unless otherwise approved by the fire code official.

1. Standpipes shall be provided in accordance with Section 3313.
2. A water supply for fire department operations, as approved by the fire code official and the fire chief.
3. Where building construction exceeds six stories above grade plane, at least one layer of noncombustible protection where required by Section 602.4 of the International Building Code shall be installed on all building elements more than 4 floor levels, including mezzanines, below active mass timber construction before erecting additional floor levels.

Exception: Shafts and vertical exit enclosures shall not be considered a part of the active mass timber construction.

4. Where building construction exceeds six stories above grade plane required exterior wall coverings shall be installed on all floor levels more than 4 floor levels, including mezzanines, below active mass timber construction before erecting additional floor level.

Exception: Shafts and vertical exit enclosures shall not be considered a part of the active mass timber construction.

Commenter's Reason: The original code change proposal was approved by the committee. However, during committee discussions, there was concern that Item 2, which discusses the water supply required for fire department operations during construction, should require also approval by the fire code official. There is concern that, with the many various ways that jurisdictions administer the fire code, not including the fire code official could be make the review and approval process awkward in some instances. This Public Comment simply adds the fire code official to Item 2, to satisfy this concern.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This section provides information that was not previously set forth in the code, and does not change the requirements of current code, thus there is no cost impact when compared with present requirements.

Public Comment 2:

Proponent: Dan Nichols, representing ICC Code Correlation Committee (ccc@iccsafe.org).

Commenter's Reason: The Code Correlation Committee (CCC) is not taking a position on this code change. The CCC submitted this public comment in order to bring a correlation issue to the attention of the full voting membership for the Public Comment Hearings and the Online Governmental Consensus Vote to allow the voting membership to coordinate actions on a package of code changes submitted dealing with tall wood buildings of mass timber construction. This package includes the parent proposal G108-18; if disapproved, the related proposals G28-18, G75-18, G80-18, G84-18, G89-18, FS5-18, FS6-18, FS73-18, FS81-18 and F266-18, will not be correlated with any existing code text if they are approved.

The Code Correlation Committee is a standing committee of the International Code Council whose objectives, procedures and organization are set forth in Council Policy CP#44-13. The objective of the Code Correlation Committee is to maintain technical and editorial consistency among the International Codes and to assist staff in the evaluation and processing of code change proposals and comments that are exclusively editorial.

F266-18

F267-18 Part I

IFC: SECTION 3318, 3318.1, 3318.1.1, 3318.1.2, NFPA

Proposed Change as Submitted

Proponent: Stephen Skalko, Stephen V. Skalko, P.E. & Associates, LLC, representing Masonry Alliance for Codes and Standards (svskalko@svskalko-pe.com); William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD THE IFC COMMITTEE, PART II WILL BE HEARD BY THE IBC-G COMMITTEE. PLEASE SEE THE TENTATIVE HEARING ORDERS FOR THE RESPECTIVE COMMITTEES.

2018 International Fire Code

Add new text as follows

SECTION 3318 PROTECTION OF COMBUSTIBLE CONSTRUCTION

3318.1 Fire safety requirements for buildings of Type III and V construction. Buildings of Types III and V construction designed to be four or more stories above grade plane shall meet the following requirements during construction unless otherwise approved by the fire official.

3318.1.1 Exposed interior combustible framing. Where portions of the building construction exceeds 40-feet in height above fire department vehicle access, exposed interior combustible framing members shall be protected during the construction process by a thermal barrier of 1/2-inch gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275 in accordance with Section 2603.4 of the International Building Code. Concealed spaces shall comply with Section 718 of the International Building Code.

The thermal barrier shall be installed on all exposed interior surfaces of combustible framing members below the 40-feet of height, including mezzanines, so that no more than two floors of combustible framing members for the building are exposed before erecting an additional floor level. When the building construction commences above the 40-feet of height, the thermal barrier shall be installed on all exposed interior combustible framing members, including mezzanines, so that a total of no more than one floor of combustible framing members for the building is exposed on the interior before erecting an additional floor level.

3318.1.2 Exposed exterior combustible framing. Where portions of the building construction exceeds 40-feet above fire department vehicle access, including mezzanines, exposed exterior combustible framing members below the 40-feet of height, shall be covered by a noncombustible material or exterior wall covering in accordance with Section 1404 of the International Building Code so that no more than two floors of exterior combustible framing are exposed before erecting additional floor levels. The noncombustible material or exterior wall covering shall continue to be installed on all exposed exterior combustible framing above the 40-feet of height, including mezzanines, so that a total of no more than one floor of combustible framing members are exposed on the exterior before erecting additional floor levels.

Add new standard(s) follows

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

275—17:

Standard Method of Fire Tests for the Evaluation of Thermal Barriers

Analysis: A review of the standard proposed for inclusion in the code, NFPA 275-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Reason: As light wood frame buildings of Type III and V construction continue to be built to large heights and areas as allowed in Tables 504.3, 504.4 and 506.2 of the code, there has been a notable increase in fires, especially for Group R2 Residential Occupancies constructed of combustible framing, while the building is under construction. This has resulted in significant loss of property for the building under construction and nearby properties exposed to the fire in part because important fire safety features such as passive fire protection for the combustible framing is not complete and automatic sprinkler system upon which these larger and taller buildings depend are not operational.

Besides the damage to the building under construction and to nearby properties some of these fires have required major street closures including interstates, and tied up firefighting resources to the extent that other areas of the communities were left under-protected for extended periods. An example is the major fire in Los Angeles with five stories of wood framing over a two-story concrete podium on December 8, 2014 that not only resulted in millions of dollars in damage to the building under construction, but also damaged adjacent buildings. The apartment building known as the DaVinci was a complete loss after the fire that was fueled by the five stories of wood frame construction. More than 250 firefighters were dispatched to the scene. The burning of the structure's wooden frame forced the closure of northbound Harbor Freeway (Hwy 110) and affected local streets causing major traffic disruptions for commuters and to the nearby business and residences. Buildings nearby were damaged by exposure to fire from the radiant heat as well as damage inside because the fire activated sprinklers in these adjacent buildings. It has been reported that the heat also melted or damaged computers and partition cubicles in neighboring buildings as well. The glazing in hundreds of windows of a nearby building was also damaged.

There are numerous examples of other large combustible framed apartment and condominium building that experienced significant fires and damage while the building was under construction that illustrate the fire risk these large buildings pose. The following is a list of six such incidences in 2017. This list is not necessarily inclusive of all similar large combustible building fires in 2017 while under construction.

1. Metropolitan Apartments, Raleigh NC March 17, 2017- 5-story apartments on concrete podium.
2. The Royale at City Place, Overland Park, KS March 20, 2017 - 5-story apartments
3. Fuse 47, College Park, MD April 24, 2017 - 5-story apartments on concrete podium.
4. Treadmark, Boston MA, June 28, 2017 - 6-story condominiums
5. Kelowna, BC, Canada July 8, 2017 - 6-story apartments on concrete podium
6. Edison on the Charles, Waltham, MA July 23, 2017 - 5-story apartments

The goal of this proposal is to provide guidance and requirements for protection when this combustible building is most vulnerable, while under construction and prior to passive and active fire protection being installed. Recently the ICC Tall Wood Building Ad Hoc Committee discussed similar fire protection measures for Mass Timber Buildings under construction. The TWB Committee recognized the risks associated with taller buildings of combustible construction and the hazards they pose for fire department exterior and interior attack tactics

To reduce the risk of these construction fires this proposal will require the exposed combustible framing members be covered with a thermal barrier on the inside of the building and the planned exterior wall covering on the outside. The thermal barrier protection is similar to the requirements for exposed foam plastic insulation (a combustible material) in 2603.4. If combustible framing should be ignited during construction both the thermal barrier and the exterior wall coverings reduce exposure of other combustible materials from the fire incident.

The passive protection should be provided when the construction reaches the 40-foot height above the fire department vehicle access. The 40-foot threshold is consistent with the threshold when standpipes for construction are required by 3311.1. These levels of fire protection are consistent with the fire risks associated with these larger buildings of combustible construction, and upon which the building code provisions are based. Also, like the standpipe requirements, the passive protection must be extended as each floor is added.

Cost Impact: The code change proposal will increase the cost of construction

This proposal is expected to increase the cost of construction due to the passive fire protection having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

Analysis: The referenced standard, NFPA 275-17, is currently referenced in other 2018 I-codes.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Although the intent of the proposal was clear it would be cost prohibitive to require this level of protection during construction. The provisions are too broadly applied to smaller buildings. Finally, this proposal would require protection from rain and snow to allow this concept to work in most cases which is not practical. The revisions in code change proposals F263-18 and F264-18 were preferred over this proposal.(Vote: 14-0)

Assembly Action:

None

F267-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Skalko, representing Alliance for Concrete Codes and Standards (svskalko@svskalko-pe.com); William Hall, Alliance for Concrete Codes and Standards, representing Alliance for Concrete Codes and Standards (jhall@cement.org)requests As Submitted.

Commenter's Reason: G267-18 should be Approved as Submitted. This action is based on the evidence of construction fires involving Types III and V buildings.

According to the National Fire Protection Association report, *Large-Loss Fires in the United States 2016*, (Stephen Badger, November 2017), there were five large loss fires involving apartments and a hotel under construction. These five fires resulted in about \$67 million dollars in losses and affected not only the buildings in question, but in several cases, fire spread to adjoining properties and destroyed other buildings.

The NFPA report has not been released for 2017 but, based on the six fires involving buildings under construction listed in the reason statement in support of F267-18, it is likely this trend will continue. This will be due in part because the fires in the NFPA 2016 report have similar characteristics to the ones listed for 2017 namely the buildings in 2016 were under construction and some involved unprotected wood frame construction.

It is important that corrective measures be taken now to eliminate this deficiency in the building and fire code regarding buildings of Type III and V under construction. The question is not one of practicality but of safety to the public and the fire service and the reduction of property losses due to these types of fires. Though it may require changes to construction methods and increase the cost of construction, the trend based on the fire incidences occurring with regularity for these types of buildings is apparent.

Recommend APPROVAL AS SUBMITTED for F267-18

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal is expected to increase the cost of construction due to the passive fire protection having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

2018 International Building Code

Add new text as follows

SECTION 3314 PROTECTION OF COMBUSTIBLE CONSTRUCTION

3314.1 Fire safety requirements for buildings of Type III and V construction. Buildings of Types III and V construction designed to be four or more stories above grade plane shall meet the following requirements during construction unless otherwise approved by the fire official.

3314.1.1 Exposed interior combustible framing. Where portions of the building construction exceeds 40-feet in height above fire department vehicle access, exposed interior combustible framing members shall be protected during the construction process by a thermal barrier of 1/2-inch gypsum wallboard or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275 in accordance with Section 2603.4. Concealed spaces shall comply with Section 718.

The thermal barrier shall be installed on all exposed interior surfaces of combustible framing members below the 40-feet of height, including mezzanines, so that no more than two floors of combustible framing members for the building are exposed before erecting an additional floor level. When the building construction commences above the 40-feet of height, the thermal barrier shall be installed on all exposed interior combustible framing members, including mezzanines, so that a total of no more than one floor of combustible framing members for the building is exposed on the interior before erecting an additional floor level.

3314.1.2 Exposed exterior combustible framing. Where portions of the building construction exceeds 40-feet above fire department vehicle access, including mezzanines, exposed exterior combustible framing members below the 40-feet of height, shall be covered by a noncombustible material or exterior wall covering in accordance with Section 1404 so that no more than two floors of exterior combustible framing are exposed before erecting additional floor levels. The noncombustible material or exterior wall covering shall continue to be installed on all exposed exterior combustible framing above the 40-feet of height, including mezzanines, so that a total of no more than one floor of combustible framing members are exposed on the exterior before erecting additional floor levels.

Reason: As light wood frame buildings of Type III and V construction continue to be built to large heights and areas as allowed in Tables 504.3, 504.4 and 506.2 of the code, there has been a notable increase in fires, especially for Group R2 Residential Occupancies constructed of combustible framing, while the building is under construction. This has resulted in significant loss of property for the building under construction and nearby properties exposed to the fire in part because important fire safety features such as passive fire protection for the combustible framing is not complete and automatic sprinkler system upon which these larger and taller buildings depend are not operational.

Besides the damage to the building under construction and to nearby properties some of these fires have required major street closures including interstates, and tied up firefighting resources to the extent that other areas of the communities were left under-protected for extended periods. An example is the major fire in Los Angeles with five stories of wood framing over a two-story concrete podium on December 8, 2014 that not only resulted in millions of dollars in damage to the building under construction, but also damaged adjacent buildings. The apartment building known as the DaVinci was a complete loss after the fire that was fueled by the five stories of wood frame construction. More than 250 firefighters were dispatched to the scene. The burning of the structure's wooden frame forced the closure of northbound Harbor Freeway (Hwy 110) and affected local streets causing major traffic disruptions for commuters and to the nearby business and residences. Buildings nearby were damaged by exposure to fire from the radiant heat as well as damage inside because the fire activated sprinklers in these adjacent buildings. It has been reported that the heat also melted or damaged computers and partition cubicles in neighboring buildings as well. The glazing in hundreds of windows of a nearby building was also damaged.

There are numerous examples of other large combustible framed apartment and condominium building that experienced significant fires and damage while the building was under construction that illustrate the fire risk these large buildings pose. The following is a list of six such incidences in 2017. This list is not necessarily inclusive of all similar large combustible building fires in 2017 while under construction.

1. Metropolitan Apartments, Raleigh NC March 17, 2017- 5-story apartments on concrete podium.
2. The Royale at City Place, Overland Park, KS March 20, 2017 - 5-story apartments
3. Fuse 47, College Park, MD April 24, 2017 - 5-story apartments on concrete podium.
4. Treadmark, Boston MA, June 28, 2017 - 6-story condominiums
5. Kelowna, BC, Canada July 8, 2017 - 6-story apartments on concrete podium
6. Edison on the Charles, Waltham, MA July 23, 2017 - 5-story apartments

The goal of this proposal is to provide guidance and requirements for protection when this combustible building is most vulnerable, while under construction and prior to passive and active fire protection being installed. Recently the ICC Tall Wood Building Ad Hoc Committee discussed similar fire protection measures for Mass Timber Buildings under construction. The TWB Committee recognized the risks associated with taller buildings of combustible construction and the hazards they pose for fire department exterior and interior attack tactics

To reduce the risk of these construction fires this proposal will require the exposed combustible framing members be covered with a thermal barrier on the inside of the building and the planned exterior wall covering on the outside. The thermal barrier protection is similar to the requirements for exposed foam plastic insulation (a combustible material) in 2603.4. If combustible framing should be ignited during construction both the thermal barrier and the exterior wall coverings reduce exposure of other combustible materials from the fire incident.

The passive protection should be provided when the construction reaches the 40-foot height above the fire department vehicle access. The 40-foot threshold is consistent with the threshold when standpipes for construction are required by 3311.1. These levels of fire protection are consistent with the fire risks associated with these larger buildings of combustible construction, and upon which the building code provisions are based. Also, like the standpipe requirements, the passive protection must be extended as each floor is added.

Cost Impact: The code change proposal will increase the cost of construction

This proposal is expected to increase the cost of construction due to the passive fire protection having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

F267-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is a problem that needs a solution, but this is not it. It is a significant change to construction methods. Not sure how this would work with light frame construction. The moisture issue is significant and need to be addressed. The comparison of light frame wood construction to mass timber construction is incorrect. There is a need to address construction fires in all construction types, and especially wood construction. There are other proposals that may better address these concerns. A dry wall crew would have to continuously come in and out of the job site. This would substantially increase the cost of construction. (Vote: 14-0)

Assembly Action:

F267-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Skalko, representing Alliance for Concrete Codes and Standards (svskalko@svskalko-pe.com); William Hall, Alliance for Concrete Codes and Standards, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests As Submitted.

Commenter's Reason: G267-18 should be Approved as Submitted. This action is based on the reasons given by the General Committee in their disapproval. The General Committee acknowledged there is a problem and a need to address construction fires and especially wood construction. Based on the evidence of construction fires involving Types III and V buildings we concur.

According to the National Fire Protection Association report, *Large-Loss Fires in the United States 2016*, (Stephen Badger, November 2017), there were five large loss fires involving apartments and a hotel under construction. These five fires resulted in about \$67 million dollars in losses and affected not only the buildings in question, but in several cases, fire spread to adjoining properties and destroyed other buildings.

The NFPA report has not been released for 2017 but, based on the six fires involving buildings under construction listed in the reason statement in support of F267-18, it is likely this trend will continue. This will be due in part because the fires in the NFPA 2016 report have similar characteristics to the ones listed for 2017 namely the buildings in 2016 were under construction and some involved unprotected wood frame construction.

It is important that corrective measures be taken now to eliminate this deficiency in the building and fire code regarding buildings of Type III and V under construction. Though it may require changes to construction methods and increase the cost of construction, the trend based on the fire incidences occurring with regularity for these types of buildings is apparent.

Recommend APPROVAL AS SUBMITTED for F267-18

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal is expected to increase the cost of construction due to the passive fire protection having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

2018 International Fire Code

Add new text as follows

3314.1 Completion during construction. Where an automatic sprinkler system is required by this code in buildings of Type III or V construction, and will be 4 or more stories above grade plane, the portion of the building or structure that is more than 40-feet in height above fire department vehicle access shall not begin construction until automatic sprinkler protection, either temporary or permanent, is provided for all stories below. As construction progresses such automatic sprinkler protection shall be extended to within one floor of the highest point of construction having secured decking or flooring.

2018 International Building Code

3312.1 Completion during construction. Where an automatic sprinkler system is required by this code in buildings of Type III or V construction, and will be 4 or more stories above grade plane, the portion of the building or structure that is more than 40-feet in height above fire department vehicle access shall not begin construction until automatic sprinkler protection, either temporary or permanent, is provided for all stories below. As construction progresses such automatic sprinkler protection shall be extended to within one floor of the highest point of construction having secured decking or flooring.

2018 International Existing Building Code

1507.1 Completion during construction. Where an automatic sprinkler system is required by this code in buildings of Type III or V construction, and will be 4 or more stories above grade plane, the portion of the building or structure that is more than 40-feet in height above fire department vehicle access shall not begin construction until automatic sprinkler protection, either temporary or permanent, is provided for all stories below. As construction progresses such automatic sprinkler protection shall be extended to within one floor of the highest point of construction having secured decking or flooring.

Reason: Automatic sprinkler protection systems continue to be the major factor that permits buildings to be built to larger heights and areas as allowed in Tables 504.3, 504.4 and 506.2 of the code. With these increases there has been a notable increase in fires, especially for Group R2 Residential Occupancies constructed of combustible framing, while the building is under construction. This has resulted significant loss of property for the building under construction and nearby properties exposed to the fire in part because important fire safety features such as passive fire protection for the combustible framing is not complete and automatic sprinkler system upon which these larger and taller buildings depend are not operational.

Besides the damage to the building under construction and to nearby properties some of these fires have required major street closures including interstates, and tied up firefighting resources to the extent that other areas of the communities were left under-protected for extended periods. An example is the major fire in Los Angeles with five stories of wood framing over a two-story concrete podium on December 8, 2014 that not only resulted in millions of dollars in damage to the building under construction, but also damaged adjacent buildings. The apartment building known as the DaVinci was a complete loss after the fire that was fueled by the five stories of wood frame construction. More than 250 firefighters were dispatched to the scene. The burning of the structure's wooden frame forced the closure of northbound Harbor Freeway (Hwy 110) and affected local streets causing major traffic disruptions for commuters and to the nearby business and residences. Buildings nearby were damaged by exposure to fire from the radiant heat as well as damage inside because the fire activated sprinklers in these adjacent buildings. It has been reported that the heat also melted or damaged computers and partition cubicles in neighboring building as well. The glazing in hundreds of windows of a nearby building was also damaged.

There are numerous examples of other large combustible framed apartment and condominium building fires while the building was under construction that illustrate the fire risk these large buildings pose. The following is a list of six such incidences in 2017. This list is not necessarily inclusive of all similar large combustible building fires in 2017.

1. Metropolitan Apartments, Raleigh NC March 17, 2017- 5-story apartment on pedestal

2. The Royale at City Place, Overland Park, KS March 20, 2017 – 5-story apartments
3. Fuse 47, College Park, MD April 24, 2017 – 5-story apartment on pedestal
4. Treadmark, Boston MA, June 28, 2017 – 6-story condominiums
5. Kelowna, BC, Canada July 8, 2017 – 6-story apartments
6. Edison on the Charles, Waltham, MA July 23, 2017 – 5-story apartments

Section 3311.1 of the code requires at least one operational standpipes be in place when portions of buildings requiring standpipes are 40 feet or more above the lowest level of fire department vehicle access. This proposal takes a similar approach to the standpipe requirement for fire safety by requiring sprinkler protection, either temporary or permanent, be provided when the construction reaches the 40-foot height above the fire department vehicle access. This level of fire protection is consistent with the fire risks associated with these larger buildings of combustible construction, and upon which the building code provisions are based. Also, like the standpipe requirements, the sprinkler system must be extended as each floor is provided with decking or flooring.

Cost Impact: The code change proposal will increase the cost of construction

This proposal is expected to increase the cost of construction due to the sprinkler protection system having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

Analysis: The topic covered in this proposal is scoped to the IFC Code Development committee and therefore have been added to correlate in the duplicated sections within the IBC and IEBC.

F270-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This concept was felt to be impractical and costly for wood construction. In addition, there would be concern for requiring such protection for colder climates. The temporary sprinkler systems would be an added modification that would need to be removed later. Also, there was some concern that the temporary measures used for sprinkler activation may create a false sense of security of the effectiveness of such systems. (Vote: 14-0)

Assembly Action:

None

F270-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Stephen Skalko, representing Masonry Alliance for Codes and Standards (svskalko@svskalko-pe.com)requests As Submitted.

Commenter's Reason: G270-18 should be Approved as Submitted. This action is based on the evidence of construction fires involving Types III and V buildings.

According to the National Fire Protection Association report, *Large-Loss Fires in the United States 2016*, (Stephen Badger, November 2017), there were five large loss fires involving apartments and a hotel under construction. These five fires resulted in about \$67 million dollars in losses and affected not only the buildings in question, but in several cases, fire spread to adjoining properties and destroyed other buildings.

The NFPA report has not been released for 2017 but, based on the six fires involving buildings under construction listed in the reason statement in support of F267-18, it is likely this trend will continue. This will be due in part because the fires in the NFPA 2016 report have similar characteristics to the ones listed for 2017 namely the buildings in 2016 were under construction and some involved unprotected wood frame construction. In addition, in most cases the fire protection system was not installed yet or operational.

It is important that corrective measures be taken now to eliminate this deficiency in the building and fire code regarding buildings of Type III and V under construction. The question is not one of practicality or cost, as indicated by the Committee, but of safety to the public and the fire service and the reduction of property losses due to these types of fires. In addition, the technology exists to provide sprinkler systems where exposed to cold climates and subject to freezing conditions. Though it may require changes to construction methods or scheduling of sprinkler installations, and increase the cost of construction, the trend based on the fire incidences occurring with regularity for these types of buildings is apparent and necessitates such actions during construction.

Recommend APPROVAL AS SUBMITTED for F270-18

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal is expected to increase the cost of construction due to the active fire protection system having to be completed on lower floors before construction can begin higher up in the building. This increased cost however is necessary to reduce the risk of damage to adjacent properties due to fire exposure which results in economic hardship for repairs and disruption to businesses and residences, to minimize the impact to the public from traffic disruptions due to the size of the conflagrations, and to reduce the demand for fire service response due to these larger taller combustible framed buildings while under construction.

2018 International Building Code

Revise as follows

[F] 307.1.1 Uses other than Group H. An occupancy that stores, uses or handles hazardous materials as described in one or more of the following items shall not be classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

1. Buildings and structures occupied for the application of flammable finishes, provided that such buildings or areas conform to the requirements of Section 416 and the International Fire Code.
2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the International Fire Code.
3. Closed piping system containing flammable or combustible liquids or gases utilized for the operation of machinery or equipment.
4. Cleaning establishments that utilize combustible liquid solvents having a flash point of 140°F (60°C) or higher in closed systems employing equipment *listed* by an *approved* testing agency, provided that this occupancy is separated from all other areas of the building by 1-hour *fire barriers* constructed in accordance with Section 707 or 1-hour *horizontal assemblies* constructed in accordance with Section 711, or both.
5. Cleaning establishments that utilize a liquid solvent having a flash point at or above 200°F (93°C).
6. Liquor stores and distributors without bulk storage.
7. Refrigeration systems.
8. The storage or utilization of materials for agricultural purposes on the premises.
9. Stationary storage battery systems installed in accordance with the International Fire Code.
10. Corrosive personal or household products in their original packaging used in retail display.
11. Commonly used corrosive building materials.
12. Buildings and structures occupied for aerosol product storage shall be classified as Group S-1, provided that such buildings conform to the requirements of the International Fire Code.
13. Display and storage of nonflammable solid and nonflammable or noncombustible liquid hazardous materials in quantities not exceeding the maximum allowable quantity per *control area* in Group M or S occupancies complying with Section 414.2.5.
14. The storage of black powder, smokeless propellant and small arms primers in Groups M and R-3 and special industrial explosive devices in Groups B, F, M and S, provided such storage conforms to the quantity limits and requirements prescribed in the International Fire Code.
15. Stationary fuel cell power systems installed in accordance with the International Fire Code.
16. Capacitor energy storage systems in accordance with the International Fire Code.
17. Group B higher education laboratory occupancies complying with Section 428 and Chapter 38 of the International Fire Code
18. Distilling or brewing of beverages conforming to the requirements of the International Fire Code.
19. The storage of beer, distilled spirits and wines in barrels and casks conforming to the requirements of the International Fire Code.

311.2 Moderate-hazard storage, Group S-1. Storage Group S-1 occupancies are buildings occupied for storage uses that are not classified as Group S-2, including, but not limited to, storage of the following:

Aerosol products, Levels 2 and 3
Aircraft hangar (storage and repair)
Bags: cloth, burlap and paper
Bamboos and rattan
Baskets
Belting: canvas and leather
Beverages: over 16-percent alcohol content
Books and paper in rolls or packs
Boots and shoes
Buttons, including cloth covered, pearl or bone
Cardboard and cardboard boxes
Clothing, woolen wearing apparel
Cordage
Dry boat storage (indoor)
Furniture
Furs
Glues, mucilage, pastes and size
Grains
Horns and combs, other than celluloid
Leather
Linoleum
Lumber
Motor vehicle repair garages complying with the maximum allowable quantities of hazardous materials listed in Table 307.1(1) (see Section 406.8)
Photo engravings
Resilient flooring
Self-service storage facility (mini-storage)
Silks
Soaps
Sugar
Tires, bulk storage of
Tobacco, cigars, cigarettes and snuff
Upholstery and mattresses
Wax candles

311.3 Low-hazard storage, Group S-2. Storage Group S-2 occupancies include, among others, buildings used for the storage of noncombustible materials such as products on wood pallets or in paper cartons with or without single thickness divisions; or in paper wrappings. Such products are permitted to have a negligible amount of plastic *trim*, such as knobs, handles or film wrapping. Group S-2 storage uses shall include, but not be limited to, storage of the following:

Asbestos
Beverages up to and including 16-percent alcohol ~~in metal, glass or ceramic containers~~
Cement in bags
Chalk and crayons
Dairy products in nonwaxed coated paper containers
Dry cell batteries
Electrical coils
Electrical motors
Empty cans
Food products
Foods in noncombustible containers
Fresh fruits and vegetables in nonplastic trays or containers
Frozen foods
Glass
Glass bottles, empty or filled with noncombustible liquids
Gypsum board
Inert pigments
Ivory
Meats
Metal cabinets
Metal desks with plastic tops and *trim*
Metal parts
Metals
Mirrors
Oil-filled and other types of distribution transformers
Parking garages, open or enclosed
Porcelain and pottery
Stoves
Talc and soapstones
Washers and dryers

2018 International Fire Code

Add new text as follows

903.2.4.2 Group F-1 Distilled Spirits. An automatic sprinkler system shall be provided throughout a Group F-1 fire area used for the manufacture of distilled spirits.

903.2.9.3 Group S-1 Distilled spirits or wine. An automatic sprinkler system shall be provided throughout a Group S-1 fire area used for the bulk storage of distilled spirits or wine.

CHAPTER **40 STORAGE OF DISTILLED SPIRITS AND WINES**

SECTION 4001 GENERAL

4001.1 General. The storage of distilled spirits and wines in barrels and casks shall comply with this chapter in addition to other applicable requirements of this code.

4001.1.1 Nonapplicability. Chapter 50 and Chapter 57 of this code are not applicable to the storage of distilled spirits and wines in barrels and casks as identified in Section 5001.1, Exception 10, and Section 5701.2, Item 10.

SECTION 4002 DEFINITIONS

4002.1 Terms defined in Chapter 2. Words and terms used in this chapter and defined in Chapter 2 shall have the meanings ascribed to them as defined therein.

SECTION 4003 PRECAUTIONS AGAINST FIRE

4003.1 Spill Control. Drainage or containment systems shall be provided by means of curbs, scuppers, special drains, or other suitable means to prevent the flow of spills throughout the building.

4003.2 Ventilation. Ventilation shall be provided for rooms and spaces where distilled spirits and wines in barrels and

casks are stored in accordance with the International Mechanical Code and one of the following:

1. The rooms and spaces shall be ventilated at a rate sufficient to maintain the concentration of vapors within the area at or below 25% of the LFL. This shall be confirmed by sampling of the actual vapor concentration under normal operating conditions. The sampling shall be conducted throughout the enclosed storage area extending to or toward the bottom and the top of the enclosed storage area. The vapor concentration used to determine the required ventilation rate shall be the highest measured concentration during the sampling procedure. The sampling shall be conducted manually or by installation of a continuously monitoring flammable vapor detection system.
2. The rooms and spaces shall be provided exhaust ventilation at a rate of not less than 1 cfm/ft² (0.3 m³/min) of solid floor area. The exhaust ventilation shall be accomplished by natural or mechanical means, with discharge of the exhaust to a safe location outside the building.

4003.3 Sources of ignition. Sources of ignition shall be controlled in accordance with Sections 4003.3.1 through 4003.4.

4003.3.1 Smoking. Smoking shall be prohibited and "No Smoking" signs provided as follows:

1. In rooms or areas where hazardous materials are stored or dispensed or used in open systems in amounts requiring a permit in accordance with Section 105.6 and 105.7
2. Within 25 feet (7620mm) of outdoor storage, dispensing or open use areas.
3. Facility or areas within facilities that have been designated as totally "no smoking" shall have "No Smoking" signs placed at all entrances to the facility or area. Designated areas within such facilities where smoking is permitted either permanently or temporarily shall be identified with signs designating that smoking is permitted in these areas only.
4. In rooms or areas where flammable or combustible hazardous materials are stored, dispensed or used.

Signs required by this section shall be in English as a primary language or in symbols allowed by this code and shall comply with Section 310.

4003.3.2 Open Flame. Open flames and high-temperature devices shall not be used in a manner that creates a hazardous condition and shall be listed for use with the hazardous materials stored or used.

4003.3.3 Industrial trucks. Powered industrial trucks used in areas designated as hazardous (classified) locations in accordance with NFPA 70 shall be listed and labeled for use in the environment intended in accordance with NFPA 505.

4003.3.4 Electrical. Electrical wiring and equipment shall be installed and maintained in accordance with Section 605 and NFPA 70.

4003.4 Lightning. Structures containing barrel storage should be protected from lightning. The lightning protection equipment shall be installed in accordance with NFPA 780 and NFPA 70.

SECTION 4004 STORAGE

4004.1 Storage. Storage shall be in accordance with this section and Section 315.

4004.2 Empty containers. The storage of empty containers previously used for the storage of flammable or combustible liquids, unless free from explosive vapors, shall be stored as required for filled containers.

4004.3 Basement storage. Class I liquids shall be allowed to be stored in basements in amounts not exceeding the maximum allowable quantity over control area for use-open systems in Table 5003.1.1(1), provided that automatic suppression and other fire protection are provided in accordance with Chapter 9. Class II and IIIA liquids shall also be allowed to be stored in basements, provided that automatic suppression and other fire protection are provided in accordance with Chapter 9.

4004.4 Bulk beverage storage areas. There shall be no storage of combustible materials in the bulk beverage storage areas not related to the beverage storage activities.

SECTION 4005 FIRE PROTECTION

4005.1 Automatic sprinkler system. The storage of distilled spirits and wines shall be protected by an approved automatic sprinkler system as required by Chapter 9.

4005.2 Portable Fire Extinguishers. Approved portable fire extinguishers shall be provided in accordance with Section 906.

SECTION 4006 SIGNAGE

4006.1 Hazard identification signs. Unless otherwise exempted by the fire code official, visible hazard identification signs as specified in NFPA 704 for the specific material contained shall be placed on stationary containers and above ground tanks and at entrances to locations where hazardous materials are stored, dispensed, used or handled in quantities requiring a permit and at specific entrances and locations designated by the fire code official.

4006.1.1 Maintenance and style. Signs and markings required by Section 4006.1 shall not be obscured or removed, shall be in English as a primary language or in symbols allowed by this code, shall be durable, and the size, color, and lettering shall be approved.

Revise as follows

5001.1 Scope. Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials shall be in accordance with this chapter.

This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that where specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.

Exceptions:

1. In retail or wholesale sales occupancies, the quantities of medicines, foodstuff or consumer products and cosmetics containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solutions not being flammable shall not be limited, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).
2. Quantities of alcoholic beverages in retail or wholesale sales occupancies shall not be limited providing the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
3. Application and release of pesticide and agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications where applied in accordance with the manufacturers' instructions and label directions.
4. The off-site transportation of hazardous materials where in accordance with Department of Transportation (DOTn) regulations.
5. Building materials not otherwise regulated by this code.
6. Refrigeration systems (see Section 605).
7. Stationary storage battery systems regulated by Section 1206.2.
8. The display, storage, sale or use of fireworks and *explosives* in accordance with Chapter 56.
9. *Corrosives* utilized in personal and household products in the manufacturers' original consumer packaging in Group M occupancies.
10. The storage of ~~beer~~, distilled spirits and wines in ~~wooden~~ barrels and casks.
11. The use of wall-mounted dispensers containing alcohol-based hand rubs classified as Class I or II liquids where in accordance with Section 5705.5.

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

1. Specific provisions for flammable liquids in motor fuel-dispensing facilities, repair garages, airports and marinas in Chapter 23.
2. Medicines, foodstuffs, cosmetics and commercial or institutional products containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solution not being flammable, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).
3. Quantities of alcoholic beverages in retail or wholesale sales or storage occupancies, provided that the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
4. Storage and use of fuel oil in tanks and containers connected to oil-burning equipment. Such storage and use shall be in accordance with Section 603. For abandonment of fuel oil tanks, this chapter applies.
5. Refrigerant liquids and oils in refrigeration systems (see Section 605).
6. Storage and display of aerosol products complying with Chapter 51.
7. Storage and use of liquids that do not have a fire point when tested in accordance with ASTM D92.
8. Liquids with a *flash point* greater than 95°F (35°C) in a water-miscible solution or dispersion with a water and inert (noncombustible) solids content of more than 80 percent by weight, which do not sustain combustion.
9. Liquids without *flash points* that can be flammable under some conditions, such as certain halogenated hydrocarbons and mixtures containing halogenated hydrocarbons.
10. The storage of beer, distilled spirits and wines in ~~wooden~~ barrels and casks.
11. Commercial cooking oil storage tank systems located within a building and designed and installed in accordance with Section 608 and NFPA 30.

Add new standard(s) follows

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

780-17:

Standard f or the Installation of Lightning Protection Systems

2018 International Mechanical Code

Revise as follows

[F] 502.9.5 Flammable and combustible liquids. Exhaust ventilation systems shall be provided as required by Sections 502.9.5.1 through 502.9.5.5 for the storage, use, dispensing, mixing and handling of flammable and combustible liquids. Unless otherwise specified, this section shall apply to any quantity of flammable and combustible liquids.

Exception-Exceptions:

1. This section shall not apply to flammable and combustible liquids that are exempt from the International Fire Code.
2. The storage of beer, distilled spirits and wines in barrels and casks conforming to the requirements of the International Fire Code.

Reason: Currently, due to changes over several code change cycles, there is confusion on how to treat distilled spirits in Building Code and for applicable safety requirements of the International Fire Code. Coordination between the codes on these spirits still have the properties of flammable liquids and proper safeguards must be provided for the occupancies housing **[F] COMBUSTIBLE LIQUID**. A liquid having a closed cup flash point at or above 100°F (38°C). Combustible liquids shall be su

Class II. Liquids having a closed cup flash point at or above 100°F (38°C) and below 140°F (60°C).

Class IIIA. Liquids having a closed cup flash point at or above 140°F (60°C) and below 200°F (93°C).

Class IIIB. Liquids having a closed cup flash point at or above 200°F (93°C).

The category of combustible liquids does not include compressed gases or cryogenic fluids.

[F] FLAMMABLE LIQUID. A liquid having a closed cup flash point below 100°F (38°C). Flammable liquids are further categorized. The Class I category is subdivided as follows:

Class IA. Liquids having a flash point below 73°F (23°C) and a boiling point below 100°F (38°C).

Class IB. Liquids having a flash point below 73°F (23°C) and a boiling point at or above 100°F (38°C).

Class IC. Liquids having a flash point at or above 73°F (23°C) and below 100°F (38°C). The category of flammable liquids does not include cryogenic fluids.

Image-1-Alcohol-Levels

Image-2-Alcohol-Levels

The International Building Code classifies the various activities into Groups. The manufacturing of beverages with over 16 percent alcohol is classified as an F-2; the manufacturing of beverages 16 percent alcohol or less is classified as an F-2:

306.2 Moderate-hazard factory industrial, Group F-1. Factory industrial uses that are not classified as Factory Industrial F Moderate Hazard and shall include, but not be limited to, the following:

Beverages: over 16-percent alcohol content

306.3 Low-hazard factory industrial, Group F-2. Factory industrial uses that involve the fabrication or manufacturing of not finishing, packing or processing do not involve a significant fire hazard shall be classified as F-2 occupancies and shall include,

Beverages: up to and including 16-percent alcohol content

The storage of beverages with up to and including 16-percent alcohol in metal, glass or ceramic containers is classified as

311.3 Low -hazard storage, Group S-2. Storage Group S-2 occupancies include, among others, buildings used for the storage of products on wood pallets or in paper cartons with or without single thickness divisions; or in paper wrappings. Such products include plastic trim, such as knobs, handles or film wrapping. Group S-2 storage uses shall include, but not be limited to, storage of

Beverages up to and including 16-percent alcohol in metal, glass or ceramic containers

However, there is no Group S classification listed for storage of beverages with over 16 percent alcohol and there are no distilling activities or bulk storage of distilled spirits in Section 307 High Hazard Group H.

311.2 Moderate-hazard storage, Group S-1. Storage Group S-1 occupancies are buildings occupied for storage uses that are but not limited to, storage of the following:

???

[F] 307.1.1 Uses other than Group H. An occupancy that stores, uses or handles hazardous materials as described in one classified as Group H, but shall be classified as the occupancy that it most nearly resembles.

2. Wholesale and retail sales and storage of flammable and combustible liquids in mercantile occupancies conforming to the IBC

6. Liquor stores and distributors without bulk storage.

The lack of a S-1 Group designation for storage activities for beverages over 16-percent alcohol or any bulk storage recognized "Uses other than Group H" causes disputes between code officials as to application of a Group H to storage of the finished process.

In the International Fire Code there is confusion about the applicability of Chapter 50 Hazardous Materials-General Provisions Combustible Liquids provisions to distilled spirits because of the exception for distilled spirits and wines stored in wooden barrels. The issue is arising because of the growing popularity of "boutique" or "craft" distillers.

A review of the International Fire Code Commentary concerning the distilled spirits in wooden barrels exception finds the conflict between the codes:

5001.1 Scope.

Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials in this chapter.

This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that where other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple requirements addressed.

Exceptions:

10. The storage of distilled spirits and wines in wooden barrels and casks.

IFC Commentary:

"Exception 10 covers the storage of distilled spirits and wines in wooden barrels and casks. This statement may appear to exclude from being a Group H occupancy. However, the IBC will still classify the storage area as a Group H occupancy if the amounts (MAQs) per control area listed in Table 307.1(1) of that code for flammable or combustible liquids. All requirements for a Group H occupancy are applicable; however, any requirements from the code (fire code) are not."

5701.1 Scope and application. Prevention, control and mitigation of dangerous conditions related to storage, use, dispensing of combustible liquids shall be in accordance with Chapter 50 and this chapter.

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters.

10. The storage of distilled spirits and wines in wooden barrels and casks.

IFC Commentary:

"Item 10 makes the storage of distilled spirits and wines in wooden barrels and casks exempt from this chapter. Although these liquids, the containers do not pose the rupture hazard that other containers do. Barrels and casks will leak their contents and that secure the staves expand and loosen. Even this hazard feature is generally mitigated by the operation of automatic spiriting progressing to the point where the metal bands get hot enough to expand. A similar exception also appears in Section 5001.1

In summary, when you manufacture distilled spirits you are an F-1 occupancy. When you manufacture wine or beer you are an S-2 occupancy. When you store distilled spirits in retail packaging you are not an H occupancy but when you store any beverage with over 16% alcohol in bulk, (includes some wines), you have an H occupancy. As far as risk goes, manufacturing of distilled spirits is an F-1 regardless of amount but an H if stored in bulk. This may be the case for the IFC, if you store your distilled spirits in bulk in wooden barrels Chapter 50 and 57 do not apply so there are no code

This proposal attempts to address this confusion recognizing the main safety issues are the need for automatic fire suppression and need for containment of spills. In 2005 the Distilled Spirits Council of The United States (DISCUS) released guidelines for facilities which addressed fire protection, ventilation and secondary containment requirements. Those guidelines were proposed for the International Fire Code.

It is proposed to make the following Group designation changes to the International Building Code:

Add a classification under S-1 for storage of beverages over 16% alcohol whether in bulk or retail packaging.

Modify the classification under S-2 to apply to all beverages up to and including 16-percent alcohol regardless of container

Modify Section [F] 307.1.1 "Uses other than Group H" to add classifications for distilling, brewing or storage of these materials

In the International Fire Code, it is proposed to strike the word "wooden" and addition of the "word beer" in the exceptions in

10. The storage of beer, distilled spirits and wines in ~~wooden~~ barrels and casks.

In the International Mechanical Code it is proposed to strike the word "wooden" from Section [F] 502.9.5 "Flammable and combustible

In conjunction with the Group classification cleanup and striking the word wooden in both the IFC and IMC, protection feature sprinkler thresholds for the manufacture of distilled spirits or bulk storage of distilled spirits regardless of square footage the International Fire Code for the Storage of Distilled Spirits and Wines.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC) and the ICC Building Code Action Committee (BCAC) Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CA there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>. BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 the BCAC has held 3 open numerous Working Group meetings and conference calls for the current code development cycle, which included members interested party to discuss and debate the proposed changes. Related documentation and reports are posted on the BCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/building-code-action-committee-bcac/>.

Bibliography: Recommended Fire Protection Practices for Distilled Spirits Beverage Facilities, Third Edition Prepared Under the Auspices of The Distilled Spirits Council of the United States, Inc.

<http://www.discus.org/policy/fireprotection/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal will likely break even on the cost of construction by clarifying what the appropriate Group designation is, elimination of the unnecessary H classifications, and clarifying what protection levels are necessary.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal was approved as the exceptions for Group H occupancies are needed and the chapter addressing the specific hazards is necessary. (Vote: 13-1)

Assembly Action:

None

F276-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Linda Purcell, representing architecture PML, Increquests As Submitted.

Commenter's Reason: F276-18

Architectural opinion, related to **use** of facilities and separation of occupancies in facilities that produce distilled spirits above 16% ABV in process and storage, above the 240 gallon limit (sprinkled building).

The intent of the code is to provide a constructed project that provides minimum life safety of users and occupants familiar, and unfamiliar, with the building. *We have no control over the use of the space after the owner takes possession.*

Based on our observed use of distilleries, and H3 rooms, after they are owner occupied, architecture PML, Inc., strongly believes that any measure of life safety that we can provide during design, as required by code, and additional life and operational safety that might be required, or supported by industry best practices, and, as would be dictated by common sense, **should be incorporated into the design, AND SUPPORTED BY THE CODE**

Regarding Occupancy Classification and separation of Occupancies--- If no separation is required between any other Occupancy classification those areas currently required to be H3 Occupancy (for the purposes of *distilled spirits*) there will be significant life safety risks to users, visitors, and even adjacent properties. We strongly recommend that separation between H3 and other occupancies continue to be required, as they are currently required in the code we are most familiar with, the 2015 IBC.

Linda Purcell, AIA

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction considering that other requirements for life safety apply outside of the IBC requirements, this actually may increase the costs to the owners, as the H3 area is specifically defined by FRR (walls) separating occupancy. Without definition of the H3 area, the actual coverage area, and protection from spark, including explosion proof devices, could be much more extensive.

Public Comment 2:

Proponent: Scott Moore, representing Dalkita, Inc. (scott@dalkita.com)requests Disapprove.

Commenter's Reason: The proponents of this measure claim that current code fails to safely regulate distilleries and that the code is unclear. This is a patently false presumption. The current code is clear. The current code does provide for safe regulation of distilleries. However, the subject is complex requiring additional rigor in design and review. This proposal would eliminate the application of H-3 or H-2 occupancy classification to distilleries using and storing Flammable Liquids in excess of the MAQs (Maximum Allowable Quantities). If approved, this proposal will create a clear and present danger to public health, safety, and welfare.

The proponents further state that their intention is to reduce or eliminate unnecessary regulations regarding distilleries. In fact, this proposal will have the opposite affect and increase regulation on not only distilleries but wineries and breweries adding significant construction costs.

It is true that summarizing code requirements for distilleries into a concise package would reduce the efforts needed to design and review such facilities. However, this proposal barely scratches the surface of applicable requirements for safe distilleries found in the current I-codes and NFPA documents they reference. This oversimplification will lead to further misunderstanding of these facilities and guide users of the code toward negligent omission of requirements not addressed in the proposed chapter 40. Safe design of distilleries, particularly micro-distilleries, is a serious matter. They are essentially Flammable Liquids factories in or adjacent to restaurants.

It is true that Ethanol, potable or not, needs to be regulated differently than other non-water miscible Flammable Liquids. This proposal continues the current code approach of discounting graduating flammability properties of varying concentrations of ethanol and water mixtures. A more helpful start to addressing this in the codes would be to identify the fact that 1C water miscible liquid MAQs would more appropriately be higher than 1B liquid MAQs. This proposal ignores the physics of the material being regulated and instead applies regulations in a more arbitrary manner than the current code.

Specific items found in this proposal that present an imminent threat to human life by eliminating regulations currently in place are enumerated below.

IBC 307.1.1(18) (19) would permit unlimited quantities of 1B Flammable Liquid, 95% ethanol with a sea level flash point of 63 degF, in ANY occupancy, including A.

IBC 307.1.1(19) would quadruple the allowable building area for storage of 1C and 1B flammable liquids in barrels (wooden and steel) by shifting the occupancy from H-3 to S-1. Wood soaked in Flammable Liquid a High-hazard commodity. Proper storage of this should be in reduced area compartmentalization as per the current code.

IFC 4001.1.1, 5001.1(10), and 5701.2(10) omit the word wooden in regard to barrels thereby treating, for instance, 55 gallon non-relieving steel barrels the same as wooden barrels. Steel barrels, when exposed to heat, will rupture explosively. Wooden barrels will not.

Specific items found in this proposal that impose additional unnecessary and costly regulation on the beer wine and spirits industry are enumerated below.

IFC 903.2.4.2 and 903.2.9.3 will regulate very small micro-distilleries, with under 120 gallons of spirit, out of business by requiring sprinklers in these facilities where current code does not.

IFC 903.2.9.3 will regulate most wineries out of business by requiring sprinklers for storage of wine where current code does not. Wine, beer, and all other ethanol mixtures under 20% ABV at sea level are non-ignitable per FM Data sheets 729 and 732. Non-ignitable water miscible ethanol mixtures should not be and are not currently regulated as combustible and flammable liquids.

IFC 4003.1 requires drainage and spill control THROUGHOUT the building. Current code only requires these features in parts of the building where Flammable Liquids are actually used and stored and makes exceptions for small quantities.

IFC 4003.2 needlessly requires ethanol vapor monitors for storage of non-ignitable wine. It requires ethanol monitors for storage of spirits in barrels. This is not only unnecessary when proper ventilation calculations are performed but, it also relies on sensors that require proper maintenance and periodic calibration for a critical safety system that could otherwise be provided as fool proof. The other option requires an excessive ventilation rate of 1cfm/sf in barrel storage. Current code requires only 0.06cfm/sf which we have found to be more than adequate to maintain ethanol vapor concentrations at less than 25% of the LFL.

IFC 4003.3.3 requires use of type EX fork trucks even if it has been proven that ventilation will maintain concentrations of Flammable Liquid vapor below 25% of the LFL. Current code acknowledges this and permits type E for trucks where appropriate.

IFC 4004.3 prohibits storage of beer and wine in basements. The current code does not. Beer and wine should be treated entirely different from distilled spirits.

IFC 4005.1 needlessly requires sprinklers for the storage of wine and spirits in bottles. Current code does not.

IMC 502.9.5 exception 2 reverses earlier proposal requirements for ventilation. This is simply confusing.

Below is a partial list of micro-distillery disasters over the past 10 years. Most of these did not meet current code but would be compliant under this new proposal.

Wigle distillery, Pittsburgh - 1 hospitalized

BJ Hookers Distillery, Harris County TX - 1 air lifted to hospital

Island Beach Distillery, Lacey Township, NJ - 1 taken to burn center

Silver Trails Distillery, Marshal County KY - 1 dead, 1 with over a year in recovery

Full Throttle Saloon, Sturgis SD - burned to the ground 2-8-15

Twister Distillery, Moore, OK - 1 hospitalized

Alchemical Solutions, Ashland OR - Neighboring residents experienced smoke related health problems

Tuthilltown Spirits, Gardiner, NY - Destroyed building, no injuries

Current IFC chapters 50 and 57 do not mean that there are no code requirements for barrels as is stated by the proponents of this measure. Rather, per the commentary, wooden barrels are only exempt from the provisions of those two chapters. This means that, under the current code where spirits are stored in wooden barrels, emergency alarms, sprinklers, 25% of the perimeter on an exterior wall, and occupancy separation are required. While 1cfm/sf of ventilation, spill control, secondary containment and explosion control are not.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The proposal will significantly increase the cost to construct distilleries by requiring additional unneeded features. It will particularly damage the wine and beer industries with added construction and operational costs by treating wine and beer, which are not flammable, the same as distilled spirits which is.

Public Comment 3:

Proponent: James Patterson, Denver Fire Department, representing Denver Fire Department requests Disapprove.

Commenter's Reason: The removal of the H classification for volumes exceeding the maximum allowable quantities does not benefit the craft distillers and weakens the code by removing required separations, and standby power requirements for required mechanical ventilation. If a distilling occupancy is not an H occupancy regardless of the alcohol quantities within the occupancy, it can be combined with other occupancies as a non-separated occupancy (such as an assembly banquet hall with a still located in the center as an operational decorative piece) that would allow the public to enter a potentially dangerous situation.

The blanket requirement for fire sprinklers without regard to quantities below the maximum allowable quantities will place an increased burden on the very small/hobby craft distillers. Current requirements allow a distiller to avoid sprinklers by maintaining a maximum allowable quantity below the 120 gallons for a non-sprinklered occupancy and volumes in 1.3 gallon or less containers are not counted in the allowable 120 gallons.

The removal of the requirement for barrels and casks to be "wooden" could create more hazardous storage scenarios such as ethanol in plastic or non-relieving metal barrels.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

The proposal's requirement for sprinkler in any distilling occupancy will increase the cost for very small operations.

The proposal's removal of the requirements for an H occupancy would decrease the cost for larger distilling operations.

Public Comment 4:

Proponent: David Tomecek, representing Self (thepyro13@hotmail.com) requests Disapprove.

Commenter's Reason: The proponents of this code change are right to recognize that the application of IBC, IFC and other International Codes to craft-level facilities (i.e., breweries, cideries, wineries, distilleries) can be confusing. However, the approach taken is problematic in that it incorrectly counteracts corrective steps taken in previous editions of the IBC/IFC, confuses the hazards and protections necessary for differing parts of the alcoholic beverage manufacturing industry and appears to misunderstand the issues associated with wooden barrels and casks versus other containers. The proposed change correctly notes that the code-making progress made with respect to alcoholic beverage manufacturing and storage has been somewhat inconsistent. The author would add that the myths and legends of the alcoholic beverage industry, along with misunderstandings of long-standing exceptions within the codes, are not helpful in interpreting and applying requirements. As written, this proposal extends many of those misunderstandings and will codify them in a way that is detrimental to the safety of building occupants, their neighbors and emergency response personnel.

There are two major issues that work against the proposal one involving the split between various portions of the alcoholic beverage industry and the other involving the exceptions often afforded wooden barrels and casks.

The IBC currently includes a threshold value of 16%, which was intentionally inserted to the IBC in the 2003 Edition (at that time it was 12%, revised to 16% in the 2009 Edition). The threshold was ostensibly introduced to address construction of spec warehouses and allow owners, designers and code officials to determine what might be allowed in the two classifications of Group S occupancies. However, that threshold was also introduced into the manufacturing side via incorporation into the Group F occupancies.

Both the 12% and 16% values have support from fire research and appropriately delineate between ethanol-containing liquids that are effectively non-hazardous and those that are, in fact, flammable/combustible liquids. The previous 12% value aligned with beverage manufacturing as it stood at the time carbonated beverages for retail sales tended to have alcohol by volume (ABV) percentages at or below 12% and non-carbonated beverages were typically above that value. Carbonated beverages such as beer, malt liquor, cider, low-alcohol wine, certain post-fermentation carbonated mixtures (e.g., wine coolers, hard lemonades and sodas) and similar liquids fell into the lower category, while non-carbonated liquids fell into the higher category. This natural split in the industry tends to follow the flammability of ethanol solutions. Ethanol solutions tend to become difficult to ignite, even at elevated temperatures, around 11%. The combination of the two elements made the use of 12% a good value.

The increase to 16% appears to have come from consideration of the fermentation process and recognition of the influence on the flammability of ethanol solutions. Beer, cider and low- to mid-strength wine have been found to be difficult to ignite based on a combination of their low ethanol concentration and presence of carbon dioxide in the mixture, effectively making the solution a non-hazard. The carbon dioxide developed during the fermentation process is sufficiently incorporated into the liquid that it carries through that process into short-term storage and final packaging into containers (during which time more CO₂ might be added). Fire testing of finished product, particularly beer, has been performed since the 1950s, and more recent testing of liquids taken at each step of the fermentation process have demonstrated similar results. That is, all have been found to be difficult to ignite such that they act like a non-combustible liquid. The 16% threshold aligns with the point at which most yeasts die off, and therefore adequate carbon dioxide to compensate for increased ethanol vapor production is not created. In effect, this natural boundary value creates a solid delineation point between hazardous and non-hazardous processes, and therefore should not be eliminated or modified. It is recognized that some super-yeasts exist in the beer and wine manufacturing areas, but the makers using these yeasts are relatively limited and can seek relief individually.

Once the fermentation threshold is exceeded or the fermented liquid is modified, such as with distillation, the influence of carbon dioxide falls off quickly and the ethanol solution becomes a flammable/combustible liquid that has no offsetting influence. Therefore, it should be treated as such and have no exception given, particularly an unlimited exception as included in the proposal.

The issue relative to wooden barrels and casks tends to revolve around the myth that wooden barrels are not a hazard. The author of this comment has noted a myriad of opinions that wooden barrels do not burn and/or wooden barrels don't fail when burned. That perspective appears to be emphasized by the IFC Commentary section noted in the proposal (for IFC Section 5702.1). But that assertion is wholly incorrect. The historical evidence from a variety of the respected research agencies is that wooden barrels do, in fact, burn and fail, but do so in a way that does not fit within the generalized approach of catastrophic failure anticipated by NFPA 30, *Flammable and Combustible Liquids Code* and IFC Chapters 50 and 57. The failure methods and resulting hazard from wooden barrels/casks was noted in a series of tests performed by the National Bureau of Fire Underwriters in the late 1940s and subsequently confirmed by tests performed by the National Fire Protection Association, the predecessor of today's FM Global, individual industry leaders (manufacturers or consortiums thereof) and public entities in states with concentrated manufacturing (e.g., Tennessee, Kentucky, Indiana and Iowa). More recently, the failure mechanisms of wooden barrels/casks were reconfirmed in tests performed by FM Global in the mid-2010s. Similar research for fall survivability, impact resistance, manufacturing quality control and other issues confirmed that wooden barrels and casks are a unique hazard that is outside the realm of generalized codes.

It is from this perspective that wooden barrels and casks have been excepted from NFPA 30 and fire codes for decades, and regulation has been deferred to insurance agencies, state regulating organizations and federal rule makers. The unique qualities of wooden barrels/casks are not present in other types, however. Barrels/casks made of metal (mostly steel, generally known as kegs), plastic, clay, concrete and other materials have been found to react to fire more closely to other containers covered by NFPA 30/IFC, and therefore are included in those controls.

Additionally, the introduction of an exception for *any* type of barrel, particularly plastic ones, as included in the proposal sets a dangerous precedence, as well. Many spirits manufacturers that create liqueurs often use plastic barrels as process vessels. High-concentration of ethanol are often shipped in intermediate bulk containers (IBCs) and are often used by spirits manufacturers to augment their own supply or as an input to their particular beverage. Mid-sized plastic containers, such as portable tanks, are used for short-term storage and processing. These makers would naturally ask why they can store spirits in plastic barrels but are regulated in those other containers. The proposed section would actually lend credence to allowing other plastic containers to be unregulated, which is obviously counterintuitive to current practice and known hazards. Other barrel/cask types have similar concerns, but the plastic items are the best example.

Those issues alone suggest that the proposal should be disapproved. However, additional concerns also exist relative to storage of alcoholic beverages as proposed:

- The proposed spill control section (IFC 4003.1) runs counter to language in other sections. In general, the IFC exempts containers less than 55 gallons in groupings of less than an aggregate of 1,000 gallons from spill control and secondary containment (see, for example 2015 IFC, Section 5004.2.1 and 5004.2.2). Since most barrels are less than 55 gallons, this chapter would place a restriction on alcoholic beverage storage not applied to other facilities.
- From a design approach, Section 4003.2, Item 1 is nonsensical. Because the evaporation rate from barrels is environment-dependent, predicting a ventilation cannot be done unless a conservative approach is taken. To comply with Item 1, the facility would need to be built and sampled to achieve compliance which obviously cannot be done without first obtaining a permit and occupancy of the building which cannot be done without providing the ventilation system.
- The specification of a hazardous location industrial truck for storage areas is overly burdensome and is an overstatement of the requirements from NFPA 505. NFPA 505 allows for determination of the type of industrial truck based on the potential operating environment, including consideration of other safety features. If one were to implement the ventilation and detection from Section 4003.2, for example, NFPA 505 would not dictate a classified location industrial truck.
- IFC, Section 4004.3 does not make sense. In effect, the change to Section 307.1.1 of the IBC would eliminate a maximum allowable quantity as being applicable to the storage. That, in turn, means that there is no MAQ to apply within Section 4004.3. But if there is an MAQ applicable in Section 4004.3, it begs the question of how it would otherwise be applicable in other portions of the IBC/IFC.

Aside from the issues related to storage, the proposal makes the leap to eliminate a Group H occupancy for distilleries altogether. This is incongruous with general practice in that the distilling process is, in reality, no different from the production of ethanol for other purposes (e.g., pharmaceuticals, chemical processing, foodstuffs, beauty and health products, etc.). Given the hazards associated with ethanol in general, carving special permissions without controls for this business segment without allowing it for others flies in the face of the general practice of the ICC. Further, that portion of the proposal seems to dismiss the idea of protecting neighboring tenants/owners and the increased risk to emergency responders, given that most craft distilleries are located in leased properties in close proximity to, or directly adjoined to, surrounding tenants or structures. Where insurance requirements and industry practices, as well as some local amendments in place around the country, dictate required physical separation (either with fire rated construction or distance), the IBC would be extremely permissive by comparison.

On the whole, the proposed modifications would unnecessarily increase protection for segments of the industry that need no such protections and would severely compromise the protections that should be afforded for other segments. Therefore, it is highly recommended that this proposal be disapproved and the effort toward consolidating requirements be revisited.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The proposed changes will significantly and unnecessarily increase the cost of construction for certain portions of the industry (beer, cider, low- to mid-level wines, etc.). Manufacturing facilities for higher ethanol concentrations may see a limited reduction in construction cost, but the predicted long-term losses within communities due to fire will offset those individual gains via the larger economy.

IFC: 202, Chapter 40 (New), Chapter 80

Proposed Change as Submitted

Proponent: Joe Scibetta, representing Self (jscibetta@buildingreports.com)

2018 International Fire Code

Add new definition as follows

ANIMAL HOUSING FACILITY Area of a building or structure, including interior and adjacent exterior spaces, where animals are fed, rested, worked, exercised, treated, exhibited, or used for production.

Add new text as follows

CHAPTER **40 ANIMAL HOUSING FACILITIES**

4001 GENERAL

4001.1 Scope. Fire protection for animal housing facilities, including agricultural buildings where livestock and poultry are housed, shall comply with the provisions of this chapter.

4002 DEFINITION

4002.1 Definitions. The following term is defined in Chapter 2:
ANIMAL HOUSING FACILITY

4003 PRECAUTIONS

4003.1 Sources of Ignition. Smoking or the use of heating or other devices employing an open flame, or the use of spark-producing equipment is prohibited in all areas of an animal housing facility, including agricultural buildings housing livestock or poultry.

4003.2 Waste Removal and Housekeeping. A procedure to ensure cleanliness and orderliness, including the removal of animal waste, shall be maintained. Permanent storage shall be prohibited in aisles, hallways, or other types of corridors.

4004 FIRE PROTECTION AND LIFE SAFETY

4004.1 Standards. Animal housing facilities shall be in accordance with the applicable provisions of the standards referenced in Table 4004.1. .

Table 4004.1
Fire and Life Safety Standards for Animal Housing

<u>Standard</u>	<u>Subject</u>
<u>NFPA 101</u>	<u>The Life Safety Code</u>
<u>NFPA 150</u>	<u>Standard on Fire and Life Safety in Animal Housing Facilities</u>

Add new standard(s) follows

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

150-16:

Standard on Fire and Life Safety in Animal Housing Facilities

Reason: Currently, the IFC does not recognize this special type of occupancy. While housing for poultry and livestock in agricultural buildings is addressed, non-agricultural facilities where animals are housed and attended to by humans are not addressed. This proposed chapter would address the fire protection and life safety concerns in all types of animal housing, including agricultural buildings that house poultry and livestock. It is important for the IFC to recognize the special operations that take place in these unique facilities, where a secondary population is wholly reliant on a primary population for the necessary, prompt attention required during a fire emergency. This language will allow the IFC to correlate with NFPA 1 and NFPA 101, which both address this special occupancy, and will provide a vital directional path from the IFC to the only standard in our industry that addresses the specific requirements for fire protection and life safety in an animal housing facility, namely NFPA 150. Such correlation and recognition by the IFC would be vital in advancing the work of property protection and life safety in this important sector of our industry.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. These facilities already exist but are simply not yet addressed in the IFC.

F277-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved as it would be difficult to enforce as building and fire officials are already overburdened. The standard has provisions that seem difficult to enforce such as facilitating the safe movement of animals out of a building during emergencies and inspecting for animal waste removal. In general the standard is actually more restrictive than certain portions of the building code. The code was written with the primary intention of protecting people. In addition, there was concern that the definition animal housing facility was too broad. (Vote: 14-0)

Assembly Action:

None

F277-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Solomon, National Fire Protection Association, representing National Fire Protection Association requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

ANIMAL HOUSING FACILITY

Area of a building or structure, including interior and adjacent exterior spaces, where animals are fed, rested, worked, exercised, treated, exhibited, or used for production. Such facilities include but are not limited to barns and stables; kennels; animal shelters; animal hospitals and veterinary facilities; zoos; laboratories; agricultural facilities housing animals; and mercantile or business occupancies with animals.

SECTION 319 ANIMAL HOUSING FACILITIES

319.1 General. Animal housing facilities where occupants are expected to delay their emergency egress to care for animals, the means of egress requirements shall comply with the applicable provisions of NFPA 150.

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy MA 02169-7471

150-16:

Standard on Fire and Life Safety in Animal Housing Facilities

Commenter's Reason: In lieu of stand-alone chapter it is suggested that a section on Animal Housing Facilities would fit better in Chapter 3 of the Code. The revised wording provides additional clarification to the types of facilities which are considered animal housing facilities. The revised wording also provides further clarification that NFPA 150 will be used in addition to the requirements of the IBC and IFC, maintaining the priority of the code on protecting people. The addition of this section is paramount to addressing protecting people in animal housing facilities. The code currently does not adequately address facilities in which people may delay evacuation for the care of animals. The addition of this section will help to protect human life in animal housing facilities by addressing the specific hazard.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The change may increase the cost of construction due to the increased level of life safety for the occupants.

F277-18

F300-18

IFC: 5601.1.3

Proposed Change as Submitted

Proponent: William Koffel, representing American Pyrotechnics Association (wkoffel@koffel.com)

2018 International Fire Code

Revise as follows

5601.1.3 Fireworks. The possession, manufacture, storage, sale, handling and use of fireworks are prohibited.

Exceptions:

1. Storage and handling of fireworks as allowed in Section 5604.
2. Manufacture, assembly and testing of fireworks as allowed in Section 5605.
3. The use of fireworks for fireworks displays as allowed in Section 5608.
4. The possession, storage, sale, handling and use of specific types of Division 1.4G fireworks where allowed by applicable laws, ordinances and regulations, provided that such fireworks and facilities comply with ~~NFPA 1124~~ Section 5609, CPSC 16 CFR Parts 1500 and 1507, and DOTn 49 CFR Parts 100-185, as applicable for consumer fireworks.

Reason: The current edition of NFPA 1124 does not contain requirements that address the retail sales and storage of consumer fireworks.

This is a companion change to a proposal that expands Section 5609 to address consumer fireworks in a comprehensive manner without a reference to NFPA 1124.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The requirements for Section 5609 are fairly consistent with industry practice and the provisions in previous editions of NFPA 1124.

F300-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 5601.1.3 Fireworks. The possession, manufacture, storage, sale, handling and use of fireworks are prohibited.

Exceptions:

1. Storage and handling of fireworks as allowed in Section 5604.
2. Manufacture, assembly and testing of fireworks as allowed in Section 5605.
3. The use of fireworks for fireworks displays as allowed in Section 5608.
4. The possession, storage, sale, handling and use of specific types of Division 1.4G fireworks where allowed by applicable laws, ordinances and regulations, provided that such fireworks and facilities comply with the 2006 edition of NFPA 1124, Section 5609, CPSC 16 CFR Parts 1500 and 1507, and DOTn 49 CFR Parts 100-185, as applicable for consumer fireworks.

Add new standard as follows:

NFPA 1124-06: Code for the Manufacture, Transportation, and Storage of Fireworks and Pyrotechnic Articles

Committee Reason: This proposal was approved with a modification to address the needs of firework sales. Although the current edition of NFPA 1124 does not address such sales jurisdictions need guidance on how to regulate. The committee felt that by referencing the 2006 edition of NFPA 1124 would provide the necessary requirements to regulate the sale of fireworks where such sales are legal. (Vote: 8-5)

Assembly Action:

None

F300-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Solomon, NFPA, representing National Fire Protection Association requests As Modified by This Public Comment.

Modify as follows:

2018 International Fire Code

5601.1.3 Fireworks. The possession, manufacture, storage, sale, handling and use of fireworks are prohibited.

Exceptions:

1. Storage and handling of fireworks as allowed in Section 5604.
2. Manufacture, assembly and testing of fireworks as allowed in Section 5605.
3. The use of fireworks for fireworks displays as allowed in Section 5608.
4. ~~The possession, storage, sale, handling and use of specific types of Division 1.4G fireworks where allowed by applicable laws, ordinances and regulations, provided that such fireworks and facilities comply with the 2006 Edition of NFPA 1124,, CPSC 16 CFR Parts 1500 and 1507, and DOTn 49 CFR Parts 100-185, as applicable for consumer fireworks.~~

5609.1 General. Where the display or temporary storage of fireworks 1.4G (consumer fireworks) is allowed by ~~Section 5601.1.3, Exception 4,~~ such display or storage shall comply with the applicable requirements of NFPA 1124.

Commenter's Reason: Delete sub-item 4 in its entirety. This section is referencing an outdated edition of an NFPA Standard, which negates over ten years of code development by both the NFPA Technical Committee on Pyrotechnics and the NFPA Standards Council. In 2007 the Fire Protection Research Foundation (FPRF) published a hazard assessment research report (see bibliography). As a result of that report, the NFPA Standards Council identified nine safety concerns

that were outlined in their October 2008 decision on this subject. In this decision they identified a process by which a series of approval committees would be tasked with reviewing any related research, reports, findings, or combination thereof, which would substantiate and provide a scientific basis for the nine areas identified; one of which included the submission of sprinkler design criteria for the protection of retail facilities that store and sell consumer fireworks. After nearly ten years and multiple requests without an adequate response, in their 2014 decision, the NFPA Standards Council temporarily withdrew NFPA 1124 and ceased development and removed all language pertaining to storage and retail sale of consumer fireworks. It is the view of the NFPA Standards Council that there should be no standards for the storage and retail sale of consumer fireworks until such time that the remaining research needs have been addressed. If the IFC is to address the retail sale of consumer fireworks, it must do so without referencing a 12 year-old standard which contains requirements that have not been scientifically proven. See bibliography for the 2008 and 2014 Standards Council Decisions.

Proposed Change as Submitted

Proponent: William Koffel, representing American Pyrotechnics Association (wkoffel@koffel.com)

2018 International Fire Code

Revise as follows

SECTION 5609 TEMPORARY STORAGE OF CONSUMER RETAIL SALES AND STORAGE OF CONSUMER FIREWORKS

5609.1 General. Where the ~~display or temporary retail sales and associated storage~~ of fireworks 1.4G (consumer fireworks) is allowed by Section 5601.1.3, Exception 4, such display or storage shall comply with the applicable requirements of ~~NFPA 1124~~ this section.

Add new text as follows

5609.2 Retail sales of consumer fireworks. Retail sales of consumer fireworks in both new and existing buildings, structures, and facilities shall comply with the requirements of this section unless otherwise indicated.

5609.2.1 Special Requirements for Retail Sales of Consumer Fireworks. Retail sales of consumer fireworks, including their related storage and display for sale of such fireworks, shall be in accordance with this section.

5609.2.1.1 Occupancy classification. Retail sales of consumer fireworks in bulidings complying with this Section shall be classified as Use Group M.

5609.2.1.2 Prohibition. The retail sales of fireworks and novelties that do not comply with the regulations of the U.S. Consumer Product Safety Commission as set forth in 16 CFR 1500 and 1507 and the regulations of the U.S. Department of Transportation as set forth in 49 CFR 100 to 178, including their related storage and display for sale, shall be prohibited.

5609.2.2 Third party testing. Consumer fireworks shall be tested and certified by an approved, independent third party testing agency for compliance with the regulations of the Consumer Product Safety Commission (CPSC) as set forth in 16 CFR 1500 and 1507, using a test sampling plan that meets CPSC requirements.

5609.2.3 Permits. Where required by state or local laws, ordinances, or regulations, a permit for the following shall be obtained for the storage of consumer fireworks in connection with the retail display or sale of consumer fireworks to the public.

5609.2.4 Fire department access. Any portion of an exterior wall shall be accessible within 150 ft. (45.7 m) of a public way or an approved fire department access road.

5609.2.5 Smoking. Smoking shall be regulated in accordance with Sections 5609.2.5.1 and 5609.2.5.2

5609.2.5.1 Location. Smoking shall not be permitted inside or within 50 ft. (15.5 m) of sales facility

5609.2.5.2 Signage. At least one sign that reads as follows, in letters at least 2 in. (51 mm) high on a contrasting background, shall be conspicuously posted at each entrance or within 10 ft. (3.05 m) of every aisle directly serving the fireworks sales area:

FIREWORKS

NO SMOKING

5609.2.6 Retail sales displays. Retail displays of fireworks shall be in accordance with Sections 5609.2.6.1 through 5609.6.3.3.

5609.6.1 Height of sales display. Partitions, counters, shelving, cases and similar space dividers shall not exceed 6 ft. (1.8 m) in height above the floor surface inside the perimeter of the retail sales area. Where located along the perimeter

of the consumer fireworks retail sales area, the maximum height of sales display shall be limited to 12 ft. (3.6 m).

5609.2.6.2 Flame breaks. Where continuous displays of consumer fireworks are located on shelving, cases, counters, and similar display fixtures, a flame break shall be provided so that the maximum distance between flame breaks does not exceed 16 ft (4.9 m) where measured along the length of the display.

5609.2.6.2.1 Extension of Flame break. The flame break shall extend be in accordance with the following:

1. From the display surface to not less than 6 in. (150 mm) above the full height of the displayed merchandise or to the underside of the display surface directly above.

2. For the full depth of the displayed merchandise.

5609.2.6.2.2 Mixed packaging. Where packaged fireworks merchandise is displayed on the same level as individual unpackaged fireworks devices, the flame break required in 5609.2.7.2.1 shall not be required where in accordance with both of the following:

1. The length of the display level containing individual unpackaged fireworks devices is interrupted by packaged fireworks merchandise, or open space, or any combination thereof, having a continuous length of not less than 8 ft. (2.4 m).
2. The distance between flame breaks does not exceed 32 ft. (9.8 m).

5609.2.6.2.3 Continous storage. Where a merchandise display level contains packaged fireworks merchandise, such merchandise shall be permitted to be displayed in a continuous length on the same level, where the display does not exceed 32 ft. (9.8 m) without the flame break required in 5609.2.6.2.1.

5609.6.2.4 Aisle. An aisle having a minimum width of 48 in. (1.2 m) shall be permitted to substitute for the flame break.

5609.2.6.2.5 Displays facing aisles. Where displays of merchandise face aisles that run along both long sides of the display fixtures or display surface, a flame break shall be installed lengthwise between the abutting display fixtures or along the approximate longitudinal centerline of the display surface so as to separate the merchandise facing one of the aisles from the merchandise that abuts it facing the other aisle.

5609.2.6.2.6 Freestanding displays. Freestanding display racks, pallets, tables, or bins containing packaged fireworks merchandise shall be permitted without flame breaks, provided the dimensions of the area occupied by the fireworks merchandise do not exceed 4 ft. (1.2 m) in width, 8 ft. (2.4 m) in length, and 6 ft. (1.8 m) in height, and the displayed fireworks merchandise is separated from other displays of merchandise by aisles having a minimum clear width of 4 ft. (1.2 m).

5609.2.6.2.7 Displays of hardboard panels. Where both of the facing vertical surfaces of the abutting display fixtures are constructed of perforated hardboard panels not less than ¼ in. (6 mm) thick that are separated from each other by an open space not less than 1 ½ in. (38 mm) wide, a flame break shall not be required.

5609.2.6.2.8 Permanent sales facilities. In Permanent Sales Facilities the longitudinal flame break shall not be required where the display fixture or surface is adjacent to an aisle that is not used for public egress.

5609.2.6.3 Shelving. Shelving shall be in accordance with 5609.2.6.3.1 through 5609.2.6.3.3

5609.2.6.3.1 General. Shelving or other surfaces used to support fireworks display merchandise shall be permitted to have not more than 10 percent of the area of the shelf contain holes or other openings.

5609.2.6.3.2 Openings. The 10 percent limitation on the area of holes or other openings in the shelf used to support fireworks display merchandise shall not be applicable under the following conditions:

1. Where both of the facing vertical surfaces of the abutting display fixtures are constructed of perforated hardboard panels not less than ¼ in. (6 mm) thick and separated from each other by an open space not less than 1 ½ in. (38 mm) wide.
2. Where such merchandise is suspended from or fastened to the shelf or surface or is displayed as packaged merchandise on the surface or in bins.

5609.2.6.3.3 Flame breaks and solid display. Flame breaks and solid display surfaces shall not be required for

packaged fireworks merchandise displayed in bins or display racks or on pallets or tables located at the end of a row of display fixtures where the following conditions are met:

1. Such end displays are separated from the ends of the display fixtures by an open space not less than 3 in. (76 mm) wide.
2. The fireworks merchandise occupies an area having dimensions not greater than the width of the end of the row of display fixtures and a depth not greater than 30 in. (910 mm).
3. The minimum required widths of the adjacent aisles are maintained, but in no case is the aisle width less than 48 in. (1.2m).

5609.2.7 Covered fuses. Only consumer fireworks meeting the criteria for covered fuses shall be permitted.

5609.2.7.1 Packaged fireworks. A consumer fireworks device shall be considered as having a covered fuse if the fireworks device is contained within a packaged arrangement, container, or wrapper that is configured such that the fuse of the fireworks device cannot be touched directly by a person handling the fireworks without the person having to puncture or tear the packaging or wrapper, unseal or break open a package or container, or otherwise damage or destroy the packaging material, wrapping, or container within which the fireworks are contained.

5609.2.8 Aerial Devices. Aerial devices shall be packaged and displayed for sale in a manner that will limit travel distance of ejected pyrotechnic components if ignition of the fireworks occurs.

5609.2.9 Other Materials. Combustible materials and merchandise shall not be stored directly above the consumer fireworks in retail sales.

5609.2.10 Training. All personnel handling consumer fireworks shall receive safety training related to the performance of their duties.

5609.3 Retail Sales of Consumer Fireworks in Permanent Sales Facilities. Permanent sales facilities for retail sale of consumer fire works shall comply with Sections 5609.3.1 through 5609.3.7.3.

5609.3.1 Quantity Limitations. The floor area occupied by the retail displays of consumer fireworks in Permanent Sales Facilities shall not exceed 40 percent of the available floor area within the retail sales area.

5609.3.2 Construction of Permanent Sales Facilities. New permanent sales facilities shall not exceed one story in height.

5609.3.3 Multiple-Tenant buildings

. Multiple-tenant buildings shall comply with Sections 5609.3.3.1 and 5609.3.3.2.

5609.3.3.1 Buildings with other tenants. Where new permanent sales facilities are located in a building containing other tenants, the permanent sales facility shall be separated from the other tenants by fire barriers with a minimum fire resistance rating of two hours and having no openings.

5609.3.3.2 Sprinkler protection. Where the new permanent sales facilities are protected with an automatic sprinkler system complying with 903.3.1.1, the fire resistance rating of the fire barrier required by 5609.3.3.1 shall be permitted to be not less than 1 hour.

5609.3.4 Fire protection. An automatic sprinkler system complying with 903.3.1.1 shall be provided throughout permanent sales facilities in which fireworks sales are conducted as follows:

1. In new permanent sales facilities greater than 3000 ft² (276 m²) in area
2. In existing permanent sales facilities greater than 7500 ft² (694 m²) in area

5609.3.5 Storage rooms. Storage rooms, containing consumer fireworks in a new Permanent Sales Facilities shall be protected with an automatic sprinkler system complying with 903.3.1.1 or separated from the retail sales area by a fire barrier having a fire resistance rating of not less than 1 hour.

5609.3.6 Fire alarms. A fire alarm system shall be provided in accordance with Section 907.

5609.3.7 Separation distances. Separation distances shall be provided in accordance with Section 5609.3.7.1 through 5609.3.7.3 as applicable.

5609.3.7.1 New facilities

New Permanent Sales Facilities shall be separated from adjacent permanent buildings and structures in accordance with Table 5609.3.7.1.

5609.3.7.2 Existing facilities. Existing Permanent Sales Facilities shall be separated from adjacent permanent buildings and structures by not less than 10 ft (3.05m) or shall be separated by a wall with a 1-hour fire resistance rating.

**Table 5609.3.7.1
SEPARATION DISTANCE BETWEEN NEW PERMANENT BUILDINGS AND STRUCTURES**

Separation distance		Exterior Wall Fireresistance Rating (hr)	Exterior Wall Opening Protection Rating (hr)
<u>Ft</u>	<u>M</u>		
<u>< 10</u>	<u><3.05</u>	<u>2</u>	<u>1-1/2</u>
<u>>10 - <60</u>	<u>>3.05- <18.3</u>	<u>1</u>	<u>3/4</u>
<u>> 60</u>	<u>>18.3</u>	<u>0</u>	<u>0</u>

5609.3.7.3 Parking.. No motor vehicle or trailer used for the storage of consumer fireworks shall be parked with 10 ft. (3 m) of a permanent sales facility, except when the vehicle or trailer is delivering, loading, or unloading fireworks or other merchandise and materials used, stored, or displayed for sale in the facility.

5609.3.8 Means of Egress. Means of egress in permanent retail sales facilities shall be in accordance with Sections 5609.3.8.1 through 5609.3.8.3.

5609.3.8.1 Number of exits. The minimum number of exits provided from the retail sales area shall be not less than three.

5609.3.8.2 Exit access travel distance. Exits provided for permanent sales facilities shall be located so that the exit access travel distance does not exceed 75 ft. (22.9 m).

5609.3.8.3 Emergency lighting. Emergency lighting shall be provided for permanent sales facilities.

5609.3.9 Operations. Operations of retail sales of consumer fireworks in permanent facilities shall be in accordance with Sections 3609.3.9.1 through 5609.3.9.3.

5609.3.9.1 Distances from Entrances and Exits. Distance to entrances and exits shall comply with Sections 5609.3.9.1.1 and 5609.3.9.1.2.

5609.3.9.1.1 Public entrances. No consumer fireworks shall be displayed for sale or stored within 5 ft (1.5 m) of any public entrance in an enclosed building or structure.

5609.3.9.1.2 Private entrances. No consumer fireworks shall be displayed for sale or stored within 2 ft (0.6 m) of any exit or private entrance in an enclosed building or structure.

5609.3.9.2 Security. Fire works shall be kept Secure in permanent sales facilities in accordance with Sections 5609.3.9.2.1 through 5609.3.9.2.3.

5609.3.9.2.1 Non business hours. Permanent sales facilities shall be secured when unoccupied and not open for business, unless fireworks are not kept in the facility during such times.

5609.3.9.2.2 Removal and transferring. The fireworks displayed or stored in a permanent sales facilities shall be allowed to be removed and transferred to a temporary storage structure or location.

5609.3.9.2.3 Ignition sources. Fireworks shall not be ignited, discharged, or otherwise used within 300 ft. (91.5 m) of a permanent sales facilities.

5609.3.9.3 Display and Handling. Not less than 50 percent of the available floor area within the retail sales area shall be open space that is unoccupied by retail displays and used only for aisles and cross-aisles.

5609.4 Requirements for Retail Sales of Consumer Fireworks in Temporary Sales Facilities. The retail sales of consumer fire works in temporary sales facilities shall be in accordance with Sections 5609.4.1 through 5609.4.6.4.

5609.4.1 Construction of Temporary Sales Facilities. New Temporary Sales Facilities shall not exceed one story in height.

Exception: Temporary Sales Facility stands greater than 1600 ft2 (148 m2) in area that also meet the construction requirements for a permanent structure.

5609.4.2 Sale from vehicles. The sale of consumer fireworks from vehicles including automobiles, trucks, motor homes and travel trailers is not permitted except when the vehicle meets the requirements for a Temporary Sales Facility stand.

5609.4.3 Signage. In addition to the signage required in 5609.2.6 at least one sign that reads as follows, in letters at least 4 in. (102 mm) high on a contrasting background, shall be conspicuously posted on the exterior the temporary sales facility:

NO FIREWORKS DISCHARGE

WITHIN 100 FEET

5609.4.4 Separation Distances. Temporary sales facilities shall be located as specified in Table 5609.4.4 and in accordance with Sections 5609.4.4.1 and 5609.4.4.2.

5609.4.4.1 Clearance to Combustibles. The area located within 10 ft. (9 m) of a temporary sales facilities shall be kept free of accumulated dry grass, dry brush, and combustible debris.

5609.4.4.2 Parking. No motor vehicle or trailer used for the storage of consumer fireworks shall be parked within 10 ft. (3 m) of a Temporary Sales Facilities, except when the vehicle or trailer is delivering, loading, or unloading fireworks or other merchandise and materials used, stored, or displayed for sale in the facility.

**Table 5609.4.4
MINIMUM SEPARATION DISTANCES FOR TEMPORARY SALES FACILITIES**

Type	Separation Distance											
	Buildings		Combustibles		Tents		Vehicle Parking		Stands		Storage of Fireworks	
	Ft	M	Ft	M	Ft	M	Ft	M	Ft	M	Ft	M
Tents	20	6.1	20	6.1	20	6.1	10	3.05	20	6.1	20	6.1
Stands	20	6.1	10	3.05	20	6.1	10	3.05	20	6.1	20	6.1

5609.4.5 Means of Egress. Means of egress and temporary retail sales of consumer fire works shall be in compliance with Sections 5609.4.5.1 through 5609.4.5.6.

5609.4.5.1 Number of Exits. The minimum number of exits provided from the retail sales area shall be not less than three for Temporary Sales Facilities that are larger than 1,200 ft2. All other Temporary Sales Facilities shall have a minimum of two exits, regardless of area.

5609.4.5.2 Egress through storage rooms. Required means of egress from the retail sales area shall not be allowed to pass through storage rooms or areas.

5609.4.5.3 Egress Travel Distance. Egress travel distance shall be in accordance with Sections 5609.4.5.3.1 and 5609.4.5.3.2.

5609.4.5.3.1 Exits provided for Temporary Sales. Facilities tents shall be located so that the exit access travel distance does not exceed 75 ft. (22.9 m).

5609.4.5.3.2 Exits provided for Temporary Sales. Facilities stands shall be located so that the exit access travel distance does not exceed 35 ft. (10.6 m).

5609.4.5.4 Aisles. Aisles shall have a minimum clear width of 48 in. (1.2 m) except in temporary sales facilities stands where the interior is not accessible to the public, the minimum clear width of aisles shall be 28 in. (710 mm).

5609.4.5.5 Dead-end aisles. Dead-end aisles shall be prohibited.

5609.4.5.6 Emergency Lighting. Emergency lighting shall be provided for temporary sales facilities. Emergency lighting shall not be required in Temporary Sales Facilities that are not open for business after dusk or for Temporary Sales Facilities stands where the interior is not accessible to the public.

5609.4.6 Sales Display. Consumer fireworks shall be displayed in a manner that prevents the fireworks from being handled by persons other than those operating, supervising, or working in the Temporary Sales Facilities stand where the stand does not allow access to the interior by the public.

5609.4.7 Portable Generators. Portable generators shall be in accordance with Sections 5609.4.7.1 through 5609.4.7.4.

5609.4.7.1 Fuel. Fuel for generators shall be permitted to be Class I, Class II, or Class III liquids and shall be limited to not more than 5 gallons (18.9 L) unless the generator fuel storage is located at least 50 ft. (15.2 m) from the temporary sales facility.

5609.4.7.2 Limitations. Portable generators supplying power to Temporary Sales Facilities shall use only Class I or Class III combustible liquid fuels.

5609.4.7.3 Separation of generators. Portable generators shall be located not less than 20 ft. (6.1 m) from the Temporary Sales Facilities.

5609.4.7.4 Separation of fuels. Generator fuels shall be stored not less than 20 ft. (6.1 m) from the Temporary Sales Facilities.

5609.5 Requirements for Retail Sales of Consumer Fireworks in Stores. Retail sale of consumer fireworks shall comply with Section 5609.5.1 through 5609.5.6

5609.5.1 Applicability. The requirements of Section 5609.4 do not apply where both of the following conditions exist:

1. The area of the retail sales floor occupied by the retail displays of consumer fireworks does not exceed 25 percent of the area of the retail sales floor in the building or 600 ft² (55.5m²), whichever is less.
2. The consumer fireworks are displayed and sold in a manner approved by the fire code official and comply with the applicable provisions of this code, federal and state law, and local ordinances.

5609.5.2 Requirements. Consumer fireworks displayed for sale in stores shall comply with all of the following:

1. Such fireworks shall be under the visual supervision of a store employee or other responsible party while the store is open to the public.
2. Such fireworks shall be packaged fireworks merchandise.
3. Such fireworks shall be packaged and displayed for sale in a manner that will limit travel distance of ejected pyro-technical components if ignition of the fireworks occurs.
4. Where consumer fireworks meeting the description of aerial devices and audible ground devices are sold, such devices shall be displayed for sale in an area of the store that is physically separated from the rest of the store in a manner that restricts entry by the public, and the area of the store shall be provided with not less than two means of egress, so located that there is no common path of travel and the distance to reach an egress point from the area does not exceed 35 ft (10.7m).

5609.5.3 Automatic Sprinkler System. The store shall be protected with an automatic sprinkler system in accordance

with 903.3.1.1 in accordance with the following:

1. New stores greater than 3000 ft² (552.2 m²) in area
2. Existing stores greater than 7500 ft² (694 m²) in area

5609.5.4 Fire Alarm System. A fire alarm system shall be provided as required by Section 907. In addition, in stores greater than 3000 ft² (280 m²), a public address system or a means for manually activating audible and visible alarm indicating devices located throughout the facility shall be provided at a constantly attended location when the store is occupied.

5609.5.5 Storage Rooms. Storage rooms containing consumer fireworks in a store shall be protected with an automatic sprinkler system complying with 903.3.1.1 or shall be separated from the retail sales area by a fire barrier having a fire resistance rating of not less than 1 hour.

5609.5.6 Means of Egress. Exits provided for stores shall be located so that the exit access travel distance from the area where consumer fireworks are displayed does not exceed 75 ft. (22.9 m).

5609.6 Storage of Consumer Fireworks. The storage of consumer fireworks shall comply with Sections 5609.6.1 through 5609.6.9.3

5609.6.1 Non applicability. This section shall not apply to buildings or facilities where the net weight of the pyrotechnic content of consumer fireworks stored does not exceed 125 lb., or 250 lb. where the building is protected throughout with an automatic sprinkler system complying with 903.3.1.1

5609.6.2 Storage locations. Consumer fireworks storage buildings shall not also be used as a magazine for the storage of other explosive materials. Consumer fireworks shall be permitted to be stored in a magazine.

5609.6.3 Reworking and processing. Any reworking or processing of consumer fireworks shall only be permitted to be performed in a building meeting the requirements of NFPA 1124 for Process Buildings.

5609.6.4 Occupancy restrictions. Consumer fireworks storage buildings shall not be used for residential occupancies and shall not be located in residential areas.

5609.6.5 Finished products. Finished consumer fireworks at a manufacturing or distribution facility shall be stored in consumer fireworks storage buildings, trailers, semitrailers, metal shipping containers, or magazines.

5609.6.6 Receiving and packaging. Receiving, picking, packing, packaging, and shipping shall be permitted in consumer fireworks storage buildings or areas.

5609.6.7 Separation Distances. Consumer fireworks storage or work buildings at distribution facilities shall be separated from adjacent permanent buildings and structures in accordance with Table 5609.6.7

**Table 5609.6.7
SEPARATION DISTANCE FOR CONSUMER FIREWORKS STORAGE OR WORK BUILDINGS**

Separation distances		Exterior Wall Fireresistance Rating (hr)	Exterior Wall Opening Protection Rating (hr)
Ft	M		
<u>< 10</u>	<u>< 3.05</u>	<u>2</u>	<u>1-1/2</u>
<u>>10 - <60</u>	<u>>3.05- <18,3</u>	<u>1</u>	<u>3/4</u>
<u>> 60</u>	<u>>18.3</u>	<u>0</u>	<u>0</u>

5609.6.8 Operations. Operations shall be in accordance with Sections 5609.8.1 through 5609.6.8.

5609.6.8.1 Receiving and storing. Receiving, storing, picking from cartons, packing into cartons, packaging into retail packages including assortments, shipping, and other similar operations involving finished consumer fireworks shall be permitted in consumer fireworks storage or work buildings, rooms, or areas that meet the requirements of this chapter.

5609.6.8.2 Picking, sorting and packaging. Picking, sorting, packaging, packing, and other similar operations involving

finished consumer fireworks shall be conducted in consumer fireworks work buildings or consumer fireworks work rooms or areas in consumer fireworks storage buildings that meet the requirements of this chapter.

5609.6.8.3 Locking doors and windows. Exterior doors and windows shall be kept locked when the building is not occupied or otherwise attended.

5609.6.8.4 Consumer fireworks. 5609.6.8.4 Consumer fireworks shall be in accordance with the following:

1. Consumer fireworks shall be stored in DOT-approved packaging.
2. Cartons shall be stacked neatly and in a stable manner.
3. Consumer fireworks returned to these buildings shall be permitted to be stored temporarily in cartons until repackaging or repacking can be performed.
4. Firearms, unless carried by authorized personnel or law enforcement personnel, shall not be permitted inside a consumer fireworks storage or work building, room, or area or within 50 ft. (15.2 m) of stored consumer fireworks.

5609.6.9 Housekeeping. Housekeeping shall comply with Section 5609.6.9.1 through 5609.6.9.3.

5609.6.9.1 Loose black powder. Loose black powder or other exposed pyrotechnic composition shall be prohibited. If loose composition is discovered, it shall be removed immediately and disposed of in an approved manner.

5609.6.9.2 Fireworks storage or work areas. Consumer fireworks storage or work buildings, rooms, or areas shall comply with all of the following:

1. Interiors shall be kept clean, dry and free of grit and rubbish.
2. Tools used for cleaning up loose pyrotechnic composition shall not have spark-producing metal parts.
3. Sweepings shall be disposed of in an approved manner.

5609.6.9.3 Clearance. The area around consumer fireworks storage or work buildings shall be kept clear of brush, dried vegetation, rubbish, and similar combustibles for a distance of at least 25 ft. (7.6 m).

Reason: The current edition of NFPA 1124 no longer contains requirements addressing the retail sales and storage of consumer fireworks. Whereas almost every state allows the sale of some consumer fireworks, the fire official has no requirements to enforce that specifically address such facilities. The proposal is not about whether the sale of consumer fireworks should be permitted; but rather, where they are permitted the proposal provides a minimum set of requirements that a fire official can apply to provide an acceptable level of safety.

The requirements contained in this proposal are not as comprehensive as the standalone requirements contained in previous editions of NFPA 1124. Instead, the approach taken was to rely on other sections of the IFC to address provisions such as illumination of the means of egress, portable fire extinguishers, electrical equipment, etc. Instead, the proposed revisions focus on requirements that are mostly unique to consumer fireworks facilities such as flame breaks and covered fuses.

The proposal contains a set of general requirements that apply to all facilities in which consumer fireworks are sold (5609.2). The general provisions are then followed by requirements unique to three separate types of facilities: permanent sales facilities (5609.3); temporary sales facilities (5609.4); and retail stores in which consumer fireworks are displayed and sold along with other goods and merchandise (5609.5). The storage related to the sale of consumer fireworks is covered in Section 5609.6.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The transition from the requirements of NFPA 1124 to the proposed requirements for Section 5609 should not impact the cost of construction.

F303-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based upon the action taken on code change proposal F300-18. There was some discussion regarding the verbiage in this proposal that it needs to better clarify how to deal with new and existing buildings. In addition, there was concern with the application of the provisions for temporary sales. Finally, Section 5609.4.5 of the proposal does not reference Chapter 10 of the coded for means of egress. (Vote: 14-0)

Assembly Action:

None

F303-18

Individual Consideration Agenda

Public Comment 1:

Proponent: William Koffel, representing American Pyrotechnics Association (wkoffel@koffel.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

FLAME BREAK

A solid material, without holes, utilized to retard the spread of flame.

5601.1.3 Fireworks. The possession, manufacture, storage, sale, handling and use of fireworks are prohibited.

Exceptions:

- 1.Storage and handling of fireworks as allowed in Section 5604.
- 2.Manufacture, assembly and testing of fireworks as allowed in Section 5605.
- 3.The use of fireworks for fireworks displays as allowed in Section 5608.
- 4.The possession, storage, sale, handling and use of specific types of Division 1.4G fireworks where allowed by applicable laws, ordinances and regulations, provided that such fireworks and facilities comply with ~~NFPA 1124~~Section 5609, CPSC 16 CFR Parts 1500 and 1507, and DOTn 49 CFR Parts 100-185, as applicable for consumer fireworks.

SECTION 5609 TEMPORARY RETAIL SALES AND ASSOCIATED STORAGE OF

CONSUMER FIREWORKS

5609.1 General. Where the display or ~~temporary~~ storage of fireworks 1.4G (consumer fireworks) is allowed by Section 5601.1.3, Exception 4, such display ~~or and~~ storage shall comply with the applicable requirements of the 2006 edition of NFPA 1124, and this section.

5609.2 Retail sales of consumer fireworks. Retail sales of consumer fireworks in both new and existing facilities shall comply with this Sections 5609.2.1 through 5609.2.5

5609.2.1 Occupancy Classification. Retail sales of consumer fireworks shall be limited to buildings of Use Group M.

5609.2.2 Permits. Where required by state or local laws, ordinances, or regulations, a permit shall be obtained for the storage of consumer fireworks in connection with the retail display or sale of consumer fireworks to the public.

5609.2.3 Flame Breaks. Where continuous displays of consumer fireworks are located on shelving, cases, counters, and similar display fixtures, a flame break shall be provided such that the maximum distance between flame breaks does not exceed 16 ft. (4.9 m.) where measured along the length of the display.

5609.2.3.1 Minimum dimensions. The flame break shall extend as follows:

1. The display surface to not less than 6 in. (150 mm) above the full height of the displayed merchandise or to the underside of the display surface directly above.
2. For the full depth of the displayed merchandise.

5609.2.3.2 Mixed packaging types. Where packaged fireworks merchandise is displayed on the same level as individual unpackaged fireworks devices, the flame break required in 5609.2.3 shall not be required where both of the following criteria are met:

1. The length of the display level containing individual unpackaged fireworks devices is interrupted by packaged fireworks merchandise, or open space, or any combination thereof, having a continuous length of not less than 8 ft. (2.4 m).
2. The distance between flame breaks does not exceed 32 ft. (9.8 m).

5609.2.3.3 Display of packaged fireworks. Where a merchandise display level contains packaged fireworks merchandise, such merchandise shall be permitted to be displayed in a continuous length on the same level, where the display does not exceed 32 ft. (9.8 m) without the flame break required in 5609.2.3.

5609.2.3.4 Aisle alternative. An aisle having a minimum width of 48 in. (1.2 m) shall be permitted to substitute for the flame break.

5609.2.3.5 Abutting displays. Where displays of merchandise face aisles that run along both long sides of the display fixtures or display surface, a flame break shall be installed lengthwise between the abutting display fixtures or along the approximate longitudinal centerline of the display surface so as to separate the merchandise facing one of the aisles from the merchandise that abuts it facing the other aisle.

5609.2.3.6 Freestanding displays. Freestanding display racks, pallets, tables, or bins containing packaged fireworks merchandise shall be permitted without flame breaks, provided the dimensions of the area occupied by the fireworks merchandise do not exceed 4 ft. (1.2 m) in width, 8 ft. (2.4 m) in length, and 6 ft. (1.8 m) in height, and the displayed fireworks merchandise is separated from other displays of merchandise by aisles having a minimum clear width of 4 ft. (1.2 m).

5609.2.3.7 Hardboard panel separation. Where both of the facing vertical surfaces of the abutting display fixtures are constructed of perforated hardboard panels not less than ¼ in. (6 mm) thick that are separated from each other by an open space not less than 1 ½ in. (38 mm) wide, a flame break shall not be required.

5609.2.3.8 Non-public aisle. The longitudinal flame break shall not be required where the display fixture or surface is adjacent to an aisle that is not used for public egress.

5609.2.4 Covered Fuses. Only consumer fireworks meeting the criteria for covered fuses shall be permitted. A consumer fireworks device shall be considered as having a covered fuse if the fireworks device is contained within a packaged arrangement, container, or wrapper that is configured such that the fuse of the fireworks device cannot be touched directly by a person handling the fireworks without the person having to puncture or tear the packaging or wrapper, unseal or break open a package or container, or otherwise damage or destroy the packaging material, wrapping, or container within which the fireworks are contained.

5609.2.5 Automatic Sprinkler System. An automatic sprinkler system complying with 903.1.1 shall be provided throughout facilities in which fireworks sales are conducted in the following buildings:

1. New facilities greater than 3000 ft² (276 m²) in area
2. Existing facilities greater than 7500 ft² (694 m²) in area

5609.3 Storage of Consumer Fireworks Storage of consumer fireworks in both new and existing buildings, structures, and facilities shall comply with the requirements of Sections 5609.3.1 and 5609.3.2.

5609.3.1 Automatic Sprinkler System. An automatic sprinkler system complying with 903.1.1 shall be provided in consumer fireworks storage buildings greater than 12,000 ft². (1115 m²).

5609.3.2 Design Criteria The automatic sprinkler system shall be designed using the following criteria for the areas in which the consumer fireworks are stored in DOT-approved packaging:

1. Consumer fireworks stored in DOT-approved packaging shall be considered as a Class IV commodity.
2. Consumer fireworks stored to a height not greater than 10 ft. (3 m) in racks, or 12 ft. (3.7 m) otherwise, shall be classified as an Ordinary Hazard (Group 2) occupancy.
3. Consumer fireworks stored to a height not greater than 12 ft. (3.7 m) in racks, but greater than 10 ft. (3 m), shall be classified as an Extra Hazard (Group 1) occupancy.
4. Consumer fireworks stored to a height greater than 12 ft. (3.7 m) shall be protected by an automatic sprinkler system, acceptable to the fire code official, that is designed using a fire control approach or a special design approach.

Commenter's Reason: Instead of providing the detailed requirements contained in the Public Proposal, the Code Development Committee chose to reference the 2006 Edition of NFPA 1124. However, the 2006 Edition of NFPA 1124 does not contain requirements for flame breaks and covered fuses. In the 2006 Edition of NFPA 1124, the threshold for when automatic sprinkler protection is required uses a higher area than what is contained in the original printing of the 2013 Edition of NFPA 1124. The Public Comment (and original Public Proposal) used the smaller area threshold consistent with the 2013 Edition of NFPA 1124.

In taking the action that was taken, the Code Development Committee requested that the FCAC review the action taken and suggest additional changes. In meeting with the FCAC, it was recommended the the requirements for flame breaks, covered fuses, and the sprinkler threshold requirements be added to Section 5609.

It should also be noted that based upon the action taken by the Code Development Committee it was impossible to revise F303 during the Code Development Hearings. As such, the clean-up necessary for Section 5609 had to be accomplished by a Public Comment. If the Public Comment is not accepted, Section 5609 will simply reference NFPA 1124, without specifying the edition, and it will not contain the additional protection provided by flame breaks, covered fuses, and more restrictive sprinkler system thresholds.

The Public Comment addresses the need to revise Section 5609 based upon the Committee Recommendation for Approval as Modified of F300-18. A correlative edit has been made to Exception 4 to Section 5601.1.3 to re-insert Section 5609 as originally proposed.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The additional cost will be that associated with flame breaks and the more restrictive sprinkler system thresholds. Most, if not all, consumer fireworks sold in the USA should not be protected with covered fuses which is not a construction cost.

Staff Analysis: Public comments to code change proposals F300-18 and F303-18 propose revisions to Section 5601.1.3 and 5609. The actions taken need to address these differences.

F303-18

F304-18

IFC: TABLE 5703.6.2, Chapter 80

Proposed Change as Submitted

Proponent: Bob Torbin, OmegaFlex, representing OmegaFlex (bob.torbin@omegaflex.net)

2018 International Fire Code

Revise as follows

**TABLE 5703.6.2
PIPING STANDARDS**

PIPING USE	STANDARD
Power Piping	ASME B31.1
Process Piping	ASME B31.3
Pipeline Transportation Systems for Liquid Hydrocarbons and Other Liquids	ASME B31.4
Building Services Piping	ASME B31.9
Double Containment Piping	UL971A: UL1369

Add new standard(s) follows

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook IL 60062

971A -2006:

**Outline of Investigation for Metallic Underground Fuel Pipe
1369-18:**

Aboveground Piping Requirements

Reason: This proposal covers metallic and composite primary carrier, secondary containment, and integral primary/secondary piping systems (piping and fittings) intended for above and below ground use in applications for the distribution of petroleum-based flammable and combustible liquids. The intent and design of double containment systems are focused on preventing fuel/liquid leaks that could result in severe fire hazards.

The primary metallic (316 stainless steel) tubing is a zero-permeation pipe which is highly resistant to corrosion with exceptional crush resistance. The UV stabilized Nylon 12 protective containment layer offers exceptional resistance to hydrocarbons, chemical and water exposure, and carries a 50 psig rating. An EFEP secondary barrier jacket layer is bonded to the Nylon 12 protective layer to offer secondary containment with exceptional permeation resistance for product compatibility. The interstitial space between the tubing and jacket allows continuous monitoring for leak detection, with a 50 psig rating for pressurized systems. The self-flaring fitting provides a metal to metal sealing surface with excellent reliability and is field-attachable using standard hand tools. This class of piping product has been used (above and below grade) for a variety of fuels for several years without failure for many applications such as marinas, gasoline stations and small power generators.

Cost Impact: The code change proposal will decrease the cost of construction. The use of a listed encasement system results in cost savings because the piping and encasement are installed simultaneously. This avoids the labor cost of separately installing the conduit and piping. In addition, the sealing and venting methods (when required) are also integrated within the encasement system, thus eliminating the need to separately assemble and/or install sealing and venting components within standard conduit.

Analysis: A review of the standards proposed for inclusion in the code, UL 971A -2006 and UL 1369-18, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

F304-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This proposal was approved based upon the proponent's reason statement and would allow for another type of double contained pipe. (Vote: 14-0)

Assembly Action:

None

F304-18

Individual Consideration Agenda

Public Comment 1:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standard UL1369-18: Aboveground Piping Requirements, must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

F304-18

F314-18

IFC: 5707.4

Proposed Change as Submitted

Proponent: Andrew Klein, representing Booster Fuels (andrew@asklein.com)

2018 International Fire Code

Revise as follows

5707.4 Mobile fueling areas. Mobile fueling shall not occur on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited unless adequate and direct access from grade-level is provided as determined by the fire code official.

Reason: There are some sites where a building or underground parking structure is below a grade-level parking lot. Fueling at such a location does not hinder emergency vehicle access, and fueling may be performed safely. This proposal provides the fire code official the ability to permit fueling at such locations when adequate emergency vehicle access is provided.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This code change proposal simply clarifies where mobile fueling is permitted.

F314-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based upon concerns related to the potential for the accumulation of vapors. A modification was presented that provided more detail regarding issues such as ventilation, location and spill control but further review is necessary. In particular it needs to be clear that all conditions presented by the modification would apply. (Vote: 14-0)

Assembly Action:

None

F314-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Andrew Klein, representing Booster Fuels and Shell (andrew@asklein.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

5707.4 Mobile fueling areas. Mobile fueling shall not occur on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited.

Exception: The fire code official is authorized to permit mobile fueling inside and on the roof level of buildings and garages that are classified as Group H-3 in accordance with Section 307.5 of the International Building Code.

Commenter's Reason: There is an industry need for mobile fueling of fleet vehicles that are garaged in parking structures. As technology advances and cities look to reduce traffic congestion, fleets of vehicles owned by car sharing companies have increased dramatically in recent years. Gasoline is still the preferred fuel source for most of these vehicles, even the autonomous ones that are being developed and tested. Car sharing businesses need code requirements to support developing technology and city needs so that they can move forward with confidence investing in infrastructure.

Fueling inside of a building is no different than any other use of flammable liquids inside of a building. Permitting mobile fueling inside of buildings constructed as H-3 Occupancies is consistent with the intent of the Code and provides the necessary requirements and guidance when constructing facilities for such purposes.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Jurisdictions may already permit fueling inside of buildings that are classified as Group H-3 occupancies through alternative means and methods. This Public Comment codifies what is already being done so that owners of ride sharing fleets can continue with confidence when expanding their fleets and the facilities that garage them.

F314-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There was general concern for dispensing fuel on a public way. In particular there is concern for such operations occurring in residential neighborhoods without additional data to better understand the risks. It was pointed out that the language appears to limit time of day but not location. There was a sense from some that the fire code official should be allowed some discretion to allow fueling in public ways under certain conditions. (Vote: 11-3)

Assembly Action:

None

F316-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Andrew Klein, representing Shell (andrew@asklein.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

5707.4 Mobile fueling areas. Mobile fueling shall not occur on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited.

Exception: The fire code official is authorized to permit mobile fueling on public streets and public ways where all of the following conditions are met:

1. Mobile fueling has been permitted by the authority having jurisdiction over public streets.
2. Mobile fueling activities do not obstruct vehicular or pedestrian traffic.
3. The safety and emergency response plan requires compliance with all applicable parking and traffic vehicle laws.

Commenter's Reason: Many jurisdictions rely on ride sharing programs to reduce congestion and eliminate the need for costly, expanded infrastructure improvements. In order for ride sharing programs to be viable, vehicles often need to be distributed throughout cities so that users of the program can access them. Fueling such vehicles presents many issues from rampant fraud and abuse of fuel cards to the inconvenience of members having to refuel at gas stations. When jurisdictions request that fueling of vehicles parked along the street be permitted, the Code must provide guidance to the fire code official as to how to permit such an activity.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The mobile fueling activities will not affect construction costs of buildings.

Public Comment 2:

Proponent: Jim Tidwell, representing FILLD (jimtidwell@tccfire.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Fire Code

5707.4 Mobile fueling areas. Mobile fueling shall not occur on public streets, *public ways* or inside *buildings*. Fueling on the roof level of parking structures or other *buildings* is prohibited.

Exception: The Fire Code Official is authorized to permit mobile fueling on public streets where all the following apply:

1. The fueling operation is at an approved location or geographic area
2. The mobile fueling vehicle and the vehicle being fueled are in compliance with all parking, traffic and vehicle laws
3. The mobile fueling operation do not obstruct vehicle or pedestrian traffic
4. Containment for spilled fuel is in place while the fueling operation is in process
5. Approved overfill protection is provided
6. The mobile fueling vehicle is positioned with respect to the vehicle being fueled to prevent traffic from driving over the delivery hose
7. Fueling operations take place during a time of day and day of week approved by the fire code official

Commenter's Reason: While mobile fueling services are relatively new, they are quickly becoming highly desirable and, in many cases, a necessary part of our daily lives. The industry has now completed more than a million fueling events with no reportable spills, fires or other incidents related to the fueling activity. This is clearly an indication that mobile fueling is not a significant risk to our communities.

Our proposal to the code development committee was contained in a floor modification identical to this public comment. The proposal was recommended for disapproval by the committee, we believe, because there was a lack of information relative to the risks of mobile fueling. One of the challenges in developing regulations for new processes or activities is that we tend to address perceived risks, and don't have the data to base the requirements on actual risks. This was the case when the 2018 requirements were developed for mobile fueling and has persisted until now. To address this knowledge gap, we engaged Jensen Hughes to conduct a risk assessment of mobile fueling, and specifically asked them to analyze the practice of on-street fueling and compare that risk to the risks associated with fixed site (service station) fueling activities. The report is available by request to any jurisdiction wishing to view it, but is obviously too voluminous to include here.

Specific to this proposal are the following passages from the report:

The purpose of the report: "Specifically, the assessment compares the risks associated with fuel dispensing operations at a fixed motor fuel dispensing facility ("service station") that directly complies with the requirements of the applicable codes and standards, and a mobile fueling operation (as conducted by Filld) located on a public street."

"These results support the consideration that mobile fueling operations do not increase the fire risk to life and property beyond that already permitted by other fueling operations currently permitted in codes and standards."

The report goes on to state that "The results of the consequence analysis show that mobile fueling operations can limit the risk of property damage to a level that is at least as good as or better than that implicit to the spatial separation requirements of IFC and NFPA 30A for fixed dispensing facilities (3.0 m)."

Based upon the risk analysis, fires per fueling event involving mobile fueling are predicted to be less frequent than those at fixed facilities, and the result of any fire that does occur will be no more harmful than those emanating from fixed fueling facilities.

The report uses industry standard practices to calculate both frequency and severity of events. The calculations are based upon historical data gleaned from valid sources, including NFPA, International Association of Oil and Gas Producers, and the Petroleum Equipment Institute, to name a few. Utilizing historical data rather than relying upon theoretical failure rates adds credibility to the findings.

Even though we believe the practice of mobile fueling poses no additional risk to our communities, the proposed change provides ample opportunity for the code official to implement requirements specific to the jurisdiction, including location, time of day, day of week, etc. Because the proposal doesn't mandate the code official to permit mobile fueling on streets, additional requirements based upon the local risk profile and response capabilities may be implemented. For instance, meaningful distinctions between truck type, aggregate fuel capacity, and driver training and certification, among other factors, give rise to meaningful differences in hazard/risk profiles. This proposal provides for a reasonable level of safety while providing enough flexibility to the local code official to address local concerns.

We ask the ICC membership to carefully study this report, which clearly indicates that mobile fueling is at least as safe as currently permitted fixed site fueling. Based upon that fact, and based upon the fact that this proposal includes strict requirements for this activity, it would be inappropriate for the code to require a higher level of protection for a lower risk activity. Please vote in support of this public comment.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposal doesn't involve construction, therefore there can be no impact on the cost of construction.

Proponent: Michael O'Brian, Chair, representing FCAC (fcac@iccsafe.org)

2018 International Fire Code

Add new text as follows

O101 QUALIFICATIONS

O101.1 Fire Marshal/Fire code official. The fire marshal/fire code official shall have experience as a firefighter or fire officer, architect, fire protection engineer, inspector, fire protection contractor or some combination of these fields. In addition, the fire marshal/fire code official shall have experience and/or formal training in supervisory skills. The fire code official shall be certified as a fire code official, fire marshal, or fire protection engineer through a recognized licensure or certification program. With the exception of architects and fire protection engineers, certification or licensure for fire marshal shall demonstrate the qualifications outlined in NFPA 1037. The fire marshal/fire code official shall be appointed or hired by the fire chief or executive management of the governing authority.

O101.2 Chief fire inspector. The fire marshal/fire code official is authorized to designate chief fire inspectors to serve as supervisors or fire service officers to administer the provisions of the International Fire Code and to supervise plans examiners and inspectors. Each supervisor or fire service officer in the role of chief fire inspector shall have experience as a firefighter or fire officer, architect, fire protection engineer, inspector, fire protection contractor, or some combination of these fields. In addition, when chief fire inspectors are appointed, they shall have experience or formal training in supervisory skills. The chief fire inspector shall be certified or licensed through a recognized licensure or certification program as a fire inspector, fire safety inspector, fire code plans examiner, fire protection engineer, or in an equivalent field of expertise. With the exception of architects and fire protection engineers, certification or licensure programs for chief fire inspector shall demonstrate qualifications in accordance with NFPA 1037 or NFPA 1031.

O101.3 Fire code plans examiner. The fire marshal/fire code official shall appoint or hire such number of officers, plans examiners, assistants and other employees as shall be authorized by the jurisdiction. To be appointed or hired as a fire code plans examiner experience as a firefighter, fire officer, fire inspector, building inspector/plans examiner, fire protection contractor, fire protection engineer or engineer in training, or architect is required. An Associate Degree in Fire Protection or Building Construction Technology shall be deemed an acceptable alternative for the necessary experience. The fire code plans examiner shall be certified or licensed through a recognized licensure or certification program as a fire code plans examiner, combination fire inspector/plans examiner, fire protection engineer, or in an equivalent field of expertise. With the exception of architects and fire protection engineers, certification or licensure programs for fire inspector or plans examiner shall demonstrate qualifications in accordance with NFPA 1031. Entry level employees or trainees shall be permitted to be hired and assigned to work under the direction and authority of the fire marshal/fire code official while obtaining the required experience and certification(s).

O101.4 Fire inspector. The fire marshal/fire code official is authorized to appoint or hire such number of officers, inspectors, assistants and other employees as shall be authorized by the jurisdiction. A person shall not be appointed or hired as fire code inspector who has not had experience as a firefighter, fire officer, fire protection contractor, fire protection engineer or engineer in training, or architect. Completion of 15 semester units or 22 quarter units from a recognized college in Fire Protection or Building Construction Technology shall be an acceptable alternative to the one year of experience. The fire code inspector shall be certified or licensed through a recognized licensure or certification program as a fire inspector, combination fire inspector/plans examiner, fire safety inspector, fire protection engineer, or in an equivalent field of expertise. With the exception of architects and fire protection engineers, certification or licensure programs for fire inspector or plans examiner shall demonstrate qualifications in accordance with NFPA 1031. Entry level employees or trainees shall be permitted to be hired and assigned to work under the direction and authority of the fire marshal/fire code official while obtaining the required experience and certification(s).

O101.5 Termination of employment. Employees in the position of fire marshal, fire code official, chief fire inspector, fire inspector, or fire code plans examiner shall not be removed from office except for cause after full opportunity has been given to be heard on specific charges before such applicable governing authority.

O102 REFERENCED STANDARDS

NFPA 1031-2014 Standard for Professional Qualifications for Fire Inspector and Plan Examiner

Reason: This proposed change is result of an evaluation of previous work by the CTC that was based on the “NIST Charleston Sofa Store Fire Recommendations”. This work and the follow-up work of the FCAC addresses the NIST and other investigative reports on the fire that occurred on the evening of June 18, 2007 in the Sofa Super Store in Charleston, South Carolina to identify issues that can be addressed by the International Codes.

In connection with their investigation, NIST analyzed the fire ground, consulted with other experts, and performed computer simulations of fire growth alternatives. Based on these analyses, NIST concluded that the following sequence of events is likely to have occurred. A fire began in packing material and discarded furniture outside an enclosed loading dock area. The fire spread to the loading dock, then into both the retail showroom and warehouse spaces. During the early stages of the fire in the two latter locations, the fire spread was slowed by the limited supply of fresh air. This under-ventilation led to generation of a large mass of pyrolyzed and only partially oxidized effluent. The smoke and combustible gases flowed into the interstitial space below the roof and above the suspended ceiling of the main retail showroom. As this space filled with unburned fuel, the hot smoke also seeped through the suspended ceiling into the main showroom and formed a hot smoke layer below the suspended ceiling. Up to this time, the extent of fire spread into the interstitial space was not visible to fire fighters in the store. If the fire spread had been visible to the fire fighters in the store, it would have provided a direct indication of a fire hazard in the showroom. Meanwhile, the fire at the back of the main showroom and the gas mixture below the suspended ceiling were both still fuel rich. When the front windows were broken out or vented, the inflow of additional air allowed the heat release rate of the fire to intensify rapidly and added air to the layer of unburned fuel below the suspended ceiling enabling the ignition of the unburned fuel/air mixture. The fire swept from the rear to the front of the main showroom extremely quickly, and then into the west and east showrooms. Nine fire fighters were killed in the Sofa Super Store fire. NIST developed eleven recommendations to help mitigate such future losses.

Recommendation 3 of the NIST report reads as follows:

“Qualified Fire Inspectors and Building Plan Examiners: NIST recommends that all state and local jurisdictions ensure that fire inspectors and building plan examiners are professionally qualified to a national standard such as NFPA 1031 Standard for Professional Qualifications for Fire Inspector and Plan Examiner. Professional qualification may be demonstrated through a nationally accepted certification examination, such as the Fire Plan Examiner; Fire Inspector I and II, and Certified Fire Marshal.”

Following a review of recommendation 3 of the NIST report a new Appendix K is proposed. This proposal is similar in scope and intent to Section A101.3 of Appendix A of the International Building Code where suggested qualifications for building official, chief inspector, inspector and plan examiner are established.

The purpose of this proposal is to provide optional criteria for qualifications of employees who enforce the Fire Code through inspections and plan examinations. A jurisdiction that wants to make this appendix a mandatory part of the code would need to specifically list this appendix in its adoption ordinance. In recognition of the fact that some jurisdictions are mandated by applicable state law to employ only persons licensed by the state to perform certain duties, the proposal was drafted as an Appendix.

This proposal would not require fire inspectors or fire plan examiners to have had previous experience in Fire Code enforcement, but would merely require that they possess experience in a related job category. As with the efforts by the CTC, it is not the intent of the FCAC to prohibit a plan review and inspection staff from hiring and training entry level employees. The training of such entry level should simply be supervised by trained and certified personnel.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal should not have any direct impact on the cost of construction. This proposal deals with the jurisdiction that serves as the authority having jurisdiction and the qualifications of personnel involved with applying and enforcing the fire code. If there are any cost impacts to construction it would possibly be the permitting costs necessary to adequately staff the fire code enforcement authority with qualified personnel.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved as it was felt better addressed by human resources. In addition, there was not a direct connection made by NIST from the Charleston fire regarding qualification requirements by the jurisdiction. The state fire marshal's office may have specific requirements which may conflict with this appendix. Also, the legal language regarding termination appears beyond the scope of the IFC. Some did support the concept since this provides some guidance and as this is an appendix would have to be specifically adopted to apply. (Vote: 8-6)

Assembly Action:

None

F328-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael O'Brian, FCAC, representing FCAC (fcac@iccsafe.org) requests As Submitted.

Commenter's Reason: As noted in the reason statement for the original proposal, this proposed change was the result of an evaluation of previous work by the Code Technology Committee (CTC) based on the "NIST Charleston Sofa Store Fire Recommendations". This work and the follow-up work of the FCAC addresses the NIST and other investigative reports on the fire that occurred on the evening of June 18, 2007 in the Sofa Super Store in Charleston, South Carolina to identify issues that can be addressed by the International Codes.

NIST analyzed the fire ground, consulted with other experts, and performed computer simulations of fire growth alternatives. Based on these analyses, NIST reached conclusions concerning the sequence of events likely to have occurred and developed eleven recommendations to help mitigate such future losses.

Recommendation 3 of the NIST report read as follows:

"Qualified Fire Inspectors and Building Plan Examiners: NIST recommends that all state and local jurisdictions ensure that fire inspectors and building plan examiners are professionally qualified to a national standard such as NFPA 1031 Standard for Professional Qualifications for Fire Inspector and Plan Examiner. Professional qualification may be demonstrated through a nationally accepted certification examination, such as the Fire Plan Examiner; Fire Inspector I and II, and Certified Fire Marshal."

Following a review of recommendation 3 of the NIST report and previous work by the CTC, the FCAC developed a new Appendix O and submitted the proposal. The intent and content of the proposal is similar to Section A101.3 of Appendix A of the International Building Code where suggested qualifications for building official, chief inspector, inspector and plan examiner are established.

The purpose of the submitted proposal was and is to provide optional criteria for qualifying employees who enforce the Fire Code through inspections and plan examinations in order to help ensure that the design, construction, and maintenance of buildings and structures are verified by personnel capable of detecting and requiring the correction of code violations. These criteria are similar to the personnel qualifications of NFPA 1730 "Standard on Organization and Deployment of Fire Prevention Inspection and Code Enforcement, Plan Review, Investigation, and Public Education Operation", NFPA 1031 "Standard for Professional Qualifications for Fire Inspector and Plans Examiner", and NFPA 1037 "Standard on Fire Marshal Professional Qualifications". The major difference is that the proposal gives emphasis to certification or licensure which would bring some level of credibility and independent verification of those qualifications. As noted in the proposal's reason statement, a jurisdiction that wants to make this appendix a mandatory part of the code would need to specifically list this appendix in its adoption ordinance. The proposal was drafted as an Appendix at least in part in recognition of the fact that some jurisdictions are mandated by applicable state law to employ only persons licensed by the state to perform certain duties.

The proposal as submitted would not require fire inspectors or fire plan examiners to have had previous experience in Fire Code enforcement, but would merely require that they possess experience in a related job category. As noted in the proposal's reason statement, it was not and is not the intent of the FCAC to prohibit a plan review and inspection staff from hiring and training entry level employees. The training of such entry level personnel should simply be supervised by trained and certified personnel.

This public comment is submitted by the ICC Fire Code Action Committee (FCAC). The FCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes with regard to fire safety and hazardous materials in new and existing buildings and facilities and the protection of life and property in wildland urban interface areas. In 2017 the Fire-CAC has held 3 open meetings and in 2018 FCAC held 2 open meetings. In addition, there were numerous conference calls, Regional Work Group and Task Group meetings for the current code development cycle, which included members of the committees as well as any interested parties, to discuss and debate the proposed changes. Related documentation and reports are posted on the FCAC website at: <https://www.iccsafe.org/codes-tech-support/cs/fire-code-action-committee-fcac/>

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal should not have any direct impact on the cost of construction. This proposal deals with the jurisdiction that serves as the authority having jurisdiction and the qualifications of personnel involved with applying and enforcing the fire code. If there are any cost impacts to construction it would possibly be the permitting costs necessary to adequately staff the fire code enforcement authority with qualified personnel.

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Revise as follows

SWIMOUT. An underwater seat area that is placed completely outside of the ~~perimeter shape~~ diving envelope of the pool. Where located at the deep end, swimouts are permitted to be used as the deep-end means of entry or exit to the pool.

Reason: A swimout is not required to be outside of the perimeter shape of a pool. Many times they are located on those areas but they are not required to be. This revised wording agrees with Figure 322.2.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal will not increase the cost of construction as it clarifies the original intent and normal practice of where swimouts are installed.

SP1-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The definition needs to clarify that a swimout has to be outside the diving envelope. The Committee agrees with the need for the proposal as it is not possible for a swimout to be outside the perimeter of a pool. (Vote:12-0)

Assembly Action:

None

SP1-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Gene Novak, Comm of Massachusetts, representing Metro West Building Officials Association requests As Modified by This Public Comment.

Modify as follows:

2018 International Swimming Pool and Spa Code

SWIMOUT. An underwater seat area that is placed completely outside of the diving envelope of the pool. Where located at the deep end, swimouts are permitted to be used as the deep-end means of entry or exit to the pool.

A swimout is similar to an underwater seat or bench, but is utilized exclusively as an entry/exit access, swimouts are permitted to be used as the means of entry or exit to or from the pool..

Commenter's Reason: Seat is already defined in the definition section of the code and defining a swimout as a seat is problematic for the following reasons: 1. A swimout is a required means of entry/exit from the swimming pool where as a seat or bench is not. By defining a swimout as a seat we are allowing for bathers to utilize the swimout as a seat. If this is a required entry/exit it should be treated solely as such including the definitions. 2. By allowing a swimout which is defined as a seat outside the diving envelope we are allowing shallow areas in the deep end of the swimming pool, this is contrary to other sections of the code, which disallow seats in deep areas over 5 feet in later parts of the ISPSC. 3. I am unaware of any other definition that is defined by another definition i.e. swimout equates to a seat. This is confusing contradictory language. Further it is foreseeable that an obstinate bather may sit/bath on the swimout obstructing a requires entry/exit access point, we must be clear as this is a primary life safety element of the swimming pool.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Will not increase nor decrease cost, rather clarify the definitions specifically the distinction between how a swimout is different from a seat/bench. Mainly the purpose and use of the feature.

SP1-18

SP5-18

ISPSC: 305.1.1

Proposed Change as Submitted

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Swimming Pool and Spa Code

Add new text as follows

305.1.1 Construction fencing required. The construction sites for in-ground swimming pools and spas shall be provided with construction fencing to surround the site from the time that any excavation occurs up to the time that the permanent barrier is completed. The fencing shall be not less than 4 feet in height.

Reason: Usually, a pool contractor is not responsible for the fencing whether permanent or temporary during construction of a pool. A pool can be under construction for several weeks (or more) which presents a fall hazard/drowning hazard where there is not some type of barrier in place. Sometimes a pool is completed and the builder has moved onto the next job without any barrier around the completed pool. This new section requires a temporary barrier until the permanent barrier is erected. The specifics about what type of barrier is acceptable are left up to the contractor with oversight by the code official. It is not the intent of this proposal to require a temporary barrier to be constructed to the same way as the code's requirements for a permanent barrier.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact: The code change proposal will increase the cost of construction. Rental of temporary construction fencing and its installation will add cost to a pool project for those contractors who have not already been taking precautions to secure the excavation/pool construction site. One national average for rental installation for 120' x 6 foot high of chain link fencing panels and bases for 1 month is \$480. Job site conditions and project site location could greatly affect the cost.

SP5-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Safety fencing is needed for every excavation. Most contractors should be doing this anyhow.
(Vote:12-0)

Assembly Action:

None

SP5-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Timothy Pate, representing Colorado Chapter Code Change Committee (tpate@broomfield.org) requests Disapprove.

Commenter's Reason: This proposal added a requirement to require construction fencing around the excavation for all swimming pools. This type of requirement does not exist in either the IRC or the IBC for excavations for foundations for any new structure. It does not make sense to require construction fencing only around excavations for swimming pools when codes do not require this for all excavations. The approval language also does not have any specific details other than the fencing needs to be at least 4" high - nothing to explain what it looks like. The committee reason states that it will be up to the contractor and code official to come up with those specific requirements. This also does not make sense since a builder will have different requirements even in adjacent jurisdictions. This proposal should be overturned and disapproved.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This will reduce construction cost since contractor will not be required to install construction fencing.

SP5-18

SP8-18

ISPSC: 305.3, 305.3.1, 305.3.2, 305.3.3, 305.3.4, 305.4

Proposed Change as Submitted

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Swimming Pool and Spa Code

Revise as follows

305.3 ~~Gates~~ Doors and gates. ~~Access~~ Doors and gates in barriers shall comply with the requirements of Sections 305.3.1 through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access doors and gates shall open outward away from the pool or spa, shall be self-closing and shall have a self-latching device.

305.3.1 Utility or service doors and gates. ~~Gates~~ Doors and gates not intended for pedestrian use, such as utility or service doors and gates, shall remain locked when not in use.

305.3.2 Double or multiple doors and gates. Double doors and gates or multiple doors and gates shall have not fewer than one leaf secured in place and the adjacent leaf shall be secured with a self-latching device. ~~The gate and barrier shall not have openings larger than 3/2 inch (12.7 mm) within 18 inches (457 mm) of the latch release mechanism. The self-latching device shall comply with the requirements of Section 305.3.3.~~ device.

Delete and substitute as follows

~~305.3.3 Latches.~~ ~~Where the release mechanism of the self-latching device is located less than 54 inches (1372 mm) from grade, the release mechanism shall be located on the pool or spa side of the gate not less than 3 inches (76 mm) below the top of the gate, and the gate and barrier shall not have openings greater than 3/2 inch (12.7 mm) within 18 inches (457 mm) of the release mechanism.~~

305.3.3 Latch release. For doors and gates in barrier, the door and gate latch release mechanisms shall be in accordance with the following:

1. Where door and gate latch release mechanisms are accessed from the outside of the barrier and are not of the self-locking type, such mechanism shall be located above the finished floor or ground surface in accordance with the following:
 - 1.1. At public pools and spas, not less than 52 inches (1219 mm) and not greater than 54 inches (1372 mm).
 - 1.2. At residential pools and spas, not less 54 inches (1372 mm)
2. Where door and gate latch release mechanisms are of the self-locking type such as where the lock is operated by means of a key, an electronic opener or the entry of a combination into an integral combination lock, the lock operation control and the latch release mechanism shall be located above the finished floor or ground surface in accordance with the following:
 - 2.1. At public pools and spas, not less than 34 inches and not greater than 48 inches (1219 mm).
 - 2.2. At residential pools and spas, at not greater than 54 inches (1372 mm).
3. At private pools, where the only latch release mechanism of a self-latching device for a gate is located on the pool and spa side of the barrier, the release mechanism shall be located at a point that is at least 3 inches (76 mm) below the top of the gate.

Add new text as follows

305.3.4 Barriers adjacent to latch release mechanisms. Where a latch release mechanism is located on the inside of a barrier, openings in the door, gate and barrier within 18 inches (457 mm) of the latch, shall not be greater than 1/2 inch (12.7 mm) in any dimension.

Revise as follows

305.4 Structure wall as a barrier. Where a wall of a dwelling or structure serves as part of the barrier and where doors, gates or windows provide direct access to the pool or spa through that wall, one of the following shall be required:

1. Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor, doors and ~~doors-gates~~ shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and *labeled* as a water hazard entrance alarm in accordance with UL 2017.
2. In dwellings ~~or structures~~ not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located at not less than 54 inches (1372 mm) ~~or more~~ above the finished floor.
3. In dwellings ~~or structures~~ that are required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.
4. In structures other than dwellings, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1220 mm) above the finished floor.
- ~~2-5.~~ A *safety cover* that is *listed* and *labeled* in accordance with ASTM F1346 is installed for the pools and spas.
- ~~3-6.~~ An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection afforded by Item 1 or 2.

Reason: Section 305.3.3 deals with latches for all gates providing access to a pool. Section 305.4 deals with alarms for doors and windows in a barrier. The current text seems to be applicable more for residential pools than public pools. There are several reason for this proposal. Pools can be interior or exterior, so latch provisions should apply to doors as well as gates. The last sentence of 305.3.2 is not needed since Section 305.3 requires compliance with the whole section. Section 305.3.3 is dealing with a situation where you reach over a gate to open the latch. Fences around public pools are typically much higher. The requirements for latches should follow the IBC Section 1010.1.9.2. This section includes an exception for operable parts of manual latches to be above 48" so that they latch is outside the reach of children.

Section 305.4 Item 1 deals with the deactivation switch for alarms on doors or windows in a pool barrier. The same allowance for height protection for children is permitted. Dwelling units are separated from structures because this wall could be on a common corridor or in another building for pools that serve hotels, apartment buildings or other community buildings. In public areas these alarm shut offs must be accessible or addressed as employee only elements under Section 1103.2.2.

2018 IBC

1010.1.9.2 Hardware height. Door handles, pulls, latches, locks and other operating devices shall be installed 34 inches (864 mm) minimum and 48 inches (1219 mm) maximum above the finished floor. Locks used only for security purposes and not used for normal operation are permitted at any height.

Exception: Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to have operable parts of the release of latch on self-latching devices at 54 inches (1370 mm) maximum above the finished floor or ground, provided the self-latching devices are not also self-locking devices operated by means of a key, electronic opener or integral combination lock.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is a clarification of the height for pool latches and alarms only. There is no change to the cost for construction.

SP8-18

Public Hearing Results

Committee Action:

SP8-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jennifer Hatfield, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Swimming Pool and Spa Code

305.3 Doors and gates. Doors and gates in barriers shall comply with the requirements of Sections 305.3.1 through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access ~~doors and gates~~ shall open outward away from the pool or spa. All doors and gates shall be self-closing and shall have a self-latching device.

Commenter's Reason: We believe an unintended consequence of the original proposal could be interpreting this section to now saying the door on a residential house must open inward, away from the pool (into the house). When the home is part of the barrier, the doors sometimes open out of the house, towards the pool. Purchasing and installing a new door to swing away from the pool is not cost-neutral.

This change simply makes a small change to ensure doors of a home, when used as a barrier would not be required to open outward away from the pool and spa.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Without the public comment concerns exist that the original proposal will have an increase cost to construction if a door on a home has to be changed to address which direction it swings.

Proposed Change as Submitted

Proponent: Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org)

2018 International Swimming Pool and Spa Code

Add new text as follows

324 INDOOR AIR QUALITY

324.1 General. Indoor pool and spa air handling system design, construction, and installation shall comply with ASHRAE 62.1.

Add new standard(s) follows

ASHRAE ASHRAE 62.1-2016 Ventilation for Acceptable Air Quality

Reason: By requiring air handling systems to be designed and installed in compliance with ASHRAE Standard 62.1 2013, *Ventilation for Acceptable Indoor Air Quality*, an indoor pool or spa will have minimum ventilation rates to ensure the indoor air quality is acceptable to human occupants so to minimize adverse health effects.

This also provides consistency with the Model Aquatic Health Code published by the Centers for Disease Control and Prevention, which requires compliance with the ASHRAE Standard when addressing indoor pool or spa air handling systems.

Bibliography: See sections 4.2.2.3.3 & 4.6.2 of the Model Aquatic Health Code, which reference and require compliance with the ASHRAE 62.1 Standard.

<https://www.cdc.gov/mahc/editions/current.html>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Simply aligning with MAHC requirements for consistency when addressing indoor facilities.

Analysis: The referenced standard, ASHRAE 62.1-2016, is currently referenced in the 2018 IMC.

Further modify as follows:

2018 International Swimming Pool and Spa Code

324.1 General. Indoor public pool and spa air handling system design, construction, and installation shall comply with ASHRAE 62.1.

Commenter's Reason: This section should only apply to public pools so in an abundance of caution this public comment simply clarify s the original intent of the proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change proposal will not increase or decrease the cost of construction because these indoor pool facilities already have to meet the ASHRAE 62.1 Standard. This simply aligns the ISPSC with what is already required via other codes, including the MAHC and International Mechanical Code.

Public Comment 2:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Swimming Pool and Spa Code

324.1 General. Indoor pool and spa air handling system design, construction, and installation shall comply with requirements of the IMC or ASHRAE 62.1.

324.1 General. Indoor pool and spa air handling system design, construction, and installation shall comply with ASHRAE 62.1.

Commenter's Reason: Modifying the proposal to allow the IMC or ASHRAE 62.1 adds an option for compliance.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This adds an option for compliance which would have the potential to possibly lower the cost of construction.

SP23-18

SP39-18

ISPSC: 504.2

Proposed Change as Submitted

Proponent: John Kelly, representing self (john.kelly@idph.iowa.gov)

2018 International Swimming Pool and Spa Code

Add new text as follows

504.2 Timer. The operation of the hydrotherapy jets shall be limited by a cycle timer having a maximum setting of 15 minutes. The cycle timer shall be located not less than 5 feet away, adjacent to, and within sight of the spa.

Reason: The ISPSC allows spas to operate at a temperature of up to 104 degrees F. The elevated temperature allowed for spas increases the risk of deaths from hyperthermia and drowning and the jet currents further increase the heat transfer rate.

A study on "The Health Hazards of Saunas and Spas and How to Minimize Them" noted that many people should limit their stays in spas to 5 or 10 minutes and that even healthy adults would be well advised not to stay in spas for more than 10 to 15 minutes.

Under Section 4.12.1.10 of the Model Aquatic Health Code the agitation system shall be connected to a timer to limit the cycle to 15 minutes. This is consistent with requirements found in many state and local health codes.

The ISPSC should recognize the risk of hyperthermia particularly with the elevated temperatures it allows for spas and given the increased heat transfer created by the hydrotherapy jets and limit the jet cycle accordingly and consistent with the Model Aquatic Health Code.

Bibliography: The Health Hazards of Saunas and Spas and How to Minimize Them
Edward Press, MD, MPH

American Journal of Public Health, August 1991, Volume 81, No. 8

2016 Model Aquatic Health Code, 2nd Edition, July 2016

U.S. Department of Health and Human Services, Centers for Disease Control and Prevention

Cost Impact: The code change proposal will increase the cost of construction
The Model Aquatic Health Code and most state and local health codes already contain a requirement for a timer so for most areas there will be no added cost. In areas with no state or local requirement there would be a small cost associated with the installation of the timer. Including the requirement within the ISPSC will provide consistency in the requirements and help address the risk in those areas where no health codes are in place.

SP39-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 504.2 Timer. The operation of the hydrotherapy jets shall be limited by a cycle timer having a maximum setting of 10 ~~15~~ minutes. The cycle timer shall be located not less than 5 feet away, adjacent to, and within sight of the spa.

Committee Reason: For the Modification: Lessening the time better accommodates use by children who would be more susceptible to long term exposure to heat.

For the Proposal: Making this a code requirement increases the level of safety that is needed for spas. (Vote: 10-1)

Assembly Action:

None

SP39-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jennifer Hatfield, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests As Submitted.

Commenter's Reason: The concern is that the proposal as modified is not consistent with the Model Aquatic Health Code and the fact 15 mins has long been the standard utilized in these heated spas.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Most jurisdictions already have requirements for a timer in these type of public settings, but where a jurisdiction does not currently require a timer a slight increase in cost will occur.

SP39-18

SP40-18

ISPSC: 509.2

Proposed Change as Submitted

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows

509.2 Operational signs. Operational signs shall include, but not be limited to, the following messages as required by the local jurisdiction:

1. Children under age 5 and persons using alcohol or drugs that cause drowsiness shall not use spas.
2. Pregnant women and persons with heart disease, high blood pressure or other health problems should not use spas without prior consultation with a health provider.
3. Children under 14 years of age shall be supervised by an adult.
4. Use of the spa when alone is prohibited (if no lifeguards on site).
- ~~1-5.~~ Do not allow the use of or operate spa if the suction outlet cover is missing, damaged or loose.
- ~~2-6.~~ Check spa temperature before each use. Do not enter the spa if the temperature is above 104°F (40°C).
- ~~3-7.~~ Keep breakable out of the spa area.
- ~~4-8.~~ Spa shall not be operated during severe weather conditions.
- ~~5-9.~~ Never place electrical appliances within 5 feet (1524 mm) of the spa.
- ~~6-10.~~ No diving.

Reason: The spa signage currently required by the ISPSC does not contain any language warning those particularly vulnerable to injury or death associated with the elevated temperature of the spa. The spa signage in the Model Aquatic Health Code (see attachment) places warnings and restrictions on those that are particularly vulnerable to the elevated temperature of a spa. The annex of the Model Aquatic Health Code notes that "Small children are still developing internal temperature regulation, and infants in particular have a small body mass compared to body surface area." It also notes that spa seating is not designed to accommodate younger children in a seated position. As such children under the age of 5 should not use a spa and children under the age of 14 should be supervised by an adult.

A study on health hazards of spas (see attachment) noted that when analyzing deaths associated with spas the chief risk factors identified were alcohol ingestion, heart disease, seizure disorders, and cocaine ingestion. These factors accounted for about 45% of the fatalities. It further noted that 61 of the 151 spa related deaths occurred in children under 12 years of age.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The signage is already required. The proposal only changes what it stated on the sign.

SP40-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: ~~4. Use of the spa when alone is prohibited (if no life guards on site).~~

Committee Reason: For the Modification:

Not allowing only one person to use a spa is too restrictive given that the spa timer is limited to 10 minutes operation per cycle. See previous action on SP39-18 for AM which modified timer operation from 15 minutes to 10 minutes.

For the Proposal:

The added warnings are standard practice in the industry and are necessary to advise persons who might be of a greater health risk when using spas. (Vote:9-3)

Assembly Action:

Disapproved

SP40-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Assembly Action requests Disapprove.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 59.8% (64) to 40.2% (43) by eligible members online during the period of May 9 - May 23, 2018.

SP40-18

SP43-18

ISPCS: SECTION 609, 609.1, 609.2, 609.2.1, 609.2.2, 609.3, 609.3.1, 609.3.2, 609.3.3, 609.4, 609.4.1, 609.7

Proposed Change as Submitted

Proponent: John Kelly, Iowa Department of Public Health, representing self

2018 International Swimming Pool and Spa Code

Revise as follows

SECTION 609 TOILET ROOMS DRESSING AND BATHROOMS SANITARY FACILITIES

609.1 General. ~~Toilet Dressing and bath sanitary facilities shall be provided in accordance with the minimum requirements of the International Building Code and International Plumbing Code and Sections 609.2 through 609.9.~~ 609.9.

609.2 Number of fixtures. ~~Pools shall have toilet facilities with the number of fixtures in accordance with Section 609.2.1 or 609.2.2. The minimum number of required water closets, urinals, lavatory, and drinking fountain fixtures shall be provided as required by the International Building Code and International Plumbing Code and the dressing facilities and number of cleansing and rinse showers shall be provided in accordance with Sections 609.2.1, 609.2.2, and 609.3.1.~~

609.2.1 Water area less than 7500-4000 square feet. Facilities that have less than ~~7500-4000~~ gross square feet (~~697-372~~ m²) of water area available for bather access shall have dressing facilities and not less than one water closet for males, one urinal for males, one lavatory for males, one one cleansing shower for males, two water closets for females, one lavatory for females and one cleansing shower for females.

609.2.2 Water area 7500-4000 square feet or more. Facilities that have ~~7500-4000~~ gross square feet (~~697-372~~ m²) or more of water area available for bather access shall have dressing facilities and not less than 0.7 water closet for males, one urinal for males, 0.85 lavatory for males, one one cleansing shower for males, two water closets for females, one lavatory for females and one cleansing shower for females for every 7500-4000 square feet (697-372 m²) or portion thereof. Where the result of the fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

609.3 Showers. Showers shall be in accordance with Sections 609.3.1 through ~~609.3.5~~ 609.3.5.

609.3.1 Deck Rinse shower. ~~Not In addition to the requirement for cleansing showers in 609.2.1 and 609.2.2, not less than one and not more than half of the total number of showers required by Section 609.2~~ rinse shower shall be located provided on the deck of or at the entrance of each pool.

Delete without substitution

609.3.2 Anti-scald device. ~~Where heated water is provided to showers, the shower water supply shall be controlled by an anti-scald device.~~

609.3.4 Flow rate. ~~Each showerhead shall have a water flow of not less than 2 gallons per minute (7.6 lpm).~~

Revise as follows

609.3.5 Temperature. At each cleansing showerhead, the heated shower water temperature shall be not less than 90°F (32°C) and not greater than 120°F (49°C). Water supplied to rinse showers shall not be required to be heated.

609.4 Soap dispensers. Soap dispensers shall be in accordance with ~~Sections 609.4.1 and 609.4.2.~~ Section 609.4.1.

609.4.1 Liquid or powder. Soap dispensers shall be provided ~~in each toilet facility, at each lavatory and cleansing shower.~~ Soap dispensers shall dispense liquid or powdered soap. Reusable cake soap is prohibited. Soap dispensers and soap shall not be provided at rinse showers.

609.7 Sanitary napkin receptacles. Sanitary napkin receptacles shall be provided in each water closet compartment for females and in the area of the cleansing showers for female use only.

Reason: The minimum number of plumbing fixtures required by the IBC/IPC and the ISPCS are inconsistent. The requirements of the IBC/IPC are the appropriate requirements and are based on the occupancy type and design

occupant load and are widely accepted, applied, and proven across many different jurisdictions for various occupancy type and design occupant loads. The ISPSC should be change to be consistent with the requirements of the IBC/IPC. Given that many patrons share a common body of water in swimming pools and spa, in addition to the plumbing fixtures required by the IBC/IPC, it is appropriate to require both cleansing showers and rinse showers to reduce the transmission of recreational water illnesses and to reduce the development of chloramines.

The Model Aquatic Health Code (MAHC) provides requirements for the number of cleansing showers under section 4.10.4.2.1 and rinse showers under section 4.10.4.3.1. As the number of showers are related to health concerns associated with transmission of recreational water illnesses and the health effects associated with chloramines, the ISPSC should be changed to be consistent with the requirements of the MAHC in relation to the minimum number of showers required.

Bibliography: 2016 Model Aquatic Health Code, 2nd Edition, July 2016
U.S. Department of Health and Human Services, Center for Disease Control and Prevention

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Typically Swimming Pools and Spas must already meet building code, plumbing code, and health code requirements so it will eliminate confusion caused by inconsistencies between the applicable codes but should not change the number of fixtures installed.

SP43-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This would be a large cost impact for facilities of 4000 to 7500 square feet. No justification was provided for this level of cost increase. (Vote: 12-0)

Assembly Action:

None

SP43-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jennifer Hatfield, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Swimming Pool and Spa Code

609.2.1 Water area less than ~~4000-7500~~ square feet. Facilities that have less than ~~4000-7500~~ gross square feet (~~372-697~~ m²) of water area available for bather access shall have dressing facilities and not less than one cleansing shower for males and one cleansing shower for females.

609.2.2 Water area ~~4000-7500~~ square feet or more. Facilities that have ~~4000-7500~~ gross square feet (~~372-697~~ m²) or more of water area available for bather access shall have dressing facilities and not less than one cleansing shower for males and one cleansing shower for females for every ~~4000-7500~~ square feet (~~372-697~~ m²) or portion thereof. Where the result of the fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

Commenter's Reason: This public comment addresses why the committee disapproved the proposal; which was the large cost impact on facilities of 4000 to 7500 square feet. By reverting back to the 7500 square feet, the committee concern is addressed. Further, the proposal is consistent with changes approved under SP 29, resulting in a need for the proposal at large with this modification.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This does not change requirements but ensures consistency with what is also required in applicable codes.

SP43-18

FG1-18

IFGC: 202

Proposed Change as Submitted

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

THIS CODE CHANGE PROPOSAL HAS BEEN PLACED ON THE IMC COMMITTEE AGENDA. PLEASE SEE THE IMC HEARING ORDER.

2018 International Fuel Gas Code

Revise as follows

[M] PIPING. Where used in this code, "piping" refers to either pipe or tubing, or both.

Reason: Definitions should not contain technical requirements. The code in other sections provide the list of acceptable materials. The deletion would coordinate with the definition as revised in the 2018 National Fuel Gas Code.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The definition changes do not impact the code's installation requirements.

FG1-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 11-0)

Assembly Action:

None

FG1-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Marcelo Hirschler, GBH International, representing GBH International (mmh@gbhint.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Fuel Gas Code

[M] PIPING. Where used in this code, "piping" refers to either pipe or tubing, or both.

A rigid conduit of iron, steel, copper, copper-alloy, or plastic, used to convey ~~fuel gas or other a~~ fluid.

Semirigid conduit of copper, copper-alloy, aluminum, plastic or steel, used to convey ~~fuel gas or other a~~ fluid.

Commenter's Reason: The proposal needs to be revised because these are the definitions of pipe and of tubing contained in the IMC (note that the definitions are preceded by [M], in the IFGC indicating that they are the responsibility of the IMC and are copied into the IFGC also).

I assume the change is intended to apply to the IFGC and not to the IMC. That goes against the approach of getting uniformity of definitions in ICC codes.

The IFGC is used to address conveying of fuel gas but the IMC deals to a large extent with other fluids, namely water and other aqueous fluids. Therefore the definition proposed for the IFGC would not be appropriate for the IMC.

The proposed changes, which could apply to both codes, reinstate the original wording and add the words "used to convey a fluid", from the proposal,

If it is ruled that this code proposal, with this public comment, cannot apply to the IMC, the code proposal should be disapproved.

The statements in the reason for the original proposal are not correct.

"Definitions should not contain technical requirements." ICC definitions are enforceable and often contain requirements, as opposed to ASTM or NFPA definitions.

"The deletion would coordinate with the definition as revised in the 2018 National Fuel Gas Code." That is only true for pipe and not for tubing.

The National Fuel Gas Code (NFPA 54), in its 2018 edition has the following definitions:

Pipe: Rigid conduit used to convey fuel gas or other fluids.

Tubing. Semirigid conduit of copper, steel, aluminum, corrugated stainless steel tubing (CSST), or plastic.

Furthermore, these definitions do not apply to a mechanical code from the NFPA, but strictly to the fuel gas code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is a definition and does not impose any requirements: it states facts.

FG1-18

FG9-18

IFGC: 301.12

Proposed Change as Submitted

Proponent: Kelly Cobeen, Wiss Janney Elstner Associates, Inc., representing Federal Emergency Management Agency/Applied Technology Council Seismic Code Support Committee (KCobeen@wje.com); Michael Mahoney, Federal Emergency Management Agency, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov)

2018 International Fuel Gas Code

Revise as follows

301.12 Seismic resistance. Where earthquake loads are applicable in accordance with the International Building Code, ~~the supports, fuel gas appliance and system supports, anchorage, and bracing~~ shall be designed and installed for the seismic forces in accordance with Chapter 16 of that code.

Reason: The added text clarifies the IBC location where specific seismic requirements are defined. This is simply intended to make the seismic design provisions more easily used, consistent with the intent as stated in 2015 NEHRP Recommended Provisions Section 1.1.2, to preserve life safety by maintaining the position of components through anchorage, bracing and strength.

Bibliography: NEHRP Recommended Seismic Provisions for New Buildings and Other Structures, 2015 Edition (FEMA P-1050-1).

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposed wording clarifies the intent of the code and does not impose any new requirements that were not already in effect.

FG9-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Adding a Chapter 16 reference will cause confusion. This will not allow the IRC earthquake provisions and instead will require one and two family dwellings to comply with the IRC. The IBC allows the IRC as an optional code and this proposal negates that. (Vote 11-0)

Assembly Action:

None

FG9-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael Mahoney, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov) requests As Submitted.

Commenter's Reason:

The Federal Emergency Management Agency (FEMA), under its Seismic Code Support Committee (SCSC), submitted FG9-18 to clarify seismic support anchorage requirements for the components relevant to that code (by adding anchorage and bracing) and to provide a more specific reference to the earthquake loads of Chapter 16 of the IBC.

This code change proposal was opposed due to confusion on whether the reference to Chapter 16 of the IBC would adversely impact use of the International Residential Code. While we attempted to explain that the seismic loads in Chapter 16 also serve as the basis for the IRC, we were not successful and the proposed code changes was recommended for disapproval.

For a nearly identical proposed code change to the International Plumbing Code, P5-18, we were able to explain that the reference to the IBC did not impact residential construction, and this change was recommended for approval unanimously.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This code change proposal simply attempts to better explain existing code language, so there is no cost impact.

FG9-18

FG10-18

IFGC: 304.13(IFGS)

Proposed Change as Submitted

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Add new text as follows

304.13(IFGS) Existing Appliances. Existing appliance installations shall be inspected to verify compliance with the provisions of Section 304 and Chapter 5 where a component of the building envelope is modified as described by one or more of 304.13 (1) through (6). Where the appliance installation does not comply with Section 304 and Chapter 5, the installation shall be altered as necessary to be in compliance with Section 304 and Chapter 5.

1. The building is modified under a weatherization program.
2. A building permit is issued for a building addition or exterior building modification.
3. Three or more window assemblies are replaced.
4. Three or more storm windows are installed over existing windows.
5. One or more exterior door and frame assemblies are replaced.
6. A building air barrier is installed or replaced.

Reason: AGA is proposing an extract of section 9.1.24 from ANSI Z223.1, National Fuel Gas Code. The code requirement would address renovations to existing buildings that could impact the supply of combustion air and the performance of venting systems. AGA is aware of weatherization programs that fail to consider the importance of ensuring that existing gas appliance installations continue to meet the IFGC combustion air and venting requirements when efforts to reduce air infiltration are undertaken. This proposal is offered solely for coordinating the IFGC with ANSI Z223.1 (NFGC). This text is offered "as is" for the IFGC and it is not intended that such text be modified from a technical standpoint. The subject text was revised in the 2018 NFGC (ANSI Z223.1) and this proposal will cause the IFGC text to be consistent with such revised text in ANSI Z223.1 (NFGC).

Bibliography: ANSI Z223.1 National Fuel Gas Code, American Gas Association, 2018

Cost Impact: The code change proposal will increase the cost of construction. The new section will require inspections and possible modifications.

FG10-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: There is a safety issue that all agree needs to be addressed. This proposal should move forward and receive feedback from the public comment phase of the process. (Vote 6-5)

Assembly Action:

Disapproved

FG10-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ted Williams, representing American Gas Association (twilliams@aga.org) requests As Submitted.

Commenter's Reason: The proposal is needed for building occupant safety where weatherization and other activities to tighten the building envelope to air infiltration for the purposes of energy efficiency may reduce the availability of gas-fired appliance combustion and ventilation air. This tightening of building envelopes without review of combustion air requirements may place occupants at risk from incomplete combustion and improper venting, both of which would be addressed by review of the combustion air requirements associate with IFGC Section 305 and Chapter 5. As a member of the standards development committees of Building Performance Institute (BPI) and Air Conditioning Contractors of America (ACCA) and commenter of record on standards actions related to building energy efficiency, I know that these organizations do not take direct responsibility for energy efficiency measures that may affect occupant safety and instead defer to the IFGC and National Fuel Gas Code to address changing needs that may be caused by energy efficiency measures. Without the change proposed in FG10-18, which was approved by the IFGC Committee, the energy efficiency measures implemented in these other documents and in energy efficiency programs and practices may be out of step with safety requirements presumed for the building prior to envelope modifications.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The change would increase the cost of construction for weatherization and rehabs where building envelopes where tightened to infiltration of outdoor air and where alternative means of providing combustion and ventilation air for safe operation of combustion appliances. This increased cost would be more than offset by alleviating risks to building occupants from insufficient air for combustion.

Public Comment 2:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org) requests Disapprove.

Commenter's Reason: The proposal will add significant cost to confirm compliance with section 3 and chapter 5 of the IFGC for all existing appliances to be inspected in a single family home and verify compliance when work is done as listed in items 1 through 6. Existing appliances that have no bearing on the work being done or the contractor doing the work. As an example having three windows replaced in an existing home or replacing one door will have no effect on an existing gas appliance. These requirements are excessive and will become a disincentive for home owners to get a permit or to contact the building department. This proposal should be disapproved.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This proposal will require the use of a third party inspection of all gas appliances, new or existing, in an existing home.

Public Comment 3:

Proponent: Assembly Action requests Disapprove.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Approve as Submitted was successful by a vote of 82.8% (111) to 17.2% (23) by eligible members online during the period of May 9 - May 23, 2018.

FG10-18

FG14-18

IFGC: 404.5

Proposed Change as Submitted

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcman@jeffco.us)

2018 International Fuel Gas Code

Revise as follows

404.5 Fittings in concealed locations. Fittings installed in concealed locations shall be limited to the following types:

1. ~~Threaded~~ Right-hand- threaded elbows, tees, couplings, plugs and ~~couplings-caps~~.
2. Brazed fittings.
3. Welded fittings.
4. Fittings listed to ANSI LC-1/CSA 6.26 or ANSI LC-~~4,4~~.

Reason: Not all fittings are in the list. Unions are not permitted to be concealed and left-right couplings are still being used. These couplings are a form of union.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This proposal is editorial in nature.

FG14-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 404.5 Fittings in concealed locations.

Fittings installed in concealed locations shall be limited to the following types:

1. ~~Threaded Right-hand threaded~~ elbows, tees, couplings, plugs and caps.
2. Brazed fittings.
3. Welded fittings.
4. Fittings listed to ANSI LC-1/CSA 6.26 or ANSI LC-4.

Committee Reason: Couplings and plugs needed to be added. Right/left couplings are still being used and should be allowed. (Vote 10-1)

Assembly Action:

As Submitted

FG14-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Assembly Action requests As Submitted.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 57.8% (63) to 42.2% (46) by eligible members online during the period of May 9 - May 23, 2018.

Public Comment 2:

Proponent: Ted Williams, representing American Gas Association (twilliams@aga.org) requests As Modified by Committee.

Commenter's Reason: As the original proposal advocated, couplings and plugs in concealed locations need to be included in list of limitations. The modification to include all threaded fittings is needed for general coverage of elbows, tees, couplings, plugs, and caps in concealed locations. During discussion of this modification, floor commentary was confused over this issue and potential applicability of the modification language over the proposal as submitted. No compelling need for disapproving of the modification was offered.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Changes to the list of fittings installed in concealed locations will not affect construction cost.

FG14-18

FG15-18

IFGC: 404.6

Proposed Change as Submitted

Proponent: James Ranfone, representing American Gas Association (jranfone@aga.org)

2018 International Fuel Gas Code

Delete and substitute as follows

~~**404.6 Underground penetrations prohibited.** Gas piping shall not penetrate building foundation walls at any point below grade. Gas piping shall enter and exit a building at a point above grade and the annular space between the pipe and the wall shall be sealed.~~

404.6 Piping through foundation wall. Underground piping where installed below grade through the foundation or basement wall of a building shall be encased in a protective pipe sleeve. The annular space between the gas piping and the sleeve shall be sealed.

Reason: A change adopted into the 2015 edition prohibits gas piping from penetrating a foundation or basement wall below grade. This change was adopted without evidence that such penetrations have resulted in a safety concern. Below grade penetrations have a long been permitted and have proven to be a safe installation method. The revised language would reinstate this allowance. At least one State, Georgia, has amended the IFGC to delete the prohibition and allow below grade penetration like the proposed text. GA text is as follows: "404.6 Piping through foundation wall. Underground piping where installed below grade through the foundation or basement wall of a building, shall be encased is a protective pipe sleeve. The annular space between the gas piping and the sleeve shall be sealed."

Cost Impact: The code change proposal will decrease the cost of construction. The change will reduce the need to bring piping above ground in some installations. That will reduce the length of piping required as well as reduce the number of fittings used.

FG15-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on proponent's published reason statement. Gas can enter building through other pipe penetrations. Above ground pipe is subject to damage. (Vote 7-4)

Assembly Action:

Disapproved

FG15-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ted Williams, representing American Gas Association (twilliams@aga.org) requests As Submitted.

Commenter's Reason: Opponents to the Committee action for Approve as Submitted once again provided no data or direct evidence to support the prohibition of below-grade through-foundation wall penetrations of gas piping, which Section 404.6 prohibits, even though millions of current gas piping installations use below-grade through-foundation wall penetrations. Opponents had no answers to Committee questions about whether or not other foundation penetrations can convey leaking gas from outside of the building and for which no protection from leaking gas might affect accumulation of gas within the structure. Opponents cited site-specific conditions that might compromise efforts at sealing below-grade through-foundation wall penetrations (such as in seismically active areas or areas with expansive soils) but offered no modifications to Section 404.6 to address these site-specific conditions and avoid the continued conflict with current installations of gas piping and installation practices that allow below-grade through-foundation wall penetrations. When asked by Committee members to assess the increased risk of exposing additional piping by requiring above-grade building entry of gas piping, no response was offered, even though such practices add risks to integrity of the piping system.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. By allowing the conventional practice of gas piping entering buildings through foundation walls below grade, the additional cost of added piping to enter the building above grade (and protecting that piping from impact, which is not required but would prudently be considered) can be avoided.

Public Comment 2:

Proponent: Assembly Action requests Disapprove.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 58.8% (67) to 41.2% (47) by eligible members online during the period of May 9 - May 23, 2018.

FG15-18

M3-18

IMC: 202

Proposed Change as Submitted

Proponent: Charles Stock, representing Spunstrand Inc

2018 International Mechanical Code

Revise as follows

THERMAL RESISTANCE (R-value). A measure of the ability to retard the flow of heat and represented in units of $\text{ft}^2 \times \text{°F} \times \text{h} / \text{BTU}$ or $\text{K} \times \text{m}^2 / \text{W}$. The R-value is the reciprocal of thermal conductance.

Reason: In recent years specifying engineers, third party product listing groups, builders, and end users have all been bombarded with questionable thermal performance claims by product manufacturers. All of this recent noise has left many wondering if they are getting the performance their projects actually require. This proposed addition of recognized/acceptable units for R-value's is an additional step towards clarifying and unifying what is and what is not actual a trusted measure of thermal performance properties. These units are published for clarification in the International Energy Conservation code for this very reason. Failing to add this clarification to the International Mechanical Code could result in the continued use of misleading or insufficiently insulated products being used in the market.

Bibliography: 2015 ICC International Energy Conservation Code, ICC, 2015

Cost Impact: The code change proposal will not increase or decrease the cost of construction. By adding further clarification, this proposal should simply assist in making sure that expected performance and value already being purchased is actually being delivered.

M3-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal is redundant with the IECC. Code officials should not be required to make such calculations. (Vote 10-1)

Assembly Action:

None

M3-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Collins, representing International Code Council Sustainability, energy and high performance code action committee (sehpcac@iccsafe.org)requests As Modified by This Public Comment.

Replace as follows:

2018 International Mechanical Code

R-VALUE (THERMAL RESISTANCE) A measure of the ability to retard the flow of heat. The R-value is the reciprocal of thermal conductanceThe inverse of the time rate of heat flow through a body from one of its bounding surfaces to the other surface for a unit temperature difference between the two surfaces, under steady state conditions, per unit area (h ft² F/Btu) [(m² K)/W].

Commenter's Reason: This proposal contains information that is intended to be used by the design professional. The building official is not required to make the actual calculations, though the building official can easily verify that the correct formula was used to determine the R-value. The SEHPCAC proposed modification is critical as it makes it less likely that the definition can be used to game the system.

This public comment was submitted by the ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors in July of 2011 to pursue opportunities and to improve and enhance assigned International Codes or portions thereof. Each year the SEHPCAC has historically held 3 open face-to face meetings and numerous Working Group meetings, conference calls and webinars. These meetings, conference calls and webinars are public and are convened to facilitate discussion and debate of proposed changes and public comments to the codes by members of the committee, as well as interested parties.This proposal contains information that is intended to be used by the design professional. The building official is not required to make the actual calculations, though the building official can easily verify that the correct formula was used to determine the R-value. The SEHPCAC proposed modification makes it less likely that the definition can be used to game the system.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

By adding further clarification, this proposal should simply assist in making sure that expected performance and value already being purchased is actually being delivered.

M4-18

IMC: 202, 202, 202

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (JBENGINEER@aol.com)

2018 International Mechanical Code

Revise as follows

FLAMMABILITY CLASSIFICATION (REFRIGERANT). ~~Refrigerants shall be assigned to one of the three classes 1, 2 or 3 in accordance with ASHRAE 34. For Classes 2 and 3, the heat of combustion shall be calculated assuming that combustion products are in the gas phase and in their most stable state. The alphabetical/numerical designation used to identify the flammability of refrigerants.~~

REFRIGERANT SAFETY CLASSIFICATIONS. ~~Groupings The alphabetical/numerical designation that indicate both the toxicity and flammability classes in accordance with Section 1103.1. The classification group is made up of a letter (A or B) that indicates the toxicity class, followed by a number (1, 2 or 3) that indicates the flammability class. Refrigerant blends are similarly classified, based on the compositions at their worst cases of fractionation, as separately determined for toxicity and flammability. In some cases, the worst case of fractionation is the original formulation of refrigerants.~~

TOXICITY CLASSIFICATION CLASSIFICATION (REFRIGERANT). ~~Refrigerants shall be classified for toxicity in one of two classes in accordance with ASHRAE 34. An alphabetic designation used to identify the toxicity of refrigerants. Class A indicates a refrigerant with lower toxicity. Class B indicates a refrigerant with higher toxicity.~~

Reason: The current definitions of “flammability classification” and “toxicity classification” are improper since these contain mandatory code requirements. The definitions should only define the term, not contain requires with the use of the word “shall.” The definition of refrigerant safety classifications is incorrect because ASHRAE 34 was revised regarding the means of identifying the classification of refrigerants.

The classification or group of refrigerant is an alphabetical/numerical designation that is used to identify the flammability and toxicity of a given refrigerant. There were two new classifications added to ASHRAE 34, A2L and B2L. These designations were previously subclasses. Now they are a full class of refrigerant.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. These are definition changes.

M4-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 9-2)

Assembly Action:

None

M4-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

REFRIGERANT SAFETY CLASSIFICATIONS GROUP CLASSIFICATION. The alphabetical/numerical designation that indicate ~~indicates~~ both the toxicity and flammability ~~classification~~ ~~classifications~~ of refrigerants.

Toxicity. See Toxicity classification (Refrigerant).

Flammability. See Flammability classification (Refrigerant).

TOXICITY CLASSIFICATION (REFRIGERANT). An ~~alphabetic~~ alphabetical designation used to identify the toxicity of refrigerants. Class A indicates a refrigerant with lower toxicity. Class B indicates a refrigerant with higher toxicity.

FLAMMABILITY CLASSIFICATION (REFRIGERANT). The alphabetical/numerical designation used to identify the flammability of refrigerants.

Indicates a refrigerant with no flame propagation.

Indicates a refrigerant with lower flammability and lower burning velocity.

Indicates a refrigerant with lower flammability.

Indicates a refrigerant with higher flammability.

Commenter's Reason: Per ASHRAE 34, the two refrigerant classifications for flammability and toxicity are combined into a safety group classification. These proposed modifications to M4-18 make the terminology consistent between ASHRAE 34 and the IMC content, for the classification definitions and also the proposed revisions of M88-18 for the headers of Table 1103.1.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
No technical changes so no impact on cost.

M4-18

M6-18

IMC: 301.18

Proposed Change as Submitted

Proponent: Kelly Cobeen, Wiss Janney Elstner Associates, Inc, representing Federal Emergency Management Agency/Applied Technology Council - Seismic Code Support Committee (KCobeen@wje.com); Michael Mahoney, Federal Emergency Management Agency, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov)

2018 International Mechanical Code

Revise as follows

301.18 Seismic resistance. Where earthquake loads are applicable in accordance with the International Building Code, mechanical system supports, anchorage, and bracing, shall be designed and installed for ~~the~~ seismic forces in accordance with Chapter 16 of the International Building Code.

Reason: The added text clarifies the IBC location where specific seismic requirements are defined. This is intended to simply make the seismic design provisions more easily used, consistent with the intent as stated in 2015 NEHRP Recommended Provisions Section 1.1.2, to preserve life safety by maintaining the position of components through anchorage, bracing and strength.

Bibliography: NEHRP Recommended Seismic Provisions for New Buildings and Other Structures. 2015 Edition (FEMA P-1050-1), Federal Emergency Management Agency, Washington, D.C.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposals clarifies the intent of the code and does not impose any new requirements that were not already in effect.

M6-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Code officials already know how to apply the IBC. (Vote 6-5)

Assembly Action:

None

M6-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael Mahoney, representing Federal Emergency Management Agency (mike.mahoney@fema.dhs.gov) requests As Submitted.

Commenter's Reason:

The Federal Emergency Management Agency (FEMA), under its Seismic Code Support Committee (SCSC), submitted M6-18 to clarify seismic support anchorage requirements for the components relevant to that code (by adding anchorage and bracing) and to provide a more specific reference to the earthquake loads of Chapter 16 of the IBC.

This code change proposal was opposed, with the committee comment being "readers already know how to use the IBC". Given the amount of confusion we see in the application of this code section, we disagree. This code change proposal simply tries to clarify seismic support anchorage requirements for the components relevant to that code (by adding anchorage and bracing) and to provide a more specific reference to the earthquake loads of Chapter 16 of the IBC.

The fact that this code change proposal was recommended for disapproval by a vote of 6 to 5 shows that many on the committee agreed with our proposal.

For a nearly identical proposed code change to the International Plumbing Code, P5-18, we were able to explain that the reference to the IBC did not impact residential construction, and this change was recommended for approval unanimously.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This code change proposal simply tries to clarify an existing code language regarding seismic support anchorage requirements .

M6-18

M13-18

IMC: 202, 403.3.1, 403.3.2, 403.3.2.1

Proposed Change as Submitted

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Mechanical Code

Add new definition as follows

BALANCED VENTILATION SYSTEM. A ventilation system where the total outdoor air supply air flow and total exhaust air flow are simultaneously within 10% of their average.

Revise as follows

403.3.1 Other buildings intended to be occupied. The design of local exhaust systems and ventilation systems for outdoor air for occupancies other than Group R-2, R-3 and R-4 ~~three stories and less above grade plane~~ shall comply with Sections 403.3.1.1 through 403.3.1.5.

403.3.2 Group R-2, R-3 and R-4 occupancies, ~~three stories and less occupancies.~~ The design of local exhaust systems and ventilation systems for outdoor air in Group R-2, R-3 and R-4 occupancies ~~three stories and less in height above grade plane~~ shall comply with Sections 403.3.2.1 through 403.3.2.5.

403.3.2.1 Outdoor air for dwelling units. ~~An outdoor air~~ A balanced ventilation system ~~consisting of a mechanical exhaust system, supply system or combination thereof~~ shall be installed to provide outdoor air for each dwelling unit. ~~Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system.~~ The balanced ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

~~0.01A_{floor}N_{br} + 1~~ $Q_{OA} = 0.01A_{floor} + 7.5(N_{br} + 1)$
where:

(Equation 4-9)

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = floor area, ft²

N_{br} = number of bedrooms; not to be less than one

Exception: The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor air flow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.

Reason: Chapter 4 requires *outdoor air* to be provided by an *outdoor air* ventilation system. For dwelling units other than those in low-rise buildings of R-2, R-3, and R-4 occupancies, this ventilation system is required to be balanced (Section 403.3.1.5). Outdoor air is defined as "Ambient air that enters a building through a ventilation system, through intentional openings for natural ventilation, or by infiltration." Unless a ventilation system is balanced, it will introduce transfer air from neighboring units, which can negate much of the benefit of ventilation. This proposal will align the requirements for low-rise mechanical ventilation units with existing requirements for mid- and high-rise ventilation units (i.e., dwelling units in buildings of all R2, R3, and R4 occupancies would need balanced ventilation systems to provide outdoor air). Further, it will permit lower ventilation rates for mid- and high-rise dwelling units than currently allowed, thereby saving significant energy.

Precedents and rationale for this proposal include:

1. **Exhaust dwelling unit ventilation systems** are not permitted for mid-rise or high-rise dwelling units in the IMC (Section 403.3.5.1 requires that systems be balanced), were not permitted for mid- or high-rise dwelling units that were in compliance with ASHRAE 62.1, and should not be permitted low-rise buildings of R-2, R-3, and R-4 occupancies either. Such systems establish pressure imbalances across dwelling units, and the majority of the makeup air introduced by such systems is not outdoor air, but is transfer air from adjacent units or corridors.
2. **Exhaust dwelling unit ventilation with dedicated passive vent air inlets** should also not be permitted in any attached dwelling unit, because research has shown that these systems consistently fail to provide the targeted outdoor air flow rates. Industry experience with dedicated makeup air inlets and a recent study conducted by the Northwest Energy Efficiency Alliance,[1] have demonstrated that occupants generally keep inlets closed. The same study concluded that, “the analysis of inlet vents failed to show clear benefits from their usage.” A separate study sponsored by the U.S. Department of Energy also found dedicated passive air inlets to be ineffective: “airflow from the passive vents was 13%-36% of the exhaust ventilation rate.... most of the makeup air comes from unintentional sources—from leaks in the exterior envelope, neighboring apartments, or the corridor.”[2] Further, this study demonstrated that verifying the targeted outdoor air flow rate at dedicated outdoor air inlets was not possible in the dwelling units tested.
3. **Supply-only** outdoor air systems with or without dedicated makeup air outlets solve some of the problems with exhaust systems (e.g., providing a known source of filtered outdoor air), but they too induce pressure differentials that can lead to transfer of odors and pollutants across dwelling units and between dwelling units and corridors/common areas, diminishing the benefit of providing filtered outdoor air.
4. Unlike exhaust-only systems, exhaust with dedicated passive vent outdoor air inlets, and supply-only systems, **balanced mechanical ventilation systems** do not induce pressure differentials across attached dwelling units and do not introduce transfer air with outdoor air. The IMC already requires that high-rise dwelling unit “ventilation systems shall be balanced by an approved method” (2015 IMC Section 403.3.1.5). Reducing pressure differentials not only reduces the transfer of odor and pollutants between dwelling units and corridors/common areas, but it also limits the migration of moisture through building assemblies via air leakage, which can lead to condensation, mold, and durability problems. Additionally, balanced systems are able to provide filtered air directly from the outdoors and to temper the outdoor air (if provided with a heat or energy recovery core), increasing the likelihood of system operation by occupants.

Cost Impact: The code change proposal will increase the cost of construction

This proposal will increase the costs of engineering and construction where similar requirements do not already exist. For example, the IMC already requires that ventilation air be balanced for mid- and high-rise dwelling units. The requirement for balanced ventilation can be achieved by coupling an in-line supply fan with an exhaust fan that has a similar exhaust rate. Where balanced ventilation is not already required by the IMC, exhaust fans are required. Assuming that the exhaust fan is already installed, the incremental cost is associated with the supply fan, supply fan ducting, and the control/wiring to run both the supply and exhaust fan off a single switch. An in-line supply fan costs around \$120 *retail*. Ducting for the in-line supply fan can be estimated at ~\$19 per linear foot, or ~\$100 for a short, 5' run from the exterior. In-line supply fans are frequently specified to provide outdoor air in multifamily projects - especially in warm and mild climates. Where this is the case, the only incremental costs associated with this proposal would be for the wiring and switch to control the supply and exhaust fan simultaneously. Any incremental costs incurred are expected to decrease as balanced systems become more common; furthermore, the incremental costs are offset by the expected improvement in air quality and its associated health benefits.

M13-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: 10% is inappropriate. The proposal would negate some of the advances in building tightness. Balancing reports are not for system design. Removing the story limit makes the code less restrictive. Commercial ventilation requirements are needed for buildings above three stories. (Vote 9-2)

Assembly Action:

None

M13-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Mike Moore, representing Broan (mmoore@newportventures.net) requests As Modified by This Public Comment.

Replace as follows:

2018 International Mechanical Code

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air* except that mechanical ventilation air requirements for Group R-2, R-3 and R-4 occupancies three stories and less in height above grade plane shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

403.3.2.1 Outdoor air for dwelling units. An outdoor air mechanical ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each dwelling unit. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.01A_{floor} + 7.5(N_{br} + 1)$$

where:

(Equation 4-9)

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = floor area, ft²

N_{br} = number of bedrooms; not to be less than one

Exception: The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor air flow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.

Commenter's Reason: Prior to 2015, whenever outdoor air was required for any building or occupancy type within the scope of the IMC, the outdoor air was required to be provided by a method of supply air and return or exhaust air (see Section 403.1). Beginning in 2015, as a result of a proposal that I authored, exhaust-only systems were explicitly permitted to serve this function for dwelling units in low-rise Group R-2, R-3, and R-4 occupancies. I proposed this rollback to the 2015 IMC to better align the ASHRAE 62.2 requirements for low-rise multifamily dwelling units with the IMC requirements. But since that time, research sponsored by the U.S. Department of Energy showed that exhaust-only systems with dedicated passive outdoor air inlets provided only a small fraction (on average less than 25% across dwelling units in 3 buildings) of outdoor air through the inlets. As such, the exception for exhaust-only ventilation as written, even with trickle vents, can no longer be justified; and at a minimum, the code should revert to its pre-2015 language with respect to requiring supply air and return or exhaust air when mechanical ventilation is provided for dwelling units. This public comment would have the effect of reinstating the pre-2015 requirement for dwelling units to have supply air and return or exhaust air whenever mechanical ventilation is required for outdoor air.

Bibliography: See original proposal for the DOE reference cited in the reason statement.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The code change proposal will increase the cost of construction where exhaust-only systems were being specified to provide outdoor air. The incremental cost associated with a supply fan is about \$120 retail. Ducting for the in-line supply fan can be estimated at ~\$19 per linear foot. In-line supply fans are frequently specified to provide outdoor air in multifamily projects - especially in warm and mild climates. Where this is the case, no incremental costs are incurred; furthermore, any incremental costs are offset by the expected improvement in air quality and its associated health benefits.

M13-18

M20-18

IMC: 401.2, 403.1

Proposed Change as Submitted

Proponent: Shaunna Mozingo, representing City of Cherry Hills Village, Colorado Code Consulting (smozingo@coloradocode.net)

2018 International Mechanical Code

Revise as follows

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in accordance with Section R402.4.1.2 of the International Energy Conservation Code, the dwelling unit shall be ventilated by Dwelling units complying with the air leakage requirements of the International Energy Conservation Code or ASHRAE 90.1 shall be ventilated by mechanical means in accordance with Section 403.~~ Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air* except that mechanical ventilation air requirements for Group R-2, R-3 and R-4 occupancies ~~three stories and less in height above grade plane~~ shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

Reason: After receiving many questions on the ventilation requirements for R-2 dwellings it has become clear that this section of the IMC is not easily understood, agreed with or being enforced as written. A stakeholder group was put together to tackle the issue and to see how we could change the ventilation requirements to be better understood. The group consisted of members from CAPMO, PNNL, Commissioning Agents, Mechanical Engineers, Code Officials, energy raters and energy advocates. The mantra of the meeting was: "We either agree that it isn't required or agree that it is - then we change it."

Here were the discussed issues that we saw:

1: The lack of understanding of R-2's over 3 stories or 3 stories and less. (IECC definitions of residential and commercial buildings). Most people aren't looking at these definitions in the IECC so they all assume that since an "R-2" is built out of the IBC it is considered a commercial building in the IECC. When they get to the IMC and it starts talking about 3 stories or less and over 3 stories they don't understand why the buildings are treated differently for ventilation or any other requirement. While, from a building science perspective it can make sense why these buildings are separated this way, a lot of education time is spent on this very issue.

RESIDENTIAL BUILDING. For this code, includes detached one- and two-family dwellings and multiple single-family dwellings (townhouses) as well as Group R-2, R-3 and R-4 buildings three stories or less in height above grade plane.

COMMERCIAL BUILDING. For this code, all buildings that are not included in the definition of "Residential building."

2: IMC wording that is confusing, especially for people who also read the IRC Mechanical and the IECC because they aren't worded the same and it makes it hard to know what the requirements are. Some confusion came in by code officials who were requiring mechanical ventilation for all R-2s, commercial or residential, because they felt that the section below was stating that all envelopes had to be as tight as 3ach/50 even if they weren't tested. We had to go to ICC for an interpretation of the issues because 50% of the people believed mechanical ventilation was required for any R-2 and 50% believed it was only required for R-2s 3 stories or less.

401.2 Ventilation required.

Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in

accordance with Section R402.4.1.2 of the International Energy Conservation Code, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

403.1 Ventilation system.

Mechanical ventilation shall be provided by a method of supply air and return or exhaust air except that mechanical ventilation air requirements for Group R-2, R-3 and R-4 occupancies three stories and less in height above grade plane shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and exhaust air. The system shall not be prohibited from producing negative or positive pressure. The system to convey ventilation air shall be designed and installed in accordance with Chapter 6.

3: ICC's code opinion:

From: Jason Toves <jtoves@ICCSafe.ORG> **Sent:** Wednesday, April 12, 2017 1:07 PM **To:** Shaunna Mozingo **Cc:** Renee Testroet **Subject:** RE: Section 401.2 - 2015 IMC

Ms. Mozingo,

Following are the responses to your questions.

April 12, 2017

RE: 15 IMC 401.2

Q1: Are R-2 occupancies in commercial buildings, as defined in the 2015 IECC, required to have a blower door test performed per Section 401.2 of the 2015 IMC?

A1: No, Section 401.2 of the IMC does not require blower door testing of R-2 occupancies in commercial buildings. It requires mechanical ventilation when R-2 occupancies are tested in accordance with Section R402.4.1.2 of the International Energy Conservation Code and the air infiltration rate is less than 5 air changes per hour, without requiring such testing.

Q2: Are R-2 occupancies in commercial buildings, as defined in the 2015 IECC, required to be mechanically ventilated per Section 401.2 of the 2015 IMC?

A2: No, Section 401.2 requires either natural ventilation per Section 402 or mechanical ventilation per Section 403. Section 401.2 only requires mechanical ventilation when R-2 occupancies are tested in accordance with Section R402.4.1.2 of the International Energy Conservation Code and the air infiltration rate is less than 5 air changes per hour, without requiring mechanical ventilation for R-2 occupancies in commercial buildings.

It should be noted that Section R402.4.1.2 of the 2015 International Energy Conservation Code applies to "Residential Buildings" (as defined in the IECC) only.

So now you decide, should ventilation actually be required in R-2 occupancies over 3 stories the same as it should be in buildings of less than 3 stories? Why should it be different when both codes require a tight building envelope with continuous air barriers?

The overarching feeling from the group was: *"Everyone is building tight. Hinging mechanical ventilation on a test is causing a problem. It should just be required for all R occupancies."*

We played around with the wording and finally just decided that it was easiest to just say that if your envelope complies with an energy code you must provide mechanical ventilation. It was that simple so that is what we did.

Cost Impact: The code change proposal will increase the cost of construction

This proposal will increase the cost of construction but depending on the method chosen to mechanically ventilate (balanced, exhaust only, supply only), the cost typically only includes the cost of a timer/timers for an exhaust fan that is already required in a bathroom so that it runs continuously or down to 25% of the time. There are definitely climates where an exhaust only or supply only system are not recommended but there are more and more options for an economical balanced system that doesn't rely on an ERV or HRV, even though those costs are coming down as well.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on proponent's published reason statement. Proposal adds option for ASHRAE 90.1 and connects the IMC to the IECC. (Vote 6-5)

Assembly Action:

Disapproved

M20-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Mike Moore, representing Broan (mmoore@newportventures.net) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Mechanical Code

401.2 Ventilation required. Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. Dwelling units complying with the air leakage requirements of the International Energy Conservation Code or ASHRAE 90.1 shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air except that mechanical ventilation air requirements for Group R-2, R-3 and R-4 occupancies three stories or less in height above grade plane shall be provided by an exhaust system, supply system or combination thereof.* The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

Commenter's Reason: M20 does a great service by providing a rational simplification to the code, namely connecting the dots that tightly constructed dwelling units should be provided with mechanical ventilation. Unfortunately, M20 also rolls back mechanical ventilation requirements for high-rise dwelling units by removing the Section 403.1 requirement for supplying outdoor air to high-rise dwelling units and instead, permitting exhaust-only systems to serve this role. Approval of M20 without modification would represent a big step back for ensuring minimum acceptable indoor air quality for high-rise dwelling units.

Prior to 2015, whenever outdoor air was required for any building or occupancy type within the scope of the IMC, Section 403.1 required the outdoor air to be provided by a method of supply air and return or exhaust air. Beginning in 2015, as a result of a proposal that I authored, exhaust-only systems were explicitly permitted to serve this function for dwelling units in low-rise Group R-2, R-3, and R-4 occupancies. I proposed this rollback to the 2015 IMC to better align the IMC requirements for low-rise multifamily dwelling units with the ASHRAE 62.2-2013 requirements for low-rise multifamily dwelling units. But since that time, field research sponsored by the U.S. Department of Energy showed that exhaust-only systems with dedicated passive outdoor air inlets provided only a small fraction of outdoor air through the inlets (on average less than 25% across dwelling units in 3 buildings studied) and that a significant percentage of the so-called outdoor air was actually coming from adjacent spaces in the form of (stale) transfer air. As such, the current exception for exhaust-only ventilation of low-rise dwelling units can no longer be justified for low-rise dwelling units and should definitely not be extended to high-rise dwelling units.

This public comment removes M20's expansion of the exception approving exhaust-only outdoor air ventilation systems for high-rise dwelling units but retains the other benefits of M20 (i.e., the logical simplification of dwelling unit mechanical ventilation requirements for tightly-constructed dwelling units).

Bibliography: 1. Maxwell, S., Berger, D., and Zuluaga, M. 2016. Evaluation of Passive Vents in New Construction Multifamily Buildings. (Subcontractor Report, NREL/SR-5500-64758). Golden, CO: National Renewable Energy Laboratory.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

The code change proposal will increase the cost of construction for high-rise dwelling units that are not currently specifying mechanical ventilation to provide outdoor air. The incremental cost associated with a supply fan is about \$120 retail. Ducting for an in-line supply fan can be estimated at ~\$19 per linear foot. Any incremental costs are offset by the expected improvement in air quality and its associated health benefits.

Public Comment 2:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org) requests Disapprove.

Commenter's Reason: This proposal removes the concept of natural ventilation. The ability to open a window to get fresh air into your home. Instead a fan or fans run in perpetuity. All residential dwelling will have to rely on a mechanical system for fresh air. A system that is prone to and bound to fail. A system that will put an unnecessary burden on low income home buyers and the homes of our most vulnerable restricted income owners, our older homeowners. A study done by Florida Solar showed an excessive failure rate for mechanical systems. The cost of construction increases with the install of the system and a further cost continues to maintain the system for as long as it can be afforded, what is the final result? To get fresh air into the home the windows are opened.

A quote from the Florida Solar Energy Center on page 18 stated "So one not surprising but notable finding is that even if a ventilation is initially installed, a percentage of homeowners will likely choose not to use it."

This proposal is too restricting and will increase the cost of construction for its initial installation and its continuing maintenance costs into the future. Being able to calculate natural ventilation should not be eliminated and the need for mechanical ventilation in all homes should not be mandated.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction This proposal would require the installation of additional ventilation fans in all climate zones.

For SI: 1 cubic foot per minute = 0.0004719 m³/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 m³/(s • m²), °C = [(°F) -32]/1.8, 1 square foot = 0.0929 m².

- a. Based on *net occupiable floor area*.
- b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).
- c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.
- d. Ventilation systems in enclosed parking garages shall comply with Section ~~404.404~~.
- e. Rates are per water closet or urinal. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
- f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
- g. Mechanical exhaust is required and recirculation from such spaces is prohibited except that recirculation shall be permitted where the resulting supply airstream consists of not more than 10 percent air recirculated from these spaces. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).
- h. For nail salons, each manicure and pedicure station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per ~~station~~ station as measured not more than 12 inches (305 mm) horizontally and vertically from the point of chemical application. Exhaust inlets shall be located in accordance with Section 502.20 ~~and 502.20.1~~. Where ~~one or more~~ required source capture systems operate continuously during occupancy, the exhaust rate and outdoor airflow rate from such systems shall be permitted to be applied to the exhaust flow rate and outdoor airflow rate required by Table 403.3.1.1 for the nail salon.
- i. Where nail salon services or a nail salon occupancy is ancillary to the main occupancy classification and a source capture system is provided in accordance with Section 502.20 and 502.20.1, the minimum ventilation rates for the main occupancy classification shall be permitted according to Table 403.3.1.1.

502.20 Manicure and pedicure stations. Manicure and pedicure stations shall be provided with ~~an a source capture~~ exhaust system in accordance with Table 403.3.1.1, Note h. Manicure tables and pedicure stations ~~not provided with~~ factory-installed exhaust inlets shall be provided with fixed in-place, immovable exhaust inlets located not more than 12 inches (305 mm) horizontally and vertically from the point of chemical ~~application~~ application and shall not draw fumes or contaminants past the human face. The source capture exhaust system shall be prohibited from recirculating air and shall discharge exhaust in accordance with Section 501.3 and shall also comply with the provisions of Section 502.20.1.

Add new text as follows

502.20.1 Makeup Air. Makeup air shall be supplied during the operation of source capture exhaust systems that are provided for manicure tables and pedicure stations . The amount of makeup air supplied to the building from all sources shall be approximately equal to the amount of exhaust air for all exhaust systems for the building. The makeup air shall not reduce the effectiveness of the exhaust system. Makeup air shall be provided by gravity or mechanical means or both. Mechanical makeup air systems shall be automatically controlled to start and operate simultaneously with the exhaust system. Makeup air intake opening locations shall comply with Section 401.4. and Makeup air temperature shall comply with Section 508.1.

Reason: INTRODUCTION

"Many of us go to nail salons to relax and to be pampered. We don't think of these places as potentially hazardous work environments, yet for many manicurists, regular on-the-job exposure to toxic chemicals is a reality. Workers often experience headaches, dizziness, rashes and other acute symptoms. Some chemicals are known to cause cancer and reproductive, developmental, and respiratory harm" (a)

The intent of these suggested modifications is to (1) better clarify the requirements for a source capture exhaust system at manicure and pedicure stations where ambiguity exists, and to (2) better ensure the effectiveness of the exhaust system in removing harmful fumes and contaminants at the source and providing a healthy, safe environment for nail salon workers and their clients.

1. PROPOSED MODIFICATION TO TABLE 403.3.1.1 note h.

REASON: The suggested modification to note h in Table 403.3.1.1 attempts to clarify the minimum distance from which the exhaust rate is to be measured and give the AHJ or design professional better criteria by which to test and confirm code compliance. Also the balancing of exhausted air with makeup air is required by the IMC, therefore, the outdoor airflow rate should be permitted to be applied to the outdoor airflow rate required by Table 403.3.1.1 for the same reasons the exhaust rate is currently permitted to be applied when the source capture system is running continuously during occupancy.

2. PROPOSED ADDITION of note j TO TABLE 403.3.1.1

REASON: The addition of note j attempts to address increasing instances where nail services are offered in places like a retail or business occupancy where those nail services are not the primary business or occupancy. In these circumstances, if a source capture system is installed in accordance with Section 502.20 and 502.20.1, additional equipment and higher operating costs to comply with the greater nail salon ventilation rates would be reduced.

3. PROPOSED MODIFICATION TO SECTION 502.20 Manicure and Pedicure Stations

REASON: Work practices are an important part of achieving successful control of fume exposures; in particular, positioning the exhaust inlet close to the source of chemical application.

It is easy to confuse a fan's ability to blow a jet of air with it's ability to draw air into an exhaust inlet. That's why an exhaust inlet must be close to the source of the contamination to be an effective source capture system. Frequent changes in the location and position of the exhaust inlet from the source of chemical application can diminish the exhaust system's ability to draw air into the exhaust inlet at the code-required minimum air flow rate.

Therefore, it is suggested that the code require the exhaust inlets to be fixed in-place and immovable (for both factory and field installations) to ensure the desired maximum source capture effectiveness without depending on user control or placement.

Although a 50CFM exhaust rate at 12 inches (horizontally and vertically) from the source of chemical application is effective in capturing fumes and other contaminants, it's important to recognize that even when this requirement is met, the possibility of fumes to be drawn past the face of the technician and consumer still exist. This suggested modification helps to eliminate this possibility.

It is important to clarify that source capture exhaust is to be discharged to the outdoors and not recirculated. This requirement is consistent with other exhaust systems regulated by the IMC. We suggest including a reference to existing Section 501.3 to better clarify this requirement.

4. PROPOSED NEW SUB-SECTION: 502.20.1 Makeup Air.

REASON: The suggested addition of a new sub-section intends to recognize and reinforce the requirement for balancing the exhausted air with makeup air and help provide guidance on intake opening locations and makeup air temperature by referencing existing Sections 401.4 and 508.1 respectively.

Bibliography: a. California Healthy Nail Salon Collaborative - website "THE NEED FOR HEALTHY NAIL SALONS" - <https://cahealthynailsalons.org/healthy-salons/>

Cost Impact: The code change proposal will not increase or decrease the cost of construction. These code change proposals will only remove ambiguity and provide better guidance for design professionals, the AHJ and end-users alike.

M21-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Section 502.20 already requires the 12 inch distance limit. Notes h and i appear to allow reduction of exhaust and outdoor air rates. Tying makeup air to commercial kitchens is not correct and balanced systems are already required. (Vote 10-1)

Assembly Action:

None

M21-18

502.20.1 Makeup Air. Makeup air shall be supplied during the operation of source capture exhaust systems that are provided for manicure tables and pedicure stations. ~~The amount of makeup air supplied to the building from all sources shall be approximately equal to the amount of exhaust air for all exhaust systems for the building. The makeup air shall not reduce the effectiveness of the exhaust system. Makeup air shall be provided by gravity or mechanical means or both. Mechanical makeup air systems shall be automatically controlled to start and operate simultaneously with the exhaust system. Makeup air intake opening locations shall comply with Section 401.4. The temperature differential between makeup air and Makeup air temperature shall comply with Section 508.1 the air in the conditioned space shall not exceed 10 degrees F (6 degrees C) except where the added heating and cooling loads of the makeup air do not exceed the capacity of the HVAC system.~~

Commenter's Reason: PROPOSED CHANGES BASED ON COMMITTEE REASONS FOR DISAPPROVAL:

1. PROPOSED MODIFICATION TO note h DELETES THE REQUIREMENT FOR THE 12 DISTANCE LIMIT ALREADY REQUIRED BY SECTION 502.20.

2. THE FOOTNOTES to TABLE 403.3.1.1 WERE MIS-NUMBERED. THIS HAS BEEN CORRECTED AND SHOULD ADDRESS THE COMMENT THE COMMITTEE HAD REGARDING note h and note i.

3. PROPOSED MODIFICATION TO 502.20.1 REMOVES THE REFERENCE TO 508.1 AND CLARIFIES REQUIREMENTS FOR MAKEUP AIR TEMPERATURE.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

M21-18

M23-18

IMC: 403.3.1.2

Proposed Change as Submitted

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Mechanical Code

Revise as follows

403.3.1.2 Exhaust ventilation. Exhaust airflow rate shall be provided in accordance with the requirements of Table 403.3.1.1. Outdoor air introduced into a space by an exhaust system shall be considered as contributing to the outdoor airflow required by Table 403.3.1.1. Intermittently operated exhaust fans in toilet rooms, bathrooms and shower rooms shall be provided with a delay-shutoff timer, occupant sensor or humidity sensor control.

Reason: This code change provides compliance options for intermittently operated exhaust fans when the facility is occupied (occupant or humidity sensor activation) and for a limited period of time after the user leaves the room (delay timer, occupant or humidity sensor deactivation). Delay timer, occupant and humidity sensor exhaust fan controls are a consistent and effective means of removing moisture and pollutants from toilet, bath and shower facilities in private dwellings and public spaces in accordance with IMC Table 403.3.1.1.

The humidity level in a restroom or shower facility can be a perfect breeding ground for mold, mildew and micro-organisms that can negatively impact occupant health. Excess moisture has tremendous potential for damaging a building. It cracks and peels paint, ruins gypsum wallboard, causes exterior paint failure, warps doors and rusts cabinets and fixtures. Without control, it can even cause deterioration of joists and framing. As it condenses on windows, walls, ceilings and cabinets, it attracts dirt. It encourages mildew on tile grout and generally provides an environment for increased bacterial growth.

According to the Home Ventilation Institute, an intermittently operated exhaust fan needs to run at least 20 minutes after each shower to sufficiently remove moisture from an average size bathroom. Exhaust systems reduce the risk of mildew and mold growth which is a sanitation and durability concern in dwellings and public spaces, regardless of climate. Delay timer, occupant and humidity sensor controlled exhaust fans are more effective than a manually operated fan or an operable window that is usually left closed during the winter and summer months of the year.

Automatic shut-off controls help to ensure exhaust fan operates when toilet, bath and shower facilities are in use and for a limited period of time after the user leaves the room. Automatic controls also save energy by ensuring fans don't unnecessarily run after removal of moisture and pollutants.

Bibliography:

1. ASHRAE 62.1-2016 Ventilation and Acceptable Indoor Air Quality
2. Home Ventilating Institute - <http://www.hvi.org/publications/HowMuchVent.cfm>

Cost Impact: The code change proposal will increase the cost of construction. A basic dial delay timer switch costs \$15, a basic occupant sensor costs \$10 and a basic humidity sensor switch costs \$46. Timer, occupant and moisture controlled exhaust fans reduce the potential of making costly moisture damage repairs to correct problems that is easy to avoid with sufficient local exhaust.

M23-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This would apply to rooms in single family dwellings, but, the code does not require fans in these rooms. How long must the fan operate? Operation details are missing. (Vote 7-4)

Assembly Action:

None

M23-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing City of Scottsdale (jbenigneer@aol.com); Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

403.3.1.2 Exhaust ventilation. Exhaust airflow rate shall be provided in accordance with the requirements of Table 403.3.1.1. Outdoor air introduced into a space by an exhaust system shall be considered as contributing to the outdoor airflow required by Table 403.3.1.1. Intermittently operated exhaust fans in ~~toilet rooms~~, bathrooms and shower rooms shall be provided with a delay-shutoff timer, occupant sensor or humidity sensor control. The delay-shutoff timer or occupant sensor control shall operate the exhaust fan for not less than 20-minutes after activation.

Commenter's Reason: This was a good change that is necessary to control humidity and odor. It is well established that an exhaust fan needs an additional 20 minutes to evacuate the humidity or odor after the use of the bathroom or shower room.

The Committee stated that fans are not always required for bathrooms and shower rooms. While fans may not be required in these rooms, this section addresses when a fan is installed. Therefore, the requirement is appropriate. The modification addresses the length of time required for the operation of the fan.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction There is a slight increase in cost for a time delay switch to be installed.

Public Comment 2:

Proponent: David Collins, representing International Code Council Sustainability, energy and high performance code action committee (sehpcac@iccsafe.org)requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

403.3.1.2 Exhaust ventilation. Exhaust airflow rate shall be provided in accordance with the requirements of Table 403.3.1.1. Outdoor air introduced into a space by an exhaust system shall be considered as contributing to the outdoor airflow required by Table 403.3.1.1. Intermittently operated exhaust fans in ~~toilet rooms~~, bathrooms and shower rooms shall be provided with a delay-shutoff timer, occupant sensor or humidity sensor control. The delay-shutoff timer or occupied sensor control shall operate the exhaust fan for not less than 20 minutes after activation.

Commenter's Reason: This was a good proposed change that is necessary to control humidity and odor. It is well established that an exhaust fan needs and additional 20 minutes to evacuate the humidity or odor after the use of a bathroom, or shower room.

The Mechanical Committee stated that fans are not always required for bathrooms and shower rooms. While fans may not be required in these rooms, this section addresses when a fan is installed. Therefore, the requirement is appropriate. This modification addresses the length of time required for the operation of the fan.

This public comment was submitted by the ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors in July of 2011 to pursue opportunities and to improve and enhance assigned International Codes or portions thereof. Each year the SEHPCAC has historically held 3 open face-to face meetings and numerous Working Group meetings, conference calls and webinars. These meetings, conference calls and webinars are public and are convened to facilitate discussion and debate of proposed changes and public comments to the codes by members of the committee, as well as interested parties.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The increased cost of construction due to this code change and public comment is minor relative to total construction cost.

M23-18

M25-18

For SI: 1 cubic foot per minute = 0.0004719 m³/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 m³/(s • m²), °C = [(°F) -32]/1.8, 1 square foot = 0.0929 m².

- a. Based on *net occupiable floor area*.
- b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).
- c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.
- d. Ventilation systems in enclosed parking garages shall comply with Section 404.
- e. Rates are per water closet or urinal. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
- f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.
- g. Mechanical exhaust is required and recirculation from such spaces is prohibited except that recirculation shall be permitted where the resulting supply airstream consists of not more than 10 percent air recirculated from these spaces. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).
- h. For nail salons, each manicure and pedicure station shall be provided with a *source capture system* capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

Reason: This proposal seeks to update the existing ventilation rate table in the IMC. Standard 62.1 is the source material for this table, and this updates table 403.3.1.1 to match the appropriate ventilation rates in 62.1-2016.

Bibliography: ASHRAE Standard 62.1-2016

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This will not increase the cost of construction.

M25-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This update is based on technical justification from the ASHRAE process and makes the table consistent with the exhaust rates in Section 403.3.2.3. (Vote 11-0)

Assembly Action:

None

M25-18

Individual Consideration Agenda

Public Comment 1:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org) requests Disapprove.

Commenter's Reason: There was no technical data presented to support these increases. This proposal doubles the requirements for kitchens and increases the requirements by 25% for bathrooms. Just because the criteria changes in ASHRAE 62.2 does not indicate there has been a problem in residential construction. The proponent has given no technical data to show there is a need for this increase.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. By changing the ventilation rates for kitchen and bathroom ventilation the whole house ventilation rate will also increase requiring further design and larger equipment, thereby increasing the cost of construction.

M25-18

M27-18

Proposed Change as Submitted

Proponent: Michael McFarland, enVerid Systems, representing enVerid Systems (mmcfarland@enverid.com)

2018 International Mechanical Code

Add new text as follows

403.3.1.1 Outdoor Airflow Rate. The outdoor air flow rate shall comply with the ventilation rate procedure specified in Section 403.3.1.1.1 or the indoor air quality procedure specified in Section 403.3.1.1.2.

Revise as follows

403.3.1.1-403.3.1.1.1 Outdoor airflow rate-Ventilation Rate Procedure. Ventilation systems shall be designed to have the capacity to supply the minimum outdoor airflow rate, determined in accordance with this section. In each occupiable space, the ventilation system shall be designed to deliver the required rate of outdoor airflow to the *breathing zone*. The occupant load utilized for design of the ventilation system shall be not less than the number determined from the estimated maximum occupant load rate indicated in Table ~~403.3.1.1-403.3.1.1.1~~. Ventilation rates for occupancies not represented in Table ~~403.3.1.1-403.3.1.1.1~~ shall be those for a listed *occupancy* classification that is most similar in terms of occupant density, activities and building construction; or shall be determined by an *approved* engineering analysis. The ventilation system shall be designed to supply the required rate of *ventilation air* continuously during the period the building is occupied, except as otherwise stated in other provisions of the code.

With the exception of smoking lounges, the ventilation rates in Table ~~403.3.1.1-403.3.1.1.1~~ are based on the absence of smoking in occupiable spaces. Where smoking is anticipated in a space other than a smoking lounge, the ventilation system serving the space shall be designed to provide ventilation over and above that required by Table ~~403.3.1.1-403.3.1.1.1~~ in accordance with accepted engineering practice.

Exception: The occupant load is not required to be determined based on the estimated maximum occupant load rate indicated in Table ~~403.3.1.1-403.3.1.1.1~~ where *approved* statistical data document the accuracy of an alternate anticipated occupant density.

Add new text as follows

403.3.1.1.2 Indoor Air Quality Procedure. Ventilation systems shall be designed to have the capacity to supply the breathing zone outdoor airflow rate determined in accordance with Sections 403.3.1.1.2.1 through 403.3.1.1.2.7.

403.3.1.1.2.1 Contaminant Sources. Each contaminant of concern, for purposes of the design, shall be identified. For each contaminant of concern, indoor sources and outdoor sources shall be identified, and the emission rate for each contaminant of concern from each source shall be determined. Where two or more contaminants of concern target the same organ system, these contaminants shall be considered to be a contaminant mixture.

403.3.1.1.2.2 Contaminant Concentration. For each contaminant of concern, a concentration limit and its corresponding exposure period and an appropriate reference to a cognizant authority shall be specified. For each contaminant mixture of concern, the ratio of the concentration of each contaminant to its concentration limit shall be determined, and the sum of these ratios shall be not greater than one.

Exception: Consideration of odors in determining concentration limits shall not be required.

403.3.1.1.2.3 Perceived Indoor Air Quality. The design level of indoor air acceptability shall be specified in terms of the percentage of building occupants, visitors, or both expressing satisfaction with perceived IAQ.

403.3.1.1.2.4 Design Approach. Zone and system outdoor airflow rates shall be the larger of those determined in accordance with Section 403.3.1.1.2.4.1 and either Section 403.3.1.1.2.4.2 or 403.3.1.1.2.4.3, based on emission rates, concentration limits, and other relevant design parameters.

403.3.1.1.2.4.1 Mass Balance Analysis. Using a steady-state or dynamic mass-balance analysis, the minimum outdoor airflow rates required to achieve the concentration limits specified in Section 403.3.1.1.2.2 shall be determined for each contaminant or contaminant mixture of concern within each zone served by the system.

403.3.1.1.2.4.2 Subjective Evaluation. Using a subjective occupant evaluation conducted in the completed building, the minimum outdoor airflow rates required to achieve the level of

acceptability specified in Section 403.3.1.1.2.3 shall be determined within each zone served by the system.

403.3.1.1.2.4.3 Similar Zone. The minimum outdoor airflow rates shall be not less than those found in accordance with Section 403.3.1.1.2.4.2 for a substantially similar zone.

403.3.1.1.2.5 Air cleaning. Based on contaminant of concern sources and concentrations, particulate or gaseous air cleaning might be specified. Particulate matter filters and air cleaners shall report a third-party efficiency reporting value (MERV) in accordance with ASHRAE Standard 52.2. Gaseous scrubbers and air cleaners shall report a third-party efficiency test for the contaminants of concern in accordance with an approved standard and a third-party certification of no by-products production such as ozone, formaldehyde, and other VOCs. Devices that add pollutants to the indoor air, even in small quantities, are prohibited under this procedure.

403.3.1.1.2.6 Combined IAQ Procedure and Ventilation Rate Procedure. Where the IAQ Procedure is used in conjunction with the Ventilation Rate Procedure and applied to a zone or system, the Ventilation Rate Procedure shall be used to determine the required zone minimum outdoor airflow, and the IAQ Procedure shall be used to determine the additional outdoor air or air cleaning necessary to achieve the concentration limits of the contaminants and contaminant mixtures of concern.

403.3.1.1.2.7 Documentation. Where the IAQ Procedure is used, the following information shall be included in the design documentation: the contaminants and contaminant mixtures of concern considered in the design process, the sources and emission rates of the contaminants of concern, the concentration limits and exposure periods and the references for these limits, and the analytical approach used to determine ventilation rates and air-cleaning requirements. The contaminant monitoring and occupant or visitor evaluation plans shall also be included in the documentation.

Reason: This proposal is to add ASHRAE 62.1 Indoor Air Quality Procedure (IAQP) as an alternative to determining outside airflow rates for mechanical ventilation (in buildings *other than* R-2, R-3, and R-4 three stories or less). Currently, the IMC Section 403 for mechanical ventilation only allows for ASHRAE 62.1 Ventilation Rate Procedure, as outlined in IMC 2018, Section 403.3.1.1. In this proposal, "403.3.1.1 Outdoor Airflow Rate" would become "403.3.1.1.1 Ventilation Rate Procedure" and all of its subsections would remain unchanged (except subsection numbering would change, for example, the first subsection would be 403.3.1.1.1.1, and so on, but these changes were not submitted to avoid confusion in the proposal). A new section "403.3.1.1.2 Indoor Air Quality Procedure" is added and uses the ASHRAE 62.1 IAQP text. In addition, Section "403.3.1.1 Outdoor Airflow Rate" will now simply introduce the two ventilation compliance options - 403.3.1.1.1 Ventilation Rate Procedure and 403.3.1.1.2 Indoor Air Quality Procedure.

The reasoning for adding ASHRAE 62.1 IAQP for determining outdoor airflow rates is as follows:

ASHRAE 62.1 is generally considered a leading authority on the topic of building ventilation. The standard has had the Indoor Air Quality Procedure (IAQP) since 1981, and has refined and improved it over the years. Adoption of this procedure is rapidly increasing among building owners, large corporations, property management firms, universities, and government institutions in the US and internationally (examples include: Apple, Google, Cisco, Morgan Stanley, Boston Properties, Hines, CBRE, ArcBest, United States GSA, United States American Embassy School, Univ of Miami, Univ of Tennessee, Harvard University, LSU, Diplomat Resorts, Air Liquide, Azrieli, Bank Leumi, China Europe International Business School, Elbit, and others). In addition, major mechanical engineering firms (MEP firms) have adopted the technology in their HVAC designs for clients, including Syska Hennessey, AHA, TLC Engineering, Haltom Engineering, and HRVAC Consulting Engineering, among others.

The rise in adoption is primarily due to new sorbent-based air cleaning technologies that address all molecular contaminants of concern inside buildings, and therefore can be used to clean and recycle indoor air so that less outside air is required for ventilation. There are several significant health and energy efficiency benefits to using less outside air:

1) "Fresh air" is no longer so fresh in big cities and near highways and airports. Studies show that living and working near a highway dramatically increases your risk of cardiovascular disease due to the higher concentrations of ultrafine particles and gases from automobiles that pass through normal particle filters. In addition, many major metropolitan areas frequently have high ozone action days as well as generally high particle pollution. Using typical mechanical ventilation rates specified in the IMC, many buildings replace their entire volume of indoor air with outside air every 1-2 hours, and therefore expose occupants to high volumes of these pollutants. With IAQP, air cleaning

technologies can be taken into consideration for managing indoor contaminant concentrations and lower outside airflow may be possible, which could reduce the influx of outdoor pollutants. Furthermore, some sorbent-based air cleaning technologies can remove outdoor pollutants such as ozone which are not captured by typical outside air filtration.

2) Energy codes are rightfully becoming more stringent, but are more and more difficult to achieve. Finding economical means to meet these energy codes is important. In addition, indoor environment quality needs to be maintained. According to the US EIA, HVAC accounts for nearly half of the energy consumption in US commercial buildings. In many climates, heating and/or cooling outside air ventilation can account for 30-50% of total HVAC energy consumption. When using IAQP with indoor air cleaning, outside airflow rates generally can be decreased quite significantly - often 60-70%, resulting in a 20-30% savings in annual HVAC energy consumption. This is a significant savings and is incremental to most other energy saving techniques.

3) Although building codes are followed at design and build stages, they are not typically followed in building operations. A high percentage of buildings are being operated with zero ventilation during summer and winter. In a survey to members of the International Facility Management Association (IFMA), 62% of them admitted to closing the outside air damper. The real percentage in the field is likely higher since those who close the outside air damper may have chosen not to complete the survey. There are numerous reasons for shutting off ventilation in a building: a) facility managers trying to reduce energy consumption due to financial incentives awarded for reducing utility bills, b) avoiding complaints when HVAC systems cannot manage the extra load introduced by outside air on extreme temperature days, c) HVAC designers will typically design systems to meet the load for 99% of the hours in the year, but this means roughly 90 hours - or 3 hours everyday for 30 days of a hot summer - require more cooling (or heating) capacity than the system can handle and therefore causing facility managers to simply close the outside air damper for the entire summer (or winter), and a very common situation is d) improperly positioned "freeze stats" that trigger the outside airflow to be closed off when temperatures reach 35 degrees F or lower. The best solution would be better enforcement of codes after occupancy. However, if these buildings had used IAQP with indoor air cleaning, at least the air cleaning would still be occurring even if outside airflow has been closed off and occupants would have better indoor air quality.

4) Lastly, the most significant reduction in HVAC load is on peak days. Thus, peak capacity of HVAC equipment can often be reduced by 20%, or even as high as 40%. This presents a significant capital expense savings in the construction or renovation of buildings, and in most designs, the addition of the sorbent-based air cleaning products will cause a net savings overall.

For all these reasons, the IMC should catch up to the ASHRAE 62.1 standard and include the Indoor Air Quality Procedure. The proposal uses this procedure almost verbatim, plus one additional section requiring filters and air cleaners to report third-party efficiency tests based on ASHRAE standardized tests 52.2 and 145.2. This section is added to ensure that the filters and air cleaners have proved their effectiveness for all contaminants of concern.

Bibliography: ASHRAE 62.1 - 2016, Section 6.3 and Appendices C and E.

Cost Impact: The code change proposal will decrease the cost of construction. The ASHRAE 62.1 Indoor Air Quality Procedure will likely be used when it can reduce the cost of construction, and this should occur in most sites due to reduction in chillers, AHU capacity, coolant piping size, outside air duct sizes, relief air ducts, and boiler/heating capacity.

M27-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: It would difficult for code officials to determine compliance with such a complex IAQ procedure. Compliance would have to be demonstrated by engineers. This would create a possible conflict with the action taken on M20-18. (Vote 10-1)

Assembly Action:

None

M27-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Mechanical Code

403.2 Outdoor air required. The minimum outdoor airflow rate shall be determined in accordance with Section 403.3 or in accordance with the Indoor Air Quality Procedure prescribed in Section 6.3 of ASHRAE Standard 62.1..

Exception: Where the *registered design professional* demonstrates that an engineered ventilation system design will prevent the maximum concentration of contaminants from exceeding that obtainable by the rate of outdoor air ventilation determined in accordance with Section 403.3, the minimum required rate of outdoor air shall be reduced in accordance with such engineered system design.

Commenter's Reason: This proposal is to clarify the existing mechanical code and specifically Section 403.2. Currently, code enforcement officials must have a copy of the "Commentary" to the International Mechanical Code to know that the "Exception" in Section 403.2 is primarily referring to the Indoor Air Quality Procedure prescribed in ASHRAE 62.1 (please see the attachment, which is a copy of p4-9 from the 2015 International Mechanical Code Commentary book). The Commentary explains that this "Exception" is referring to ASHRAE 62.1 Indoor Air Quality Procedure.

To make the Code easier to use and easier to enforce, we propose that Section 403.2 make a direct reference to the Indoor Air Quality Procedure prescribed in ASHRAE 62.1, without relying on the Commentary. In other words, the Indoor Air Quality Procedure is stated within the body of the IMC, thereby not limiting its appearance to only within the Commentary portion of the Code.

Please note that the original proposal had the same intent, but added all of the text of the Indoor Air Quality Procedure from ASHRAE Standard 62.1 into new and existing Code Sections. This was deemed as complex by the International Mechanical Code, as well as would violate ASHRAE copyright permissions, and so we have revised this proposal appropriately by simply referencing ASHRAE 62.1.

Bibliography: ANSI/ASHRAE Standard 62.1

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This gives the user of the code the option to use a different path and therefore will not increase the cost of construction.

Public Comment 2:

Proponent: Michael McFarland, representing enVerid Systems (mmcfarland@enverid.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Mechanical Code

403.2 Outdoor air required. The minimum outdoor airflow rate shall be determined in accordance with Section 403.3.

Exception: Where the *registered design professional* demonstrates that an engineered ventilation system design, such as in accordance with the Indoor Air Quality Procedure prescribed in Section 6.3 of ASHRAE Standard 62.1, will prevent the maximum concentration of contaminants from exceeding that obtainable by the rate of outdoor air ventilation determined in accordance with Section 403.3, the minimum required rate of outdoor air shall be reduced in accordance with such engineered system design.

Commenter's Reason: The International Mechanical Code Committee felt that the original proposal was too complex. I have modified this proposal appropriately by providing a much simpler change to the code without changing the overall intent of the proposal. The Code Committee also thought the original proposal would conflict with proposal M20, but this new modification makes no changes to the sections addressed in M20. In addition, M20 is specific to R2, R3, and R4 buildings, and this proposal does not apply to those.

This modified proposal makes no change to what is or is not compliant, nor does it change code enforcement, but it does provide more clarity to code officials and engineers. Currently, Section 403.2 in the IMC includes a paragraph labeled "Exception". This paragraph refers to an "engineered ventilation solution" but provides no guidance as to what that is. The only clarification currently provided is in the Commentary to the Code, where it explains that an "engineered ventilation solution" is the Indoor Air Quality Procedure prescribed in ASHRAE 62.1 (please see the attachment, which is a copy of p4-9 from the 2015 International Mechanical Code Commentary book).

To make the Code easier to use and easier to enforce, we propose that Section 403.2 make a direct reference to the Indoor Air Quality Procedure prescribed in ASHRAE 62.1, without relying solely on the Commentary. In other words, the Indoor Air Quality Procedure would be stated within the body of the IMC, thereby not limiting its appearance to only within the Commentary portion of the Code. In this way, code officials and code users will know what is meant by an "engineered ventilation solution."

Bibliography: The attachment is from the following:

2015 INTERNATIONAL MECHANICAL CODE® COMMENTARY, INTERNATIONAL CODE COUNCIL, 2015, p4-9.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal simply provides a clarification in the Code, and does not create any change to what is or is not compliant to the Code. Thus, there is no change to the cost of construction.

M27-18

M32-18

IMC: 202, 403.3.2.1

Proposed Change as Submitted

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingscience.com)

2018 International Mechanical Code

Add new definition as follows

BALANCED VENTILATION. Any combination of concurrently operating mechanical exhaust and mechanical supply whereby the total mechanical exhaust airflow rate and the total mechanical supply airflow rate are substantially the same.

Revise as follows

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each dwelling unit. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

(Equation 4-9)

$$Q_{OA} = 0.01 A_{floor} + 7.5(N_{br} + 1)$$

where:

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft²

N_{br} = number of bedrooms; not to be less than one

Exception-Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor air flow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4.9 shall be reduced by 25%, provided that all of the following conditions apply:
 - 2.1. A ducted system supplies recirculated air directly to each bedroom and the largest common area.
 - 2.2. For continuously operating systems, not less than 70% of the air volume in the conditioned space is recirculated each hour through the ducted system, or for intermittently operated systems, an equivalent air recirculation is provided during each four-hour period.
 - 2.3. The whole-house ventilation system is a balanced ventilation system.

Reason: This code change credits the better performance of whole-building dilution ventilation systems that are distributed, mixed and balanced.

Distributed, mixed and balanced ventilation is more effective at controlling indoor contaminants than typical exhaust ventilation that provides no distribution and mixing. Exhaust ventilation can draw in contaminants from garages, attics, crawlspaces, soil and wall assemblies in single-family detached and multi-family construction as well as from neighboring units in multi-family construction. Ventilation that does not provide distribution and mixing can allow high levels of contaminant concentration in various spaces within houses, especially rooms where people spend a lot of time with doors closed such as bedrooms. Distribution and mixing homogenizes interior conditions reducing potentially harmful high intermittent contaminant concentrations in interior spaces. There are multiple ways to get to 70% mixing; for example, a recirculation mode that ensures that a central space conditioning system fan operates at least 20 minutes per hour would often meet the criteria for 70% air recirculation.

This code change does not penalize exhaust ventilation, it justifiably credits balanced ventilation. Exhaust only ventilation should not be given the same indoor air quality credit since typical exhaust ventilation systems result in less air change than balanced ventilation systems and do not provide as effective control of contaminants.

Cost Impact: The code change proposal will decrease the cost of construction. The lower required ventilation rate recognizes that more effective ventilation requires less ventilation. This option could lower the cost of both construction and operation.

M32-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The word "substantially" in the definition is vague. The "largest common area" in exception 2, part 2.1 is not defined. (Vote 6-5)

Assembly Action:

None

M32-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Collins representing International Code Council Sustainability, energy and high performance Code Action Committee (SEHPCAC@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each dwelling unit. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

Q_{OA} =
0.01A_{floor} + 7.5(
N_{br} +
1)
where:

(Equation 4-9)

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft²

N_{br} = number of bedrooms; not to be less than one

Exceptions:

- period. outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor air flow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4.9 shall be reduced by 25%, provided that all of the following conditions apply:
 - 2.1. A ducted system supplies recirculated air directly to each bedroom and the largest of the great room, family room, dining room or similar common area areas.
 - 2.2. For continuously operating systems, not less than 70% of the air volume in the conditioned space is recirculated each hour through the ducted system, or for intermittently operated systems, an equivalent air recirculation is provided during each four-hour period.
 - 2.3. The whole-house ventilation system is a balanced ventilation system.

BALANCED VENTILATION. Any combination of concurrently operating mechanical exhaust and mechanical supply whereby the total mechanical exhaust airflow rate is within 10 percent of the total mechanical supply airflow rate.

Commenter's Reason: This public comment addresses the specific concerns expressed by the Hearing Committee. 10 percent adequately accommodates the discrepancies in the capacities of airflow measurement equipment.

This public comment was submitted by the ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors in July of 2011 to pursue opportunities and to improve and enhance assigned International Codes or portions thereof. Each year the SEHPCAC has historically held 3 open face-to face meetings and numerous Working Group meetings, conference calls and webinars. These meetings, conference calls and webinars are public and are convened to facilitate discussion and debate of proposed changes and public comments to the codes by members of the committee, as well as interested parties.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The lower required ventilation rate recognizes that more effective ventilation requires less ventilation. This option could lower the cost of both construction and operation.

Public Comment 2:

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingsscience.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Mechanical Code

BALANCED VENTILATION. Any combination of concurrently operating mechanical exhaust and mechanical supply whereby the total mechanical exhaust airflow rate ~~and is within 10% of the total mechanical supply airflow rate~~ ~~are substantially the same.~~

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each dwelling unit. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

QOA=
0.01A_{floor}+7.5(
N_{br} +
1)

$$Q_{OA} = 0.01A_{\text{floor}} + 7.5(N_{br} + 1)$$

where:

(Equation 4-9)

Q_{OA} = outdoor airflow rate, cfm

A_{floor} = ~~conditioned~~ floor area, ft²

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor air flow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9..
2. The minimum mechanical ventilation rate determined in accordance with Equation 4.9 shall be reduced ~~by 25%~~ by 30%, provided that ~~all~~ both of the following conditions apply:
 - 2.1. A ducted system supplies ~~recirculated ventilation air~~ directly to each bedroom and ~~the largest common area.~~
 - 2.2. ~~For continuously operating systems, not less than 70% of the air volume in the conditioned space is recirculated each hour through the ducted system, or for intermittently operated systems, an equivalent air recirculation is provided during each four hour period to one or more of the following rooms:~~
 - 2.1.1. Living room
 - 2.1.2. Dining room
 - 2.1.3. Kitchen.
 - 2.2.2-3. The whole-house ventilation system is a balanced ventilation system.

Commenter's Reason: The words "substantially the same" are made less subjective by substituting "within 10%", as requested by the committee.

Following the verbal recommendation of the committee, the word "conditioned" was eliminated from "conditioned floor area" .

The new 2.1 better describes "the largest common area" as "the living room, dining room or kitchen", meeting the committee request.

The text of exception 2.2 was deleted because the new 2.1 made it redundant and because the previous language of 2.2 was complicated.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This modification provides potentially reduced construction and operating costs to those who choose to use balanced ventilation.

M32-18

M33-18

IMC: 403.3, ASHRAE

Proposed Change as Submitted

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Mechanical Code

Revise as follows

403.3 Outdoor air and local exhaust airflow rates. Group R-2, R-3 and R-4 occupancies three stories and less in height above grade plane shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2-~~or~~ ASHRAE 62.2. Other buildings intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

Add new standard(s) follows

ASHRAE

ASHRAE
1791 Tullie Circle NE
Atlanta GA 30329

62.2-2016:

Ventilation and Acceptable Indoor Air Quality in Residential Buildings with Addenda b, d, k, l, q, and s

Reason: This proposed modification would provide ventilation system designers/specifiers of low-rise dwelling units with the OPTION of using ASHRAE Standard 62.2 to comply with the ventilation requirements of the IMC without requiring designers/specifiers to use the standard. ASHRAE 62.2 is the ANSI standard for establishing minimum acceptable indoor air quality for dwelling units. There are several reasons that designers/specifiers may want to use ASHRAE 62.2 instead of the IMC for compliance, including: greater flexibility for specifying climate-appropriate ventilation controls, ability to achieve energy and cost savings for homeowners by shifting operation of the ventilation system to times when ambient temperature and humidity are favorable, flexibility to specify innovative systems that can be demonstrated to provide equivalent exposure to pollutants, ability to down-size and save money on balanced ventilation equipment versus what may be required by the code, and 62.2's use by code-plus programs such as ENERGY STAR and LEED.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Costs of compliance with 62.2 versus alternative compliance paths will vary based on the application. This proposal gives builders the OPTION of using 62.2, meaning there will be no required increase or decrease in the cost of construction.

M33-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 9-2)

Assembly Action:

None

M33-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Craig Conner, representing self (craig.conner@mac.com) requests Disapprove.

Commenter's Reason: ASHRAE 62.2-2016 is not a usable document for codes. It is overly complex and contains several questionable sections. All residential proposals for including 62.2 were disapproved and there is currently not reference to ASHRAE 62.2 in the I-codes.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Parts of ASHRAE 62.2-2016 would be more costly. Parts are difficult to use and would be more costly to apply. Enforcing parts of ASHRAE 62.2-2016 would be difficult as this would be the only reference in the I-codes. It becomes another document for code staff to read. Even as an option it adds complexity to code enforcement. Since it is an option, perhaps it could be judged neutral on costs.

M33-18

M34-18

IMC: 501.2, 504.1, 505.3,

Proposed Change as Submitted

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcman@jeffco.us)

2018 International Mechanical Code

Revise as follows

501.2 Independent system required. Single or combined mechanical exhaust systems for environmental air shall be independent of all other exhaust systems. Dryer, ~~domestic kitchen and hazardous~~ exhaust shall be independent of all other systems. Type I exhaust systems shall be independent of all other exhaust systems except as provided in Section 506.3.5. Single or combined Type II exhaust systems for food-processing operations shall be independent of all other exhaust systems. ~~Kitchen Commercial kitchen~~ exhaust systems shall be constructed in accordance with ~~Section 505 for domestic cooking operations and Sections 506 through 509, for commercial cooking operations.~~

504.1 Installation. Clothes dryers shall be exhausted in accordance with the manufacturer's instructions. Dryer exhaust systems shall ~~be independent of all other systems and shall~~ convey the moisture and any products of combustion to the outside of the building.

Exception: This section shall not apply to listed and labeled condensing (ductless) clothes dryers.

505.3 Exhaust ducts. Domestic cooking exhaust equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, ~~and shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.~~ Installations in Group I-1 and I-2 occupancies shall be in accordance with the International Building Code and Section 904.13 of the International Fire Code.

Exceptions:

1. In other than Groups I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - 2.1. The duct shall be installed under a concrete slab poured on grade.
 - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
 - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
 - 2.5. The PVC ducts shall be solvent cemented.

Delete without substitution

~~**510.4 Independent system.** Hazardous exhaust systems shall be independent of other types of exhaust systems.~~

Reason: This is strictly an editorial clean up as the code doesn't have to keep repeating itself.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is strictly editorial.

M34-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 10-1)

None

M34-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov) requests Disapprove.

Commenter's Reason: This code proposal is not just editorial clean up as suggested. Why is domestic kitchen exhaust and hazardous exhaust grouped together? It doesn't make any sense. Why is the reference to 505 removed but the reference to 506-509 remain?

These changes add confusion to the code in an attempt to clean it up. I suggest we leave these codes as currently written.

Section 510.4 can absolutely NOT be deleted. This is the only code section in 510 that specifically states the requirement for independent exhaust. If this is allowed to be deleted, the only place the requirement would remain is in an obscure section in the beginning of section 501 where it is grouped with domestic kitchen exhaust. This is not wise. Redundancy is a key safety component in industry, where these systems are used and it should be a key safety component in the code as well. If editorial code clean up means deleting important sections, then I urge your disapproval.

I was at the committee action hearings, and the only reason this passed is because the committee was exhausted from just finishing all the changes in ventilation and this one just kind of slipped through.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The original code proposal was editorial only and did not affect the cost of construction and this public comment does not change that."

M34-18

M40-18

IMC: 506.3.2.5

Proposed Change as Submitted

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Mechanical Code

Revise as follows

506.3.2.5 Grease duct test. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. ~~A light test.~~ One of the following tests shall be performed to determine that all welded and brazed joints are liquid tight.

1. A water spray test as prescribed in this section
2. Where approved, a light test as prescribed in this section
3. An approved equivalent test

A light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. A test shall be performed for the entire duct system, including the hood-to-duct connection. The duct work shall be permitted to be tested in sections, provided that every joint is tested. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.

A water test shall be performed by simulating a grease duct cleaning operation by use of a pressure washer that is designed for grease duct cleaning and that operates at a pressure of not less than 1500 psi. The water shall be applied directly to all areas to be tested. Water applied to the duct interior surfaces shall not be visible on any exterior surfaces of the duct during the test.

Reason: The flexibility within this proposal will allow the code official some discretion to decide which duct test has worked best in the past and which to apply to the current installation. Based upon information from industry, code officials and end users, there are alternative methods of duct leakage testing currently being used successfully by industry. The intent of the language is to not limit the user to the light test or prohibit other methods where approved by local authority having jurisdiction. As an example, the State of Minnesota 2015 Mechanical and Fuel Gas Code has options of a light, air or water test. Additionally, there has been questions regarding the effectiveness of the light test to find pinhole leaks and leaks around over-lapping joints.

ASHRAE Standard 154-2016 "Ventilation for Commercial Cooking Operations" included the alternate water or approved equivalent tests during the last revision cycle. The proposed language harmonizes the two documents.

A recent committee member reported to the Standard 154 committee regarding comments from IKECA regarding leak testing. IKECA's recommendation was a water pressure test. Their comments included that the light test is ineffective, especially on pinhole leaks covered by slag. The water pressure washing without detergent prior to wrapping the duct is the most effective method to find leaks. Contractors bristle at this initially, but when told that this is the same conditions the duct will be subjected to at the first duct cleaning they are more receptive. As a result, some contractors are beginning to require that this test be performed before wrapping to ensure there are no leaks, and this helps them in that they are not called back at a later date to fix leaking exhaust ducts.

Bibliography: ASHRAE Standard 154-2016 "Ventilation for Commercial Cooking Operations"

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposal will not increase the cost of construction.

M40-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Item # 3 is vague regarding an equivalent test. There is no consensus on the water test procedure. (Vote 11-0)

Assembly Action:

M40-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

506.3.2.5 Grease duct test. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. One of the following tests shall be performed to determine that all welded and brazed joints are liquid tight.

1. A water spray test as prescribed in this section
2. Where approved, a light test as prescribed in this section
- ~~3. An approved equivalent test~~

A light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. A test shall be performed for the entire duct system, including the hood-to-duct connection. The duct work shall be permitted to be tested in sections, provided that every joint is tested. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.

A water test shall be performed by simulating a grease duct cleaning operation by use of a pressure washer that is designed for grease duct cleaning and that operates at a pressure of not less than 1500 psi. The water shall be applied directly to all areas to be tested. Water applied to the duct interior surfaces shall not be visible on any exterior surfaces of the duct during the test.

Commenter's Reason: The removal of the third alternate approved equivalent addresses concerns represented by the Mechanical committee and opponents of this proposal at the Committee Action Hearings. This leaves the choice of tests to a water wash down test or the traditional light test. The water wash down test is very much supported by factory-built duct manufacturers, grease duct cleaners (IKECA), and the ASHRAE kitchen ventilation technical committee (TC5.10). A vast array of field experience from these groups has shown to expose duct leaks during grease duct cleaning operations (using pressure washer spray guns) that were originally commissioned only with a light test.

The light test simply cannot reach all areas of a given duct run. This proposal and public comment still leaves the option for the AHJ to make the determination on which leakage test is appropriate for a given duct system. The reality is that a duct system will eventually see a water wash down test during routine cleaning and maintenance, but unfortunately as the code is written now, only after the restaurant is fully operational and the finished space is complete.

Bibliography: ASHRAE Standard 154-2016 "Ventilation for Commercial Cooking Operations"
NFPA 96 "Standard for Ventilation Control & Fire Protection of Commercial Cooking"

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This code change proposal and public comment only adds cost if a water test is chosen. A water wash down test costs more than a light test, but the building owner will incur this cost routinely during cleaning and maintenance. It is more beneficial to the building owner to make sure that no water leaks during the construction phase as opposed to post construction that will cause downtime and become more costly to fix.

Public Comment 2:

Proponent: Keith Page, representing Hart & Cooley / Selkirk - Engineering Manager requests As Modified by This Public Comment.

Further modify as follows:

2018 International Mechanical Code

506.3.2.5 Grease duct test. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. One of the following tests shall be performed to determine that all welded and brazed joints are liquid tight.

1. A water spray test as prescribed in this section
2. Where approved, a light test as prescribed in this section
- ~~3. An approved equivalent test~~

A light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. A test shall be performed for the entire duct system, including the hood-to-duct connection. The duct work shall be permitted to be tested in sections, provided that every joint is tested. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.

A water test shall be performed by simulating a grease duct cleaning operation by use of a pressure washer that is designed for grease duct cleaning and that operates at a pressure of not less than 1500 psi. The water shall be applied directly to all areas to be tested. Water applied to the duct interior surfaces shall not be visible on any exterior surfaces of the duct during the test.

Commenter's Reason: I propose to remove the third alternate "approved equivalent" since it was vague and rather leave the choice of tests as a water wash down test or the traditional light test. The water wash down test is very much supported by factory-built duct manufacturers, grease duct cleaners (IKECA), and the ASHRAE kitchen ventilation technical committee (TC5.10). A vast array of field experience from these groups has shown to expose duct leaks during grease duct cleaning operations (using pressure washer spray guns) that were originally commissioned with only the light test. The light test simply cannot reach all areas of any given duct run. This proposal still leaves the option for the AHJ to make the determination on which leakage test is appropriate for a given duct system. The reality is that a duct system will eventually see a water wash down test during routine cleaning and maintenance, but unfortunately as the code text is now, only after the restaurant is fully operational and the finished space is complete,

Bibliography: ASHRAE Standard 154-2016 "Ventilation for Commercial Cooking Operations"
NFPA 96 "Standard for Ventilation Control & Fire Protection of Commercial Cooking"

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This only adds cost if the water test is chosen. A water wash down test costs more than a light test does, but the building owner will eventually endure that cost routinely during cleaning and maintenance. It is better to make sure no water leaks out during the construction phase than to find out when the restaurant is fully finished and operating causing water damage and down time.

M40-18

M50-18

IMC: 505.3

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Mechanical Code

Revise as follows

505.3 Exhaust ducts. Domestic cooking exhaust equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems. Installations in Group I-1 and I-2 occupancies shall be in accordance with the International Building Code and Section 904.13 of the International Fire Code.

Exceptions:

1. ~~In other than Groups I-1 and I-2, where~~ Where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - 2.1. The duct shall be installed under a concrete slab poured on grade.
 - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
 - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
 - 2.5. The PVC ducts shall be solvent cemented.

Reason: In Section 505.3, Exception #1 language was incorrectly added that would prohibit Group I-1 and I-2 occupancies from having recirculating hoods. As long as proper mechanical or natural ventilation is provided, the hood is installed per manufacturer's instructions, and it meets the ventilation requirements, there is no justification on why these hoods cannot be re-circulating.

Cost Impact: The code change proposal will decrease the cost of construction. This exception where permitted in Groups I-1 and I-2 could result in a reduction of shaft and duct requirements to vent the hood to the outside, possibly through several floors.

M50-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Group I-1 and I-2 occupancies should still have exhaust to outdoors. (Vote 11-0)

Assembly Action:

None

M50-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

505.3 Exhaust ducts. Domestic cooking exhaust equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems. Installations in Group I-1 and I-2 occupancies shall be in accordance with the International Building Code and Section 904.13 of the International Fire Code.

Exceptions:

1. ~~Where in other than Groups I-1 and I-2, where~~ installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. ~~In Groups I-1 and I-2, where installed in accordance Sections 407.2.6 and 420.8 of the International Building Code, and where mechanical ventilation is provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.~~
- ~~2.3.~~ Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - ~~2.1-3.1.~~ The duct shall be installed under a concrete slab poured on grade.
 - ~~2.2-3.2.~~ The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - ~~2.3-3.3.~~ The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
 - ~~2.4-3.4.~~ The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
 - ~~2.5-3.5.~~ The PVC ducts shall be solvent cemented.

Commenter's Reason: While we see the committee's opinion that common use kitchens in Groups I-1 and I-2 should exhaust to the outdoors, there is no justification provided for this decision. NFPA 96 currently allows re-circulating hoods for commercial cooking applications, which produce far higher levels of output than what the types of kitchens addressed in this public comment.

In order to try to address the committee's concerns we have made the following changes.

First, we are limiting the non-ducting applications to a cooking facility serving 30 or fewer residents with the references to Section 407.2.5 and 420.8. These applications use domestic cooking appliances and a UL 300A hood, with built-in fire suppression. This is a limited application in highly supervised areas with many other restrictions on the cooking equipment including shut offs, sprinklers, extinguishers, etc.

This limitation will require larger commercial-style cooking operations in Groups I-1 and I-2 to still be vented to the outdoors.

Second, we have removed the option to provide natural ventilation, meaning that mechanical ventilation must be provided in order to use a ductless hood, and users won't be able to rely on an "open window" in the middle of winter.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This exception where permitted in Groups I-1 and I-2 could result in a reduction of shaft and duct requirements to vent the hood to the outside, possibly through several floors.

Public Comment 2:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

505.3 Exhaust ducts. Domestic cooking exhaust equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems. Installations in Group I-1 and I-2 occupancies shall be in accordance with the International Building Code and Section 904.13 of the International Fire Code.

Exceptions:

1. ~~Where~~ In other than Groups I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Within individual Group I-1 dwelling or sleeping units, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
- ~~2-3.~~ Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - ~~2-1-3.1.~~ The duct shall be installed under a concrete slab poured on grade.
 - ~~2-2-3.2.~~ The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - ~~2-3-3.3.~~ The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
 - ~~2-4-3.4.~~ The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
 - ~~2-5-3.5.~~ The PVC ducts shall be solvent cemented.

Commenter's Reason: The committee's disapproval was related to common use kitchen in Groups I-1 and I-2. This proposed exception is for Group I-1 individual apartments that are similar in nature to any residential apartment where re-circulating hoods are typically used. There is no justification to require exterior exhaust in this application. However, the way that the code is currently written for Group I-1, these domestic cooking appliances, with domestic hoods would be required to vent outside.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This exception where permitted in Group I-1 could result in a reduction of shaft and duct requirements to vent the hood to the outside, possibly through several floors.

M50-18

M51-18

IMC: 505.3, 505.7

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Mechanical Code

Revise as follows

505.3 Exhaust ducts. Domestic cooking exhaust equipment shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems. ~~Installations in Group I-1 and I-2 occupancies shall be in accordance with the International Building Code and Section 904.13 of the International Fire Code.~~

Exceptions:

1. In other than Groups I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - 2.1. The duct shall be installed under a concrete slab poured on grade.
 - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
 - 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
 - 2.5. The PVC ducts shall be solvent cemented.

Add new text as follows

505.7 Domestic cooking systems. Cooktops and ranges installed in the following occupancies shall be protected in accordance with Section 904.13.1 of the International Fire Code.

1. In Group I-1 occupancies where domestic cooking facilities are installed in accordance with Section 420.8 of the International Building Code.
2. In Group I-2, Condition 1 occupancies where domestic cooking facilities are installed in accordance with Section 407.2.6 of the International Building Code.
3. In Group R-2 college dormitories where domestic cooking facilities are installed in accordance with Section 420.10 of the International Building Code.

Reason: M45-15 as modified created the last sentence to IMC Section 505.3. The last sentence in 505.3 is an incorrect and circular reference. There are no exhaust hood requirements in IBC 407 or 410 (Group I-2 and I-1 respectively) - those sections send you to IMC for exhaust hood. The intent seems to be more as a reference to the protection in the hood in IFC Section 904.13. See new Section 505.7 for a better reference that is a copy of text already in IFC 904.13. Our intent is that if the other proposals related to domestic cooking in Group I-1 and I-2 are accepted that the references would be coordinated in the IMC and IFC.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is an editorial correction of references.

M51-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Disapproval was consistent with the recommendation for M50-18. (Vote 11-0)

Assembly Action:

None

M51-18

Individual Consideration Agenda

Public Comment 1:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Submitted.

Commenter's Reason: While code proposals M50 and M51 were both dealing with Groups I-1 and I-2, the reasons are not interrelated. Therefore the committee reason for disapproval of this code proposal was incorrect. This is not a technical change, but an editorial correction of references. The new language is a copy of IFC Section 904.13. The deleted reference in Section 505.3 are to sections that have nothing to do with exhaust hood installation.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is already a requirement in the IFC. There will be no change of requirements.

M51-18

M62-18

IMC: 511, 511.1, 511.1.1, 511.1.5

Proposed Change as Submitted

Proponent: Robert Davidson, Davidson Code Concepts, LLC, representing Self (rjd@davidsoncodeconcepts.com)

2018 International Mechanical Code

SECTION 511 DUST, STOCK AND REFUSE CONVEYING SYSTEMS

Revise as follows

511.1 Dust, stock and refuse conveying systems. Dust, stock and refuse conveying systems shall comply with the provisions of Section 510 and Sections 511.1.1 through 511.2 and the International Fire Code.

511.1.1 Collectors and separators. Collectors and separators involving such systems as centrifugal separators, bag filter systems and similar devices, and associated supports shall be constructed of noncombustible materials and shall be located on the exterior of the building or structure. A collector or separator shall not be located nearer than 10 feet (3048 mm) to combustible construction or to an unprotected wall or floor opening, unless the collector is provided with a metal vent pipe that extends above the highest part of any roof with a distance of 30 feet (9144 mm).

Exceptions:

1. Collectors such as "Point of Use" collectors, close extraction weld fume collectors, spray finishing booths, stationary grinding tables, sanding booths, and integrated or machine-mounted collectors shall be permitted to be installed indoors provided that the installation is in accordance with the International Fire Code and NFPA 70.
2. Collectors in independent exhaust systems handling combustible dusts shall be permitted to be installed indoors provided that such collectors are installed in compliance with the International Fire Code and NFPA 70.

511.1.5 Explosion relief vents control. ~~A safety or explosion relief vent~~ Explosion control shall be provided in accordance with the requirements of the International Fire Code on all systems that convey combustible refuse or stock ~~of an explosive nature, that produce combustible dusts in such a manner that the concentration and conditions create a fire or explosion hazard based on a Dust Hazard Analysis prepared~~ in accordance with ~~the requirements~~ Section 2203.2 of the International Building Fire Code.

Reason: This proposal is follow up work correlating the IBC, IMC and IFC provisions with the work done on Chapter 22 Combustible Dust and Chapter 37 Combustible Fibers in the IFC along with Section 426 of the IBC. Last cycle IBC Section 426 and Chapter 22 Combustible Dust-Producing Operations were updated to apply the new NFPA 652 Standard on the Fundamentals of Combustible Dust as the lead document when identifying and managing combustible dust hazards. In this proposal Section 511.1 has been modified to add "and the International Fire Code" in the top scoping section. In looking at 511.1 and the following sections the IFC would only apply for the exceptions to Section 511.1.1 when it should apply generally regardless of whether or not a system is located inside or on th exterior of a facility.

Section 511.1.5 is modified to rename it "Explosion Control" which is the correct terminology, the necessary protection features are much more than just "relief vents". "Explosion control" has been inserted as the lead requirement to be applied with linkage to the IFC as the correct document for installing explosion control. In addition language has been added "that produce combustible dusts in such a manner that the concentration and conditions create a fire or explosion hazard based on a Dust Hazard Analysis prepared" which is a phrase being applied and updated in other areas of the codes foor the required assessment of the potential hazard. Finally, the pointer to Section 2203.2 of the IFC leads the designer and the code official to the linkage with NFPA 652.

Cost Impact: The code change proposal will not increase or decrease the cost of construction Updating the language to correlate with other changes in the codes is not expected to increase or decrease the cost of construction, however, increasing clarification in code application provides an opportunity to reduce costs.

M62-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 11-0)

Assembly Action:

None

M62-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeffrey Shapiro, representing Self (jeff.shapiro@intlcodeconsultants.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

511.1.5 Explosion control. Explosion control shall be provided in accordance with the requirements of the International Fire Code on all systems that convey combustible dust or combustible refuse or stock that ~~produce~~ produces combustible dusts in such a manner that the concentration and conditions could create a fire or explosion hazard. Determination of concentrations or conditions that are deemed to not create a fire or explosion hazard shall be based on a Dust Hazard Analysis prepared in accordance with Section 2203.2 of the International Fire Code.

Commenter's Reason: The revision clarifies that ducts conveying combustible dust, not just refuse or stock that produces combustible dust, require explosion control consideration. In addition, the revision defaults to the need for explosion control in all cases unless a dust hazard analysis demonstrates otherwise, recognizing that some may choose to just provide explosion control or venting, as opposed to preparing a dust hazard analysis.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The change is intended to clarify and enhance application of the original proposal.

M62-18

M64-18

IMC: 601.5

Proposed Change as Submitted

Proponent: Brent Ursenbach, representing Salt Lake County Planning and Development Services (bursenbach@slco.org)

2018 International Mechanical Code

601.5 Return air openings. Return air openings for heating, ventilation and air-conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturer's installation instructions, ACCA Manual D or the design of the registered design professional.
5. Return air taken from one dwelling unit shall not be discharged into another dwelling unit.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.
8. Return air shall not be taken from indoor swimming pool enclosures and associated deck areas.

Exceptions:

1. Where the air from such spaces is dehumidified in accordance with Section 403.2.1, Item 2.
2. Dedicated HVAC systems serving only such spaces.

Exceptions:

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen and are located not less than 10 feet (3048 mm) from the cooking appliances.
2. Taking return air from a kitchen is not prohibited in a dwelling unit where the kitchen and living spaces are in a single room and the cooking appliance is electric and located not less than 5 feet in any direction from the return air intake opening.
- ~~2-3.~~ Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage.

Reason: There is an increasing trend towards smaller living spaces, including studio apartment, extended stay hotels, small homes and even tiny homes. Where the cooking appliance and living space are combined in a single space, requiring 10' between to return air inlet and the small cooking appliance serves no purpose. Cooking odors, even from burned food, will spread throughout the room, no matter how far the return is located from the appliance.

As some may be concerned with air-flow towards a return inlet impacting the flame of a gas burner, this exception is limited to electric appliances.

Cost Impact: The code change proposal will decrease the cost of construction

This proposal will in some cases, reduce the length of return air duct required, reduce duct ceiling drops, resulting in a material and labor savings.

M64-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 6-4)

Assembly Action:

None

M64-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ted Williams, representing American Gas Association (twilliams@aga.org) requests Disapprove.

Commenter's Reason: The proponent did not provide sound rationale for providing an exception for electric cooking appliances. Since cooking effluent is the contaminant source of concern and is independent of cooking appliance energy source, an exception for electric cooking appliances is unwarranted.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
The restriction and exception of cooking appliances by fuel type will not affect construction costs.

M64-18

M67-18

IMC: 602.2.1.7

Proposed Change as Submitted

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

2018 International Mechanical Code

Revise as follows

602.2.1.7 Plastic plumbing piping and tubing. Plastic piping and tubing used in plumbing systems shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with all requirements of ASTM E84 or UL 723. Mounting methods, supports and test specimen dimensions that are not specified in ASTM E84 or UL 723 shall be prohibited.

Exception: Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

Reason: A growing issue in the plumbing industry is that the ASTM E 84 test protocol is being modified to test combustible piping materials. At the direction of plastics manufacturers, test labs will modify mounting methods, supports and test specimen dimensions to achieve results that are in compliance with the 25/50 benchmarks the code requires. These results are then used to secure a listing by third party certifiers to serve as proof to code officials of compliance to the flame spread and smoke developed index requirements found in the code.

The question of whether a piping material is in compliance to the flame spread and smoke developed requirements of the code is often further blurred as third party certifiers provide listings indicating that materials meet the 25/50 requirements using modified test methods. Third party certifiers disclose this information in their full listing or report, but this is not always easily identified or even accessible to officials. An inspector seeing ASTM E 84 on a pipe would likely assume that it meets the requirement of the code without fully knowing or understanding the restrictions that exist in the listing. In fact, listing agencies assume that the inspector will analyze the listing and make their own determination on compliance. This code change proposal provides notice to the official that simply adding the ASTM E 84 or UL 723 marking to the wall of the pipe does not necessarily mean that the product was tested in full compliance with the standard in the manner that the code intends.

Charlotte Pipe has conducted ASTM E 84 tests at two different test facilities and found that results below the 25/50 flame spread and smoke developed index are not achievable when performed to the full requirements of ASTM E 84. Our testing has shown that CPVC and PVC piping will not pass the ASTM E 84 without modification of the mounting method, supports or test specimen dimensions.

If the practice of accepting modified test results is allowed to continue, then the requirements of the code will not be achieved. ASTM E 84 is a comparison test, and the 25/50 flame spread and smoke developed index is not a requirement of the standard, but of the code itself. If the 25/50 requirement is too restrictive, then an effort should be made to change the code. If the ASTM E 84 test method is flawed, change the standard. However, we can no longer allow the use of modified tests and third party listings to circumvent the requirements of the code which exist to preserve the health and safety of the public.

July 24, 2017
Revised September 25, 2017

Subject: Report of Surface Burning Characteristics Tests on Samples As
Submitted By Charlotte Pipe and Foundry Company

Dear Mr. Morris:

This is a Report summarizing the results of tests conducted under the Commercial Inspection and Testing Services (CITS) program of UL LLC (UL) identified as Assignment No. 4787930429.

GENERAL:

The results relate only to items tested.

METHOD:

Each test was conducted in accordance with Standard ANSI/UL723, Tenth Edition, dated September 10, 2008 with revisions through August 12, 2013, "Test for Surface Burning Characteristics of Building Materials", (ASTM E84).

The test determines the Surface Burning Characteristics of the material, specifically the flame spread and smoke developed indices when exposed to fire.

UL LLC
333 Pfingsten Road, Northbrook, IL 60062-2096 USA
T: 847.272.8800 / F: 847.272.8129 / W: UL.com

The maximum distance the flame travels along the length of the sample from the end of the igniting flame is determined by observation. The Flame Spread Index of the material is derived by plotting the progression of the flame front on a time-distance basis, ignoring any flame front recession, and using the equations described below:

- A. $CFS = 0.515 A_T$ when A_T is less than or equal to 97.5 minute-foot.
- B. $CFS = 4900/(195-A_T)$ when A_T is greater than 97.5 minute-foot.

Where A_T = total area under the time distance curve expressed in minute-foot.

The Smoke Developed Index (SDI) is determined by rounding the Calculated Smoke Developed (CSD) as described in UL 723. The CSD is determined by the output of photoelectric equipment operating across the furnace flue pipe. A curve is developed by plotting the values of light absorption (decrease in cell output) against time. The CSD is derived by expressing the net area under the curve for the material tested as a percentage of the area under the curve for untreated red oak.

The CSD is expressed as:

$$CSD = (A_m/A_{ro}) \times 100$$

Where:

- CSD = Calculated Smoke Developed
- A_m = The area under the curve for the test material.
- A_{ro} = The area under the curve for untreated red oak.

SAMPLES:

The samples utilized in this investigation were neither prepared nor selected by a Laboratories' representative such that no verification of composition can be provided.

None

M67-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: A product that is listed and labeled is assumed to meet the requirements of the standard with no need to state the conditions of the standard in the code text. The proposed last sentence addresses abuses in testing.

Assembly Action:

None

M67-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Brian Helms, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

602.2.1.7 Plastic plumbing piping and tubing. Plastic piping and tubing used in plumbing systems shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with ~~all requirements of~~ ASTM E84 or UL 723. Mounting methods, supports and test specimen dimensions that are not specified in ASTM E84 or UL 723 shall be prohibited.

Exception: Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

Commenter's Reason: This comment deletes redundant text from the original proposal. The proposal addresses the growing issue of modified ASTM E84 testing of combustible materials.

At the direction of plastics manufacturers, test labs will modify mounting methods, supports and test specimen dimensions to achieve results that are in compliance with the 25/50 benchmarks the code requires. These results are then used to secure a listing by third party certifiers to serve as proof to code officials of compliance to the flame spread and smoke developed index requirements found in the code.

The question of whether a piping material is in compliance to the flame spread and smoke developed requirements of the code is often further blurred as third party certifiers provide listings indicating that materials meet the 25/50 requirements using modified test methods. Third party certifiers disclose this information in their full listing or report, but this is not always easily identified or even accessible to officials. An inspector seeing ASTM E 84 on a pipe would likely assume that it meets the requirement of the code without fully knowing or understanding the restrictions that exist in the listing. In fact, listing agencies assume that the inspector will analyze the listing and make their own determination on compliance. This code change proposal provides notice to the official that simply adding the ASTM E84 or UL 723 marking to the wall of the pipe does not necessarily mean that the product was tested in full compliance with the standard in the manner that the code intends.

If the practice of accepting modified test results is allowed to continue, then the requirements of the code will not be achieved. ASTM E 84 is a comparison test, and the 25/50 flame spread and smoke developed index is not a requirement of the standard, but of the code itself. If the 25/50 requirement is too restrictive, then an effort should be made to change the code. If the ASTM E 84 test method is flawed, change the standard. However, we can no longer allow the use of modified tests and third party listings to circumvent the requirements of the code which exist to preserve the health and safety of the public.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This code change proposal will not increase or decrease the cost of construction and is intended to clarify existing language by identifying and prohibiting testing practices that circumvent the existing code requirements

M67-18

M70-18

IMC: 603.2, ACCA

Proposed Change as Submitted

Proponent: David Bixby, Air Conditioning Contractors of America (ACCA), representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

2018 International Mechanical Code

Revise as follows

603.2 Duct sizing. Ducts installed within a single dwelling unit shall be sized in accordance with ACCA Manual D, the appliance manufacturer's installation instructions or other approved methods; Zoned duct systems shall also comply with ACCA Manual Zr. Ducts installed within all other buildings shall be sized in accordance with the ASHRAE *Handbook of Fundamentals* or other equivalent computation procedure.

Add new standard(s) follows

ACCA

Air Conditioning Contractors of
America
2800 Shirlington Road, Suite 300
Arlington VA 22206

ANSI/ACCA 11 Manual Zr - 2018:

Residential HVAC System Zoning

Reason: Currently there is no coverage in the mechanical code to address the design of zoned duct systems. ACCA Manual Zr provides procedures for designing zoned comfort systems for single family detached homes, duplex and triplex homes, row houses, town houses, and large multi-family structures that are compatible with ACCA Manual J procedures for residential load calculations. In addition, use of Manual Zr will avoid the potential for an improperly designed zoned duct system to adversely impact the safe operation and durability of the heating/cooling equipment. For code officials, Manual Zr has three normative sections to determine clear compliance. Manual Zr is also a consensus-based ANSI standard. A proposal to add ACCA Manual Zr to Chapter 15, Referenced Standards, has also been submitted.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
No cost impacts.

M70-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposed standard is a design guide. (Vote 8-3)

Assembly Action:

None

M70-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Bixby, Air Conditioning Contractors of America, representing Air Conditioning Contractors of America (david.bixby@acca.org)requests As Submitted.

Commenter's Reason: ACCA's public comment provides the ICC with the final published ANSI/ACCA 11 Manual Zr - 2018: *Residential HVAC System Zoning*. The final version is identical to the draft standard submitted with our original proposal. ACCA Manual Zr provides procedures for designing zoned comfort systems for single family detached homes, duplex and triplex homes, row houses, town houses, and large multi-family structures that are compatible with ACCA Manual J, Residential Load Calculations.

Three "Normative" sections provide the following ANSI/ACCA requirements as shown below.

Section N1 - General Requirements for Residential Zoned Systems. Zoning principles and design principles that apply to all types of zoning systems.

Section N2 - Requirements for Zone Damper Systems. Design principles that are peculiar to zone damper systems.

Section N3 - Requirements for Ductless Equipment, Unitary Equipment, and Hot Water Heat.

In addition to the above required sections, there are other informational sections, calculation tools, and examples relevant to the standard. This format is similar to ANSI/ACCA Manuals D, J and S, which are already specified by the code and are currently enforced per their own "Normative" sections.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This will not affect the cost of a zoned comfort system as Manual Zr represents a minimum requirement for designing and installing such systems based on nationally-recognized core competencies for such construction.

Public Comment 2:

Proponent: Patrick McLaughlin, representing Air-Conditioning, Heating & Refrigeration Institute (pmclaugma@aol.com)requests As Submitted.

Commenter's Reason: The Air Conditioning, Heating & Refrigeration Institute is in strong support of adoption of Manual Zr. It's members participated with ACCA in the development of Manual Zr to help insure proper zoned duct system installation. Referencing Manual Zr in the duct system section will also provide a valuable resource to the code official.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Properly designed zoned duct systems will have long term cost benefit.

M70-18

M71-18

IMC: 602.2.1.8

Proposed Change as Submitted

Proponent: Jay Peters, Codes and Standards International, representing The Copper Development Association (peters.jay@me.com)

2018 International Mechanical Code

Revise as follows

602.2.1.8 Pipe and duct insulation within plenums. Pipe and duct insulation contained within plenums, including insulation adhesives, shall have a flame spread index of not more than 25 and a smoke developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Pipe and duct insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F(121°C). Pipe and duct insulation shall be listed and labeled. Pipe and duct insulation shall not be used to reduce the maximum flame spread and smoke-developed indexes specified in Section 602.2.1.7 except where tested as a composite assembly of the pipe, tubing, insulation, coatings and adhesives in accordance with ASTM E84 or UL 723.

Reason:

Fire walls, partitions, and similar protective assemblies are tested as composite assemblies, not as individual components. It is critical to have the best understanding possible of how an installed system will perform in the field which equates to replicating those conditions, especially in a plenum. This proposal clarifies that when materials do not meet minimum plenum safety requirements, simply covering them with plenum rated insulation may not be adequate protection, depending on the properties of the material being protected. Some insulation manufacturers market insulation materials for plenums, utilizing a "modified" E84 test, yet the code does not have provisions to use modified tests. Although there are insulation products that meet the flame and smoke requirements for plenums, the materials wrapped within them may begin to degrade, deteriorate and off-gas toxic fumes and substances into plenum spaces due to the high heat, even when protected. This off-gas could result in potential health and life-safety issues for occupants and first responders. All materials within plenums must meet the minimum plenum criteria and the code specifically identifies the proper tests. The IMC does not currently allow for "modified" test procedures in plenums.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal clarifies that installations must meet the existing code provisions.

M71-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 602.2.1.8 Pipe and duct insulation within plenums.

Pipe and duct insulation contained within plenums, including insulation adhesives, shall have a flame spread index of not more than 25 and a smoke developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Pipe and duct insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F(121°C). Pipe and duct insulation shall be listed and labeled. Pipe and duct insulation shall not be used to reduce the maximum flame spread and smoke-developed indexes ~~specified in Section 602.2.1.7~~ except where the pipe or duct and its related insulation, coatings, and adhesives are tested as a composite assembly in accordance with section 602.2.1.7. ~~of the pipe, ducts, tubing, insulation, coatings and adhesives in accordance with ASTM E84 or UL 723.~~

Committee Reason: Approval was based on the proponent's published reason statement. The modification references a code section instead of test standards. (Vote 11-0)

Assembly Action:

None

M71-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Charles Haack, representing North American Insulation Manufacturers Association (chaack@naima.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

602.2.1.8 Pipe and duct insulation within plenums. Pipe and duct insulation contained within plenums, including insulation adhesives, shall have a flame spread index of not more than 25 and a smoke developed index of not more than 50 when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Pipe and duct insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below ~~250°F(121°C)~~ 250°F(121°C). Pipe and duct insulation shall be listed and labeled. ~~Pipe~~ Where composite pipe and duct insulation assemblies are installed, they shall not be used to reduce the maximum flame spread and smoke-developed indexes except where the pipe or duct and its related insulation, coatings, and adhesives are tested ~~be tested~~ as a composite assembly in accordance with ~~section 602.2.1.7.~~ ASTM E84 or UL 723, and shall be listed for application in plenums.

Commenter's Reason: The proposed text is confusing and overly prescriptive. The purpose of evaluating composite pipe and duct insulation systems is not to reduce the maximum flame spread allowed under 602.2.1.7. The purpose is to comply with the flame spread and smoke developed requirements in Chapter 6 for use in plenums. Similar language is already contained in 602.2.1 Exception 5.3.

Also, identifying a list of components to be included in the composite assembly is overly prescriptive, and does not reflect all potential composite assemblies. For example, as written, it states that pipe and tubing shall be tested together, along with insulation, coatings and adhesives. Also, no mention is made of tapes. The additional language proposed here is derived from IMC 602.2.1 Exception 5.3.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change proposal will not increase or decrease the cost of construction. This proposal clarifies that installations must meet the existing code provisions.

M71-18

M72-18

IMC 607.4 (IBC 717.4)

Proposed Change as Submitted

Proponent: Joseph Sandman, representing self (josephs@fioptics.com)

THIS CODE CHANGE PROPOSAL HAS BEEN PLACED ON THE IBC-FS AGENDA. PLEASE SEE THE IBC-FS HEARING ORDER.

2018 International Mechanical Code

Revise as follows

[BF] 607.4 Access and identification. Fire and smoke dampers shall be provided with an *approved* means of access, ~~large enough~~ to permit inspection and maintenance of the damper and its operating parts. Dampers equipped with fusible links, internal operators, or both shall be provided with an access door that is not less than 12 inches (305mm) square or provided with a removable duct section. The access shall not affect the integrity of fire-resistance-rated assemblies. The access openings shall not reduce the fire-resistance rating of the assembly. Access points shall be permanently identified on the exterior by a label having letters not less than 0.5 inch (12.7 mm) in height reading: FIRE/SMOKE DAMPER, SMOKE DAMPER or FIRE DAMPER. Access doors in ducts shall be tight fitting and suitable for the required duct construction.

Reason: Fire and smoke dampers are an important part of a HVAC ductwork system, in the event of a fire they are designed to close and prevent the spread of fire and smoke throughout the building duct work system, giving the building occupants enough time to evacuate and also providing the fire department sufficient time to enter the building and extinguish the fire safely.

The NFPA requires all fire and smoke dampers be periodically inspected, maintained and tested per their guidelines to assure these dampers function properly in the event of a fire.

The NFPA requires that fire and smoke dampers are inspected and maintained through an access door that provides full unobstructed access to these dampers. These access doors are mounted on the ductwork as close as possible to the damper. Access doors work well for large fire and smoke dampers because the ductwork size is large enough to except an adequate sized access door, the problem is with the smaller fire and smoke dampers, the ductwork is too small to mount an adequate size access door. NFPA 80 addresses this problem by mandating the minimum size access door shall be no smaller than 12 inch square or you must supply a removable ductwork section, this removable section provides the technician performing the inspection with the unobstructed access needed to properly inspect and maintain the smaller fire and smoke dampers.

Our concerns are with the smaller fire and smoke dampers, because in many cases the removable ductwork sections for these dampers are not being provided as mandated by the NFPA 80, rather inadequate small access doors are being installed in the ductwork system next to the fire and smoke damper. Small access doors don't provide the access needed to properly inspect and maintain the fire and smoke dampers. The inadequacies of these access doors is nothing new in the HVAC industry, in many cases when it becomes time for the periodic damper inspections the maintenance technician will ignore and pass over the small fire and smoke dampers knowing that it's virtually impossible to perform the inspection through the access doors. We are asking for your help in addressing this problem, these fire and smoke dampers are much to important to be ignored, they save lives and countless dollars in property damage, the solutions are known they are just not being implemented.

My recommendation would be to adopt the National Fire Protection Association (NFPA) standards as set forth in NFPA 80 - **19.2.3 Access.** Dampers equipped with fusible links, internal operators, or both shall be provided with an access door that is not less than 12 in. (305mm) square or provided with a removable duct section.

Cost Impact: The code change proposal will not increase or decrease the cost of construction The proposed change will reduce the time for inspecting and servicing fire dampers by 50%.

M72-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The proposal increases ability to inspect and service dampers. Approval is consistent with recommendation for FS66-18. The proposed text is more enforceable because it states dimensions instead of "large enough." (Vote 14-0)

Assembly Action:

None

M72-18

Individual Consideration Agenda

Public Comment 1:

Proponent: William Koffel, representing Air Movement and Control Association (wkoffel@koffel.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

607.4 Access and identification. ~~Fire Access and identification of fire and smoke dampers shall be provided with an approved means of access, to permit inspection and maintenance of the damper and its operating parts. Dampers equipped with fusible links, internal operators, or both shall be provided with an access door that is not less than 12 inches (305mm) square or provided with a removable duct section. The access shall not affect the integrity of fire-resistance-rated assemblies. The access openings shall not reduce the fire-resistance-rating of the assembly. Access points shall be permanently identified on the exterior by a label having letters not less than 0.5 inch (12.7 mm) in height reading: FIRE/SMOKE DAMPER, SMOKE DAMPER or FIRE DAMPER. Access doors in ducts shall be tight fitting and suitable for the required duct construction.~~

comply with Sections 717.4.1 through 717.4.2.

607.4.1 Access Fire and smoke dampers shall be provided with an approved means of access that is large enough to permit inspection and maintenance of the damper and its operating parts. Dampers equipped with fusible links, internal operators, or both shall be provided with an access door that is not less than 12 inches (305 mm) square or provided with a removable duct section.

607.4.1.1 The access shall not affect the integrity of fire-resistance-rated assemblies. The access openings shall not reduce the fire-resistance-rating of the assembly. Access doors in ducts shall be tight fitting and suitable for the required duct construction.

607.4.1.2 Restricted Access Where space constraints or physical barriers restrict access to a damper for periodic inspection and testing, the damper shall be a single- or multi-blade damper and shall comply with the remote inspection requirements of NFPA 80 or NFPA 105.

607.4.2 Identification Access points shall be permanently identified on the exterior of a label having letters not less than 1/2 inch (12.7 mm) in height reading: FIRE/SMOKE DAMPER, SMOKE DAMPER or FIRE DAMPER.

Commenter's Reason: The Public Comment merely revises the IMC to be consistent with the Committee Recommendation for Approval as Modified for FS66-18. The Committee Reason Statement for M72-18 indicated the desire of the Committee to be consistent with the action on FS66-18. The proposed language in the Public Comment was not submitted as a modification during the Committee Action Hearings since I felt that it was substantive. However, I promised the Committee that a Public Comment would be submitted to make the IMC consistent with the IBC language resulting from the action on FS66-18.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
The language is consistent with requirements proposed for the 2021 Edition of the IBC.

M72-18

M73-18

IMC: 602.2.1.7

Proposed Change as Submitted

Proponent: Marcelo Hirschler, GBH International, representing GBH International (gbhint@aol.com)

2018 International Mechanical Code

Revise as follows

602.2.1.7 Plastic plumbing piping and tubing. Plastic piping and tubing used in plumbing systems shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with ASTM E84 or UL 723. The testing shall be conducted without water within the pipe.

Exception: Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

Reason: This proposal should be simple clarification but it highlights the fact that many approvals (even at ICC ES) are based on testing in accordance with a "modified" version of ASTM E84. One of the key modifications is the use of water within the pipes during testing. ASTM E84 does not authorize the use of water during testing of pipes (or of any other product). The reports indicate that a "modified" version of ASTM E84 has been used for the testing but that does not follow the intent (or the letter) of either ASTM E84 or the IMC. The intent of the use of products in plenums is for comparative testing of the products as received for inclusion in the plenum, and that does not include water.

This proposal has language very similar to that in M77 from the last cycle, and has the same effect. M77 was approved as submitted at the Public Comment hearing but failed in the Online Governmental Consensus Voting Process. I attach the full proposal and comment section for M77, with its associated information.

The language in M77 at the last cycle discussed the inclusion of "any liquid" within the pipe. The present proposal is more specific in that it states that it is not allowed to include water because that is the liquid that is being used. Note that fires in plenums typically occur during construction or renovation, when pipes are not full of water (or any other liquid). Note also that this section is generic for any plastic pipe in plenums and not exclusive to those carrying water.

The proposal was disapproved by the mechanical code committee because they felt it was not necessary for the code to clarify what is in the test standards. A variety of ICC ES approvals show that, in fact, products are being approved when tested with water, meaning that the clarification is important to ensure that there is an understanding that such "modifications" are not acceptable.

Cost Impact: The code change proposal will increase the cost of construction

The effect of this change is that some pipe materials that are in use today with incorrect fire testing and/or incorrect listings will have to be replaced in new construction by safer materials tested in proper accordance with ASTM E84.

M73-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 10-1)

Assembly Action:

None

M73-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Michael Cudahy, representing self (mikec@cmservices.com)requests Disapprove.

Commenter's Reason: The inclusion of individual testing requirement language in parts of the code is not appropriate and was rejected during the previous cycle's Online Governmental Consensus Voting Process.

The appropriate venue to determine testing conditions is the standards, using the standards writing consensus process, monitored by the standards writing organizations and not during a brief code hearing discussion. Will we now include every potential test condition after every standard method listed anywhere in the code? Where does it end?

Leave it to the appropriate process. We again urge rejection.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

We are asking that the code not be changed, and no cost change could result.

Public Comment 2:

Proponent: Forest Hampton, representing Lubrizol Advanced Materials, Inc. (forest.hampton@lubrizol.com)requests Disapprove.

Commenter's Reason: A similar proposal, M77-18, adding standards language to this section of the code was ultimately defeated during the online governmental consensus vote in the last cycle. I urge the committee to uphold this consensus and disapprove this proposal and keep standards writing at ASTM and not in the code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

My public comment removes the proposed new language and reverts the code language back to what it was in the 2018 code and therefore has no impact on cost.

Public Comment 3:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org)requests Disapprove.

Commenter's Reason: Proponent is trying to put a lab requirement in an installation code. The proposal doesn't belong here. This requirement should be in standards that are mentioned but not in the code or be done by the manufacturer.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This requirement does not belong in the code, but should be in the standards or be done by the manufacturer.

M73-18

M74-18

IMC: 604.3

Proposed Change as Submitted

Proponent: Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

2018 International Mechanical Code

Revise as follows

604.3 Coverings and linings. ~~Coverings~~ Duct coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Coverings and linings shall be listed and labeled.

Exception: Polyurethane foam insulation that is spray applied to the exterior of ducts in attics and crawlspaces shall be subject to all of the following requirements:

1. The foam plastic insulation shall have a flame spread index not greater than 25 and a smoke developed index not greater than 450, when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231.
2. The foam plastic insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C).
3. The foam plastic insulation complies with the requirements of Section 2603 of the International Building Code.
4. The foam plastic insulation is protected against ignition in accordance with the requirements of Section 2603.4.1.6 of the International Building Code.

Reason: The proposal is the same as M98-15 PC1. M98 was approved as modified by the committee. PC1 was approved during the Public Comment hearing but failed to get the necessary majority in the online vote. The proposal adds an exception allowing a greater smoke-developed index for some applications of foam plastic insulation on the exterior surfaces of ducts in attics or crawlspaces under certain specified conditions. The exception applies only to foam insulation meeting the requirements of IBC Section 2603 and the ignition barrier requirements in IBC Section 2603.4.1.6. This additional option is consistent with the options in Section M1601.3 of the IRC.

Additionally, this proposal allows a reduction in stringency of the flame spread requirement under certain conditions- specifically it provides for the use of foam plastic insulation for duct coverings in a manner consistent with the provisions for foam plastics in crawlspaces using surface burning characteristics in IBC Section 2603, and the ignition barrier requirements of IBC 2603.4.1.6. The proposal also maintains the appropriate requirements for hot surface performance testing of ASTM C411.

Cost Impact: The code change proposal will decrease the cost of construction. The proposal will permit greater flexibility in material selection.

M74-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 7-4)

Assembly Action:

None

M74-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Charles Haack, representing North American Insulation Manufacturers Association (chaack@naima.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

604.3 Coverings and linings. Duct coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below ~~250°F-250 F (121°C121 C)~~. Coverings and linings shall be listed and labeled.

Exception: Polyurethane foam insulation that is spray applied to the exterior of ducts in attics and crawlspaces shall be subject to all of the following requirements:

1. The foam plastic insulation shall have a flame spread index not greater than 25 and a smoke developed index not greater than ~~450~~50, when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231.
2. The foam plastic insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which they are exposed in service. The test temperature shall not fall below ~~250°F-250 F (121°C121 C)~~.
3. The foam plastic insulation complies with the requirements of Section 2603 of the International Building Code.
4. The foam plastic insulation is protected against ignition in accordance with the requirements of Section 2603.4.1.6 of the International Building Code.
5. Coverings and linings shall be listed and labeled.

Commenter's Reason: This proposal allows a greater smoke developed index for spray applied foam plastics, without providing sufficient safeguards against smoldering combustion under fire exposure conditions. The ASTM C411 testing only addresses in-service conditions, not fire scenarios. The "hot surface temperature" in the test refers to the surface temperature of the pipe, not an ambient external fire which will have much higher temperatures.

Smoldering, which often occurs in combustible materials prior to ignition, can generate large quantities of smoke. One of the options permitted under 2603.4.1.6 (item 4 of this new exception) is "corrosion-resistant steel having a base metal thickness of 0.016 inch (0.4 mm);". While this might delay flaming ignition, it would expose the foamed plastics to much higher temperatures in an external fire condition.

In addition, the requirement for coverings and linings to be listed and labeled appears to have inadvertently been lost because the exemption is to the entire base requirement. It is restored here

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change proposal will not increase or decrease the cost of construction. This proposal clarifies that installations must meet the existing code provisions.

M74-18

M78-18 Part I

IMC: 602.1,

Proposed Change as Submitted

Proponent: Robert Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IMC COMMITTEE AND PART II WILL BE HEARD BY THE IRC M/P COMMITTEE. PLEASE SEE THE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Mechanical Code

Revise as follows

602.1 General. Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces, and mechanical equipment rooms, ~~and the framing cavities addressed in Section 602.3~~ Plenums shall be limited to one fire area. Air systems shall be ducted from the boundary of the fire area served directly to the air-handling equipment. Fuel-fired appliances shall not be installed within a

Delete without substitution

~~**602.3 Stud cavity and joist space plenums.** Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:~~

- ~~1. 1. Such cavities or spaces shall not be utilized as a *plenum* for supply air.~~
- ~~2. 2. Such cavities or spaces shall not be part of a required fire resistance rated assembly.~~
- ~~3. 3. Stud wall cavities shall not convey air from more than one floor level.~~
- ~~4. 4. Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the International Building Code.~~
- ~~5. 5. Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by *approved* fire blocking as required in the International Building Code.~~
- ~~6. 6. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.~~

Reason: This code change proposal will create alignment between the IECC and the IMC as the IECC does not allow building cavities to be used as duct work that is seeing pressure from the air handling unit. It is impossible to control the air that is being pushed and pulled through building cavities that are used as ducts. When you pan a floor system for example, the air that is returning to the furnace comes from many more places than the room the intended. Air, having a tremendous ability to transport moisture, energy, and pollutants needs to be better controlled than is possible by using building cavities as duct work and therefore HVAC systems need to be fully ducted. The Energy Code recognizes the Building durability, efficiency, and safety concerns with gaining better control of air flow that is being pushed and pulled by the hair handling. Moisture control, energy control, pollutant control, house and room pressure control are all gained by fully ducting HVAC systems and not allowing building cavities to be used as duct work.

Cost Impact: The code change proposal will increase the cost of construction
This Code proposal will increase the code of construction because it will require fully ducted HVAC systems which improving durability, safety, and efficiency of the building we build

M78-18 Part I

M78-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Robert Schwarz, EnergyLogic, representing EnergyLogic, Inc. (robby@nrglogic.com); Shaunna Mozingo (sdmozingo@shaunnamozingo.com) requests As Submitted.

Commenter's Reason: The Committee's reason statement for disapproval stated that no evidence was provided that building cavities used as duct work cause a problem. In addition, they stated that air leakage in these cavities is within the thermal envelope, thus there is no loss. The Department of Energy (D.O.E.) has published statistics indicating that the average duct system leaks between 20% and 40%. This leakage is often connected directly to the outdoors causing pressure differentials in buildings that create building safety, durability, health, and efficiency issues.

When you google "Building Cavities as Ductwork" you find a number of articles from nationally recognized building scientist as well as trade groups, DOE, EnergyStar, code groups and others that all point out that utilizing building cavities to carry pressurize air from the supply or to the return side of the furnace is a bad idea. My original reason statement spoke to the reality of uncontrolled pressures in leaky building cavities and the fact that the Energy Code recognizes the building durability, efficiency, and safety concerns associated with uncontrolled air flow that is being pushed and pulled through building cavities by the air handling unit.

I have summarized these concerns and provided links to resources for the information listed below that supports and provides evidence that duct leakage through building cavities is a problem. I urge you to do your own research for I am sure you will conclude as I have that using a building cavity as the duct system in a building is more detrimental than beneficial. By simply installing a true duct in the cavity the issue is solved.

From the Building America Solution Center

Building Cavities Not Used as Supply or Return Ducts

- "Cavities (or interstitial spaces) within walls are also sometimes used as supply or return air pathways. These cavities often connect inside air with outside air from an attic or crawlspace. It is very difficult to make such cavity spaces airtight. When cavity spaces are used as return air pathways or supply air ducts, a few issues will arise. Because cavity spaces are leaky, building pressure imbalances across the building envelope will occur, driving building infiltration. A cavity space used as a return air pathway will pull pollutants into the building from unknown sources. Another issue (less talked about) with using cavity spaces as return air pathways is fire safety. Building materials such as wood products do not meet the flame and smoke spread criteria as do approved duct materials. Using cavities as return or supply ducts is not a fire hazard in itself but will encourage a fire to spread throughout the building. In humid climates, a cavity space used as a return air pathway will pull humid air into the cavity space, possibly encouraging mold or rotting of building materials."
- <https://bas.c.pnnl.gov/resource-guides/building-cavities-not-used-supply-or-return-ducts#quicktabs-guides=1>

Perhaps the Worst HVAC Duct Idea Ever — The Panned Joist Return,. Allison Bailes on August 18, 2011

- **"Panned joist return ducts are almost always terribly leaky. Those junctions between wood and metal are difficult to seal, and the thermal expansion and contraction of the wood will often cause sealing materials to fail."**
- <https://www.energyvanguard.com/blog/43723/Perhaps-the-Worst-HVAC-Duct-Idea-Ever-The-Panned-Joist-Return>

From Building Science Corporation:

Inf-801: What's Wrong With this Practice? Using unsealed wall cavities or panned floor joists as return plenum

- “The negatively pressurized cavities will draw air through any cracks to try to alleviate the pressure difference. This means that the return system will suck on the walls—and any contaminants that might be in the walls—and redistribute them to the living space. By negatively pressuring the walls in a hot-humid climate, warm humid air could be drawn into the walls from the exterior, and condensation is likely to occur on the cooler air-conditioned surfaces.”
- <https://buildingscience.com/documents/information-sheets/information-sheet-wrong-using-unsealed-wall-cavities-or-panned-floor-joists-as-return-plenium>

Info-603 Duct sealing

- “The only place air should be able to leave the supply duct system and the furnace or air handling unit is at the supply registers. The only place air should be able to enter the return duct system and the furnace or air handling unit is at the return grilles. A forced air system should be able to be pressure tested the way a plumber pressure tests a plumbing system for leaks. Builders don’t accept leaky plumbing systems, so they should not accept leaky duct systems.”
- <https://buildingscience.com/documents/information-sheets/information-sheet-duct-sealing>

DOE Building Technologies Program Study Measure Guideline: Sealing and Insulating of Ducts in Existing Homes

- One reason is that building cavities are very prone to air leakage: gaps in framing and/or drywall are very common, and many building cavities have electrical and plumbing penetrations. Using building cavities as ductwork on the return air side can also result in pollutants entering the air stream and being distributed throughout the home.
- Building Cavities are difficult to impossible to seal to the standards called for by the IECC.

“Duct leakage can also lead to pressure imbalances within homes. Such imbalances not only can affect comfort and efficiency but can also impact health and durability. In homes with some types of combustion equipment, for example, large return duct leaks in a basement system can cause negative pressures which, in turn, can interfere with proper draft. Under these conditions, exhaust gases can be sucked into the home. Other risks of pressure imbalances include buildup of moisture (and associated problems like mold) in parts of buildings.”

<https://www.nrel.gov/docs/fy12osti/53494.pdf>

Washington State University, “Improving Forced Air Heating Systems”

<https://docplayer.net/30025411-Supplement-a-improving-forced-air-heating-systems.html>

According to Energy Star: “Supply-side leakage to the outside can cause a negative pressure difference in the building with reference to outside. Return-side leakage, on the other hand, can cause a positive pressure difference in the building with reference to the outside. On average, such leakage can cause a 10% to 20% increase in heating and cooling energy use, along with a 20% to 50% decrease in heating and cooling equipment efficiency.”

In houses with forced-air heating and cooling systems, ducts are used to distribute conditioned air throughout the house. In a typical house, however, about 20 to 30 percent of the air that moves through the duct system is lost due to leaks, holes, and poorly connected ducts. The result is higher utility bills and difficulty keeping the house comfortable, no matter how the thermostat is set.

DOE: Leaky Ducts are Top Energy Waster

<https://www.achrnews.com/articles/124595-doe-leaky-ducts-are-top-energy-waster>

Minimizing Energy Losses in Ducts

Ducts that leak heated air into unheated spaces can add hundreds of dollars a year to your heating and cooling bills, but you can reduce that loss by sealing and insulating your ducts.

<https://www.energy.gov/energysaver/minimizing-energy-losses-ducts>

Duct Leakage Can Create 3 Big Problems in Your Home

3 major effects that duct leakage can have on your home

- **1. Makes your home less efficient.** When your home has duct leaks, conditioned air escapes before it gets to your living spaces. This decreases your home's efficiency levels in two ways. First, your furnace and air conditioner waste energy on conditioning air that is never actually used. Second, your heating and cooling system has to work harder and longer to maintain your desired home temperature levels, which can severely increase operating costs.
- **2. Makes your home less comfortable.** Duct leakage makes it difficult for your home to heat and cool properly. Depending on where the leakage is located, some rooms might never receive enough conditioned air, which can create uneven temperature levels in your home. In addition, unconditioned air can leak into your ducts and alter your home's temperature levels.
- **3. Worsens your home's air quality.** Another side effect of unconditioned air leaking into your ducts is that it can worsen your home's air quality. That's because the air that leaks inside is unfiltered, and it can contain all sorts of contaminants. This is especially problematic when duct leaks occur in parts of your home that are commonly dusty (such as your attic).

M78-18 Part I

M78-18 Part II

IRC: M1601.1.1

Proposed Change as Submitted

Proponent: Robert Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com)

2018 International Residential Code

Revise as follows

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. 1.*Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. 2.Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. 3.Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. 4.Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA HVAC *Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. 5.The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. 6.*Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. ~~7.Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:~~
8. ~~7.1.7.These cavities or spaces shall~~ Building framing cavities shall not be used as
a plenum for supply air.
 1. ~~7.2.These cavities or spaces shall not be part of a required fire resistance rated assembly.~~
 2. ~~7.3.Stud wall cavities shall not convey air from more than one floor level.~~
 3. ~~7.4.Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.~~
 4. ~~7.5.Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air ducts or plenums.~~
9. 8.Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Reason: There is a conflict in the International Residential code in chapter 11 and chapter 16. Chapter 11 states in section N1103.3.5 "Mandatory - Building framing cavities shall not be used as ducts or plenums". Chapter 16 as shown above is allowing air to travel in plenums uncontained by ductwork. This code change directly addresses this conflict by deleting confusing and conflicting language in number 7 of section M1601.1.1 and replacing it with the language that has been used successfully in another section of the code.

Air is a fluid like water is a fluid. Code will not stand for a plumbing system that leaks but allows a minimum level of duct leakage even though the air that is carried through the duct system carries heat, moisture, and pollutants that can be detrimental to the building occupant and the structure. Many have read the language in chapter 11 of the IRC in the last two cycles of the code to mean that both the supply side and the return side of an HVAC system need to be fully ducted. However, chapter 16 and the commentary has left a window of opportunity for contractors to continue to utilize building cavities for return air plenums that are directly carrying air from the furnace blower rather than a plenum that contains duct that contains the air from the air handling unit. To be crystal clear, this code change proposal is largely in response to that and is designed to confirm that all HVAC duct systems are fully ducted to ensure life safety, long term durability, cost effectiveness, comfort and efficiency as they are all impacted by air under pressure being forced through un-ducted building cavities.

A number of papers have been written about the decrease in efficiency and comfort as well as the increase in building durability issues and cost of ownership associated with air traveling through and out of un-ducted building cavities. Much of this air also is pulled into and out of the building due to the connection of the cavity to the outside or adjacent spaces such as garages and attics. Negative pressure is a significant issue for combustion safety is a home which is more likely to impact atmospherically vented appliances through the leakage associated with building cavities used as returns. For all of these reasons and more, all air pushed or pulled by an HVAC blower motors should be contained inside a sealed duct system. The duct system intern can be run through a plenum to the locating in a building it is supplying and returning from.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

There is zero cost impact because the IECC and Chapter 11 of the IRC in section R403.3.5 /N1103.3.5 state "Mandatory - Building framing cavities shall not be used as ducts or plenums". In addition, the Applicability/General section of all codes states "..... Where, in any specific case, different sections of this code specify different materials, methods of construction, or other requirements, the most restrictive shall govern." Since building cavities cannot be used as ducts or plenums then any cost associated with this construction practice should have already been absorbed.

M78-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: No evidence was provided that these cavities cause a problem. Air leakage in these cavities is within the thermal envelope, thus there is no loss. (Vote 10-0)

M78-18 Part II

M81-18

IMC: SECTION 920.4 (New)

Proposed Change as Submitted

Proponent: John Williams, Chair, representing Healthcare Committee (AHC@iccsafe.org)

2018 International Mechanical Code

SECTION 920 UNIT HEATERS

920.1 General. Unit heaters shall be installed in accordance with the listing and the manufacturer's instructions. Oil-fired unit heaters shall be tested in accordance with UL 731.

920.2 Support. Suspended-type unit heaters shall be supported by elements that are designed and constructed to accommodate the weight and dynamic loads. Hangers and brackets shall be of noncombustible material. Suspended-type oil-fired unit heaters shall be installed in accordance with NFPA 31.

920.3 Ductwork. A unit heater shall not be attached to a warm-air duct system unless *listed* for such installation.

Add new text as follows

920.4 Prohibited Uses. In Group I-2 and ambulatory care facilities, suspended-type unit heaters are prohibited in corridors, exit access stairways and ramps, exit stairways and ramps and patient sleeping areas.

Reason: Suspended type heaters should not be in the means of egress because of the element of risk for these types of heaters, such as open flame, carbon monoxide and other products of combustion. Fuel being piped to these heaters could be an additional risk. The defend in place concept relies on the means of egress to temporarily house residents and patients (K523).

This proposal is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The elimination of this type of heater unit will not add cost to these types of facilities.

M81-18

Public Hearing Results

M81-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Steven Rosenstock, representing Edison Electric Institute (srosenstock@eei.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

920.4 Prohibited Uses. In Group I-2 and ambulatory care facilities, suspended-type unit heaters are prohibited in corridors, exit access stairways and ramps, exit stairways and ramps and patient sleeping areas.

Exception: Electric unit heaters that meet applicable safety standards.

Commenter's Reason: This public comment provides a necessary exception. Electric unit heaters should not be banned.

Looking at the original reason statement, and at certain safety codes such as NFPA 101, the key concern is emissions and impact on indoor air quality. However, the current proposal bans electric unit heaters (with no emissions) as well. Electric unit heaters meet all applicable safety codes and do not produce any indoor air emissions. Therefore, they do not harm indoor air quality and should be allowed for use in these areas.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. If these electric unit heaters are allowed to be used, the costs will be increased compared to a situation where such unit heaters are banned. However, the areas will have to be heated by some sort of heating system, so there is a cost to run ductwork or piping to those areas.

M81-18

IMC: Chapter 2, SECTION 202, 202, 202 (New), 202, Chapter 11, SECTION 1101, 1101.2, SECTION 1103, 1103.1, TABLE 1103.1, SECTION 1104, 1104.3, 1104.3.1, 1104.3.1.1 (New), 1104.3.1.1.1 (New), 1104.3.1.1.2 (New), 1104.3.1.1.3 (New), 1104.3.1.1.4 (New)

Proponent: Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org)

2018 International Mechanical Code

CHAPTER 2 DEFINITIONS

SECTION 202 GENERAL DEFINITIONS

Revise as follows:

FLAMMABILITY CLASSIFICATION (REFRIGERANT). ~~Refrigerants shall be assigned to one of the three classes 1, 2 or 3 in accordance with ASHRAE 34. For Classes 2 and 3, the heat of combustion shall be calculated assuming that combustion products are in the gas phase and in their most stable state. The alphabetical/numerical designation used to identify the flammability of refrigerants.~~

Class 1. ~~Refrigerants that do not show flame propagation when tested in air at 14.7 psia (101 kPa) and 140°F (60°C). Indicates a refrigerant with no flame propagation.~~

Class 2L. Indicates a refrigerant with lower flammability and lower burning velocity.

Class 2. ~~Refrigerants having a lower flammability limit (LFL) of more than 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) and a heat of combustion of less than 8169 Btu/lb (19 000 kJ/kg). Indicates a refrigerant with lower flammability.~~

Class 3. ~~Refrigerants that are highly flammable, having a LFL of less than or equal to 0.00625 pound per cubic foot (0.10 kg/m³) at 140°F (60°C) and 14.7 psia (101 kPa) or a heat of combustion greater than or equal to 8169 Btu/lb (19 000 kJ/kg). Indicates a refrigerant with higher flammability.~~

Add new definition as follows:

REFRIGERANT CONCENTRATION LIMIT (REFRIGERANT) (RCL) The refrigerant concentration limit, in air, intended to reduce the risks of acute toxicity, asphyxiation, and flammability hazards in normally occupied, enclosed spaces.

Revise as follows:

REFRIGERANT SAFETY CLASSIFICATIONS GROUP CLASSIFICATION. ~~Groupings that indicate the toxicity and flammability classes in accordance with Section 1103.1. The classification group is made up of a letter (A or B) that indicates the toxicity class, followed by a number (1, 2 or 3) that indicates the flammability class. Refrigerant blends are similarly classified, based on the compositions at their worst cases of fractionation, as separately determined for toxicity and flammability. In some cases, the worst case of fractionation is the original formulation. The alphabetical/numerical designation that indicates both toxicity and flammability classifications of refrigerants.~~

Toxicity. See "Toxicity classification (Refrigerant)."

Flammability. See "Flammability classification (Refrigerant)."

TOXICITY CLASSIFICATION-CLASSIFICATION (REFRIGERANT). ~~Refrigerants shall be classified for toxicity in one of two classes in accordance with ASHRAE 34: An alphabetical designation used to identify the toxicity of refrigerants. Class A indicates a refrigerant with lower toxicity. Class B indicates a refrigerant with higher toxicity.~~

CHAPTER 11 REFRIGERATION

SECTION 1101 GENERAL

1101.2 Factory-built equipment and appliances. *Listed and labeled* self-contained, factory-built *equipment* and appliances shall be tested in accordance with UL 207, 412, 471 ~~or 1995-, 484, 541, 1995, 60335-2-24, 60335-2-40 or 60335-2-89.~~ Such *equipment* and appliances are deemed to meet the design, manufacture and factory test requirements of this code if installed in accordance with their listing and the manufacturer's instructions.

SECTION 1103 REFRIGERATION SYSTEM CLASSIFICATION

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Each refrigerant shall be assigned to one of the following refrigerant safety group classifications: A1, A2L, A2, A3, B1, B2L, B2, or B3. For refrigerants that do not have values in Table 1103.1, the safety group, RCL value, and OEL value shall be determined in accordance with ASHRAE 34 and approved.

TABLE 1103.1

REFRIGERANT CLASSIFICATION, AMOUNT AND OEL

CHEMICAL REFRIGERANT	FORMULA	CHEMICAL NAME OF BLEND	REFRIGERANT SAFETY GROUP CLASSIFICATION	AMOUNT OF REFRIGERANT PER OCCUPIED SPACE				[F] DEGREES OF HAZARD ^a

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. For installations that are entirely outdoors, use 3-1-0.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk. ~~The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~

SECTION 1104 SYSTEM APPLICATION REQUIREMENTS

1104.3 Refrigerant restrictions. Refrigerant applications, maximum quantities and use shall be restricted in accordance with Sections 1104.3.1 through 1104.3.4.

1104.3.1 Air-conditioning for human comfort. In other than industrial occupancies where the quantity in a single independent circuit does not exceed the amount in Table 1103.1, Group B1, B2, ~~B2L~~ and B3 refrigerants shall not be used in high-probability systems for air-conditioning for human comfort. Refrigerating systems containing Group A2L refrigerants shall comply with Section 1104.3.1.1.

Add new text as follows:

1104.3.1.1 Group A2L Refrigerants. High-probability systems using Group A2L refrigerants for human comfort applications shall comply with Sections 1104.3.1.1.1 through 1104.3.1.1.4. Nonoccupiable spaces with refrigerant containing equipment, including piping, shall comply with the amounts indicated in Table 1103.1, except as permitted by Section 1104.3.1.1.3.

1104.3.1.1.1 Listing and Installation Requirements. Where required per Section 1104.3.1.1, refrigerating systems shall be listed, labeled, and installed in accordance with the manufacturer's instructions, and any markings on the equipment restricting the installation. The nameplate shall include a symbol indicating that a flammable refrigerant is used, as specified by the product listing. A label indicating that a flammable refrigerant is used shall be placed adjacent to service ports and other locations where service involving components containing refrigerant is performed, as specified by the product listing.

A refrigerant detector shall be provided in accordance with Section 1104.3.1.1.4 where one or more of the following conditions are met:

1. For Commercial, Public Assembly and Large Mercantile occupancies where the refrigerant charge of any independent circuit exceeds 22 lb (10 kg).
2. For Institutional and Residential occupancies where the refrigerant charge of any independent circuit exceeds 6.6 lb (3 kg).
3. Where using the provisions of Section 1104.3.1.1.3.
4. Where a refrigerant detector is required by the product listing.

When the refrigerant detector senses a rise in refrigerant concentration above the value specified in Section 1104.3.1.1.4, all of the following shall apply:

1. A minimum flow rate of supply air shall be provided in accordance with the following equation: $Q \geq 1001 \times M / LFL$, (for SI: $Q \geq 60000 \times M / LFL$), where Q is the supply air flow rate ft³/min (m³/h), M is the refrigerant charge lb (kg), and LFL is the lower flammability limit lb per 1000 ft³ (g/m³).
2. The compressor and all other electrical devices shall be turned off, excluding the control power transformers, control systems, and the supply air fan. The supply air fan shall continue to operate for not less than 5 minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 1104.3.1.1.4.
3. Any device that controls air flow located within the product or in duct work that supplies air to the

occupied space shall be fully opened. Any device that controls air flow shall be listed.

4. Heaters and electrical devices located in the ductwork shall be turned off

1104.3.1.1.2 Ignition Sources. Open flame-producing devices shall not be permanently installed in the ductwork that serves the space. Continuously operating hot surfaces exceeding 1292°F (700°C) shall not be located within the ductwork that serves the space. Unclassified electrical devices shall not be located within the ductwork that serves the space.

1104.3.1.1.3 Refrigerant Containing Equipment Located Indoors. For refrigeration compressors and pressure vessels located in an indoor space that is accessible only during service and maintenance it shall be permissible to exceed the amounts indicated in Table 1103.1 where all of the following conditions apply:

Exceptions:

1. The largest single circuit charge does not exceed 6.6 lb (3 kg) for Residential and Institutional occupancies, and does not exceed 22 lb (10 kg) for C
2. The space where compressors and pressure vessels are located is provided with an air distribution system in accordance with the following equation: $Q \geq 1001 \times M / LFL$, (for SI: $Q \geq 60000 \times M / LFL$), where Q is the supply air flow rate ft³/min (m³/h), M is the refrigerant charge lb (kg), and LFL is the lower flammable limit lb per 1000 ft³ (g/m³).
3. Exhaust air is removed from the air distribution system at a minimum rate of 4 air changes per hour and the system has provisions for makeup air. Exhaust air that is removed from the air distribution system is either discharged outside of the building envelope, or discharged to an indoor space, provided that the refrigerant concentration will not exceed the amount indicated in Table 1103.1.
4. The air distribution system is started when the refrigerant detector senses refrigerant in accordance with Section 1104.3.1.1.4. The location of the refrigerant detector is in accordance with Section 1104.3.1.1.4. The air distribution system continues to operate for not less than 30 minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 1104.3.1.1.4 (1.).
5. The inlet for return air to the air distribution system is located where refrigerant from a leak is expected to accumulate. The inlet elevation is within 12 inches (30 cm) of the lowest elevation in the space where the compressor or pressure vessel is located.
6. In addition to the requirements of Section 1104.3.1.1.2 there are no open flame producing devices or continuously operating hot surfaces exceeding 1292°F (700°C) that are located within space where the equipment is installed.

1104.3.1.1.4 Refrigerant Detectors.

Refrigerant detectors shall comply with all of the following:

1. The refrigerant detector set point to activate the functions required by Section 1104.3.1.1.1 shall be at a value not exceeding 25% of the lower flammable limit (LFL).
2. One or more refrigerant detectors shall be located such that refrigerant will be detected if the refrigerating system is operating, or not operating. For refrigerating systems that are connected to the occupied space through ductwork, refrigerant detectors shall be located within the listed equipment. For refrigerating systems that are directly connected to the occupied space without ductwork, the refrigerant detector shall be located in the equipment, or shall be located in the occupied space at a height of not more than 12 inches (30 cm) above the floor and within a horizontal distance of not more 3.3 ft (1.0 m) with a direct line of sight of the unit.
3. The refrigerant detector as installed, including any sampling tubes, shall cause the functions required by Section 1104.3.1.1.1 within a time not to exceed 10 seconds, after exposure to a refrigerant concentration exceeding 25% of the LFL.
4. The refrigerant detector shall provide a means for automatic operational self-test as provided in the product listing. Use of a refrigerant test gas is not required. If a failure is detected, a trouble alarm shall be activated and the actions required by Section 1104.3.1.1.1 shall be initiated.
5. The refrigerant detector shall be tested during installation to verify the alarm set point and response time as required by Section 1104.3.1.1.4 items 1 and 3. After installation, the refrigerant detector shall be tested to verify the alarm set point and response time annually or at an interval not exceeding the manufacturer's installation instructions, whichever is less.

Reason:

The proposed code changes include technical content based on ASHRAE Standard 34-2016 with Addendum G and ASHRAE Standard 15-2016 with Addendum D. The revisions in these two ASHRAE addenda are dependent and must be correlated as shown in this code change proposal. Upon publication, these addenda will be incorporated into the 2019 editions of ASHRAE 34 and ASHRAE 15.

There was a considerable amount of industry research into the use of flammable refrigerants that occurred in 2016 and 2017, following the announcement in June 2016 of a collaborative research effort between ASHRAE, AHRI, and US DOE. ASHRAE SSPC15 relied upon this body of knowledge in drafting the addenda to the 2016 edition of Standard 15.

The refrigerant safety group classification is an alphabetical/numerical designation that is used to identify both the toxicity and flammability classifications of a given refrigerant. There are two new safety group classifications added to ASHRAE 34: A2L and B2L. Previously 2L was a sub-class of class 2 as an interim measure to implement changes to refrigerant flammability classification into ASHRAE 34 prior to making associated changes to a future edition of ASHRAE 15; but now 2L is a separate class and safety requirements must be revised to distinguish between class 2 and class 2L.

The current definitions of “flammability classification” and “toxicity classification” are improper since both contain mandatory code requirements. The definitions should only define the term, not contain code requirements with the use of the word “shall.” The current definition of refrigerant safety classifications is incorrect due to revisions to ASHRAE 34. The attempt to define the technical requirements of flammability are not correct. ASHRAE 34 goes into extensive requirements as to how to test and classify a refrigerant regarding flammability. The code should leave the technical requirements to ASHRAE 34 which is accomplished in Section 1103.1. The definition only has to identify the meanings of the classification categories. These terms used are found in the body of ASHRAE 34. The addition of “refrigerant” to the term “flammability classification” and “toxicity classification” clarify that the definitions only apply to refrigerants. Flammability and toxicity are terms also used in the ventilation sections of the code. These definitions do not apply to the use of those terms in Chapter 5.

Additional UL standards are added in Section 1101.2, because without product safety standards that include provisions for equipment using Group A2L refrigerants, the proposal would have no means of implementation, since it relies upon the use of listed and labeled equipment. Rapid refrigerant detection of Group A2L flammable refrigerants, and air movement to enable rapid mixing of released refrigerant, are at the core of the requirements presented in this code proposal.

Bibliography:

Addendum G to ASHRAE Standard 34-2016

Addendum D ASHRAE Standard 15-2016

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

While this proposal may introduce new requirements for A2L refrigerants, the type of refrigerant utilized within a building is up to the owner and designer. Therefore this proposal does not necessarily increase the cost of construction.

Individual Consideration Agenda

Public Comment 1:

Proponent:

Connor Barbaree, ASHRAE, representing ASHRAE (cbarbaree@ashrae.org) requests As Modified by This Public Comment

Modify as follows:

2018 International Mechanical Code

REFRIGERANT CONCENTRATION LIMIT (REFRIGERANT) (RCL) The refrigerant concentration limit, in air, intended to reduce the risks of acute toxicity, asphyxiation, and flammability hazards in normally occupied, enclosed spaces.

SECTION 1103 REFRIGERATION SYSTEM CLASSIFICATION

1103.1 Refrigerant classification.

Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Each refrigerant shall be assigned to one of the following refrigerant safety group classifications: A1, A2L, A2, A3, B1, B2L, B2, or B3. For refrigerants that do not have values in Table 1103.1, the safety group, RCL value, and OEL value shall be determined in accordance with ASHRAE 34 and approved.

TABLE 1103.1

REFRIGERANT CLASSIFICATION, AMOUNT AND OEL

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- For installations that are entirely outdoors, use 3-1-0.
- Class I ozone depleting substance; prohibited for new installations.
- Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

SECTION 1104 SYSTEM APPLICATION REQUIREMENTS

1104.3 Refrigerant restrictions.

Refrigerant applications, maximum quantities and use shall be restricted in accordance with Sections 1104.3.1 through 1104.3.4.

1104.3.1 Air-conditioning for human comfort.

In other than industrial occupancies where the quantity in a single independent circuit does not exceed the amount in Table 1103.1, Group B1, B2, B2L and B3 refrigerants shall not be used in high-probability systems for air-conditioning for human comfort. Refrigerating systems containing Group A2L refrigerants shall comply with Section 1104.3.1.1.

1104.3.1.1 Group A2L Refrigerants.

High-probability systems using Group A2L refrigerants for human comfort applications shall comply with Sections 1104.3.1.1.1 through 1104.3.1.1.4. Nonoccupiable spaces with refrigerant containing equipment, including piping, shall comply with the amounts indicated in Table 1103.1, except as permitted by Section 1104.3.1.1.3.

1104.3.1.1.1 Listing and Installation Requirements.

Where required per Section 1104.3.1.1, refrigerating systems shall be listed, labeled, and installed in accordance with the manufacturer's instructions, and any markings on the equipment restricting the installation. The nameplate shall include a symbol indicating that a flammable refrigerant is used, as specified by the product listing. A label indicating that a flammable refrigerant is used shall be placed adjacent to service ports and other locations where service involving components containing refrigerant is performed, as specified by the product listing. A refrigerant detector shall be provided in accordance with Section 1104.3.1.1.4 where ~~one or more of any of~~ the following conditions ~~are met~~ apply:

1. ~~1.~~ For Commercial, Public Assembly and Large Mercantile occupancies where the refrigerant charge of any independent circuit exceeds ~~22 lb (10 kg)~~.
2. ~~2.~~ For Institutional and Residential occupancies where ~~0.212 X LFL (lb) where LFL is in lb/1000 ft³ (6 X LFL (kg) where LFL is in KG/m³) unless the concentration of refrigerant in a complete discharge from any independent circuit will not exceed 50% of the RCL.~~
3. ~~2.~~ For Institutional occupancies.
4. ~~3.~~ For residential occupancies, where the refrigerant charge of any independent circuit exceeds ~~6.6 lb (3 kg)~~ ~~0.212 x LFL where LFL is in lb/1000 ft³ (6 x LFL where LFL is in kg/m³)~~.
5. ~~3-4.~~ Where using the provisions of Section 1104.3.1.1.3.
6. ~~4-5.~~ Where a refrigerant detector is required by the product listing.

~~When the refrigerant detector senses a rise in refrigerant concentration above the value specified in Section 1104.3.1.1.4, all of the following shall apply:~~

1. ~~1. A minimum flow rate of supply air shall be provided in accordance with the following equation: $Q \geq 1001 \times M / LFL$, (for SI: $Q \geq 60000 \times M / LFL$), where Q is the supply air flow rate ft³/min (m³/h), M is the refrigerant charge lb (kg), and LFL is the lower flammability limit lb per 1000 ft³ (g/m³).~~
2. ~~2. The compressor and all other electrical devices shall be turned off, excluding the control power transformers, control systems, and the supply air fan. The supply air fan shall continue to operate for not less than 5 minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 1104.3.1.1.4.~~
3. ~~3. Any device that controls air flow located within the product or in duct work that supplies air to the occupied space shall be fully opened. Any device that controls air flow shall be listed.~~
4. ~~4. Heaters and electrical devices located in the ductwork shall be turned off~~

1104.3.1.1.1 Detector activation.

When the refrigerant detector senses a rise in refrigerant concentration above the value specified in Section 1104.3.1.1.4, all of the following shall apply:

1. 1. A minimum flow rate of supply air shall be provided in accordance with the following equation: $Q \geq 1001 \times M / LFL$, (for SI: $Q \geq 60000 \times M / LFL$), where Q is the supply air flow rate ft³/min (m³/h), M is the refrigerant charge lb (kg), and LFL is the lower flammability limit lb per 1000 ft³ (kg/m³).
2. 2. The compressor and all other electrical devices shall be turned off, excluding the control power transformers, control systems, and the supply air fan. The supply air fan shall continue to operate for not less than 5 minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 1104.3.1.1.4.
3. 3. Any device that controls air flow located within the product or in duct work that supplies air to the occupied space shall be fully opened. Any device that controls air flow shall be listed.
4. 4. Heaters and electrical devices located in the ductwork shall be turned off. The heaters and electrical devices shall remain off for not less than 5 minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 1104.3.1.1.4.

1104.3.1.1.2 Ignition Sources.

Open flame-producing devices shall not be permanently installed in the ductwork that serves the space. Continuously operating hot surfaces exceeding ~~4292~~ 1290°F (700°C) shall not be located within the ductwork that serves the space unless there is an airflow of not less than 200 feet per minute (1 m/s) across the heating device(s) and there is proof of airflow before the heating device(s) is energized. Unclassified electrical devices shall not be located within the ductwork that serves the space.

1104.3.1.1.3 Refrigerant Containing Equipment Located Indoors.

For refrigeration compressors and pressure vessels located in an indoor space that is accessible only during service and maintenance it shall be permissible to exceed the amounts indicated in Table 1103.1 where all of the following conditions apply:

Exceptions:

1. The largest single circuit charge does not exceed 6.6 lb (3 kg) for Residential and Institutional occupancies, and does not exceed 22 lb (10 kg) for [Commercial, Public Assembly and Large Mercantile occupancies](#).
2. The space where compressors and pressure vessels are located is provided with an air distribution system in accordance with the following equation: $Q \geq 4004 \frac{1000}{M} \times M / LFL$, (for SI: $Q \geq 60000 \times M / LFL$), where Q is the supply air flow rate ft³/min (m³/h), M is the refrigerant charge lb (kg), and LFL is the lower [flammable flammability](#) limit lb per 1000 ft³ (g/m³).
3. ~~Exhaust air is removed from the air distribution system at a minimum rate of 4 air changes per hour and the~~ [The air distribution](#) system has provisions for makeup air. Exhaust air that is removed from the air distribution system is either discharged outside of the building envelope, or discharged to an indoor space, provided that the refrigerant concentration will not exceed the amount indicated in Table 1103.1.
4. 1104.3.1.1.4.tribution system is started when the refrigerant detector senses refrigerant in accordance with Section 1104.3.1.1.4. The location of the refrigerant detector is in accordance with Section 1104.3.1.1.4. The air distribution system continues to operate for not less than 30 minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 1104.3.1.1.4 (1.).
5. accumulate. for return air to the air distribution system is located where refrigerant from a leak is expected to accumulate. The inlet elevation is within 12 inches (30 cm) of the lowest elevation in the space where the compressor or pressure vessel is located.
6. In addition to the requirements of Section 1104.3.1.1.2 there are no open flame producing devices [that do not contain a flame arrestor](#) or continuously operating hot surfaces exceeding 1292°F (700°C) that are located within space where the equipment is installed.

1104.3.1.1.4 Refrigerant Detectors.

1. Refrigerant detectors shall comply with all of the following:
2. 1. The refrigerant detector set point to activate the functions required by Section 1104.3.1.1.1 [1](#) and [1104.3.1.1.3](#) shall be at a value not exceeding 25% of the lower [flammable flammability](#) limit (LFL).
3. 2. One or more refrigerant detectors shall be located such that refrigerant will be detected if the refrigerating system is operating, or not operating. For refrigerating systems that are connected to the occupied space through ductwork, refrigerant detectors shall be located within the listed equipment. For refrigerating systems that are directly connected to the occupied space without ductwork, the refrigerant detector shall be located in the equipment, or shall be located in the occupied

- space at a height of not more than 12 inches (30 cm) above the floor and within a horizontal distance of not more 3.3 ft (1.0 m) with a direct line of sight of the unit.
4. 3. The refrigerant detector as installed, including any sampling tubes, shall cause the functions required by Section 1104.3.1.1.1 within a time not to exceed ~~40~~ 15 seconds, ~~after exposure to a~~ when a refrigerant concentration ~~exceeding~~ exceeds 25% of the LFL.
 5. 4. The refrigerant detector shall provide a means for automatic operational self-test as provided in the product listing. Use of a refrigerant test gas is not required. If a failure is detected, a trouble alarm shall be activated and the actions required by Section 1104.3.1.1.1 shall be initiated.
 6. 5. The refrigerant detector shall be tested during installation to verify the alarm set point and response time as required by Section 1104.3.1.1.4 items 1 and 3. After installation, the refrigerant detector shall be tested to verify the alarm set point and response time annually or at an interval not exceeding the manufacturer's installation instructions, whichever is less.

Commenter's Reason:

During the first hearing ASHRAE requested that this change be rejected since the ASHRAE 15 Committee (SSPC 15) was still finalizing the requirements of Addendum d to ASHRAE 15 regarding the use of Group A2L refrigerants for high probability systems for human comfort. This proposed modification reflects the changes made by the Committee to ASHRAE 15 regarding A2L refrigerants. The acceptance of this change will result in the Mechanical Code being consistent with ASHRAE 15. It will also allow the expanded use of low global warming potential refrigerants.

The only definition included in this modification is the addition of the term, "REFRIGERANT CONCENTRATION LIMIT (REFRIGERANT) (RCL)" and revision to the term "Refrigerant Safety Classification". These two definitions are required by this change proposal. The other definitions in the original M88 are not absolutely required by this proposal, and were already added to the code in code change proposal M4-18, which was recommended for approval by the Committee.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change would allow the use of A2L refrigerants in high probability systems. This is an option, not a requirement. Hence, there is no increase or decrease in the cost of construction.

Proponent: Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration
(jeff.shapiro@intlcodeconsultants.com)

2018 International Mechanical Code

Revise as follows:

1101.1 Scope. This chapter shall govern the design, installation, construction and repair of refrigeration systems that vaporize and liquefy a fluid during the refrigerating cycle. ~~Refrigerant piping design and installation, including pressure vessels and pressure relief devices, shall conform to this code.~~ Permanently installed refrigerant storage systems and other components shall be considered as part of the refrigeration system to which they are attached.

Add new text as follows:

1101.1.1 Refrigerants other than ammonia. Refrigerant piping design and installation, including pressure vessels and pressure relief devices, for systems containing a refrigerant other than ammonia shall comply with this chapter and ASHRAE 15.

1101.1.2 Ammonia refrigerant. Refrigeration systems using ammonia as the refrigerant shall comply with IAR 2, IAR 3, IAR 4 and IAR 5, and shall not be required to comply with this chapter.

Delete without substitution:

~~**1101.6 General.** Refrigeration systems shall comply with the requirements of this code and, except as modified by this code, ASHRAE 15. Ammonia refrigerating systems shall comply with this code and, except as modified by this code, ASHRAE 15, IAR 2, IAR 3, IAR 4 and IAR 5.~~

Revise as follows:

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. ~~For installations that are entirely outdoors, use 3-1-0.~~ The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.
- f. ~~The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to rooms and spaces that: are within industrial occupancies; contain a refrigerant evaporator; are maintained at temperatures below 68°F (20°C); and are used for manufacturing, food and beverage preparation, meat cutting, other processes and storage. Where a machinery room would otherwise be required by Section 1104.2, a machinery room shall not be required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.

Exceptions Exception:

1. Refrigerant detectors are not required in unoccupied areas that contain only continuous piping that does not include valves, valve assemblies, equipment, or equipment connections.
2. ~~Where approved alternatives are provided, refrigerant detectors for ammonia refrigeration are not required for rooms or areas that are always occupied, and for rooms or areas that have high humidity or other harsh environmental conditions that are incompatible with detection devices.~~
4. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.4).
5. All electrical *equipment* and appliances conform to Class 1, Division 2, *hazardous location* classification requirements of NFPA 70 where the quantity of any Group A2, B2, A3 or B3 refrigerant ; ~~other than ammonia~~, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space.
6. All refrigerant-containing parts in systems with a total connected compressor power exceeding 100 horsepower (hp) (74.6 kW) except evaporators used for refrigeration or dehumidification, condensers used for heating, control and pressure relief valves for either, low-probability pumps and connecting piping are located either outdoors or in a *machinery room*.

1104.3.3 All occupancies. The total of all Group A2, B2, A3 and B3 refrigerants ~~other than R-717, ammonia~~, shall not exceed 1,100 pounds (499 kg) except where *approved*.

1104.3.4 Protection from refrigerant decomposition. Where any device having an open flame or surface temperature greater than 800°F (427°C) is used in a room containing more than 6.6 pounds (3 kg) of refrigerant in a single independent circuit, a hood and exhaust system shall be provided in accordance with Section 510. Such exhaust system shall exhaust *combustion* products to the outdoors.

Exception: A hood and exhaust system shall not be required where any of the following apply:

1. The refrigerant is R-~~717~~, R- 718 or R-744.
2. The *combustion* air is ducted from the outdoors in a manner that prevents leaked refrigerant

from being combusted.

1105.6.3 Ventilation rate. ~~For other than ammonia systems, the mechanical~~ Mechanical ventilation systems shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions, as required by Sections 1105.6.3.1 and 1105.6.3.2. ~~The minimum required emergency ventilation rate for ammonia shall be 30 air changes per hour in accordance with IIAR2.~~ Multiple fans or multispeed fans shall be allowed to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.

Delete without substitution:

~~**1105.8 Ammonia discharge.** Pressure relief valves for ammonia systems shall discharge in accordance with ASHRAE 15.~~

Revise as follows:

[F] 1105.9 Emergency pressure control system. ~~Permanently installed refrigeration systems containing more than 6.6 pounds (3 kg) of flammable, toxic or highly toxic refrigerant or ammonia~~ Emergency pressure control systems shall be provided ~~with an emergency pressure control system~~ in accordance with Section 605.10 of the International Fire Code.

Delete without substitution:

~~**1106.3 Ammonia room ventilation.** Ventilation systems in ammonia machinery rooms shall be operated continuously at the ventilation rate specified in Section 1105.6.3.~~

Exceptions:

- ~~1. Machinery rooms equipped with a vapor detector that will automatically start the ventilation system at the ventilation rate specified in Section 1105.6.3, and that will actuate an alarm at a detection level not to exceed 1,000 ppm.~~
- ~~2. Machinery rooms conforming to the Class 1, Division 2, hazardous location classification requirements of NFPA 70.~~

Revise as follows:

1106.4 Flammable refrigerants. Where refrigerants of Groups A2, A3, B2 and B3 are used, the *machinery room* shall conform to the Class 1, Division 2, *hazardous location* classification requirements of NFPA 70.

Exceptions-Exception:

- ~~1. Ammonia machinery rooms that are provided with ventilation in accordance with Section 1106.3.~~
2. Machinery rooms for systems containing Group A2L refrigerants that are in accordance with Section 1106.5.

1108.2 Test gases. Tests shall be performed with an inert dried gas including, but not limited to, nitrogen and carbon dioxide. Oxygen, air, combustible gases and mixtures containing such gases shall not be used.

~~**Exception:** The use of air is allowed to test R-717, ammonia, systems provided that they are subsequently evacuated before charging with refrigerant.~~

Reason:

IIAR is an ANSI accredited standards developer with a complete suite of standards to regulate ammonia refrigeration from initial design through decommissioning of systems. IIAR standards adopted by the IMC and IFC comprehensively regulate ammonia refrigeration, and there is no need to continue the complexity of overlapping requirements in the IMC.

When IIAR 2 was completely rewritten in 2014 to become both a code and a standard, a gap analysis was performed with the IMC and other model codes to confirm or facilitate alignment. The resulting IIAR 2 became a comprehensive document, intended to function as a standalone design regulation without reliance on a mechanical code. This is particularly valuable to jurisdictions in the U.S. and abroad that do not adopt a mechanical code.

A similar change was approved for the 2018 Uniform Mechanical Code. The 2018 UMC no longer covers ammonia refrigeration, instead deferring to IIAR standards. Likewise, ASHRAE is processing Addendum A to ASHRAE 15,

which deletes ammonia refrigeration requirements from that standard.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

IIAR standards are already adopted by the IMC, and thereby, compliance with these standards is already required. Deferral of ammonia systems to IIAR 2 will reduce the complexity of overlapping regulations and should not impact cost of construction.

Internal ID: 1190

Public Hearing Results

Committee Action:

As Submitted

Committee Reason:

Approval was based on the proponent's published reason statement. (Vote 11-0)

Assembly Action:

None

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- a. aDegrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. ~~For installations that are entirely outdoors, use 3-1-0. The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

Commenter's Reason:

This change proposal needs to be correlated with M88-18, M97-18, and M98-18, to reflect changes to the refrigerant flammability classifications published in Addendum G to ASHRAE Standard 34-2016, namely that 2L is no longer a sub-class of Class 2, making Class 2L its own class.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This update to reflect current safety classification of refrigerants does not impose any cost changes.

M93-18

M95-18

IMC: 1101.2, Table Table 1101.2, UL

Proposed Change as Submitted

Proponent: Jonathan Roberts, UL LLC, representing UL LLC (jonathan.roberts@ul.com)

2018 International Mechanical Code

Revise as follows

1101.2 Factory-built equipment and appliances. *Listed and labeled* self-contained, factory-built *equipment and appliances* shall be tested in accordance with ~~UL 207, 412, 471 or 1995~~ the applicable standards specified in Table 1101.2. Such *equipment and appliances* are deemed to meet the design, manufacture and factory test requirements of this code if installed in accordance with their listing and the manufacturer's instructions.

Add new text as follows

**Table 1101.2
Factory-built equipment and appliances**

<u>EQUIPMENT</u>	<u>STANDARD</u>
<u>Refrigeration fittings, including press-connect, flared, and threaded</u>	<u>UL 109 and UL 207</u>
<u>Air conditioning equipment</u>	<u>UL 1995 or UL/CSA 60335-2-40</u>
<u>Packaged terminal air conditioners</u>	<u>UL 484 or UL/CSA 60335-2-40</u>
<u>Split-system air conditioners</u>	<u>UL 1995 or UL/CSA 60335-2-40</u>
<u>Dehumidifiers</u>	<u>UL 474 or UL/CSA 60335-2-40</u>
<u>Unit coolers</u>	<u>UL 412 or UL/CSA 60335-2-89</u>
<u>Commercial refrigerators, freezers, beverage coolers, and walk-in coolers</u>	<u>UL 471 or UL/CSA 60335-2-89</u>
<u>Refrigerating units and walk-in coolers</u>	<u>UL 427 or UL 60335-2-89</u>
<u>Refrigerant-containing components and accessories</u>	<u>UL 207</u>

Add new standard(s) follows

UL LLC
333 Pfcngsten Road
Northbrook IL 60062-2096

109-97:

Tube Fittings for Flammable and Combustible Fluids, Refrigeration Service and Marine Use
427-11:

Standard for Refrigerating Units
474-15:

Standard for Dehumidifiers
484-14:

Standard for Room Air Conditioners
60335-2-89-17:

Household and Similar Electrical Appliances - Safety - Part 2-89: Particular Requirements for Commercial Refrigerating Appliances with an Incorporated or Remote Refrigerant Unit or Compressor
UL/CSA 60335-2-40 -17:

Household and Similar Electrical Appliances - Safety - Part 2-40: Particular Requirements for Electrical Heat Pumps, Air-Conditioners and Dehumidifiers.

Reason: Establishing a table to identify the standards that apply to the various types of equipment and appliances will assist in uniform application of this code requirement. Adding UL 109, UL 427, UL 474, UL 484, UL 60335-2-89, and UL 60335-2-40, which are standards used in testing and listing refrigeration equipment, will make the code complete.

Cost Impact: The code change proposal will decrease the cost of construction
Reduce costs by providing clarity

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

M95-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: EQUIPMENT STANDARDS

Refrigeration fittings, including press-connect, flared, and threaded	UL 109 and UL 207
Air conditioning equipment 40	UL 1995 or UL/CSA 60335-2-
Packaged terminal air conditioners <u>and heat pumps</u>	UL 484 or UL/CSA 60335-2-40
Split-system air conditioners <u>and heat pumps</u>	UL 1995 or UL/CSA 60335-2-40
Dehumidifiers 40	UL 474 or UL/CSA 60335-2-
Unit coolers 89	UL 412 or UL/CSA 60335-2-
Commercial refrigerators, freezers, beverage coolers, and walk-in coolers	UL 471 or UL/CSA 60335-2-89
Refrigerating units and walk-in coolers	UL 427 or UL 60335-2-89
Refrigerant-containing components and accessories	UL 207

Committee Reason: This cleans up the table and adds current standards. The modification adds heat pumps. (Vote 11-0)

Assembly Action:

None

M95-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (JBEngineer@aol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

UL

UL LLC
333 Pvingsten Road
Northbrook IL 60062-2096

**Table 1101.2
Factory-built equipment and appliances**

EQUIPMENT	STANDARD
Refrigeration fittings, including press-connect, flared, and threaded	UL 109 and UL 207
Air conditioning equipment	UL 1995 or UL/CSA 60335-2-40
Packaged terminal air conditioners	UL 484 or UL/CSA 60335-2-40
Split-system air conditioners	UL 1995 or UL/CSA 60335-2-40
Dehumidifiers	UL 474 or UL/CSA 60335-2-40
Unit coolers	UL 412 or UL/CSA 60335-2-89
Commercial refrigerators, freezers, beverage coolers, and walk-in coolers	UL 471 or UL/CSA 60335-2-89
Refrigerating units and walk-in coolers	UL 427 or UL 60335-2-89
Refrigerant-containing components and accessories	UL 207

1101.2 Factory-built equipment and appliances. *Listed and labeled* self-contained, factory-built *equipment* and appliances shall be tested in accordance with the applicable standards specified in Table 1101.2. Such *equipment* and appliances are deemed to meet the design, manufacture and factory test requirements of this code if installed in accordance with their listing and the manufacturer's instructions.

Commenter's Reason: The line on refrigerant fittings is unnecessary with the revised piping section proposed in M99. All of the appropriate standards are listed in M99 more specifically to their application.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This is an editorial change regarding the location of the reference standards. As such, there is no impact to the cost of construction.

M95-18

M96-18

IMC: 1104.2, 1104.2.1, 1104.3.1, 1104.3.2

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (JBEngineer@aol.com)

2018 International Mechanical Code

Revise as follows

1104.2 Machinery room. Except as provided in Sections 1104.2.1 and 1104.2.2, all components containing the refrigerant shall be located either outdoors or in a *machinery room* where the quantity of refrigerant in an independent circuit of a system exceeds the amounts shown in Table 1103.1. For refrigerant blends not listed in Table 1103.1, the same requirement shall apply where the amount for any blend component exceeds that indicated in Table 1103.1 for that component. This requirement shall also apply where the combined amount of the blend components exceeds a limit of 69,100 parts per million (ppm) by volume. Machinery rooms required by this section shall be constructed and maintained in accordance with Section 1105 for Group A1 and B1 refrigerants and in accordance with Sections 1105 and 1106 for Group A2L, A2, B2L, B2, A3 and B3 refrigerants.

Exceptions:

1. Machinery rooms are not required for *listed equipment* and appliances containing not more than 6.6 pounds (3 kg) of refrigerant, regardless of the refrigerant's safety classification, where installed in accordance with the equipment's or appliance's listing and the *equipment* or *appliance* manufacturer's installation instructions.
2. Piping in conformance with Section 1107 is allowed in other locations to connect components installed in a *machinery room* with those installed outdoors.

1104.2.1 Institutional occupancies. The amounts shown in Table 1103.1 shall be reduced by 50 percent for all areas of institutional occupancies except kitchens, laboratories and mortuaries. The total of all Group A2, B2L, B2, A3 and B3 refrigerants shall not exceed 550 pounds (250 kg) in occupied areas or machinery rooms.

1104.3.1 Air-conditioning for human comfort. In other than industrial occupancies where the quantity in a single independent circuit does not exceed the amount in Table 1103.1, Group B1, B2L, B2 and B3 refrigerants shall not be used in high-probability systems for air-conditioning for human comfort.

1104.3.2 Nonindustrial occupancies. Group A2 and B2L, B2 refrigerants shall not be used in high-probability systems where the quantity of refrigerant in any independent refrigerant circuit exceeds the amount shown in Table 1104.3.2. Group A3 and B3 refrigerants shall not be used except where *approved*.

Exception: This section does not apply to laboratories where the floor area per occupant is not less than 100 square feet (9.3 m²).

Reason: ASHRAE 34 changed the classification of refrigerants. Two new groups were added, A2L and B2L. Previously, these types of refrigerants were subclasses of A2 and B2 respectively. With the change in designation, these sections needs to be updated to reflect the additional classifications of refrigerants. Both A2L and B2L refrigerants are flammable, however, they have a lower burning velocity. A2L refrigerants are used in high probability systems, whereas, B2L refrigerants are not.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change reflect the change in classification of refrigerants.

M96-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal is not ready because the ASHRAE standard is still under development. Piecemeal fixes are premature. A public comment is encouraged after the ASHRAE work is complete. (Vote 10-1)

Assembly Action:

None

M96-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (jbenigneer@aol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

1104.2 Machinery room. Except as provided in Sections 1104.2.1 and 1104.2.2, all components containing the refrigerant shall be located either outdoors or in a *machinery room* where the quantity of refrigerant in an independent circuit of a system exceeds the amounts shown in Table 1103.1. For refrigerant blends not listed in Table 1103.1, the same requirement shall apply where the amount for any blend component exceeds that indicated in Table 1103.1 for that component. This requirement shall also apply where the combined amount of the blend components exceeds a limit of 69,100 parts per million (ppm) by volume. Machinery rooms required by this section shall be constructed and maintained in accordance with Section 1105 for Group A1 and B1 refrigerants and in accordance with Sections 1105 and 1106 for Group A2L, A2, B2L, B2, A3 and B3 refrigerants.

Exceptions:

1. Machinery rooms are not required for *listed equipment* and appliances containing not more than 6.6 pounds (3 kg) of refrigerant, regardless of the refrigerant's safety classification, where installed in accordance with the equipment's or appliance's listing and the *equipment or appliance* manufacturer's installation instructions.
2. Piping in conformance with Section 1107 is allowed in other locations to connect components installed in a *machinery room* with those installed outdoors.

1104.3.2 Nonindustrial occupancies. Group A2 ~~and B2L~~, and B2 refrigerants shall not be used in high-probability systems where the quantity of refrigerant in any independent refrigerant circuit exceeds the amount shown in Table 1104.3.2. Group A3 and B3 refrigerants shall not be used except where *approved*.

Exception: This section does not apply to laboratories where the floor area per occupant is not less than 100 square feet (9.3 m²).

Commenter's Reason: This is a companion change to M88-18 and the new definitions added in M4-18. There are locations within the chapter where A2L and B2L need to be added to the text. Otherwise, the new classification will fall through the cracks. The change on nonindustrial occupancies did not list B2L correctly. Previous modification proposed to Section 1104.2.1 and 1104.3.1 are not included in this modification since they are addressed in the Public Comment to M88-18.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. This change is editorial in nature adding the refrigerant classification to the current code based on changes to ASHRAE 34.

M96-18

M97-18

IMC: TABLE 1103.1

Proponent: Julius Ballanco, representing Daikin US (JBENGINEER@aol.com)

2018 International Mechanical Code

Revise as follows:

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283m³

- a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.
- b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.
- c. For installations that are entirely outdoors, use 3-1-0.
- d. Class I ozone depleting substance; prohibited for new installations.
- e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.
- f. ~~The ASHRAE Standard 34 flammability classification for this refrigerant is 2L, which is a subclass of Class 2.~~

Reason:

ASHRAE 34 changed the classification of refrigerants. Two new groups were added, A2L and B2L. Previously, these types of refrigerants were subclasses of A2 and B2 respectively. With the change in designation, the table needs to be updated to reflect the appropriate classification. Additionally, note f no longer applies.

Cost Impact

The code change proposal will not increase or decrease the cost of construction .

This only changes the classification of existing refrigerants.

Internal ID: 1075

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There may be equipment listed for use with A2L refrigerants, but that doesn't mean that the equipment is safe. This proposal might lose some safety requirements. (Vote 11-0)

Assembly Action:

None

M97-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (jbenigneer@aol.com)requests As Submitted.

Commenter's Reason: This Public Comment is being submitted in the event that M88-18 is not approved as amended by the membership. If M88-18 is approved as amended, this code change will be withdrawn. The changes to this table are identical to the changes found in M88-18, however, M88-18 is tied to the acceptance of Group A2L refrigerants for high probability system for comfort cooling. The code already has separate requirements for A2L refrigerants for use in machinery rooms. Hence, the table needs to be properly updated.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This change modifies the listing for A2L refrigerants. This is editorial in nature based on changes to ASHRAE 34.

Public Comment 2:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org)requests As Submitted.

Commenter's Reason: Appendix G to ASHRAE Standard 34-2016 has been published, making 2L a class rather than a sub-class. Proposal M97-18 is contingent on acceptance and approval of either F79-18 or M88-18, and also M98-18.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
The proposal only changes the classification of existing refrigerants.

M97-18

M98-18

IMC: 1103.1

Proposed Change as Submitted

Proponent: Julius Ballanco, representing Daikin US (JBENGINEER@aol.com)

2018 International Mechanical Code

Revise as follows

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Each refrigerant shall be assigned to a single group of refrigerants. The group of refrigerants shall be A1, A2L, A2, A3, B1, B2L, B2, and B3.

Reason: This proposed change adds general requirements found in ASHRAE 34. This added text will assist the code official in understanding how refrigerants are classified into a specific group of refrigerants. It will also make it clear to the code official that a refrigerant can only fall within one group of refrigerants.

ASHRAE 34 approved a change making A2L and B2L full groups of refrigerants. Previously, A2L was a subgroup of A2 and B2L was a subgroup of B2 refrigerants.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change only impacts the classification of refrigerants.

M98-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There needs to be more industry consensus. We should not jump ahead without being certain. Service personnel are afraid of the risks. ASHRAE needs to complete its work. (Vote 11-0)

Assembly Action:

None

M98-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Each refrigerant shall be assigned to a single safety group of refrigerants. The ~~group of refrigerants~~ refrigerant safety groups shall be A1, A2L, A2, A3, B1, B2L, B2, and B3.

Commenter's Reason: Appendix G to ASHRAE Standard 34-2016 has been published, making 2L a class rather than a sub-class. Proposal M98-18 is contingent on acceptance and approval of either F79-18 or M88-18, and also M97-18.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

A change in the safety groups will not impact construction cost.

Public Comment 2:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (jbenigneer@aol.com) requests As Submitted.

Commenter's Reason: This Public Comment is being submitted in the event that M88-18 is not approved as amended by the membership. If M88-18 is approved as amended, this code change will be withdrawn. The change to this section is identical to the change found in M88-18, however, M88-18 is tied to the acceptance of Group A2L refrigerants for high probability system for comfort cooling. The code already has a new definition of refrigerants, hence this section clarifies the different groups of refrigerants. Furthermore, Group A2L refrigerants are already identified in the code for use in machinery rooms.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change is editorial in nature. It will properly identify the refrigerant types in accordance with the change made to ASHRAE 34.

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (Chair, Refrigerant Piping Committee) (JBENGINEER@aol.com)

2018 International Mechanical Code

Delete and substitute as follows

~~SECTION 1107 REFRIGERANT PIPING~~

SECTION 1107 PIPING MATERIAL

1107.1 Piping. Refrigerant piping material for other than R-717 (ammonia) systems shall conform to the requirements in this section.

Piping material and installations for R-717 (ammonia) refrigeration systems shall comply with IAR 2.

1107.2 Used Materials. Used pipe, fittings, valves and other materials that are to be reused shall be clean and free of foreign materials and shall be approved for reuse.

1107.3 Material rating. Materials, joints and connections shall be rated for the operating temperature and pressure of the refrigerant system. Materials shall be suitable for the type of refrigerant and type of lubricant in the refrigerant system. Magnesium alloys shall not be used in contact with any halogenated refrigerants. Aluminum, zinc, magnesium, and their alloys shall not be used in contact with R-40 (methyl chloride).

1107.4 Piping materials standards. Refrigerant pipe shall conform to one or more of the standards listed in Table 1107.4. The exterior of the pipe shall be protected from corrosion and degradation.

**TABLE 1107.4
REFRIGERANT PIPE**

<u>Piping Material</u>	<u>Standard (See Chapter 15)</u>
<u>Aluminum Tube</u>	<u>ASTM B210, ASTM B210M, ASTM B491/B491M</u>
<u>Brass (Copper Alloy) Pipe</u>	<u>ASTM B43</u>
<u>Copper Pipe</u>	<u>ASTM B42, ASTM B302</u>
<u>Copper Tube^a</u>	<u>ASTM B68, ASTM B75, ASTM B88, ASTM B280, ASTM B819</u>
<u>Copper Linesets</u>	<u>ASTM B1003, ASTM B280</u>
<u>Steel Pipe^b</u>	<u>ASTM A53, ASTM A106</u>
<u>Steel Tube</u>	<u>ASTM A254, ASTM A334</u>

a. Soft annealed copper tubing larger than 1 $\frac{3}{8}$ in. (35 mm) O.D. shall not be used for field assembled refrigerant piping, unless it is protected from mechanical damage.

b. ASTM A53, Type F steel pipe shall not be used for refrigerant lines having an operating temperature less than -20°F (-29°C).

1107.4.1 Steel pipe Group A2, A3, B2, and B3. The minimum weight of steel pipe for Group A2, A3, B2, and B3 refrigerants shall be Schedule 80 for sizes 1-1/2 inch or less in diameter.

1107.5 Pipe fittings. Refrigerant pipe fittings shall be approved for installation with the piping materials to be installed, and shall conform to one of more of the standards listed in Table 1107.5 or shall be listed and labeled as complying with UL 207.

**TABLE 1107.5
REFRIGERANT PIPE FITTINGS**

Fitting Material	Standard (See Chapter 15)
Aluminum	ASTM B361
Brass (Copper Alloy)	ASME B16.15, ASME B16.24
Copper	ASME B16.15, ASME B16.18, ASME B16.22, ASME B16.24, ASME B16.26, ASME B16.50
Steel	ASTM A105, ASTM A181, ASTM A193, ASTM A234, ASTM A420, ASTM A707

1107.5.1 Copper brazed field swaged.. The minimum and maximum cup depth of field fabricated copper brazed swaged fitting connections shall comply with Table 1107.5.1.

**TABLE 1107.5.1
COPPER BRAZED SWAGED CUP DEPTHS**

Fitting Size (Inch)	Minimum Depth (Inch)	Maximum Depth (Inch)
1/8	0.15	0.23
3/16	0.16	0.24
1/4	0.17	0.26
3/8	0.20	0.30
1/2	0.22	0.33
5/8	0.24	0.36
3/4	0.25	0.38
1	0.28	0.42
1-1/4	0.31	0.47
1-1/2	0.34	0.51
2	0.40	0.60
2-1/2	0.47	0.71
3	0.53	0.80
3-1/2	0.59	0.89
4	0.64	0.96

1107.6 Valves. Valves shall be of materials that are compatible with the type of piping material, refrigerants, and oils in the system. Valves shall be listed and labeled and rated for the temperatures and pressures of the refrigerant systems in which the valves are installed.

1107.7 Flexible connectors, expansion and vibration compensators. Flexible connectors and expansion and vibration control devices shall be listed and labeled for use in refrigerant systems.

SECTION 1108 JOINTS AND CONNECTIONS

1108.1 Approval. joints and connections shall be of an approved type. Joints and connections shall be tight for the pressure of the refrigerant system when tested in accordance with Section 1110.

1108.1.1 Joints between different piping materials.. joints between different piping materials shall be made with approved adapter fittings. Joints between dissimilar metallic piping materials shall be made with a dielectric fitting or a dielectric union conforming to dielectric tests of ASSE 1079. Adapter fittings with threaded ends between different materials shall be joined with thread lubricant in accordance with Section 1108.3.4.

1108.2 Preparation of pipe ends. Pipe shall be cut square, reamed and chamfered, and shall be free of burrs and obstructions. Pipe ends shall have full-bore openings and shall not be undercut.

1108.3 Joint preparation and installation. Where required by Sections 1108.4 through 1108.9, the preparation and installation of brazed, flared, mechanical, press-connect, soldered, threaded and welded joints shall comply with Sections 1108.3.1 through 1108.3.5.

1108.3.1 Brazed joints. Joint surfaces shall be cleaned. An approved flux shall be applied where required by the braze filler metal manufacturer. The piping being brazed shall be purged of air to remove the oxygen and filled with one of the following inert gases: oxygen-free nitrogen, helium, or argon. The piping system shall be pre-purged with an inert gas for a minimum time corresponding to five volume changes through the piping system prior to brazing. The pre-purge rate shall be at a minimum velocity of 100 feet per minute. The inert gas shall be directly connected to the tube system being brazed to prevent the entrainment of ambient air. After the pre-purge, the inert gas supply shall be maintained through the piping during the brazing operation at a minimum pressure of 1.0 psi and a maximum pressure of 3.0 psi. The joint shall be brazed with a filler metal conforming to AWS A5.8.

1108.3.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

1108.3.2.1 Flared joints. Flared fittings shall be installed in accordance with the manufacturer's instructions. The flared fitting shall be used with the tube material specified by the fitting manufacturer. The flared tube end shall be made by a tool designed for that operation.

1108.3.2.2 Press-connect joints. Press-connect joints shall be installed in accordance with the manufacturer's instructions.

1108.3.3 Soldered joints.. Joint surfaces to be soldered shall be cleaned and a flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32. Solder joints shall be limited to refrigerant systems using Group A1 refrigerant and having a pressure of less than or equal to 200 psi.

1108.3.4 Threaded joints.. Threads shall conform to ASME B1.20.1, ASME B1.20.3, ASME B1.13M, or ASME B1.1. Thread lubricant, pipe-joint compound, or thread tape shall be applied on the external threads only and shall be approved for application on the piping material.

1108.3.5 Welded joints. Joint surfaces to be welded shall be cleaned by an approved procedure. Joints shall be welded with an approved filler metal.

1108.4 Aluminum tube. Joints between aluminum tubing or fittings shall be brazed, mechanical, press-connect, or welded joints conforming to Section 1108.3.

1108.5 Brass (copper alloy) pipe. Joints between brass pipe or fittings shall be brazed, mechanical, press-connect, threaded, or welded joints conforming to Section 1108.3.

1108.6 Copper pipe. Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, press-connect, soldered, threaded, or welded joints conforming to Section 1108.3.

1108.7 Copper tube. Joints between copper or copper-alloy tubing or fittings shall be brazed, flared, mechanical, press-connect, or soldered joints.

1108.8 Steel pipe. Joints between steel pipe or fittings shall be mechanical joints, threaded, press-connect, or welded joints conforming to Section 1108.3.

1108.9 Steel tube. Joints between steel tubing or fittings shall be flared, mechanical, press-connect, or welded joints conforming to Section 1108.3.

SECTION 1109 REFRIGERANT PIPE INSTALLATION

1109.1 General. Refrigerant piping installations, other than R-717 (ammonia) refrigeration systems, shall comply with the requirements of this section. The design of refrigerant piping shall be in accordance with ASME B31.5.

1109.2 Piping location. Refrigerant piping shall comply with the installation location requirements of Sections 1109.2.1 through 1109.2.6. Refrigerant piping for group A2L and B2L shall also comply with the requirements of Section 1109.3.

Refrigerant piping for group A2, A3, B2 and B3 shall also comply with the requirements of Section 1109.4.

1109.2.1 Minimum height.. Exposed refrigerant piping installed in open spaces that afford passage shall be not less than 7 feet 3 inches (2210 mm) above the finished floor.

1109.2.2 Refrigerant pipe enclosure. Refrigerant piping shall be protected by locating it within the building elements or within protective enclosures.

Exception: Piping protection within the building elements or protective enclosure shall not be required in any of the following locations:

1. Where installed without ready access or located more than 7 feet 3 inches (2210 mm) above the finished floor.
2. Where located within 6 feet (1830 mm) of the refrigerant unit or appliance.
3. Where located in a machinery room complying with Section 1105.

1109.2.3 Prohibited locations. Refrigerant piping shall not be installed in any of the following locations:

1. Exposed within a fire-resistance-rated exit access corridor.
2. Interior exit stairway.
3. Interior exit ramp.
4. Exit passageway, or
5. Elevator, dumbwaiter or other shaft containing a moving object.

1109.2.4 Piping in concrete floors. Refrigerant piping installed in concrete floors shall be encased in pipe, conduit, or ducts. The piping shall be protected to prevent damage from vibration, stress and corrosion.

1109.2.5 Refrigerant pipe shafts. Refrigerant piping that penetrates two or more floor/ceiling assemblies shall be enclosed in a fire-resistance-rated shaft enclosure. The fire-resistance-rated shaft enclosure shall comply with Section 713 of the International Building Code.

Exceptions:

1. For systems using R718 refrigerant.
2. Piping in a direct system using Group A1 refrigerant where the refrigerant quantity does not exceed the limits of Table 1103.1 for the smallest occupied space through which the piping passes.
2. Piping located on the exterior of the building where vented to the outdoors.

1109.2.6 Exposed piping surface temperature. Exposed piping with ready access having surface temperatures greater than 120°F (49°C) or less than 5°F (-15°C) shall be protected from contact or shall have thermal insulation that limits the exposed insulation surface temperature to a range of 5°F (-15°C) to 120°F (49°C).

1109.3 Installation requirements for A2L and B2L refrigerants. Piping systems using Group A2L or B2L refrigerant shall comply with the requirements of Sections 1109.3.1 through 1109.3.3.

1109.3.1 Pipe protection. In addition to the requirements of Section 305.5, aluminum, copper, and steel tube used for Group A2L and B2L refrigerants and located in concealed locations where tubing is installed in studs, joists, rafters or similar member spaces and located less than 1-1/2 inches (38 mm) from the nearest edge of the member, shall be continuously protected by shield plates. Protective steel shield plates having a minimum thickness of 0.0575 inch (1.463 mm) (No. 16 gage) shall cover the area of the tube plus the area extending not less than 2 inches beyond both sides of the tube..

1109.3.2 Shaft ventilation. Refrigerant pipe shafts with systems using Group A2L or B2L refrigerants shall be naturally or mechanically ventilated. The shaft ventilation exhaust outlet shall comply with Section 501.3.1. Naturally ventilated shafts shall have a pipe, duct, or conduit not less than 4 inches in diameter that connects to the lowest point of the shaft and extends to the outdoors. The pipe, duct, or conduit shall be level or pitched downward to the outdoors. Mechanically ventilated shafts shall have a minimum airflow velocity in accordance with Table 1109.3.2. The mechanical ventilation shall be continuously operated or activated by a refrigerant detector. Systems utilizing a refrigerant detector shall activate the mechanical ventilation at a maximum refrigerant concentration of 25 percent of the lower flammable limit of the refrigerant. The detector, or a sampling tube that draws air to the detector, shall be located in an area where

refrigerant from a leak will concentrate. The shaft shall not be required to be ventilated for double wall refrigerant pipe where the interstitial space of the double wall pipe is vented to the outdoors.

TABLE 1109.3.2
SHAFT VENTILATION VELOCITY

<u>Cross Sectional Area of Shaft (sq. in.)</u>	<u>Minimum Ventilation Velocity (feet per minute)</u>
<u>≤ 20</u>	<u>100</u>
<u>> 20 - ≤ 250</u>	<u>200</u>
<u>> 250 - ≤ 1250</u>	<u>300</u>
<u>> 1250</u>	<u>400</u>

1109.3.3 Pipe identification. Refrigerant pipe located in areas other than the room or space where the refrigerating equipment is located shall be identified. The pipe identification shall be located at intervals not exceeding 20 feet on the refrigerant piping or pipe insulation. The identification shall indicate the refrigerant designation and safety group classification of refrigerant used in the piping system. For Group B2L refrigerants the identification shall also include the following statement: "DANGER - Toxic Refrigerant." The minimum height of lettering of the identification label shall be ½ inch.

1109.4 Installation requirements for A2, A3, B2, and B3 refrigerants. Piping systems using Group A2, A3, B2, or B3 refrigerant shall comply with the requirements of Section 1109.4.1 through 1109.4.3.

1109.4.1 Piping material. Piping material for Group A2, A3, B2, or B3 refrigerant located inside the building, except for machinery rooms, shall be copper pipe, brass pipe, or steel pipe. Pipe joints located in areas other than the machinery room shall be welded. Self-contained listed and labeled equipment or appliances shall have piping material based on the listing requirements.

1109.4.3 Shaft ventilation. Refrigerant pipe shafts with systems using Group A2, A3, B2, or B3 refrigerants shall be continuously mechanically ventilated. The shaft ventilation exhaust outlet shall comply with Section 501.3.1. Mechanically ventilated shafts shall have a minimum airflow velocity as specified in Table 1109.3.2. The shaft shall not be required to be ventilated for double wall refrigerant pipe where the interstitial space of the double wall pipe is vented to the outdoors.

1109.4.3 Pipe identification.. Refrigerant pipe shall be identified with the refrigerant designation and safety group classification of refrigerant used in the piping system and the following statement: "DANGER - Risk of Fire or Explosion, Flammable Refrigerant." For Group B2 and B3 refrigerants the identification shall also include the following statement: "DANGER - Toxic Refrigerant." The identification shall be at intervals not exceeding 5 feet on the refrigerant piping or pipe insulation. The minimum height of lettering of the identification label shall be 1 inch.

1109.5 Refrigerant pipe penetrations. The annular space between the outside of a refrigerant pipe and the inside of a pipe sleeve or opening in a building envelope wall, floor, or ceiling assembly penetrated by a refrigerant pipe shall be sealed in an approved manner with caulking material, foam sealant or closed with a gasketing system. The caulking material, foam sealant or gasketing system shall be designed for the conditions at the penetration location and shall be compatible with the pipe, sleeve and building materials in contact with the sealing materials. Refrigerant pipes penetrating fire-resistance-rated assemblies or membranes of fire-resistance-rated assemblies shall be sealed or closed in accordance with Section 714 of the International Building Code.

1109.6 Stress and strain. Refrigerant piping shall be installed so as to prevent strains and stresses that exceed the structural strength of the pipe. Where necessary, provisions shall be made to protect piping from damage resulting from vibration, expansion, contraction, and structural settlement.

1109.7 Condensate control. Refrigerating piping and fittings that, during normal operation, will reach a surface temperature below the dew point of the surrounding air, and are located in spaces or areas where condensation has the potential to cause a safety hazard to the building occupants, structure, electrical equipment or any other equipment or appliances, shall be insulated or protected in an approved manner to prevent damage from condensation.

1109.8 Stop valves. Stop valves shall be installed in specified locations in accordance with Sections 1109.8.1 and 1109.8.2. Stop valves shall be supported in accordance with Section 1109.8.3 and identified in accordance with Section 1109.8.4.

Exceptions:

1. Systems that have a refrigerant pump out function capable of storing the entire refrigerant charge in a receiver or heat exchanger.
2. Systems that are equipped with provisions for pump out of the refrigerant using either portable or permanently installed refrigerant recovery equipment.
3. Self-contained listed and labeled systems.

1109.8.1 Refrigerating systems containing more than 6.6 pounds (3.0 kg) of refrigerant. Stop valves shall be installed in the following locations on refrigerating systems containing more than 6.6 pounds (3.0 kg) of refrigerant:

1. The suction inlet of each compressor, compressor unit or condensing unit.
2. The discharge outlet of each compressor, compressor unit or condensing unit.
3. The outlet of each liquid receiver.

1109.8.2 Refrigerating systems containing more than 100 pounds (45 kg) of refrigerant. In addition to stop valves required by Section 1109.8.1, systems containing more than 100 pound (45 kg) of refrigerant shall have stop valves installed in the following locations:

1. Each inlet of each liquid receiver.
2. Each inlet and each outlet of each condenser, where more than one condenser is used in parallel

Exceptions:

1. Stop valves shall not be required on the inlet of a receiver in a condensing unit, nor on the inlet of a receiver that is an integral part of the condenser.
2. Systems utilizing nonpositive displacement compressors.

1109.8.3 Stop valve support. Stop valves shall be supported to prevent detrimental stress and strain on the refrigerant piping system. The piping system shall not be utilized to support stop valves on copper tubing or aluminum tubing 1 inch (25.4 mm) OD or larger in diameter.

1109.8.4 Identification. Stop valves shall be identified where their intended purpose is not obvious. Where valves are identified by a numbering or lettering system, legend(s) or key(s) for the valve identification shall be located in the room containing the indoor refrigeration equipment. The minimum height of lettering of the identification label shall be ½ inch (12.7 mm).

SECTION 1108 FIELD TEST

1110 REFRIGERANT PIPING SYSTEM TEST

1110.1 General. Refrigerant piping systems, other than R-717 (ammonia) refrigeration systems, that are erected in the field, shall be pressure tested for strength and leak tested for tightness, in accordance with the requirements of this section, after installation and before being placed in operation. Tests shall include both the high and low-pressure sides of each system.

Exception: Listed and labeled equipment, including compressors, condensers, vessels, evaporators, gas bulk storage tanks, safety devices, pressure gauges and control mechanisms, shall not be required to be tested.

1110.2 Exposure of refrigerant piping system. Refrigerant pipe and joints installed in the field shall be exposed for visual inspection and testing prior to being covered or enclosed.

1110.3 Test gases. The medium used for pressure testing the refrigerant system shall be one of the following inert gases: oxygen-free nitrogen, helium, or argon. For R-744 refrigerant systems carbon dioxide shall be allowed as the test medium. For R-718 refrigerant systems water shall be allowed as the test medium. Oxygen, air, combustible gases and mixtures containing such gases shall not be used as test medium. Systems erected on the premises with tubing not exceeding 5/8 inch (15.8 mm) OD shall be allowed to use the refrigerant identified on the nameplate label or marking as the test medium.

1110.4 Test apparatus. The means used to pressurize the refrigerant piping system shall have on its outlet side, a test pressure measuring device and either a pressure-limiting device or a pressure-reducing device. The test pressure

measuring device shall have an accuracy of ±3 percent or less of the test pressure, and shall have a resolution of 5% or less of the test pressure.

1110.5 Piping system pressure test and leak test. The refrigerant piping system shall be tested as a whole or separate tests shall be conducted for the low pressure-side and high pressure-side of the piping system. The refrigerant piping system shall be tested in accordance with both of the following methods:

1. The system shall be pressurized for a period of not less than 60 minutes to not less than the lower of the design pressures or the setting of the pressure relief device(s). The design pressures for testing shall be the pressure listed on the label nameplate of the condensing unit, compressor, compressor unit, pressure vessel, or other system component with a nameplate. Additional test gas shall not be added to the system after the start of the pressure test. The system shall not show loss of pressure on the test pressure measuring device during the pressure test. Where using refrigerant as a test medium in accordance with Section 1110.3, the test pressure shall be not less than the saturation dew point pressure at 77°F (25°C).
2. A vacuum of 500 microns shall be achieved. After achieving a vacuum, the system shall be isolated from the vacuum pump. The system pressure shall not rise above 1500 microns for a period of not less than 10 minutes.

1110.5.1 Joints and refrigerant-containing parts in air ducts. Joints and all refrigerant-containing parts of a refrigerating system located in an air duct of an air-conditioning system that conveys conditioned air to and from human-occupied spaces shall be tested at a pressure of 150 percent of the higher of the design pressure or pressure relief device setting.

1110.5.2 Limited charge systems. Limited-charge systems with a pressure relief device, erected on the premises, shall be tested at a pressure not less than one and one-half times the pressure setting of the relief device. Listed and labeled limited charge systems shall be tested at the equipment or appliance design pressure.

1110.6 Booster compressor. Where a compressor protected by a pressure relief device is used as a booster to obtain an intermediate pressure and such compressor discharges into the suction side of another compressor, the booster compressor shall be considered to be a part of the low pressure side of the system.

1110.7 Centrifugal/nonpositive displacement compressors. Where testing systems using centrifugal or other nonpositive displacement compressors, the entire system shall be considered to be the low pressure-side for test purposes.

1110.8 Contractor or engineer declaration. The installing contractor or registered design professional of record shall issue a certificate of test to the code official for all systems containing 55 pounds (25 kg) or more of refrigerant. The certificate shall give the test date, name of the refrigerant, test medium, and the field test pressure applied to the high pressure-side and the low pressure-side of the system. The certification of test shall be signed by the installing contractor or registered design professional and shall be made part of the public record.

Reason: I organized a group of 8 experts in the field of refrigerant piping to help develop this code change. I refer to them as the Refrigerant Piping Committee. However, I am submitting this change as the proponent. In addition to the Committee I created, I circulated a draft to other experts in the field of refrigeration. I received a number of comments through that review. Those comments have been incorporated in the final text that I am submitting. It is the intent of the Refrigerant Piping Committee to submit a similar change to ASHRAE 15 and the UMC. The goal is to update all refrigerant piping requirements addressing every type of refrigerant system other than ammonia.

This proposed change reorganizes and updates the requirements for refrigerant piping. Many of the requirements remain the same as in the current code. The change follows the format used in other chapters in the Mechanical Code and Plumbing Code for listing piping material, joints and connections, and installation requirement.

Section 1107 remains the piping material section, however, the title is changed to be consistent with other chapters. There is no need to repeat refrigerant. Section 1107.1 is the general section indicating that compliance to the section for material requirements. The exception to Section 1107.1 is necessary to clarify that the ammonia piping requirements are regulated by IAR 2. Without this statement, there could be confusion since Section 1101.6 states to apply IAR 2 except as modified by this code. The piping requirements do not apply to ammonia systems. Similar exception language appears in Section 1109.1 and 1110.1.

There is currently no section regarding used materials, yet other chapters include requirements for used materials. This section is similar to the used material requirements in other chapters.

Section 1107.3 is a general requirement for the piping material to be rated for the temperatures, pressures, and type of refrigerant. The aluminum exception for R-40 (methyl chloride) currently appears in Section 1107.5.5. The requirements have been expanded to include zinc and magnesium alloys since these materials are also susceptible to failure from R-40 (methyl chloride). Magnesium alloys cannot be used with any halogenated refrigerants since the material will react and fail. This prohibition has been added.

Section 1107.4 includes a table for listing all of the acceptable piping material. The appropriate standards for the piping material are listed in the table. While the word brass was previously converted to copper alloy throughout the code, ASTM B43 is still identified as a brass pipe standard. Therefore, brass was used with copper alloy included in parenthesis.

The current code has a restriction on the use of mechanical joints with annealed copper tubing. This is a hold over requirement that is out of date. ASME B31.5 has a different limitation. Note 1 to the table includes the requirements listed in ASME B31.5.

Note 2 of the table currently appears in Section 1107.5.1. The requirement remains the same.

Section 1107.5 includes a table of the fitting standards used in refrigerant piping systems. Some of the standards are new to this chapter since the previous requirements were weak with regard to referencing the appropriate fitting standards. There is also a general reference to UL 207. There are refrigerant fittings that do not meet the fitting standard, however, they are listed to UL 207. This is an appropriate standard for specialty type of refrigerant fittings.

Copper tubing is a common material used in refrigerant piping systems. A common joint is a swaged fitting which is made in the field. Since the swaging of copper expands the wall of the pipe, thus weakening the outer tube of the joint where not supported by the joint filler material and inner tube, the depth of the swage must be included. This depth is similar to the brazed fitting cup depths in the ASME B16.50 standard. The maximum depth allows a 50% increase in cup depth. A greater depth will result in too weak a pipe wall.

Section 1107.6 adds requirements for valves. The current code has valve installation requirements but is missing valve material requirements.

Section 1107.7 adds material requirements for flexible connectors and expansion and vibration compensators. These components are required to be listed and labeled for refrigerant systems.

Section 1108 is organized similar to the joints and connections section in Chapter 12. Many of the requirements are new since the current code requirements are not up to date. The section is organized with general requirements in the beginning, followed by joining methods, and completed with piping material allowances of various joining methods.

Section 1108.1 is the general section on joints requiring them to be approved and meet the tightness requirements to pass the system test.

Section 1108.1.1 lists requirements for joints between different materials. A reference to the testing requirements in ASSE 1079 is made in the section for joints between dissimilar metals. The standard has appropriate testing requirements for dielectric tests that can be used on refrigeration piping systems even though the standard appears to address water piping systems. Section 1108.2 is similar to the preparation of pipe ends found in other chapters. The same requirements would apply to refrigerant piping.

Section 1108.3 lists all of the acceptable joining methods. For brazing, there are requirements for using an inert gas inside the piping. This prevents oxidation on the interior of the piping. If there is excessive oxidation, it could result in obstruction of small piping or components in the system, as well as other system chemistry degradation, increasing the probability of future repair work. Reducing the frequency of opening refrigerating systems for repair reduces the exposure to numerous hazards and risks. For many of the joints, a reference to UL 207 is included. This standard covers the various refrigerant joining methods. The press-connect refrigerant fittings are listed to this standard, as are many mechanical joints.

Section 1108.3.4 includes all of the various threads that are used in refrigerant piping systems. This expands the listing of ASME standards for threaded joints.

Sections 1108.4 through 1108.9 list each material and the acceptable joining methods for the particular material.

The piping installation requirements are listed in a separate section from the material and joints and connections. The piping requirements have been expanded to address the necessary safety measures to assure a proper piping installation.

With a greater use of VRV and VRF systems, there is significantly more refrigerant piping installed inside a building. Additionally, with split systems and multi-split systems in multistory residential buildings, there is also a significant amount of piping installed.

There will be an expanded use of Group A2L refrigerants that are low global warming potential refrigerants. These refrigerants were previously listed as a subgroup of A2 refrigerants. As a separate group, the requirements need to be provided to address the installation of piping with Group A2L refrigerants.

The new section on piping is divided into four main subject matters. The first part of the section addresses piping requirements for all types of refrigerants being used. The second part is for Group A2L and B2L refrigerants. The third part is for piping requirements for Group A2, A3, B2, and B3 refrigerants. The last part has additional general requirements for piping installations.

Section 1109.1 includes a reference to ASME B31.5. This standard is currently referenced in Section 1107.1. There is no change regarding the application of ASME B31.5.

Section 1109.2 identifies which sections are applicable to which refrigerant groups.

Section 1109.2.1 is a rewording of the requirements currently found in Section 1107.2.

Section 1109.2.2 is a new section requiring refrigerant piping to be concealed within the building elements. While this is implied in the current code, it is not stated. Section 1109.2.2.1, allowing refrigerant piping to be exposed, is similar to the current allowance specified in Sections 1107.2 and 1107.3. The other allowance would be refrigerant piping located in a machinery room. Exposed piping is anticipated in a machinery room where access is restricted to authorized personnel.

Section 1109.2.3 is similar to current Section 1107.2. One of the changes is the allowance for refrigerant piping to be located in the ceiling of a corridor, hence, not exposed. This appears to be implied, however, when the ceiling space is considered a part of the corridor, it appears to be prohibited. Refrigerant piping, especially for multi-split systems is often installed in the ceiling of a corridor. If the RCL requirements are met, there is no hazard posed to the corridor.

Section 1109.2.4 is a duplication of the requirements currently found in Section 1107.2.1.

Section 1109.2.5 is a new section regulating the requirements for shaft containing refrigerant piping. A fire-resistance-rated shaft will be required when the refrigerant piping connects three or more stories. Other utilities can also be located within the same shaft. There are three exceptions proposed to the shaft requirements in Section 1109.2.5.1, one is when water is use, that is R718 refrigerant. The second is for the use of Group A1 refrigerants provided the smallest space in which the pipe pass meets the RCL requirements for the refrigerant. The last exception is for when the piping is installed on the outside of the building where any leak would vent to atmosphere.

Section 1109.2.6 is also a new requirement. This section is intended to protect an individual from directly contacting a hot or cold refrigerant pipe. The temperatures are based on avoiding burning the skin or causing frostbite or frost damage to the skin. One of the methods of protection would adding insulation around the pipe. This is the most common method of protection for exposed piping.

Section 1109.3 is a new section regulating the installation of piping using Group A2L or B2L refrigerants. These refrigerants are lower flammable, lower burning velocity refrigerants. While the refrigerant will burn, it doesn't ignite or burn very easily. Since it is flammable additional protection requirements are proposed.

Section 1109.3.1 will require continuous protection when the piping is located within 1-1/2 inches of the nearest edge of a member. Currently the code requires this level of protection in certain locations, such as the top plate and bottom plate. This section will require the protection where ever the piping is installed. The protection is intended to prevent the tubing from be punctured by a nail or screw.

Section 1109.3.2 requires ventilation of the shaft in which the refrigerant piping is located. A minimal movement of air will exhaust the leaking refrigerant out of the shaft. The velocity rates identified in Table 1109.3.2 are taken from a peer reviewed paper published by ASME, and ensure that density differences between air and refrigerant will not defeat the purpose to exhaust the released refrigerant out of the shaft, whether in horizontal or vertical shaft orientation.

The ventilation would only be required when there is a leak of refrigerant. A leak detector is required in the shaft to identify when a leak occurs. Another option would be to naturally ventilate the shaft or continuously ventilate the shaft. Since most refrigerants are heavier than air, they tend to move downward. If naturally ventilated, the refrigerant moves to outside the building. An exception to the ventilation requirements would be the use of double wall pipe. While this is not commonly installed, the possibility exists that there will be greater use of double wall pipe.

The final requirement in Section 1109.3.3 specifies the labeling requirements for the piping. Since B2L refrigerant is toxic, there are special requirements to label the pipe as containing toxic refrigerant.

Section 1109.4 has the special requirement for the more flammable and more toxic refrigerants. Section 1109.4.1 requires the systems to be installed using only pipe, not tubing. The added strength of the pipe will reduce any potential leak from a puncture. The exception to this requirement would be self-contained listed equipment. Some refrigerators and similar appliances are using Group A3 refrigerants. However, these appliances are tested and listed.

Section 1109.4.2 requires any shaft with these refrigerants to be continuously ventilated. The same velocity requirements apply to this group of refrigerants as Group A2L and B2L. There is also an exception for double wall pipe.

Section 1109.4.3 specifies the labeling requirements. The labels are similar to what is required in UL/CSA 60335-2-40.

Section 1109.5 is a new section regulating pipe penetrations. Any time a pipe penetrated a wall, floor, or ceiling, it must be sealed to prevent the passage of any refrigerant that may be leaking. There is a direct reference to the building code for penetrations of fire-resistance-rated assemblies.

Section 1109.6 is a new requirement for pipe protection. Similar language has been used for other piping systems in the Mechanical Code and the Plumbing Code. The requirements are also applicable to refrigerant piping.

Sections 1109.7 through 1109.8.4 are rewording and relocation of current Sections 1107.4, 1107.8, 1107.8.1, 1107.8.2, and 1107.8.3.

The Refrigerant Piping Committee spent a considerable amount of time rewriting and discussing the testing requirements. The basis for Section 1110 is the current Section 1108. The key elements of Section 1108 are captured in the new section. The significant differences relate to the test medium, the test equipment, and the pressure and vacuum test.

The test gas is specified as being either oxygen-free nitrogen, helium, or argon. These are the three inert gases used for testing refrigerant piping systems. Carbon dioxide refrigerant systems are permitted to be tested with carbon dioxide. Water refrigerant piping systems are permitted to be tested with water.

For smaller systems, refrigerant contractors have used the refrigerant for testing. This would be permitted for systems having 5/8 inch or smaller tubing.

The accuracy of the test gage is not currently specified. Most test gages used by refrigerant contractors have an accuracy within 2-1/2 percent. The allowance for up to 3 percent takes into consideration other gages that may be used.

For the testing of the system, the Committee believes it is important to run two tests; one is a pressure test, the other is a vacuum test. When testing with internal pressures, a one-way leak in the reverse direction may not be discovered. However, when a vacuum is placed on the system, the leak will be identified. The standard test for refrigerant systems is one hour for pressure and 10 minutes for a vacuum. These tests have been added to the section.

Cost Impact: The code change proposal will increase the cost of construction

The additional testing required for refrigerant piping will take additional time which equates to a high cost for labor.

M99-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This provides direction to the code officials to inspect for proper installations. Workers often braze without nitrogen purge, for example, and there is nothing to cite in current code. The code needs teeth to address bad practices. This adds safety provisions that are not in current code. The testing requirements are a worthy addition to the code. (Vote 6-5)

Assembly Action:

None

M99-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Daikin US (jbengineer@aol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Mechanical Code

1109.2 Piping location. Refrigerant piping shall comply with the installation location requirements of Sections 1109.2.1 through ~~1109.2.6~~ 1109.2.7. Refrigerant piping for group A2L and B2L shall also comply with the requirements of Section 1109.3. Refrigerant piping for group A2, A3, B2 and B3 shall also comply with the requirements of Section 1109.4.

1109.2.7 Pipe identification. Refrigerant pipe located in areas other than the room or space where the refrigerating equipment is located shall be identified. The pipe identification shall be located at intervals not exceeding 20 feet on the refrigerant piping or pipe insulation. The minimum height of lettering of the identification label shall be ½ inch. The identification shall indicate the refrigerant designation and safety group classification of refrigerant used in the piping system. For Group A2, A3, B2, and B3 refrigerant the identification shall also include the following statement: "DANGER - Risk of Fire or Explosion. Flammable Refrigerant." For any Group B refrigerant, the identification shall also include the following statement: "DANGER - Toxic Refrigerant."

1109.3.3 Pipe identification. ~~Refrigerant pipe located in areas other than the room or space where the refrigerating equipment is located shall be identified. The pipe identification shall be located at intervals not exceeding 20 feet on the refrigerant piping or pipe insulation. The identification shall indicate the refrigerant designation and safety group classification of refrigerant used in the piping system. For Group B2L refrigerants the identification shall also include the following statement: "DANGER - Toxic Refrigerant." The minimum height of lettering of the identification label shall be ½ inch.~~

1109.4.3 Pipe identification. ~~Refrigerant pipe shall be identified with the refrigerant designation and safety group classification of refrigerant used in the piping system and the following statement: "DANGER - Risk of Fire or Explosion. Flammable Refrigerant." For Group B2 and B3 refrigerants the identification shall also include the following statement: "DANGER - Toxic Refrigerant." The identification shall be at intervals not exceeding 5 feet on the refrigerant piping or pipe insulation. The minimum height of lettering of the identification label shall be 1 inch.~~

Commenter's Reason: The identification requirements should have been placed in the general piping installation requirements rather than the subsections on A2L and B2L, and A2, A3, B2, and B3. The also assures that Group B1 refrigerants are properly identified.

The remainder of the proposed requirement are unchanged. Only these sections require further clarification.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is an editorial change moving the pipe identification requirements to the general piping section.

Public Comment 2:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org) requests As Submitted.

Commenter's Reason: ASHRAE SSPC15 supports the intent of these extensive changes and has formed a working

group to incorporate the requirements into an addendum to ASHRAE 15.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The additional testing required for refrigerant piping will take additional time and incrementally add cost.

Public Comment 3:

Proponent: David Bixby, Air Conditioning Contractors of America, representing Air Conditioning Contractors of America (david.bixby@acca.org) requests Disapprove.

Commenter's Reason: ACCA opposes the Committee's approval of this proposal for the same reasons as the Committee disapproved proposals M96-18 and M97-18. The proponent's rationale states that he intends to submit a similar change to ASHRAE Standard 15. In addition, the proposal includes the expanded use of Group A2L refrigerants. ACCA believes that it is best for the code not to get too far ahead of ASHRAE standards on these matters and to wait for the ASHRAE standards changes to be finalized and published before such coverage is added to the code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

Public comment is to disapprove the proposal so it will not impact cost if the proposal is disapproved.

M99-18

M102-18

IMC: 1107.5.6, 1107.5

Proposed Change as Submitted

Proponent: William Chapin, Professional Code Consulting, LLC, representing Professional Code Consulting, LLC (bill@profcc.us)

2018 International Mechanical Code

Add new text as follows

1107.5.6 PE-RT/AL/PE-RT. Polyethylene of raised temperature/aluminum/polyethylene of raised temperature (PE-RT/AL/PE-RT) tubing shall conform to ASTM FXXXX.

Revise as follows

1107.5 Materials for refrigerant pipe and tubing. Piping materials shall be as set forth in Sections 1107.5.1 through ~~1107.5.5-1107.5.6~~.

Reason: The ASTM F17 Subcommittee for composite pipe is creating the standard for PE-RT/AL/PE-RT tubing that is currently being used in HVAC/R line sets. The standard is expected to be published in the coming months. This standard ensures that the tubing is tested and rated for the application.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Cost can vary depending on system design.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

M102-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 11-0)

Assembly Action:

None

M102-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Mueller Industries (JBEngineer@aol.com) requests Disapprove.

Commenter's Reason: There is no standard for the piping material identified. Furthermore, the piping material is plastic. Plastic pipe has not been allowed in refrigerant piping system because of the possible failure of the pipe during a fire. If there is a fire and the refrigerant load completely escapes during the fire, the firefighters are exposed to hydrogen fluoride. All of the surfaces are also exposed to hydrogen fluoride. Touching the surfaces will expose the skin to contamination.

Before the International Mechanical Code allows plastic piping material for refrigerant piping systems, this should be proposed to ASHRAE and ASME. There should also be research conducted on the impact during a fire of using this material. ASHRAE 15 currently does not have any provisions for plastic pipe for refrigerant systems. Similarly, ASME B31.5 does not recognize the use of plastic pipe for refrigerant piping systems. Just because there is a standard does not mean that the piping material is viable for refrigerant piping systems. There must be a full evaluation regarding the use of plastic pipe for refrigerant systems.

It should also be noted that the proposal is incomplete. There are no joining methods identified. There are no fitting standards provided. There is no protection requirements indicated. This is a poorly submitted code change that should not have been recommended for approval.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Since there is no standard and no product, there is no means of evaluating the impact to the cost of construction.

Public Comment 2:

Proponent: Tim Earl, representing GBH International (tearl@gbhinternational.com) requests Disapprove.

Commenter's Reason: This proposal references an ASTM standard that does not yet exist. It doesn't even contain a number, instead stating "ASTM FXXX."

The last ballot for this standard closed in June, and it received negative votes. That means that those votes will be addressed at the next committee meeting in November 2018. Based on those discussions, a new draft is likely to be circulated. That draft could be significantly different than the previous draft. At best, the final standard will be published sometime in 2019.

That means that, if the committee action stands, the version which is eventually published and referenced in the code does not even exist today, and could include clauses that have not yet been written. It would be completely irresponsible to reference a standard in the code before interested parties can actually read it. Clauses which violate CP28 and/or restrict certain segments of industry could appear in the next draft, and there would be no way to stop it.

There was no testimony on this proposal at Committee Action Hearings, and the committee simply approved it (inexplicably) based on the reason statement.

This proposal should not have been approved by the committee, and must be disapproved now as the standard is not available for review in its final form (since it doesn't even exist in its final form yet).

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

There is no cost impact in disapproving a code change to reference a standard which does not exist.

M102-18

M112-18

Polyvinyl chloride (PVC)	ASTM D2464; ASTM D2466; ASTM D2467; CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D3261; ASTM F1807; ASTM F2098; ASTM F2159; ASTM F2735; ASTM F2769; CSA B137.1; CSA B137.18, <u>NSF 358-4</u>

NSF 358-4-2017:

Polyethylene of raised temperature (PE-RT) pipe and fittings for water-based ground-source (geothermal) heat pump systems

Reason: At the proposal deadline, NSF 358-4 was still a draft standard, but it is expected to be published prior to the public hearing. The balloted draft standard will be submitted with the proposal. Anyone may receive a complimentary copy of this draft standard for the purpose of reviewing this proposal by emailing brown@nsf.org. These tables contain the acceptable materials for geothermal ground loop pipe and fittings. PE-RT piping and associated fittings are already accepted materials with referenced standards. NSF 358-4 is a proposed ANSI standard written specifically to contain requirements for PE-RT geothermal piping and fittings. Companion standards NSF 358-1 (PE) and NSF 358-3(PP) are already approved in this table. NSF 358-4 addresses performance pressure testing, long term strength, chemical resistance, constant tensile load joint testing, suitability for burial and marking specific to geothermal PE-RT piping systems.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Adding an additional option will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

M112-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposed new standard is not yet published. (Vote 10-1)

Assembly Action:

None

M112-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeremy Brown, representing NSF International (brown@nsf.org) requests As Submitted.

Commenter's Reason: NSF 358-4 was rejected by the committee because the standard was not completed at the time of this proposal's submittal. No one spoke against this standard from a technical standpoint. A draft standard was submitted to the committee at the time of proposal. The standard is complete without any changes from the draft submitted to the committee.

A copy of the standard may be viewed at http://www.nsf.org/newsroom_pdf/NSF_358-4-2018-watermarked.pdf. There is no controversy around this standard. It is the 4th in a suite of NSF Standards covering geothermal pipe and fittings. NSF 358-1 (Polyethylene) and NSF 358-2 (Polypropylene) are already referenced in Tables 1210.4 and Table 1210.5. NSF 358-3 (Crosslinked Polyethylene) was approved as submitted by the committee in P113.

NSF 358-4 Polyethylene of raised temperature (PE-RT) pipe and fittings for water-based ground-source (geothermal) heat pump systems should be added to provide an additional option to the code for this material.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Referencing this standard creates another option for demonstrating compliance. This is cost neutral.

M112-18

M119-18 Part II

IRC: M2103.1

Proposed Change as Submitted

Proponent: Chris Haldiman, representing Watts Water Technologies (chris.haldiman@wattswater.com)

2018 International Residential Code

M2103.1 Piping materials. Piping for embedment in concrete or gypsum materials shall be standard-weight steel pipe, copper and copper-alloy pipe and tubing, cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pressure pipe, chlorinated polyvinyl chloride (CPVC), ~~polybutylene~~, cross-linked polyethylene (PEX) tubing, polyethylene of raised temperature (PE-RT) or polypropylene (PP) with a rating of not less than ~~100-80~~ psi at 180°F (~~690-552~~ kPa at 82°C).

Reason: A 100 psi rating is not necessary in hydronic applications, particularly when the tubing is encased in a hard concrete or a gypsum material. Hydronic heating systems are typically designed with operating pressures of 12 psi - 20 psi, and these systems contain expansion tanks incorporated in them that are factory set to 12 psi. Safety relief valves on the boilers are typically set at 30 psi or 50 psi.

ASTM Standard F2623, "Standard Specification for Polyethylene of Raised Temperature (PE-RT) SDR 9 Tubing", states in Section 1.4, "The tubing produced under this specification shall be permitted for use in general fluid transport, including hydronics and irrigations systems."

I believe the retention of 100 psi minimum was an oversight when ASTM F2623 PE-RT was added to Table 1202.4.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The code change proposal will not increase or decrease the cost of construction.

M119-18 Part II

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on proponent's published reason statement. The revision aligns with the material standard. Boilers have 30 to 50 PSI relief valves to prevent higher pressures. (Vote 9-1)

Assembly Action:

Disapproved

M119-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Assembly Action requests Disapprove.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 55.8% (63) to 44.2% (50) by eligible members online during the period of May 9 - May 23, 2018.

M119-18 Part II

NOTE: M119-18 Part I DID NOT RECEIVE A PUBLIC COMMENT AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

M119-18 Part I

IMC: 1209.1

Proposed Change as Submitted

Proponent: Chris Haldiman, representing Watts Water Technologies (chris.haldiman@wattswater.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IMC COMMITTEE AND PART II WILL BE HEARD BY THE IRC M/P COMMITTEE. PLEASE SEE THE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Mechanical Code

Revise as follows

1209.1 Materials. Piping for heating panels shall be standard-weight steel pipe, Type L copper tubing, polybutylene or other *approved* plastic pipe or tubing rated at ~~100-80 psi (689 kPa)~~ 552kPa at 180°F (82°C).

Reason: A 100 psi rating is not necessary in hydronic applications, particularly when the tubing is encased in a hard concrete or a gypsum material. Hydronic heating systems are typically designed with operating pressures of 12 psi - 20 psi, and these systems contain expansion tanks incorporated in them that are factory set to 12 psi. Safety relief valves on the boilers are typically set at 30 psi or 50 psi.

ASTM Standard F2623, "Standard Specification for Polyethylene of Raised Temperature (PE-RT) SDR 9 Tubing", states in Section 1.4, "The tubing produced under this specification shall be permitted for use in general fluid transport, including hydronics and irrigations systems."

I believe the retention of 100 psi minimum was an oversight when ASTM F2623 PE-RT was added to Table 1202.4.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The code change proposal will not increase or decrease the cost of construction.

M119-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The pressure should not be reduced to less than 100 psi. (Vote 7-4)

Assembly Action:

None

M119-18 Part I

M120-18

IMC: Table TABLE 1302.3, 1302.9, ASTM, UL

Proposed Change as Submitted

Proponent: Bob Torbin, OmegaFlex, representing OmegaFlex (bob.torbin@omegaflex.net)

2018 International Mechanical Code

Revise as follows

**TABLE 1302.3
FUEL OIL PIPING**

MATERIAL	STANDARD (see Chapter 15)
Copper or copper-alloy pipe	ASTM B42; ASTM B43; ASTM B302
Copper or copper-alloy tubing (Type K, L or M)	ASTM B75; ASTM B88; ASTM B280; ASME B16.51
Labeled pipe	(See Section 1302.4)
Nonmetallic pipe	ASTM D2996
Steel pipe	ASTM A53; ASTM A106
Steel tubing	ASTM A254; ASTM A539
Stainless steel tubing	ASTM A240; UL1369; UL971A

Add new text as follows

1302.9 Corrugated stainless steel tubing containment system. Corrugated stainless steel tubing that is factory-installed within a non-metallic containment system shall be listed and labeled in accordance with UL 1369 or UL 971A.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428
US

A240/A240M- 15a:

Standard Specification for Chromium and Chromium-nickel Stainless Steel Plate, Sheet and Strip for Pressure Vessels and for General Applications

UL

UL LLC
333 Pfingsten Road
Northbrook IL 60062-2096
US

971A-2006:

Outline of Investigation for Metallic Underground Fuel Pipe 1369-18:

Reason: The corrugated stainless steel tubing double-containment system, including termination fittings, is intended for use with fuel oil, as well as motor vehicle, aviation and marine fuels either above or below grade. The intent and design of double containment systems are focused on preventing fuel oil leaks that could result in severe fire hazards. The corrugated stainless steel primary tubing is a zero-permeation pipe which is highly resistant to corrosion with exceptional crush resistance. The UV stabilized Nylon 12 protective containment layer offers exceptional resistance to hydrocarbons, chemical and water exposure, and carries a 50 psig rating. An EFEP secondary barrier jacket layer is bonded to the Nylon 12 protective layer to offer secondary containment with exceptional permeation resistance for product compatibility. The interstitial space between the tubing and jacket allows continuous monitoring for leak detection,

with a 50 psig rating for pressurized systems. The self-flaring fitting provides a metal to metal sealing surface with excellent reliability and is field-attachable using standard hand tools. This class of piping product has been used for a variety of fuels for several years without failure, and is also permitted in the IFGC for similar applications for fuel gas systems (see Section 404.14).

Cost Impact: The code change proposal will decrease the cost of construction

The use of a listed encasement system results in cost savings because the piping and encasement are installed simultaneously. This avoids the labor cost of separately installing the conduit and piping. In addition, the sealing and venting methods (when required) are also integrated within the encasement system, thus eliminating the need to separately assemble and/or install sealing and venting components within standard conduit.

M120-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: ~~1302.9 Corrugated stainless steel tubing containment Piping systems. Corrugated stainless steel tubing that is factory installed within a non-metallic containment Aboveground pipe systems shall be listed and labeled in accordance with UL 1369. Underground pipe systems shall be listed and labeled in accordance with~~ ~~or~~ UL 971A.

Copper or copper-alloy pipe	ASTM B42; ASTM B43; ASTM B302
Copper or copper-alloy tubing (Type K, L or M)	ASTM B75; ASTM B88; ASTM B280; ASME B16.51
Labeled pipe	(See Section 1302.4)
Nonmetallic pipe	ASTM D2996
Steel pipe	ASTM A53; ASTM A106
Steel tubing	ASTM A254; ASTM A539
Stainless steel tubing	ASTM A240; UL1369; UL971A

Committee Reason: Approval was based on the proponent's published reason statement. The modification corrects the problems that were inconsistent with the code currently. (Vote 11-0)

Assembly Action:

None

M120-18

Individual Consideration Agenda

Public Comment 1:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standard UL 1369-18 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

M120-18

RB5-18

IRC: R105.2

Proposed Change as Submitted

Proponent: Jim Tidwell, Tidwell Code Consulting, representing Honeywell (jimtidwell@tccfire.com)

2018 International Residential Code

Revise as follows

R105.2 Work exempt from permit. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

Building:

1. One-story detached *accessory structures*, provided that the floor area does not exceed 200 square feet (18.58 m²).
2. Fences not over 7 feet (2134 mm) high.
3. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge.
4. Water tanks supported directly upon *grade* if the capacity does not exceed 5,000 gallons (18 927 L) and the ratio of height to diameter or width does not exceed 2 to 1.
5. Sidewalks and driveways.
6. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
7. Prefabricated swimming pools that are less than 24 inches (610 mm) deep.
8. Swings and other playground equipment.
9. Window awnings supported by an exterior wall that do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
10. Decks not exceeding 200 square feet (18.58 m²) in area, that are not more than 30 inches (762 mm) above *grade* at any point, are not attached to a dwelling and do not serve the exit door required by Section R311.4.

Electrical:

1. *Listed* cord-and-plug connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles but not the outlets therefor.
3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
4. Electrical wiring, devices, *appliances*, apparatus or *equipment* operating at less than 25 volts and not capable of supplying more than 50 watts of energy.
5. Minor repair work, including the replacement of lamps or the connection of *approved* portable electrical *equipment* to *approved* permanently installed receptacles.

Gas:

1. Portable heating, cooking or clothes drying *appliances*.
2. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
3. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Mechanical:

1. Portable heating *appliances*.
2. Portable ventilation *appliances*.
3. Portable cooling units.
4. Steam, hot- or chilled-water piping within any heating or cooling *equipment* regulated by this code.
5. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
6. Portable evaporative coolers.
7. Self-contained refrigeration systems containing 10 pounds (4.54 kg) or less of ~~refrigerant~~ or non-flammable (A-1) refrigerant.
8. Self-contained refrigeration systems containing non-flammable (A-1) refrigerants that are actuated by motors of 1 horsepower (746 W) or less.
- ~~8-9.~~ Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe; provided, however, that if any concealed trap, drainpipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures, and the removal and reinstallation of water closets, provided such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Reason: The existing exemption for permitting residential size HVAC systems is founded on the fact that all refrigerants used in these systems have been non-flammable up until now. Changing out a system historically hasn't presented a significant risk. That changes with the introduction of flammable refrigerants. Changing out a system now may require significantly more design work to assure a safe installation. In addition, piping may need to be re-routed or replaced in some cases. If flammable refrigerants are used, it is no longer a simple equipment replacement, but a much more complex issue with significant safety risk. Requiring a permit will provide the jurisdiction with the opportunity to address that risk during the review and inspection process.

Cost Impact: The code change proposal will increase the cost of construction. While the actual cost of construction isn't impacted, the requirement for a permit will add to the final cost.

RB5-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Approval was based on the proponent's published reason statement. (Vote 6-2)

Assembly Action:

None

RB5-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Connor Barbaree, representing ASHRAE (cbarbaree@ashrae.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Residential Code

R105.2 Work exempt from permit. Exemption from *permit* requirements of this code shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or ordinances of this *jurisdiction*. *Permits* shall not be required for the following:

Building:

1. One-story detached *accessory structures*, provided that the floor area does not exceed 200 square feet (18.58 m²).
2. Fences not over 7 feet (2134 mm) high.
3. Retaining walls that are not over 4 feet (1219 mm) in height measured from the bottom of the footing to the top of the wall, unless supporting a surcharge.
4. Water tanks supported directly upon *grade* if the capacity does not exceed 5,000 gallons (18 927 L) and the ratio of height to diameter or width does not exceed 2 to 1.
5. Sidewalks and driveways.
6. Painting, papering, tiling, carpeting, cabinets, counter tops and similar finish work.
7. Prefabricated swimming pools that are less than 24 inches (610 mm) deep.
8. Swings and other playground equipment.
9. Window awnings supported by an exterior wall that do not project more than 54 inches (1372 mm) from the exterior wall and do not require additional support.
10. Decks not exceeding 200 square feet (18.58 m²) in area, that are not more than 30 inches (762 mm) above *grade* at any point, are not attached to a dwelling and do not serve the exit door required by Section R311.4.

Electrical:

1. *Listed* cord-and-plug connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles but not the outlets therefor.
3. Replacement of branch circuit overcurrent devices of the required capacity in the same location.
4. Electrical wiring, devices, *appliances*, apparatus or *equipment* operating at less than 25 volts and not capable of supplying more than 50 watts of energy.
5. Minor repair work, including the replacement of lamps or the connection of *approved* portable electrical *equipment* to *approved* permanently installed receptacles.

Gas:

1. Portable heating, cooking or clothes drying *appliances*.
2. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
3. Portable-fuel-cell *appliances* that are not connected to a fixed piping system and are not interconnected to a power grid.

Mechanical:

1. Portable heating *appliances*.
2. Portable ventilation *appliances*.
3. Portable cooling units.
4. Steam, hot- or chilled-water piping within any heating or cooling *equipment* regulated by this code.
5. Replacement of any minor part that does not alter approval of *equipment* or make such *equipment* unsafe.
6. Portable evaporative coolers.
7. Self-contained ~~refrigeration~~ refrigerating systems, containing Group A1 or A2L refrigerants in accordance with IMC Table 1103.1, with either of the following:
 - 7.1. 10.0 pounds (4.54 kg) or less a motor of 1.00 horsepower (746 W) or less. of refrigerant, or that are
 - 7.2. actuated by motor
8. Self-contained refrigerating systems, containing Group A2 or A3 refrigerants in accordance with IMC Table 1103.1, with either 0.331 pounds (150 g) or less refrigerant.
9. Portable-fuel-cell appliances that are not connected to a fixed piping system and are not interconnected to a power grid.

Plumbing:

1. The stopping of leaks in drains, water, soil, waste or vent pipe; provided, however, that if any concealed trap, drainpipe, water, soil, waste or vent pipe becomes defective and it becomes necessary to remove and replace the same with new material, such work shall be considered as new work and a *permit* shall be obtained and inspection made as provided in this code.
2. The clearing of stoppages or the repairing of leaks in pipes, valves or fixtures, and the removal and reinstallation of water closets, provided such repairs do not involve or require the replacement or rearrangement of valves, pipes or fixtures.

Commenter's Reason: Self-contained systems are all required to be listed and labeled in accordance with the relevant UL product safety standard. The UL standards have requirements for protection of refrigerant tubing, with more stringent requirements when flammable refrigerants are used, so the proponent's reason statement about re-routing piping do not make sense. Split-type refrigerating systems for cooling or split-type heat pumps, with field installed piping, are not exempt from permit requirements.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The actual cost of construction is not impacted. Some cases not qualifying for the exemption may require a permit with small impact on total cost.

Public Comment 2:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing National Association of Home Builders (jbengineer@aol.com); Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org) requests Disapprove.

Commenter's Reason: This change would be over reaching in applying to typical units that are installed without a permit. You can buy a window air conditioning unit, that is permanently installed through the wall, at many of

the major home super stores that use R32 as the refrigerant. R32 falls into the category of an A2L refrigerant. As such, it would not be exempt from the requirement for a permit.

Similarly, small mini-splits using R32 refrigerant would not be exempt from requiring a permit when they are replaced. However, a mini-split using R410A would be exempt. Both units are safe to use because of the small refrigerant charge size.

The proponent states that the original exemption was based on A1 refrigerants. There is no documentation to support this claim. The exemption is based on a small charge size that will not be detrimental to the occupants. That remains true for an A2L unit being installed.

All of the current units exempt, including units using Group A2L refrigerants, are listed to a consensus standard. Hence, the use of these smaller units in residences is safe without the need for a permit regardless of the refrigerant used.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

A permit fee would not be required for the installation of small air conditioning units, including window air conditioners that are permanently installed.

RB5-18

RM3-18

IRC: M1307.7

Proposed Change as Submitted

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Add new text as follows

M1307.7 Prohibited support. Gypsum board shall not be used as a support base under an appliance.

Reason: If appliances are installed resting on gypsum board, the board can compress, degrade from heat, moisture and vibration and crumble, with the result being movement and settling of the appliance which would put stress on gas piping, vent connectors, chimney connectors, electrical connections and ductwork. Gypsum board is not intended to be a support base for vertical deadloads.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

RM3-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The support of appliances is already covered in the code. (Vote 6-3)

Assembly Action:

None

RM3-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Tim Earl, representing The Gypsum Association (tearl@gbhinternational.com) requests As Submitted.

Commenter's Reason: Gypsum panel products are not intended for use as appliance supports and will not perform adequately when misused in this way.

The members of the Gypsum Association, the manufacturers of these products, note the following reasons for not using their products in this application:

Gypsum panels do not have the compressive strength to support heavy loads over time and will eventually "crush" under the weight of the appliance. This can cause stress on fittings and connections that may lead to a life safety hazard.

If an appliance such as a refrigerator or water heater were to leak water onto the panel, this can not only further exacerbate the issue with compressive strength mentioned above, but also lead to the growth of mold, especially in panel products not intended for high moisture conditions. The mold is an additional life safety/health concern.

It was stated at the Committee Action Hearings that one jurisdiction places gypsum panel products under appliances because it is a thermal barrier or greater depending upon thickness and type. Indeed, for a single event fire exposure this is true. However, continual heat exposure as may occur under a furnace or water heater burner will degrade this ability over time by causing calcination (the release of chemically combined water from the gypsum matrix) - this is why gypsum panels are required to be a set distance from heat in a situation such as a grease duct. As this degradation occurs the panels will lose strength due to changes in their crystalline structure and become more likely to compress and create issues.

Some committee members cited as their reason for disapproval the fact that the mechanical code already prohibits this. A thorough review of the IMC showed that this is not true. The use of gypsum panel products as appliance supports is not currently prohibited in the code.

For the reasons above, we strongly encourage overturning the committee and approving the code change as submitted.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This proposal would not affect costs, as there are other alternatives to gypsum panels for this application which cost no more than gypsum panels.

RM3-18

RM5-18

IRC: M1309

Proposed Change as Submitted

Proponent: Craig Conner, representing self (craig.conner@mac.com); Jani Palmer (Palmer.Janise@epa.gov)

2018 International Residential Code

Add new text as follows

M1309 Radon testing. Radon testing shall be performed for radon zone 1, as defined in Appendix F. This section requires that tests be performed and the results be provided to the owner, but does not require a specific test result.

Exceptions:

1. Testing is not required where the authority having jurisdiction has defined the radon zone as Zone 2 or 3.
2. Testing is not required where the occupied space is located above an open space.

Testing shall be performed as specified in items 1 through 10:

1. Testing shall be performed after the dwelling passes its air tightness test.
2. Testing shall be performed after the radon control system installation is complete. If the system has an active fan, the residence shall be tested with the fan operating.
3. Testing shall be performed at the lowest floor level that will be occupied, whether or not the space is finished. Spaces that are physically separated and served by different HVAC systems shall be tested separately.
4. Testing shall not be performed in a closet, hallway, stairway, laundry room, furnace room, bathroom or kitchen.
5. Testing shall be performed with a commercially available radon test kit or with a continuous radon monitor that can be calibrated. Testing with test kits shall include two tests, and the test results shall be averaged. Testing shall be in accordance with the testing device manufacturer's instructions.
6. Testing shall be performed by the builder, a registered design professional, or an approved third party.
7. Testing shall be conducted over a period of not less than 48 hours or not less than the period specified by the testing device manufacturer, whichever is longer. The initial testing shall begin prior to occupancy, but need not be completed prior to occupancy.
8. Test results shall be provided directly to the owner by the test lab or testing party and shall be delivered either before or after occupancy.
9. An additional pre-paid test kit shall be provided to the owner to utilize at the owner's discretion. The test kit shall include mailing or emailing the results from the testing lab to the owner.
10. The owner or registered design professional shall be notified in writing prior to occupancy, stating one of the following:
 - 10.1. A radon test result of 4 pCi/L or above is the 'action level' set by EPA. The EPA recommends radon reduction measures to lower radon levels below 4 pCi/L."
 - 10.2. For a radon test result of 4 pCi/L or above [name of builder or authority having jurisdiction] recommends radon reduction measures to lower radon levels below 4 pCi/L."

Reason: Radon tests are the only way to know if a residence has significant levels of radon. The test kits are inexpensive and easy to use. This change is designed not to delay the sale or occupancy of the home. Testing in radon zone 1 provides information for areas that tend to have higher levels of radon.

Cost Impact: The code change proposal will increase the cost of construction. Multiple companies make inexpensive radon test kits. This change would require two tests which are averaged, plus a third test kit to be left with the owners. Three tests including pre-paid testing, postage and tax will cost less than \$80, often less than \$50.

RM5-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The text is proposed in wrong location. Belongs in an appendix or the building part of code, not in mechanical part. This puts pressure on the contractor after the home is built. The owner may not be in the picture. There might not be a design professional involved. Items 7 and 10 conflict. There is a need to address ongoing testing requirements. (Vote 10-0)

Assembly Action:

None

RM5-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Craig Conner, representing self (craig.conner@mac.com); Jani Palmer, representing US Environmental Protection Agency (palmer.janise@epa.gov); Gary Hodgden, representing himself (gary@aair.com); Bruce Snead representing himself (bsnead@ksu.edu) requests As Modified by This Public Comment.

Replace as follows:

2018 International Residential Code

AF103.13 Radon testing. Where radon-resistant construction is required for new construction, radon testing shall also be required for new construction.

Testing shall be performed as specified in items 1 through 10:

1. Testing shall be performed after the dwelling passes its air tightness test.
2. Testing shall be performed after the radon control system installation is complete. If the system has an active fan, the residence shall be tested with the fan operating.
3. Testing shall be performed at the lowest floor level that will be occupied, whether or not the space is finished. Spaces that are physically separated and served by different HVAC systems shall be tested separately.
4. Testing shall not be performed in a closet, hallway, stairway, laundry room, furnace room, bathroom or kitchen.
5. Testing shall be performed with a commercially available radon test kit or with a continuous radon monitor that can be calibrated. Testing with test kits shall include two tests, and the test results shall be averaged. Testing shall be in accordance with the testing device manufacturer's instructions.
6. Testing shall be performed by the builder, a registered design professional, or an approved third party.
7. Testing shall be conducted over a period of not less than 48 hours or not less than the period specified by the testing device manufacturer, whichever is longer.
8. Written radon test results shall be provided by the test lab or testing party. Written test results shall be included with construction documents.
9. An additional pre-paid test kit shall be provided to the owner to utilize at the owner's discretion. The test kit shall include mailing or emailing the results from the testing lab to the owner.
10. Where the radon test result is 4 pCi/L or greater, the fan for the radon vent pipe shall be installed as specified in Sections AF103.8 and AF103.12.

Exception: Testing is not required where the occupied space is located above an unenclosed open space.

Commenter's Reason: The only way to know for sure if a radon system works is to test it. The test is in effect the commissioning for a radon system. The tests are inexpensive.

This responds to several comments. Multiple people requested that that the radon test requirement be moved into the radon appendix, Appendix F. Some commented that there may not yet be an owner when the home is built, so this public comment allows test results to be provided with construction documents. The language in #7 and #10 was clarified.

This deletes mention of test results delivered after occupancy, which would be after the code enforcement authority has lapsed.

More than half the states have some kind of statewide radon requirement or have local jurisdictions that have adopted radon requirements. You can look at your state's radon requirement in the LawAtlas project. (<http://lawatlas.org/datasets/state-radon-laws> , click "explore", click your state)

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Multiple companies make inexpensive radon test kits. This change would require two tests which are averaged, plus a third test kit to be left with the owners. Three tests including pre-paid testing, postage and tax will cost less than \$80, often less than \$50.

RM5-18

RM7-18

IRC: M1401.1

Proposed Change as Submitted

Proponent: David Bixby, Air Conditioning Contractors of America (ACCA), representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

2018 International Residential Code

M1401.1 Installation. Heating and cooling *equipment* and *appliances* shall be installed in accordance with the manufacturer's instructions and the requirements of this code. HVAC systems shall be installed in compliance with ACCA 5 QI.

Reason: ACCA 5 QI details nationally-recognized minimum criteria for the proper installation of HVAC systems in new and existing residential and commercial buildings. This Standard provides a universally accepted definition for quality installation across a broad spectrum of the HVAC industry (e.g., manufacturers, distributors, contractors, user groups, customers, utilities, efficiency advocates, trade associations, professional societies, and governmental agencies). In this Standard, the QI elements focus on the application and how well the system is selected and actually installed. ACCA 5 QI is also a consensus-based ANSI standard. A proposal to add ACCA 5 QI to Chapter 44, Referenced Standards, has also been submitted.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
No cost impacts.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

RM7-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The requirement would add cost and complexity to installations and would prohibit homeowners from performing their own work. The standard is aimed at contractors, is not enforceable and is a best practice guide. (Vote 10-0)

Assembly Action:

None

RM7-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Bixby, Air Conditioning Contractors of America, representing Air Conditioning Contractors of America (david.bixby@acca.org) requests As Submitted.

Commenter's Reason: ACCA 5 QI is an ANSI standard which details the nationally-recognized minimum criteria for the proper design and installation of HVAC systems. It was developed with input from equipment OEM's, utilities, jurisdictions, energy efficiency advocates, and allied organizations. The requirement to comply with ACCA 5 QI would NOT prohibit homeowners from performing their own work. Homeowners who are knowledgeable in performing their own work, thereby serving in the contractor role, would benefit from following an easy to understand nationally-recognized minimum criteria. To that end, ACCA 5 QI is available to the public as a free download by going to the following link: www.acca.org/quality

Those who are currently knowledgeable in performing such work are already using the same minimum core requirements that are outlined in ACCA 5 QI. It would only add cost and complexity if installers (or homeowners) are not following industry accepted minimums. To do otherwise would be risking the safety, efficiency and performance of the installation, which could create more cost in the future as a result of poor design and installation.

For this Standard, core areas that characterize a quality installation include: **(1) Design Aspects**, such as heat gain/loss load calculations, equipment capacity selection; **(2) Distribution Aspects**, such as duct leakage, airflow balance; **(3) Equipment Installation Aspects**, such as electrical requirements, system controls, refrigerant charge, and system documentation; and **(4) Owner Education Aspects** for proper system documentation and owner/operator education.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposal would not increase cost of design and installation of HVAC systems as ACCA 5 QI contains the minimum nationally-recognized core competencies that are needed to perform a safe and efficient installation. If these minimum competencies are not followed, the cost and complexity would be adversely affected if not designed and installed properly.

RM7-18

RM9-18

IRC: M1411.3.1.2

Proposed Change as Submitted

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcman@jeffco.us)

2018 International Residential Code

Add new text as follows

M1411.3.1.2 Appliance, equipment and insulation in pans. Where appliances, equipment or insulation are subject to water damage when auxiliary drain pans fill, that portion of the appliance, equipment and insulation shall be installed above the rim of the pan. Supports located inside of the pan to support the appliance or equipment shall be water resistant and approved.

Reason: This is editorial in nature and is missing from this code. This can be found in the IMC Section 307.2.3.2 and in the IPC. This addition will make the IRC consistent with the other codes.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This change is editorial in nature.

RM9-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This is consistent with the IMC requirements. The appliances need to be protected regardless of their location in residential or commercial. (Vote 8-2)

Assembly Action:

None

RM9-18

Individual Consideration Agenda

Public Comment 1:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Residential Code

M1411.3.1.2 Appliance, equipment and insulation in pans. Where appliances, equipment or insulation are subject to water damage when auxiliary drain pans fill, that portion of the appliance, equipment and insulation shall be installed above the rim of the pan. Supports located inside of the pan to support the appliance or equipment shall be water resistant ~~and approved~~.

Commenter's Reason: Removing and approved takes away the question of who approves as well as exactly what is approved.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This modification will not change the cost of construction.

RM9-18

RM12-18

IRC: M1503.3

Proposed Change as Submitted

Proponent: Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net)

2018 International Residential Code

M1503.3 Exhaust discharge. Domestic cooking exhaust equipment shall discharge to the outdoors through a duct. The duct shall have a smooth interior surface, shall be air tight, shall be equipped with a backdraft damper and shall be independent of all other exhaust systems. Ducts serving domestic cooking exhaust equipment shall not terminate in an attic or crawl space or areas inside the building.

Listed and labeled ductless range hoods shall not be required to discharge to the outdoors where all of the following conditions are met:

Exception: ~~Where installed in accordance with the manufacturer's instructions, and where mechanical or natural ventilation is otherwise provided, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.~~

1. The equipment is installed in accordance with the manufacturer's instructions.
2. Mechanical or natural ventilation is otherwise provided in the cooking area.
3. The equipment is installed in a newly constructed dwelling unit other than single family, or is installed in an existing kitchen not having an existing range hood exhaust duct to the outdoors.

Reason: Cooking is typically the largest source of indoor air pollution in homes, with concentrations of key pollutants frequently exceeding U.S. National Ambient Air Quality Standards. Over time, exposure to these pollutants has been shown to reduce length and quality of life. Clearly, kitchen ventilation is needed to comply with the purpose of the IRC to "safeguard public safety, health, and general welfare through...ventilation" (among other means). Unless captured and exhausted at the source, cooking pollutants spread rapidly through a home and deposit themselves on surfaces, only to be released again into the breathing zone when disturbed at a later time. For new construction in detached buildings, where the builder elects to install a range hood, requiring that the range hood be ducted is a very low-cost item with high returns in terms of occupant health. For reasons of constructability and cost sensitivity (not health), this proposal would only permit ductless range hoods when they are installed in an attached dwelling unit of new construction or when they are installed in an existing kitchen that doesn't have an pre-existing range hood exhaust duct.

Cost Impact: The code change proposal will increase the cost of construction

Where builders are already installing ducts with range hoods, there will not be any increase in the cost of construction.

Where new, single-family dwelling units are not currently provided with ducts for their range hoods, this proposal would increase the cost of construction. Installed duct costs can be estimated at ~ \$9.85 per linear foot for 3.25"x10" galvanized sheet metal (RS Means, 2015, Section 23 31 13.13.0500), and a damper would cost about \$15 retail.

RM12-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The text is item 3 is hard to interpret. This proposal discriminates against single family dwellings. (Vote 10-0)

Assembly Action:

None

RM12-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Mike Moore, representing Broan (mmoore@newportventures.net) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Residential Code

M1503.3 Exhaust discharge. Domestic cooking exhaust equipment shall discharge to the outdoors through a duct. The duct shall have a smooth interior surface, shall be air tight, shall be equipped with a backdraft damper and shall be independent of all other exhaust systems. Ducts serving domestic cooking exhaust equipment shall not terminate in an attic or crawl space or areas inside the building.

Listed and labeled ductless range hoods shall not be required to discharge to the outdoors where all of the following conditions are met:

1. The equipment is installed in accordance with the manufacturer's instructions.
2. Mechanical or natural ventilation is otherwise provided in the cooking area.
3. The equipment is installed in a newly constructed dwelling unit ~~other than single family~~ that is not a detached one-family dwelling unit, or the equipment is installed in an existing kitchen not having an existing range hood exhaust duct to the outdoors.

Commenter's Reason: Per the original reason statement, exhausting kitchen pollutants at its source is one of the most significant measures that can be implemented to provide minimum acceptable indoor air quality in dwelling units. In detached single-family dwellings of new construction, a designer/builder has plenty of options for locating a kitchen exhaust fan to very simply exhaust it to the outdoors at a low first-cost.

This modification to the original proposal addresses the committee's objection regarding confusing language by clarifying the language in #3. The committee also objected to this proposal on the grounds that it unfairly discriminates against single family dwellings. From a public health perspective, the committee is correct that there is no good reason to exempt any dwelling unit from a requirement to duct kitchen exhaust equipment to the outdoors. However, requiring an exhaust duct for kitchen exhaust in all cases could be especially costly for some attached dwelling units that may have less options for cost-effectively ducting kitchen exhaust to the exterior. As such, I've restricted requirements to provide kitchen ducts with exhaust ducts to the exterior to the following scenarios: A) installation of a kitchen exhaust appliance in a new, detached, one-family dwelling unit and B) installation of a kitchen exhaust appliance in an existing kitchen with an existing range hood exhaust duct to the outdoors.

Bibliography: See original proposal for references.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Where builders are already installing ducts with range hoods, there will not be any increase in the cost of construction. Where new, single-family dwelling units are not currently provided with ducts for their range hoods, this proposal would increase the cost of construction. Installed duct costs can be estimated at ~ \$9.85 per linear foot for 3.25" x10" galvanized sheet metal (RS Means, 2015, Section 23 31 13.13.0500), and a damper would cost about \$15 retail.

RM12-18

RM17-18

IRC: M1504.3

Proposed Change as Submitted

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Residential Code

Revise as follows

M1504.3 Exhaust openings. Air exhaust openings shall terminate as follows:

1. Not less than 3 feet (914 mm) from property lines.
2. Not less than 3 feet (914 mm) from gravity air intake openings, operable windows and doors.
3. Not less than 10 feet (3048 mm) from mechanical air intake openings except where either of the following apply:
 - 3.1. The exhaust opening is located not less than 3 feet (914 mm) above the air intake opening.
 - 3.2. The exhaust opening is part of a factory-built intake/exhaust combination termination fitting installed in accordance with the manufacturer's instructions, and the exhaust air is drawn from a living space.
4. Openings shall comply with Sections R303.5.2 and R303.6.

Reason: This proposal is very similar to a PMGCAC proposal on the same subject. The only difference is that this proposal does not include the word "approved" in front of "factory-built intake/exhaust termination combination fitting". In some jurisdiction, equipment or products requiring approval will trigger an "alternative means and methods" process to secure a permit. As explained in the reason statement below, these products have been determined to perform well across manufacturers and models. With good performance and insignificant deviation across products, there is no need to further scrutinize these products or delay permits for dwelling units that specify them. This is the position of the Home Ventilating Institute.

The rest of the reason statement echoes that in the PMGCAC proposal:

Intake/exhaust combination terminations are regularly installed with heating and energy recovery ventilators (H/ERVs) used for dwelling units. Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water.

Manufacturer tests conducted by Natural Resources Canada (NRC) have demonstrated that use of intake/exhaust combination terminations results in minimum cross-contamination of airflows (i.e., not exceeding 4%; see NRC report A1-007793¹). These results are aligned with ASHRAE 62.2 approval of such devices which limits cross-contamination to 10%, as verified by the manufacturer. If approved, this proposed modification to the IRC would limit application of intake/exhaust combination terminations to "approved", "factory-built" units. Approval of this proposed modification is expected to result in more affordable and architecturally-flexible terminations.

Note: The IRC defines living space as, "space within a *dwelling unit* utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes". The use of the term "environmental air" was also considered, but was abandoned because "environmental air" can also include exhaust air from parking garages and clothes dryers, which we want to exclude from this exception.

Bibliography: Bibliography:

1. Ouazia, B. 2016. Evaluation of a dual hood performance in term of contaminant re-entrainment from exhaust to supply. A1-007793. National Research Council Canada. *For a copy of the report, please contact the proponent at the email address provided. Additional reports are available from the proponent upon request.*

Cost Impact: The code change proposal will decrease the cost of construction. This proposal can reduce the number of intake and exhaust penetrations required for a dwelling unit, thereby reducing the cost of construction.

RM17-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There is no listing or product approval for the fitting. (Vote 8-1)

Assembly Action:

None

RM17-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Mike Moore, representing Broan (mmoore@newportventures.net) requests As Submitted.

Commenter's Reason: Four proposals were submitted at the committee hearings to address factory-built intake/exhaust combination termination fittings for use within dwelling units -- two to the IMC (M16 and M17) and two to the IRC (RM17 and RM27). M17 and RM27 contained essentially the same language that would permit these fittings if approved (i.e., successfully navigating an alternative means and methods evaluation process). M16 and RM17 contained essentially the same language that would permit these fittings without requiring an alternative means and methods evaluation process.

In Columbus, the IMC committee approved M17 as submitted. At a minimum, to facilitate coordination across codes, RM27 should also be approved as submitted. However, it can be argued that M17 and RM27 s requirements for a special approval process for these terminations introduce unnecessary costs, especially since third-party testing of such terminations has shown excellent separation of supply and exhaust streams (see original rationale for more information), and these devices have been provided by manufacturers for installation with dwelling unit ventilation systems for about 2 decades with no known failures reported. Until failures or deficiencies of such terminations are documented, there is no compelling reason to require an alternative means and methods process for approval which would add cost and time to projects with little to no benefit to the consumer. So, we are also requesting support of PCs to approve M16 and RM17 As Submitted, which will remove any requirements for special approval of these terminations. In summary, the requested action at the final hearings is As Submitted for the following proposals: M16, M17, RM17, and RM27.

INSTALLATION I (JOIST MOUNTING-I) CONTINUED

10. Install outdoor hood and connect with insulated ducts.

(1) Panasonic recommends the use of the optional Wall Cap (Model: FV-WC04VE1) which is easy to install with one wall penetration and keeps the airstreams separate to minimize short-circuiting. (Fig. 4-2~5)

For more details, please check the INSTALLATION INSTRUCTIONS of Wall Cap.

Dual Hood Part 99-190

With the Lifebreath Dual Hood, only one 6 in hole is required in the exterior wall to complete two connections: fresh air intake and stale air exhaust.

RM19-18

IRC: M1505.4.4

Proposed Change as Submitted

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Residential Code

Revise as follows

M1505.4.4 Local exhaust rates. *Local exhaust* systems shall be designed to have the capacity to exhaust the minimum airflow rate determined in accordance with Table M1505.4.4. Intermittently operated exhaust fans in bathrooms and toilet rooms shall be provided with a delay-shutoff timer or humidity sensor control.

Exception: A delay-shutoff timer or humidity sensor control switch is not required for exhaust fans that function as a component of a programmed whole-house ventilation system.

Reason: This code change provides compliance options for intermittently operated exhaust fans when the bathroom is occupied (manual or humidity sensor activation) and for a limited period of time after the user leaves the room (delay timer or humidity sensor deactivation). Delay timer and humidity sensor exhaust fan controls are a consistent and effective means of removing indoor moisture and pollutants.

During a bath or shower, the humidity level in a bathroom can be a perfect breeding ground for mold, mildew and microorganisms that can negatively impact occupant health. Excess moisture has tremendous potential for damaging the structure. It cracks and peels paint, ruins gypsum wallboard, causes exterior paint failure, warps doors and rusts cabinets and fixtures. It can cause deterioration of joists and framing. As it condenses on windows, walls, ceilings and cabinets, it attracts dirt. It encourages mildew on tile grout and generally provides an environment for increased bacterial growth.

According to the Home Ventilation Institute, an intermittently operated exhaust fan needs to run at least 20 minutes after each shower to sufficiently remove moisture from an average size bathroom. Bathroom exhaust systems reduce the risk of mildew and mold growth, which is a sanitation and durability concern in all homes, regardless of climate. Delay timer and moisture sensor controlled exhaust fans are more effective than a manually operated fan or an operable window that is usually left closed during the winter and summer months of the year.

Automatic shut-off controls help to ensure exhaust fan operates when the bathroom is in use and for a limited period of time after the user leaves the room. Automatic controls also save energy by ensuring fans don't run unnecessarily after removal of moisture and pollutants.

Assembly Action:

None

RM19-18

Individual Consideration Agenda

Public Comment 1:

Proponent: David Collins, representing International Code Council Sustainability, energy and high performance code action committee (sehpcac@iccsafe.org)requests As Modified by This Public Comment.

Modify as follows:

2018 International Residential Code

M1505.4.4 Local exhaust systems rates. *Local exhaust* systems shall be designed to have the capacity to exhaust the minimum airflow rate determined in accordance with Table M1505.4.4. Intermittently operated exhaust fans in bathrooms ~~and shall be provided with a humidity sensor control or a delay-shutoff timer capable of and configured to delay fan shutoff for not less than 20 minutes.~~ Intermittently operated exhaust fans in toilet rooms shall be provided with a delay-shutoff timer or humidity sensor control capable of delaying fan shutoff for not less than 20 minutes.

Exception: A delay-shutoff timer or humidity sensor control switch is not required for exhaust fans that function as a component of a programmed whole-house ventilation system.

Commenter's Reason: Contrary to the committee statement, this code change is not redundant with other sections in the code. This modification clarifies the requirements by making a distinction between exhaust fan controls in bathrooms for moisture removal and exhaust fan controls in toilet rooms for odor removal.

It is well established that an exhaust fan needs an additional 20 minutes to evacuate the humidity or odor after the use of a bathroom unless a humidity sensor control is employed for moisture removal. These requirements only apply when an exhaust fan is provided in a bathroom in lieu of an operable window and not part of a programmed whole-house ventilation system.

When employed, bathroom exhausts reduce the risk of mildew and mold growth, which is a sanitation and durability issue in homes, regardless of climate. Automatic shut-off controls help to ensure exhaust fan operates when the bathroom is in use and for a limited period of time after the user leaves the room. Automatic controls also save energy by ensuring fans don't run unnecessarily after removal of moisture and pollutants.

This public comment was submitted by the ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors in July of 2011 to pursue opportunities and to improve and enhance assigned International Codes or portions thereof. Each year the SEHPCAC has historically held 3 open face-to face meetings and numerous Working Group meetings, conference calls and webinars. These meetings, conference calls and webinars are public and are convened to facilitate discussion and debate of proposed changes and public comments to the codes by members of the committee, as well as interested parties.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. A basic dial delay timer switch costs \$15, while a basic humidity sensor switch costs \$46. Timer and moisture controlled exhaust fans reduce the potential of making costly moisture damage repairs to correct problems that is easy to avoid with adequate local exhaust.

Public Comment 2:

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov); Julius Ballanco, JB Engineering and Code Consulting, P.C. (jbenengineer@aol.com)requests As Modified by This Public Comment.

Further modify as follows:

2018 International Residential Code

M1505.4.4 Local exhaust ~~rates~~ systems. *Local exhaust* systems shall be designed to have the capacity to exhaust the minimum airflow rate determined in accordance with Table M1505.4.4. Intermittently operated exhaust fans in bathrooms with a shower or bathtub and shall be provided with a humidity sensor control or shall be provided with a timer switch capable of operating the exhaust fan for not less than 20 minutes after the fan is manually activated. ~~Intermittently operated exhaust fans in toilet rooms shall be provided with a delay-shutoff timer switch or humidity sensor control capable of operating the exhaust fan for not less than 20-minutes after the fan is manually activated.~~

Exception: A delay-shutoff timer or humidity sensor control switch is not required for exhaust fans that function as a component of a programmed whole-house ventilation system.

Commenter's Reason: Contrary to the committee statement, this code change is not redundant with other sections in the code. This modification clarifies the requirements by making a distinction between exhaust fan controls in bathrooms for moisture removal and exhaust fan controls in toilet rooms for odor removal.

It is well established that an exhaust fan needs an additional 20 minutes to evacuate the humidity or odor after the use of a bathroom unless a humidity sensor control is employed for moisture removal. These requirements only apply when an exhaust fan is provided in a bathroom in lieu of an operable window and not part of a programmed whole-house ventilation system.

When employed, bathroom exhausts reduce the risk of mildew and mold growth, which is a sanitation and durability issue in homes, regardless of climate. Automatic shut-off controls help to ensure exhaust fan operates when the bathroom is in use and for a limited period of time after the user leaves the room. Automatic controls also save energy by ensuring fans don't run unnecessarily after removal of moisture and pollutants.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. A basic dial delay timer switch costs \$15, while a basic humidity sensor switch costs \$46. Timer and moisture controlled exhaust fans reduce the potential of making costly moisture damage repairs to correct problems that is easy to avoid with adequate local exhaust.

RM19-18

RM22-18

IRC: 202, M1505.4.3

Proposed Change as Submitted

Proponent: Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing Self (joe@buildingscience.com)

2018 International Residential Code

BALANCED VENTILATION. Any combination of concurrently operating mechanical exhaust and mechanical supply whereby the total mechanical exhaust airflow rate and the total mechanical supply airflow rate are substantially the same.

Revise as follows

M1505.4.3 Mechanical ventilation rate. The whole house mechanical ventilation system shall provide outdoor air at a continuous rate as determined in accordance with Table M1505.4.3(1) or Equation 15-1.

Ventilation rate in cubic feet per minute = $(0.01 \times \text{total square foot area of house}) + [7.5 \times (\text{number of bedrooms} + 1)]$

(Equation 15-1)

Exception-Exceptions:

1. The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25 percent of each 4-hour segment and the ventilation rate prescribed in Table M1505.4.3(1) is multiplied by the factor determined in accordance with Table M1505.4.3(2).
2. The minimum mechanical ventilation rate determined in accordance with Table M1505.4.3(1) or Equation 15-1 shall be reduced by 25%, provided that all of the following conditions apply:
 - 2.1. A ducted system supplies recirculated air directly to each bedroom and the largest common area.
 - 2.2. For continuously operating systems, not less than 70% of the air volume in the conditioned space is recirculated each hour through a ducted system, or for intermittently operating systems, an equivalent air recirculation is provided during each four hour period.
 - 2.3. The whole-house ventilation system is a balanced ventilation system.

Reason: This code change credits the better performance of whole-building dilution ventilation systems that are distributed, mixed and balanced.

Distributed, mixed and balanced ventilation is more effective at controlling indoor contaminants than typical exhaust ventilation that provides no distribution and mixing. Ventilation with effective distribution and mixing prevents or minimizes high levels of contaminant concentration in various spaces within houses, especially rooms where people spend a lot of time with doors closed such as bedrooms. Distribution and mixing homogenizes interior conditions reducing potentially harmful high intermittent contaminant concentrations in interior spaces. Complex field testing and contaminate transport software analysis have shown that 70% mixing combined with a 25% reduced balanced ventilation is equally as effective as a typical exhaust ventilation.

This code change does not penalize exhaust ventilation, it justifiably credits balanced ventilation. Exhaust only ventilation should not be given the same indoor air quality credit in energy rating calculations since typical exhaust ventilation systems result in less air change than balanced ventilation systems and do not provide as effective control of contaminants. This code change rectifies that inequity.

Technical justification for this proposed code change can be found in the following links:

https://buildingscience.com/sites/default/files/migrate/pdf/CP-0909_ASHRAE_Calibrated_Multizone_Airflow.pdf

https://buildingscience.com/sites/default/files/migrate/pdf/CP-0908_ASHRAE_Modifying_Ventilation_Airflow.pdf

https://buildingscience.com/sites/default/files/migrate/pdf/CP-0802_Field_Test_Room_to_Room.pdf

<http://www.nrcan.gc.ca/energy/efficiency/housing/home-improvements/18633>

https://www.nrc-cnrc.gc.ca/ctu-sc/files/doc/ctu-sc/ctu-n15_eng.pdf

Cost Impact: The code change proposal will decrease the cost of construction. Choosing to use a more effective type of ventilation will result in a lower ventilation rate which could reduce both construction and operating costs.

RM22-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The words "substantially the same" in the definition are subjective. The number of modifications offered indicate the need to revise this proposal in a public comment. (Vote 10-0)

Assembly Action:

None

RM22-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Craig Conner, representing Self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingscience.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Residential Code

BALANCED VENTILATION. Any combination of concurrently operating mechanical exhaust and mechanical supply whereby the total mechanical exhaust airflow rate ~~and is within 10% of the total mechanical supply airflow rate are substantially the same.~~

M1505.4.3 Mechanical ventilation rate. The whole house mechanical ventilation system shall provide outdoor air at a continuous rate as determined in accordance with Table M1505.4.3(1) or Equation 15-1.

Ventilation rate in cubic feet per minute = $0.01 \times$ total square foot area of house + ~~7.5~~ number of bedrooms + 1

Exceptions:

(Equation 15-1)

1. The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25 percent of each 4-hour segment and the ventilation rate prescribed in Table M1505.4.3(1) is multiplied by the factor determined in accordance with Table M1505.4.3(2).
2. The minimum mechanical ventilation rate determined in accordance with Table M1505.4.3(1) or Equation 15-1 shall be reduced by ~~25%~~ 30%, provided that ~~all both~~ of the following conditions apply:
 - 2.1. A ducted system supplies ~~recirculated ventilation~~ air directly to each bedroom and ~~the largest common area.~~
 - 2.2. ~~For continuously operating systems, not less than 70% of the air volume in the conditioned space is recirculated each hour through a ducted system, or for intermittently operating systems, an equivalent air recirculation is provided during each four hour period to one or more of the following rooms:~~
 - 2.1.1. Living room
 - 2.1.2. Dinning room
 - 2.1.3. Kitchen
 - ~~2.2.2.3.~~ The whole-house ventilation system is a balanced ventilation system.

Commenter's Reason: The words "substantially the same" are made less subjective by describing them as "within 10%" as requested by the committee.

The new 2.1 better describes the "largest common area" as the "living room, dining room or kitchen".

The text of exception 2.2 was deleted because the new 2.1 made it redundant and because the previous language of 2.2 was complicated.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This modification still provides potentially reduced construction and operating costs to those who choose to use balanced ventilation.

RM22-18

RM25-18

IRC: M1505.1, ASHRAE

Proposed Change as Submitted

Proponent: Mike Moore, representing The Home Ventilating Institute (mmoore@newportventures.net)

2018 International Residential Code

Revise as follows

M1505.1 General. Where local exhaust or whole-house mechanical ventilation is provided, the ~~equipment-ventilation system~~ shall be designed in accordance with this section, or the ventilation system shall be designed in accordance with ASHRAE 62.2.

Add new standard(s) follows

ASHRAE

ASHRE
1791 Tullie Circle NE
Atlanta GA 30329
US

62.2-2016:

Ventilation and Acceptable Indoor Air Quality in Residential Buildings with Addenda b, d, k, l, q, and s.

Reason: This proposed modification would provide builders with the OPTION of using ASHRAE Standard 62.2 to comply with the ventilation requirements of the IRC without requiring builders to use the standard. ASHRAE 62.2 is the ANSI standard for establishing minimum acceptable indoor air quality for dwelling units. There are several reasons that builders may want to use ASHRAE 62.2 instead of the IRC for compliance, including: greater flexibility for specifying climate-appropriate ventilation controls, ability to achieve energy and cost savings for homeowners by shifting operation of the ventilation system to times when ambient temperature and humidity are favorable, flexibility to specify innovative systems that can be demonstrated to provide equivalent exposure to pollutants, ability to down-size and save money on balanced ventilation equipment versus what may be required by the code, 62.2's use by code-plus programs such as ENERGY STAR and LEED, and ability to size the system as a function of measured dwelling unit air leakage instead of a one-size-fits-all approach.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Use of this standard is proposed as an OPTIONAL path. Costs associated with using 62.2 versus other compliance paths will vary based on the application. As such, this proposal will neither decrease nor increase the cost of construction.

RM25-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: ASHRAE 62.2 could supersede all of Chapter 15 and the builder could use 62.2 under the alternate approval provision in Chapter one. (Vote 10-0)

Assembly Action:

None

RM25-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Mike Moore, representing Broan (mmoore@newportventures.net) requests As Submitted.

Commenter's Reason: In Columbus, the IMC committee approved M33, which introduced the *option* for dwelling units to comply with the ventilation requirements of the IMC by following the requirements of ASHRAE 62.2, Ventilation and Acceptable Indoor Air Quality in Residential Buildings. To provide consistency across the IMC and IRC, dwelling units in the IRC should also have the *option* of complying with ventilation requirements of the IRC by following the requirements of ASHRAE 62.2. Further, approval of this proposal As Submitted is aligned with the ASHRAE/ICC memorandum of understanding signed in 2006, which states: *Both organizations agree to look for ways to develop appropriate code-enforceable language for ASHRAE standards and provide guidance to support the adoption of ASHRAE standards into ICC codes.*

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. Increasing options for compliance can decrease the cost of construction. See the original proposal for specific examples of potential cost savings and advantages of using ASHRAE 62.2 in place of the IRC ventilation requirements.

RM25-18

RM27-18

IRC: M1504.3

Proposed Change as Submitted

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows

M1504.3 Exhaust openings. Air exhaust openings shall terminate as follows:

1. Not less than 3 feet (914 mm) from property lines.
2. Not less than 3 feet (914 mm) from gravity air intake openings, operable windows and doors.
3. Not less than 10 feet (3048 mm) from mechanical air intake openings except where either of the following apply:
 - 3.1. the exhaust opening is located not less than 3 feet (914 mm) above the air intake opening.
 - 3.2. The exhaust opening is part of an approved factory-built intake/exhaust combination termination fitting installed in accordance with the manufacturer's instructions, and the exhaust air is drawn from a living space.
4. Openings shall comply with Sections R303.5.2 and R303.6.

Reason: Intake/exhaust combination terminations are regularly installed with heating and energy recovery ventilators (H/ERVs) used for dwelling units. Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water.

Manufacturer tests conducted by Natural Resources Canada (NRC) have demonstrated that use of intake/exhaust combination terminations results in minimum cross-contamination of airflows (i.e., not exceeding 4%; see NRC report A1-007793¹). These results are aligned with ASHRAE 62.2 approval of such devices, which limits cross-contamination to 10%, as verified by the manufacturer. If approved, this proposed modification to the IRC would limit application of intake/exhaust combination terminations to "approved", "factory-built" units. Approval of this proposed modification is expected to result in more affordable and architecturally flexible terminations.

Note: The IRC defines *living space* as, "space within a *dwelling unit* utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes".

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Bibliography:

- Ouazia, B. 2016. Evaluation of a dual hood performance in term of contaminant re-entrainment from exhaust to supply. A1-007793. National Research Council Canada. *For a copy of the report, please contact the proponent at the email address provided. Additional reports are available from the proponent upon request.*

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

RM27-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: These fittings are already allowed under the Chapter 1 alternate approval provisions. Some performance data is needed upon which to base an alternate approval. There is no test standard for such fittings. (Vote 8-1)

Assembly Action:

None

RM27-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Mike Moore, representing Broan (mmoore@newportventures.net) requests As Submitted.

Commenter's Reason: In Columbus, the IMC committee approved IMC proposal M17, which is basically the same proposal as RM27 but for the IMC. Third party testing of factory-built intake/exhaust combination termination fittings has shown excellent separation of supply and exhaust streams (see original rationale for more information), and these devices have been provided by manufacturers for installation with dwelling unit ventilation systems for about 2 decades, with no known failures reported. Included with this comment are examples of these units provided by major manufacturers of ventilation products.

At a minimum, the IRC and IMC should be aligned to ensure that these terminations have a clear path to approval within the code (i.e., like M17, RM27 should be approved as submitted to ensure that the terminations are clearly eligible to be approved). Arguably, until failures or deficiencies of such terminations are documented, there is no compelling reason to require an alternative means and methods process for approval which would add cost and time to projects with little to no benefit to the consumer; so please also approve M16 and RM17 As Submitted which will remove any requirements for special approval of these terminations. In summary, the requested action at the final hearings is As Submitted for the following proposals: M16, M17, RM17, and RM27.

INSTALLATION I (JOIST MOUNTING-I) CONTINUED

10. Install outdoor hood and connect with insulated ducts.

(1) Panasonic recommends the use of the optional Wall Cap (Model: FV-WC04VE1) which is easy to install with one wall penetration and keeps the airstreams separate to minimize short-circuiting. (Fig. 4-2~5)

For more details, please check the INSTALLATION INSTRUCTIONS of Wall Cap.

Dual Hood Part 99-190

With the Lifebreath Dual Hood, only one 6 in hole is required in the exterior wall to complete two connections: fresh air intake and stale air exhaust.

Note

- Tested by: National Research Council Canada
- Program: Building Regulations for Market Access Report Number: A1-007793
- Report Date: 15 February 2016
- Found to comply with requirement as set in the NBC

Dimensions of the Dual Outdoor Port Backplate

A	B	C	D
8 1/2" (214 mm)	9" (231 mm)	3/4" (19 mm)	3" (76 mm)

Dimensions of the Dual Outdoor Port

A	B	E	F
8 1/2" (214 mm)	9" (231 mm)	1 1/2" (48 mm)	3 1/4" (92 mm)

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. See original proposal.

RM31-18

IRC: M1601.1.1

Proposed Change as Submitted

Proponent: David Bixby, Air Conditioning Contractors of America (ACCA), representing Air Conditioning Contractors of America (bixster1953@yahoo.com)

2018 International Residential Code

Revise as follows

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards* or *NAIMA Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
 - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
 - 7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
 - 7.3. Stud wall cavities shall not convey air from more than one floor level.
 - 7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
 - 7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.
9. Zoned duct systems shall be designed and installed in accordance with ACCA Manual Zr.

Reason: Currently there is no coverage in the residential code to address the design of zoned duct systems. ACCA Manual Zr provides procedures for designing zoned comfort systems for single family detached homes, duplex and triplex homes, row houses, town houses, and large multi-family structures that are compatible with ACCA Manual J procedures for residential load calculations. In addition, use of Manual Zr will avoid the potential for an improperly designed zoned duct system to adversely impact the safe operation and durability of the heating/cooling equipment. For code officials, Manual Zr has three normative sections to determine clear compliance. Manual Zr is also a consensus-based ANSI standard.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
No cost impacts.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

RM31-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: ACCA Manual D already refers to Manual Zr. The standard is not yet published. The committee did not review the final version of the draft standard. (Vote 10-0)

Assembly Action:

None

RM31-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Patrick McLaughlin, Self, representing Air-Conditioning, Heating & Refrigeration Institute (pmclaugma@aol.com); David Bixby (david.bixby@acca.org); Eric Brodsky (ebrodskype@gmail.com); John Brown (jbrown@ewccontrols.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Residential Code

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than ~~250°F~~ 250 F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the ~~manufacturer's~~ manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA HVAC *Duct Construction Standards— Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed ~~125°F~~ 125 F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
 - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
 - 7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
 - 7.3. Stud wall cavities shall not convey air from more than one floor level.
 - 7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
 - 7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.
9. Zoned duct systems shall be designed and installed in accordance with the equipment manufacturer's instructions and ACCA Manual Zr ~~Zr~~ or in accordance with the equipment manufacturer's instructions and other approved methods.

Commenter's Reason: MCLAUGHLIN: RM31 was disapproved at the Committee Action Hearings primarily because the standard was not submitted as the ANSI approved published version at the time. The ANSI approved and published version has been submitted and is the exact same standard that was before the committee. The Air Conditioning, Heating & Refrigeration Institute member companies, who manufacture the effected equipment participated in the development of the standard with the Air Conditioning Contractors Association and strongly feel that ACCA Manual Zr will provide installers with necessary design guidance that will improve the installation of the systems. ACCA has modified the original submittal to clarify that manufactures instructions are also included as they are in the current code. Please approve this public comment

BIXBY: ACCA's public comment provides the final published ANSI/ACCA 11 Manual Zr - 2018: Residential HVAC System Zoning. The final published version is identical to the draft submitted in our original proposal. ACCA Manual Zr specifies procedures for designing zoned duct systems which are not contained in ACCA Manual D for single duct systems. Therefore, it is imperative that Manual Zr be specified by the IRC to avoid the potential for an improperly designed zoned duct system which could adversely impact the safe operation and durability of the heating/cooling equipment. In addition, ACCA requests that the proposal be further modified as underlined below.

9. Zoned duct systems shall be designed and installed in accordance with ACCA Manual Zr and the manufacturer's instructions or by other approved methods.

BRODSKY:

There is no coverage in the residential code to address the design of zoned duct systems. ACCA Manual Zr and the manufacturers instructions provides procedures for designing zoned comfort systems for residential homes, and structures that are compatible with ACCA Manual J procedures for residential load calculations. Use of Manual Zr will avoid the potential for an improperly designed zoned duct system that can adversely impact energy usage, occupant comfort as well as the operation of heating/cooling equipment. An National Association of Homebuilders (NAHB) study demonstrated that a proper zoning strategy could have over a 25% energy savings compared to a non-zoned home, as well as improved homeowner comfort. Manual Zr is a ANSI standard with normative sections that offer information written with clear code compliance

BROWN:

Manual Zr provides Code Officials and the AHJ, the means to determine whether a residential zone system was installed at a level of competency, that will avoid efficiency losses, equipment failures and most importantly, litigation.

Manual Zr employs a scientifically sound and defensible design methodology, for all currently manufactured types of HVAC Zone Systems.

AHRI member Zoning Manufacturers fully embrace ACCA Manual Zr. Using physics, Manual Zr levels the playing field and effectively homogenizes the zone manufacturer's design guidance.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

MCLAUGHLIN/BRODSKY: However, properly designed zoned duct systems will have long term cost benefit.

BIXBY: This code change will not affect the cost of a zoned comfort system as it represents a nationally-recognized minimum requirement for proper design and installation per manufacturer's instructions.

BROWN: The net effect of the public comment and code change proposal will decrease the cost of construction.

The cost impact of this decision is positive when compared to the current negative cost due to the lack of standardized design guidance.

RM31-18

RM39-18

IRC: Table TABLE M2105.4, Table TABLE M2105.5, NSF

Proposed Change as Submitted

Proponent: Jeremy Brown, representing NSF International (brown@nsf.org)

2018 International Residential Code

Revise as follows

**TABLE M2105.4

MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC)	ASTM D2846; ASTM F437; ASTM F438; ASTM F439; ASTM F441; ASTM F442; CSA B137.6
Cross-linked polyethylene (PEX)	ASTM F876; CSA B137.5
High-density polyethylene (HDPE)	ASTM D2737; ASTM D3035; ASTM F714; AWWA C901; CSA B137.1; CSA C448; NSF 358-1
Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe	ASTM F1282; AWWA C 903; CSA B137.9
Polypropylene (PP-R)	ASTM F2389; CSA B137.11, NSF 358-2
Polyvinyl chloride (PVC)	ASTM D1785; ASTM D2241; CSA 137.3
Raised temperature polyethylene (PE-RT)	ASTM F2623; ASTM F2769, CSA B137.18, <u>NSF358-4</u>

**TABLE M2105.5
GROUND-SOURCE LOOP PIPE FITTINGS**

PIPE MATERIAL	STANDARD
Chlorinated polyvinyl chloride (CPVC)	ASTM D2846; ASTM F437; ASTM F438; ASTM F439; ASTM F1970; CSA B137.6
Cross-linked polyethylene (PEX)	ASTM F877; ASTM F1807; ASTM F1960; ASTM F2080; ASTM F2159; ASTM F2434; CSA B137.5
High-density polyethylene (HDPE)	ASTM D2683; ASTM D3261; ASTM F1055; CSA B137.1; CSA C448; NSF 358-1
Polyethylene/aluminum/polyethylene (PE-AL-PE)	ASTM F1282; ASTM F2434; CSA B137.9
Polypropylene (PP-R)	ASTM F2389; CSA B137.11; NSF 358-2
Polyvinyl chloride (PVC)	ASTM D2464; ASTM D2466; ASTM D2467; ASTM F1970, CSA B137.2; CSA B137.3
Raised temperature polyethylene (PE-RT)	ASTM D2683; ASTM D3261; ASTM F1055; ASTM F1807; ASTM F2098; ASTM F2159; ASTM F2735; ASTM F2769; CSA B137.1; CSA B137.18, <u>NSF 358-4</u>

Add new standard(s) follows

NSF International
789 N. Dixboro Road P.O. Box 130140

NSF 358-4-2017:

Polyethylene of raised temperature (PE-RT) pipe and fittings for water-based ground-source (geothermal) heat pump systems

Reason: At the proposal deadline, NSF 358-4 was still a draft standard, but it is expected to be published prior to the public hearing. The balloted draft standard will be submitted with the proposal. Anyone may receive a complimentary copy of this draft standard for the purpose of reviewing this proposal by emailing brown@nsf.org.

These tables contain the acceptable materials for geothermal ground loop pipe and fittings. PE-RT piping and associated fittings are already accepted materials with referenced standards. NSF 358-4 is a proposed ANSI standard written specifically to contain requirements for PE-RT geothermal piping and fittings. Companion standards NSF 358-1 (PE) and NSF 358-3(PP) are already approved in this table. NSF 358-4 addresses performance pressure testing, long term strength, chemical resistance, constant tensile load joint testing, suitability for burial and marking specific to geothermal PE-RT piping systems.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Providing an additional option is cost neutral.

Analysis: A review of the standard proposed for inclusion in the code, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

RM39-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposed standard is not yet published. (Vote 10-0)

Assembly Action:

None

RM39-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jeremy Brown, representing NSF International (brown@nsf.org) requests As Submitted.

Commenter's Reason: NSF 358-4 was rejected by the committee because the standard was not completed at the time of this proposal's submittal. No one spoke against this standard. A draft standard was submitted to the committee at the time of proposal. The standard is complete without any changes from the draft submitted to the committee.

A copy of the standard may be viewed at http://www.nsf.org/newsroom_pdf/NSF_358-4-2018-watermarked.pdf. There is no controversy around this standard. It is the 4th in a suite of NSF Standards covering geothermal pipe and fittings. NSF 358-1 (Polyethylene) and NSF 358-2 (Polypropylene) are already referenced in Tables M2105.4 and Table M2105.5. NSF 358-3 (Crosslinked Polyethylene) was approved as submitted by the committee in P40.

NSF 358-4 Polyethylene of raised temperature (PE-RT) pipe and fittings for water-based ground-source (geothermal) heat pump systems should be added to provide an additional option to the code for this material.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This standard provide an another option for compliance and so is therefore cost neutral.

RM39-18

PSD1-18

IPSDC: 101.2, 101.3, 107.2, 107.2.1, 107.2.2, 1 (New), 304, 304.1, 304.1.1, 304.2, 304.3, 304.4, 304.5, 304.6, 504.5, 802.1, 802.4, 802.5, 802.10, 805.3, 805.6, Chapter 11, 1101.1, 1101.2, 1202.4, Chapter 14

Proposed Change as Submitted

Proponent: Dennis Hallahan, Infiltrator Water Technologies, representing National Onsite Wastewater Recycling Association (dhallahan@infiltratorwater.com)

2018 International Private Sewage Disposal Code

Revise as follows

[A] 101.2 Scope. Septic tank and effluent absorption systems or other treatment tank and effluent disposal systems shall be permitted where a public sewer is not available to the property served. ~~Unless specifically approved, the private sewage disposal system of each building shall be entirely separate from and independent of any other building.~~ The use of a common system or a system on a parcel other than the parcel where the structure is located shall be subject to the full requirements of this code as for systems serving public buildings.

[A] 101.3 Public sewer connection. Where public sewers become available to the premises served, the use of the *private sewage disposal system* shall be discontinued within that period of time required by law, but such period shall not exceed one year. The building sewer shall be disconnected from the *private sewage disposal system* and connected to the public sewer.

Exception: Where approved by the code official for such reasons as excessive cost or project difficulty, or where the existing system does not pose a health threat or is code compliant, then connection to the public sewer shall not be required.

[A] 107.2 Special inspections. Special inspections of alternative ~~engineered~~ design *private sewage disposal systems* shall be conducted in accordance with Sections 107.2.1 and 107.2.2.

[A] 107.2.1 Periodic inspection. The registered design professional or designated inspector shall periodically inspect and observe the alternative ~~engineered~~ design to determine that the installation is in accordance with the approved plans. Discrepancies shall be brought to the immediate attention of the *private sewage disposal system* contractor for correction. Records shall be kept of all inspections.

[A] 107.2.2 Written report. The registered design professional shall submit a final report in writing to the code official upon completion of the installation, certifying that the alternative ~~engineered~~ design conforms to the approved construction documents. A notice of approval for the *private sewage disposal system* shall not be issued until a written certification has been submitted.

SECTION 304 ALTERNATIVE ENGINEERED DESIGN

304.1 Alternative engineered design. The design, documentation, inspection, testing and approval of an alternative ~~engineered~~ design *private sewage disposal system* shall comply with Sections 304.1.1 through 304.6.

304.1.1 Design criteria. An alternative ~~engineered~~ design shall conform to the intent of the provisions of this code and shall provide an equivalent level of quality, strength, effectiveness, fire resistance, durability and safety. Material, equipment or components shall be designed and installed in accordance with the manufacturer's instructions.

304.2 Submittal. The registered design professional shall indicate on the permit application that the *private sewage disposal system* is an alternative ~~engineered~~ design. The permit and permanent permit records shall indicate that an alternative ~~engineered~~ design was part of the approved installation.

304.3 Technical data. The registered design professional shall submit sufficient technical data to substantiate the proposed alternative ~~engineered~~ design and to prove that the performance meets the intent of this code.

304.4 Construction documents. The registered design professional shall submit to the code official two complete sets of signed and sealed construction documents for the alternative ~~engineered~~ design.

304.5 Design approval. Where the code official determines that the alternative ~~engineered~~ design conforms to the intent of this code, the *private sewage disposal system* shall be approved. If the alternative ~~engineered~~ design is not approved, the code official shall notify the registered design professional in writing, stating the reasons therefor.

304.6 Inspection and test. The alternative ~~engineered~~ design shall be inspected in accordance with the requirements of Section 107.

Add new text as follows

504.5 Thermoplastic Tanks. Thermoplastic tanks shall conform to IAPMO Z1000, IAPMO IGC 262-2013 or CSA B66-16.

Revise as follows

504.5 6 Manholes. Manhole ~~collars and extensions shall be of the same material as the tank.~~ Manhole covers shall be of concrete, steel, cast iron, thermoplastic or other approved material.

802.1 General. Septic tanks shall be fabricated or constructed of welded steel, monolithic concrete, fiberglass, thermoplastic or an approved material. Tanks shall be water tight and fabricated to constitute an individual structure, and shall be designed and constructed to withstand anticipated loads. The design of prefabricated septic tanks shall be approved. Plans for site-constructed concrete tanks shall be approved prior to construction.

805.3 Construction. Holding tanks shall be constructed of welded steel, monolithic concrete, glass-fiber-reinforced polyester, thermoplastic or other approved materials.

802.4 Manholes. Each compartment of a tank shall be provided with not fewer than one manhole opening located over the inlet or outlet opening, and such opening shall be not less than 24 inches (610 mm) square or 24 inches (610 mm) in diameter. Where the inlet compartment of a septic tank exceeds 12 feet (3658 mm) in length, an additional manhole shall be provided over the baffle wall. Manholes shall terminate not greater than 6 inches (152 mm) below the ground surface. ~~Manholes shall be of the same material as the tank. Steel tanks shall have not less than a 2-inch (51 mm) collar for the manhole extensions permanently welded to the tank. The manhole extension on fiberglass tanks shall be of the same material as the tank and an integral part of the tank. The collar shall be not less than 2 inches (51 mm) high.~~

802.5 Manhole covers. Manhole risers shall be provided with a fitted, water-tight cover of concrete, steel, cast iron, thermoplastic or other approved material capable of withstanding all anticipated loads. Manhole covers terminating above grade shall have an approved locking device.

805.6 Manholes. Each tank shall be provided with either a manhole not less than 24 inches (610 mm) square or with a manhole having a 24-inch (610 mm) inside diameter extending not less than 4 inches (102 mm) above ground. Finished grade shall be sloped away from the manhole to divert surface water from the manhole. Each manhole cover shall have an effective locking device or tamper resistant screw fastener. Service ports in manhole covers shall be not less than 8 inches (203 mm) in diameter and shall be 4 inches (102 mm) above finished grade level. The service port shall have an effective locking cover or a brass cleanout plug.

802.10 Manhole riser joints. Joints on concrete risers and manhole covers shall be tongue-and-groove or shiplap type and sealed water tight using neat cement, mortar or bituminous compound. Joints on steel risers shall be welded or flanged and bolted and water tight. Steel manhole extensions shall be bituminous coated both inside and outside. Methods of attaching fiberglass and thermoplastic risers shall be water tight and approved.

CHAPTER **11 RESIDENTIAL-ADVANCED WASTE-WATER TREATMENT SYSTEMS**

1101.1 Scope. The provisions of this chapter shall govern ~~residential-advanced wastewater treatment~~ systems.

1101.2 Residential-Advanced waste-water treatment systems. The regulations for materials, design, construction and performance shall comply with NSF 40, NSF 245 or NSF 350, as applicable.

1202.4 Other inspections. In addition to the required inspection prior to backfilling, the code official shall conduct any other inspections deemed necessary to determine compliance with this code. Including inspections to verify adequate ongoing performance of the system as required.

Add new standard(s) follows

NSF/ANSI 245 - 2013:

Wastewater Treatment Systems - Nitrogen Reduction
NSF/ANSI 350-2014:

Onsite Residential and Commercial Water-Reuse Treatment Systems

B66-16:

Design, material, and manufacturing requirements for prefabricated septic tanks and sewage holding tanks

IAPMO IAPMO/ANSI Z1000-2013 Prefabricated Septic Tanks

IAPMO IAPMO IGC 262-2013 Corrugated Thermoplastic Tanks

Reason: 101.1 Cluster system designs are very common, can serve more than one building, and allow additional solutions to protect public health.

101.3 A private sewage treatment system can provide wastewater treatment similar to a public sewer.

107.2, 107.2.1, 304, 304.1, 304.1.1, 304.2, 304.3, 304.4, 304.5, 304.6:

In the 2015 International Private Sewage Disposal Code, the phrase Alternative Engineered Design is stated 16 times, including the table of contents and the index, therefore there are additional locations to remove this term. The Code does not define an "Alternative Engineered Design", nor does it provide guidance as to what constitutes an Alternative Engineered Design. Many states, provinces, and international programs allow registered sanitarians or environmental specialists to design sewage treatment systems, hence NOWRA requests that the term "engineered" be removed from this section and others.

New Section 504.5 Thermoplastic tanks are approved by all 50 states and provinces and are common internationally.

504.5 (this section number should be moved up to 504.6) Thermoplastic collars and extensions are approved by all 50 states. It is common practice to have materials differing than the tank. For example, thermoplastic extensions are cast into concrete tanks.

802.1 Thermoplastic tanks are approved by all 50 states and provinces and are common internationally.

802.4 Thermoplastic collars and manhole extensions are approved by all 50 states and provinces. It is common practice to have materials differing than the tank.

802.5, 802.10, & 805.3 Thermoplastic materials have been in use for many years and are approved in all states and provinces.

805.6 Tamper resistant screws are standard practice are approved in many state and provincial codes.

11 The title is proposed to change to Advanced Waste-Water Treatment Systems because this is the most common industry term. The term "Residential" is removed because the facilities served can be residential or commercial.

1101.1 Change consistent with Section 11 above.

1101.2 The term Residential is removed to be consistent with Section 11 above. Available new standards are NSF 245 and NSF 350 to address nutrient removal and reuse.

1202.4 As the decentralized wastewater industry progresses, many states, provinces, and counties require operational permits for private sewage treatment systems, both conventional and/or advanced waste-water treatment systems.

Cost Impact: The code change proposal will decrease the cost of construction

101.1 By allowing other solutions to be considered the cost may be lowered.

101.3 The private sewage treatment system option may have a lower cost.

107.2, 107.2.1, 304, 304.1, 304.1.1, 304.2, 304.3, 304.4, 304.5, & 304.6:

Allowing other certified professionals to design systems will increase choices and may lower costs.

New Section 504.5 The inclusion of Thermoplastic tanks will increase choices and may offer cost savings in materials and labor.

504.5 The inclusion of thermoplastic collars and extensions will increase choices and may offer cost savings.

802.1 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

802.4 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

802.5 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

802.10 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

805.3 The inclusion of thermoplastic materials will increase choices and may offer cost savings.

805.6 The inclusion of tamper resistant screws will increase choices and may offer cost savings.

11 The code change proposal will have no impact on the cost of construction.

1101.1 The code change proposal will have no impact on the cost of construction.

1101.2 For the jurisdictions that require treatment in accordance with these standards, the code change proposal will have no impact on the cost of construction.

1202.4 For the jurisdictions that require operational permits, the code change proposal will have no impact on the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, NSF 245-2013, IAPMO Z1000-2013, IAPMO IGC 262-2013 and CSA B66-16 with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018. The referenced standard, NSF 350-2014, is currently referenced in other 2018 I-codes.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Evaluation of site and system by an arbitrary person seems too open. Removal of "engineered" is inappropriate as these systems require engineering input. (Vote:13-1)

Assembly Action:

None

PSD1-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Private Sewage Disposal Code

101.3 Public sewer connection. Where public sewers become available to the premises served, the use of the *private sewage disposal system* shall be discontinued within that period of time required by law, but such period shall not exceed one year. The building sewer shall be disconnected from the *private sewage disposal system* and connected to the public sewer.

~~**Exception:** Where approved by the code official for such reasons as excessive cost or project difficulty, or where the existing system does not pose a health threat or is code compliant, then connection to the public sewer shall not be required. Existing private sewage disposal systems in accordance with Section 102.4.~~

304.1 Alternative ~~engineered~~ design. The design, documentation, inspection, testing and approval of an alternative design *private sewage disposal system* shall comply with Sections 304.1.1 through 304.6.

802.5 Manhole covers. Manhole risers shall be provided with a fitted, water-tight cover of concrete, steel, cast iron, thermoplastic or other approved material capable of withstanding all anticipated loads. Manhole covers terminating above grade shall have an approved locking ~~device~~ device or tamper resistant screw fasteners.

1202.4 Other inspections. In addition to the required inspection prior to backfilling, the code official shall conduct any other inspections deemed necessary to determine compliance with this code. ~~including code. Such inspections to verify adequate ongoing performance of the system as required shall verify that the installation will perform in a safe and sanitary condition.~~

Commenter's Reason: The National Onsite Wastewater Recycling Association (NOWRA) is the largest organization within the United States dedicated to educating and representing members within the onsite and decentralized wastewater treatment industry. Their members include educators, regulators, engineers, contractors, manufacturers, suppliers, service providers, and other parties.

The original proposal is the result of NOWRA members working together to advise regulatory bodies of issues hindering the acceptance of decentralized advanced wastewater treatment systems. These systems can provide optimal wastewater management for homes, businesses and industrial centers where water recycling is encouraged or necessary to reduce the demand on municipal potable water systems and wastewater treatment infrastructures. Because many locations in North America are already restricting potable water use because of the lack of raw water supplies caused by climate changes, population growth, or the exorbitant cost of treatment of poor quality raw water; decentralized, onsite advanced wastewater treatment systems offer one solution to these problems.

Technical Support for the Public Comment

The following are the committee's two reasons for disapproval and the remedy provided for each in this public comment:

Section 101.3 : "Evaluation of site and system by an arbitrary person seems too open". It is agreed that cost can be a subjective assessment. Accordingly it has been removed in the exception and replaced by a reference to Section 102.4 which explicitly permits existing installations to remain in service provided they are properly maintained. Section 102.4

reads as follows:

102.4 Existing installations. *Private sewage disposal systems* lawfully in existence at the time of the adoption of this code shall be permitted to have their use and maintenance continued if the use, maintenance or repair is in accordance with the original design and no hazard to life, health or property is created by the system.

This is and should be the key consideration - does the existing private sewage disposal system perform in a safe and sanitary condition? If it does, the code allows it to remain operational. Further, Section 102.5 Maintenance requires both existing and new systems to be maintained in proper operating condition and empowers the code official to require reinspection at any time.

Sections 107 and 304: "Removal of "engineered" is inappropriate as these systems require engineering input." The removal of term "engineered" is not an indication that a responsible design professional is not involved in alternative designs. Section 304.2 specifically requires that a "registered design professional" perform these designs. The Chapter 2 definition of "registered design professional" does not require the "registered design professional" to be an engineer. There are other types of design professionals who are registered or licensed to practice their respective design profession. Many states, provinces, and international programs allow registered or licensed sanitarians or environmental specialists to design sewage treatment systems. Becoming registered or licensed requires significant education and training to satisfy the statutory requirements of the entities that issue such registrations and licenses. Removal of term "engineered" is simply to avoid misunderstandings about who the registered design professional can be. The deletion of the term "engineered" in the title to Section 304.1 was overlooked in the original proposal and has been corrected in this public comment.

Two additional changes are included in this public comment, Sections 802.5 and 1202.4.

Section 802.5: The revision to Section 802.5 provides an alternative to manhole cover locking devices and was actually a modification that was suggested by the floor, ruled in order by the Chair and testified upon at the hearing. There was no opposition to this modification at the hearing.

Section 1202.4: The change is intended to clarify the proposed additional sentence, resulting in an inspection which ensures a safe and sanitary installation.

The remainder of the original proposal is retained unchanged. It was noted at the CAH that the proposal includes requirements that are appropriate for "Advanced Waste Water Treatment Systems" by virtue of the addition of the noted additional NSF standards.

This public comment is submitted by the ICC PMGCAC. CAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 and 2018 the PMGCAC has held one face-to-face meeting and 11 conference call meetings which included members of the committee as well as any interested party to discuss and debate the proposed changes and public comments. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac/>.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The proposal along with this public comment offers alternative methods for providing for wastewater disposal for building. Options offer designers a choice of the most cost effective method for solving construction challenges.

PSD1-18

PSD3-18

IPSDC: 802.1

Proposed Change as Submitted

Proponent: William Hall, Portland Cement Association, representing Alliance For Concrete Codes and Standards (jhall@cement.org); Eric Carleton, National Precast Concrete Association, representing National Precast Concrete Association (ecarleton@precast.org); Stephen Szoke, representing American Concrete Institute (steve.szoke@concrete.org)

2018 International Private Sewage Disposal Code

Revise as follows

802.1 General. Septic tanks shall be fabricated or constructed of welded steel, monolithic concrete, fiberglass or an approved material. Tanks shall be water tight and fabricated to constitute an individual structure, and shall be designed and constructed to withstand anticipated ~~loads.~~ hydraulic and structural loads including soil, hydrostatic, flotation and traffic when conditions exist. When required by the code official, the design of septic tanks shall be by a registered professional engineer within the state or province of the septic tank installation. The design of prefabricated septic tanks shall be approved. Plans for site-constructed concrete tanks shall be approved prior to construction.

Reason: Section 802.1 General. The current language ignores clarifying that the critical components of septic tank design is both hydraulic for correct sizing and structural for continued function of the tank without failure. The listing of specific loads is for the benefit of the reviewer to be aware that each site is unique and requires the designer to be aware and acknowledge those variable conditions have been analyzed.

Section 802.4 Manholes. The reasoning to strike the existing sentence is the same as describe in section 504.5, the existing language requires the use of the same materials for the extension sections (risers) as that of the lid and tank. Current septic tank fabrication methods have successfully fabricated hybrid systems which utilize precast concrete for the tank chamber for the attributes it possesses and other materials for the risers which are directly cast into the flattop lid to make a watertight seal.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Provides clarification

PSD3-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: It is too specific to require a register professional engineer from the specific state of province to design the tank. (Vote:11-3)

Assembly Action:

None

PSD3-18

Individual Consideration Agenda

Public Comment 1:

Proponent: William Hall, Portland Cement Association, representing Alliance for Concrete Codes and Standards (jhall@cement.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Private Sewage Disposal Code

802.1 General. Septic tanks shall be fabricated or constructed of welded steel, monolithic concrete, fiberglass or an approved material. Tanks shall be water tight and fabricated to constitute an individual structure, and shall be designed and constructed to withstand anticipated hydraulic and structural loads including soil, hydrostatic, flotation and traffic when conditions exist. When required by the code official, the design of septic tanks shall be by a registered professional engineer ~~within the state or province of the septic tank installation~~. The design of prefabricated septic tanks shall be approved. Plans for site-constructed concrete tanks shall be approved prior to construction.

Commenter's Reason: Section 802.1 General. The current language ignores clarifying that the critical components of septic tank design are both hydraulic loading for correct sizing and structural for continued tank function without failure. The listing of specific loads is for the benefit of the reviewer to be aware that each site is unique and requires the designer of record to be aware and acknowledge those variable conditions have been analyzed. The committee did not like the proposed language dealing with design professional. While the engineer should be aware of local soil properties, the committee felt it should not be limited to engineers within the state or province.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The public comment only clarifies responsibility and does not affect materials or labor costs of construction.

PSD3-18

P1-18 Part II

IRC: R202

Proposed Change as Submitted

Proponent: Pennie L Feehan, Pennie L. Feehan Consulting, representing Copper Development Association
(penniefeehan@me.com)

2018 International Residential Code

Add new definition as follows

COPPER ALLOY. A homogeneous mixture of not less than two metals where not less than 50% of the finished metal is copper.

Reason:

It is important to understand that copper tube is an almost pure copper alloy, composed of 99.9% Cu + Ag combined with no greater than 0.04% P. Whereas, a copper alloy is a mixture of at least two metals in which copper is the primary component comprising no less than 50% and is combined with other elements to create different copper alloys.

Therefore, brass, bronze, red brass, etc. are all forms of Copper Alloy.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This code change proposal will not increase or decrease the cost of construction.

P1-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: No definitions for materials are in the code now, so this is unneeded text. (Vote: 7-0)

Modify as follows:

2018 International Mechanical Code

COPPER ALLOY. ~~A homogeneous mixture of not less than two metals where not less than 50% of the finished metal metal alloy where the principal component is copper.~~

Commenter's Reason: This definition is similar to definitions found on the internet and was approved by the IPC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This definition simply clarifies what is already required by the code and therefore, does not impact the cost of materials.

P1-18 Part III

P1-18 Part IV

IFGC: 202 (New)

Proposed Change as Submitted

Proponent: Pennie L Feehan, Pennie L. Feehan Consulting, representing Copper Development Association
(penniefeehan@me.com)

2018 International Fuel Gas Code

Add new definition as follows

COPPER ALLOY. A homogeneous mixture of not less than two metals where not less than 50% of the finished metal is copper.

Reason: It is important to understand that copper tube is an almost pure copper alloy, composed of 99.9% Cu + Ag combined with no greater than 0.04% P. Whereas, a copper alloy is a mixture of at least two metals in which copper is the primary component comprising no less than 50% and is combined with other elements to create different copper alloys. Therefore, brass, bronze, red brass, etc. are all forms of Copper Alloy.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This code change proposal will not increase or decrease the cost of construction.

IPC: TABLE 403.1 (IBC: [P] TABLE 2902.1)

Proposed Change as Submitted

Proponent: Don Davies, Salt Lake City Corporation, representing Utah Chapter of International Code Council (don.davies@slcgov.com)

2018 International Plumbing Code

Revise as follows

**TABLE 403.1
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES^a (See Sections 403.1.1 and 403.2)**

NO.	CLASSIFICATION	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 424.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
			MALE	FEMALE	MALE	FEMALE			
1	Assembly	Theaters and other buildings for the performing arts and motion pictures ^d	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
		Nightclubs, bars, taverns, dance halls and buildings for similar purposes ^d	1 per 40	1 per 40	1 per 75		—	1 per 500	1 service sink
		Restaurants, banquet halls and food courts ^d	1 per 75	1 per 75	1 per 200		—	1 per 500	1 service sink
		Gaming areas	1 per 100 for the first 400 and 1 per 250 for the remainder exceeding 400	1 per 50 for the first 400 and 1 per 150 for the remainder exceeding 400	1 per 250 for the first 750 and 1 per 500 for the remainder exceeding 750		—	1 per 1,000	1 service sink
		Auditoriums without permanent seating, art galleries, exhibition halls, museums, lecture halls, libraries, arcades and gymnasiums ^d	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
		Passenger terminals and transportation facilities ^d	1 per 500	1 per 500	1 per 750		—	1 per 1,000	1 service sink
		Places of worship and other religious services ^d	1 per 150	1 per 75	1 per 200		—	1 per 1,000	1 service sink

		Coliseums, arenas, skating rinks, pools and tennis courts for indoor sporting events and activities	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink
		Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities ^f	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink
2	Business	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses	1 per 25 for the first 50 and 1 per 50 for the remainder exceeding 50	1 per 40 for the first 80 and 1 per 80 for the remainder exceeding 80	—	—	—	1 per 100	1 service sink ^e
3	Educational	Educational facilities	1 per 50	1 per 50	—	—	—	1 per 100	1 service sink
4	Factory and industrial	Structures in which occupants are engaged in work fabricating, assembly or processing of products or materials	1 per 100	1 per 100	—	—	—	1 per 400	1 service sink
5	Institutional	Custodial care facilities	1 per 10	1 per 10	1 per 8	—	—	1 per 100	1 service sink
		Medical care recipients in hospitals and nursing homes	1 per room ^c	1 per room ^c	1 per 15	—	—	1 per 100	1 service sink per floor
		Employees in hospitals and nursing homes ^b	1 per 25	1 per 35	—	—	—	1 per 100	—
		Visitors in hospitals and nursing homes	1 per 75	1 per 100	—	—	—	1 per 500	—
		Prisons ^b	1 per cell	1 per cell	1 per 15	—	—	1 per 100	1 service sink
		Reformatories, detention centers, and correctional centers ^b	1 per 15	1 per 15	1 per 15	—	—	1 per 100	1 service sink

		Employees in reformatories, detention centers and correctional centers ^b	1 per 25	1 per 35	—	1 per 100	—
		Adult day care and child day care	1 per 15	1 per 15	1	1 per 100	1 service sink
6	Mercantile	Retail stores, service stations, shops, salesrooms, markets and shopping centers	1 per 500	1 per 750	—	1 per 1,000	1 service sink ^e
7	Residential	Hotels, motels, boarding houses (transient)	1 per sleeping unit	1 per sleeping unit	1 per sleeping unit	—	1 service sink
		<u>Hostels (transient)</u>	<u>1 per 10</u>	<u>1 per 10</u>	<u>1 per 8</u>	<u>1 per 100</u>	<u>1 service sink</u>
		Dormitories, fraternities, sororities and boarding houses (not transient)	1 per 10	1 per 10	1 per 8	1 per 100	1 service sink
		Apartment house	1 per dwelling unit	1 per dwelling unit	1 per dwelling unit	—	1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per 20 dwelling units
		Congregate living facilities with 16 or fewer persons	1 per 10	1 per 10	1 per 8	1 per 100	1 service sink
		One- and two-family dwellings and lodging houses with five or fewer guestrooms	1 per dwelling unit	1 per dwelling unit	1 per dwelling unit	—	1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per dwelling unit
7	Residential	Congregate living facilities with 16 or fewer persons	1 per 10	1 per 10	1 per 8	1 per 100	1 service sink
8	Storage	Structures for the storage of goods, warehouses, storehouse and freight depots. Low and Moderate Hazard.	1 per 100	1 per 100	—	1 per 1,000	1 service sink

Reason: Hostels are not addressed in the code and they are unique in that they operate like a hotel/motel for transient stay as an R-1 occupancy but the restrooms facilities provided resemble the requirements for R-2 boarding houses where

restroom facilities are shared as opposed to hotels and motels where each sleep unit must be provided with its own water closet, lavatory and tub or shower. This creates a problem when applying the provisions of I.B.C. Table 2902.1. The resolution would be to create another R-1 occupancy designation with a description of Hostels and place the requirements for plumbing fixtures from R-2 boarding houses into that classification. A precedent has already been established with two R-2 classifications one for boarding houses and another for apartments which have different requirements. Arbitrarily placing hostels in an R-2 occupancy group would also subject that use to the more restrictive accessibility requirements of I.B.C. Section 1106.2.2.1. While hostels are not that common in the U.S. they are quite common elsewhere in the world and the I.B.C. is an international code so this issue should be addressed.

Cost Impact: The code change proposal will decrease the cost of construction

As the code is written, the hostel would be required to be classified as an R-1 occupancy and would be required to have restrooms in each sleeping room. With the proposed change, the hostel classification would still remain an R-1 occupancy but the number of restrooms would decrease.

Analysis: Duplicated text in the IBC is not shown for brevity.

P13-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Coverage for hostels needs to begin by the IBC identifying the group classification that they fall under. (Vote:13-1)

Assembly Action:

None

P13-18

Individual Consideration Agenda

Public Comment 1:

Proponent: William Warlick, representing Salt Lake City Building Services (william.warlick@slcgov.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

HOSTEL. Lodging facility for transient stay providing shared bathing and restroom facilities and where community cooking facilities may or may not be provided on site.

310.2 Residential Group R-1. Residential Group R-1 occupancies containing *sleeping units* where the occupants are primarily *transient* in nature, including:

- Boarding houses (transient) with more than 10 occupants*
- Congregate living facilities (transient) with more than 10 occupants*
- Hostels
- Hotels (transient)*
- Motels (transient)*

310.3 Residential Group R-2. Residential Group R-2 occupancies containing *sleeping units* or more than two *dwelling units* where the occupants are primarily permanent in nature, including:

- Apartment houses
- Congregate living facilities (nontransient) with more than 16 occupants*

- Boarding houses (nontransient)*
- Convents
- Dormitories*
- Fraternities and sororities
- Monasteries

- Hostels
- Hotels (nontransient)
- Live/work units*
- Motels (nontransient)
- Vacation timeshare properties

Commenter's Reason: As requested by the Committee, we propose a definition for *hostel* in the IBC Chapter 2 and add the defined term to Group R1 and R2 descriptions.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This public comment only clarifies the what the proposal intends to regulate. As indicated in the proposal, the cost of construction will decrease because fewer toilet facilities will be required.

P13-18

P14-18

IPC: 403.1.1

Proposed Change as Submitted

Proponent: Josephine Ortega, representing University of California

2018 International Plumbing Code

Revise as follows

403.1.1 Fixture calculations. To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table 403.1. Fractional numbers resulting from applying the fixture ratios of Table 403.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

Exception-Exceptions:

1. The total occupant load shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Where multi-user facilities are designed to serve all genders, the minimum fixture count shall be calculated 100%, based on total occupant load. In such multi-user user facilities, each fixture type shall be in accordance with ICC A117.1 and each urinal that is provided shall be located in a stall.

Reason: This proposal will permit designers to design gender specific facilities using either the men or women category. The proposal will also bridge the gap of designing for facilities that elect to install all-inclusive bathroom/restrooms.

1. See attached

Bibliography: [Title of book] [Report/Document #] [Author] [Year published] [Page #]

P14-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Bryan Romney, representing selfrequests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

403.1.1 Fixture calculations. To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table 403.1. Fractional numbers resulting from applying the fixture ratios of Table 403.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

Exceptions:

1. The total occupant load shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Where adopted by local, state or federal law in the jurisdiction to allow multi-user facilities ~~are~~ designed to serve all genders, the minimum fixture count shall be calculated 100%, based on total occupant load. In such multi-user user facilities, each fixture type shall be in accordance with ICC A117.1 and each urinal that is provided shall be located in a stall.

Commenter's Reason: Approve as modified by this Public Comment.

The IBC and IPC and other legacy codes have for many years prescribed the requirements for multi-stall toilet facilities for male and female. The expectation of separate facilities for male and female has long been accepted by the public and code officials as a point of law and even civil rights. Recent changes to this expectation have prompted this proposed code change which could be adopted in the IPC and ultimately in the IBC for All-Inclusive multi-stall toilet facilities. However, this issue is not a building or plumbing code issue, it is more appropriately a civil rights issue which should be decided in the judicial system, public referendum, state law, ordinance, or whatever mechanism is recognized by the jurisdiction to establish legal and defensible and constitutional law. The language of this proposed code change does not stipulate whether action by the code official to allow Exception #2 is legal and constitutional which honors the civil rights of all people. The proposed code change would put at risk the actions by the jurisdiction, permit applicant and potentially those involved in the design and construction of an all-inclusive toilet facility without first having been vetted by the public and deemed law for the city, county, state or other jurisdictional areas governed by the IBC and IPC.

For example, if an all-inclusive toilet facility was constructed and a segment of the public decided that this facility was a violation of privacy and was an act of discrimination of their civil rights and legal action ensued, without the due process of law to vet this type of facility as legal and adopted by law, this all-inclusive toilet facility and the actions by those who approved and built it would be at risk of legal action. Other potential objections which could prompt such legal challenges are those people who question the impact of all-inclusive toilet facilities on children (Group E Occupancies) for age groups kindergarten through the 12th grade, the lack of privacy in the sink area, sanitation of the water closets in the stalls used by both men and women, or the action by jurisdictions to require all-inclusive toilet rooms in places of worship or other public buildings. There is no language in this proposed code change which restricts a jurisdiction from required compliance to Exception #2 at will for all or certain occupancies.

Additionally, the proponent in the Reason statement includes bathrooms in addition to restrooms. It is unclear as to the intent of the proponent to include bathrooms. There are no proposed code changes for all-inclusive bathrooms. If there is a proposed code change for bathrooms to be designed as all-inclusive facilities, then the same reasons as described above apply and must be considered for modifications as proposed by this Public Comment.

It is of vital importance that this proposed code change be modified by this public comment in order to protect all people's civil rights and avoid legal action. This proposed code change is not an exception which belongs in the IPC and IBC alone, but rather an action which should be determined by the due process of the law. Provide a safe and defensible position for the jurisdiction, the code official, the permit applicant, the design professionals, the contractors and others by approving this Public Comment.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost impact shown in the original proposed code change is not accurate. The cost impact by the proposed code change is significantly more when compared to the cost of a typical toilet room. The proposed All-Inclusive Toilet Room would require the construction of separate stalls for water closets and urinals. This construction would require floor to ceiling walls and doors which will need finishes which are durable and waterproof in accordance with IBC section 1210.2.2. The partition construction of each stall would be a custom installation as compared to a manufactured metal compartment system currently used. The door for each stall would need to be a type of door and frame which has acoustic features not required currently. The individual stalls proposed for All-Inclusive Toilet Rooms will require individual HVAC systems and Individual Lighting systems. These requirements under the current code requirements are significantly less when compared to potential design solutions for the All-Inclusive toilet room proposal. Without further assessment of the cost impact, disapproval of this proposed change should be reason enough for disapproval.

Public Comment 2:

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov) requests Disapprove.

Commenter's Reason: This proposal is intended to allow men and women to share the same restroom, but it does not address the separate facilities code sections at all. This adds confusion to the code and this proposal should not be approved. Also, approval of P15-18 makes this proposal obsolete.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction. Disapproval of this proposal will not cause the code to require anything more or less than it does now.

Public Comment 3:

Proponent: Bryan Romney, University of Utah, representing self requests Disapprove.

Commenter's Reason: Move to Disapprove

The IBC and IPC and other legacy codes have for many years prescribed the requirements for multi-stall toilet facilities for male and female. The expectation of separate facilities for male and female has long been accepted by the public and code officials as a point of law and even civil rights. Recent changes to this expectation have prompted this proposed code change which could be adopted in the IPC and ultimately in the IBC for All-Inclusive multi-stall toilet facilities. However, this issue is not a building or plumbing code issue, it is more appropriately a civil rights issue which should be decided in the judicial system, public referendum, state law, ordinance, or whatever mechanism is recognized by the jurisdiction to establish legal and defensible and constitutional law. The language of this proposed code change does not stipulate whether action by the code official to allow Exception #2 is legal and constitutional which honors the civil rights of all people. The proposed code change would put at risk the actions by the jurisdiction, permit applicant and potentially those involved in the design and construction of an all-inclusive toilet facility without first having been vetted by the public and deemed law for the city, county, state or other jurisdictional areas governed by the IBC and IPC.

For example, if an all-inclusive toilet facility was constructed and a segment of the public decided that this facility was a violation of privacy and was an act of discrimination of their civil rights and legal action ensued, without the due process of law to vet this type of facility as legal and adopted as law, this all-inclusive toilet facility and the actions by those who approved and built it would be at risk of legal action. Other potential objections which could prompt such legal challenges are those persons who question the impact of all-inclusive toilet facilities on children (Group E Occupancies) for age groups kindergarten through the 12th grade, the lack of privacy in the sink area, sanitation of the water closets in the stalls used by both men and women, or the action by jurisdictions to require all-inclusive toilet rooms in places of worship or other public buildings. There is no language in this proposed code change which restricts a jurisdiction from required compliance to Exception #2 at will for all or certain occupancies.

Additionally, the proponent in the Reason statement includes bathrooms in addition to restrooms. It is unclear as to the intent of the proponent to include bathrooms. There are no proposed code changes for all-inclusive bathrooms. If there is a proposed code change for bathrooms to be designed as all-inclusive facilities, then the same reasons as described above apply and must be considered for disapproval.

Disapproval is requested.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

The cost impact shown in the original proposed code change is not accurate. The cost impact by the proposed code change is significantly more when compared to the cost of a typical toilet room. The proposed All-Inclusive Toilet Room would require the construction of separate stalls for water closets and urinals. This construction would require floor to ceiling walls and doors which will need finishes which are durable and waterproof in accordance with IBC section 1210.2.2. The partition construction of each stall would be a custom installation as compared to a manufactured metal compartment system currently used. The door for each stall would need to be a type of door and frame which has acoustic features not required currently. The individual stalls proposed for All-Inclusive Toilet Rooms will require individual HVAC systems and Individual Lighting systems. These requirements under the current code requirements are significantly less when compared to potential design solutions for the All-Inclusive toilet room proposal. Without further assessment of the cost impact, disapproval of this proposed change should be reason enough for disapproval.

IPC: 403.1.1 (IBC [P] 2902.1.1), 403.1.2 (IBC [P] 2902.1.2), 403.2 (IBC [P] 2902.2)

Proposed Change as Submitted

Proponent: David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Plumbing Code

Revise as follows

403.1.1 Fixture calculations. To determine the occupant load of each sex, the total occupant load shall be divided in half. To determine the required number of fixtures, the fixture ratio or ratios for each fixture type shall be applied to the occupant load of each sex in accordance with Table 403.1. Fractional numbers resulting from applying the fixture ratios of Table 403.1 shall be rounded up to the next whole number. For calculations involving multiple *occupancies*, such fractional numbers for each *occupancy* shall first be summed and then rounded up to the next whole number.

Exception-Exceptions:

1. The total occupant load shall not be required to be divided in half where *approved* statistical data indicates a distribution of the sexes of other than 50 percent of each sex.
2. Distribution of the sexes is not required where single-user water closets and bathing room fixtures are provided in accordance with Section 403.1.2.

403.1.2 Single-user toilet ~~facility~~ and bathing room fixtures. The plumbing fixtures located in single-user toilet ~~facilities~~ and bathing rooms, including family or assisted-use toilet and bathing rooms that are required by Section 1109.2.1 of the International Building Code, shall contribute toward the total number of required plumbing fixtures for a building or tenant space. Single-user toilet ~~facilities~~ and bathing rooms, and family or assisted-use toilet rooms and bathing rooms shall be identified for use by either sex.

The total number of fixtures shall be permitted to be based on the required number of separate facilities or based on the aggregate of any combination of single-user or separate facilities.

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required to be designated by sex where single-user toilets rooms are provided in accordance with Section 403.1.2.
6. Separate facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for use by both sexes and privacy for water closets are installed in accordance with Section 405.3.4.

Reason: As part of the changes to the 2018 code provisions were added to allow single user toileting features to be counted toward the total number of fixtures required despite their designation by sex or family. This change is proposed to clarify how toilet rooms that are configured in such a manner to allow use by either sex can also be used. Many communities have been asking to use these provisions in advance of full adoption of the 2018 codes because of their need to address significant issues of gender and equality for access.

The codes only require the installation of family or assisted-use facilities in a limited number of occupancies. With this change the codes will allow the design of facilities that are available to those needing assistance by other assistants that are of an opposite gender without causing any discomfort by anyone.

Cost Impact: The code change proposal will decrease the cost of construction

This change would reduce the cost of construction because the duplication of areas used for single sex facilities can be eliminated saving unneeded floor area.

Analysis: Duplicated text in the International Building Code is not shown for brevity.

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 6. Separate facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for use by both sexes and privacy for water closets are installed in accordance with Section 405.3.4. Urinals shall be located in an area visually separated from the remainder of the facility or each urinal that is provided shall be located in a stall.

Committee Reason: For the Modification: For multi-user, both sex toilet facilities, urinals need to have similar visual separation.

For the Proposal: The Committee agreed with the published reason statement. (Vote:11-3)

Assembly Action:

None

P15-18

Individual Consideration Agenda

Public Comment 1:

Proponent: James Colgate, representing National Center for Transgender Equality (james.colgate@bryancave.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Plumbing Code

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required to be designated by sex where single-user toilets rooms are provided in accordance with Section 403.1.2.
6. Separate facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for use by ~~both sexes~~ all persons and privacy for water closets are installed in accordance with Section 405.3.4. ~~Urinals~~ Urinals shall be located in an area ~~visually~~ physically separated from the remainder of the facility by a door or each urinal that is provided shall be located in a stall.

Commenter's Reason: The 2018 code provisions were modified to allow single user toilets to be counted toward the total number of fixtures required. This change clarifies that such single user toilets shall not be required to be designated by sex.

Further this change seeks to eliminate the requirement that separate facilities are required in grouped toilet facilities and to permit an alternative design option. Private establishments in the United States and many establishments throughout Europe already offer gender neutral facilities, which have proven to be useful, effective and economical. This change would address issues of gender and equality and will address the issue of a person or child needing assistance by a person of a different gender.

Lastly, the provision on urinals addresses restrooms that may be converted to this newly permitted design or newly built facilities that provide urinals. This change ensures that urinals are kept separate from the facility at large to prevent causing any discomfort to persons using such facilities.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This change would effectively decrease the cost of construction by eliminating the duplication of space needed for separate facilities. The number of fixtures required would remain the same, but waiting time would be reduced by allowing any person to use any available facility.

Public Comment 2:

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required to be designated by sex where single-user toilets rooms are provided in accordance with Section 403.1.2.
6. Separate facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for use by both sexes and privacy for water closets and urinals are installed is provided in accordance with Section 405.3.4. ~~6. Urinals shall be located in an area visually separated from the remainder of the facility or each urinal that is provided shall be located in a stall.~~

405.3.6 Privacy, multi-user either sex toilet rooms. Where rooms having multiple water closets or urinals are designed for use by either sex, such rooms shall comply with all of the following:

1. Each water closet and each urinal shall be located in a compartment having floor-to-ceiling walls or partitions. The compartment door shall comply with all of the following:
 - 1.1. The door height shall be not less than 6 feet, 8 inches.
 - 1.2. The head jamb and side jambs of the door frame shall have continuous stop mouldings that prevent viewing of the compartment interior when the door is closed.
 - 1.3. The door locking hardware shall provide an exterior indication that the door is secured from the inside of the compartment.
2. Each compartment shall be provided with exhaust ventilation.

The required number of lavatories shall be permitted to be located within water closet or urinal compartments provided that both of the following apply:

1. Not more than one required lavatory is located in a compartment.
2. Not more than ½ of the required number of lavatories are located in compartments.

Commenter's Reason: This original proposal sends the user to section 405.3.4 for privacy requirements. This proposal also allows men and women to share the restroom. This has never been approved for restrooms with multiple water closets.

Section 405.3.4 states that water closets shall occupy a separate compartment to ensure privacy . This language is too ambiguous and unclear. Without a definition for privacy , additional provisions are needed to add clarity.

This public comment will add the necessary privacy and safety that is needed for a proposal like this to be approved. Attached are several photos showing very typical gaps of up to 1 inch around doors and near walls as well as privacy concerns above and below the partition walls.

Also attached is a design guide approved by the City of Portland that addresses this very scenario.

TOPIC: Separate Facilities - OSSC/29/#2

CODE: Oregon Structural Specialty Code: 2014 Edition

REVISED: December 29, 2016 [Paul L. Scarlett], Director

REFERENCE: Oregon Structural Specialty Code – Chapter 29

SUBJECT: Requirements for Separate Facilities for Plumbing Systems

QUESTION: What constitutes a separate facility for each sex where plumbing fixtures are required?

RESPONSE: The Oregon Structural Special Code (OSSC) Section 2902.2 states that where plumbing fixtures are required, separate facilities shall be provided for each sex. However, "separate facilities" are not defined by the OSSC. The Bureau of Development Services (BDS) has determined that facilities meeting the following requirements may be considered separate facilities for the purposes of this code section. See Figure 1.

- A. **Full Height Walls and Doors.** Each water closet must be enclosed by a 6'-8" minimum door that fills the door frame, and floor to ceiling partitions or walls;
- B. **Overlapping Jambs.** Each water closet must have a doorjamb that overlaps the door in the closed position;
- C. **Occupied Indicators.** Each water closet must have locking hardware that functions with an indicator showing whether it is occupied or vacant;
- D. **Ventilation.** Each water closet must have separate ventilation;
- E. **Lavatories.** The lavatory(s) may be located within the water closet or outside of the water closets in a cluster setting; and
- F. **Other Requirements.** All other code requirements, including but not limited to, minimum number of fixtures required, accessibility, family or assisted-use facilities, and signage must be met.

Facilities where the aggregate of water closets and lavatories are located in separate rooms for each sex may also be considered separate facilities for the purpose of this code section. See Figure 2.

Other alternatives may be reviewed and considered on a case-by-case basis through the BDS administrative appeals process.

New September 16, 2016
Revised December 29, 2016

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. This public comment will add the necessary privacy and safety provisions for this proposal to be approved.

Public Comment 3:

Proponent: Bruce Pitts, representing Self (bhpbhp@yahoo.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Plumbing Code

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required to be designated by sex where single-user toilets rooms are provided in accordance with Section 403.1.2.
6. Separate facilities shall not be required ~~where rooms having both~~ for water closets located in floor-to-ceiling compartments, with solid, full-height, lockable doors and occupied indicators identified for use by all genders. Any interior compartment door undercuts shall not exceed 0.5 inch (13 mm). lavatory fixtures are designed for use by both sexes and privacy for water closets are installed in accordance with Section 405.3.4. In all gender toilet rooms containing water closets, lavatories and urinals, urinals that are provided shall be located in an area visually separated from the remainder of the facility, or each urinal that is provided shall be identified and located in a stall compartment by these provisions.

Commenter's Reason: Referencing IPC Section 405.3.4 for privacy could result in partial-height compartments found in separate-sex facilities. All gender facilities solve state bathroom bills, provide potty parity, accommodate opposite-sex parent-caregivers and reduce floor area. Minimum compartment door undercuts are important for privacy and sound attenuation. A door as narrow as 22 inches wide with a 0.5 inch undercut satisfies a 0.08 in wg pressure drop and a 1.5 loss coefficient at maximum 70 CFM exhaust per IMC Table 403.3.1.1. Example of a 22 inch door undercut height = $(70 \text{ CFM}/4005) \times (1.5/.08)^{.5} = 0.078$ square feet x 144 square inches/square feet = 10.9 square inches/22 inch wide door = 0.49 inch high door undercut height, round up to 0.5 inch. Wider doors at this undercut would have even better pressure drop and loss coefficients.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction

One all-gender facility instead of two separate-sex facilities reduces floor area.

Public Comment 4:

Proponent: Bryan Romney, representing selfrequests As Modified by This Public Comment.

Further modify as follows:

Commenter's Reason: Approve as modified by this Public Comment.

The IBC and IPC and other legacy codes have for many years prescribed the requirements for multi-stall toilet facilities for male and female. The expectation of separate facilities for male and female has long been accepted by the public and code officials as a point of law and even civil rights. Recent changes to this expectation have prompted this proposed code change which could be adopted in the IPC and ultimately in the IBC for All-Inclusive multi-stall toilet facilities. However, this issue is not a building or plumbing code issue, it is more appropriately a civil rights issue which should be decided in the judicial system, public referendum, state law, ordinance, or whatever mechanism is recognized by the jurisdiction to establish legal and defensible and constitutional law. The language of this proposed code change does not stipulate whether action by the code official to allow Exception #2 is legal and constitutional which honors the civil rights of all people. The proposed code change would put at risk the actions by the jurisdiction, permit applicant and potentially those involved in the design and construction of an all-inclusive toilet facility without first having been vetted by the public and deemed law for the city, county, state or other jurisdictional areas governed by the IBC and IPC.

For example, if an all-inclusive toilet facility was constructed and a segment of the public decided that this facility was a violation of privacy and was an act of discrimination of their civil rights and legal action ensued, without the due process of law to vet this type of facility as legal and adopted as law, this all-inclusive toilet facility and the actions by those who approved and built it would be at risk of legal action. Other potential objections which could prompt such legal challenges are those who question the impact of all-inclusive toilet facilities on children (Group E Occupancies) for age groups kindergarten through the 12th grade, the lack of privacy in the sink area, sanitation of the water closets in the stalls used by both men and women, or the action by jurisdictions to require all-inclusive toilet rooms in places of worship or other public buildings. There is no language in this proposed code change which restricts a jurisdiction from required compliance to Exception #2 at will for all or certain occupancies.

Additionally, the proponent in the Reason statement does not include reasons for all-inclusive bathrooms or restrooms. It is unclear as to the intent of the proponent to not include the reasons. There are no proposed code changes for all-inclusive bathrooms only toilet facilities. If there is a proposed code change for bathrooms to be designed as all-inclusive facilities, then the same reasons as described above apply and must be considered for disapproval.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost impact shown in the original proposed code change is not accurate. The cost impact by the proposed code change is significantly more when compared to the cost of a typical toilet room. The proposed All-Inclusive Toilet Room would require the construction of separate stalls for water closets and urinals. This construction would require floor to ceiling walls and doors which will need finishes which are durable and waterproof in accordance with IBC section 1210.2.2. The partition construction of each stall would be a custom installation as compared to a manufactured metal compartment system currently used. The door for each stall would need to be a type of door and frame which has acoustic features not required currently. The individual stalls proposed for All-Inclusive Toilet Rooms will require individual HVAC systems and Individual Lighting systems. These requirements under the current code requirements are significantly less when compared to potential design solutions for the All-Inclusive toilet room proposal. Without further assessment of the cost impact, it is unknown the potential cost impact to these types of projects.

Public Comment 5:

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov) requests Disapprove.

Commenter's Reason: This proposal allows men and women to share a restroom with multiple stalls without any additional privacy requirements. This will create a very unsafe and uncomfortable environment, especially for women and children.

I think gender neutral restrooms are great and should be limited to single user restrooms only. We do not need men to have access to the women's restroom and I think that has been demonstrated in the few cases this has been tried already.

Also, this practice is not currently being done widespread in Europe as so easily claimed by the proponent. Lastly, I was at the code hearings and I can tell you the committee was not prepared to vote on this issue. One committee member even asked staff why this was not in the IBC general committee.

I urge your disapproval on this issue.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction.

Disapproval of this proposal will not cause the code to require anything more or less than it does now.

Public Comment 6:

Proponent: Bryan Romney, representing self requests Disapprove.

Commenter's Reason: Move to Disapprove

The IBC and IPC and other legacy codes have for many years prescribed the requirements for multi-stall toilet facilities for male and female. The expectation of separate facilities for male and female has long been accepted by the public and code officials as a point of law and even civil rights. Recent changes to this expectation have prompted this proposed code change which could be adopted in the IPC and ultimately in the IBC for All-Inclusive multi-stall toilet facilities.

However, this issue is not a building or plumbing code issue, it is more appropriately a civil rights issue which should be decided in the judicial system, public referendum, state law, ordinance, or whatever mechanism is recognized by the jurisdiction to establish legal and defensible and constitutional law. The language of this proposed code change does not stipulate whether action by the code official to allow Exception #2 is legal and constitutional which honors the civil rights of all people. The proposed code change would put at risk the actions by the jurisdiction, permit applicant and potentially those involved in the design and construction of an all-inclusive toilet facility without first having been vetted by the public and deemed law for the city, county, state or other jurisdictional areas governed by the IBC and IPC.

For example, if an all-inclusive toilet facility was constructed and a segment of the public decided that this facility was a violation of privacy and was an act of discrimination of their civil rights and legal action ensued, without the due process of law to vet this type of facility as legal and adopted as law, this all-inclusive toilet facility and the actions by those who approved and built it would be at risk of legal action. Other potential objections which could prompt such legal challenges are those who question the impact of all-inclusive toilet facilities on children (Group E Occupancies) for age groups kindergarten through the 12th grade, the lack of privacy in the sink area, sanitation of the water closets in the stalls used by both men and women, or the action by jurisdictions to require all-inclusive toilet rooms in places of worship or other public buildings. There is no language in this proposed code change which restricts a jurisdiction from required compliance to Exception #2 at will for all or certain occupancies.

Additionally, the proponent in the Reason statement does not include reasons for all-inclusive bathrooms or restrooms. It is unclear as to the intent of the proponent to not include the reasons. There are no proposed code changes for all-inclusive bathrooms only toilet facilities. If there is a proposed code change for bathrooms to be designed as all-inclusive facilities, then the same reasons as described above apply and must be considered for disapproval.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction.

The cost impact shown in the original proposed code change is not accurate. The cost impact by the proposed code change is significantly more when compared to the cost of a typical toilet room. The proposed All-Inclusive Toilet Room would require the construction of separate stalls for water closets and urinals. This construction would require floor to ceiling walls and doors which will need finishes which are durable and waterproof in accordance with IBC section 1210.2.2. The partition construction of each stall would be a custom installation as compared to a manufactured metal compartment system currently used. The door for each stall would need to be a type of door and frame which has acoustic features not required currently. The individual stalls proposed for All-Inclusive Toilet Rooms will require individual HVAC systems and Individual Lighting systems. These requirements under the current code requirements are significantly less when compared to potential design solutions for the All-Inclusive toilet room proposal. Without further assessment of the cost impact, disapproval of this proposed change should be reason enough for disapproval.

P15-18

P17-18

IPC: 403.2 (IBC [P]2902.2)

Proposed Change as Submitted

Proponent: James P. Colgate, Esq., RA, CFM, Bryan Cave LLP, representing National Center for Transgender Equality (James.Colgate@bryancave.com); David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

2018 International Plumbing Code

Revise as follows

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required where all water closet compartments are provided with partitions, including the doors thereto, that extend to the floor and to the ceiling.

Reason: Colleges across the United States, private businesses, membership clubs, and many establishments throughout Europe have adopted an alternative design for bathroom and toilet facilities that removes the requirement that such facilities be designated for use by a specific sex. This design has proven to be useful, effective, and economical. NCTE's proposal would give designers the option of group toilet rooms regardless of sex, as long as each stall has partitions on all four sides that extend to the floor. Partitions ensure that the user's privacy is maintained. This proposal is advantageous because the partitions remove the embarrassment that many people face in a shared restroom facility. Additionally, group toilet facilities promote shorter wait times for the restroom and waste less space on a general bathroom waiting area.

This proposal also shares many of the benefits the Membership intended when they adopted P40-15, Public Comment 2. Specifically, grouped toilet facilities mitigate the anxiety transgender individuals experience when they are required to use the bathroom that does not match their identity. Allowing designers to construct gender-neutral toilet facilities will save proprietors time, money, and space without having to construct two identical bathrooms for each sex.

It should be noted that this proposal does not trigger compliance with Exception 2 of Section 1109.2 of the *International Building Code*, which requires that 50% of single-user toilet or bathing rooms clustered in a single location be accessible. Section 1109.2.1.2 of the *International Building Code* defines "toilet room" to include a water closet and a lavatory. Under NCTE's proposed design scheme, the partitioned stalls need not contain sinks or wash basins, and would therefore be treated as ordinary toilet compartments and subject to the 5% rule of Section 1109.2.2 of the *International Building Code*.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The same numbers of fixtures are still required and waiting time will be reduced by allowing any sex to use the available toilet stalls. Further, the general waiting area and space required for two facilities will not be necessary in places with this design option. While that may save a small cost, an additional cost may be expended to create partitions on all four sides that extend to the floor.

Analysis: Duplicated text in the International Building Code is not shown for brevity.

P17-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The Committee preferred P16-18 for handling the topic. (Vote:14-0)

Assembly Action:

None

P17-18

Individual Consideration Agenda

Public Comment 1:

Proponent: James Colgate, representing National Center for Transgender Equality (james.colgate@bryancave.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required where all water closet compartments are provided with partitions, including the doors thereto, that extend to the floor and to the ceiling, with no gaps between the doors and partitions. Urinals shall be located in a room separated from the remainder of the facility or each urinal that is provided shall be located in a compartment equivalent to those required for water closets.

Commenter's Reason: This change seeks to eliminate the requirement that separate facilities are required in grouped toilet facilities and to permit an alternative design option. Colleges across the United States, private businesses, membership clubs and many establishments throughout Europe already offer this design, which has proven to be useful, effective and economical. This change would address issues of gender and equality and will address the issue of a person or child needing assistance by a person of a different gender.

Further, this provision addresses privacy concerns that may result from the implementation of gender neutral restrooms. By requiring stalls that are entirely enclosed, each user will experience complete privacy in a gender neutral facility. Further, this provision ensures that urinals are kept private from the remainder of the gender neutral facility, such that anyone not using a urinal would not be exposed to any discomfort.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change would likely not affect the cost of construction. While cost is decreased by eliminating the duplication of space needed for separate facilities, cost is increased because of the requirement to build larger doors and possibly require separate lighting and ventilation in such stalls. The number of fixtures required would remain the same and waiting time would be reduced by allowing any person to use any available facility.

Public Comment 2:

Proponent: Bryan Romney, representing selfrequests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. ~~Separate~~ Where adopted by local, state or federal law in the jurisdiction to allow multi-user facilities designed to serve all genders, separate facilities shall not be required where all water closet compartments are provided with partitions, including the doors thereto, that extend to the floor and to the ceiling.

Commenter's Reason: Approved as modified by this Public Comment.

The IBC and IPC and other legacy codes have for many years prescribed the requirements for multi-stall toilet facilities for male and female. The expectation of separate facilities for male and female has long been accepted by the public and code officials as a point of law and even civil rights. Recent changes to this expectation have prompted this proposed code change which could be adopted in the IPC and ultimately in the IBC for All-Inclusive multi-stall toilet facilities. However, this issue is not a building or plumbing code issue, it is more appropriately a civil rights issue which should be decided in the judicial system, public referendum, state law, ordinance, or whatever mechanism is recognized by the jurisdiction to establish legal and defensible and constitutional law. The language of this proposed code change does not stipulate whether action by the code official to allow Exception #5 is legal and constitutional which honors the civil rights of all people. The proposed code change would put at risk the actions by the jurisdiction, permit applicant and potentially those involved in the design and construction of an all-inclusive toilet facility without first having been vetted by the public and deemed law for the city, county, state or other jurisdictional areas governed by the IBC and IPC.

For example, if an all-inclusive toilet facility was constructed and a segment of the public decided that this facility was a violation of privacy and was an act of discrimination of their civil rights and legal action ensued, without the due process of law to vet this type of facility as legal and adopted as law, this all-inclusive toilet facility and the actions by those who approved and built it would be at risk of legal action. Other potential objections which could prompt such legal challenges are those who question the impact of all-inclusive toilet facilities on children (Group E Occupancies) for age groups kindergarten through the 12th grade, the lack of privacy in the sink area, sanitation of the water closets in the stalls used by both men and women, or the action by jurisdictions to require all-inclusive toilet rooms in places of worship or other public buildings. There is no language in this proposed code change which restricts a jurisdiction from required compliance to Exception #5 at will for all or certain occupancies.

Additionally, the proponent in the Reason statement includes bathrooms in addition to restrooms. It is unclear as to the intent of the proponent to include bathrooms. There are no proposed code changes for all-inclusive bathrooms. If there is a proposed code change for bathrooms to be designed as all-inclusive facilities, then the same reasons as described above apply and must be considered for modification.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost impact shown in the original proposed code change is not accurate. The cost impact by the proposed code change is significantly more when compared to the cost of a typical toilet room. The proposed All-Inclusive Toilet Room would require the construction of separate stalls for water closets and urinals. This construction would require floor to ceiling walls and doors which will need finishes which are durable and waterproof in accordance with IBC section 1210.2.2. The partition construction of each stall would be a custom installation as compared to a manufactured metal compartment system currently used. The door for each stall would need to be a type of door and frame which has acoustic features not required currently. The individual stalls proposed for All-Inclusive Toilet Rooms will require individual HVAC systems and Individual Lighting systems. These requirements under the current code requirements are significantly less when compared to potential design solutions for the All-Inclusive toilet room proposal. Without further assessment of the cost impact, it is unknown the potential cost impact to these types of projects.

Public Comment 3:

Proponent: Joel Sanders, Joel Sanders Architect, representing Stalled! (jsanders@joelsandersarchitect.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Plumbing Code

403.2 Separate facilities. Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required where all water closet compartments are provided with partitions, including the doors thereto, that extend to not greater than 4 inches above the floor and to not less than the ceiling-7 feet above the floor.

Commenter's Reason: While the 2018 code provisions were modified to allow single user toilets to be counted toward the total number of fixtures required, this change seeks to eliminate the requirement that separate facilities are required in grouped toilet facilities and to permit an alternative design option.

Private establishments in the United States and many establishments throughout Europe already offer gender neutral facilities, which have proven to be useful, effective and economical. This change has a number of advantages. Transgender and gender non-conforming people who do not identify with their gender assigned at birth will not have to choose between two options—men's room and women's room -- that don't align with their identities. By consolidating a greater number of people in one rather than two rooms, there are more eyes to monitor, reducing risk of violence. Most important, gender neutral facilities meet not only the needs of the trans community, but they also accommodate the needs of a wide range of differently embodied subjects of varying ages, genders, and disabilities. For example, it facilitates caregiving between people of different gender expressions. Now a father can accompany his young daughter, or a woman can take her elderly male friend to the restroom.

This change to the code provision seeks to eliminate typical sex-segregated facilities characterized by stalls whose revealing gaps, at floor, ceiling and doors compromise visual privacy. We recommend implementing stalls that extend no more than 4 inches from the floor with a height of at least 7 feet to achieve this privacy.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change would likely not affect the cost of construction. Cost is decreased by eliminating the duplication of space needed for separate facilities. While fully-enclosed floor-to-ceiling partitions for stalls are preferable, they are slightly more expensive to build because each stall could require individual lighting and ventilation. Therefore, we propose the more economical approach of stall doors with small gaps at floor and ceiling that ensure complete visual privacy, without impacting mechanical and lighting requirements. This will keep costs to a minimum because then easy-to-install, mass-produced partitions can be used, allowing the stalls to continue to share lighting and ventilation. The number of fixtures required would remain the same and waiting time would be reduced by allowing any person to use any available facility.

Public Comment 4:

Proponent: Bryan Romney, representing selfrequests Disapprove.

Commenter's Reason: The IBC and IPC and other legacy codes have for many years prescribed the requirements for multi-stall toilet facilities for male and female. The expectation of separate facilities for male and female has long been accepted by the public and code officials as a point of law and even civil rights. Recent changes to this expectation have prompted this proposed code change which could be adopted in the IPC and ultimately in the IBC for All-Inclusive multi-stall toilet facilities. However, this issue is not a building or plumbing code issue, it is more appropriately a civil rights issue which should be decided in the judicial system, public referendum, state law, ordinance, or whatever mechanism is recognized by the jurisdiction to establish legal and defensible and constitutional law. The language of this proposed code change does not stipulate whether action by the code official to allow Exception #2 is legal and constitutional which honors the civil rights of all people. The proposed code change would put at risk the actions by the jurisdiction, permit applicant and potentially those involved in the design and construction of an all-inclusive toilet facility without first having been vetted by the public and deemed law for the city, county, state or other jurisdictional areas governed by the IBC and IPC. For example, if an all-inclusive toilet facility was constructed and a segment of the public decided that this facility was a violation of privacy and was an act of discrimination of their civil rights and legal action ensued, without the due process of law to vet this type of facility as legal and adopted as law, this all-inclusive toilet facility and the actions by those who approved and built it would be at risk of legal action. Other potential objections which could prompt such legal challenges are those who question the impact of all-inclusive toilet facilities on children (Group E Occupancies) for age groups kindergarten through the 12th grade, the lack of privacy in the sink area, sanitation of the water closets in the stalls used

by both men and women, or the action by jurisdictions to require all-inclusive toilet rooms in places of worship or other public buildings. There is no language in this proposed code change which restricts a jurisdiction from required compliance to Exception #2 at will for all or certain occupancies.

Additionally, the proponent in the Reason statement does not include reasons for all-inclusive bathrooms or restrooms. It is unclear as to the intent of the proponent to not include the reasons. There are no proposed code changes for all-inclusive bathrooms only toilet facilities. If there is a proposed code change for bathrooms to be designed as all-inclusive facilities, then the same reasons as described above apply and must be considered for disapproval.

The proponent's original proposal was disapproved by Committee action. However, there are multiple Public Comments to allow this proposal to be heard in the Public Hearings. This proposal and its other Public Comments must be disapproved for the reasons stated above.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost impact shown in the original proposed code change is not accurate. The cost impact by the proposed code change is significantly more when compared to the cost of a typical toilet room. The proposed All-Inclusive Toilet Room would require the construction of separate stalls for water closets and urinals. This construction would require floor to ceiling walls and doors which will need finishes which are durable and waterproof in accordance with IBC section 1210.2.2. The partition construction of each stall would be a custom installation as compared to a manufactured metal compartment system currently used. The door for each stall would need to be a type of door and frame which has acoustic features not required currently. The individual stalls proposed for All-Inclusive Toilet Rooms will require individual HVAC systems and Individual Lighting systems. These requirements under the current code requirements are significantly less when compared to potential design solutions for the All-Inclusive toilet room proposal. Without further assessment of the cost impact, disapproval of this proposed change should be reason enough for disapproval.

P17-18

P22-18 Part I

IBC: 1109.2.1.7

Proposed Change as Submitted

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov)

THIS IS A TWO PART CODE CHANGE. BOTH PARTS OF THIS CODE CHANGE WILL BE HEARD BY THE PLUMBING CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Revise as follows

1109.2.1.7 Privacy. Doors to family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator.

Reason: This code change proposal will alleviate privacy and safety concerns by requiring the occupied indicator for single user restrooms. Without an occupied indicator, the only way for someone to see if the room is in use is to turn the handle. This causes safety and privacy concerns for the user. This can cause severe discomfort, even fear, for children or people who have suffered trauma. This proposal will proactively provide increased comfort and safety for everyone.

Cost Impact: The code change proposal will increase the cost of construction. Adding the occupied indicator to the already required privacy lock increases the cost of the hardware by no more than a few dollars per door.

P22-18 Part I

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: Users will no longer be alarmed by "handle jiggling" by those on the outside checking to see if the door is locked. (Vote:8-6)

Assembly Action:

None

P22-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Building Code

1109.2.1.7 Privacy. Doors to family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator. For Group I-1, I-2, and Group B ambulatory care facilities, the type of means for unlocking such doors from the outside of the room shall be the responsibility of the facility designer.

Commenter's Reason: A concern was brought up by the National Association of Healthcare Facilities during the committee action hearings regarding the privacy lock for single user toilet rooms. The privacy lock has always been required, this code proposal simply adds the occupied indicator and was approved by the committee. This public comment adds an exception for healthcare facilities. I have inspected several hospitals and they are currently being built this way. They have a pull chain near the water closet for emergencies and they have a privacy lock with occupied indicator that is openable by staff in case of emergency. This language is meant to clarify the code to match current building practices.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction as stated in the code proposal, the occupied indicator will increase the cost of construction by a few dollars per door.

P22-18 Part I

P22-18 Part II

IPC: 403.3.7; IBC: 2902.3.7

Proposed Change as Submitted

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov)

2018 International Plumbing Code

Add new text as follows

403.3.7 Privacy. Doors to single-user toilet and bathing rooms and family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator.

2018 International Building Code

2902.3.7 Privacy. Doors to single-user toilet and bathing rooms and family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator.

Reason: This code change proposal will alleviate privacy and safety concerns by requiring the occupied indicator for single user restrooms. Without an occupied indicator, the only way for someone to see if the room is in use is to turn the handle. This causes safety and privacy concerns for the user. This can cause severe discomfort, even fear, for children or people who have suffered trauma. This proposal will proactively provide increased comfort and safety for everyone.

Cost Impact: The code change proposal will increase the cost of construction. Adding the occupied indicator to the already required privacy lock increases the cost of the hardware by no more than a few dollars per door.

P22-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This would result in a risk to life in healthcare facilities and is an unnecessary increase in the cost of construction. (Vote:8-6)

Assembly Action:

None

P22-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Jason Phelps, representing Self (jason.phelps@hillsboro-oregon.gov) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Plumbing Code

403.3.7 Privacy. Doors to single-user toilet and bathing rooms and family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator. For Group I-1, I-2, and Group B ambulatory care facilities, the type of means for unlocking such doors from the outside of the room shall be the responsibility of the facility designer.

2018 International Building Code

2902.3.7 Privacy. Doors to single-user toilet and bathing rooms and family or assisted-use toilet and bathing rooms shall be securable from within the room and be provided with an "occupied" indicator.

Exception: Group I-1, I-2, and Group B ambulatory care facilities are permitted to have a lock that is operable by staff in case of an emergency.

Commenter's Reason: This exception is meant to clarify the code to match current building practices. A concern was brought up by the National Association of Healthcare Facilities during the committee action hearings regarding the privacy lock for single user toilet rooms. The privacy lock has always been required, this code proposal simply adds the occupied indicator and was approved by the committee. This public comment adds an exception for healthcare facilities. I have inspected several hospitals and they are currently being built this way. They have a pull chain near the water closet for emergencies and they have a privacy lock with occupied indicator that is operable by staff in case of emergency. This language is meant to clarify the code to match current building practices.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction as stated in the code proposal adding the occupied indicator will increase the cost by a few dollars per door.

Public Comment 2:

Proponent: John Williams, representing Healthcare Committee (ahc@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

403.3.7 Privacy. ~~Doors~~ Where doors to single-user toilet and room, bathing rooms and family or assisted-use toilet and bathing rooms shall be ~~are~~ securable from within the ~~room and be provided with an "occupied" indicator~~ toilet and bathing room the locking devices shall include an occupied indicator.

Exception: Locking devices shall not be required to have occupied indicators on doors for toilet rooms or bathing room in the following locations:

1. Within individual dwelling or sleeping units.
2. Within a private office.

2018 International Building Code

2902.3.7 Privacy. ~~Doors~~ Where doors to single-user toilet ~~and room,~~ bathing rooms and family or assisted-use toilet and bathing rooms shall be are securable from within the room ~~and be provided with an "occupied" indicator.~~ toilet and bathing room the locking devices shall include an occupied indicator.

Exception: Locking devices shall not be required to have occupied indicators on doors for toilet rooms or bathing room in the following locations:

1. Within individual dwelling or sleeping units.
2. Within a private office.

Commenter's Reason: IBC Section 1209.3.1 Exception 1 requires a lock only on single occupant toilet rooms utilized by the public or employees - therefore, our assumption is that single occupant toilet rooms within apartments, hotel rooms, within private offices, or within a hospital room are not required to have a lock. The original proponent stated that his concerns were for a privacy indicator so that you did not have to knock on the door to see if these rooms are occupied. The revised text would only require the indicator if the door was equipped with a lock. The exception would allow for bathrooms that choose to have locks, such as within a hotel room, to not have to have privacy indicators. This modification will also address the hospital and nursing home concern that bathrooms within a dwelling or sleeping unit (i.e. patient sleeping rooms) are not required to be locked. Within a private office exception will address private bathrooms within doctor's offices.

This public comment is submitted by the ICC Committee on Healthcare (CHC). The CHC was established by the ICC Board to evaluate and assess contemporary code issues relating to healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. In 2017 and 2018 the CHC held 2 open meetings and numerous conference calls, *which included members of the committees as well as any interested parties, to discuss and debate the proposed changes.* Information on the CHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CHC effort can be downloaded from the CHC website at: <https://www.iccsafe.org/codes-tech-support/cs/icc-committee-on-healthcare/>.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. However, the modification will limit this requirement to where someone provides a lock on a public bathroom.

P23-18

IPC: 403.6

Proposed Change as Submitted

Proponent: Eirene Knott, BRR Architecture, representing Metropolitan Kansas City Chapter of the ICC
(Eirene.Knott@brrarch.com)

2018 International Plumbing Code

Add new text as follows

403.6 Service sink location. Service sinks shall not be required to be located in individual tenant spaces in a covered mall provided that service sinks are located within a distance of travel of 300 feet (91 m) of the most remote location in the tenant space and not more than one story above or below the tenant space. Service sinks shall be located on an accessible route.

Reason: There were at least two attempts in the 2015/2016/2017 code development cycle to reduce or remove the requirement of a service sink. One proposal was to not require a service sink where the occupant load was 30 or less. The committee felt that raising the occupant threshold and applying that load across the board would result with some occupancies not having a sink but would need the sink for other regulations such as health code requirements. The other proposed code changes came from the PMG CAC adding a new section for service sinks allowing for a service sink to be located in a central core of a building. The committee disapproved that code change because it called for a minimum outlet drain of 3 inches in diameter. The committee felt the 3-inch requirement was overkill and felt the proposed code change also superseded the requirements of Table 403.1.

Despite attempts during the public comment phase where both proposal were approved, both were disapproved in the final action process. Based on the action at the public comment phase, there is an understanding that some small tenant spaces, especially those within a mall, do not need to have the service sink in a readily accessible location. Since both drinking fountains and public toilets are allowed to be within 300 feet of a tenant space in a mall, the same travel distance seems reasonable for access to a service sink. I have opted to have this change apply only to tenants within a covered mall as in some parts of the country it may not be practical for tenants in an outdoor mall to push a mop bucket 300 feet in the snow.

For a small tenant that may not meet footnote e to Table 403.1, the addition of a service sink can take up much needed tenant space, let alone add an additional cost that can negatively impact the tenant space overall. Most small tenants do not need a service sink but knowing that one would be available to them, just like a public restroom and drinking fountain are available within the same travel distances, would provide a sense of security.

Cost Impact: The code change proposal will decrease the cost of construction. This may reduce the cost of construction as each individual tenant would not be required to provide a service sink, reducing the cost of materials needed.

P23-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Transporting water for 300 feet in a mop bucket is going to create a slip hazard. The proposal needs expanded to include the requirement that the tenants have access to the service sink. (Vote:12-2)

Assembly Action:

None

P23-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Eirene Knott, representing Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com) requests As Submitted.

Commenter's Reason: The committee disapproved this code change citing that transporting water for 300 feet in a mop bucket will create a slip hazard and that tenants need to have access to the service sink. As the code is currently written, small tenants in mall locations would be required to provide a mop sink when the occupant load for a retail store exceeds 15, per Table 403.1, footnote e . Using the square footage for a retail space of 60 square feet per person, that amounts to tenant spaces which are greater than 900 square feet. However, this small tenant space would not be required to provide toilet facilities as Section 403.3.4 allows for tenant spaces in a mall to be within 300 feet of required toilet facilities. There are often times in a retail setting where getting to the toilet facility can be an emergency yet malls are allowed to have up to 300 feet of travel to get to a toilet facility for both employees and the general public.

Why should a tenant space, which can provide toilet facilities within 300 feet, be required to provide a service sink if one is provided within a reasonable distance to the tenant space? If an employee has 300 feet in which to travel to go to the bathroom, that same distance seems reasonable for an employee to be able to access a service sink rather than provide a plumbing fixture that will seldom, if ever, get used.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This may reduce the cost of construction as each individual tenant would not be required to provide a service sink, reducing the cost of materials needed.

P23-18

P24-18

IPC: 404.1, 404.2, 404.3

Proposed Change as Submitted

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Marsha Mazz, representing U.S. Access Board (mazz@Access-Board.gov); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)

2018 International Plumbing Code

Revise as follows

404.1 Where required. Accessible plumbing facilities and fixtures shall be provided in accordance with the International Building Code and ICC A117.1.

Delete without substitution

~~**404.2 Accessible fixture requirements.** Accessible plumbing fixtures shall be installed with the clearances, heights, spacings and arrangements in accordance with ICC A117.1.~~

~~**404.3 Exposed pipes and surfaces.** Water supply and drain pipes under accessible lavatories and sinks shall be covered or otherwise configured to protect against contact. Pipe coverings shall comply with ASME A112.18.9.~~

Reason: Section 404.2 and 404.3 were added by P42-12. They should be removed for multiple reasons. The reference to IBC would also get a reference to ICC A117.1 in Section 1101.2, however, if there is a concern that this may be missed by plumbing inspectors, the reference can be added in Section 404.1.

In Section 404.2, the laundry list is incomplete on what is required in the A117.1 for accessible plumbing fixtures. Since standards are only referenced to the extent the code sends you there (Section 102.8), this could be misinterpreted as intending to limit requirements that would be applicable in the standard. The requirement for pipe protection is a technical requirement for accessible lavatories, address in A117.1 Section 606.6, so it should not be repeated here. The ASME A112.18.9 standard addresses the requirements for heat transfer, not cold, therefore it only addresses half the issue associated with water, and not all the issues associated with accidental contact. The test for hot water is substantially hotter than tempered water which is required for public lavatories. Also, if the pipes are protected from contact by some type of shield as indicated in the photo, there is no exception for compliance with the standard, even if there is no contact with the pipes. If ASME A112.18.9 should be referenced, this standard should be reviewed through the ICC A117.1 process for technical issues associated with accessibility requirements. It does not belong in the IPC.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposal will eliminate possible conflicts between the IPC and ICC A117.1.

P24-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 404.1 Where required. Accessible plumbing facilities and fixtures shall be provided in accordance with Chapter 11 of the International Building Code and ICC A117.1.

404.2 Accessible fixture requirements. Accessible plumbing fixtures shall be installed in accordance with ICC A117.1.

404.3 Exposed pipes and surfaces. Water supply and drain pipes under accessible lavatories and sinks shall be covered or otherwise configured to protect against contact. Pipe coverings shall comply with ASME A112.18.9.

Committee Reason: For the Modification: Reference standard ASME A112.18.9 needs to be retained for the pipe coverings. The reference to standard A117.1 needs to be retained to point to the information needed for installation. For the Proposal: The Committee agreed with the published reason statement. (Vote:13-0)

Assembly Action:

None

P24-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Plumbing Code

~~**404.3 Exposed pipes and surfaces.** Water supply and drain pipes under accessible lavatories and sinks shall be covered or otherwise configured to protect against contact. Pipe coverings shall comply with ASME A112.18.9.~~

Commenter's Reason: Section 404.3 should be deleted. The requirement for pipe protection under the accessible lavatory or sink is already stated in ICC A117.1 Section 606.6. ICC A117.1 Section 606.6 also states that there shall be no sharp or abrasive surfaces under the lavatory or sink, so only part of the requirement is in this section. The standard referenced in Section 404.3, ASME A112.18.9, should be deleted. During the testimony it was stated that this standard was proposed to the ICC A117.1 and that they were told that standards are not in ICC A117.1. This is not the case - see Section ICC A117.1 Section 105.2 for a list of standards referenced. The ICC A117.1 committee rejected this standard because the standard only requires testing for hot water. It does not address the issue of accidental contact for sharp edges where someone moving under the sink could suffer cuts or bruises - even though that is stated in the purpose of the standard.

From a technical perspective, the test for hot water is substantially hotter than tempered water which is required for public lavatories - specifically 104 degrees Fahrenheit for 5 hours. What is the justification for this? Also, if the pipes are protected from contact by some type of shield, there is no exception for compliance with the standard, even if there is no possible contact with the pipes. The name of this standard is "Protectors/Insulators for Exposed Waste and Supplies on Accessible Fixture", so this standard is not applicable for shielded locations. See the picture in the original proposal for an example.

Also, P25-18 proposed an additional standard ASTM C1822. The reason statement said the new standard covers all of ASME A112.18.9, so therefore this standard would also be redundant. This group does have a public comment to P25 asking for disapproval.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposal is only clarification that will eliminate potential conflicts between the IPC and ICC A117.1.

P25-18

IPC: 404.3, Chapter 15

Proposed Change as Submitted

Proponent: Howard Ahern, representing Plumberex Speciality Products

2018 International Plumbing Code

Revise as follows

404.3 Exposed pipes and surfaces. Water supply and drain pipes under accessible lavatories and sinks shall be covered or otherwise configured to protect against contact. Pipe coverings shall comply with ASME A112.18.9 or ASTM C1822.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959
US

C1822-2015:

Standard Specification for Insulating Covers on Accessible Lavatory Piping

Reason: There is a new standard that has been developed specifically for insulating covers over water supply pipes and drain piping under accessible lavatories. The new standard is titled: ASTM C1822-2015 Standard Specification for Insulating covers on Accessible Lavatory Piping. The Standard was developed by the C16.40 Thermal Insulation Systems committee. The new standard covers all of ASME A112.18.9 requirements but is a more comprehensive standard than ASME A112.18.9 and has additional language covering requirements related to restrictions on cable tie fasteners associated with a Federal lawsuit.

This code modification allows both the ASME A112 18.9 standard and would also allow ASTM C1822 compliance. designers are able to comply with either standard. Both standards are needed for these products allowing compliance with either standard will help contractors and inspectors with compliance and identification, while also allowing greater compliance with Department of Justice 2010 Americans with Disability Act standard for Assessable Design Standard 606.5 and ANSI Standard A117.1.

Bibliography: Howard Ahern representing Plumberex Speciality Products.
Member ASME A112. 18.9 standard

Chairman ASTM C1822 Standard Committee

Cost Impact: The code change proposal will not increase or decrease the cost of construction
no cost increase would be associated with this modification

Analysis: A review of the standard proposed for inclusion in the code, ASTM C1822-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P25-18

Committee Action:

As Submitted

Committee Reason: The Committee agreed with the published reason statement. (Vote:14-0)

Assembly Action:

None

P25-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Dawn Anderson, representing self (gonedawning@yahoo.com); Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org); David Collins, representing the American Institute of Architects (dcollins@preview-group.com); Dominic Marinelli, representing United Spinal Association (DMarinelli@accessibility-services.com)requests Disapprove.

Commenter's Reason: Similar to ASME A122.18.9 address in P24-18, this new standard requires testing at 140 degrees Fahrenheit for 5 hours. What is the 'accessibility' justification for this temperature or this amount of time?

It is not clear what federal lawsuit the reason statement is talking about, but the only requirement is that the insulating cover shall not be "attached by cable tie fasteners, adhesive or adhesive tape" (Section 10.7) This standard also includes requirements for surface burning characteristics (12.1) and rate of burning (12.4). What is the 'accessibility' justification for these requirements? The reason statement says compliance with this standard will not increase cost. Is that based on the code already requires compliance with ASME A112.18.9? While the standard is not considered proprietary, how many products on the market can meet these requirements?

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The original proposal said adding this additional standard would not be a cost increase. Meeting this additional standard will be a cost increase. Disapproval of this additional standard will remove that increase.

P25-18

P27-18

IPC: 405.3.1

Proposed Change as Submitted

Proponent: Daniel Gleiberman, SLOAN, representing SLOAN (dangleib@gmail.com)

2018 International Plumbing Code

Revise as follows

405.3.1 Water closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition, vanity or other obstruction. ~~Where~~ For water closets, urinals, or bidets, where partitions or other obstructions do not separate adjacent fixtures, fixtures shall not be set closer than 30 inches (762 mm) center to center between adjacent fixtures. There shall be not less than a 21-inch (533 mm) clearance in front of a water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall be not less than 30 inches (762 mm) in width and not less than 60 inches (1524 mm) in depth for floor-mounted water closets and not less than 30 inches (762 mm) in width and 56 inches (1422 mm) in depth for wall-hung water closets.

Exception: An accessible children's water closet shall be set not closer than 12 inches (305 mm) from its center to the required partition or to the wall on one side.

Reason: This code section is a subsection of Section 405 entitled "Installation of Fixtures". This code change proposal clarifies that lavatories must be installed to meet the 15 inch separation from the center of the fixture to any obstruction.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The change clarifies the current code requirement

P27-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The language is not clear as to what is trying to be accomplished. (Vote:13-0)

Assembly Action:

None

P27-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (jbenigneer@aol.com); Daniel Gleiberman (dangleib@gmail.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

405.3.1 Water closets, urinals, lavatories and bidets. A water closet, urinal, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition, vanity or other obstruction. ~~For water closets, urinals, or bidets, where~~ Where partitions or other obstructions do not separate adjacent fixtures, ~~water closets, urinals, or bidets, the fixtures shall not be set closer than 30 inches (762 mm) center to center between adjacent fixtures or adjacent water closets, urinals, or bidets.~~ There shall be not less than a 21-inch (533 mm) clearance in front of a water closet, urinal, lavatory or bidet to any wall, fixture or door. Water closet compartments shall be not less than 30 inches (762 mm) in width and not less than 60 inches (1524 mm) in depth for floor-mounted water closets and not less than 30 inches (762 mm) in width and 56 inches (1422 mm) in depth for wall-hung water closets.

Exception:

An accessible children's water closet shall be set not closer than 12 inches (305 mm) from its center to the required partition or to the wall on one side.

Commenter's Reason: I made a commitment to the Plumbing Code Committee that I would correct the proposal and bring it back as a Public Comment. The proponent has good intentions, but the wording was confusing. The sentences being modified was only intended to apply to water closets, bidets, and urinals. The modified text identifies that the requirements only apply to these three fixtures.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is an editorial clean up of the code change. There is no cost of construction associated with the change.

P27-18

P29-18

IPC: 405.3.6

Proposed Change as Submitted

Proponent: Gary Schenk, City of SeaTac, WA, representing Washington Association of Building Officials (gschenk@ci.seatac.wa.us); Gary Lampella, City of Seatac WA, representing Washington Association of Building Officials TDC (garyl@nwcodeprofessionals.com)

2018 International Plumbing Code

Add new text as follows

405.3.6 Privacy. Public restrooms shall be visually screened from outside entry or exit doors to ensure user privacy within the restroom. This provision shall also apply where mirrors would compromise personal privacy.

Exception: Visual screening shall not be required for single-occupant toilet rooms with lockable doors.

Reason: Although this section currently has provisions for sidewall or partition privacy within the restrooms, it does not address privacy from viewing the user at the fixture from outside the restroom. It also addresses the placement of mirror reflection viewing from the outside.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a minor design consideration. It can be addressed at the design stage.

P29-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The Committee agreed with the published reason statement. (Vote:7-6)

Assembly Action:

Disapproved

P29-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Assembly Action requests Disapprove.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 60.7% (68) to 39.3% (44) by eligible members online during the period of May 9 - May 23, 2018.

Staff Analysis: Proposal G132-18 was heard by the IPC committee along with P29-18. Proposal G132 modifies the language in IBC Section [P]1209.3 to result in the same requirements that P29-18 is requiring. This public comment was created as a result of a successful floor motion for D. Approval of P29-18 will duplicate, in the IPC, the requirements that will be successfully added (by the consent agenda vote) to the IBC

P29-18

P35-18

IPC: 408.3, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows

408.3 Bidet water temperature. The discharge water temperature from a bidet fitting shall be limited to not greater than 110°F (43°C). ~~The water temperature shall be regulated by a water temperature heater conforming to ASSE 1084 or by a limiting device conforming to either ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.~~

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason: A new standard, ASSE 1084, was developed for water heaters that limit the temperature of hot water similar to an ASSE1070 valve. The standard is comparable to ASSE 10710/ASME A112.1070/CSA B125.7. The water heater cannot produce a temperature of hot water exceeding 120° F. The water heater must be capable of shutting off the supply of hot water when the temperature exceeds the set limit. These water heaters may be installed in the close proximity of the fixtures they serve.

Cost Impact: The code change proposal will decrease the cost of construction. This option may lower the cost of an installation.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1084 2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P35-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposed standard is not yet complete. (Vote:14-0)

Assembly Action:

None

P35-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com) requests As Submitted.

Commenter's Reason: At the first hearing, the draft of ASSE 1084 was not submitted on time, nor was the standard complete. The standard has now been completed, hence the change should be approved as submitted.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
The result of this change is options for the code user. As such, there is no construction cost impact.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standard ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

Public Comment 2:

Proponent: Conrad Jahrling, representing ASSE International (conrad.jahrling@asse-plumbing.org) requests As Submitted.

Commenter's Reason: As of July 16th, 2018
Status of ASSE 1084-2018: Currently finishing working group discussions. The performance of the device is designed to conform similarly to ASSE 1070 / ASME A112.1070 / CSA B125.70, except with only a cold water inlet. Projected date of completion is Oct 15th.

The ASSE standards development process after standards have completed the open working group is outlined as:

- Ballot the ASSE PSC consensus body for 21 days.
- Resolve comments between commenters, staff, and PSC chair.
- Send to public comment with ANSI for 45-day review. Resolve comments between commenters, staff, and PSC chair.
- Submit to ANSI for review and approval.
- Publish.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
There are alternative devices being proposed to the currently described methods in the text.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standard ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

P35-18

P38-18 Part I

IBC: 202, 1109.5, 2902.7 (New)

Proposed Change as Submitted

Proponent: Jenifer Gilliland, City of Seattle, Washington, representing City of Seattle, Washington
(jenifer.gilliland@seattle.gov)

THIS IS A 2 PART CODE CHANGE. PART I AND PART II WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2018 International Building Code

Add new definition as follows

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. This definition includes a freestanding apparatus for the same purpose that is not connected to the potable water distribution system and that is supplied with potable water from a container, bottle or reservoir.

Revise as follows

1109.5 ~~Drinking~~ High and low drinking fountains. Where drinking fountains are provided on an exterior site, on a floor or within a secured area, the drinking fountains shall be provided in accordance with Sections 1109.5.1 and 1109.5.2.

1109.5.1 Minimum number. Not fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.

Exceptions:

1. A single drinking fountain with two separate spouts that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.
2. Where drinking fountains are primarily for children's use, drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

1109.5.2 More than the minimum number. Where more than the minimum number of drinking fountains specified in Section 1109.5.1 is provided, 50 percent of the total number of drinking fountains provided shall comply with the requirements for persons who use a wheelchair and 50 percent of the total number of drinking fountains provided shall comply with the requirements for standing persons.

Exceptions:

1. Where 50 percent of the drinking fountains yields a fraction, 50 percent shall be permitted to be rounded up or down, provided that the total number of drinking fountains complying with this section equals 100 percent of the drinking fountains.
2. Where drinking fountains are primarily for children's use, drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

[P] 2902.6 Small occupancies. Drinking fountains shall not be required for an occupant load of 15 or fewer.

Add new text as follows

2902.7 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other occupancies where more than two drinking fountains are required, water dispensers shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.

Reason: Reason for proposal 1:

It is important for both the building official and the plumbing inspector to fully understand the requirements for drinking fountains including when they can be eliminated, switched out, and when high/low drinking fountains are required. Currently, only a portion of the information is available in the IPC and IBC.

The IPC does not have language addressing two important points needed for accessible drinking fountains:

- 1) The IPC doesn't include the requirements found in the IBC that are based on where the fountain is being provided - per floor, per secure area, or outside.
- 2) The IPC doesn't address high/low requirements for three or more drinking fountains.

This proposal adds the relevant sections currently found in IBC to IPC. The changes to the language are editorial for coordination only.

There also appears to be a conflict between the IPC allowing half of the drinking fountains to be switched out starting at two drinking fountains, and the accessibility requirement requiring at least two. Adding "two or more" to the IPC Section 410.4 will eliminate that conflict. This information should be repeated in IBC Chapter 29 along with the information that small occupancies do not have to have drinking fountains.

Reason for proposal 2:

A freestanding apparatus should not be substituted for a drinking fountain. There is nothing to stop a building owner from discontinuing the service or removing the equipment.

Having access to drinking fountains where someone can get water or access to a water dispenser where someone can use their own cup or bottle is important for occupant's health as well as helping our environment by reducing the number of plastic bottles going into the landfill. By eliminating the option to substitute a non-plumbed free standing apparatus containing a reservoir for a drinking fountain, we will also be saving the energy it would have taken to deliver the jugs or containers of water to supply the apparatus.

The water dispenser, which in many installations would be a water bottle filling station, could be plumbed as a separate fixture, combined with the traditional high-low drinking fountain in new equipment, or attached after-the-fact to existing drinking fountains.

Bibliography: [1] (Deirdre Hanners, Grand Canyon National Park's Environmental Specialist)
https://www.nps.gov/grca/playourvisit/refilling_stations.htm

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Cost for proposal 1 -

This is a coordination/clarification of existing requirements in the IBC and the IPC.

Cost for proposal 2 -

Where this option is chosen, a permanent fixture would need to be installed instead of allowing for a portable system. However, there are a variety of options to choose from so the cost to the building owner should be about the same.

Staff Note: In Part I, the intent is for the text in the IPC for the definition of water dispenser and Section 410.4 to be copied verbatim into the IBC as a new definition and new Section 2902.7. The Code Correlation Committee will decide, prior to publication of the codes, whether a scoping designation will be applied to this new definition and new section in the IBC. The title change of IBC Section 1109.5 is only editorial.

P38-18 Part I

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The Committee agreed with the published reason statement. (Vote:14-0)

Assembly Action:

None

P38-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: James Kendzel, representing American Supply Association (jkendzel@asa.net) requests As Modified by This Public Comment.

Modify as follows:

2018 International Building Code

DRINKING FOUNTAIN A plumbing fixture that is connected to the potable water distribution system and the drainage system. The fixture allows the user to obtain a drink directly from a stream of flowing water without the use of any accessories.

Commenter's Reason: The proposed modification is to add the definition of "drinking fountain" from the IPC into the IBC along with the definition for "water dispenser" which is being added to the IBC based on the current proposal. Both terms are used in the current language of the IBC and proposed new text to be added to the IBC in the proposal. The change does not alter the intent of the original proposal but provides a consistency in definition and assurance that the full intent of the IPC language, including applicable definitions, are incorporated into the IBC.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

No cost impact since there is no substantive change to the proposal being suggested but rather an incorporation of applicable definitions already existing in the IPC to ensure consistency.

P38-18 Part I

P38-18 Part II

IPC: 410.3 (New), [BE]410.3, 410.3.2(New), 410.4

Proposed Change as Submitted

Proponent: Jenifer Gilliland, City of Seattle, Washington, representing City of Seattle, Washington (jenifer.gilliland@seattle.gov)

2018 International Plumbing Code

SECTION 202 GENERAL DEFINITIONS

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. This definition includes a freestanding apparatus for the same purpose that is not connected to the potable water distribution system and that is supplied with potable water from a container, bottle or reservoir.

SECTION 410 DRINKING FOUNTAINS

410.2 Small occupancies. Drinking fountains shall not be required for an occupant load of 15 or fewer.

Add new text as follows

410.3 High and low drinking fountains. Where drinking fountains are provided on an exterior site, on a floor or within a secured area, the drinking fountains shall be provided in accordance with Sections 410.3.1 and 410.3.2.

Revise as follows

~~**[BE] 410.3 410.3.1 High and low drinking fountains - Minimum number.** Where drinking fountains are required, not fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.~~

Exceptions:

1. A single drinking fountain with two separate spouts that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.
2. Where drinking fountains are primarily for children's use, the drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

Add new text as follows

410.3.2 More than the minimum number. Where more than the minimum number of drinking fountains specified in Section 1109.5.1 is provided, 50 percent of the total number of drinking fountains provided shall comply with the requirements for persons who use a wheelchair and 50 percent of the total number of drinking fountains provided shall comply with the requirements for standing persons.

Exceptions:

1. Where 50 percent of the drinking fountains yields a fraction, 50 percent shall be permitted to be rounded up or down, provided that the total number of drinking fountains complying with this section equals 100 percent of the drinking fountains.

2. Where drinking fountains are primarily for children's use, drinking fountains for people using wheelchairs shall be permitted to comply with the children's provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

Revise as follows

410.4 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not

be required in those restaurants. In other occupancies where more than two drinking fountains are required, *water dispensers* shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains.

Reason: Reason for proposal 1:

It is important for both the building official and the plumbing inspector to fully understand the requirements for drinking fountains including when they can be eliminated, switched out, and when high/low drinking fountains are required. Currently, only a portion of the information is available in the IPC and IBC.

The IPC does not have language addressing two important points needed for accessible drinking fountains:

1) The IPC doesn't include the requirements found in the IBC that are based on where the fountain is being provided - per floor, per secure area, or outside.

2) The IPC doesn't address high/low requirements for three or more drinking fountains.

This proposal adds the relevant sections currently found in IBC to IPC. The changes to the language are editorial for coordination only.

There also appears to be a conflict between the IPC allowing half of the drinking fountains to be switched out starting at two drinking fountains, and the accessibility requirement requiring at least two. Adding "two or more" to the IPC Section 410.4 will eliminate that conflict. This information should be repeated in IBC Chapter 29 along with the information that small occupancies do not have to have drinking fountains.

Reason for proposal 2:

A freestanding apparatus should not be substituted for a drinking fountain. There is nothing to stop a building owner from discontinuing the service or removing the equipment.

Having access to drinking fountains where someone can get water or access to a water dispenser where someone can use their own cup or bottle is important for occupant's health as well as helping our environment by reducing the number of plastic bottles going into the landfill. By eliminating the option to substitute a non-plumbed free standing apparatus containing a reservoir for a drinking fountain, we will also be saving the energy it would have taken to deliver the jugs or containers of water to supply the apparatus.

The water dispenser, which in many installations would be a water bottle filling station, could be plumbed as a separate fixture, combined with the traditional high-low drinking fountain in new equipment, or attached after-the-fact to existing drinking fountains.

Bibliography: [1] (Deirdre Hanners, Grand Canyon National Park's Environmental Specialist)
https://www.nps.gov/grca/planyourvisit/refilling_stations.htm

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Cost for proposal 1 -

This is a coordination/clarification of existing requirements in the IBC and the IPC.

Cost for proposal 2 -

Where this option is chosen, a permanent fixture would need to be installed instead of allowing for a portable system. However, there are a variety of options to choose from so the cost to the building owner should be about the same.

Staff note: In Part 2, the intent is for the text in the IBC Section 1109.5, 1109.5.1 and 1109.5.2 to be copied verbatim into the IPC as Sections 410.3, 410.3.1 and 410.3.2 . A [BE] is shown in front of the text to indicate this, however, code committee scoping will be officially determined at a later date. There is a revision to IPC Section 410.4.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The Committee agreed with the published reason statement. (Vote:14-0)

P38-18 Part II

P42-18

IPC: 411.3, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows

411.3 Water supply. Where hot and cold water is supplied to an emergency shower or eyewash station, the temperature of the water supply shall only be controlled by a temperature actuated mixing valve complying with ASSE 1071. Where water is supplied directly to an emergency shower or eyewash station from a water heater, the water heater shall comply with ASSE 1085.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1085-2018:

Performance Requirements for Water Heaters for Emergency Equipment

Reason: A new standard, ASSE 1085, was developed for water heaters specifically designed for emergency fixtures. The standard is comparable to the valve standard, ASSE 1071. The water heater cannot produce a temperature of hot water exceeding 100° F. The water heater produces water within a minute at the tepid temperature range required for emergency fixtures. These water heaters are typically installed within the close proximity of the emergency fixture. This is an alternative methods for meeting the high flow rates for emergency showers without the need for adding to the hot water demand of the plumbing within the building.

Cost Impact: The code change proposal will decrease the cost of construction. The availability of more options to achieve code compliance usually results in lower construction costs.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1085-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P42-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: These water heating units are already being successfully used in the indicated application. The standard is necessary to control the manufacturing of these units. (Vote:8-6)

Assembly Action:

None

P42-18

Individual Consideration Agenda

Public Comment 1:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standard ASSE 1085-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

P42-18

P45-18 Part I

IPC: 412.3, 412.4, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows

412.3 Individual shower valves. Individual shower and tub-shower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and shall be installed at the point of use. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted. ~~In-line thermostatic valves shall not be utilized for compliance with this section.~~ The means for regulating the maximum temperature shall be by one of following:

1. A field adjustment and setting of the maximum temperature limit means of the shower or tub-shower combination valve in accordance with the manufacturer's instructions.
2. A limiting device conforming to either ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
3. A thermostatic mixing valve conforming to ASSE 1017.
4. A water heater conforming to ASSE 1082.
5. A water heater conforming to ASSE 1084.
6. A temperature actuated flow reduction device conforming to ASSE 1062.

412.4 Multiple (gang) showers. Multiple (gang) showers supplied with a single-tempered water supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ~~ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and is installed at the point of use. Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturers' instructions.~~ complies with Section 412.3.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1082-18:

Performance Requirements for Water Heaters used as Temperature Control Devices for Hot Water Distribution Systems

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason: The scald prevention requirements for a shower valve are by the requirement for a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves. The high temperature limit was originally added to protect children that play hot and cold while taking a shower. This was extended to protecting people who inadvertently turn up the temperature of the shower valve.

The current code only stipulates the setting of the limit stop on the fixture fitting or shower valve, however, other viable means are available for setting the maximum temperature. The other viable means are often superior to setting the limit stop on the fixture fitting.

When the limit stop is adjusted, it is based on the temperature setting of the water heater and the cold water temperature. If the cold water temperature drops, which happens in some areas during the winter months, the setting

temperature drops. If the water heater is increased in temperature, the setting temperature rises. This phenomena does not occur when other means are used to regulate the high temperature.

Section 412.7 already permits the use of a TARF complying with ASSE 1062 for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

For Section 412.4, there is no need to repeat all of the requirements in Section 412.3. If an individual shower valve is installed in gang showers, the requirements of Section 412.3 automatically apply. The revision merely emphasizes this requirement.

The changes to the Residential Code will make the requirements consistent with the Plumbing Code.

Cost Impact: The code change proposal will decrease the cost of construction. Other options, which may be a lower cost, will be available for setting the maximum temperature.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P45-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Devices complying with ASSE 1017 and ASSE 1062 do not have the capability to protect against thermal shock. (Vote:11-3)

Assembly Action:

None

P45-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com) requests As Submitted.

Commenter's Reason: There was confusion regarding the application of the standards specified. Thermal shock protection is provided by the ASSE 1016/ASME A112.1016/CSA B125.16 shower valve. The remaining items merely are used to set the upper temperature limit. Section 412.7 already permits the use of an ASSE 1062 device for upper temperature limit protection. Hence, the Committee statement was inaccurate. The ASSE 1017 device is also only setting the upper temperature limit. That is permitted by the current code. If the maximum water temperature out of the shower valve is less than 120 degrees F, there is no adjustment necessary. The limitation of the hot water temperature is the ASSE 1017 valve.

It must be noted that NEITHER ASSE 1070/ASME A112.1070/CSA B125.70, ASSE 1017, ASSE 1082, ASSE 1084, nor ASSE 1062 are providing thermal shock or scald protection. These devices and water heater are providing upper temperature limits in a shower. There is no change to the protection required by an ASSE 1016/ASME A112.1016/CSA B125.16 shower valve.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change presents options to the code user. As such, there is no impact to the cost of construction.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018 and ASSE 1085-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

P45-18 Part I

P45-18 Part II

IRC: P2708.4, Chapter 44

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Residential Code

Revise as follows

P2708.4 Shower control valves. Individual shower and tub/shower combination valves shall be equipped with control valves of the pressure-balance, thermostatic-mixing or combination pressure-balance/thermostatic-mixing valve types with a high limit stop in accordance with ASSE 1016/ASME A112.1016/CSA B125.16. ~~The high limit stop A means shall be set provided to limit the water temperature to not greater than 120°F (49°C). In-line thermostatic valves shall not be used for compliance with this section.~~ The means for regulating the maximum temperature shall be by one of the following:

1. A field adjustment and setting of the maximum temperature limit means of the shower or tub-shower combination valve in accordance with the manufacturer's instructions.
2. A limiting device conforming to either ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
3. A thermostatic mixing valve conforming to ASSE 1017.
4. A water heater conforming to ASSE 1082.
5. A water heater conforming to ASSE 1084.
6. A temperature actuated flow reduction device conforming to ASSE 1062.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason: The scald prevention requirements for a shower valve are by the requirement for a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves. The high temperature limit was originally added to protect children that play hot and cold while taking a shower. This was extended to protecting people who inadvertently turn up the temperature of the shower valve.

The current code only stipulates the setting of the limit stop on the fixture fitting or shower valve, however, other viable means are available for setting the maximum temperature. The other viable means are often superior to setting the limit stop on the fixture fitting.

When the limit stop is adjusted, it is based on the temperature setting of the water heater and the cold water temperature. If the cold water temperature drops, which happens in some areas during the winter months, the setting temperature drops. If the water heater is increased in temperature, the setting temperature rises. This phenomena does not occur when other means are used to regulate the high temperature.

Section 412.7 already permits the use of a TARF complying with ASSE 1062 for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

For Section 412.4, there is no need to repeat all of the requirements in Section 412.3. If an individual shower valve is installed in gang showers, the requirements of Section 412.3 automatically apply. The revision merely emphasizes this requirement.

The changes to the Residential Code will make the requirements consistent with the Plumbing Code.

Cost Impact: The code change proposal will decrease the cost of construction. Other options, which may be a lower cost, will be available for setting the maximum temperature.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1082-2018 and ASSE 1084-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: ASSE 1082 is not yet completed. (Vote:10-0)

Assembly Action:

None

P45-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com) requests As Submitted.

Commenter's Reason: At the first hearing, ASSE 1082 was not completed. The standard has been finalized. Based on the original supporting statement, the change should be accepted.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change presents options to the code user. As such, there is no impact to the cost of construction.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018 and ASSE 1085-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

P45-18 Part II

P46-18 Part II

IRC: P2708.4

Proposed Change as Submitted

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2018 International Residential Code

Revise as follows

P2708.4 Shower control valves. Individual shower and tub/shower combination valves shall be equipped with control valves of the pressure-balance, thermostatic-mixing or combination pressure-balance/thermostatic-mixing valve types with a high limit stop in accordance with ASSE 1016/ASME A112.1016/CSA B125.16. Shower control valves shall be rated for the flow rate of the installed showerhead. The high limit stop shall be set to limit the water temperature to not greater than 120°F (49°C). In-line thermostatic valves shall not be used for compliance with this section.

Reason: The thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. The proposed text is consistent with similar requirements found in ASSE 1016/ASME A112.1016/CSA B125.16 and ASME A112.18.1/CSA B125.1. As manufacturers continue to innovate with more water- and energy-efficient showerheads, this proposal is needed to ensure that new buildings built to the code will safely accommodate the showerheads selected by the designer or builder. Note that this language does not require that the showerhead itself have a flow rate of less than 2.5 gpm, but simply that the flow rating of the shower valve matches the flow rate of the installed showerhead to provide the scald and thermal shock protection required by the recognized standard when the valve model is tested. Note that the 2012 Uniform Plumbing Code, Section 408.3, contains a similar requirement for 'matching' the valve and showerhead flow rates as follows:

"Showers and tub-shower combinations shall be provided with individual control valves of the pressure balance, thermostatic, or combination pressure balance/thermostatic mixing valve type that provide scald and thermal shock protection for the rated flow of the installed showerhead."

The IPC and IRC should be no less protective of health and safety than the UPC.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Adoption of this proposal will have no effect on the cost of construction, because it calls for the installation of showerheads and shower mixing valves that are compatible, rather than calling for the installation of a particular showerhead or shower control valve that might carry a cost premium. Care in specification and installation is required, not a special product or special installation technique. As noted above, the proposal does not require that the showerhead itself have a flow rate of less than 2.5 gpm, and compliance can be achieved with minimally compliant valves and showerheads. If an architect or builder chooses to install a more efficient showerhead with a lower flow rate, there are control valves available at moderate price points that can accommodate the builder's decision.

P46-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: In residential settings, for a variety of reasons, the builder-supplied original showerheads are often replaced by the building occupants soon after initial occupancy of the building. Knowing this fact, the proposed requirement doesn't effectively provide for any real added level of safety after these types of buildings are occupied. (Vote:5-4)

Assembly Action:

None

P46-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)requests As Submitted.

Commenter's Reason: The committee felt that there was no benefit in this safety requirement because the occupants would likely replace the originally installed showerhead. While that may be true, this can be said about any safety provision in the entire code. Homeowners can always undo, tamper with or eliminate any safety device or installation and that is completely out of the control of the code official and the builder. The builder makes sure that the properly rated shower head and control valve combination is installed and the code official inspects for such. The installation is safe when the owners move into the house. What happens to the shower head after that is beyond the control of the builder and code official. It is important for the code to state the proposed safety requirement for the initial installation, but is also important to advise those that change the controls and shower heads in the future. If the homeowner created a hazard by changing the original shower head, and an injury resulted, the code would be stating that the what the home owner did was a violation, thereby relieving the builder of liability.

The proposed text is necessary for safeguarding public health and safety, and is consistent with similar requirements found in industry standards (ASSE 1016/ASME A112.1016/CSA B125.16 and ASME A112.18.1/CSA B125.1). Furthermore, manufacturers are already marking control valve packaging to indicate the rated flow rate of the showerhead to be used and showerhead packaging to indicate the rated flow rate of the control valve to be used. Therefore, the requirement is enforceable.

This public comment is submitted by the ICC PMGCAC. CAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2017 and 2018 the PMGCAC has held one face-to-face meeting and 11 conference call meetings which included members of the committee as well as any interested party to discuss and debate the proposed changes and public comments. Related documentation and reports are posted on the PMGCAC website at: <https://www.iccsafe.org/codes-tech-support/codes/code-development-process/pmg-code-action-committee-pmgcac/>.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Adoption of this proposal will have no effect on the cost of construction, because it calls for the installation of showerheads and shower mixing valves that are compatible, rather than calling for the installation of a particular showerhead or shower control valve that might carry a cost premium. Care in specification and installation is required, not a special product or special installation technique. As noted above, the proposal does not require that the showerhead itself have a flow rate of less than 2.5 gpm, and compliance can be achieved with minimally compliant valves and showerheads. If an architect or builder chooses to install a more efficient showerhead with a lower flow rate, there are control valves available at moderate price points that can accommodate the builder's decision.

Public Comment 2:

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)requests As Submitted.

Commenter's Reason: The IRC-Plumbing Committee erred by turning down this proposal even as the IPC Committee approved the same language. The proposal was offered by the PMG CAC to ensure that showers would be safely operated in the as-built condition, by ensuring that the rated flow of a shower mixing valve is adequate to provide thermal protection at the flow rate of the showerhead being installed. The IRC-Plumbing Committee strayed into speculation about after-occupancy changes in showerheads. But occupants can make many, many changes to a building in future years that might render it less safe or even unsafe, and yet the codes covering new construction and major renovation seek to

make new buildings as safe as reasonably possible. This provision addresses the need for a newly installed shower to operate safely. The fact that other steps may be needed to better inform consumers about shower safety does not negate in any way the value and purpose of this proposal as submitted -- as was concluded by the IPC Committee looking at the same proposal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Adoption of this proposal will have no effect on the cost of construction, because it calls for the installation of showerheads and shower mixing valves that are compatible, rather than calling for the installation of a particular showerhead or shower control valve that might carry a cost premium. Care in specification and installation is required, not a special product or special installation technique.

P46-18 Part I

IPC: 412.3, 412.4

Proposed Change as Submitted

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows

412.3 Individual shower valves. Individual shower and tubshower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and shall be installed at the point of use. Shower control valves shall be rated for the flow rate of the installed showerhead. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturer's instructions. In-line thermostatic valves shall not be utilized for compliance with this section.

412.4 Multiple (gang) showers. Multiple (gang) showers supplied with a single-tempered water supply pipe shall have the water supply for such showers controlled by an *approved* automatic temperature control mixing valve that conforms to ASSE 1069 or CSA B125.3, or each shower head shall be individually controlled by a balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valve that conforms to ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 and is installed at the point of use. Where a showerhead is individually controlled, shower control valves shall be rated for the flow rate of the installed showerhead. Such valves shall be equipped with a means to limit the maximum setting of the valve to 120°F (49°C), which shall be field adjusted in accordance with the manufacturers' instructions.

Reason: The thermal protection afforded by shower valves can be compromised if the flow rate of the showerhead is less than the flow rate for which the protective components of the valve have been designed. The proposed text is consistent with similar requirements found in ASSE 1016/ASME A112.1016/CSA B125.16 and ASME A112.18.1/CSA B125.1. As manufacturers continue to innovate with more water- and energy-efficient showerheads, this proposal is needed to ensure that new buildings built to the code will safely accommodate the showerheads selected by the designer or builder. Note that this language does not require that the showerhead itself have a flow rate of less than 2.5 gpm, but simply that the flow rating of the shower valve matches the flow rate of the installed showerhead to provide the scald and thermal shock protection required by the recognized standard when the valve model is tested. Note that the 2012 Uniform Plumbing Code, Section 408.3, contains a similar requirement for 'matching' the valve and showerhead flow rates as follows:

"Showers and tub-shower combinations shall be provided with individual control valves of the pressure balance, thermostatic, or combination pressure balance/thermostatic mixing valve type that provide scald and thermal shock protection for the rated flow of the installed showerhead."

The IPC and IRC should be no less protective of health and safety than the UPC.

This proposal is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Adoption of this proposal will have no effect on the cost of construction, because it calls for the installation of showerheads and shower mixing valves that are compatible, rather than calling for the installation of a particular showerhead or shower control valve that might carry a cost premium. Care in specification and installation is required, not a special product or special installation technique. As noted above, the proposal does not require that the showerhead

itself have a flow rate of less than 2.5 gpm, and compliance can be achieved with minimally compliant valves and showerheads. If an architect or builder chooses to install a more efficient showerhead with a lower flow rate, there are control valves available at moderate price points that can accommodate the builder's decision.

Public Hearing Results

Committee Action:

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows

412.5 Bathtub and whirlpool bathtub valves. The *hot water* supplied to bathtubs and whirlpool bathtubs shall be limited to not greater than 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 or by a water heater complying with ASSE 1082 or ASSE 1084, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section 412.3.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason: There are two new standards for water heaters, ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the currently listed water-temperature limiting device.

Water heaters complying with either one of these standards can provide tempered water within a range of a few degrees depending on the flow rate. The temperature range is similar to the allowable temperature range for an ASSE 1070/ASME A112.1070/CSA B125.70 device. The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

Bibliography: 1082-2017 Performance Requirements for Water Heaters used as Temperature Control Devices for Hot Water Distribution Systems 412.5
1084-2017 Performance Requirements for Water Heaters used as Temperature Limiting Devices 412.5

Cost Impact: The code change proposal will not increase or decrease the cost of construction
The code change proposal will not increase or decrease the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P50-18 Part I

IPC: 412.5, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows

412.5 Bathtub and whirlpool bathtub valves. The hot water supplied to bathtubs and whirlpool bathtubs shall be limited to not greater than 120°F (49°C) ~~by a The water temperature limiting device that conforms~~ temperature shall be regulated by one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3,
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.

Exception: ~~except~~ Water temperature regulation by one of the items indicated in this section shall not be required where such regulation is ~~Where such protection is otherwise provided by a combination tub/shower valve in accordance with Section 412.3.~~

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason: The requirement for regulating the maximum temperature of water for bathtubs and whirlpool bathtub is a scald prevention requirement. The current code allows the use of a device complying with ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3. This change identifies other viable methods of controlling the temperature of the hot water. e identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

The change to the Residential Code will make the requirements consistent with the Plumbing Code.

Cost Impact: The code change proposal will decrease the cost of construction. The options may result in lower costs.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: It is known that ASSE 1017 valves have a problem with temperature creep. The ASSE 1082 standard does not address the potential for temperature creep. (Vote:10-4)

Assembly Action:

None

P50-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

412.5 Bathtub and whirlpool bathtub valves. The *hot water* supplied to bathtubs and whirlpool bathtubs shall be limited to not greater than ~~±20°F~~ 120 F (49°C/49 C) The water temperature shall be regulated by one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3,
2. A ~~thermostatic mixing valve conforming to ASSE 1017.~~
- ~~3. A water heater conforming to ASSE 1082.~~
- ~~4.3.~~ A water heater conforming to ASSE 1084.

Exception: Water temperature regulation by one of the items indicated in this section shall not be required where such regulation is provided by a combination tub/shower valve in accordance with Section 412.3.

Commenter's Reason: I pointed out during the first hearing that ASSE 1017 should have been deleted in a modification. Also, during the first hearing, ASSE 1084 had not been completed. The standards are now available.

The Committee statement mentions that ASSE 1082 provides no protection against creep. As I testified, a water heater being controlled for outlet temperature cannot have creep. The creep that occurs in an ASSE 1017 valve is related to improper adjustment of a recirculating system. Even with a recirculating system, a water heater cannot have creep. The outlet temperature is always within the allowable range of the set point.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change provides an option to the code users. As such, there is no impact to the cost of construction.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018 and ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

Performance Requirements for Water Heaters used as Temperature Control Devices for Hot Water Distribution Systems

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason: The requirement for regulating the maximum temperature of water for bathtubs and whirlpool bathtub is a scald prevention requirement. The current code allows the use of a device complying with ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3. This change identifies other viable methods of controlling the temperature of the hot water. e identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

The change to the Residential Code will make the requirements consistent with the Plumbing Code.

Cost Impact: The code change proposal will decrease the cost of construction
The options may result in lower costs.

P50-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: ASSE 1082 is not yet completed. (Vote:10-0)

Assembly Action:

None

P50-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Residential Code

P2713.3 Bathtub and whirlpool bathtub valves. Hot water supplied to bathtubs and whirlpool bathtubs shall be limited to not greater than ~~120°F~~ 120 F (49°C) The water temperature shall be regulated by one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
2. A ~~thermostatic mixing valve conforming to ASSE 1017.~~
- ~~3. A water heater conforming to ASSE 1082.~~
- ~~4.3.~~ A water heater conforming to ASSE 1084.

Exception: Water temperature regulation by one of the items indicated in this section shall not be required where such regulation is provided by a combination tub/shower valve in accordance with Section P2708.4.

Commenter's Reason: During the first hearing, I indicated that ASSE 1082 was not yet complete. The standard has been finalized. Also during the first hearing, I indicated that based on the input I received that ASSE 1017 should be deleted. The modification deletes reference to ASSE 1017.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change provides an option to the code users. As such, there is no impact to the cost of construction.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018 and ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

P50-18 Part II

P51-18

IPC: 412.10, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows

412.10 Head shampoo sink faucets. Head shampoo sink faucets shall be supplied with hot water that is limited to not more than 120°F (49°C) ~~by a water temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.~~ Each faucet shall have integral check valves to prevent crossover flow between the hot and cold water supply connections. The means for regulating the maximum temperature shall be one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70.
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.
5. A temperature actuated flow reduction device conforming to ASSE 1062.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason: The scald prevention requirements for head shampoo sink faucets is similar to the upper limit requirement for shower valves. There other viable means are available for setting the maximum temperature besides a device complying with ASSE 1070/ASME A112.1070/CSA B125.70. The other viable means of meeting the high temperature limit. Section 412.7 already permits the use of a TARF complying with ASSE 1062 for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

Cost Impact: The code change proposal will decrease the cost of construction. The available options could result in lower costs.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P51-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 412.10 Head shampoo sink faucets. Head shampoo sink faucets shall be supplied with hot water that is limited to not more than 120°F (49°C) . Each faucet shall have integral check valves to prevent crossover flow between the hot and cold water supply connections. The means for regulating the maximum temperature shall be one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70.

~~2. A thermostatic mixing valve conforming to ASSE 1017.~~

~~3. 2.~~ A water heater conforming to ASSE 1082.

~~4. A water heater conforming to ASSE 1084.~~

~~5. 3.~~ A temperature actuated flow reduction device conforming to ASSE 1062.

Committee Reason: For the Modification: ASSE 1084 is not yet completed and ASSE 1017 is not appropriate for the application.

For the Proposal: The Committee agreed with the published reason statement. (Vote:10-4)

Assembly Action:

None

P51-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Conrad Jahrling, representing ASSE International (conrad.jahrling@asse-plumbing.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

412.10 Head shampoo sink faucets. Head shampoo sink faucets shall be supplied with hot water that is limited to not more than ~~120°F~~ 120 F (49°C) . Each faucet shall have integral check valves to prevent crossover flow between the hot and cold water supply connections. The means for regulating the maximum temperature shall be one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70.
2. A water heater conforming to ASSE ~~1082~~ 1084.
3. A temperature actuated flow reduction device conforming to ASSE 1062.

Commenter's Reason: A device that conforms with ASSE 1084 has the same temperature control output tolerances and requirements as a device that conforms with ASSE 1070 / ASME A112.1070 / CSA B125.70. The difference between the two is that an ASSE 1084 device adds heat to the system and only requires a cold water supply inlet. ASSE 1084 devices include electrical heater safety controls that are specific to point-of-use applications, whereas ASSE 1082 devices do not as they are for distribution.

As of July 16th, 2018:

ASSE 1082-2018 will be in public review until Sept 11. The performance of the device is designed to conform similarly to ASSE 1017, except with only a cold water inlet. Projected date of completion is Oct 15th.

ASSE 1084-2018 is currently finishing working group discussions. The performance of the device is designed to conform similarly to ASSE 1070 / ASME A112.1070 / CSA B125.70, except with only a cold water inlet. Projected date of completion is Oct 15th.

The ASSE standards development process after standards have completed the open working group is outlined as:

Ballot the ASSE PSC consensus body for 21 days.
Resolve comments between commenters, staff, and PSC chair.
Send to public comment with ANSI for 45-day review. Resolve comments between commenters, staff, and PSC chair.
Submit to ANSI for review and approval.
Publish.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

These devices are alternatives to current code-required methods. There is not a cost impact for including alternative methods in the code.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018 and ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

Public Comment 2:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standards ASSE 1082-2018 and ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

P51-18

P53-18

IPC: 413.5

Proposed Change as Submitted

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Add new text as follows

413.5 Floor slope to floor and trench drains. The floor surface in the area or room served by a floor or trench drain shall have a slope to such drains at not less than one-fourth unit vertical in 12 units horizontal (2-percent slope).

Reason: This is long overdue. Everyone has seen this issue at some point in their life. There is some emergency situation and although there is an emergency floor drain/trench drain in the room or area, some water remains on the surface (sometimes several inches) due to the fact there is no real requirement for the area to have slope to the drain. In many cases the highest point in the room or area is actually the inlet to the floor drain/trench drain. It does seem odd that it is covered in great detail when we look at the requirements for a shower liner, however, a floor surface somehow doesn't matter. What many have failed to realize by overlooking this issue is that even though the floor drain/trench drain may be located in a concrete floor (with or without floor covering of some type), there are other portions of the building that can be greatly impacted. For instance, the walls that make up the room. Some assume these would be CMU units, but construction would allow for many other materials. If the walls were metal studs with drywall for instance, the metal studs could be subjected to deterioration from rust caused by the water that remained at the base of the wall because the surface was not sloped correctly. The drywall often becomes a breeding ground for mold as well.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. There should not be a cost impact related to this proposal.

P53-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This requirement might not apply in some applications. The slope could result in an excessive amount of fall in the floor surface. The topic of this proposal (sloping floors towards floor drains) would be better suited to be proposed and evaluated for inclusion into the IBC. (Vote:13-0)

Assembly Action:

None

P53-18

Individual Consideration Agenda

Public Comment 1:

Proponent: James Richardson Jr, representing City of Columbus (jarichardson@columbus.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

413.5 Floor slope to floor and trench drains. The floor surface in the area or room served by a floor or trench drain shall have a slope to such drains ~~at not less than one-fourth unit vertical in 12 units horizontal (2-percent slope),~~ with a minimum acceptable height difference between the highest point in the horizontal floor surface and the inlet to the fixture of 1/4 inch.

Commenter's Reason: Proponents reason statement.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
There will be no realized cost impact as this change only requires the prepared surface under the concrete to be sloped accordingly.

P53-18

P60-18

IPC: 419.5, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows

419.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. ~~Tempered~~ The tempered water shall be delivered through an approved water temperature limiting device that conforms to controlled by one of the following:

1. A temperature limiting device conforming to either ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.
5. A temperature actuated flow reduction device conforming to ASSE 1062.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason: The requirements for public lavatories is out of date based on the changes made to the standard. Previously, ASSE 1070 was considered a thermostatic mixing valve standard with safety features. The standard was revised to be a safety standard without performance requirements for thermostatic mixing. Some valves are adjustable, while others are not.

The requirement for tempered water for public lavatories is a comfort requirement as well as a scald prevention requirement. However, comfort overrides the safety requirement since tempered water is limited to a maximum temperature of 110° F. Scalding temperatures are in excess of this temperature. Other viable means of tempering water to 110° F or less are an ASSE 1017 valve or a water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

The last device listed is a TARF complying with ASSE 1062. Section 412.7 already permits the use of these devices for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

Cost Impact: The code change proposal will decrease the cost of construction
The options may result in a lower installation cost.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P60-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The Committee prefers the language of P61-18. The ASSE 1017 valve is incorrect for the application. (Vote:14-0)

Assembly Action:

None

P60-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting,, representing Bradley Corporation (jbenigneer@aol.com)requests As Submitted.

Commenter's Reason: The Committee stated that they preferred P61-18, yet they rejected P61-18. For hand washing, any of the identified methods can provide comfortable water temperatures. Hand washing upper temperature was intended for comfort and easy adjustment of water temperature, not scald protection. The origins of the requirement are related to ICC A117.1 for handicapped lavatories. This requirement was expanded to all public lavatories. After the development of ASSE 1070 that standard was added to this section. However, there is no justification for such a mandate when other viable options are available. While an ASSE 1070 device works fine, there are other methods available. This change identifies all of the acceptable means of regulating hot water temperature.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. By adding options, the cost of construction will be lowered since other valves and devices are less expensive.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018 and ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

P60-18

P64-18

IPC: 421.5.2

Proposed Change as Submitted

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Revise as follows

421.5.2 Shower ~~lining~~ linings. Floors under shower compartments, except where prefabricated receptors have been provided, shall be lined and made water tight utilizing material complying with Sections 421.5.2.1 through 421.5.2.6. Such liners shall turn up on all sides not less than 2 inches (51 mm) above the finished threshold level. Liners shall be recessed and fastened to an *approved* backing so as not to occupy the space required for wall covering, and shall not be nailed or perforated at any point less than 1 inch (25 mm) above the finished threshold. Liners shall be pitched one-fourth unit vertical in 12 units horizontal (2-percent slope) and shall be sloped toward the fixture drains and be securely fastened to the waste outlet at the seepage entrance, making a water-tight joint between the liner and the outlet. For showers that are designed with a zero height threshold, a trench drain shall be provided that runs 2 inches beyond the full width of the shower compartment opening on both sides. The trench drain shall have a flashing clamp and the shower liner material shall be securely fastened to the waste outlet at the seepage entrance, making a water-tight joint between the liner and the outlet. The shower liner shall also be required to extend 2 inches above the floor level and 1 inch beyond the edges of the trench drain. If for some reason the trench drain cannot be accommodated, the entire room the shower is located in shall be considered part of the shower compartment and provided with a liner for the entire floor surface.

The completed liner shall be tested in accordance with Section 312.9.

Exceptions:

1. Floor surfaces under shower heads provided for rinsing laid directly on the ground are not required to comply with this section.
2. Where a sheet-applied, load-bearing, bonded, waterproof membrane is installed as the shower lining, the membrane shall not be required to be recessed.

Reason: The plumbing code has not yet dealt with site built zero height threshold showers. These continue to be a problem for jurisdictions since the code provides no direction or parameters for how these should be constructed. We have seen installations end up causing substantial damage to a structure due to water migration between the floor covering and the sub floor. This proposal provides two possibilities which should result in adequate protection for the structure.

Bibliography: See "Reason Statement"

Cost Impact: The code change proposal will increase the cost of construction. This will result in an increase in the cost of construction, but will also provide adequate protection for the structure to prevent hidden damage.

P64-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The slope could be in excess of what ADA limitations are for shower floors. There are other methods that can be used to achieve the same result. Requiring this one method is too restrictive. (Vote:12-1)

Assembly Action:

None

P64-18

Individual Consideration Agenda

Public Comment 1:

Proponent: James Richardson Jr, City of Columbus, representing City of Columbus Ohio (jarichardson@columbus.gov)requests As Submitted.

Commenter's Reason: This is an issue that needs addressed in the plumbing code. We have observed property after property that suffered significant damage because there is a lack of direction regarding the construction of a "barrier - free" or "zero-threshold" site built shower. Water always seeks its' own level and in doing so migrates horizontally. Often there is damage to not only the subfloor, but also to the base of the wall and the vertical studs.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The increase in the cost of construction will be offset by the savings realized from preventing the damage in the first place.

P64-18

P65-18

IPC: 423.3, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows

423.3 Footbaths and pedicure baths. The water supplied to specialty plumbing fixtures, such as pedicure chairs having an integral foot bathtub and footbaths, shall be limited to not greater than 120°F (49°C) ~~by a~~. The water - temperature limiting device that conforms - temperature shall be regulated by one of the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.
5. A temperature actuated flow reduction device conforming to ASSE 1062.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1082-2018:

Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

Reason: The requirement for regulating the maximum temperature of water for pedicure chairs having an integral foot bathtub, footbaths, and head shampoo sinks is a scald prevention requirement. The current code allows the use of a device complying with ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.

Section 412.7 already permits the use of a TARF complying with ASSE 1062 for controlling the water temperature discharging from a faucet. Hence, the identification of the standard in this section complements the requirements in Section 412.7.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 120° F are water heater meeting one of the two new standards.

The two new standard for water heaters are ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve.

Cost Impact: The code change proposal will decrease the cost of construction
The options may reduce the cost of an installation.

Analysis: A review of the standard proposed for inclusion in the code, ASSE 1082-2018 and ASSE 1084-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P65-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There appears to be too many concerns of testifiers about the differences between ASSE 1017 and ASSE 1082 "devices". ASSE 1017 valves are not acceptable for point-of-use applications. The ASSE 1084 standard is not yet completed. (Vote:12-2)

Assembly Action:

None

P65-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, representing Self (jbenigneer@aol.com)requests As Submitted.

Commenter's Reason: Footbaths and pedicure baths are administered under the control of an attendant. The temperature is not adjusted by the person whose feet are being bathed. The upper temperature limit is not for anti-scald as implied. The upper temperature limit is to provide a means of warming the bath, at the same time, not having scalding water spray on the bather. Any one of the device listed can provide upper temperature limit on the hot water.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction This will present an option to the user. The valves being added as options cost less to purchase.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018 and ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

P65-18

P66-18

IPC: 423.3, Chapter 15

Proposed Change as Submitted

Proponent: Misty Guard, representing Bradley Corporation (Misty.Guard@bradleycorp.com)

2018 International Plumbing Code

Revise as follows

423.3 Footbaths and pedicure baths. The water supplied to specialty plumbing fixtures, such as pedicure chairs having an integral foot bathtub and footbaths, shall be limited to not greater than 120°F (49°C) by a water-temperature-limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 or from a water heater complying with ASSE 1082 or ASSE 1084.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason: There are two new standards for water heaters, ASSE 1082 and ASSE 1084. These water heaters are equivalent to ASSE 1017 and ASSE 1070 respectively. As such, they have the capability of providing an equivalent level of performance as the currently listed water-temperature limiting device.

Water heaters complying with either one of these standards can provide tempered water within a range of a few degrees depending on the flow rate. The temperature range is similar to the allowable temperature range for an ASSE 1070/ASME A112.1070/CSA B125.70 device.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The code change proposal will not increase or decrease the cost of construction.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P66-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 423.3 Footbaths and pedicure baths. The water supplied to specialty plumbing fixtures, such as pedicure chairs having an integral foot bathtub and footbaths, shall be limited to not greater than 120°F (49°C) by a water-temperature-limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 or from a water heater complying with ASSE 1082 ~~or ASSE 1084~~.

Committee Reason: For the Modification: The ASSE 1084 standard is not yet completed.
For the Proposal: Devices that comply with the requirements of ASSE 1082 are being successfully used. The Committee approved a previous proposal for these devices to be used for head shampoo sinks. (Vote:10-4)

Assembly Action:

None

P66-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Conrad Jahrling, representing ASSE International (conrad.jahrling@asse-plumbing.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

423.3 Footbaths and pedicure baths. The water supplied to specialty plumbing fixtures, such as pedicure chairs having an integral foot bathtub and footbaths, shall be limited to not greater than 120 F (49 C) by a water-temperature-limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3 or from a water heater complying with ASSE ~~1082~~1084.

Commenter's Reason: This is a misapplication of ASSE 1082. The purpose of a device that conforms with ASSE 1082 is to supply hot or tempered water at a controlled output temperature for distribution. The tolerances for control are the same as the tolerances described in ASSE 1017 for mixing valves. Similarly, a device conforming to ASSE 1017 would not be appropriate in this application.

Conversely, a water heater that conforms to ASSE 1084 would be appropriate.

As of July 16th, 2018:

ASSE 1082-2018 will be in public review until Sept 11. The performance of the device is designed to conform similarly to ASSE 1017, except with only a cold water inlet. Projected date of completion is Oct 15th.

ASSE 1084-2018 is currently finishing working group discussions. The performance of the device is designed to conform similarly to ASSE 1070 / ASME A112.1070 / CSA B125.70, except with only a cold water inlet. Projected date of completion is Oct 15th.

The ASSE standards development process after standards have completed the open working group is outlined as:

- Ballot the ASSE PSC consensus body for 21 days.
- Resolve comments between commenters, staff, and PSC chair.
- Send to public comment with ANSI for 45-day review. Resolve comments between commenters, staff, and PSC chair.
- Submit to ANSI for review and approval.
- Publish.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

These devices are alternatives to current code-required methods. There is not a cost impact for including alternative methods in the code.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-

2018 and ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

Public Comment 2:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standards ASSE 1082-2018 and ASSE 1084-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

IPC: 501.2

Proposed Change as Submitted

Proponent: Ronald George, representing Self (Ron@Plumb-TechLLC.com)

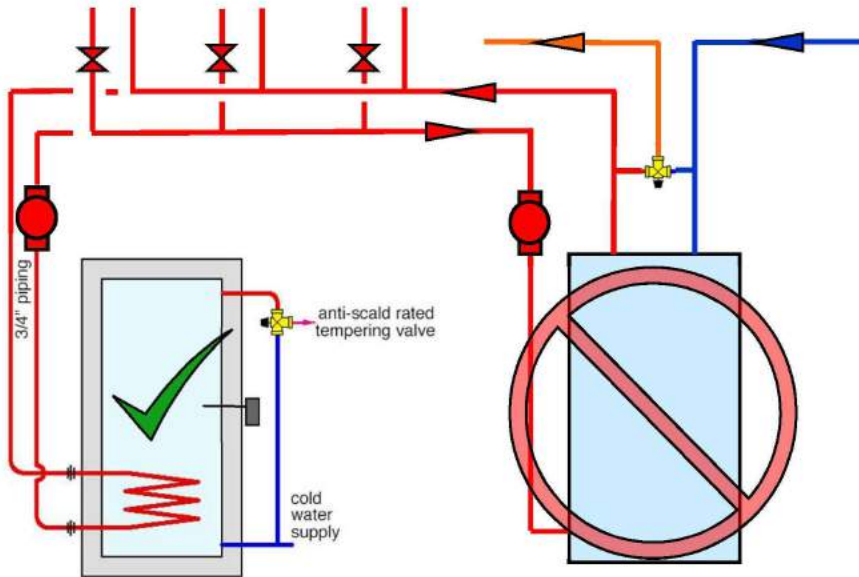

2018 International Plumbing Code

Revise as follows

501.2 Water heater as space heater. Where a combination potable water heating and space heating system requires water for space heating at temperatures greater than 140°F (60°C), a master thermostatic mixing valve complying with ASSE 1017 shall be provided to limit the water supplied to the potable *hot water* distribution system to a temperature of 140°F (60°C) or less. ~~The potability of the water~~ water for the space heating system shall be maintained throughout the system, separated from the potable water system by use of a double wall heat exchanger.

Reason: This code change still allows a single heating appliance to provide both the heating and domestic hot water for a building, however it requires a heat exchanger to separate the two fluid systems. This is because heating hot water systems can sit idle for up to 8 or 9 months per year in southern climates. This causes the water to sit stagnate for many months when the thermostat does not call for heat. This stagnant period is when bacteria grows in a biofilm to very high numbers until the thermostat calls for heat. Then the bacteria is pumped into the water heater where it is transmitted to people from showers and other aerosolizing fixtures. The potential for Legionellosis or Legionnaires' disease is very high. The control valve or zone circulating pump remains off and allows water treatment chemicals to dissipate and bacteria can growth to very high levels in an uncirculated heating circuit. In systems where they cycle the zone valve or circulating pump, it wastes energy and overheats the spaces during summer months. There are other issues that are outlined below.

Combined systems require someone very familiar with how both systems are supposed to operate to properly operate and maintain the system. Proper maintenance of the system can be a comfort or Legionella bacteria growth issue when the temperatures are low and a serious safety and scald issue when temperatures are high. A combined system is a hybrid system that utilizes a boiler or boilers to heat water for heating the building environment and it uses boiler water to heat the domestic hot water for bathing, washing and cleaning uses. There are two applications for these combined systems. One application is heating the building environment with heating hot water which generally needs to be at a very high temperature around 180F to 210F without using oversized heating coils. The other application is for bathing, showering and domestic hot water uses which generally use a lower temperature around 85F to 120F. If the water gets too hot, there are scalding dangers, so proper controls (thermostatic mixing valves) are very important for these types of systems. I have been investigating scald incidents with combined systems since the mid-1990s and I have seen a significant number of these combined systems involved in scald litigation cases because these systems are generally not designed, installed, operated or maintained properly. The following is a list of problems or pitfalls that I have found over the years that are related to combined heating hot water and domestic hot water systems.

A combination Boiler/Water heater should be configured as shown on the left to keep from having domestic hot water sitting stagnant in heating coils and a heating circuit for months during non-heating months. The Boiler/Water heater on the right creates a large dead leg which contributes to Legionella Bacteria growth during non-heating season months. The first call for heat in the fall doses the hot water tank with a high concentration of bacteria from the dead leg.

Codes: There is very little code language on Combines heating hot water and domestic hot water systems. There are only two plumbing code sections in the model codes that mention these combined systems and they give important, but often overlooked requirements. One section calls for the piping and components in a combined system to be approved for use in potable water systems. The other code section calls for a thermostatic mixing valve if the system temperature exceeds 140 degrees Fahrenheit.

There are many more issues that need to be addressed to have a safe and properly designed system. If you can avoid these pitfalls you will have a much safer system:

Pitfall Number 1: Open System vs Closed System “Open systems” are systems with domestic hot water flowing from the city water supply through the heating hot water system components such as pumps, control valves and heating coils. Open systems introduce a lot of oxygen and minerals into the heating coil of the boiler and can cause corrosion and scale build-up issues on heating surfaces. Open systems often have scale build-up on the boiler heating surfaces in hard water areas. High Flue gas temperatures are a sign of scale build-up which minimizes heat transfer into the water and therefore the flue temperatures rise. “Closed Systems” are systems with a double wall heat exchanger separating the fluid of the heating hot water system and the domestic hot water. The boiler loop can be chemically treated and mineral build-up on heating surfaces is minimized. Closed loop systems generally require a double wall heat exchanger when boiler chemicals are used. Open systems provide a significant challenge because the fluid in the system must be potable water and it is difficult to circulate domestic hot water through many hydronic components without having scale, corrosion, build-up of air pockets and oxidation problems. Most hydronic systems have pumps, valves, coils and components that are not approved for drinking water service. Closed systems allow the heating hot water to be chemically treated to prevent corrosion and scale build-up on heating surfaces. Closed hydronic heating systems are the preferred type of combined systems because it eliminates a lot of opportunities for systems problems. There are water heaters with hot water coils in the tank that can be used for this application or a plate and frame or shell and tube heat exchanger can be used for this application. Open systems often see corrosion problems in the components that are not compatible for domestic water systems.

Pitfall Number 2: System Operating Temperatures The next challenge is with the system operating temperatures. Heating hot water systems are generally designed to operate between 180 degrees Fahrenheit and 210 degrees Fahrenheit. Domestic hot water systems are designed to operate between 85 degrees Fahrenheit for the lowest temperature of tempered water to 140 degrees Fahrenheit the highest hot water temperature for kitchens or laundries. “Tempered Water” is water having a temperature range between 85°F (29°C) and 110°F (43°C). “Hot Water” is water at a temperature greater than or equal to 110°F (43°C) and generally domestic hot water for bathing and showering is limited to a maximum of 120 degrees Fahrenheit in code language related to showers and bathtub facilities. Domestic hot water for dishwashing and laundries can be higher. Generally, domestic hot water systems operate at a maximum of 140 degrees Fahrenheit and heating hot water Systems operate best around 190 to 200 degrees Fahrenheit. If the

combined-open heating hot water system is set to 120 degrees F the building will be cold in winter months because there will not be enough heat coming out of the heating units. If the system temperature is set to a higher temperature to satisfy the heating coils or baseboard heater requirements then there is a significant scald risk on the domestic hot water side of the system unless thermostatic mixing valves are used to limit hot water temperatures.

Pitfall Number 3 - Not including all of the required components in the combined systems A combined system has many components that are required for it to operate properly. If all of the components are not installed in the proper location, then the system will experience problems. These components include but are not limited to: The boiler, and expansion tank, isolation valves, unions, dielectric waterways, circulating pumps, air eliminators or air vents, control valves, relief valves, balancing valves, heating coils, fin tube radiators, thermostats, pressure gauges, temperature gauges, flushing connections, plumbing fixtures, drains, etc. All of these components must work in concert and be designed to work together as a system. If any one or several of the components are not installed, or if they are undersized, adjusted or installed improperly the problems and safety issues can occur.

Pitfall Number 4 - Seasonal Pumping and Pump Sizing In large centrally piped systems, when the winter heating season occurs all of the components in a combined heating hot water and domestic hot water system will require a simultaneous peak demand in the morning when it is showering time. So the circulating pump must be sized for the simultaneous peak heating and showering loads. During the winter months, it does not make sense to circulate a large quantity of water, so often I see a smaller circulating pump that is piped around the large circulating pump so it can be used in the winter months when the large circulators are not needed for building heating. This creates a large dead leg in the hot water piping where Legionellae bacteria can grow when the heating hot water pumps are shut down.

Pitfall Number 5 - Dead legs During the summer months the fan coil units and branches to baseboard heating units are shut off with a solenoid valve or the circulating pump on these branches does not run all summer long. It is not unusual for heating system to sit idle for over six months in southern climates. When the first call for heating is made there is usually a slug of brackish and foul tasting water that is high in debris, metals and bacteria content. Combined systems are by design creating very large dead legs which is a plumbing code violation in many plumbing codes. Controls on combined systems need to incorporate a periodic flushing of the zones by operating the solenoid valves and circulators on each zone on at least a bi-weekly basis if not more often. Chlorine dissipates in the domestic water over time and when heated. So dead legs are more susceptible to bacteria growth. In combined systems where a significant portion of the system is used seasonally for heating and the remainder of the system is being used year round for domestic hot water, combined systems are open systems that are susceptible to bacteria growth in stagnant sections of heating coil piping. Heating coils in the summer season are an area with huge potential for bacterial amplification when hydronic systems are coupled with domestic hot water systems and there is no physical barrier or heat exchanger to separate the fluids between the two systems.

Pitfall Number 6 - Peak load problems - Space heating and Shower loads simultaneously The early morning is the generally coldest time of day and it is also when guests at a hotel or an apartment building or condominium take their morning showers. Equipment, piping, pumps and valves must be sized to handle this simultaneous peak load. If the heating coils, pipe and pump equipment is not sized big enough the temperature of the space will drop and the shower water temperature will drop to an uncomfortable temperature. Either condition is likely to result in call and complaints about water temperatures or space temperatures being too low.

Pitfall Number 7 - Sizing Sizing problems can arise when engineers, owners or contractors try to be thrifty and save a few bucks by rounding down on their peak load calculations and downsizing pumps, piping, valves or coils. When this happens, you can bet the maintenance department phone will be ringing off the hook with complaints of spaces being too cold or not enough hot water for a shower during cold weather conditions. The maintenance men usually do what comes natural when they receive a call of not enough heat, they go to the boiler and turn the temperature up. When someone is scalded they always claim they never touched the thermostat. Turning up the temperature will not cause problems for the heating coils, but it does significantly increase the risk of scalding if the maintenance man does not go around and re-adjust all of the maximum temperature limit stops in the showers and tub/shower valves. If the shower has an old two-handle or single handle non-compensating type shower valve that cannot compensate for changes in incoming temperature or pressure, then the risk of scalding is even greater. The best solution is to have a Thermostatic mixing valve on the hot water supply to the bathing and washing fixtures to limit the hot water to a safe temperature. If the hot water and heating water piping are still separated, and the system uses one boiler then a temperature actuated master thermostatic mixing valve conforming to ASSE 1017 or the appropriate CSA B-125 mixing valve can be located at the water heater to lower the hot water to a safe delivery temperature. If the combined system utilizes the same piping for heating hot water and domestic hot water then, a temperature limiting valve conforming to ASSE 1070 should be used in-line to mix cold water with hot water to provide a safe temperature of hot water for bathing or showering fixtures locally.

Pitfall Number 8 - Maintenance The main problem with a combined system is the system includes components and controls for two different mechanical trade disciplines. Often if there is a service call on one of these systems, the service technician may only be familiar with one system or the other. If the system was designed with a specific operating temperature it is not uncommon for a service tech familiar with only one system to set the temperature of the system to what he is accustomed to setting the temperature to. There are also many components in the system that

one trade or the other may be unfamiliar with. For example in one case the owner called an HVAC technician to work on his combined system. The HVAC technician was used to setting hydronic system for building heating at 190 to 200 degrees Fahrenheit. The technician set the temperature to 190 degrees and later a woman was scalded when she got in her shower. The HVAC technician did not know about he needed to reset the maximum temperature limit stop on all of the ASSE 1016 shower valves when he readjusted the boiler set point temperature. There are maintenance technicians that are trained and fully capable of working on combined systems, but they would need to have the design drawings, design operating temperatures and sequence of operations in order to properly maintain the system.

Pitfall Number 9 – Cast Iron Boiler on an Open System I have seen Cast iron boilers used on an open combined heating hot water and domestic hot water system. Cast iron boilers do not perform well with open systems because of the large quantities of water that introduces oxygen and minerals which cause rust stains, oxidation and fouling of the heating surfaces. This mistake does not take long to find because of the rust stains that appear in the sinks, bathtubs & showers. Cast iron boiler can work nicely, but they must have a separate closed loop of boiler water that is treated with corrosion inhibitors and other boiler chemicals as needed. The boiler water can then be piped to a coil in a hot water tank or to a heat exchanger to provide domestic hot water.

Pitfall Number 10 - No Hot Water Tank with Copper Fin Tube Boilers I have seen installation where someone thought they could save a few bucks by eliminating the storage tank and using the heating hot water main as the storage tank. This does not work in motels, hotels, apartment buildings and condos with large peak loads. In facilities like these there needs to be a stored volume of water ready for use in a dump load such as a morning shower period. Copper fin-tube boilers can only raise the temperature of the water 20 - 40 degrees Fahrenheit as the water flows through the boiler. If the water flows too slow, through the boiler, it will scale up and if the water flows too fast (in excess of five feet per second) the copper will erode away. These types of boilers work fine, the just need to have a storage tank for plumbing applications with a dump load. In heating applications the BTU input is matched to the heating load calculations and the system works fine. In a large domestic hot water or a combined heating hot water/domestic hot water system, copper fin-tube boilers should have an adjacent storage tank in order to work properly. If there is no storage tank, the system temperatures will drop off drastically during peak winter showering and building heating periods. The usual result is the maintenance personnel turn up the temperature and higher temperatures increase the risk of scalding.

Pitfall Number 11 - No Thermal Expansion Tank/Proper Thermal Expansion Tank Materials All heating hot water system and domestic hot water systems must have a thermal expansion tank. The thermal expansion tank should be sized for a system start-up from ambient to hot. Another problem I have encountered with these combined systems is usage of a hydronic expansion tank on a combined system. If the same water flows through the coils and to the plumbing fixtures, the system must have a thermal expansion tank rated for use in a potable water system. If the system has one boiler and two separate piping systems with a heat exchanger each piping system should have a thermal expansion tank.

Pitfall Number 12 - Scalding Injuries & Deaths Many designers, contractors and owners forget there are lives at stake when they design and build the combined heating hot water and domestic hot water systems. People have been scalded to death and people have been seriously injured when the systems are not designed, installed or maintained properly. This is more than just a savings on first-cost of an installation, it is a system that warrants serious attention because the public's safety is at stake. A properly sized and located thermostatic mixing valve conforming to ASSE 1017 or ASSE 1070 should be located in the combined system in accordance with the scoping requirements for each type of valve to prevent scalding. At shower locations an ASSE 1016 valve should be used and it should be properly set by the installer and/or the maintenance personnel to limit the maximum outlet temperature to 120 F or less.

Pitfall Number 13 - Litigation Combined systems are susceptible to problems. Problems can lead to injuries and injuries can lead to litigation. If an open combined heating hot water and domestic hot water system cannot be properly maintained for the entire life of the system, don't design it, don't install it or don't request that it be installed because problems will arise. Combined systems require an extensive amount of work and oversight by a person with knowledge of both the heating water requirements and domestic hot water requirements to make sure the system works properly and to make sure someone does not get injured. You must document everything when working on a combined system because when someone gets injured, everyone will be named in the lawsuit.

Pitfall Number 14 – Code Requirements for Thermostatic Mixing Valves The 2009 International Plumbing Code has the following Language dealing with combined systems: 501.2 Water heater as space heater. Where a combination potable water heating and space heating system requires water for space heating at temperatures higher than 140°F (60°C), a master thermostatic mixing valve complying with ASSE 1017 shall be provided to limit the water supplied to the potable hot water distribution system to a temperature of 140°F (60°C) or less. The potability of the water shall be maintained throughout the system. The above code language limits the domestic hot water system to 140 degrees Fahrenheit, and in other code sections the temperature for showers and tub/shower combination units is limited to 120 degrees Fahrenheit. The 2009 International Plumbing code also has the following language addressing maximum water temperatures for instantaneous water heaters: 501.6 Water temperature control in piping from tankless heaters. The temperature of water from tankless water heaters shall be a maximum of 140°F (60°C) when intended for domestic uses. This provision shall not supersede the requirement for protective shower valves in accordance with Section 424.3.

Pitfall Number 15 - Engineered System vs Value Engineered systems I have seen where a value engineering option was offered by a contractor to combine the domestic hot water system with the heating hot water system. This was not a value to the owner and it was not engineered. During the evaluation process the owner decided to allow the contractor to combine the systems without the contractor providing engineered drawings. This decision gave the contractor the ability to use whatever he wanted to use since there were no engineered drawings. The owner got a system that did not work, and had black brackish water flushed out of the dead legs every fall when the heating system was turned on and the stagnant water was circulated through the domestic water piping. I submitted a report almost 200 pages long documenting the many problems in that system.

Pitfall Number 16 - Pipe Materials I have seen where a pipe material cost cutting option that was labeled as a value engineering option was given by a contractor. The option was accepted and the contractor simply eliminated the domestic hot water system and changed the hydronic system from black steel to galvanized steel piping. This was in a condominium building that had about 500 condos that sold in the neighborhood of 1 million dollars each. The galvanized pipe started to rust significantly within two years of service and rust stains were significant in all fixtures. The seasonal dead legs from the heating coils allowed rust barnacles to form until the first call for heat. When the flow in these dead leg branches would resume on the first call for heat in the fall it would flush rust, debris and iron oxide and stagnant water into the strainers of the control valves and into the domestic water system. Galvanized steel pipe should never be used on a domestic hot water system because domestic hot water in an open system connected to the city water main introduces a large quantity of oxygenated water into the system and causes rust. Oxygenated water will cause significant corrosion in ferrous metals such as black steel and galvanized pipe. All components of a combined system should be copper or another code approved non-ferrous material for domestic hot water service if they are in contact with the city water supply. Another thing I often see is iron valves installed in these combined systems. This is usually the result of a heating contractor installing or performing maintenance on the combined system and it is usually the result of the contractor not being familiar with the requirements in the code for all components to be all bronze and/or approved for domestic water use.

Pitfall Number 17 - Pumps When sizing pumps for a combined system there should be two separate systems. The closed system should have large circulating pumps designed for the heating hot water flows. The open system should have small circulator pumps to maintain hot water to the farthest fixture. It is also a good idea to split the load into two and use two smaller pumps to allow for some redundancy and allow for one pump to be maintained while the other is in service. It's a good idea to do this with the boilers also to provide some redundancy. The hydronic system should be a closed loop that can use large ductile iron bodied pumps. The domestic water system is an open system and should have an all bronze circulator. I have seen combined systems where it was an open system with large ductile iron pumps in the main piping before the boilers to provide an adequate flow of heating hot water in the winter months. Then because they did not want to run the large pumps just to maintain the domestic hot water temperature at the end of the system, a small bronze circulator was installed on a branch off of the main with check valves to prevent short circuiting the flow through the larger pumps. The problem with an open system is when the large pumps are shut down for sometimes over 6 months the pumps, and all hydronic circuits to heating coils and baseboard heaters become dead legs in the piping system. Dead legs are places where bacteria like Legionellae can grow and thrive. This is why there should be a separate closed piping circuit for the heating hot water system piping.

Pitfall Number 18 - Corrosion Ferrous piping in a domestic hot water system is not advisable. Although galvanized pipe is allowed by code for domestic hot water systems, it should never be used in a domestic hot water system if you intend for the building systems to last more than a couple of years. Hot water tends to accelerate corrosion in galvanized piping systems. All domestic hot water piping should be copper or another approved non-ferrous material. Another problem with combined systems is the use of large cast iron and ductile iron hydronic heating circulating pumps that are installed in combined systems that were not approved for domestic water systems. I have seen galvanized steel pipes and even black steel pipe nipples used in domestic hot water systems. When the systems were first turned on in the fall large slugs of iron oxide laden water is forced into the domestic hot water distribution system. This generally results in sinks and bathtubs filled with black and orange rusty looking water until the entire system get flushed out significantly. The ferrous materials in the combined system typically lead to other problems with plugged strainers on control valves and other components. The iron oxide can also provide a surface for bacteria to grow.

Pitfall Number 19 - Corrosion inhibitors and other boiler water treatment chemicals I visited one building on the east coast where the combined system consisted of 8 inch galvanized water pipes. The galvanized pipes were corroding to the point where the hot water was very cloudy and orange. The building maintenance personnel chose to add an injection pump to inject chemicals into the domestic water main entering the building to raise the PH of the water and to intentionally build up a layer of scale inside the piping to minimize the amount of corrosion in the galvanized piping. The problem was the scale also formed on the heating surfaces and in the control valves causing them to fail. Upon inspection of the barrel of chemicals being injected into the water supply there were warning labels that stated the materials were toxic to humans. I reported this to the building owner to correct the situation immediately. This was another case of a heating contractor working on a plumbing system and not being familiar with plumbing code requirements. The solution he came up with would be a possible option for a hydronic system, but in a domestic water system that was a code violation and a health and safety issue.

Pitfall Number 20 - Loss of Both Systems When There is a Problem Another problem with combined systems is when there is a problem with a combined system that causes the system to shut down, both the domestic hot water system and the heating hot water system is out of service. If it is a boiler problem or another major problem the entire building could be without both systems for a long period of time. Combined system should have separate piping loops and redundant equipment to allow for some usage if one system or the other requires service.

Pitfall Number 21 - Legionellae Bacteria A research report in 1988 authored by Al Steele who was the president of the ASPE Research foundation at the time recommended storing domestic hot water between 135 degrees Fahrenheit and 140 degrees Fahrenheit to kill Legionellae bacteria and utilizing a thermostatic mixing valve to mix the hot water down to a safe delivery temperature below 120 degrees Fahrenheit to minimize scalding. The higher storage temperature around 140 degrees Fahrenheit was suggested because it is above the temperatures where Legionella bacteria can survive and multiply. With a storage temperature of 140 degrees Fahrenheit the Legionellae bacteria will die within 32 minutes.

Table -1 Legionellae Bacteria Growth and Disinfection Temperature Chart.

158 F and above F (70 C +): Legionellae Bacteria Disinfection range.

At 151 Degrees F (66 Degrees C): Legionellae die within 2 minutes.

At 140 Degrees F (60 Degrees C): Legionellae die within 32 minutes.

At 135 Degrees F (57.5 Degrees C) Legionellae die within 2 hours.

At 131 Degrees F (55 Degrees C): Legionellae die within 5 to 6 hours.

Above 122 Degrees F (50 Degrees C): They can survive but do not multiply.

95 to 115 Degrees F (35 to 46 Degrees C): Ideal Legionellae Bacteria growth range.

68 to 122 Degrees F (20 to 50 Degrees C): Legionellae Bacteria growth range.

Below 68 Degrees F (20 Degrees C): Legionellae can survive but are dormant.

The Legionellae bacteria cannot survive water temperatures above 131 degrees Fahrenheit (55 Degrees C) for more than five or six hours. The bacteria die instantly at temperatures above 158 degrees F (70 degrees C). General protection against the bacteria can be achieved by designing an operating water temperature of at least 140 degrees F (60 degrees C) or higher. As temperatures increase, so does the risk of scalding.

For system water temperatures below 140 Degrees F (60 Degrees C) special provisions are necessary to allow for cleaning and chemical treatment procedures for addressing the Legionellae Bacteria in the Domestic Hot Water System. Given a storage temperature of 140 degrees Fahrenheit that should be high enough to protect the water heater from the bacteria, but in open systems with Legionellae bacteria in the municipal water supply, it would continually re-seed the potable hot water system with high dosages of potentially Legionellae bacteria infested water. This is another reason why combined systems should have a closed loop for the heating hot water system.

Pitfall Number 22 - Leakage of Boiler Water. When boiler water is at a higher temperature than 140 degrees Fahrenheit, (180 to 210 degrees Fahrenheit) and it is allowed to leak through a faulty zone valve or solenoid valve if there is debris in the line or if the boiler water is allowed to flow by gravity circulation through a circulating pump that is de-energized, there is the potential for overheating the domestic hot water. In these cases a system can have a thermostat set to de-energize the circulating pumps or close the solenoid valve and if they leak, the domestic hot water can rise above the set point to a temperature close to the boiler water temperature. A thermostat that controls a solenoid valve or circulating pumps on the water heater should never be used to control the temperature in a domestic hot water system because thermostats allow too much of a temperature variation from when it senses the water to turn on or off the pump or solenoid valve and there is potential for leakage and temperature creep. The best way to address this is to provide a thermostatic mixing valve that conforms to ASSE 1017 on the domestic hot water line coming from the hot water tank to provide a safe hot water distribution temperature. If you are considering a combined system, avoiding these pitfalls listed above should help keep your building warm and the occupants in a safe temperature of hot water. If you don't avoid these pitfalls you could find yourself in hot water. Another option would be to keep life simple and keep the systems separate. Then you will not have to worry about someone coming along later and messing up your system design with system modifications or poor maintenance that can create scalding issues then steer clear of combined heating hot water and domestic hot water systems and you will steer clear of potential litigation also.

Cost Impact: The code change proposal will increase the cost of construction This will cause an increase in equipment costs.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The Committee agreed with the published reason statement. (Vote:7-6)

Assembly Action:

Disapproved

P70-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBEngineer@aol.com) requests Disapprove.

Commenter's Reason: There is a lack of understanding of the operation of these system by the proponent. Thousands of water heaters have been used as the heating source for an air handling unit. The proponent alleges bacteria growth, yet there is no data provided identifying any system with bacteria growth. The proponent also claims energy waste. Again, this shows a lack of understanding as to how these systems work. If a viable system is going to be prohibited by the code, there should be proper technical justification to support such a drastic change, not supposition.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Systems that currently comply with the code are viable and economical. Disapproval of this proposal will allow for these economical heating systems to continue to be installed without an increase or decrease in cost caused by a change in the code requirements.

Public Comment 2:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org) requests Disapprove.

Commenter's Reason: This proposal indicates water in piping will sit stagnant for 6 to 8 months. This is an incorrect statement. The water heating and space heating unit is a dual function appliance. It draws water whenever hot water is used in any of the fixtures in the dwelling, there is no part of the piping system that sits dormant. This proposal will only succeed in increasing the complexity of the heating unit and further increase the cost of construction.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction
Providing a double wall heat exchanger will add to the cost of construction.

Public Comment 3:

Proponent: Assembly Action requests Disapprove.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 75.5% (77) to 24.5% (25) by eligible members online during the period of May 9 - May 23, 2018.

P70-18

P79-18 Part I

IPC: 604.3, TABLE 604.3

Proposed Change as Submitted

Proponent: DONALD SURRENA, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows

604.3 Water distribution system design criteria. The water distribution system shall be designed, and pipe sizes shall be selected such that under conditions of sized for peak demand, the capacities at the fixture supply pipe outlets shall be not less than using the values shown in Table 604.3. The minimum flow rate and flow pressure provided to fixtures and appliances not listed in Table 604.3 shall be in accordance with the manufacturer's installation instructions.

TABLE 604.3
FLOW RATES AND PRESSURES FOR DESIGNING WATER DISTRIBUTION SYSTEM DESIGN CRITERIA
REQUIRED CAPACITY AT FIXTURE SUPPLY PIPE OUTLET SYSTEMS

FIXTURE SUPPLY OUTLET SERVING	FLOW RATE^a (gpm)	FLOW PRESSURE (psi)
Bathtub, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	4	20
Bidet, thermostatic mixing valve	2	20
Combination fixture	4	8
Dishwasher, residential	2.75	8
Drinking fountain	0.75	8
Laundry tray	4	8
Lavatory, private	0.8	8
Lavatory, private, mixing valve	0.8	8
Lavatory, public	0.4	8
Shower	2.5	8
Shower, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	2.5 ^b	20
Sillcock, hose bibb	5	8
Sink, residential	1.75	8
Sink, service	3	8
Urinal, valve	12	25
Water closet, blow out, flushometer valve	25	45
Water closet, flushometer tank	1.6	20
Water closet, siphonic, flushometer valve	25	35
Water closet, tank, close coupled	3	20
Water closet, tank, one piece	6	20

For SI: 1 pound per square inch = 6.895 kPa, 1 gallon per minute = 3.785 L/m.

- a. For additional requirements for flow rates and quantities, see Section 604.4.
- b. Where the shower mixing valve manufacturer indicates a lower flow rating for the mixing valve, the lower value shall be applied.

Reason: The section and the table were intended to be used to set design capacities for the domestic water systems,

not for field testing. With the emphasis on low flow fixtures and lower flow rating for mixing valves these numbers are causing confusion and misinterpretation in the field. Looking at the table what would be the health or safety reason for a bathtub to be required to flow at 4 gpm at 20 psi, or a water closet at 6 gpm at 20 psi or even 3 gpm at 20 psi as the table states? Balanced mixing valves are shown as 2.5 gpm at 20 psi or even lower if the manufacturer indicates. How does the inspector regulate the psi from 20 to 8 depending on the fixture being measured? These are all design specifications and not volumes to be measured at the fixture at differing psi.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a clarification change that will not impact the cost of construction.

P79-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There doesn't appear to be a legitimate reason for this proposal. The section language already indicates that the table is for design purposes. (Vote:13-1)

Assembly Action:

None

P79-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org) requests As Submitted.

Commenter's Reason: This proposal was approved by the IRC committee 8 in favor and 2 opposed. This is a clarification of a table and text to indicate the requirements are design criteria and not inspection criteria.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is a clarification for the use of the values in the table. There is no cost impact for clarifications of the code.

P79-18 Part I

P79-18 Part II

IRC: P2903.1, Table TABLE P2903.1

Proposed Change as Submitted

Proponent: DONALD SURRENA, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

2018 International Residential Code

Revise as follows

P2903.1 Water supply system design criteria. The water service and water distribution systems shall be designed and pipe sizes shall be selected such that under conditions of sized for peak demand, the capacities at the point of outlet discharge shall be not less than using values shown in Table P2903.1.

TABLE P2903.1
REQUIRED CAPACITIES AT POINT OF OUTLET DISCHARGE FLOW RATE AND PRESSURES FOR DESIGNING PIPING SYSTEMS

FIXTURE SUPPLY OUTLET SERVING	FLOW RATE (gpm)	FLOW PRESSURE (psi)
Bathtub, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	4	20
Bidet, thermostatic mixing valve	2	20
Dishwasher	2.75	8
Laundry tray	4	8
Lavatory	0.8	8
Shower, balanced-pressure, thermostatic or combination balanced-pressure/thermostatic mixing valve	2.5 ^a	20
Sillcock, hose bibb	5	8
Sink	1.75	8
Water closet, flushometer tank	1.6	20
Water closet, tank, close coupled	3	20
Water closet, tank, one-piece	6	20

For SI: 1 pound per square inch = 6.895 kPa, 1 gallon per minute = 3.785 L/m.

- a. Where the shower mixing valve manufacturer indicates a lower flow rating for the mixing valve, the lower value shall be applied.

Reason: The section and the table were intended to be used to set design capacities for the domestic water systems, not for field testing. With the emphasis on low flow fixtures and lower flow rating for mixing valves these numbers are causing confusion and misinterpretation in the field. Looking at the table what would be the health or safety reason for a bathtub to be required to flow at 4 gpm at 20 psi, or a water closet at 6 gpm at 20 psi or even 3 gpm at 20 psi as the table states? Balanced mixing valves are shown as 2.5 gpm at 20 psi or even lower if the manufacturer indicates. How does the inspector regulate the psi from 20 to 8 depending on the fixture being measured? These are all design specifications and not volumes to be measured at the fixture at differing psi.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This is a clarification to existing language and will not impact the cost of construction.

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This is a needed clarification because these pressures and flows cannot be "inspected". This table is only intended to be used for calculation and pipe sizing purposes. (Vote:8-2)

Assembly Action:

None

P79-18 Part II

P82-18 Part I

IPC: Table TABLE 604.4

Proposed Change as Submitted

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Revise as follows

**TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS**

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY^b
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head ^{a,c}	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standards.
- c. Where a shower compartment is served by multiple shower heads, the concurrent discharge of all shower heads controlled by a single valve shall not exceed the maximum flow rate.

Reason: This code change limits the combined shower head flow rate to 2.5 gpm where multiple heads are installed unless the shower is designed to allow only one shower head to operate at a time. Multiple shower heads were not common when EAct was enacted 25 years ago to limit the flow rate of shower heads. Since then, shower compartments have trended towards multiple shower heads and body sprays.

This code change ensures that where a shower compartment is served by multiple shower heads, the maximum flow rate is 1) controlled by a single valve for each shower head, 2) designed to allow only one shower head to be in operation at a time or 3) controlled by a single valve for the combined flow rate of multiple heads not exceeding the maximum flow rate.

Shower compartments with multiple showering stations are typically provided with a separate valve for each shower head. Shared shower compartments with separate valve controls are common features and meet the intent of this code change.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. There is no cost impact.

P82-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is a CalGreen requirement that should not be a minimum for everywhere else. (Vote:14-0)

Assembly Action:

None

P82-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Anthony Floyd, representing City of Scottsdale (afloyd@scottsdaleaz.gov) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

**TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS**

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY^b
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head ^{a,c}	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI:

1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standards.
- c. Where a shower compartment is served by multiple shower heads, ~~the concurrent discharge of all shower heads controlled by a single each shower control valve shall not exceed the maximum flow rate~~ operate not more than two shower heads or other outlets at any given time.

Commenter's Reason: This modification recognizes shower compartments with multiple shower heads or other shower outlets such as rain heads and body sprays that are not currently addressed in the code. Unlike the CalGreen standard (as referenced by the committee), this modification will allow up to two shower outlets controlled by a single control valve with a higher combined flow rate.

In addition, the shower head flow rate limit remains at 2.5 gpm, not the 2.0 gpm that's in CalGreen. Kohler, Delta, American Standard, Toto and other shower valve product manufacturers have diverter control valves readily available on the market. This modification provides a reasonable limitation on the total volume of water in showers with multiple shower heads and/or other shower outlets that is in line with the Energy Policy Act (1992) for water conservation.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change is based on the shower compartment design and number of installed shower heads. It does not require any additional fixtures or valves to be installed.

Public Comment 2:

Proponent: David Collins, representing International Code Council Sustainability, energy and high performance Code Action Committee (sehpcac@iccsafe.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

**TABLE 604.4
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS**

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY ^b
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head ^{a,c}	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray or body spray is a shower head .
- b. Consumption tolerances shall be determined from referenced standards.
- c. Where a shower compartment is served by multiple shower heads, ~~the concurrent discharge of all shower heads controlled by a single~~ each shower control valve shall ~~not exceed the maximum flow rate~~ operate not more than two shower heads.

Commenter's Reason: This modification recognizes shower compartments with multiple shower heads or other shower outlets such as rain heads and body sprays that are not currently addressed in the code. Unlike the CalGreen standard (as referenced by the committee), this modification will allow up to two shower outlets controlled by a single control valve with a higher combined flow rate.

In addition, the shower head flow rate limit remains at 2.5 gpm, not the 2.0 gpm that's in CalGreen. Kohler, Delta, American Standard, Toto and other shower valve product manufacturers have diverter control valves readily available on the market. This modification provides a reasonable limitation on the total volume of water in showers with multiple shower heads and/or other shower outlets that is in line with the Energy Policy Act (1992) for water conservation.

This public comment was submitted by the ICC Sustainability, Energy and High Performance Code Action Committee (SEHPCAC). The SEHPCAC was established by the ICC Board of Directors in July of 2011 to pursue opportunities and to improve and enhance assigned International Codes or portions thereof. Each year the SEHPCAC has historically held 3 open face-to-face meetings and numerous Working Group meetings, conference calls and webinars. These meetings, conference calls and webinars are public and are convened to facilitate discussion and debate of proposed changes and public comments to the codes by members of the committee, as well as interested parties.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change is based on the shower compartment design and number of installed shower heads. It does not require any additional fixtures or valves to be installed.

P82-18 Part I

P82-18 Part II

IRC: Table TABLE P2903.2

Proposed Change as Submitted

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Residential Code

Revise as follows

**TABLE P2903.2
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS^b**

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	2.2 gpm at 60 psi
Shower head ^{a,c}	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A handheld shower spray shall be considered to be a shower head.
- b. Consumption tolerances shall be determined from referenced standards.
- c. Where a shower compartment is served by multiple shower heads, the concurrent discharge of all shower heads controlled by a single valve shall not exceed the maximum flow rate.

Reason: This code change limits the combined shower head flow rate to 2.5 gpm where multiple heads are installed unless the shower is designed to allow only one shower head to operate at a time. Multiple shower heads were not common when EAct was enacted 25 years ago to limit the flow rate of shower heads. As houses and bathrooms have increased in size, many shower compartments have expanded to include multiple shower heads and body sprays.

This code change ensures that where a shower compartment is served by multiple shower heads, the maximum flow rate is 1) controlled by a single valve for each shower head, 2) designed to allow only one shower head to be in operation at a time or 3) controlled by a single valve for the combined flow rate of multiple heads not exceeding the maximum flow rate.

Shower compartments with multiple showering stations are typically provided with a separate valve for each shower head. Shared shower compartments with separate valve controls are common features and meet the intent of this code change.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. There is no cost impact.

P82-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This requirement would limit the design possibilities for buildings and shower system manufacturers. (Vote:9-1)

Assembly Action:

None

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change is based on the shower compartment design and number of installed shower heads. It does not require any additional fixtures or valves to be installed.

P82-18 Part II

P91-18

IPC: 606.1

Proposed Change as Submitted

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcmann@jeffco.us)

2018 International Plumbing Code

Revise as follows

606.1 Location of full-open valves. Full-open valves shall be installed in the following locations:

1. On the building water service pipe from the public water supply near the curb.
2. On the water distribution supply pipe at the entrance into the structure.
 - 2.1 In multiple tenant buildings, where a common water supply piping system is installed to supply other than one and two family dwellings, a main shutoff valve shall be provided for each tenant.
3. On the discharge side of every water meter.
4. On the base of every water riser pipe in occupancies other than multiple-family residential occupancies that are two stories or less in height and in one- and two-family residential occupancies.
5. On the top of every water down-feed pipe in occupancies other than one- and two-family residential occupancies.
6. On the entrance to every water supply pipe to a dwelling unit, except where supplying a single fixture equipped with individual stops.
7. On the water supply pipe to a gravity or pressurized water tank.
8. On the water supply pipe to every water heater.

Reason: It is a needless inconvenience to have to shut down an entire building when tenants need to work on their own water piping or in the case of emergencies. For the minimal cost of a valve, it makes sense to isolate tenant spaces just as what is done for gas piping. Opening the system causes air in pipes in other units that they might not be aware of and possibly causing a water hammer situation that can have a negative effect on the piping.

Cost Impact: The code change proposal will increase the cost of construction
The increase will be the cost of the valve and the labor to install it.

P91-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: The Committee agreed with the published reason statement. (Vote:10-4)

Assembly Action:

None

P91-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, representing Self (jbengineer@aol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

606.1 Location of full-open valves. Full-open valves shall be installed in the following locations:

1. On the building water service pipe from the public water supply near the curb.
2. On the water distribution supply pipe at the entrance into the structure.
 - 2.1. In multiple tenant buildings, where a common water supply piping system is installed to supply other than one and two family dwellings, a main shutoff valve shall be provided for each tenant except where each fixture is equipped with individual stops.
3. On the discharge side of every water meter.
4. On the base of every water riser pipe in occupancies other than multiple-family residential occupancies that are two stories or less in height and in one- and two-family residential occupancies.
5. On the top of every water down-feed pipe in occupancies other than one- and two-family residential occupancies.
6. On the entrance to every water supply pipe to a dwelling unit, except where supplying a single fixture equipped with individual stops
7. On the water supply pipe to a gravity or pressurized water tank.
8. On the water supply pipe to every water heater.

Commenter's Reason: For high rise plumbing systems, piping design goes from horizontal to vertical. (This actually occurs for building 4 stories and taller.) In vertical piping arrangements, multiple risers can serve a single tenant space. There is not a single pipe that serves all of the fixtures in that tenant space. This change would, in effect, prohibit a common piping design which is highly efficient and economical. Each fixture has a shut off valve in this piping arrangement. Hence, the except adds a requirement for individual stops. The code already requires a shut off valve at the top of each downfeed or the bottom of each riser. This will provide the control for shutting off the water in a high rise building.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This change will allow vertical piping arrangements to be installed in tall buildings. This is a less expensive means of installing the water piping. If the modification is not accepted, vertical piping installation would not be permitted.

Public Comment 2:

Proponent: Jeffrey Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

606.1 Location of full-open valves. Full-open valves shall be installed in the following locations:

1. On the building water service pipe from the public water supply near the curb.
2. On the water distribution supply pipe at the entrance into the structure.
- 2.1 In multiple tenant buildings, where a common domestic water supply piping system is installed to supply other than one and two family dwellings, a main shutoff valve shall be provided for each tenant.
3. On the discharge side of every water meter.
4. On the base of every water riser pipe in occupancies other than multiple-family residential occupancies that are two stories or less in height and in one- and two-family residential occupancies.
5. On the top of every water down-feed pipe in occupancies other than one- and two-family residential occupancies.
6. On the entrance to every water supply pipe to a dwelling unit, except where supplying a single fixture equipped with individual stops.
7. On the water supply pipe to a gravity or pressurized water tank.
8. On the water supply pipe to every water heater.

Commenter's Reason: While the IPC is strictly for plumbing systems there could be an interpretation to valve automatic sprinkler systems for individual units. An application of the IPC with the current wording could apply to every unit on every floor and goes far beyond the installation standards (NFPA 13 and NFPA 13R). Including the word domestic clarifies the valve is only for the plumbing system.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This clarification would eliminate excessive valves, electric supervision and maintenance costs for individual valves of automatic sprinkler systems in each unit.

P91-18

P94-18

IPC: 607.1

Proposed Change as Submitted

Proponent: Duane Jonlin, representing City of Seattle (duane.jonlin@seattle.gov)

2018 International Plumbing Code

Revise as follows

607.1 Where required. In residential *occupancies*, *hot water* shall be supplied to plumbing fixtures and equipment utilized for bathing, washing, culinary purposes, cleansing, laundry or building maintenance. In nonresidential *occupancies*, *hot water* shall be supplied for culinary purposes, cleansing, laundry or building maintenance purposes. In nonresidential *occupancies*, *hot water* or *tempered water* shall be supplied for bathing and washing purposes.

Exception: Where the water serving public lavatories that are not served by separate hot and cold water pipes is not heated, or is heated with a water heating system that is not capable of heating the water to a temperature above 80° F, this section shall not apply.

Reason: Use of 120-degree water for handwashing *increases* the risk of disease transmission, as well as wasting energy and increasing the cost and complexity of construction. Room temperature water provides equal handwashing hygiene, while not supporting the growth of legionella. This proposal makes hot water *optional* for lavatories, and provides significant cost savings: the hot water piping, circulation pumps, pipe insulation, tempering valves, mixing valves and numerous other components would become unnecessary, and little if any water heating would be required. Operational savings and risk reduction persist for the life of the building, with dramatically decreased energy, maintenance, and equipment replacement costs, and no growth of legionella.

Owners can still provide hot water for handwashing, but this proposal allows those concerned with cost, safety and disease control to opt out if they so choose.

Bibliography: Show Me the Science - How to Wash Your Hands, Centers for Disease Control and Prevention (2017), page 1, www.cdc.gov/handwashing/show-me-the-science-handwashing.html

The environmental cost of misinformation: why the recommendation to use elevated temperatures for handwashing is problematic, International Journal of Consumer Studies, Carrico, Amanda R., et al. (2013) page 2.

Cool Water as Effective as Hot for Removing Germs During Handwashing, Infection Control Today (2017) page 1

Water temperature as a factor in handwashing efficacy, Food Service Technology, Michaels, B, et al, (2002) pages 139-149

Cost Impact: The code change proposal will decrease the cost of construction
This proposal makes hot water for lavatories *optional*.

For those who choose to provide hot water for lavatories, there is no cost change.

For those who choose *not* to provide hot water for lavatories, there are significant cost savings in materials, labor and space usage, due to the elimination of an entire system serving those lavatories. In addition, operational savings for energy, maintenance and equipment replacement are dramatically reduced and in some cases eliminated for the building's water heating and distribution system.

P94-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The Committee is not against the concept however, the language in the exception is not clear and could conflict with Section 419.5. (Vote:14-0)

Assembly Action:

As Submitted

P94-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Duane Jonlin, representing City of Seattle (duane.jonlin@seattle.gov); Jenifer Gilliland, representing City of Seattle, Washington requests As Modified by This Public Comment.

Replace as follows:

2018 International Plumbing Code

419.5 Tempered water for public hand-washing facilities. *Tempered water* shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70 or CSA B125.3.

Exception: Where the water serving public lavatories that are not served by separate hot and cold water pipes is not heated, or is heated with a water heating system that is not capable of heating the water to a temperature above 80 degrees F, this section shall not apply to those public lavatories.

607.1 Where required. In residential *occupancies*, *hot water* shall be supplied to plumbing fixtures and equipment utilized for bathing, washing, culinary purposes, cleansing, laundry or building maintenance. In nonresidential *occupancies*, *hot water* shall be supplied for culinary purposes, cleansing, laundry or building maintenance purposes. In nonresidential *occupancies*, *hot water* or *tempered water* shall be supplied for bathing and washing purposes.

Exception: Where the water serving public lavatories that are not served by separate hot and code water pipes is not heated, or is heated with a water heating system that is not capable of heating the water to a temperature above 80 degrees F, this section shall not apply to those public lavatories.

Commenter's Reason: The goal of the proposed code change is to make hot water, as defined by the International Plumbing Code, *optional* for public lavatories. Adoption of P94 will result in several benefits for the building owner as well as the public including reductions in construction cost, disease transmission risk, and energy consumption. In its review of the proposal, the Plumbing Code Committee stated that it was "not against the concept. However, the language in the exception is not clear and could conflict with Section 419.5." To address this concern, the wording of the changes to IPC 714.2 exception in the original proposal also being added to Section IPC 419.5. This should eliminate concerns about the alignment of these sections.

Bibliography: Please see sources in original proposal.

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The cost reductions will include reductions in the size of water heating and pumping equipment, length and diameter of hot water piping, pipe insulation, and mixing valves. In addition, there will be reductions in space requirements, both in equipment rooms and in wall/ceiling cavities.

P94-18

P96-18

IPC: 607.1.1, 607.1.2, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows

607.1.1 Temperature limiting means. A thermostat control for a water heater shall ~~not only~~ serve as the temperature limiting means for the purposes of complying with the requirements of this code for maximum allowable *hot* or *tempered water* delivery temperature at fixtures where the water heater complies with ASSE 1082, ASSE 1084, or ASSE 1085.

607.1.2 Tempered water temperature control. Tempered water shall be ~~supplied through a water temperature controlled by one the following:~~

1. A limiting device that conforms conforming to ASSE 1070/ASME A112.1070/CSA B125.70 and shall limit the tempered water to not greater than set to a maximum of 110°F (43°C).
2. A thermostatic mixing valve conforming to ASSE 1017.
3. A water heater conforming to ASSE 1082.
4. A water heater conforming to ASSE 1084.

This provision shall not supersede the requirement for protective shower valves in accordance with Section 412.3.

Add new standard(s) follows

ASSE

ASSE International
18927 Hickory Creek Drive, Suite
220
Mokena IL 60448

1085-2018:

Performance Requirements for Water Heaters for Emergency Equipment

1084-2018:

Performance Requirements for Water Heaters used as Temperature Limiting Devices

1082-2018:

Performance Requirements for Water Heaters Used as Temperature Control Devices for Hot Water Distribution Systems.

Reason: The restriction on the use of the water heater thermostat for regulating water temperature is based on standard water heaters. There are three new water heater standards that regulate the outlet temperature of the water heater. Hence, it is appropriate to use reference these standards as the only water heaters in which the water heater thermostat can be used to regulate the upper temperature limit.

Tempered water is a comfort requirement, as well as, a scald prevention requirement. However, comfort overrides the safety requirement since tempered water is limited to a maximum temperature of 110° F. Scalding temperatures are in excess of this temperature. Other viable means of controlling tempered water to 110° F or less are available in addition to a limiting device that complies with ASSE 1070/ASME A112.1070/CSA B125.70. The most common means of controlling tempered water is with a thermostatic mixing valve that complies with ASSE 1017.

A thermostatic mixing valve is an effective method of regulating the maximum temperature. The temperature is maintained within a few degrees depending on the flow rate. Scalding temperatures are in excess of this temperature. Other viable means of maintaining the water temperature to a maximum of 110° F are water heater meeting one of the three new water heater standards.

The three new standard for water heaters are ASSE 1082, ASSE 1084, and ASSE 1085. These water heaters are equivalent to ASSE 1017, ASSE 1070, and ASSE 1071 respectively. As such, they have the capability of providing an equivalent level of performance as the corresponding mixing valve. While a water heater complying with ASSE 1071 is designed to supply tepid water for emergency fixtures, the tepid temperature range can also meet the tempered temperature range. Hence, an ASSE 1085 water heater is also a viable option.

Cost Impact: The code change proposal will decrease the cost of construction. The options may lower the cost of installation.

Analysis: A review of the standards proposed for inclusion in the code, ASSE 1085-2018, ASSE 1084-2018 and ASSE1082-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P96-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 607.1.1 Temperature limiting means. A thermostat control for a water heater shall only serve as the temperature limiting means for the purposes of complying with the requirements of this code for maximum allowable hot or tempered water delivery temperature at fixtures where the water heater complies with ASSE 1082, ~~ASSE 1084~~, or ASSE 1085.

Committee Reason: For the Modification: The ASSE 1084 standard is not yet completed.
For the Proposal: The Committee agreed with the published reason statement. (Vote:10-4)

Assembly Action:

Disapproved

P96-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Conrad Jahrling, representing ASSE International (conrad.jahrling@asse-plumbing.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

607.1.1 Temperature limiting means. A thermostat control for a water heater shall only serve as the temperature limiting means for the purposes of complying with the requirements of this code for maximum allowable *hot or tempered water* delivery temperature at fixtures where the water heater complies with ASSE 1082, ~~or ASSE 1085~~.

607.1.2 Tempered water temperature control. Tempered water shall be controlled by one the following:

1. A limiting device conforming to ASSE 1070/ASME A112.1070/CSA B125.70 set to a maximum of 110 F (43 C).
- ~~2. A thermostatic mixing valve conforming to ASSE 1017.~~
- ~~3. A water heater conforming to ASSE 1082.~~
- 4.2. A water heater conforming to ASSE 1084.

This provision shall not supersede the requirement for protective shower valves in accordance with Section 412.3.

Commenter's Reason: *With regard to 607.1.1*

Only devices that conform to ASSE 1082 are appropriate for this application for water distribution. Water heaters conforming to ASSE 1084 only supply tempered water to point-of-use devices and fittings, similar to water temperature limiting devices conforming to ASSE 1070 / ASME A112.1070 / CSA B125.70. Water heaters conforming to ASSE 1085 only supply emergency fixtures that conform to ISEA Z358.1.

With regard to 607.1.2

Devices that conform to either ASSE 1017 or ASSE 1082 are not for controlling water temperature by the end user, which is the scope of this section. It is only appropriate to use a device that conforms to ASSE 1084 or ASSE 1070 / ASME A112.1070 / CSA B125.70.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

These are alternative devices being proposed to the currently required methods in the code. Alternatives in the code do not cause a cost impact.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018, ASSE 1084-2018 and ASSE 1085-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

Public Comment 2:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Bradley Corporation

(JBEngineer@aol.com)requests As Submitted.

Commenter's Reason: At the time of the hearing, ASSE 1084 was not completed. The standard is now available.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposal will accept the original code change. The cost impact is the same as state in the original change.

Staff Analysis: In accordance with Section 3.6.3.1 of ICC Council Policy 28, the new referenced standards ASSE 1082-2018, ASSE 1084-2018 and ASSE 1085-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

Public Comment 3:

Proponent: Assembly Actionrequests Disapprove.

Commenter's Reason: This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 58.3% (60) to 41.7% (43) by eligible members online during the period of May 9 - May 23, 2018.

Public Comment 4:

Proponent: CP28 Administration.

Commenter's Reason: The administration of ICC Council Policy 28 (CP28) is not taking a position on this code change. This public comment is being submitted to bring a procedural requirement to the attention of the ICC voting membership. In accordance with Section 3.6.3.1.1 of ICC Council Policy 28 (partially reproduced below), the new referenced standards ASSE 1082-2018, ASSE 1084-2018 and ASSE 1085-2018 must be completed and readily available prior to the Public Comment Hearing in order for this public comment to be considered.

(CP28) 3.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If the proposed new standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the Committee Action Hearing by the applicable code development committee responsible for the corresponding proposed changes to the code text. If the committee action at the Committee Action Hearing is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing

Bibliography: Lorem ipsum dolor amit.

P99-18

IPC: 609.2

Proposed Change as Submitted

Proponent: Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO)
(gmcman@jeffco.us)

2018 International Plumbing Code

Revise as follows

609.2 Water service. Hospitals shall have two water service pipes installed in such a manner so as to minimize the potential for an interruption of the supply of water in the event of a water main or water service pipe failure. Each water service pipe shall enter the building independently and shall be sized in accordance with Section 603.1.

Reason: This Section lacks some specificity and doesn't provide much guidance. The intent is to eliminate the possibility of water service interruption. There needs to be a separation distance for the two water lines that designers can employ based the the situation. No specific number has been submitted as each situation will require analysis by the designers

Cost Impact: The code change proposal will not increase or decrease the cost of construction
This is editorial in nature and isnt requiring anything in addition to whats already required.

P99-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is already taken care of by the definition of water service pipe. (Vote:13-0)

Assembly Action:

None

P99-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmmann@jeffco.us) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

609.2 Water service. Hospitals shall have two water service pipes installed in such a manner so as to minimize the potential for an interruption of the supply of water in the event of a water main or water service pipe failure. Each water service pipe shall enter the building ~~independently and separately~~ and shall be sized in accordance with Section 603.1.

Commenter's Reason: The committee didn't care for the word "independently" and preferred the word "separately" instead.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This is editorial and will not increase cost.

P99-18

P104-18

IPC: 702.6, TABLE 702.6 (New), 901.3, 902.1.1 (New), Chapter 15

Proposed Change as Submitted

Proponent: Brian Helms, Charlotte Pipe and Foundry, Plastics Division, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

2018 International Plumbing Code

Revise as follows

702.6 Chemical waste drainage system. A chemical waste drainage system, including its vent system, shall be completely ~~separated independent~~ from the ~~any~~ sanitary drainage system. The pipes and fittings of a chemical waste drainage system shall conform to any of the applicable standards indicated in Table 702.6. The pipe and fitting material shall be recommended by the manufacturers of the pipe and fittings for the temperatures, types and concentrations of chemicals that the system is designed for. The drainage in a chemical waste drainage system shall be treated in accordance with Section 803.2 before discharging to the a sanitary drainage system. ~~Separate drainage systems for chemical wastes and vent pipes shall be of an approved material that is resistant to corrosion and degradation for the concentrations of chemicals involved.~~

Add new text as follows

**TABLE 702.6
CHEMICAL DRAINAGE SYSTEM PIPE AND FITTINGS**

<u>MATERIAL</u>	<u>STANDARD</u>
<u>Chlorinated polyvinyl chloride (CPVC)</u>	<u>ASTM F2618</u>
<u>High silicon iron</u>	<u>ASTM A518/A518M</u>
<u>Polypropylene (PP)</u>	<u>ASTM F1412</u>
<u>Polyvinylidene flouride (PVDF)</u>	<u>ASTM F1673</u>
<u>Chemical-resistance glass</u>	<u>ASTM C1053</u>
<u>Stainless steel drainage systems</u>	<u>ASME A112.3.1</u>

Revise as follows

901.3 Chemical waste ~~vent systems, drainage system venting.~~ The vent system for a chemical waste drainage system shall be independent of the ~~sanitary vent system and shall terminate separately~~ any vent system for a sanitary drainage system. The termination of a vent system for a chemical waste drainage system shall be through the roof to the outdoors or to an air admittance valve that complies with ASSE 1049. Air admittance valves for chemical waste drainage systems shall be constructed of materials ~~approved~~ in accordance with Section 702.6 and shall be tested for chemical resistance in accordance with ASTM F1412.

Add new text as follows

902.1.1 Chemical waste drainage system vents. The pipe and fitting materials for the vent system of a chemical waste drainage system shall be in accordance with Section 702.6. The methods utilized for construction and installation of such venting system shall be in accordance with the pipe and fitting manufacturers' instructions.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959

F2618-15:

Standard Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Pipe and Fittings for Chemical Waste Drainage Systems

C1053-00 (2015):

Standard Specification for Borosilicate Glass Pipe and Fittings for Drain, Waste, and Vent (DWV)

Applications

A518/A518M -99 (2012):

Standard Specification for Corrosion-Resistant High-Silicon Iron Castings

Reason: Corrosive and laboratory waste drainage is very different from other applications such as food handling and sterilization included in this chapter. Since the code provides direction on system design in section 803.2, it should also provide direction on allowable materials for these applications. This code change proposal includes all materials either currently manufactured or available in the market that are manufactured to standards specifically for corrosive or laboratory waste drainage applications.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This code change proposal will not increase or decrease the cost of construction because it is intended to clarify allowable third party certified products appropriate for corrosive or laboratory waste applications.

Analysis: A review of the standard proposed for inclusion in the code, ASTM F2618-15, ASTM C1053-00 (2015), and ASTM A518/A518M -99 (2012) with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P104-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This is too broad of approach. It is not enforceable. (Vote:12-1)

Assembly Action:

None

P104-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Brian Helms, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

**TABLE 702.6
CHEMICAL DRAINAGE SYSTEM PIPE AND FITTINGS**

Portions of table not shown remain unchanged.

MATERIAL	STANDARD
Stainless steel drainage systems	ASME A112.3.1

702.6 Chemical waste drainage system. A chemical waste drainage system, including its vent system, shall be completely independent from any sanitary drainage system. The pipes and fittings of a chemical waste drainage system shall conform to any of the to the applicable standards indicated in Table 702.6. ~~The pipe and fitting material shall be recommended by the manufacturers of the pipe and fittings for the temperatures, types and concentrations of chemicals that the system is designed for.~~ The drainage in a chemical waste drainage system shall be treated in accordance with Section 803.2 before discharging to a sanitary drainage system.

902.1.1 Chemical waste drainage system vents. The pipe and fitting materials for the vent system of a chemical waste drainage system shall be in accordance with Section 702.6. ~~The methods utilized for construction and installation of such venting system shall be in accordance with the pipe and fitting manufacturers' instructions.~~ 702.6.

Commenter's Reason: This comment clarifies the language from the original proposal and removes Stainless Steel from the proposed table.

Chemical waste drainage is very different from sanitary drainage applications included in Chapter 7. Chemical waste applications require pipe and fitting systems that are specifically designed to convey waste that may be harmful to other piping materials as well as the health and safety of the public. The code currently provides direction on allowable materials for sanitary drainage systems in tables 702.1, 702.2, 702.3 and 702.4 but is not as specific regarding chemical waste in 702.6.

Since the code requires chemical waste systems to be completely separated from the sanitary system in section 702.6 and provides direction on system design in section 803.2, it should also include a table to provide direction on allowable materials for these applications. Currently, section 702.6 requires an "approved" material, which by definition in Chapter 2, means that the material should be "acceptable to the code official." The removal of this statement and the addition of the proposed table will eliminate any confusion regarding appropriate materials for chemical waste drainage applications.

Materials used for vents in these systems should exhibit the same physical characteristics regarding temperature and chemical resistance and therefore should be held to the same requirements.

This code change proposal includes all materials either currently manufactured or available in the market that are manufactured to standards specifically for corrosive or laboratory waste drainage applications.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of

construction

This code change proposal will not increase or decrease the cost of construction because it is intended to clarify allowable third party certified products appropriate for chemical waste drainage applications.

P104-18

P108-18

IPC: Table 702.4, 705.10.4 (New), Chapter 15

Proposed Change as Submitted

Proponent: Brian Conner, representing Charlotte Pipe and Foundry (bconner@charlottepipe.com)

2018 International Plumbing Code

Add new text as follows

705.10.4 Push-fit joints. Push-fit joints shall conform to ASME A112.4.4 and shall be installed in accordance with the manufacturer's instructions.

Revise as follows

2018 International Plumbing Code

Add new text as follows

705.10.4 Push-fit joints. Push-fit joints shall conform to ASME A112.4.4 and shall be installed in accordance with the manufacturer's instructions.

Revise as follows

**TABLE 702.4
PIPE FITTINGS**

	MATERIAL	STANDARD
	Acrylonitrile butadiene styrene (ABS) plastic pipe in IPS diameters	ASTM D2661; ASTM F628; CSA B181.1
	Acrylonitrile butadiene styrene (ABS) plastic pipe in sewer and drain diameters	ASTM D2751
	Cast iron	ASME B16.4; ASME B16.12; ASTM A74; ASTM A888; CISPI 301
	Copper or copper alloy	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME B16.26; ASME B16.29
	Glass	ASTM C1053
	Gray iron and ductile iron	AWWA C110/A21.10
	Polyethylene	ASTM D2683
	Polyolefin	ASTM F1412; CSA B181.3
	Polyvinyl chloride (PVC) plastic in IPS diameters	ASTM D2665; ASTM F1866; <u>ASME A112.4.4</u>
	Polyvinyl chloride (PVC) plastic pipe in sewer and drain diameters	ASTM D3034
	Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D.	ASTM D2949
	Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F1673; CSA B181.3
	Stainless steel drainage systems, Types 304 and 316L	ASME A112.3.1
	Steel	ASME B16.9; ASME B16.11; ASME B16.28
	Vitrified clay	ASTM C700

For SI: 1 inch = 25.4 mm.

Add new standard(s) follows

A112.4.4-2017:

Plastic Push Fit Drain, Waste, and Vent (DWV) Fittings

Reason: A new standard has been published for push fit fittings to be used in DWV applications. Fittings are to be used with ABS or PVC pipe only in non-pressure applications.

Cost Impact: The code change proposal will not increase or decrease the cost of construction
Zero Cost

Analysis: A review of the standard proposed for inclusion in the code, ASME A112.4.4-2017, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P109-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The Committee already addressed this topic in P108-18. (Vote:14-0)

Assembly Action:

None

P109-18 Part I

P116-18

IPC: 717 (New), 717.1 (New), Chapter 15

Proposed Change as Submitted

Proponent: Sidney Cavanaugh, representing LMK Technologies (sidneycavanaugh@yahoo.com)

2018 International Plumbing Code

Add new text as follows

717 BUILDING SEWER AND SEWER SERVICE LATERAL REHABILITATION

717.1 Building sewer and sewer service lateral rehabilitation. Any rehabilitation of building sewer piping and sewer service lateral piping shall be in accordance with ASTM F2599. Any rehabilitation of building sewer and sewer service lateral pipe and its connection to the main sewer pipe shall be in accordance with F2561. All rehabilitation of building sewer piping and sewer service laterals shall include the use of hydrophilic rings or gaskets meeting ASTM F3240 to assure water tightness and elimination of ground water penetration.

Add new standard(s) follows

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box
C700
West Conshohocken PA 19428-2959

F2599-16:

Standard Practice for The Sectional Repair of Damaged Pipe By Means of An Inverted Cured-In-Place Liner

F2561-17:

Standard Practice for Rehabilitation of a Sewer Service Lateral and Its Connection to the Main Using a One Piece Main and Lateral Cured-in-Place Liner

F3240-17:

Standard Practice for Installation of Seamless Molded Hydrophilic Gaskets (SMHG) for Long-Term Watertightness of Cured-in-Place Rehabilitation of Main and Lateral Pipelines

Reason: To add necessary requirements for rehabilitation of building sewers and sewer service laterals that are currently missing from IPC.

Cost Impact: The code change proposal will not increase or decrease the cost of construction but in most cases it would decrease cost since there is no need of digging up and replacing existing piping

Analysis: A review of the standard proposed for inclusion in the code, ASTM F2599-16, ASTM F2561-17, ASTM F3240-17, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P116-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 717.1 Building sewer and sewer service lateral rehabilitation. ~~Any Cured-in-place~~ rehabilitation of building sewer piping and sewer service lateral piping shall be in accordance with ASTM F2599. ~~Any Cured-in-place~~ rehabilitation of building sewer and sewer service lateral pipe and its connection to the main sewer pipe shall be in accordance with F2561. All ~~cured-in-place~~ rehabilitation of building sewer piping and sewer service laterals shall include the use of hydrophilic rings or gaskets meeting ASTM F3240 to assure water tightness and elimination of ground water penetration.

Committee Reason: For the Modification: Clarification is necessary to to indicate that the process is only for cured-in-place rehabilitation.

For the Proposal: The Committee agreed with the published reason statement. (Vote:14-0)

Assembly Action:

None

P116-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Joanne Carroll, Subtegit Group Inc., representing National Association of Sewer Service Companies (jcarroll@subtegit.com) requests Disapprove.

Commenter's Reason: Disapprove the code change. The proposed text is written to exclude valid materials and processes in place of proprietary materials and processes. Also, the proposed addition of ASTM standards require these proprietary materials and processes.

The proposed code change requires the use of hydrophilic seals or gaskets to provide a watertight seal. However, most cured-in-place-pipe technologies do not use hydrophilic seals or gaskets but rather use epoxy and other methods to make a watertight seal. Mandating the use of gaskets eliminates most of the current technology that has been used for decades. There was no technical justification provided to eliminate the use of current methods in favor of this technology.

The proposal P116-18 includes patented or otherwise exclusive supplier, material and practices including proposed reference ASTM Standards F2599, F2561 and F3240. In accordance with ASTM Regulations, *when an approved standard requires the use of a patented material, product, or apparatus, the standard shall include a footnote requesting interested parties to submit information regarding the identification of alternatives to the patented items.* Patent reference is shown on the first page of each of the proposed reference ASTM Standards further supporting this Public Comment to Disapprove the addition of ASTM Standards F2599, F2561 and F3240, and the proposal which required these Standards. In addition, CP#28-05 Code Development, Section 3.6.2.5, states that "The standard shall not have the effect of requiring proprietary materials."

Bibliography: ASTM (2017), "Regulations Governing ASTM Technical Committees, Section 15 Patents in Standards", ASTM International, 2017

ICC (2017), "CP#28-05 Code Development", International Code Council, 2017

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. The net effect of the public comment and disapproval of the code change proposal will decrease the cost of construction by providing more options for products which meet the Code; and, by not limiting these products only to patented materials and practices.

Public Comment 2:

Proponent: Carl Marc-Aurele, representing Formadrain Inc. (carl@formadrain.com) requests Disapprove.

Commenter's Reason: This proposal restricts technologies that could be used to successfully achieve building sewer rehabilitation to the submitter's own products.

ASTM F2599 describes a methodology that inverts a liner inside a pipe. Even after modification, the wording "Cured-in-place rehabilitation [...] shall be in accordance with ASTM F2599" prevents the use of pulled-in-place technologies and future invention as well. The inclusion of ASTM F2599 without the inclusion of ASTM F1216, F1743 and many other rehabilitation related standards is misleading and uninclusive.

ASTM F2561, ASTM F2599 and ASTM F3240 all include the use of "hydrophilic rings" as the sole acceptable sealing method for liners. The hydrophilic seals are proprietary patented technology from the submitter and they are not the only way of achieving proper sealing at the ends of liners, as other technologies and resins (such as epoxy versus polyester) are successfully certified NSF14 and pass the leakage test on a quarterly basis and achieve the necessary water tightness without the use of these proprietary seals.

I am pro-rehabilitation of building sewers, but this proposal is product driven and not results driven. I therefore disapprove of the code change proposal and strongly recommend the committee revises its position accordingly.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

It depends on the point of view:

Comparing CIPP with conventional dig-and-replace, using CIPP in building sewers will most of the time decrease the cost of construction.

Comparing LMK's own CIPP with other CIPP technologies, the hydrophilic seals being a patented and proprietary technology, the restriction to use them in every situation (even when not necessary with the CIPP system used) will have other CIPP manufacturers forced to add an unnecessary proprietary part to their already working systems to comply with the IPC and therefore increase the cost of construction.

Public Comment 3:

Proponent: Abraham I. Murra, Self, representing Trelleborg Pipe Seals Lelystad B.V. requests Disapprove.

Commenter's Reason: ASTM F2561, ASTM F2599, and ASTM F3240 are proprietary standards that cover products protected by patents, as stated in the first pages of each of the standards (see note below). Referencing those standards in the code would exclude alternative technologies and violate the ANSI patent policy. It is not possible to comply with any one of the standards referenced without infringing patent rights; therefore, it would become necessary to pay royalties and request licenses from the owner of the patents, effectively granting the patent holder control of the marketplace and restricting it. There are no technical reasons justifying the restrictions in the proposal, as there are several other technologies that can and have been successfully used in the rehabilitation of pipes. Therefore, I request that the proposal be disapproved.

Note: F2561-16, Standard Practice for Rehabilitation of a Sewer Service Lateral and Its Connection to the Main Using a One Piece Main and Lateral Cured-in-Place Liner states: "*The rehabilitation of a sewer service lateral and its connection to the main using a one-piece main and lateral cured-in-place liner is covered by patents (LMK Enterprises, Inc. 1779 Chessie Lane, Ottawa, IL 61350). Interested parties are invited to submit information regarding the identification of acceptable alternatives to this patented item to the Committee on Standards, ASTM Headquarters...*"

Cost Impact: The net effect of the public comment and code change proposal will decrease the cost of construction. This public comment will **prevent** the cost of construction from increasing.

The contrary, that is, accepting code change proposal # P116-18 will **increase** the cost of construction, because it would become necessary to pay royalties and request licenses from the owner of the patents, effectively granting the patent holder control of the marketplace and restricting it.

P116-18

P120-18

IPC: 1002.1

Proposed Change as Submitted

Proponent: James Richardson Jr, representing City of Columbus Ohio (jarichardson@columbus.gov); Robert Schutz, representing City of Columbus, OH (RJSchutz@columbus.gov)

2018 International Plumbing Code

Revise as follows

1002.1 Fixture traps. Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.3.3. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
3. ~~A grease interceptor intended to serve as a fixture trap in accordance with the manufacturer's installation instructions shall be permitted to serve as the trap for a single fixture or a combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the developed length of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm).~~
- 4.3. Floor drains in multilevel parking structures that discharge to a building storm sewer shall not be required to be individually trapped. Where floor drains in multilevel parking structures are required to discharge to a combined *building sewer* system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.

Reason: This is an error in the code that has been present since the change was made to section 802.1.7 requiring that utensil/pot/pan sinks to be indirectly connected. Previously a direct connection was also permissible, which promulgated exception # 3. Since a direct connection is no longer permissible for these type of sinks, exception # 3 would be in direct violation of 802.1.7

Bibliography: 2018 International Plumbing Code
PUB. - 08/31/2017

802.1.7 Food utensils, dishes, pots and pans sinks.

Sinks, in other than dwelling units, used for the washing, rinsing or sanitizing of utensils, dishes, pots, pans or service ware used in the preparation, serving or eating of food **shall discharge indirectly through an air gap or an air break to the drainage system.**

1002.1 Fixture traps.

Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.3.3. A fixture shall not be double trapped.

Exceptions:

1. 1. This section shall not apply to fixtures with integral traps.
2. 2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
3. **3. A grease interceptor intended to serve as a fixture trap in accordance with the manufacturer's installation instructions shall be permitted to serve as the trap for a single fixture or a combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the developed length of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm).**
4. 4. Floor drains in multilevel parking structures that discharge to a building storm sewer shall not be required to be individually trapped. Where floor drains in multilevel parking structures are required to discharge to a combined building sewer system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. There will be no cost impact due to the fact that the requirement is already in chapter 8 for an indirect connection.

P120-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: 1002.1 Fixture traps. Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.3.3. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
3. Floor drains in multilevel parking structures that discharge to a building storm sewers shall not be required to be individually trapped. Where floor drains in multilevel parking structures are required to discharge to a combined building sewer system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.

4. Where a hydromechanical grease interceptor serves a food utensil, dishes, pots and pans sink, in accordance with the manufacturer's installation instructions. The branch drain serving the interceptor shall be provided with an emergency floor drain down stream of the interceptor connection, and the branch shall serve only the emergency floor drain and the interceptor. Where the interceptor serves combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the developed length of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm). The food utensil, dishes, pots and pans sink shall be required to connect directly with the interceptor.

Committee Reason: For the Modification: An emergency floor drain would relieve the pressure on the fixture drain to prevent backup into sink should the drain system back up.

For the Proposal: The Committee agreed with the published reason statement. (Vote:13-1)

Assembly Action:

None

P120-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Max Weiss, representing Plumbing and Drainage Institute (mweiss@pdionline.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

1002.1 Fixture traps. Each plumbing fixture shall be separately trapped by a liquid-seal trap, except as otherwise permitted by this code. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm), and the horizontal distance shall not exceed 30 inches (610 mm) measured from the centerline of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section 802.3.3. A fixture shall not be double trapped.

Exceptions:

1. This section shall not apply to fixtures with integral traps.
2. A combination plumbing fixture is permitted to be installed on one trap, provided that one compartment is not more than 6 inches (152 mm) deeper than the other compartment and the waste outlets are not more than 30 inches (762 mm) apart.
3. Floor drains in multilevel parking structures that discharge to a building storm sewer shall not be required to be individually trapped. Where floor drains in multilevel parking structures are required to discharge to a combined *building sewer* system, the floor drains shall not be required to be individually trapped provided that they are connected to a main trap in accordance with Section 1103.1.
4. Where a hydromechanical grease interceptor serves a food utensil, dishes, pots and pans sink, in accordance with the manufacturer's installation instructions. The branch drain serving the interceptor shall be provided with an emergency floor drain and trap downstream of the interceptor connection, and the branch shall serve only the emergency floor drain and the interceptor. Where the interceptor serves combination sink of not more than three compartments where the vertical distance from the fixture outlet to the inlet of the interceptor does not exceed 30 inches (762 mm) and the developed length of the waste pipe from the most upstream fixture outlet to the inlet of the interceptor does not exceed 60 inches (1524 mm). The food utensil, dishes, pots and pans sink shall be required to connect directly with the interceptor.

Commenter's Reason: Language implies hydromechanical interceptor has integral water seal (trap). It does not. Therefore adding the words, "and trap" clarifies that a trap is necessary on the branch line.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. A required emergency floor drain and trap will add cost.

P120-18

P121-18

IPC: 1002.4.1.1

Proposed Change as Submitted

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)

2018 International Plumbing Code

Revise as follows

1002.4.1.1 Potable water-supplied trap seal primer valve. A potable water-supplied trap seal primer valve shall supply water to the trap. Water-supplied trap seal primer valves shall conform to ASSE 1018-, and shall be of the type that uses not more than 30 gallons per year per trap. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal on the inlet side of the trap.

Reason: A water-supplied trap seal primer that is unrestricted can discharge 300 to 500 gallons a year to a trap. By comparison, a 2-inch trap, for example, actually requires less than 1/2 gallon per year to maintain the trap seal. Trap seal primer valves that limit the amount of water discharged to 8 gallons per year have been on the market for several years. The maximum of 30 gallons of discharge per year in this proposal is contained in both the 2015 *International Green Construction Code* (IgCC) and the 2015 IAPMO *Green Plumbing and Mechanical Code Supplement*. It is time to bring this common-sense requirement into the IPC to prevent an unnecessary waste of drinking water.

Bibliography: 2015 *International Green Construction Code*, International Code Council, 2015, sec. 702.8.2. 2015 *Green Plumbing and Mechanical Code Supplement*, International Association of Plumbing and Mechanical Officials, 2015, sec. 415.1.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This code change proposal applies to only one of four available compliance paths where trap seal protection is required, and thus will not increase the cost of construction.

P121-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Trap sizes vary and the minimal volume might not be enough for larger traps in some locations. (Vote:12-1)

Assembly Action:

As Submitted

P121-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org) ; Julius Ballanco, representing Self (jbenigneer@aol.com) requests As Submitted.

Commenter's Reason: The committee's concerns about the inadequacy of 30 gallons of water per year to maintain a trap seal are misplaced. The purpose of a trap primer is not to flush the trap, but simply to maintain the seal. Traps evaporate from their surface area, and even a large trap can be maintained with far less than 30 gallons. At an evaporation rate of 12 inches per year, which is generous for indoor ambient conditions, even a 6-inch trap would require less than 6 gallons. 30 gallons a year is more than adequate for this purpose, regardless of trap size or location. Discharges of more than 30 gallons per year are clearly excessive, and at the scale of a large building, multiplied in a community with many large buildings, can add up to significant waste of treated drinking water. This proposal only applies to primer valves using potable water to maintain the trap seal.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This code change proposal applies to only one of four available compliance paths where trap seal protection is required, and thus will not increase the cost of construction.

P121-18

P123-18

IPC: 1003.3.2

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

2018 International Plumbing Code

Revise as follows

1003.3.2 Food waste disposers restriction. A food waste disposer shall not discharge to a grease interceptor.

Exception: A two or three compartment sink that is required to discharge to a grease interceptor shall be permitted to have a food waste disposer provided that the disposer rating is not greater than 1.0 horsepower.

Reason: The commercial food handling industry has requested that small food waste disposers be permitted on two or three compartment sinks to handle the incidental food waste that accumulates in the wash sink after cleaning. The food waste disposer would not be the typical commercial food waste disposer unit handling all of the food waste from the establishment. It would only account for a small portion of food waste remaining during the washing operation.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This would allow an optional installation.

P123-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This could create too much opportunity for too many solids to carry over to the interceptor. (Vote:13-1)

Assembly Action:

None

P123-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBEngineer@aol.com)requests As Submitted.

Commenter's Reason: I proposed the original code change that restricts the discharge of food waste disposer through a grease interceptor. It was pointed out to me after the change was approved that food handling establishments like to install a small food waste disposer on the wash sinks to collect any food particles that make it past the scraping of the dishes or pots and pans. At the end of the wash cycle, the disposer reduces the size of the particle.

If a disposer is not installed, it is feared that large food particle can pass into the grease interceptor. This would be more detrimental than the smaller particle passing through a disposer. By keeping the size of the disposer to 1 hp or less, a food handling establishment is not going to use the disposer as a primary means of disposing of food particles.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This provides an option to the code users. There is no impact to the cost of construction.

Public Comment 2:

Proponent: Max Weiss, representing Plumbing and Drainage Institute (mweiss@pdionline.org)requests Disapprove.

Commenter's Reason: Food waste disposers should not discharge to interceptors. Solids accumulation will modify internal fluid mechanics and interfere with proper function of the interceptor.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Approval of this public comment will nullify the proposal therefore costs of construction will not change.

P123-18

P124-18

IPC: 1003.3.2.1

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

2018 International Plumbing Code

Add new text as follows

1003.3.2.1 Existing installations. For existing installations where the food waste disposer discharges through the grease interceptor, the grease interceptor shall be properly sized to include the discharge from the food waste disposer. The sizing of the grease interceptor shall be based on the continuous flow from the food waste disposer.

Reason: The code was revised to add the prohibition for the discharge of food waste disposers through grease interceptors. However, there are many existing installations where the food waste disposer discharges through the grease interceptor. When the grease interceptor is replaced, the sizing must include the increase load from the food waste disposer.

It is common practice to have the food waste disposer operating in a food handling establishment. When connected to a grease interceptor, this can add a greater load than normal dishwashing sinks. This additional load must be considered when sizing the replacement grease interceptor. The time interval between cleaning of the grease interceptor must also be considered.

In a recently published paper, "A critical review of fat, oil, and grease (FOG) in sewer collection systems: Challenges and control," the importance of properly sizing and maintaining a grease interceptor was identified as a means of reducing the problems of FOG build up in public sewer systems. This proposed change will provide guidance in the proper sizing when an existing system has a food waste disposer discharging to a grease interceptor. This will reduce the contributions of FOG to the public sewer system.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This addresses existing installations and has no impact on the cost.

P124-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Sizing is already covered by the code and by local departments. (Vote:13-1)

Assembly Action:

None

P124-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBEngineer@aol.com)requests As Submitted.

Commenter's Reason: There are a number of installations of grease interceptors that precede the code requirement prohibiting a food waste disposer to discharge through a grease interceptor. There needs to be a sizing requirement in place for the installation of replacement grease interceptors. The code should not rely on the local official to understand the need to size the grease interceptor for the load including the existing food waste disposer.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This provides a means of properly sizing a replacement grease interceptor.

Public Comment 2:

Proponent: Max Weiss, representing Plumbing and Drainage Institute (mweiss@pdionline.org)requests Disapprove.

Commenter's Reason: Food waste disposers should not discharge to an interceptor. Solids accumulation will modify internal fluid mechanics and interfere with proper function. Interceptor sizing is dealt with elsewhere in the code.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Disapproving the proposal will not change the code and thus, will have no impact on the cost of construction.

P124-18

P125-18

IPC: 1106.2, 1106.2.1, Table TABLE 1106.2.1, 1106.2.1.1, 1106.2.1.2, 1106.2.2, 1106.2.2.1

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows

1106.2 Size of storm drain piping. ~~Storm drain pipe sizing.~~ Vertical and horizontal ~~The storm drain drainage piping shall be sized based on the flow rate through the roof drain. The flow rate in storm drain piping shall not exceed that specified in Table 1106.2 in accordance with Section 1106.2.1 or Section 1106.2.2.~~

Add new text as follows

1106.2.1 Roof drainage. The rainwater drainage flow rate from the roof surface shall be determined based on the rainfall rate of a 60 minute storm with a 100 year return period and the area of the roof being drained in accordance with Table 1106.2.1.

**TABLE 1106.2.1
ROOF AREA DRAINAGE FLOW RATE**

Roof Drainage Area (sq. ft.)	Drainage Flow Rate (gpm)					
	Based on Rainfall Rates (in/hr)					
	<u>1</u>	<u>2</u>	<u>3</u>	<u>4</u>	<u>5</u>	<u>6</u>

1106.2.1.1 Roof drain. The flow rate used for sizing the roof drainage system shall be not less than the roof drain manufacturer's published flow rate based on a head height of 4 inches (102 mm) of water ponding. Storm drainage piping shall be sized in accordance with Table 1106.2.

1106.2.1.2 Secondary roof drainage. The opening for the secondary roof drainage shall be not less than 2 inches (51 mm) and not more than 5 inches (76 mm) above the bottom opening of the primary roof drain.

1106.2.2 Engineered Roof Drain Flow Rate. Vertical and horizontal storm drain piping shall be sized based on the flow rate through the roof drain. The flow rate used for sizing the storm drainage piping shall be based on the maximum anticipated ponding at the roof drain based on a rainfall rate of a 60 minute storm with a 100 year return period and a 5 minute storm with a 10 year return period. The flow rate used for sizing the storm drainage piping system shall be the manufacturer's published flow rate for the roof drain based on the established maximum anticipated water ponding height. The storm drainage piping shall be sized in accordance with Table 1106.2.

1106.2.2.1 Secondary roof drainage. The discharge through the secondary roof drain shall not be considered when establishing the maximum height of ponding at the primary roof drain. The opening for the secondary roof drainage shall be not less than 2 inches (51 mm) above the bottom opening of the primary roof drain.

Reason: The code was revised a few cycles ago to reflect the research published by the ASPE Research Foundation. ASPE RF and IAPMO cosponsored research on the performance of roof drains in storm drainage systems. There has been a number of requests for a fast sizing method that does not require engineering calculations. The change adds such a fast, cook-book method of sizing the storm drainage piping system. The ASPE RF research report states the problem associated with a storm drainage system is the improper sizing of the storm drainage pipe. The old sizing method did not account for the high quality of the roof drain. The research report is included with the submittal and can be downloaded at no cost at www.aspe.org.

The code change identifies two methods for sizing the storm drainage system. The first sizing method listed in Section 1106.2.1 Roof Drainage, is the quick sizing method. When using this method, the storm drain pipe may be sized large than the engineered sizing method. The quick method will not result in smaller diameter pipe for the storm drainage system.

These requirements respond to the request by inspectors, contractors, and engineers. The first sizing method identified was developed to provide a cookbook method of sizing rather than conducting a full engineering design analysis. The sizing of the storm drainage system still relies on the values published by the roof drain manufacturers. This data identifies the flow rate based on head height through the roof drain.

Because the method takes a cookbook approach, the secondary roof drainage must be considered. For that reason, secondary roof drainage is required to be between 2 inch and 5 inches above the primary roof drainage. This is calculated into the flow rate sizing values in Table 1106.2.1. It will assure that the system will not exceed the ponding height determined in flow calculations.

The second method, identified as Section 1106.2.2 Engineered Roof Drain Flow Rate, is the current sizing method required by the code. One change has been added to the engineered sizing method. The engineered sizing will require the evaluation of the roof drainage system for a microburst, which is a 5-minute storm with a 10-year return period. While a 100-year storm may appear to be the most drastic storm for sizing a system, a microburst can overpower the storm drainage piping resulting in failure of the piping system. The microburst will typically not have a significant impact on the roof loading compared to a 100-year storm of 60-minute duration. The ASPE RF research report recommends the evaluation of both a 100-year storm of 60 minutes duration and a 10-year storm of 5-minute duration.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. This provides an option for sizing the storm drainage system.

P125-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal needs more coordination with the roofing contractor groups to develop a public comment that refines this proposal. (Vote:9-5)

Assembly Action:

None

P125-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Max Weiss, representing Plumbing and Drainage Institute (mweiss@pdionline.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Plumbing Code

1106.2.1.1 Roof drain. The flow rate used for sizing the roof drainage system shall be ~~not less than the roof drain manufacturer's published flow rate~~ based on a head height of 4 inches (102 mm) of water ponding. Storm drainage piping shall be sized in accordance with Table 1106.2.

1106.2.1.2 Secondary roof drainage. The opening for the secondary roof drainage shall be not less than 2 inches (51 mm) and not more than ~~5-4~~ inches (~~76-101~~ mm) above the bottom opening of the primary roof drain.

1106.2.2 Engineered Roof Drain Drainage Flow Rate. ~~Vertical and horizontal storm drain piping shall be sized based on the flow rate through the roof drain. The flow rate used for sizing the storm drainage piping shall be based on the maximum anticipated ponding at the roof drain based on a rainfall rate of a 60 minute storm with a 100 year return period and a 5 minute storm with a 10 year return period . The flow rate used for sizing the storm drainage piping system shall be the manufacturer's published flow rate for the roof drain based on the established maximum anticipated water ponding height. The storm drainage piping shall be sized and~~ in accordance with Table 1106.2.

Commenter's Reason: The roof drain fixture should not be used to control drainage rate. Stack configuration is the greatest single variable affecting flow rate. 4" ponding limitation, roof area, rainfall rate determine drainage system requirement in gpm. Roof drain fixture simply has to be capable of that flow at that head.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The public comment modifications adjusts the proposal to reflect what is common practice in the industry today. Therefore, the proposal as modified will not impact the cost of labor or materials.

Public Comment 2:

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBEngineer@aol.com) requests As Submitted.

Commenter's Reason: The reason given for the rejection was that the proposal needs to be coordinated with the roofing contractors. The concern with the contractors is the roof load based on the design. While the roofing contractors thought the roof load should be addressed in this proposal, it is unnecessary. Roof loading is already addressed in Section 1101.7. There is no need to duplicate the requirements from that section in this proposal.

The main purpose of this proposal is to add a simplified method of designing the storm drainage system. That is what is provided in the additional design method. While it results in oversizing of the drainage piping, the system will perform without failure. A simplified design option has been requested by code officials, engineers, contractors, and staff.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

This change provides an alternative method for sizing the roof drainage system. Alternatives have no cost impact.

Public Comment 3:

Proponent: Max Weiss, representing Plumbing and Drainage Institute (mweiss@pdionline.org) requests Disapprove.

Commenter's Reason: This proposal and related sections require further development.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of this proposal results in the current code not changing. Therefore, the net effect on costs is zero.

P125-18

P126-18

IPC: 1102.6, Chapter 15

Proposed Change as Submitted

Proponent: Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Froet Industries (JBEngineer@aol.com)

2018 International Plumbing Code

Revise as follows

1102.6 Roof Drains. Roof drains shall conform to ASME A112.6.4 or ASME A112.3.1. Roof drains, other than siphonic roof drains, shall be tested and rated in accordance with ASME A112.6.4 or ASPE/IAPMO Z1034.

Add new standard(s) follows

ASPE

American Society of Plumbing
Engineers
6400 Shafer Ct., Suite 350
Rosemont IL 60018-4914

ASPE/IAPMO 21034-2015:

Test Method for Evaluating Roof Drain Performance

Reason: ASPE/IAPMO Z1034 is the consensus standard for testing and rating roof drains for their flow rate at different ponding heights. The current code requires the manufacturer to publish their flow rates. The flow rates are determined by testing to either of the two standards referenced.

Siphonic roof drains are rated differential with the system designed in accordance with ASPE 45 and the roof drain tested in accordance with ASME A112.6.9.

The testing requirements in the standard are consistent with the results published in the ASPE Research Foundation Roof Drainage Research Report. There are third party laboratories currently testing and certifying roof drains to the ASPE/IAPMO Z1034 standard.

Cost Impact: The code change proposal will increase the cost of construction. There is a cost associated with the testing of roof drains.

Analysis: A review of the standard proposed for inclusion in the code, ASPE/IAPMO 21034-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P126-18

Public Hearing Results

Committee Action:

As Submitted

Committee Reason: This will answer some questions about roof drains and storm drain system piping requirements in the code. (Vote:14-0)

Assembly Action:

None

P126-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Max Weiss, representing Plumbing and Drainage Institute (mweiss@pdionline.org) requests Disapprove.

Commenter's Reason: Drainage systems must be sized in accordance with anticipated load and provision for air. Roof drain fixtures must be sized in accordance with drainage system design capacity. Wording in proposal was obtuse and intra-contradictory.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

Disapproval of a proposal will not change the code therefore, the costs of construction will not be impacted.

P126-18

P131-18 Part I

IPC: 1301.1.1 (New), Chapter 15

Proposed Change as Submitted

Proponent: Dave Cantrell, representing The Joint CSA/ICC Rainwater System Design and Installation Consensus Committee (dave.cantrell.codes@gmail.com)

THIS IS A 2 PART CODE CHANGE PROPOSAL. PART I WILL BE HEARD BY THE IPC COMMITTEE. PART II WILL BE HEARD BY THE IRC-PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

2018 International Plumbing Code

Add new text as follows

1301.1.1 Alternate compliance path. Systems for nonpotable uses that comply with CSA B805/ICC 805 are deemed to comply with this chapter.

Add new standard(s) follows

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

CSA B805-18/ICC 805-2018:

Rainwater Harvesting Systems

Reason: This proposal adds the CSA B805/ICC 805 Standard as an alternate compliance path for rainwater to be used in nonpotable applications. The Canadian Standards Association and the International Code Council jointly formed the Rainwater System Design and Installation Consensus Committee (IS-RCSDI) in order to create a Rainwater Harvesting Standard for use in North America. Nonpotable rainwater harvesting systems that conform to this Standard will comply with Chapter 13, thus providing a far more comprehensive guidance document as an alternate compliance path. While this new Standard addresses rainwater for potable use and stormwater for nonpotable use, neither of which are addressed in Chapter 13, including this Standard in Chapter 14 would not mandate such uses. However, it will provide code officials with the guidance needed for reviewing and inspecting these types of water reuse systems that are becoming more common with ever-increasing water conservation measures.

Here are some necessary provisions that the committee felt obligated to include in this Standard:

1. This Standard addresses roof surface rainwater and stormwater being used as source water. It addresses rainwater intended for use in nonpotable applications as well as potable applications.

2. Recognizing that the risk to public health increases with the number of persons using a rainwater harvesting system, this Standard provides different methods for protecting water based on the influent water quality, the system, and the application. Stormwater runoff is expected to have a higher likelihood of contamination as a result of its flowing overland. Therefore, this Standard specifies additional treatment process requirements for stormwater runoff and does not cover its use for potable water applications.

3. In order to ensure the consideration of the wide range of variables associated with each site, location, design, and application, this Standard requires that a water safety plan be developed for all rainwater harvesting systems. The water safety plan considers the specific challenges and risks presented by the site and associated impact on source water quality, operation of system components, and the risk associated with the end use.

4. Applications for harvested rainwater are separated into four end use tiers that consider the exposure potential through ingestion, inhalation, and skin contact. It further separates these tiers into two groups, one for single-family residential and one for multifamily, commercial and public facilities.

5. This Standard specifies minimum performance criteria for each end use tier in consideration of the health risk and identifies possible treatment process options to meet the specified performance criteria.

6. Based on the expected source water quality, this Standard establishes suitable water quality parameters that are used to substantiate that the treatment process is operating as intended to produce safe water for the specified end use.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposed alternate compliance path is an option provided to the user, not a requirement. Therefore, no added cost is mandated to the user of the code.

Analysis: A review of the standard proposed for inclusion in the code, CSA 805-17/ICC 805-2017, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P131-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Consistency with action on P131 Part II. (Vote:13-1)

Assembly Action:

As Submitted

Staff Analysis: P131-18 Part II, an identical proposal to this proposal, was heard by the IRC-PM Committee. The reason for disapproval was "An alternative compliance path to use this standard instead of the code is available through Section R104.11 (alternative methods.)"

P131-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgac@iccsafe.org); Dave Cantrell (dave.cantrell.codes@gmail.com); Paul Gulletson (paul.gulletson@csagroup.org) requests As Modified by This Public Comment.

Replace as follows:

2018 International Plumbing Code

1301.1 ~~Scope-General.~~ The provisions of Chapter 13 shall govern the materials, design, construction and installation of systems for the collection, storage, treatment and distribution of nonpotable water. For nonpotable rainwater systems, the provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment and distribution of nonpotable water. The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the jurisdiction.

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

CSA B805-18/ICC 805-18:

Rainwater Harvesting Systems

Commenter's Reason: The committee reason for disapproval was that alternative compliance paths are already allowed in Chapter one, Section 105.2. While this is true, Section 105.2 offers no guidance as to what a viable alternative path should be. Providing a specified alternative compliance path gives the code official and the designer a tangible source of design specifications. The committee also thought that a standard for rainwater systems is not appropriately located in Chapter 13, however, Chapter 13 is the only chapter that addresses non-traditional water systems and Chapter 13 includes Section 1303, which covers nonpotable rainwater systems. Based on the committee's reason, the code would never need to specify any alternative compliance requirements, and would always burden the code official with making an equivalency determination with no guidance from the code. The proposed standard, CSA B805/ICC 805 was jointly developed by ICC and the Canadian Standards Association. The committee offered no technical justification for not including the proposed standard in the code.

This public comment is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed language only provides for an option to the user. Because this is not a requirement, there is no added or decreased cost of construction caused by this option being placed on the code.

P131-18 Part I

P131-18 Part II

IRC: P2912.1.1 (New), Chapter 44

Proposed Change as Submitted

Proponent: Dave Cantrell, representing The Joint CSA/ICC Rainwater System Design and Installation Consensus Committee (dave.cantrell.codes@gmail.com)

2018 International Residential Code

Add new text as follows

P2912.1.1 Alternate compliance path. Systems for nonpotable uses that comply with CSA B805/ICC 805 are deemed to comply with Section P2912.

Add new standard(s) follows

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

CSA B805-18/ICC 805-2018:

Rainwater Harvesting Systems

Reason: This proposal adds the CSA B805/ICC 805 Standard as an alternate compliance path for rainwater to be used in nonpotable applications. The Canadian Standards Association and the International Code Council jointly formed the Rainwater System Design and Installation Consensus Committee (IS-RCSDI) in order to create a Rainwater Harvesting Standard for use in North America, one that will provide further guidance for rainwater to serve both potable and nonpotable uses. Nonpotable rainwater harvesting systems that conform to this Standard will comply with Section P2912, thus providing a far more comprehensive guidance document as an alternate compliance path. While this new Standard addresses rainwater for potable use and stormwater for nonpotable use, neither of which are addressed in Section P2912, including this Standard in Chapter 44 would not mandate such uses. However, it will provide code officials with the guidance needed for reviewing and inspecting these types of water reuse systems that are becoming more common with ever-increasing water conservation measures.

Here are some necessary provisions that the committee felt obligated to include in this Standard:

1. This Standard addresses roof surface rainwater and stormwater being used as source water. It addresses rainwater intended for use in nonpotable applications as well as potable applications.
2. Recognizing that the risk to public health increases with the number of persons using a rainwater harvesting system, this Standard provides different methods for protecting water based on the influent water quality, the system, and the application. Stormwater runoff is expected to have a higher likelihood of contamination as a result of its flowing overland. Therefore, this Standard specifies additional treatment process requirements for stormwater runoff and does not cover its use for potable water applications.
3. In order to ensure the consideration of the wide range of variables associated with each site, location, design, and application, this Standard requires that a water safety plan be developed for all rainwater harvesting systems. The water safety plan considers the specific challenges and risks presented by the site and associated impact on source water quality, operation of system components, and the risk associated with the end use.
4. Applications for harvested rainwater are separated into four end use tiers that consider the exposure potential through ingestion, inhalation, and skin contact. It further separates these tiers into two groups, one for single-family residential and one for multifamily, commercial and public facilities.

P132-18 Part I

IPC: 1301.1.1 (New), Chapter 15

Proposed Change as Submitted

Proponent: Dave Cantrell, representing The Joint CSA/ICC Rainwater System Design and Installation Consensus Committee (dave.cantrell.codes@gmail.com)

2018 International Plumbing Code

Add new text as follows

1301.1.1 Alternate compliance path. Systems designed for potable uses shall comply with CSA B805/ICC 805.

Add new standard(s) follows

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

CSA B805-18/ICC 805-2018:

Rainwater Harvesting Systems

Reason: This proposal adds the CSA B805/ICC 805 Standard as an alternate compliance path for rainwater to be used in both potable and nonpotable applications. The Canadian Standards Association and the International Code Council jointly formed the Rainwater System Design and Installation Consensus Committee (IS-RCSDI) in order to create a Rainwater Harvesting Standard for use in North America, one that will provide further guidance for rainwater to serve both potable and nonpotable uses.

Chapter 13 does not address rainwater for potable use, nor does it contain provisions for the use of stormwater for nonpotable use. This Standard provides code officials the guidance needed for reviewing and inspecting these types of water reuse systems that are becoming more common with ever-increasing water conservation measures. For this reason this Standard should be referenced in Chapter 14. It should further be noted that nonpotable rainwater harvesting systems that conform to this Standard will comply with Chapter 13, thus providing a far more comprehensive guidance document as an alternate compliance path.

Here are some necessary provisions that the committee felt obligated to include in this Standard:

1. This Standard addresses roof surface rainwater and stormwater being used as source water. It addresses rainwater intended for use in nonpotable applications as well as potable applications.

2. Recognizing that the risk to public health increases with the number of persons using a rainwater harvesting system, this Standard provides different methods for protecting water based on the influent water quality, the system, and the application. Stormwater runoff is expected to have a higher likelihood of contamination as a result of its flowing overland. Therefore, this Standard specifies additional treatment process requirements for stormwater runoff and does not cover its use for potable water applications.

3. In order to ensure the consideration of the wide range of variables associated with each site, location, design, and application, this Standard requires that a water safety plan be developed for all rainwater harvesting systems. The water safety plan considers the specific challenges and risks presented by the site and associated impact on source water quality, operation of system components, and the risk associated with the end use.

4. Applications for harvested rainwater are separated into four end use tiers that consider the exposure potential through ingestion, inhalation, and skin contact. It further separates these tiers into two groups, one for single-family residential and one for multifamily, commercial and public facilities.

5. This Standard specifies minimum performance criteria for each end use tier in consideration of the health risk and identifies possible treatment process options to meet the specified performance criteria.

6. Based on the expected source water quality, this Standard establishes suitable water quality parameters that are used to substantiate that the treatment process is operating as intended to produce safe water for the specified end use.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The proposed alternate compliance path is an option provided to the user, not a requirement. Therefore, not added cost

is mandated to the user of the code.

Analysis: A review of the standard proposed for inclusion in the code, CSA 805-18/ICC 805-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P132-18 Part I

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Consistency with action on P131 Part I. Also, Chapter 13 is for nonpotable water systems and this standard involves potable water. (Vote:13-1)

Assembly Action:

P132-18 Part I

Individual Consideration Agenda

Public Comment 1:

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Paul Gulletson (paul.gulletson@csagroup.org); Dave Cantrell (dave.cantrell.codes@gmail.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Plumbing Code

602.3 ~~Individual~~ Alternative potable water supply-supplies. Where a potable public water supply is not available, potable water from one or more of the following individual sources of potable water supply shall be utilized:

1. An individual water supply in accordance with Sections 602.3.1 through 602.3.5.1.
2. A rainwater harvesting system in compliance with CSA B805/ICC 805.

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

CSA B805-18/ICC 805-18:

Rainwater Harvesting

Commenter's Reason: The committee thought that a standard for potable rainwater systems is not appropriately located in Chapter 13. Therefore, this public comment places this potable water alternative source in Section 602 where other potable water systems are regulated.

Another committee reason for disapproval was that alternative compliance paths are already allowed in Chapter one, Section 105.2. While this is true, Section 105.2 offers no guidance as to what a viable alternative path should be. Providing a specified alternative compliance path gives the code official and the designer a tangible source of design specifications. Based on the committee's reason, the code would never need to specify any alternative compliance requirements, and would always burden the code official with making an equivalency determination with no guidance from the code. The proposed standard, CSA B805/ICC 805 was jointly developed by ICC and the Canadian Standards Association.

The committee offered no technical justification for not including the proposed standard in the code.

This public comment is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed language only provides for an option to the user. Because this is not a requirement, there is no added or decreased cost of construction caused by this option being placed on the code.

P132-18 Part II

IRC: P2912.1.1 (New), Chapter 44

Proposed Change as Submitted

Proponent: Dave Cantrell, representing The Joint CSA/ICC Rainwater System Design and Installation Consensus Committee (dave.cantrell.codes@gmail.com)

2018 International Residential Code

Add new text as follows

P2912.1.1 Alternate compliance path. Systems designed for potable uses shall comply with CSA B805/ICC 805.

Add new standard(s) follows

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland OH 44131-5516

CSA B805-18/ICC 805-18:

Rainwater Harvesting Systems

Reason: This proposal adds the CSA B805/ICC 805 Standard as an alternate compliance path for rainwater to be used in both potable and nonpotable applications. The Canadian Standards Association and the International Code Council jointly formed the Rainwater System Design and Installation Consensus Committee (IS-RCSDI) in order to create a Rainwater Harvesting Standard for use in North America, one that will provide further guidance for rainwater to serve both potable and nonpotable uses.

Section P2912 does not address rainwater for potable use, nor does it contain provisions for the use of stormwater for nonpotable use. This Standard provides code officials the guidance needed for reviewing and inspecting these types of water reuse systems that are becoming more common with ever-increasing water conservation measures. For this reason this Standard should be referenced in Chapter 44. It should further be noted that nonpotable rainwater harvesting systems that conform to this Standard will comply with Section P2912, thus providing a far more comprehensive guidance document as an alternate compliance path.

Here are some necessary provisions that the committee felt obligated to include in this Standard:

1. This Standard addresses roof surface rainwater and stormwater being used as source water. It addresses rainwater intended for use in nonpotable applications as well as potable applications.

2. Recognizing that the risk to public health increases with the number of persons using a rainwater harvesting system, this Standard provides different methods for protecting water based on the influent water quality, the system, and the application. Stormwater runoff is expected to have a higher likelihood of contamination as a result of its flowing overland. Therefore, this Standard specifies additional treatment process requirements for stormwater runoff and does not cover its use for potable water applications.

3. In order to ensure the consideration of the wide range of variables associated with each site, location, design, and application, this Standard requires that a water safety plan be developed for all rainwater harvesting systems. The water safety plan considers the specific challenges and risks presented by the site and associated impact on source water quality, operation of system components, and the risk associated with the end use.

4. Applications for harvested rainwater are separated into four end use tiers that consider the exposure potential through ingestion, inhalation, and skin contact. It further separates these tiers into two groups, one for single-family residential and one for multifamily, commercial and public facilities.

5. This Standard specifies minimum performance criteria for each end use tier in consideration of the health risk and identifies possible treatment process options to meet the specified performance criteria.

6. Based on the expected source water quality, this Standard establishes suitable water quality parameters that are used to substantiate that the treatment process is operating as intended to produce safe water for the specified end use.

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The proposed alternate compliance path is an option provided to the user, not a requirement. Therefore, not added cost

is mandated to the user of the code.

Analysis: A review of the standard proposed for inclusion in the code, CSA B805-18/ICC 805-2018, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2018.

P132-18 Part II

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Alternative compliance paths are already provided for under Section R104.11 (Vote:10-10)

Assembly Action:

None

P132-18 Part II

Individual Consideration Agenda

Public Comment 1:

Proponent: Pennie Feehan, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Dave Cantrell (dave.cantrell.codes@gmail.com); Paul Gulletson (paul.gulletson@csagroup.org)requests As Modified by This Public Comment.

Replace as follows:

2018 International Residential Code

P2602.1 General. The water-distribution system of any building or premises where plumbing fixtures are installed shall be connected to a public water supply. Where a public water-supply system is not available, or connection to the supply is not feasible, potable water from one or more of the following an individual water supply shall be provided.:

1. An individual water supply in accordance with this section.
2. A rainwater harvesting system in compliance with CSA B805/ICC 805.

Individual water supplies shall be constructed and installed in accordance with the applicable state and local laws. Where such laws do not address the requirements set forth in NGWA-01, individual water supplies shall comply with NGWA-01 for those requirements not addressed by state and local laws.

Sanitary drainage piping from plumbing fixtures in buildings and sanitary drainage piping systems from premises shall be connected to a public sewer. Where a public sewer is not available, the sanitary drainage piping and systems shall be connected to a private sewage disposal system in compliance with state or local requirements. Where state or local requirements do not exist for private sewage disposal systems, the sanitary drainage piping and systems shall be connected to an approved private sewage disposal system that is in accordance with the International Private Sewage Disposal Code .

Exception: Sanitary drainage piping and systems that convey only the discharge from bathtubs, showers, lavatories, clothes washers and laundry trays shall not be required to connect to a public sewer or to a private sewage disposal system provided that the piping or systems are connected to a system in accordance with Section P2910 or P2911.

CSA B805-18/ICC 805-18:

Rainwater Harvesting Systems

Commenter's Reason: The committee thought that a standard for potable rainwater systems is not appropriately located in Section P2912. Therefore, this public comment places this potable water alternative source in Section P2602.1 where other potable water systems are regulated.

Another committee reason for disapproval was that alternative compliance paths are already allowed in Chapter one, Section 104.11. While this is true, Section 104.11 offers no guidance as to what a viable alternative path should be. Providing a specified alternative compliance path gives the code official and the designer a tangible source of design specifications. Based on the committee's reason, the code would never need to specify any alternative compliance

requirements, and would always burden the code official with making an equivalency determination with no guidance from the code. The proposed standard, CSA B805/ICC 805 was jointly developed by ICC and the Canadian Standards Association.

The committee offered no technical justification for not including the proposed standard in the code.

This public comment is submitted by the ICC Plumbing/Mechanical/Gas Code Action Committee (PMG CAC). The PMG CAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance the International Codes or portions thereof that were under the purview of the PMG CAC. In 2017 the PMG CAC held one face-to-face meeting and 11 conference call meetings. Numerous interested parties attended the committee meetings and offered their input.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The proposed language only provides for an option to the user. Because this is not a requirement, there is no added or decreased cost of construction caused by this option being placed on the code.

Public Comment 1:

Proponent: Craig Conner, representing self (craig.conner@mac.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Residential Code

P2913 POTABLE RAINWATER COLLECTION AND DISTRIBUTION SYSTEMS

P2913.1 General. This section shall apply to detached single-family dwellings that use rainwater as potable water. Potable rainwater systems shall meet the requirements of Sections P2913.2 through P2913.9, P2906, and Section 2912.

P2913.2 Roof materials. The following roof materials shall be prohibited for roofs that collect rainwater: shingles with fire retardant, copper, and materials that contain asbestos. Materials that contain lead, including but not limited to flashings and roof jacks, shall be prohibited.

P2913.3 Cross connection. Potable water supplies shall be protected against cross connection with rainwater as specified in P2902.1.

P2913.4 Disinfection. Disinfection shall be provided by at least one of the following:

1. Ultraviolet (UV) light providing at least 40 mJ/cm² at 254 nm for the highest water flow rate. A UV sensor with visible alarm, audible alarm, or water shutoff shall be triggered when the UV light is below the minimum at the sensor. In addition filtration no greater than 5 µm shall be located upstream of the UV light or
2. filtration no greater than 0.2 µm , or
3. other approved disinfection

P2913.5 Non-contaminating materials. Materials and systems that collect, convey, pump, or store rainwater for potable rainwater systems shall comply with NSF 53, NSF 61 or equivalent.

P2913.6 Water quality. The quality of the water at the point of use shall be verified in accordance with the requirements of the jurisdiction.

P2913.7 Sunlight. The rainwater storage shall not admit sunlight.

P2913.8 Pipe color. Potable rainwater pipe shall not be required to be purple post disinfection.

Commenter's Reason: Chapter 29 does not currently address rainwater for potable use. Proposals P131 and P132 proposed a new standard on rainwater use, but was disapproved by the committees in four separate votes. Section P2911 of the IRC already covers non-potable rainwater. This proposal adds requirements specific to potable rainwater. This proposal applies only to single-family residences.

The requirements in this proposal are simple.

-- The existing Section 2906 on Materials, Joints and Connections is required. The requirements for non-potable rainwater already in Section 2912 are also required for potable rainwater; debris excluder, roof washer, gutters, inspections, manuals, etc. (P2913.1)

--Roof materials that are not suitable for potable rainwater collection are prohibited (P2913.2).

--Cross connection that would allow rainwater to flow back into other water supply systems is prohibited (P2913.3).

--Disinfection to address biological contaminants is required, with UV light being by far the most common; however microfiltration and other options are allowed (P2913.4).

--Potable rainwater systems have components upstream of the potable water that must not contaminate the incoming water. The cited standards (NSF 53 on Drinking Water Treatment Units and NSF 61 on Drinking Water System Components) are already used in Chapter 29. (P2912.5) The Safe Drinking Water Act is a Federal Law that requires much lower levels of lead in plumbing products.

--Water quality is required to meet the quality requirements of the jurisdictions using language similar to the existing code (P2912.6).

--Sunlight in the rainwater tank would allow algae to grow, so it is prohibited (P2913.7).

--Purple pipe would not be required after disinfection because post-disinfection these pipes carry only potable water (P2912.8).

This proposal replaces the rainwater standard originally proposed. Even if the new rainwater standard were only an option, the proposed rainwater standard would need to be understandable to code enforcement staff. A few examples from the standard originally proposed- there are multiple uses of "should" and "guidance" instead of "shall" or mandatory language. For example in Section 5..1.1 item #1 says "Where water is used for public drinking water supplies, the authority having jurisdiction should be consulted for specific regulatory requirements for water quality." The word "should" is inappropriate. Requirements for the authority having jurisdiction are not optional. Also, the required "Water Safety Plan" is poorly defined and mostly discussed in non-mandatory sections. For example, Annex D on the Water Safety Plan is "informative".

Code requirements for rainwater need to be usable. Please approve this replacement proposal.

Doug Pushard and Darrel McMaster contributed greatly to this public comment.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. Construction of rainwater collection and storage will add cost. The added cost will be strongly dependent on the size of the system. Use of rainwater systems will likely reduce the costs of operating the home.

IRC: P2705.1, P2708.6, P2713.4, SECTION P2726, P2726.1, P2726.2, P2726.2.1, P2726.2.2, P2726.3, P2726.4, P2726.4.1, P2726.4.2, P2726.4.3, P2726.5, P2726.6

Proposed Change as Submitted

Proponent: Jake Pauls, representing Jake Pauls Consulting Services (bldguse@aol.com)

2018 International Residential Code

Revise as follows

P2705.1 General. The installation of fixtures shall conform to the following:

1. Floor-outlet or floor-mounted fixtures shall be secured to the drainage connection and to the floor, where so designed, by screws, bolts, washers, nuts and similar fasteners of copper, copper alloy or other corrosion-resistant material.
2. Wall-hung fixtures shall be rigidly supported so that strain is not transmitted to the plumbing system.
3. Where fixtures come in contact with walls and floors, the contact area shall be water tight.
4. Plumbing fixtures shall be usable including safety of users of showers, bathtubs and bathtub-shower combinations in accordance with R301.1, R306, R307, R308, R311, R320, P2701, P2708, P2713, and P2726.
5. Water closets, lavatories and bidets. A water closet, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition or vanity or closer than 30 inches (762 mm) center-to-center between adjacent fixtures. There shall be a clearance of not less than 21 inches (533 mm) in front of a water closet, lavatory or bidet to any wall, fixture or door.
6. The location of piping, fixtures or equipment shall not interfere with the operation of windows or doors.
7. In flood hazard areas as established by Table R301.2(1), plumbing fixtures shall be located or installed in accordance with Section R322.1.6.
8. Integral fixture-fitting mounting surfaces on manufactured plumbing fixtures or plumbing fixtures constructed on site, shall meet the design requirements of ASME A112.19.2/CSA B45.1 or ASME A112.19.3/CSA B45.4.

Add new text as follows

P2708.6 Grab Bars and Stanchions for Showers and Bathtub-Shower Combinations. Showers and bathtub-shower combinations shall provide stanchions or similar vertically-oriented, handholds typically not attached to walls, and grab bars in accordance with P2726.

P2713.4 Grab Bars and Stanchions for Bathtubs and Bathtub-Shower Combinations. Bathtubs and bathtub-shower combinations shall provide grab bars or stanchions in accordance with P2726.

SECTION P2726 GRAB BARS FOR BATHTUBS AND SHOWERS.

P2726.1 General. Grab Bars and Stanchions for Bathtubs, Bathtub-Shower Combinations, and Showers. Bathtubs, bathtub-shower combinations, and showers not required to be accessible shall be provided with grab bars or stanchions complying with P2726.1 through P2726.6. Dimensions specified are to the centerline of the grab bar or stanchion.

P2726.2 Grab Bars or Stanchions for Bathtubs and Bathtub-Showers. Grab bars or stanchions complying with P2726.2.1 and P2726.2.2 shall be provided at bathtubs and bathtub-shower combinations.

P2726.2.1 Vertical Grab bar or Stanchion. A vertical grab bar or stanchion shall be provided and shall comply with the following criteria.

1. Approach. The grab bar or stanchion shall be located so that it is usable without any obstruction. An unobstructed clear floor space 21 inches (533 mm) wide minimum and 21 inches (533 mm) deep minimum, measured from the outer side of the bathtub, shall be provided and shall be located within 12 inches (305 mm) of the grab bar or stanchion.
2. Length. The grab bar or stanchion shall be 36 inches (914 mm) long minimum.
3. Position. The grab bar or stanchion shall be positioned in accordance with the following criteria:
 - 3.1. The lower end of the grab bar or stanchion shall be 24 inches (610 mm) minimum and 27 inches maximum above the finished floor.
 - 3.2. Grab bars located inside a combination bathtub-shower compartment shall have their centerline 6 inches (152 mm) minimum, measured horizontally, to the shower curtain rod and 8 inches (200 mm) maximum, measured horizontally from the outer side of the bathtub.
 - 3.3. Grab bars and stanchions shall be permitted within 6 inches (152 mm) outside of the outer side of the bathtub complying with P2726.2.1.1

P2726.2.2 Horizontal Grab Bar. A 24-inch (610 mm) long minimum grab bar shall be provided on the long, non-entry side of bathtubs and bathtub-shower combinations. The grab bar shall be installed in a horizontal position and shall be centered, plus or minus two inches, along the length of the tub. The horizontal grab bar shall be located 8 inches (205 mm) minimum and 10 inches (255 mm) maximum above the tub rim.

Exception: A diagonal grab bar or, with 24 inches (610 mm) minimum length is permitted if installed with its higher end 12 inches (305mm) maximum from the control wall. The higher end of the grab bar shall be 25 inches (635 mm) minimum and 27 inches (685 mm) maximum above the tub rim. The lower end shall be located 8 inches (205 mm) minimum and 10 inches (255 mm) maximum above the tub rim.

P2726.3 Vertical Grab Bar or Stanchion for Showers. A vertical grab bar or stanchion shall be provided for showers. The vertical grab bar or stanchion shall be located either interior to or outside the shower compartment, within 3 inches (76 mm) of the compartment access and egress opening. The grab bar or stanchion shall be 24 inches (610 mm) long minimum with its lower end 39 inches (991 mm) maximum above the finished floor.

P2726.4 Other Details. Grab bars and stanchions shall comply with P2726.4

P2726.4.1 Cross Section. Grab bars and stanchions shall be circular in cross section having an outside diameter of 1.25 inches (32 mm) minimum and 2 inches (51 mm) maximum.

P2726.4.2 Spacing. The space between the grab bar or stanchion and adjacent surfaces plus water controls shall be 1.5 inches (32 mm) minimum.

P2726.4.3 Surface Hazards. Grab bars, stanchions and adjacent surfaces shall be free of sharp or abrasive elements. Edges shall be rounded with a minimum radius of 0.25 inch (6 mm).

P2726.5 Structural Characteristics. Allowable stresses shall not be exceeded for materials used when a vertical or horizontal force of 250 pounds (1112 N) is applied an any point on the grab bar, stanchion, fasteners, mounting device or supporting structure. Grab bars and stanchions shall not rotate within their fittings.

P2726.6 Design and Installation for Water. Grab bars, stanchions, fasteners, mounting device or supporting structure shall be designed and installed in accordance with P2701.1, with suitable materials, to withstand effects of water, including corrosion and other deterioration through their service life.

Reason:

“Reason Statement” or Justification for Grab Bars and Stanchions

for Bathtubs, Bathtub-Shower Combinations and Showers

Complying with New Requirements in IRC, especially Section P2726

Proposed by Jake Pauls, BArch, CPE, HonDSc

Introduction

Points of Control. Grab bars, handrails and stanchions are important building components providing—in combination with our hands and our feet—what are called (in ergonomics) “points of control” to maintain balance and aid in ambulation and other movement activities that are crucial to utilizing means of egress for safety generally (in both normal and emergency conditions) and which pose dangers of injurious falls, the leading source of injuries in most countries, including the USA.

A brief digression to explain “stanchions.” You see them routinely on transportation vehicles such as subway trains and city buses. They are the **vertical** assemblies of graspable tubing that are fixed between ceilings, horizontal handrails just above head height, seats, floors, etc. usually located between seating and passageways or aisles. The term, stanchions is used in ADA requirements for transportation vehicles and for this context Wikipedia has the following description: “On board most buses and trams/subways, vertical supports to provide stability when passengers are standing. They are located throughout most city buses and are connected to seats, floor, roof, etc.” This term is used in contexts similar to those for the “poles” referred to in NFPA’s recent adoption of new requirements for grab bars or poles for new bathtubs, bathtub-shower combinations and showers.

Examples of Points of Control in Specific Contexts. The starred, central cell of Table 1. shows the equity, with points of control—**shown in bold italics**—achieved with now-proposed grab bars, handrails and stanchions being required, in Section 1003, in the same way that handrails are required for stairs in the rest of the IBC.

Table 1. Minimum Number of Points of Control Provided with New (★) or Currently Imposed Rules or Practices

Number of Points of Control Via Hands or Feet	≤1	1	2	3	3-4
Standard walker for older adult with altered gait.					✓
Occupational settings with risk of worker falls from heights. Also, stairs where users can use two handrails simultaneously, one on each side.				✓	
Stairs where users have only a single handrail. <i>Grab bar(s) usable for bathtub/shower entry/egress.</i>			✓ ★		
Bathtubs/showers with slip resistant underfoot surfaces when wet.		✓			
Bathtubs/showers without slip resistant underfoot surfaces when wet, the common condition currently.	✓				

The Problems To Be Solved with A New Requirement for Grab bars, handrails and stanchions. The central and most important point of this code change proposal is to respond to the relatively high risk of injurious falls when entering and exiting bathing/showering facilities, *in all new settings where they occur*. Such risks exceed those for stairs on an exposure-adjusted basis. That is, the time during which one is stepping into or out of a bathtub or shower is more risky than a similar stepping behavior on a stair. The former result in about 25 percent of the injuries as do falls on stairs. This is based on about 300,000 US hospital emergency room visits per year for bathtubs and showers versus about 1.2 million US hospital emergency room visits per year for stairs, using comparably serious injury data for 2010 (discussed by Lawrence, *et al.*, 2015 in the journal *Injury Prevention*). The societal cost of these injuries, plus about two and a half times additional, medically treated injuries, was (for 2010) about 20 billion dollars for US bathtubs and showers and about 93 billion dollars for US stairs with the greatest risk for both being in homes, where bathing/showering is a near daily activity for most people in the US (Lawrence, *et al*, 2015). (See also the annex to this justification for details of injuries documented by the US Consumer Product Safety Commission, CPSC.)

Table 1 depicts the current inequity as well as the increased equity that will be achieved when bathtubs and showers are subject to the same principle about availability of points of control (usable by ones hands or feet) that are crucial to our stability in utilizing those portions of the means of egress that entail elevation differences, changes of slope, and changes in slip resistance. The current—at best—one point of control provided with typical bathtubs and showers (i.e., one foot in a stable placement on a slip-resistant surface) would be augmented by one point of control available reliably to one hand. This achieves equity of safety with stairs where we can count on one foot planted on a tread and one hand on a handrail. For some situations, involving bathtubs used for immersion bathing (with occupants seated or lying on the bottom of the tub) two points of control, utilizing grab bars, handrails or stanchions—one for each hand—are needed for this equity and, more practically, to accomplish the relatively difficult stand-to-sit and sit-to-stand transfers within the tub.

Size of the Problem with Bathtubs and Showers Compared to Other Large Problems. Figure 1, a pie chart, shows the approximate scales of the nonfatal injury problem for three dangers to building occupants. In the US, the traditional danger of fire-related injuries is far smaller than that from bathing/showering and even smaller in relation to stair-related injuries. Right now, in the I-Codes, the segment for bathing/showering is not addressed while many, many pages of the I-Codes deal with fire-related injury prevention. Again, the proposal for grab bars and other points of control to be provided equitably, will provide a major improvement to injury prevention that, heretofore, has been largely ignored in code development and in practice except in some hotel properties where no more than half of the grab bars, handrails or stanchions to be required under the new proposal are provided for bathtubs.

Figure 1. Comparing three dangers resulting in injuries in buildings

There is an inverse relationship between these epidemiological insights and the extent of coverage of the great dangers of stairs and baths/showers in building codes and housing codes plus leading healthy homes literature.

International Codes, Scientific/Technical/Policy/Managerial Perspectives

Precedent Set by NFPA Codes. The foregoing is the philosophical and epidemiological foundation for the proposed addition of requirements for grab bars, handrails and stanchions in Section 1003 of the IBC and, in future or elsewhere, in the I-Codes generally. There is also the precedent taken in NFPA 101 and NFPA 5000 in their 2018 editions where grab bars (alternatively poles which are given the more-technical name “stanchions” in this IBC proposal) were proposed and almost completely adopted (with the exception of health care, discussed below) for new bathtubs and showers in buildings regulated by these codes. The new requirements were mostly noncontroversial and it is hoped that the same will be true with the proposals now submitted to the I-Codes. The justification for the new requirements far outweigh the opposition to them as the ergonomic, biomechanics, epidemiological, etiological and economic aspects have been carefully considered and addressed to the satisfaction of many people who know building codes and safety standards well and whose votes on the many committees considering the issue attest to the multiple justifications for this new feature of building codes and safety standards.

Parallel Code Development Activity in Canada. A proposal, comparable to what NFPA has adopted, is being addressed by a Grab Bar Task Group for the National Building Code of Canada and, when its next cycle commences, will also be proposed for action by the ICC A117 Committee for a new section, on mainstreamed grab bar, handrail and stanchion features for the A117.1 standard. Leaders in the standards and codes field, conversant with the value of grab bars, handrails and stanchions have been discussing such mainstreaming since early 2016, at an international meeting of experts on bathing/showering safety held in Toronto and partly available for study in a free streaming video that is available with several other streaming videos addressing points of control, grab bars, cost-benefit issues, etc., that are all listed in the Bibliography provided with this proposal. So a lot of the groundwork has been laid and different perspectives have been elicited and discussed.

Survey of Existing Facilities. Centered on hotels, health care facilities**, airport airline club shower facilities*, and homes, the proponent for this code change has been conducting a personal, opportunity-based survey of bathing/showering facilities worldwide, including the following countries where his work on building use and safety has taken him in recent years or his work is followed by other professionals, including public health authorities.

- Canada**
- USA* **

- UK*
- Sweden**
- Finland
- Netherlands
- Italy
- Singapore*
- Australia**
- New Zealand
- Japan

The survey is documented in many hours of video and thousands of photographs plus many measurements, in residential occupancies, of three-, four-, five-piece bathrooms ranging in size from a few square meters (20 square feet) to spaces big enough to park an automobile, occasionally with tubs and showers almost that big. Generally, the more compact the bathroom, the easier it is to provide the needed points of control—and with very substantial cost savings.

Hotels Surveyed. They were operated by Marriott, Sheraton, Intercontinental, Holiday Inn, Best Western, Hyatt, Hilton in almost of the countries listed above. In some of them, meetings were held with hotel managers and those responsible for risk management.

Detailed Justifications for Specific New Sections in IRC

P2705.1 already has the heart of the proposal in its item 4, “Plumbing fixtures shall be usable.” The proposal simply fleshes this out with sufficient detail to implement this objective.

P2708. The new text, for the Section for Showers, clarifies, for Showers, that stanchions (sometimes termed “poles,” as in NFPA’s requirements) are equivalent to required grab bars of the conventional sort. It directs IRC users to a new P2726 for requirements.

P2713. 4. The new text, for the section on Bathtubs, directs users to a new P2726 for requirements.

P2726.1. This new text introduces the detailed requirements and clarifies that dimensions (taken at right angles to the grab bar or stanchion) are to the centerline of the device.

P2726.2. These detailed requirements, here for vertical points of control, are based on research findings and recommendations described below and are roughly similar to what NFPA adopted for the 2018 edition of NFPA 101 and NFPA 5000. They are also being considered currently for the National Building Code of Canada.

In these detailed requirements for the vertical points of control, the first things is to establish where within the plan of the bathroom, they will adequately serve users. This is based on Section R307 of the IRC which, along with Figure R307.1, sets the required minimum 21-inch (533 mm) clearances in front of fixtures (toilet, lavatory and tub), the areas through which bathers need to move reasonably unobstructed to access the tub and to exit the tub. The required points of control have to be within 12 inches (905 mm), measured horizontally, of these clear areas.

The dimensions shown here, plus the general superiority of vertical grab bars for ambulatory transfers, are based on extensive Canadian research over the last two decades as well as a meeting of US and Canadian experts in early 2016 that is partially available—for its presentations of Principle Investigators—on free streaming video (with links also provided in the Bibliography). An example of a vertical pole that is recognized as at least equivalent to the conventional vertical grab bar is shown in Figure 2, above, along with relevant discussion that supports the superiority of a properly installed stanchion which can be more easily positioned where the tub is most likely to be accessed. These dimensions are generally similar to what NFPA adopted for its 2018 editions of NFPA 101 and NFPA 5000. They are stated slightly

differently in the IBC proposal to take better account of bathtubs that do not have walls on one to three sides. As in the NFPA-adopted requirements, P2726.2.1.3(2) addresses the often-missed issue of a wall-mounted conventional, vertical grab bar interfering with the shower curtain getting a good seal on the end wall.

Figure 2. Demonstration set up of both conventional grab bars (nominally meeting the length and location criteria of proposed IRC requirements and a stanchion plus a horizontally-fixed section—like a handrail—of the same tubing used for the stanchion (both completely meeting the length, location and structural strength requirements of proposed IRC requirements (which are consistent with IBC, ICC A117.1 and NFPA requirements)

Besides aesthetic advantages, the stanchion and the full-tub-length bars /tubing are clearly superior in placement flexibility—as they do not require walls for attachment—and better performance for a wider range of users and uses including here, especially for the stanchion, serving a use that is not addressed in P2726 for stand-to-sit and sit-to-stand transfers for toilet users that might be a bonus benefit used more frequently than would be uses related to bathing and showering. This is especially the case in small, residential-use bathrooms such as serving hotel guest rooms, where (for space and plumbing efficiency reasons) often have bathtubs and toilets in close proximity. This is addressed further in the Cost Impact section of the justification.

Note that the straight tubing based stanchion and the horizontal bar/tubing are not held by mere compression fit; they are held by adhesive that is permanent and waterproof. The lower part of the stanchion was tested at sustained loads of 300 pounds of horizontal, shearing force without any indication of failure. Its fixing plate shear area exceeds the shear area of conventional grab bar screws by a factor of six and unlike the case for conventional grab bar screws there is no issue with water intrusion and corrosion as well as deterioration of the structural backing for the screws. (See the section below describing field observations of serious deterioration of conventional grab bars fixing details that are often not designed for water intrusion.) Here it should be noted that automobiles, today, utilize high-performance adhesives where, in the past, screws were the norm but these, and the necessary perforations in parts, performed poorly from a corrosion perspective. Water pumps as well as body panels and headlamp plus taillight assemblies are examples of how modern automobiles are built with waterproof, automotive-grade adhesives. Examples of greater use of modern adhesives are also found increasingly in building construction.

Here it must be emphasized that grab bars and stanchions have to be structurally installed; some of the products available in the marketplace, e.g., suction-cup grab bars—that have a temporary and precarious adhesion to smooth tiles—and compression-fit (via a jackscrew mechanism) temporary transfer poles do not meet the structural requirements imposed in the proposed new requirements, the same structural performance requirements applied—withstanding loads of 250 pounds—currently applicable to conventional grab bars in the IBC. In Figure 2, below, the photograph shows a demonstration bathtub-shower combination with a redundant set of both conventional (vertical and diagonal) grab bars and (vertical and horizontal, straight lengths of tubing fixed at their ends)—they easily meet the 250-pound structural load criterion.

P2726.2.2 Horizontal Grab Bar. As with the vertical grab bar, described above (for P2726.2.1), the dimensions and need for this second grab bar are based on Canadian research identified in the Bibliography and is addressed in the video of the presentation by Dr. Nancy Edwards, Principal Investigator of the early Canadian work which also addressed the option of a diagonal grab bar provided via the exception to 2726.2. Note that the base requirement covers installations where the bathtub is not enclosed on one or more sides with a wall. Such horizontal grab bars are intended for use by persons using the tub for immersion bathing which requires stand-to-sit and sit-to-stand transfers that utilize a horizontal or diagonal grab bar (and might also utilize a vertical grab bar or pole addressed by 27.2.1). 2726.2.2 permits horizontal handrails, which could be the same tubing used for the stanchion, to be used in a horizontal orientation. These could be longer (e.g., full tub length) than conventional, horizontal grab bars which need a parallel wall for support, unlike the horizontal tubing fixed between end walls only.

P2726.2.3. Vertical Grab Bar or Stanchion for Showers. Because of the variety of dedicated showers, especially in plan shape and size, this requirement is stated in a relatively flexible fashion relying more on a performance approach than specific dimensions, other than the minimum length and lower end position that takes into account various statures of users as well as the possibility there might be a seat in the shower. The inclusion of a stanchion takes into account the structural differences between bathtubs and free-standing showers; the latter would be good candidates for a stanchion positioned between the ceiling and the floor just outside the shower entrance.

2726.4. Other Details. Generally the requirements referenced here are based mostly on current requirements of ICC A117.1-2017 and with a new provision that addresses often-seen issues of water damage to conventional grab bars that range from the cosmetic to the catastrophic.

27.26.4.1 Cross Section. This is the same as ICC A117.1-2017 without an exception for noncircular sections which are rarely seen within bathrooms.

P2726.4.2. Spacing. This is based on a simplified version of ICC A117.1-2017.

P2726.4.3. Surface Hazards. This expands on a requirement, P2701.1.

P2726.5. Structural Characteristics. This is based on current requirements of ICC A117.1

2726.6. Design and Installation for Water. This last section is new and it addresses a serious problem with a non-trivial number of grab bars that have been seen in hotels, especially in the USA and Canada. Many are not designed, installed and maintained to address deterioration and corrosion problems with conventional, wall-mounted grab bars due to easy water intrusion and entrapment between conventional grab bar mounting plates and the covers fastened over them. Often, when water is entrapped here, there is no way for it to drain out, particularly from the lower portion of the enclosed space.

Problems Found in the Field with Conventional Grab Bars

Here follows some detail on what has been observed in the field on two large problems addressed in 2726.6 as well as in 2726.2.1.3(2).

During the course of his opportunity-based survey of grab bars provided for bathrooms in hotel guest rooms the proponent of this code change has found two problems with many installations.

The first, affecting over 50 percent of the surveyed bathtub-shower combinations, comes from placement of vertical grab bars underneath—and within a few inches horizontally of the end bracket for shower curtains. This makes sealing the shower curtain against the end wall of the bathtub-shower combination very difficult so that the danger of water getting outside the bathtub, on the adjacent floor is heightened unreasonably and needlessly. The proposed section

1003.8.2.1.3(3) addresses this problem as follows: “If attached to a wall, a grab bar or handrail shall be located inside the bathtub or combination bathtub-shower compartment and shall be no closer than 6 inches (152 mm), measured horizontally to the shower curtain rod.”

A much more worrying problem is found with a smaller percentage of conventional, wall-mounted grab bar installations, specifically grab bars which have cover plates over the screw plate onto which the tube of the grab bar is welded. There is invariably a space between the hole in the cover plate through which the tubing (grasped) portion of the grab bar passes and the tubing itself. Water can easily enter here and get trapped by the cover plate thus creating a pool of water and debris (hair, shampoo residue, etc.) from the showering process.

Aside from the hygiene problem here, there is a greatly heightened risk of two structural problems. One is water intrusion into the wall, around the fixing screws—typically two or three for each end of the grab bar, causing deterioration of the backing material so the screws become loose enough to be extractable with ones fingers. The second problem is equally worrisome especially as the quality of the steel used in (off-shore) grab bars is relatively poor in terms of corrosion of the screws and, less often, the mounting plates. The worst case seen recently had the heads of all the screws holding a grab bar so corroded that their heads were completely deteriorated and the grab bar could be pulled away from the walls with little force by one hand—clearly far, far less than the stipulated load of 250 pounds that codes in the US stipulate for structural strength.

The proponent has many photographs of these problems as well as a few videos showing how loose the grab bars have become due to corrosion as well as backing deterioration from water. One such photograph is provided in Figure 3, below; it is not the worst situation seen in the field.

Figure 3. Corrosion behind grab bar cover plate

Clearly such examples need to be addressed in several ways including stronger inspection by authorities and improved management of facilities. Improved design and manufacture of conventional grab bars would help too but, until that occurs, this proposal offers the stanchion options as well as mounting locations that keep the important “points of control” in relatively dry locations, for example at the exterior of a shower enclosure, but still near enough to the entrance to be usable from both outside and inside the enclosure. Proposed Section 2726.2.3 contains the provision, for the grab bar or stanchion to be located either interior to or outside of the shower compartment. . . .

Annexes

Annex 1: Representative sample of narratives of actual bathtub/shower-related injuries that led to US hospital emergency department visits, and for about one in ten of such visits led to hospital admission, **Annex 2,** (plus an additional 30 percent who went directly to hospital admission without an ED visit) in 2010. These are collected and published by the US Consumer Product Safety Commission (CPSC) National Electronic Injury Surveillance System (NEISS) and many more can be downloaded from the CPSC/NEISS Web site, <https://www.cpsc.gov/Research--Statistics/NEISS-Injury-Data>. Accessed January 8, 2018.

Annex 1: US CPSC NEISS: First 112 Sample Narratives (of 6,946 cases) for Product Code 0611 Injuries in 2010 - ER released w/wo treatment

(Product Code 611 covers bathtubs or showers including fixtures or accessories; excluding enclosures, faucets, spigots and towel racks)

41 YOM FRACTURED A RIB BY SLIPPING IN THE BATHTUB & FALLING AGAINST THE TOILET AT HOME.

53 YOF SUSTAINED A CONTUSION OF A SHIN BY BUMPING IT WHILE SHOWERING AT HOME.

18 YOF SPRAINED HER LOWER BACK BY FALLING IN THE SHOWER AT SCHOOL.

02 YOF SUSTAINED A LACERATION OF THE CHIN BY FALLING IN THE BATHTUB AT HOME.

18 YOF SUSTAINED A HEAD INJURY BY FALLING IN A SHOWER AT HOME.

80 YOM DISLOCATED A HIP BY LIFTING LEG IN SHOWER.

86 YOF SUSTAINED A LACERATION OF THE SCALP BY TRIPPING ON A RUG IN THE SHOWER AT HOME.

71 YOF SUSTAINED A HEAD INJURY BY FALLING FROM TOILET AGAINST THE BATHTUB AT HOME.

68 YOF SPRAINED AN ANKLE BY FALLING IN A SHOWER.

47 YOF FRACTURED A KNEE BY FALLING IN THE SHOWER AT HOME.

02 YOF SUSTAINED A LACERATION OF THE CHIN BY FALLING IN THE BATHTUB.

22 YOM SPRAINED A FOOT WHILE STEPPING OUT OF A SHOWER AT JAIL.

23 YOF SUSTAINED A CONTUSION OF A FOOT BY TRIPPING ON A RUG & STRIKING AGAINST A TUB AT HOME.

40 YOM SUSTAINED A LACERATION OF THE NOSE FROM BEING STRUCK BY THE SHOWER HEAD IN THE SHOWER AT HOME.

21 MOM RUPTURED AN EAR DRUM WITH A COTTON-TIPPED SWAB WHILE BATHING IN TUB AT HOME.

48 YOF SUSTAINED A CONTUSION OF THE NECK BY FALLING IN THE BATHTUB AT HOME.

04 YOF SLIPPED IN BATHTUB FELL AND INJURED FACE DX/ FACIAL LAC L KNEE STR

10 YOF FELL OUT OF SHOWER AND INJURED L KNEE. HAS ABRASION TO KNEE ALSO

80 YOF FELL IN SHOWER AT HOME HIT HEAD. DX/ HEAD INJURY

94 YOM SLIPPED AND FELL IN SHOWER AND HIT FACE ON FLOOR. DX/ FACIAL FX

55 YOM SLL LEG HEMATOMA

72 YOF CAUGHT FOOT IN TUB, INJURING LOWER LEG. NOW HAS HEMATOMA AND INCREASING PAIN.

22 YOF AT HOME FAINTED WHILE IN SHOWER AND FELL CUTTING FOREHEAD.

26 YOF SLIPPED AND FELL IN TUB DX: KNEE STRAIN

90 YOF GETTING OUT OF SHOWER WITH WALKER SLIPPED ON THE FLOOR AND HIT HEAD DX/ SCALP ABRASION

30 YOM SLIPPED AND FELL INTO TUB DX: CONTUSION TO BACK

51 YOF SLIPPED IN TUB AND HIT HEAD DX/ SCALP LAC

60 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO COCCYX

44 YOM FELL AND HIT ABDOMEN ON BATHTUB AT HOME. DX/ ABDOMINAL CONTUSION

04 YOM WITH CUT TO FACE FELL IN TUB DX: LACERATION TO FACE

51 YOF AT HOME FELL AT 5PM WHEN LOST BALANCE AND HIT L SIDE OF RIBS ON BATHTUB.

33 YOF SLIPPED AND FELL IN TUB DX: HEAD LACERATION

23 MOM FELL IN BATHTUB AT HOME AND HIT CHIN CAUSING LACERATION.

62 YOM WITH BACK PAIN FELL INTO TUB DX; CONTUSION TO LOWER BACK

63 YOF FELL INTO BATHTUB / NO INJURIES OR COMPLAINTS

54 YOM SLIPPED AND FELL IN TUB DX: RIB FRACTURE

02 YOM SLIPPED IN TUB AT HOME AND INJURED FACE DX/ CHIN LAC

25 YOF WITH CHEST PAIN AFTER FALL INTO TUB DX: CONTUSION TO CHEST

84 YOM FELL OUT OF SHOWER ON TO THE FLOOR AT HOME HIT HEAD DX/ HEAD INJURY

85 YOF SLIPPED AND FELL IN TUB AND HIT HEAD AT HOME DX/ HEAD INJURY

06 YOM AT HM WAS TAKING A BATH & SWIMMING IN TUB WHEN HE STRUCK HIS HEAD AGAINST FAUCET CAUSING HEAD LACERATION.

28 YOM AT HOME FELL IN SHOWER. WAS RESPONSIVE PER EMS.

26 YOF SLIPPED / FELL IN THE SHOWER DX: R EAR LAC. / HEAD & R SHOULDER CONTUSION

36 YOF THIS AM SLIPPED WHILE TRYING TO GET OUT OF BATHTUB AND LANDED ON BUTTOCKS.

28 YOF RIPPED FINGER NAIL OFF WHEN SLIPPED IN THE SHOWER AND THE NAIL BENT BACKWARDS.

26 YOF INJURED KNEE STEPPING OUT OF SHOWER DX/ RIGHT KNEE SPRAIN

50 YOM FELL IN BATHTUB AND HIT CHEST DX/ RIB FX

83 YOM CUT SCROTUM FELL IN TUB DX: LACERATION TO SCROTUM

71 YOF FELL OUT OF BATHTUB AT HOME AND HIT HEAD ON THE FLOOR DX/ HEAD INJURY

89 YOF FELL IN TUB HITTING HEAD DX: CLOSED HEAD INJURY

69 YOF WAS IN SHOWER AND FELL BACKWARDS STRIKING HER BACK.

08 YOF AT HOME LACERATED FACE ABOVE R ORBITAL. HIT HER HEAD ON SOAP DISH WHILE SHOWERING. NO LOC.

40 YOM SLIPPED AND FELL IN SHOWER AND INJURED CHEST. DX/ RIB FX

17 YOF FELL IN TUB HURT NECK DX: NECK STRAIN

23 YOM INJURED LOWER BACK BENDING OVER IN SHOWER AT HOME DX/ LUMBAR STRAIN

83 YOF FELL IN THE TUB AT ASSISTED LIVING AND INJURED SHOULDER DX/ RT SHOULDER CONTUSION

02 YOM HIT FACE ON BATHTUB AT HOME DX/ FACIAL LAC

74 YOM FELL AND HIT HEAD IN TUB DX: CONTUSION TO HEAD

85 YOF SLIPPED AND FELL GETTING OUT OF TUB DX: CONTUSION TO HIP

58 YOF SLIPPED AND FELL INTO TUB HIT HEAD DX: CLOSED HEAD INJURY

13 MOM AT HOME FELL IN BATHTUB AND HIT FOREHEAD AND MOUTH.

06 YOM SLIPPED IN BATHTUB AND HIT HEAD DX/ HEAD CONTUSION

78 YOM SLIPPED AND FELL IN TUB DX: LACERATION TO HEAD

08 YOM SLIPPED IN TUB TWISTED ANKLE DX: ANKLE STRAIN

51 YOF HIT HEAD ON SOAP DISH IN SHOWER 2 TIMES THIS WEEK HAS HEADACHE DX/ CONCUSSION

51 YOF SLIPPED IN SHOWER AND INJURED KNEE AT HOME DX/ RIGHT KNEE CONTUSION

83 YOM SLIPPED AND FELL IN THE SHOWER LAST NIGHT AND INJURED BACK DX/ BACK PAIN

31 YOM HIT EYE WITH TOWEL WHILE GETTING OUT OF THE SHOWER AT HOME DX/ RIGHT EYE CORNEAL ABRASION

24 YOF FELL GETTING OUT OF SHOWER HIT HEAD DX/ SCALP LAC

48 YOF SLIPPED IN SHOWER HIT HEAD + LOC DX/ HEAD INJURY

11 YOM SLIPPED IN SHOWER AND INJURED LEG. DX/ LEFT LEG CONTUSION

30 YOF SLIPPED AND FELL INTO TUB DX: CONTUSION TO HIP

18 MOM FELL IN TUB DX: LACERATION TO FACE

46 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO LOWER BACK

30 YOM CUT HAND ON BROKEN SOAP DISH AT HOME. DX// RIGHT HAND LAC

70 YOF SLIPPED AND FELL IN TUB DX: CONTUSION TO CHEST

31 YOM CUT THUMB ON SHOWER DRAIN THIS AM.

62 YOF SLIPPED IN THE SHOWER AND FELL ON THE FLOOR AT HOME DX/ LEFT WRIST SPRAIN

67 YOM FELL GETTING OUT OF SHOWER HIT HEAD ON TUB AT HOME DX/ SCALP CONTUSION

45 YOF PASSED OUT IN SHOWER AT GROUP HOME HIT HEAD. DX/ HEAD INJURY

04 YOF FELL IN BATHTUB AND HIT MOUTH DX/ LIP LAC

43 YOM SLIPPED IN BATHTUB AND INJURED KNEE DX/ LEFT KNEE CONTUSION

15 YOM TAKING SHOWER AND SHOWER DOOR SHATTERED AND PT FEET WERE CUT WITH THE GLASS AT HOME DX/ BILAT FOOT LAC

73 YOF AT 9AM TODAY WAS GETTING OUT OF TUB AND SLIPPED AND BUMPED L RIBS ON THE TUB. C/O RIB PAIN.

87 YOF BENT DOWN TO PUT SCALE AWAY FELL AND HIT INTO TUB AT HOME DX/ LEFT HIP CONTUSION22 YOM FELL IN TUB AT HOME AND INJURED CHEST DX/ RIB FX

40 YOF SLIPPED GETTING OUT OF BATHTUB AND INJURED LOWER BACK DX/ LOW BACK PAIN

34 YOM FELL AND HIT TUB DX: SHOULDER STRAIN

70 YOF SLIPPED FELL HIT CHEST ON SIDE OF TUB DX: CONTUSION TO CHEST

89 YOF SLIPPED AND FELL IN THE SHOWER LAST NIGHT AT NURSING HOME INJURED CHEST DX/ CHEST CONTUSION

44 YOM FELL IN TUB AND HIT CHEST DX.CHEST CONTUSION

36 YOF SLIPPED AND FELL IN TUB DX: LACERATION TO FACE

56 YOM CUT WRIST ON BROKEN SHOWER KNOB AT HOME DX/ LEFT WRIST LAC

88 YOF FELL AT HOME IN SHOWER AND HIT HEAD ON TUB DX/ SCALP CONTUSION

51 YOM SLIPPED AND FELL IN TUB DX: NECK STRAIN

23 YOM FELL IN BATH TUB AND INJURED CHEST DX/ CHEST CONTUSION

59 YOM FELL IN SHOWER AND INJURED SHOULDER DX/ LEFT SHOULDER FX

46 YOM HAD FALL HIT TUB DX: CONTUSION TO FACE

78 YOF FELL AT HOME AND HIT FACE ON BATHTUB DX/ FACIAL CONTUSION

29YOF WITH BACK PAIN AFTER FALL IN TUB DX: LOW BACK STRAIN

31 YOF FELL GETTING OUT OF TUB AT HOME INJURED FLANK DX/ FLANK CONTUSION

72 YOF AT HOME FELL WHEN SLIPPED ON URINE IN BATHROOM AND HIT HEAD ON SIDE OF BATH TUB.

19 YOF SLIPPED AND FELL INTO TUB DX: CONTUSION TO LOWER BACK

08 YOM FELL IN THE SHOWER AT HOME AND HIT EAR DX/ LEFT EAR LAC

62 YOM SLIPPED / FELL IN THE SHOWER. DX: RIB CONTUSION

09 YOF FELL IN TUB AND HIT LIP. DX/ LIP LAC

56 YOF WITH SHOULDER PAIN AFTER USING BATHBRUSH IN SHOWER DX: SHOULDER STRAIN

75 YOF AT HOME FELL OFF HASSOCK APPROX 30 MIN AGO HITTING HEAD AND L ARM ON BATHTUB. DENIES LOC.

62 YOF SLIPPED IN TUB HITTING FOOT DX: CONTUSION TO FOOT

04 YOM SLIPPED IN THE BATHTUB AND HIT CHIN DX/ CHIN LAC

34 YOM FELL IN THE SHOWER AT HOME INJURED BACK DX/ BACK SPRAIN

25 YOF + ETOH BAL 313 FELL IN SHOWER AND HIT HEAD DX/ HEAD CONTUSION

Annex 2: US CPSC NEISS: First 48 Sample Narratives (of 630 cases) for Product Code 0611 Injuries in 2010 - ER treated & Then Admitted to Hospital

(Product Code 611 covers bathtubs or showers including fixtures or accessories; excluding enclosures, faucets, spigots and towel racks)

89 YOF GETTING OUT OF THE SHOWER THE NEXT THING SHE KNEW SHE WAS ON THE FLOOR WITH HEAD AND SHOULDER INJURY; SHOULDER AND HEAD CONTUSION

69 YOM WAS WASHING HIMSELF IN SHOWER, FELL ONTO BLUNT PART OF BATHTUB, IMMEDIATELY HAD PAIN & TROUBLE BREATHING. DX - MULTIPLE RIB FXS

56 YOF SLIPPED IN THE SHOWER AND FELL FORWARD HITTING HER FACE & INJURING HER RT ARM- DX- MECHANICAL FALL W/ FRACTURE RT SHOULDER

78 YOF FAMILY FOUND HER ON THE FLOOR BETWEEN TOILET AND BATHTUB, SHE STATED SHE PASSED OUT WHEN SHE WAS IN SHOWER; SHOULDER INJURY

47 YOM HAD A WET SHEETROCK FALL ON HEAD WHILE IN SHOWER, +LOC, WAS CONFUSED. DX - BLUNT HEAD TRAUMA W/BRIEF LOC

62 YOM HAD A SYNCOPAL TODAY AT HOME IN THE SHOWER INJURING EYE AREA- DX- LACERATION TO FACE(EYE)

78 YOF PRESENT TO ER FROM HOME WHEN SHE WAS TAKING A BATH AND COLLAPSED - DX- CARDIAC ARREST, RESUSCITAED

43 YOM PRESENT TO ER AFTER HE WAS IN THE BATHTUB AND SLIP AND FELL GETTING OUT HITTING HEAD ON FLOOR- DX- BLUNT HEAD TRAUMA

81 YOM PRESENT TO ER AFTER A FALL IN THE SHOWER AT HOME TODAY INJURING THE HEAD AREA- DX- BLUNT HEAD TRAUMA

41 YOM FELL OUT OF SHOWER AT ASSISTED LIVING HOME YESTERDAY ONTO RT SIDE C/O RT HIP & RT LEG PAIN. DX - RT HIP FRACTURE

80 YOF TRYING TO GET OUT OF BATHTUB ACCIDENTLY FELL INJURED LOWER BACK; BACK CONTUSION AND AMBULATORY DYSFUNCTION

92 YOM PRESENT TO ER AFTER A FALL IN BATHTUB THIS MORNING INJURING RT HIP-DX- FRACTURE RT LOWER TRUNK (HIP)

88 YOF PRESENT TO ER AFTER A FAL IN BATH TUB AT SNF INJURING LT HIP- DX - FRACTURE LT LOWER TRUNK (HIP)

88 YOF WAS GETTING OUT OF SHOWER, FELT DIZZY & FELL STRIKING BACK OF HEAD ON FLOOR INJURING LT ARM. DX - SKIN TEAR LACERATION

88 YOF GETTING OUT OF BATHTUB THIS MORNING FELL TRIED TO BRACE HERSELF INJURED SHOULDER; SHOULDER FRACTURE

71 YOF WAS FOUND DOWN BY SON IN BATHTUB AT HOME, HAS INJURY TO LT EYE & FOREHEAD, IS REPETITIVE. DX - BLUNT HEAD TRAUMA, +ETOH

86 YOF LOST BALANCE WHEN SHE TURNED AROUND & FELL INTO BATHTUB C/O LOW BACK PAIN. DX - LOW BACK PAIN, POSS FX VS CONTUSION

80 YOF HUSBAND DID NOT WANT HER SMOKING IN HOUSE, WENT TO BATHROOM STOOD ON THE TOILET, OPENED WINDOW, SLIPPED BETWN TOILET/TUB; PELVIC FX

44 YOF FELL IN SHOWER TODAY SUSTAINING HEAD INJURY. DX - SCALP LACERATION

37 YOF SUSTAINED A MECHANICAL FALL IN SHOWER ONTO RT UPPER EXTREMITY, C/O RT SHOULDER PAIN. DX - RT DISTAL CLAVICLE FX

37 YOM HAD A GROUND LEVEL FALL IN BATHROOM STRIKING LOWER BACK ON BATHTUB. DX - SPINAL CONTUSION

84 YOF HAD SYNCOPAL EPISODE IN SHOWER AND FELL. DX: L 10TH RIB FX, INABILITY TO AMBULATE.

87 YOF FELL IN SHOWER. DX: RHABDOMYOLYSIS.

93 YOF FELL IN SHOWER AT ASSISTED LIVING. DX: L DISTAL HUMERUS FX.

79 YOM FELL IN SHOWER. DX: A FIB W/RAPID VENTRICULAR RESP, SYNCOPE, SDH, SAH, ELEVATED INR.

84 YOF FELL WHILE GETTING OUT OF BATHTUB SUSTAINING A FRACTURE TO HER LUMBAR SPINE

90 YOF SLIPPED IN BATHTUB AND GRAZED HEAD ON SHELF AT ASSISTED LIVING. DX: R KNEE STRAIN W/POSS INTERNAL DERANGEMENT, CLOSED HEAD INJURY.

82 YOF WITH NO INJ FROM FALL IN TUB

85 YOM WITH NO IN, FELL IN BATHTUB, ADMITTED FOR OTHER REASONS

52 YOM W/ALS FELL AND BECAME STUCK BETWEEN TOILET AND TUB. DX: RHABDOMYOLYSIS STATUS POST FALL, NASAL FX.

95 YOF FELL IN SHOWER SUSTAINING CHEST CONTUSION

71 YOF SLIPPED AND FELL IN SHOWER. DX: SYNCOPE, LARGE HEAD LAC, COAGULOPATHY, HYPOKALEMIA, LONT QT, ALCO

79 YOF FELL IN SHOWER SUSTAINING A FRACTURED KNEE

87 YOF WITH RIB FRACTURE FROM FALL IN TUB

79 YOM WITH LOWER BACK STRAIN FROM FALL IN SHOWER

81 YOF TURNED IN SHOWER AND FELL SUSTAINING A FRACTURED HIP

97 YOF FELL IN THE SHOWER AT NURSING HOME. DX: TRAUMATIC SDH, AGGITATION.

70 YOF FELL IN SHOWER AT HOME AND WAS UNABLE TO GET UP, SUSTAINED CHI, BACK CONTUSIONS

88 YOF FELL AGAINST BATHTUB AND WALL AT ASSISTED LIVING. DX: BACK/SHOUL PX, SYNCOPE, STAGE I THORACIC DECUBITUS ULCER, MULT OLD THORACIC FX'S.

88 YOF SLIPPED ON WET FLOOR GETTING OUT OF SHOWER AT NURSING HOME. DX: BACK CONT, PNEUMONIA, HYPOXEMIA, PLEURAL EFFUSION.

41YOF WITH NO INJURIES FROM FALL IN SHOWER, WAS ADMITTED

83 YOM FELL IN THE SHOWER. DX: TRAUMATIC ICH, FACIAL LAC, CONCUSSION W/O LOC, RENAL FAILURE.

94 YOM FELL GETTING OUT OF THE SHOWER AND HIT HEAD SUSTAINING A LACERATION

79 YOM FELL ON SIDE OF BATHTUB. DX: SYNCOPE, CHEST WALL CONT.

55 YOM SLIPPED AND FELL IN BATHTUB. DX: R HEMOTHORAX/PNEUMOTHORAX, MULT R RIB FX'S.

86 YOF FELL BACKWARDS INTO BATHTUB & HIT HEAD AT HOME DX: LACERATION TO SCALP/ ACUTE DEHYDRATED

95 YOF TRIPPED OVER THROW RUG WHILE GETTING INTO SHOWER AT HOME DX; AVULSION TO FACE/ MALIGNANT HYPERTENSION

53 YOF SLIPPED IN SHOWER AND FELL HITTING HIP ON TOILET AT HOME DX: STRAINED RIGHT HIP/ UNCONTROLABLE DIABETES

Bibliography: Bibliography

Approximately 50 internationally-produced scientific and technical references, on bathing/showering safety, were compiled by the proponent, in 2016, for an American Public Health Association (APHA) draft policy highlighting, especially two Canadian research studies that also are addressed in video presentations by Principal Investigators (Dr. Nancy Edwards, Dr. Alison Novak) for the research and posted, for free streaming viewing at, <https://vimeo.com/164239941> Accessed January 8, 2018. Additional videos covering technical aspects of bathing and showering safety (including cost impact and benefit issues*) are found at the following links (all of which are available, with descriptions, at www.bldguse.com, the proponent's Professional Practice Website, Accessed January 8, 2018.).

Bibliography Entries. The draft policy statement, for APHA consideration in 2016, was titled, "Improving Fall Safety and Related Usability of Bathrooms within Buildings through Safety Standards, Building Codes, Housing Codes and Other Mechanisms." (The numbers shown for this bibliography—in connection with the ICC code change proposal—are those used in the 2016 draft policy.)

Note that, given the source and the fairly standard format for scientific papers, this format departs from the suggested ICC format and logistics prevent converting the following to the ICC format.

Cost Impact: The code change proposal will increase the cost of construction

Cost Impact

The code change proposal will increase the cost of residential construction, but that increased cost pales in comparison to the benefits of enhanced usability and reduction of fall injuries, the majority of which occur in residential settings, especially homes.

The additional material in the form of conventional grab bars or poles plus their fixings is about 50 dollars per grab bar or pole (using *retail* prices for the components confirmed as recently as 2017) and with a conventional three-fixture bathroom with a bathtub there would be a need for two such grab bars or poles or one of each. Labor to install these would be about one hour for each. Thus an overall, installed cost is on the order of \$200 per bathroom. The service life would be on the order of two or more decades.

Against this added cost of an installed single grab bar or two per bathroom there are the ongoing benefits of enhanced normal (non-injury) uses which, for a typical US household for a 20-year period, for example, number about 7,000 per person or on the order of 20,000 per household. Those enhanced uses, with grab bars, have an economic value that is larger than the benefit of averted injuries from falls.

Currently without grab bars, our bathtubs and showers are the site of injuries serious enough to require professional medical attention at a rate, annually (using 2010 data) of about 1 million per 110 billion uses or about one in 110,000 uses. Every one of those non-injury uses has a value. By comparison, for stairs this ratio is about one professionally treated fall injury for every million flight uses in home settings and one such injury for every ten million flight uses in public settings where, under the IBC and more-detailed inspection procedures, stairs are nearly one order of magnitude safer than those nominally constructed under the IRC. See the video presentation by Jake Pauls to the April 2017 meeting, “The Impact of Building Codes and Standards in Public Health and Safety,” held in Melbourne, Australia, in connection with the 15th World Congress on Public Health. The streaming video containing this presentation, which includes the “Injury Pyramids” used for the above stair safety calculation, is available freely at <https://vimeo.com/239276202> (as listed in the first part of the Bibliography accompanying this proposal) accessed Jan 8, 2018.

The injuries-averted benefit, over twenty years, has a value, in 2010 dollars, about 6.5 times greater than the installation cost, based on the very reasonable assumption that half the falls are averted with the specified grab bars or poles. For the vertical poles that also enhance and make safer the use of toilets that, being adjacent to a bathtub, can serve stand-to-sit and sit-to-stand transfers for toileting, this benefit increases by about 35 percent to nearly 9 times greater than the installation cost. These projections are based on the injury economic data provided by the 2015 paper in the respected journal, *Injury Prevention*, by Lawrence, Spicer and Miller (see Bibliography for details).

The bottom line is that the benefits of both enhanced normal uses, in the tens of thousands per household over a 20-year period, combined with the benefit of averted injuries, is on the order of at least 20 or more times the cost of providing the grab bars, especially if they take the form of vertical poles serving bathtub-shower combination users as well as toilet users in a three-piece bathroom provision that is very common in homes and hotels, for

example. For hotels, while the lavatory sink(s) may be in a separate space, the toilet and bathtub-shower combination are usually close together so that a single pole can serve transfers for both. Thus the cost impact of grab bar or pole installations is very small in relation to the benefits and that cost of installation is very small in relation to the overall price of a dwelling unit or hotel guest room for example.

RP3-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Although this is a legitimate concern, to require these in every home is overkill. Stanchions might interfere with shower doors, clearances at water closets and other fixtures. Although this proposal is focused for areas in and around bathing fixtures, this topic is more aligned to be placed in building part of the code (Chapter 3). Perhaps the first step towards a future possible requirement for these bars is to require blocking to be installed for proper attachment of the indicated bar arrangements. Requirements for bar mounting blocking in manufactured plumbing fixtures (such as fiberglass shower and bathtub enclosures) needs to be addressed in the product standards for those products such as CSA B45.5/IAPMO Z124. (Vote:10-0)

RP3-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jake Pauls, representing Jake Pauls Consulting Services (bldguse@aol.com) requests As Modified by This Public Comment.

Modify as follows:

2018 International Residential Code

P2705.1 General. The installation of fixtures shall conform to the following:

1. Floor-outlet or floor-mounted fixtures shall be secured to the drainage connection and to the floor, where so designed, by screws, bolts, washers, nuts and similar fasteners of copper, copper alloy or other corrosion-resistant material.
2. Wall-hung fixtures shall be rigidly supported so that strain is not transmitted to the plumbing system.
3. Where fixtures come in contact with walls and floors, the contact area shall be water tight.
4. Plumbing fixtures shall be usable ~~including safety of users~~. Usability of showers, bathtubs and bathtub-shower combinations shall include safety of access to, bathing plus showering in accordance with R301.1, R306, R307, R308, R311, R320, P2701, P2708, P2713, and P2726, and egress from the facility achieved with provision of grab bars and stanchions in accordance with either R307 or the International Building Code, 2021, Section 1209.
5. Water closets, lavatories and bidets. A water closet, lavatory or bidet shall not be set closer than 15 inches (381 mm) from its center to any side wall, partition or vanity or closer than 30 inches (762 mm) center-to-center between adjacent fixtures. There shall be a clearance of not less than 21 inches (533 mm) in front of a water closet, lavatory or bidet to any wall, fixture or door.
6. The location of piping, fixtures or equipment shall not interfere with the operation of windows or doors.
7. In flood hazard areas as established by Table R301.2(1), plumbing fixtures shall be located or installed in accordance with Section R322.1.6.
8. Integral fixture-fitting mounting surfaces on manufactured plumbing fixtures or plumbing fixtures constructed on site, shall meet the design requirements of ASME A112.19.2/CSA B45.1 or ASME A112.19.3/CSA B45.4.

P2708.6 Grab Bars and Stanchions for Showers and Bathtub-Shower Combinations. Showers and bathtub-shower combinations shall ~~provide stanchions or similar vertically oriented, handholds typically not attached to walls, and grab bars in accordance with P2726~~ be provided with grab bars and stanchions in accordance with either R307 or the International Building Code, 2021, Section 1209.

P2713.4 Grab Bars and Stanchions for Bathtubs and Bathtub-Shower Combinations. Bathtubs and bathtub-shower combinations shall ~~provide~~ be provided with grab bars or stanchions in accordance with ~~P2726~~ grab bars and stanchions in accordance with either R307 or the International Building Code, 2021, Section 1209.

Commenter's Reason: (1) While there was much that was confusing, if not also mistaken, in the Columbus hearing of the IRC-P Committee, I have tried to apply what was constructively suggested by way of a fix to my proposal. That is to work toward a change that might only be fully implemented in 2019 in the Group B process. This will build upon technical requirements, first proposed for, a new Section 2726, to be proposed for Chapter 3, Planning, of the IRC.

(2) While building toward action in the Group B process in 2019, I am also building on what can be done in Group A during 2018. This relies on a separate public comment I have submitted for the addition of new requirements for bath/shower safety within Section 1209 of the IBC which refers, for scoping, to Chapter 29 which includes some bathroom scoping, requiring one bathtub or shower, for each one and two-family dwelling (Table 2902.1). Thus, within IBC Section 1209, Toilet and Bathroom requirements, I have submitted a public comment to relocate what was originally proposed for the Egress Chapter to Chapter 12 with some revisions based on the Egress Committee's comments in Columbus. This takes care of bath/shower safety in all contexts, i.e., including IBC buildings. Based on what was done in an earlier adoption, by NFPA 101 and NFPA 5000, 2018 editions, I provide exceptions for certain occupancies in Institutional Groups I-2 and I-3.

(3) For the IRC plumbing chapter, I have greatly simplified the originally proposed requirements in RP3-18, based on comments from the IRC Plumbing Committee as well as comments from the IBC Egress Committee to recognize what can be done in Group A deliberations this year and what remains to be done in Group B deliberations next year. Thus requirements in both the IBC and the IRC are referenced in the public comment on RP3-18, my original proposal.

(4) Turning to a point-by-point response to the IRC hearing commenters and Committee members, the Committee Reason statement for disapproval of RP3-18 was very disappointing with the boldly inappropriate statement (from industry testimony) that "to require these (grab bars and stanchions) in every home is overkill." It is disappointing not just because an uninformed and factually incorrect statement was repeated; it reflects badly on ICC and its "safety" mission statement implied in its Web URL.

(5) To claim that the modest proposal to seek some kind of equity with what is nominally required—without great protest from industry—was "overkill" is akin to the automobile industry and its regulators to claim that it is overkill for every automobile to have functioning brakes and steering systems — as if drivers were supposed to have the ability to drive safely lacking such basic prevention and mitigation systems not only provided in a basic fashion but with all the improvements made in recent decades with these automotive systems we have all come to take for granted; they function well and reliably.

(6) The ridiculous comment about "overkill" is far more apt when describing the toll of injuries—another topic that both audience testifiers and at least one committee member revealed major misconceptions. In my proposal substantiation I provided the annual toll, for the year 2010, of one million medically treated injuries that year for bath and shower-related injuries in the US. (See the section of the justification under the heading, "**The Problems To Be Solved with A New Requirement for Grab bars, handrails and stanchions.**" The annual societal injury cost of these injuries came to tens of billions of dollars for the US, again, for the year 2010. In the same section, I also noted that the risk per unit of time for exposure to the most dangerous aspects of showering and bathing—the transfers into and out of the facilities—exceeded the risk of stair-related fall injuries for comparable units of exposure—a few steps on a stair.

(7) Turning to something also noted in the Committee Reason statement but discussed very confusingly in the testimony and Committee remarks, we agree somewhat that Chapter 27 of the IRC is not the best place to have the detailed requirements for grab bars and stanchions needed to bring bathtubs and showers into parity with home stairs (for four or more steps in a flight) to have at least one handrail—and a inferior one at that due to the industry demands for oversized, hard-to-grip railings in homes. It was a strategic move on my part, as the proponent, to use the opportunity, in Group A hearings to open the debate about grab bars, etc. At least that offered an opportunity for some of the misinformation, within the committees and others, to come out to be corrected while there was time to get set up for Group B hearings in 2019.

(8) However, even here the inconsistency in arguments pose a problem. For example, it is inconsistent and very unhelpful for one of the acknowledged leaders among plumbing professionals to argue both that I needed to collaborate with the plumbing industry—who this leader claimed had been working on slipping and grab bar issues for decades—but also to be told that the plumbing section of the IRC, Chapter 27, was the wrong place to deal with grab bars, etc. They claimed it should be left to other professionals to work this into Chapter 3 of the IRC dealing with spatial planning. How can this be? And how can I be blamed, as I was for not working with the plumbing industry standards committees—as if I, with 15 committee memberships already in the US alone, was delinquent for not working closely with the plumbing industry that has done a dreadful job with providing slip-resistant bathtubs and shower pans, let alone doing nothing about grab bars, etc., despite reportedly working on these matters intensively for decades?

(9) Those industry professionals knew months before the hearings that I had submitted proposal RP3-18 but they did nothing to contact me. They knew, or should have known, from my proposal justification available early in 2018, that I had produced several videos that dealt authoritatively and effectively with issues of slipping in industry-provided slippery bathtubs and showers and I have championed both conventional and unconventional points of control for baths and showers based on extensive research evidence. Why did they not contact me before, or even after the hearings in Columbus about the committee meetings that I, according to them, should be attending to meet with industry authorities? Moreover, why was I accused of not working with ICC/ANSI A117 about grab bars when I brought key leaders of that Committee together to discuss points of control and bath/shower slipping issues a few years ago in my role as the longest serving individual member of A117?

(10) Turning to other aspects of the hearing as reflected in the Committee Reason for disapproval, BLOCKING was noted as the "first step towards a future possible requirement for these bars." This statement makes as much sense as providing all new cars with brake drums and brake fluid connections with the engine but not providing the brake pedal and connection to the power braking and ABS system in the engine compartment. Alternatively provide power steering but no steering wheel. Of course blocking alone is an nonsensical, ineffective way to stop falls in baths and showers as if we are to be comforted by the hidden blocking somewhere behind the tile surface of the bath/shower enclosure. Notably, blocking requirements for walls are ineffective if, as is increasingly the case, there are no walls around the bathtub or the shower walls are flimsy plastic where any post-installation holes in the enclosure destroy the water protection provided to the surrounding structure. Blocking alone has never saved anyone from a loss of balance becoming a serious fall. Experts on bath/shower-related falls agree there is nothing as effective as universal provision of grab bars or equivalent devices **before** a bath or shower is first used.

(11) Finally, it is without any evidence of a major problem for someone to claim that "stanchions might interfere with shower doors, clearances at water closets and other fixtures." I have had a stanchion installed in my 5 by 7-foot bathroom for a long time, mounted above the middle of the access-side, tub wall. It has never interfered with other bathroom functions. I have also stayed in many hotel guest rooms worldwide (averaging over 100 hotel nights annually) where, increasingly, hotels are replacing bathtubs with dedicated showers (with and without doors) in their predominantly glass, full-length or half-length panels. In no case I have examined would a functionally placed stanchion interfere with a door or with access to/from the shower or to/from the water closet that is very commonly placed adjacent to the shower. I have shot photos of almost all of these guest room bathrooms. Some mock up a stanchion doing double duty for shower access/egress as well as toilet use which for 75-year knees like mine poses increasing difficulty and danger without the vertically oriented stanchion within easy and effective reach.

(12) I am looking for some intelligence from those returning to this topic in Richmond and in hearings next year when the proposal for grab bars to be addressed in IRC Section 307 comes up. In the interim, if not for Richmond, please read the lengthy justification, with its many, many scientific references before we once again address this critically important public health issue. Also please view the free streaming videos at my Web site to see how to solve the slipping problems not only within bathtubs and showers but on the adjacent bathroom floor. It turns out the the most important thing plumbers deal with—water—is not your enemy when bathing and showering; it can indeed be your friend and a much more reliable one at that than were the statements of professionals who testified in Columbus on RP3-18.

(13) **Postscript about Reason Statement.** I am leaving my original proposal Reason Statement untouched from what was submitted in January. This means that "poles" are still referred to in some places where, now, the preferred standard term is "stanchions," for which a definition has been proposed for NFPA codes, as follows: "A fixed, generally upright bar or pole used as a support when grasped by a hand." Stanchions have a long history in transportation vehicles, dating back likely earlier than conventional grab bars.

Bibliography: The originally submitted Bibliography provided with my proposal is still effective for this comment.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction. The cost impact provided with the original proposal stands for this public comment as there was no criticism from testifiers or the Committee about this in the original proposal.

RP3-18

RP10-18

IRC: P2905.3

Proposed Change as Submitted

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

2018 International Residential Code

Add new text as follows

P2905.3 Hot water supply to fixtures. The developed length of hot water piping, from the source of hot water to the fixtures that require hot water, shall not exceed 50 feet (15 240 mm). Water heaters and recirculating system piping shall be considered to be sources of hot or tempered water.

Reason: This change adds a new section to limit the hot water supply line length from the source of hot water to the fixtures that require hot or tempered water. This provision is replicated from existing IPC Section 607.2. Hot water supply lines greater than 50 feet waste water (proportional to pipe size) while occupants wait for hot water to reach fixtures for bathing, washing and culinary purposes. Even though hot water supply lines are insulated, the hot water remaining in the lines between demand periods cools down. Limiting the length and consequent volume of heated water in the supply lines reduce the amount of wasted water and occupant waiting time.

Cost Impact: The code change proposal will not increase or decrease the cost of construction. Cost is based on proximity of hot water source to point of use.

RP10-18

Public Hearing Results

Committee Action:

As Modified

Committee Modification: P2905.3 Hot water supply to fixtures. The developed length of hot water piping, from the source of hot water to the fixtures that require hot water, shall not exceed ~~50~~ 100 feet (~~15-240 mm~~). Water heaters and recirculating system piping shall be considered to be sources of hot or tempered water.

Committee Reason: For the Modification: 100 feet is a more feasible threshold than 50 feet.
For the Proposal: Sustainability goals are important. The code needs to provide clear direction that the fixtures cannot be too far away from the hot water source. (Vote:6-4)

Assembly Action:

None

RP10-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov) requests As Modified by This Public Comment.

Further modify as follows:

2018 International Residential Code

P2905.3 Hot water supply to fixtures. The developed length of hot water piping, from the source of hot water to the fixtures that require hot water, shall not exceed 75 ~~100~~ feet . Water heaters and recirculating system piping shall be considered to be sources of hot water.

Commenter's Reason: The 100 foot maximum length approved by the committee is twice the maximum length of 50 feet that exists in the IPC for commercial buildings. This modification reduces the maximum length to 75 feet as a reasonable limit for the average size single family home of 2600 square feet.
This change provides a simplified approach to reducing water that is wasted while waiting for hot water, conserve energy and provide convenience for homeowners. The modification provides clear direction for designers and builders in considering the location of the hot water source with respect to plumbing fixtures.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
Cost is based on the floor plan layout and proximity of hot water source to point of use.

Public Comment 2:

Proponent: DONALD SURRENA, NATIONAL ASSOCIATION OF HOME BUILDERS, representing National Association of Home Builders (dsurrena@nahb.org) requests Disapprove.

Commenter's Reason: Modification was 100 feet, but from where? This will be a compliance problem for inspection and plan review. There is no guidance for how to measure or exactly what to measure. Is it 100 ft. for each branch or is it cumulative 100 ft. for all branches?

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction
This will only complicate the inspection and plan review, which may increase the departmental cost of review and inspection.

Add new text as follows

SECTION P3110 SOIL GAS VENT PIPING

P3110.1 Scope. The provisions of this section shall govern the materials, construction, and installation of soil gas vent pipe and connectors.

P3110.2 Soil gas vent pipe. A gas-tight pipe of 3-inch [76 mm] nominal size or larger shall be extended from below the slab or crawl space through the interior of the building and exit the roof. The pipe shall be centered in a cylindrical space which is located in the attic below the roof, is not adjacent to an eave or wall, and has a vertical height of not less than 48 inches [122 cm] and diameter of not less than 21 inches [53 cm]. Materials used shall comply with Section P3002.

P3110.2.1 Soil gas vent pipe termination. The vent pipe shall terminate vertically upward not less than 12 inches [305 mm] above the roof in a location not less than 10 feet [3048 mm] away from any window, air intake, or other opening into the conditioned spaces of the building that is less than 2 feet [610 mm] below the exhaust point. The vent pipe shall terminate not less than 10 feet [3048 mm] from window or other opening in adjoining or adjacent buildings.

P3110.3 Soil gas vent pipe connector. A tee fitting or equivalent method shall be installed to secure the soil gas vent pipe to the perforated piping or geotextile matting from which soil gas is collected.

P3110.3.1 Crawl spaces. In a building with a crawl space, a soil gas vent pipe connector shall be installed with not less than 10 feet [3048 mm] of perforated pipe or geotextile matting connected to each of the two horizontal openings of the connector. The connector and pipe or geotextile matting shall be located below a soil gas membrane complying with ASTM Class A, B, or C.

P3110.3.2 Slab-on-grade and basements. In buildings with a basement or slab-on-grade, a soil gas vent pipe connector of 4-inch [102 mm] nominal diameter shall be installed with not less than 4 feet [1219 mm] of perforated pipe or geotextile matting connected to each of the two horizontal openings of the connector.

P3110.3.3 Drain tile systems. Where an interior drain tile system is present, the two horizontal openings of the soil gas vent pipe connector shall be connected to the drain tile system.

Reason: Chapter 31 governs the piping, tubing and fittings for vents in one- and two-family dwellings. Soil gas vents are commonly installed by plumbers yet there is no information about soil gas vents in Chapter 31 or elsewhere in the plumbing sections of the IRC. Sections 401 through 701 of *ANSI AARST CCAH-2013, Reducing Radon in New Construction of One and Two Family Dwellings* describe the pipe-related (and other) requirements for soil gas vents. This proposed code change concisely adds the standard's requirements for such vents, which will ensure that plumbers have the correct information within the IRC plumbing chapter on vents. This change does not add a requirement to provide a soil gas vent but rather delivers the specification for how to provide one when a building project requires one.

Bibliography: [ANSI AARST CCAH-2013, Reducing Radon in New Construction of One and Two Family Dwellings] [AARST Consortium on Radon Standards] [2013] [<http://aarst-nrpp.com/wp/america-national-radon-standards/>]

Cost Impact: The code change proposal will not increase or decrease the cost of construction. The provisions are not required for every home. They only apply to homes where the builder or buyer includes soil gas vent pipe.

RP13-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This doesn't belong in the plumbing chapters because it is not plumbing. These requirements would increase the cost of construction. (Vote:10-0)

Assembly Action:

None

RP13-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Jane Malone, representing American Association of Radon Scientists and Technologists, American Lung Association, Cancer Survivors Against Radon (CanSAR), Citizens for Radioactive Radon Reduction, National Center for Healthy Housing (jmalone@aarst.org) requests As Modified by This Public Comment.

Modify as follows:

2018 International Residential Code

SECTION P3110 SOIL GAS VENT PIPING

P3110.1 Scope. ~~The provisions of this section shall govern the materials, construction, and installation of soil gas vent pipe and connectors shall be in accordance with the requirements of Sections P3110.2 through P3110.3.3.~~

P3110.2 Soil gas vent pipe. A gas-tight pipe of 3-inch [76 mm] nominal size or larger shall be extended from below the slab or crawl space through the interior of the building and exit the roof. ~~The, with a slope not less than 1/8 inch per foot (10 mm/m). In the attic, the pipe shall be centered in a cylindrical space which is located in the attic below the roof, is not adjacent to an eave or wall, and that~~ has a vertical height of not less than ~~48-36~~ inches [122-91 cm] and diameter of not less than 21 inches [53 cm]. Materials used shall comply with Section P3002.1(1).

P3110.2.1 Soil gas vent pipe termination. The vent pipe shall terminate vertically upward not less than 12 inches [305 mm] above the roof in a location not less than 10 feet [3048 mm] away from any window, air intake, or other opening into the conditioned spaces of the building that is less than 2 feet [610 mm] below the exhaust point. The vent pipe shall terminate not less than 10 feet [3048 mm] from any window or other opening in adjoining or adjacent buildings.

P3110.3 Soil gas vent pipe connector. A tee fitting or equivalent method shall be installed to secure the soil gas vent pipe to the vertical opening and to the perforated piping or geotextile matting from which soil gas is collected.

P3110.3.1 Crawl spaces. In a building with a crawl space, a soil gas vent pipe connector shall be installed with not less than 10 feet [3048 mm] of perforated pipe or geotextile matting connected to each of the two horizontal openings of the connector. The connector and perforated pipe or geotextile matting shall be located below a soil gas membrane ~~complying with ASTM Class A, B, or C.~~ constructed of polyethylene sheeting not less than 10 mil in thickness.

Commenter's Reason: This code change proposal as modified by public comment will help to ensure oversight by code officials and reduce problems caused by incorrectly installed radon pipe.

Vents are the subject of Chapter 31 of the IRC, yet there is no information about soil gas vents in Chapter 31 (or elsewhere in the plumbing sections of the IRC or elsewhere in the body of the IRC). The proposed code change would supply the standard requirements for such vents, in the same code section as other vents, to help ensure that code officials have the correct information in jurisdictions where radon features are being installed yet Appendix F is not in effect.

Under the proposed P3110.1 Scope, the comment amends the original proposal to clarify that the language that follows only applies where a radon system is installed voluntarily: "The installation of soil gas pipe shall be in accordance with" the subsequent requirements. The height of the attic space in proposed P31110.2 is corrected from 48 inches to 36 inches. The comment also fixes editorial issues and adds pipe slope, and replaces an incomplete ASTM reference with more general language.

Cost Impact: The net effect of the public comment and code change proposal will increase the cost of construction

The proposed new code section will increase the cost of construction where soil gas vent piping is provided. The additional cost would be \$39-70 for materials (10-20 feet of 4" perforated pipe or matting (\$10-20), 10-36 feet of 3" piping (\$14-35) and one tee fitting (\$15)) and a minimal labor cost component to install the pipe.

Public Comment 2:

Proponent: Michael Cudahy, representing self (mikec@cmservices.com) requests As Submitted.

Commenter's Reason: Having some information in the residential code on these life safety radon venting systems is a good inclusion, and we see no technical justification for rejection. It does no harm to the code, it improves awareness.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

If a radon system is required or not is not determined by this code language. Therefore, it will not alter costs of construction.

RP13-18

RP16-18

IRC: Appendix U (New)

Proposed Change as Submitted

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)

2018 International Residential Code

Add new text as follows

AU101.1 Scope. This appendix shall apply to:

1. New buildings.
2. Additions to existing buildings.
3. Alterations to existing buildings.

SECTION AU102 DEFINITIONS

AU102.1 General. The following words and terms, for purposes of this appendix, shall have the meanings shown herein. Chapter 2 shall be referred to for general definitions.

Add new definition as follows

AUTOMATIC. Self-acting, operating by its own mechanism when actuated by some impersonal influence, such as a change in current strength, pressure, temperature, or mechanical configuration.

AUTOMATIC IRRIGATION CONTROLLER. A timing device used to remotely control valves that operate an irrigation system.

REGENERATION. The maintenance process that restores a medium in a system so that it can continue to perform its water treatment function.

RUNOFF. Water that is not absorbed by the soil or landscape to which it is applied and flows from the landscape area.

SUBMETER. A meter installed subordinate to a utility service meter.

WATER SOFTENER. A pressurized water treatment device in which hard water is passed through a bed of cation exchange media (either inorganic or synthetic organic) for the purpose of exchanging calcium and magnesium ions for sodium or potassium ions, thus producing a softened water that is more desirable for laundering, bathing, and dishwashing.

AU103 PLUMBING FIXTURES AND FIXTURE FITTINGS

AU103.1 Maximum flow and water consumption. The maximum water consumption flow rates and quantities for plumbing fixtures and fittings shall be in accordance with Table AU103.1.

**TABLE AU103.1
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS^b**

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	1.5 gpm at 60 psi
Shower head ^a	2.0 gpm at 80 psi
Sink faucet ^c	1.8 gpm at 60 psi
Water closet	1.28 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa

- a. A handheld shower spray shall be considered to be a shower head.
- b. Consumption tolerances shall be determined from referenced standards.
- c. Kitchen faucets shall be permitted to have a temporary increase in flow to not exceed 2.2 gpm provided that upon either the user's physical release of the increased flow activation mechanism or the user's closure of the faucet valve, the faucet reverts to the flow indicated in the table.

AU104 WATER SOFTENERS AND TREATMENT DEVICES

AU104.1 Water softeners. Water softeners shall be listed and labeled in accordance with NSF 44 and shall comply with Sections AU104.1.1 through AU104.1.3.

AU104.1.1 Demand-initiated regeneration. Water softeners shall be equipped with demand-initiated regeneration control systems. Such control systems shall automatically initiate the regeneration cycle after determining the depletion, or impending depletion, of softening capacity.

AU104.1.2 Water consumption. Water softeners shall have a maximum water consumption during regeneration of 4 gallons per 1,000 grains of hardness removed as measured in accordance with NSF 44.

AU104.1.3 Salt efficiency. Water softeners shall have a rated salt efficiency of not less than 4,000 grains of total hardness exchange per pound of salt, based on sodium chloride equivalency.

AU104.2 Reverse osmosis water treatment systems. Point-of-use reverse osmosis systems shall be equipped with an automatic shutoff valve that prevents the production of reject water when there is no demand for treated water.

AU105 AUTOMATIC IRRIGATION SYSTEMS

AU105.1 Automatic irrigation controllers. Where installed as part of a permanent landscape irrigation system, irrigation controllers shall regulate irrigation based on weather, climatological, or soil moisture status data. The controller shall have an integrated or separate sensor to suspend irrigation events during rainfall.

AU105.2 Misdirection and runoff prohibited. Automatic irrigation systems shall not direct water onto building exterior surfaces, foundations, exterior paved surfaces, or adjoining lots. Systems shall not generate runoff.

AU105.3 Landscape water measurement. A submeter shall be installed to separately record the volume of all water supplied to an outdoor landscape with an irrigated area of 5,000 square feet or greater served by an automatic irrigation system.

Exception: Where a utility service meter is installed to record the volume of all water supplied to the landscape through a service connection dedicated to irrigation.

Reason: This proposal adds a short, voluntary appendix to the IRC containing requirements that will enhance the water efficiency of dwellings subject to the code. The language of this appendix is NOT mandatory unless, and to the extent, specifically referenced in the adopting ordinance or regulation of the jurisdiction. The purpose of the proposal is to offer enhanced water efficiency provisions applicable to one- and two-family homes in code language for consideration by jurisdictions using the IRC. The ICC offers enhanced or "stretch code" provisions for large buildings in the International Green Construction Code (IgCC), but the IgCC does NOT apply to low-rise residential buildings. The ICC also offers "green" building standards for residential buildings of all sizes in ICC 700, the *National*

Green Building Standard. However, ICC 700 is a points-based rating system, NOT code language, and the practices in its chapter on water efficiency are not mandatory. This new appendix will fill this gap, allowing jurisdictions that customarily use the IRC the opportunity to consider enhanced water efficiency requirements in familiar code format.

The proposal is intentionally brief, focusing on three areas of water consumption where enhanced performance criteria are well-known, and that together are responsible for the great majority of single-family residential water use in nearly all jurisdictions -- plumbing products, water softening, and landscape irrigation.

* Plumbing products: Requirements are based on performance levels established by the US EPA *WaterSense* Program for water closets, lavatory faucets, and showerheads, and by the 2016 California Green Building Standards Code (CalGreen) for kitchen faucets. These provisions are all found in IgCC 2015 as well, in Table 702.1, applicable to residential occupancies covered by that code.

* Water softeners and treatment devices: These requirements for water use and salt efficiency (an important consideration for maintaining water quality and the ability to beneficially recycle municipal wastewater) were all included in section 704 of IgCC 2015, and are adopted here for applicability to the one- and two-family homes covered by the IRC. Water consumption during regeneration and salt efficiency are considered "elective performance claims" under NSF 44, and must be verified by test procedures laid out in section 711 of that standard. The requirements for demand-initiated regeneration and salt efficiency have been mandatory requirements for all residential water softeners installed in California since 2002.

* Automatic irrigation systems: These requirements are also drawn from the IgCC, where landscape metering requirements are specified in section 701.2.1 and other irrigation system requirements are laid out in section 404.1.2. Although the IgCC requires separate metering for irrigated landscapes of all sizes, a less stringent requirement may be appropriate for single-family residences. This proposal limits the metering requirement to residential landscapes of 5,000 square feet or more, the threshold of applicability for landscape metering contained in the California Code of Regulations, Title 23, Chapter 2.7, also known as the Model Water Efficient Landscape Ordinance (MWELO). MWELO also requires that irrigation controllers in all newly permitted landscape installations in California be either weather-based or soil moisture sensor-based, as required in this proposal. Note that the requirements of section AU105 are only applicable to permanent irrigation systems with automatic controls, and have no applicability to hose-end sprinklers.

Terms that are not otherwise defined in the IRC are included in a definitions section of the appendix. The definitions have been drawn variously from the IgCC, MWELO, the IAPMO Green Plumbing and Mechanical Code Supplement, and NSF 330.

It should be noted that when considering this voluntary appendix, adopting jurisdictions are free to adopt the appendix in its entirety, but may adopt any individual provision of their choosing that they find most relevant to local conditions and most practical for enforcement. Each element of the proposal stands on its own. The scope of the proposal has also been drafted in such a way as to highlight its applicability to project types (new buildings, additions to buildings, and alterations) and allow adopting jurisdictions full latitude to narrow the scope in that regard should they so choose.

Each successive year brings new evidence of the impacts of our changing climate, and significant among these impacts are greater extremes and frequency of both droughts and floods. The hydrological record of the last 100 years has become less useful as a predictor of water supply reliability. Few can doubt that efficient water use will become even more important in the decades ahead than it is today. Residential water use typically constitutes 60 to 65% of all publicly supplied drinking water, and the majority of residential use is found in single-family homes. For all these reasons, the IRC would be made more valuable to jurisdictions throughout the country if it included enhanced water efficiency criteria in clear code language for voluntary adoption.

US Environmental Protection Agency, *WaterSense* Program, www.epa.gov/watersense/technical-specifications

Cost Impact: The code change proposal will not increase or decrease the cost of construction

The proposal offers enhanced water efficiency specifications for voluntary adoption by jurisdictions using the IRC. As such, there is no general impact on users of the IRC.

The content of this voluntary appendix establishes enhanced efficiency criteria for plumbing products, water softeners, and certain landscape irrigation equipment.

Regarding plumbing products, products are widely available from multiple manufacturers. Based on US EPA *WaterSense* product listings, as of September 2017 there are over 3,100 models of tank-type toilets, over 15,000 models of lavatory faucets, and nearly 6,000 models of showerheads that meet the criteria in this proposal. Although prices for plumbing products vary widely, based on considerations of style, color, and trim, there is no price premium attached to higher water use efficiency *per se*. See, for example, the staff reports of the California Energy Commission on standards for lavatory faucets and showerheads that found no price premium for products performing at the level proposed in this voluntary appendix.

Regarding water softeners, costs vary widely, but much of this difference is due to capacity, rather than efficiency of performance. The key criteria in this proposal have been statewide requirements for residential water softeners in California since 2002. As such, compliant products are widely available from multiple manufacturers. By way of illustration, as of this writing, the least expensive residential cation exchange water softener now available from Lowes fully complies with all criteria in this proposal (http://pdf.lowes.com/installationguides/090259891214_install.pdf), as does the least expensive cation exchange water softener available from Home Depot (<https://www.homedepot.com/b/Kitchen-Water-Filters-Water-Softeners/N-5yc1vZaq3y/Ntk-semanticsearch/Ntt-water+softener?NCNI-5>).

Regarding irrigation controllers, prices also vary widely, with a major driver being the number of zones controlled by the controller. Some 800 models of irrigation controllers have been certified to the *WaterSense* specification for weather-based irrigation controllers, so supply and choice of compliant products are ample. Smart controllers are now required for all newly permitted landscape installations in California, ensuring continued competitive interest in this product area. The prevailing price differential between a timer-based controller and a smart controller meeting the criteria of this proposal has been around \$100. But several products are on the market that cut this differential in half, and at least one weather-based irrigation controller is now on the market at a price comparable to a timer-based controller.

When products meet enhanced criteria for water efficiency, costs are typically recouped by savings on water and/or sewer charges over the life of the product. According to the *2016 Water and Wastewater Rate Survey*, over the last decade, water charges have annually increased by 5.34 % and wastewater charges have annually increased by 5.98 %, far exceeding the annual inflation rate of 2.07 % for that period. These trends are expected to continue, underscoring the cost-effectiveness of installation of water-efficient products.

RP16-18

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Even though this would be an "above code" appendix, there is concern that if a jurisdiction adopts, there could be drainage (sewer) problems with lesser flows being discharged. Discussions about lowering flow rates in the body of the code raised similar concerns. (Vote:6-4)

Assembly Action:

None

RP16-18

Individual Consideration Agenda

Public Comment 1:

Proponent: Craig Conner, representing self (craig.conner@mac.com) requests As Modified by This Public Comment.

Replace as follows:

2018 International Residential Code

APPENDIX U Water Efficiency

AU101.1

Maximum flow and water consumption.

The maximum water consumption flow rates and quantities for plumbing fixtures and fitting shall be in accordance with Table AU101.1.

TABLE U101.1
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

<u>PLUMBING FIXTURE OR FIXTURE FITTING</u>	<u>MAXIMUM FLOW RATE OR QUANTITY</u>
<u>Lavatory faucet</u>	<u>1.5 gpm at 60 psi</u>
<u>Shower head^a</u>	<u>2.0 gpm at 80 psi</u>
<u>Sink faucet^c</u>	<u>1.8 gpm at 60 psi</u>
<u>Water closet</u>	<u>1.28 gallons per flushing cycle</u>

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa

a. A handheld shower spray shall be considered to be a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Kitchen faucets shall be permitted to have a temporary increase in flow to not exceed 2.2 gpm provided that upon either the user s physical release of the increased flow activation mechanism or the user's closure of the faucet valve, the faucet reverts to the flow indicated in the table

Commenter's Reason: The faucet flow rate, shower head flow rate, and water closet flush volumes in the table are broadly available with no incremental cost. This is a good option for any jurisdiction that has water availability issues, or water treatment volume issues. Using efficient fixtures and fittings is far less expensive than building new facilities or otherwise trying to supply water for new construction.

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

These fixtures and fittings are broadly available as a no cost option, therefore this change will not increase or decrease the cost of a new home.

For municipalities with water supply shortages, water pumping volume limitations or water treatment volumes issues this may limit their future costs. In addition water supply, water pumping and wastewater treatment are usually the largest municipal energy costs. This change may help moderate those costs.

Public Comment 2:

Proponent: Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org) requests As Submitted.

Commenter's Reason: State and local code officials would be better served if this proposal is adopted as submitted. The proposal consists of a brief voluntary appendix containing several water efficiency measures in code language, specifically for plumbing products, water softeners, and certain landscape irrigation equipment. Each of these measures has been previously approved by the ICC voting membership in the adoption of successive editions of the International Green Construction Code. However, the IgCC is applicable to large building projects, not the one- and two-family homes covered by the IRC. IAPMO offers a compendium of above-code water efficiency measures for voluntary code adoption applicable to single-family construction, but there is no parallel in the ICC family of codes. Thus this proposal fills a gap, for the benefit of state and local jurisdictions that customarily use the IRC. The technical committee offered no explanation for maintaining the availability of voluntary water efficiency code language for large projects covered by the IgCC, but their recommended denial of publication of similar voluntary provisions in the IRC.

In its reason statement, the committee speculated about drainage flows in sanitary collection systems, which is a utility-specific issue that jurisdictions considering adoption of the appendix can consider through local review and public comment. The provisions in the appendix are well known for reducing unnecessary or excessive water use. The US Geological Survey recently reported that residential water use in the US was 82 gallons per capita per day in 2015. The proposals in the appendix relating to plumbing fixtures could, on average, reduce per capita indoor water use by about 8 to 10 gallons per day, leaving ample discharges for sanitary collection and transport of waste. Nevertheless, as a voluntary appendix, state and local officials are free to adopt any portion of the appendix, alone or in combination. Some jurisdictions may choose to adopt only the landscape irrigation efficiency measures, which have no impact on sanitary collection systems at all. They should have that opportunity, by approval of the proposal as submitted.

Bibliography: Dieter, et al, *Estimated Use of Water in the United States in 2015*, Circular 1441, US Geological Survey, June 2018, p. 22..

Cost Impact: The net effect of the public comment and code change proposal will not increase or decrease the cost of construction

The code change proposal will not increase or decrease the cost of construction. The proposal offers enhanced water efficiency specifications for voluntary adoption by jurisdictions using the IRC. As such, there is no general impact on users of the IRC.

RP16-18
