

## FeatherStone Light Weight Rock Veneer

FeatherStone Rock Products introduces a unique product with substantial advantage over real stone or man-made stone, which are common and popular in the market today.

The trade show exhibit shows a **custom colour to match the need of an interior designer** for a commercial project in Edmonton. She was so impressed she ordered a similar colour scheme for the exterior of her own home.

**LEED friendly:** FeatherStone is made with 55% by volume of recycled (post-consumer) glass which has been processed using a unique German technology that produces light weight, nano-porous spheres that range in size from 0.25 mm to 4.0 mm diameter, which we use as the filler replacement for pumice or Perlite, commonly used in our competitors' rock products. This results in **non-combustible, stone panels or clusters**, which are up to 40% lighter weight than many of the other common man-made stone products, and up to 75% lighter than real stone veneers. This saves on freight, labour and, in some cases, mitigates the need for extra structural reinforcements when a fireplace is added during a renovation.

**Durable – Long Lasting Finish:** These nano-porous spheres are “moisture breathable” but do not absorb water. This unique set of properties makes our FeatherStone hydrophobic since it won't absorb large amounts of water, they will last longer than Perlite or pumice-based products in areas where freeze-thaw cycles can result in micro-cracks and eventual degradation of these other products over time.
