

During October 2022 we will be offering Laser treatment as part of our continuous improvement process.

Ask for details

### WHY?

Less evasive, less painful, often with visibly quicker results, no risks.

We are continually looking at better and more effective ways to treat our patients, the use of LASERS in foot health treatment is widespread in the USA but surprisingly uncommon in the UK. Like traditional treatments it does not work on every case but it shows remarkable results in a large number of cases. Foot Clinics report over 89% of cases show quick improvement and when used alongside traditional methods 100% of cases can be treated. The treatment is painless and clean and much less invasive than traditional treatment for a wide range of foot health and muscular conditions.

## How K•Laser Can Help

Laser therapy uses selected wavelengths of light to stimulate key molecules in human tissues. Decades of medical research have identified the wavelengths, energy level and frequencies that induce changes in cellular metabolism (Photobiostimulation), for instance melanin absorbing sunlight changes skins pigmentation.

K-Laser delivers energy from superficial to deep tissues activating a cascade of photochemical reactions that promotes cell function, enabling treated tissues to accelerate the stages of the healing process and reduce pain sensation. This is a safe and non-invasive technique that uses the body's own reparative processes.

K-Laser has been used in various published studies as an innovative treatment for foot pathologies. Not only its mechanism of action improve healing, blood flow and pain, but can treat toenail infections.
