

THE NEW EDGE AVIATION

COMMON USES FOR DRONES TODAY.

Aerial photography: One of the most popular uses of drones is to take pictures and videos in the air. Collecting footage in the air can be used for journalism, documentaries, and personal photography.

Real estate: With today's technology, homebuyers have an easier time than ever looking at potential homes. More and more real estate companies are realizing the benefits of using drones to take aerial videos of their properties to show potential buyers online.

Inspections: There are plenty of ways drones can be used for inspection purposes. Whether it's farmers using drones to check on crops and livestock or utility companies using drones to inspect power lines and oil and gas pipelines, the use of drone flying is making inspecting from a safe distance possible.

Deliveries: More recently, companies have begun experimenting with drone use for shipping and delivery. Being able to reach a wider audience, even in remote areas, could improve the efficiency of deliveries around the world.

Geographical mapping: When it comes to reaching hard to access areas like mountaintops, drones are allowing users to create 3D maps. These maps then allow data to be collected right from the image itself.
