What is Wind Mitigation inspection Florida?

A wind mitigation inspection (also called a windstorm mitigation inspection) is when a certified inspector checks your home's wind-resistant features generally the roof. Insurance companies require updated reports every 3 years, typically as one of the conditions of obtaining Insurance for Associations.

These are useful for individual property insurance as Insurers will generally provide a discount on personal insurance.

Reporting for building types:

Uniform Mitigation Verification Inspection Form (OIR-B1-1802)

This form is used for the following personal residential risks:

- Single-family dwellings
- 1-4 unit residential dwellings, including apartments and condominiums.
- Residential buildings up to 3 stories, including 5 or more unit apartments and condominiums

Building Type II And III Mitigation Verification (MIT-BT II & III)

This form is used for the following residential properties:

- Residential units located in buildings with more than 3 stories (including apartments and condominiums)
- Commercial residential buildings with more than 3 stories

Please note that there is a second report (see above) that is generally required for buildings 4 stories and above. Some insurance companies will not accept the Form 1802 that is shown for up to 3 storie buildings, some do. You will need to check.

DMI Pricing of \$295 for CVE (a discount of \$55 includes both reports for 3+ story buildings if the Insurance Company does not accept the Form 1802 that is used for buildings less than 3 stories. Some Insurance Companies will accept the 1802 for all buildings.

As well, please be aware the if you have installed hurricane impact windows and doors, the unit owner must obtain the mitigation report. The chart below indicates all pricing as well as the additional cost if you have replaced the windows and doors. The Association is still required to do a Wind Mitigation in this case.
