

PRODUCT & SERVICE OVERVIEW

ZONE StimStac™ system is a field proven Formation Seal V single-set rotational-release **Dual** injection packer system. Located between the Formation Seal V packers is a mechanically activated **STIMPort™** Treatment Valve which provides for a uniform treatment across the specific zone of the wellbore to be isolated and selectively acid fracture stimulated.

ZONE StimStac™ system is designed to be inflated, deflated and retrieved one time per run. However, the system is capable of being redressed On-Site for additional runs should the job need arise.

The **ZONE StimStac™** system is run in the well on threaded pipe (work string) and is inflated with the application of work-string hydraulic pressure. To deflate and retrieve the system, the work-string is pulled upward and then rotated 6 revolutions to the right, allowing pressure between the elements and the annulus above to equalize. An additional pull causes the elements to deflate into the tubing and the annulus below the packers. Once the elements have completely deflated, the system is ready to be retrieved.

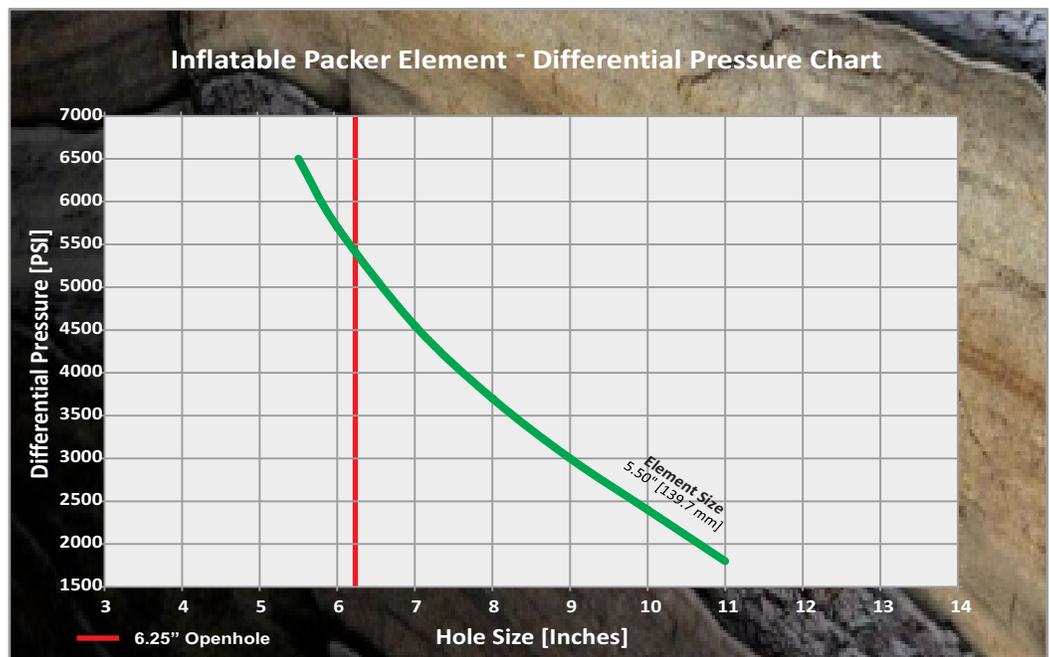

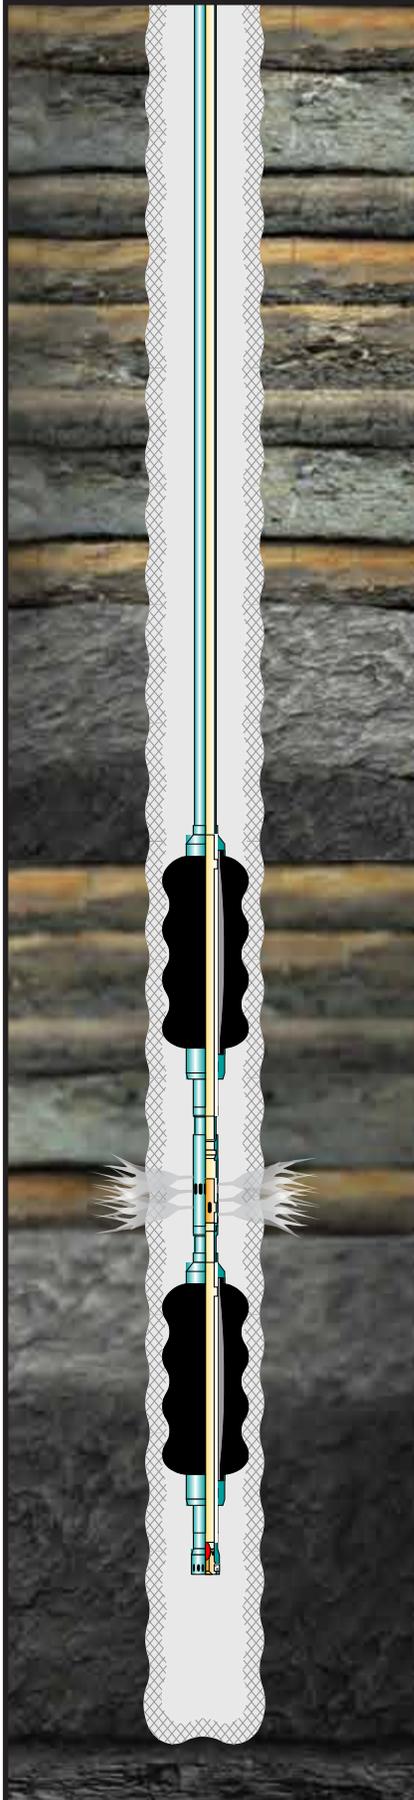

APPLICATIONS

- Suitable for use in Vertical, Deviated or Horizontal Applications
- Open or Cased Hole Zonal Isolation
- Open or Cased Hole Zonal Isolation Acid Stimulation
- Nitrogen Foam Acid Fracture Stimulation

BENEFITS and FEATURES

- Mechanically Activated System
- Dual Packers Inflate and Deflate Simultaneously with No Work-String Movement Required
- Simple Rotational Release Deflation of the Complete System
- Aircraft Cable Element Design for Maximum Safety and System Integrity
- Will Set in Damaged or Out-of-Round Wellbores or Casing
- Heavy Duty Rental Fleet Quality Tools

Dynamic Oilfield Services, LLC is a progressive oilfield service company specializing in Openhole Fracture and Acid Stimulation Completions and specialty service tools.

Office Location:

Dynamic Oilfield Services, LLC • 4245 Matlock Road • Bowling Green, KY 42104
Managing Partner: Patrick Parson • Phone (270) 991-1004
