"There Is No Downside to FenBlock's Titration Solution to Pain Management and Patient Centered Recovery"

Neil Jackson, Founder/CEO

The Pain Management Crisis—spanning complex chronic conditions requiring fentanyl, morphine, oxycodone, and other medications—continues to challenge communities across America. Families seek better solutions, veterans work toward optimal pain relief, and underserved populations face limited access to patient-centered titration approaches. For far too long, the available pain management strategies have been either static dosing, invasive procedures, or costly therapies that create new burdens without empowering patients in their own recovery journey.

FenBlock™ changes this narrative by creating patient-centered pain management with successful recovery outcomes.

A Breakthrough by Design: Precision Titration

FenBlock™ is exceptional in its titration-focused design:

Non-Pharmacologic – FenBlock™ contains no drugs, eliminating the risk of side effects or complications while enabling precise titration for optimal pain management.

Non-Invasive – There are no surgical procedures, no implants, and no devices requiring electricity or magnets—only controlled titration through advanced barrier technology for personalized recovery.

Patient-Empowered – FenBlock™ works in true partnership between patient and care team, giving patients an active voice in their pain management and recovery journey with clear milestones, oversight, and coaching that builds confidence and successful outcomes.

At its core, FenBlock™ is a graduated barrier material—proprietary, safe, and engineered to regulate the diffusion of **all major opioids** delivered through transdermal patches, including:

- Fentanyl
- Morphine
- Oxycodone
- Buprenorphine
- Hydromorphone

This simple but powerful titration principle means physicians can finally manage dosages with mathematical precision, optimizing pain relief while supporting patient recovery goals in collaboration with informed, empowered patients until optimal therapeutic outcomes are achieved.

The Win-Win of Patient-Centered Pain Management

What makes FenBlock™ truly revolutionary is how it transforms pain management into a collaborative partnership focused on successful recovery outcomes:

For Physicians:

- Precise, predictable titration control for optimal pain relief
- Improved patient outcomes through personalized dosing
- Enhanced patient engagement through shared decision-making
- Evidence-based protocols supporting recovery goals

For Patients:

- Active participation in their own pain management and recovery
- Clear understanding of their therapeutic timeline and goals
- Reduced anxiety through predictable, manageable treatment steps
- Maintained dignity and autonomy in treatment decisions

For Care Teams:

- Unified approach to patient-centered pain management
 - Improved communication between all stakeholders
 - Measurable progress tracking toward recovery goals
 - Enhanced treatment plan adherence and successful outcomes
-

A Universal Solution for Pain Management and Recovery

FenBlock's™ patient-centered approach serves all demographics and pain management scenarios:

Chronic Pain Patients – Cancer, cardiac, and post-surgical patients gain control over their pain management journey while actively participating in personalized titration protocols designed for their specific recovery needs.

Native American Tribes and Nations – Where pain management access has been limited, FenBlock offers a culturally sensitive, non-drug solution that empowers both local healthcare providers and tribal members in shared treatment decisions focused on healing and recovery.

The Nation's Military – Active-duty service members, reservists, and veterans partner with medical teams using FenBlock's precise titration to maintain optimal function while safely managing pain through personalized recovery protocols.

Underserved Populations – From rural America to inner cities, where access to specialized pain management is limited, FenBlock™ provides practical, affordable, physician-directed titration that puts patients at the center of their recovery journey.

Pain Management Specialists – FenBlock enables precise, patient-involved titration for complex pain conditions, supporting successful outcomes through collaborative care approaches that honor both medical expertise and patient experience.

By serving patients from every background with collaborative titration protocols, FenBlock™ helps close the gap in healthcare equity while honoring patient autonomy.

Safety and Empowerment Without Compromise

Unlike alternative treatments—whether substitute medications or neuromodulation devices—FenBlock's safety and patient empowerment are inherent in its design. The proprietary barrier material works with the physics of fluid diffusion, ensuring predictable titration control without altering the drug, the patch, or the patient's body, while keeping patients fully informed and involved in every decision.

There are no added drugs. No complex machinery. No invasive procedures. No decisions made without patient input.

Only a safe, proven material that empowers both physicians and patients to collaboratively manage opioid dependency and pain relief in a way that is effective, compassionate, and respectful of patient autonomy.

A Path Forward: The Win-Win Reality

"There Is No Downside to FenBlock's Solution to Opioid Dependency and Managed Titration"

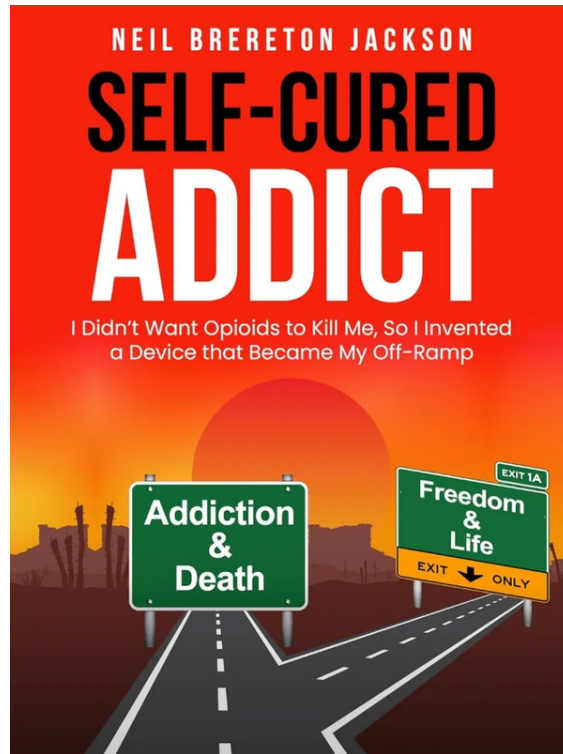

With FenBlock™, the traditional treatment paradigm transforms into a true win-win scenario:

- Physicians gain precise control while patients gain meaningful participation
- Medical teams achieve better outcomes while patients maintain dignity and choice
- Families experience hope while patients reclaim independence
- Communities begin healing while individuals feel empowered

FenBlock™ represents more than technology—it embodies a philosophy where successful titration emerges from the partnership between medical expertise and patient wisdom. It's a mission that recognizes that the best outcomes happen when patients have a strong voice in their care, supported by a treating medical team committed to shared success.

This is collaborative medicine. This is empowered recovery. This is the breakthrough whose time has come.
