

# INSTRUCTIONS

## FAUCET REPAIR

1. Turn off water supply to faucet; turn on faucet and wait for the water to stop running.
2. Remove handle caps/screws and pull off handle.  
Note: If handle is stuck you might have to use a faucet handle puller tool.
3. Clean faucet body and parts and re-assemble using new parts provided.
4. Note: Do not be alarmed if your kit has extra parts, they have been provided to fix look alike faucet models that require slightly different parts. These parts should be discarded.
