

# Integrated 'Pest' Management

The application of any product is not integrated.  
It is segregated.

Integrated, passive systems attract and retain beneficials  
to balance pest populations.

## Management Protocols

- Protect from strong winds by planting windrows.
- Provide a water source that includes access and egress structures.
- Create islands of refugia within constructed areas to reduce habitat fragmentation.
- Plant native perennials or their analogs in the ground and mulch soil.
- Pest predators are highly susceptible to insecticides. Avoid insecticidal control of pests. Including "all-natural" or "organic"!
- All systems of agriculture are year-round.
