Laura

Overview

Laura leads a program that places shipping containers, modified to be medical clinics, in rural South Africa. She then finds and trains a local nurse and places her in charge of the clinic. The nurse becomes the health care option for the local community.

Problem

The nurses in the rural clinics have limited infrastructure. This causes barriers to resupplying the clinics with medical products and equipment. Currently the needs are being communicated using Email. With over 60 clinics this process is becoming confusing and difficult.

QuickTemplate Solution

A Supply Request Template was created to capture the needs of the clinic. The form is filled out by the nurse whenever new supplies are needed. The template is then sent by the built in E-Sign feature to both Laura and the supply company. Laura approves each request and then the supply company sends out the supplies.

Supply Request Template

The nurse in charge of each clinic is equipped with the QuickTemplate app and the Supply Request Template. When supplies are needed they use their phone to fill out the template with the details of their order. When complete they use the built in E-Sign capabilities to send the template to both Laura and to the supply company.

International Workflow

Nurse completes the Supply Request Template specifying the supplies required and uses E-Sign to send it to Laura

Laura Signs off on the request and the document is automatically sent to the supply company for delivery.
