

The Genesis Instruments **Modular Pump It™** is an accurate and rapid dispensing instrument used to deliver liquid nutritionals or vaccines by means of injection, oral, intranasal or topical administration. The body structure acts as a grip and barrel using a single molded piece. Manufacturers can assemble their specific pump method using the multiple component system. A variety of threaded or draw-off configurations and custom colors are available.

A large variety of **triggers** can attach to the plunger whether injectable, topical or oral.

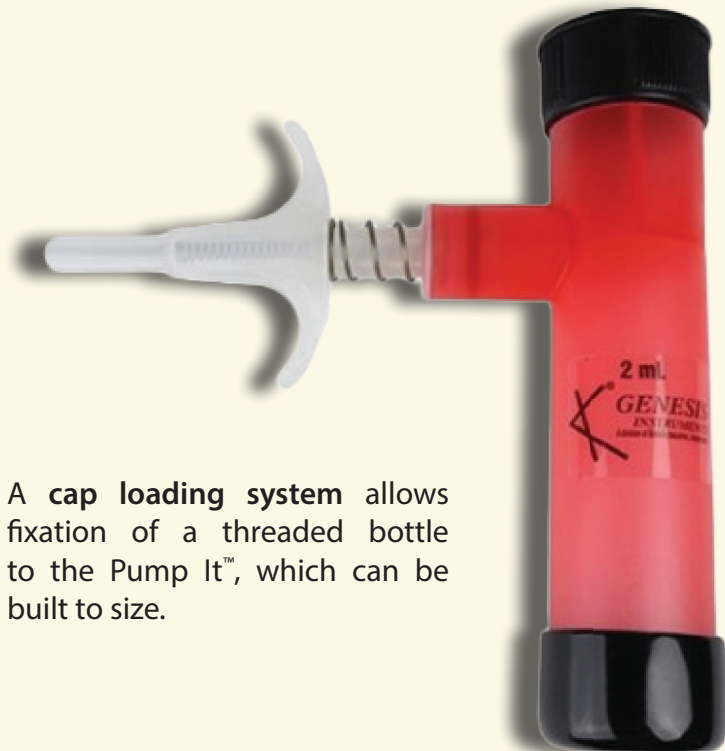

The **draw-off loading system** uses various barbs connecting to a backpack, bottle or container whether injectable, topical or oral.

**Customization is available
to meet specific
manufacturer needs!**

A **cap loading system** allows fixation of a threaded bottle to the Pump It™, which can be built to size.
