

For Immediate Release:

## **Better Fresh Technology Announces New Electrolyzed Systems for Garden, Greenhouse and Lawn Care**

BFTech EO\* water process announces two newly developed equipment systems and patented process that can be used for domestic and commercial applications.

BFTech EO\* water process is used for onsite control of certain disease's and plant microbes, which can occur during the growing cycle, such as, "powdery mildew, mold, and foliar disease."

### **Adjuvants – Pesticides**

BFTech EO STT™ Micro-Structure water process can work with the adjuvants to assure consistent results by enhancing adjuvants, which are already present in certain pesticides. In some cases, additional adjuvants may be added to pesticides for buffering, dispensing, emulsifying, spreading, sticking and wetting. STT Micro-Structured water process reduces surface tension to nanobubble/microbubble size – a key element of the newly announced technology. The STT will suspend minerals in water that can affect foliar issues. STT micro-structure process will reduce certain minerals from binding to pesticides that decrease pesticide performance - like calcium, magnesium ions.

STT micro-structure water reduces possible clumping and uneven mixing that cause pumps to plug and feed lines, which result in expensive cleanup.

One of the biggest advantages of STT micro-structure neutral pH water is due to the molecular restructure of positive and negative mineral ions. In combination the reduced surface tension (microbubble) produced by the STT breakthrough technology, pesticide and fungicides concentrations can be reduced. This is due to enhanced foliar coverage, increased moisture absorption in soils and dramatically enhanced hydration (% retention) for plant growth.

## **Greenhouse Environment –**

BFTech STT Micro-Structured water process will enhance all aspects of your process - ventilation, cooling, soil pasteurization, fumigation, irrigation/micro-irrigation, better plant nutrition, cleaner humidifying system, enhanced spraying system for plant and foliar coverage, sustainable re-use of water, and water treatment discharge applications.

Call and ask for the Better Fresh Technology AquaFew™ enhanced system for integrated insect and mite pest management, for propagation *from seed to sale of your product*.
