- Detects data entry errors
- Detects missing or invalid social security numbers
- Detects duplicate patients in databases
- Detects issues, corrects errors and protects patient health data

NETWORK FRIENDLY

- No additional network components to install
- Solution as a Service
- Minimum impact on IT Staff resources
- Results found day one

FINANCIAL

- Proven revenue benefit by shortening the revenue cycle
- Increase materially first pass reimbursement
- Significant back office efficiency gained through rightsizing of resources
- Benefits are recognized in every department day one of implementation

The Problem:

Which record should be used?
Over time information changes. The database integrity becomes compromised. Systems slow down. Users become frustrated.

Why are there multiple Patient records?
Patients may be entered in the medical database under different names over time for multiple legal reasons. The Patient may not be aware they have a record entered under a different name.

Can the patient record be trusted in a critical situation?
Incorrect patient health records can lead to life threatening situations and financial problems for both the patient and the provider.

The Goal:
Create a unique 'golden' patient record that is trustworthy and can be verified. To find and log all the errors in the medical record applications. To design a sustainable remediation solution that will keep all medical records healthy over time.

The Solution:

MED-DETECT an affordable solution to look deeply into the organization's patient account data in order to validate patient health information accuracy.

MED-DETECT creates a unique 'golden' patient record number that enables matching across EHR/EMR applications, multiple databases and most networks.

MED-DETECT ensures the Patient Health Record and the information that it contains is trustworthy and verifiable.

MED-DETECT as a SAAS (Software-As-A-Solution). No new network components need to be installed to use this solution.

MED-DETECT intuitive to use by staff because it significantly reduces time spent researching errors.

MED-DETECT identifies records that have potential problems. User defined reports can be run based on "ALERTS" to be reviewed in detail.

MED-DETECT minimizes and deters medical identity theft and insurance fraud.
