Emergency Procedures

Powerlines

What happens if overhead or underground powerlines are contacted?

The machinery or vehicle will become 'live' at the same voltage as the power lines contacted. The electricity will attempt to pass through the vehicle to the ground.

Anything else in contact with the powerlines will also become 'live', such as fences and trees.

A potentially dangerous electrical field will be created around anything in contact with the powerlines. This field extends for approximately 8 metres around these items.

What should you do if contact is made with powerlines?

Try not to panic, remain calm. An attempt should be made to break the contact by driving the vehicle a minimum of 8 metres away from the powerline. If it is not possible to break the contact:

1. Stay in the vehicle until the power has been isolated and the powerlines removed. Don't risk being electrocuted by attempting to leave the vehicle before power is disconnected.
2. Advise anyone near the incident site to stay a minimum of 8 metres away from the vehicle and anything else in contact with the powerlines.
3. Call emergency services (000) reporting wires down and a life-threatening situation.
4. Treat all powerlines as if they are 'live'.

Emergency Procedures

Powerlines

What if the person in the vehicle needs to be evacuated?

An emergency evacuation from a vehicle is extremely dangerous and should only be attempted as a last resort, such as if the vehicle is on fire. Remember, never approach the vehicle to assist in an evacuation.

1. If escape from the vehicle is absolutely necessary, it's critical that you jump clear ensuring that you don't have contact with the vehicle and ground at the same time.
2. When you jump, ensure that you land with your feet together that you do not touch the vehicle, fall forward or backwards or allow your feet to step apart.
3. You must shuffle with your feet together until you are at least 8 metres clear of the vehicle, powerlines or anything else in contact with them. Avoid being in line with the side of the tyres/rims as they may explode.
4. Once clear, do not return to the vehicle for any reason.

Tyres can explode during or after contact with powerlines

If a vehicle contacts overhead powerlines, there will be a massive electrical current flowing through the vehicle and its tyres. This can cause the tyres to explode on contact or could cause the tyres to start burning inside.

- This creates a build up of gases and heat which could cause the tyre to explode at a later time, even 24 hours after the incident.
- The resulting explosion could potentially injure persons in the proximity with flying debris.
- The vehicle should be isolated at a safe distance for 24 hours to avoid injury.
