Introduction

This document serves as a comprehensive thematic and narrative index to the *Stories of Care* (SoC) collection—an initiative developed as part of the Erasmus+ project, “Transforming the case stories of families affected by mental illness into learning and awareness raising tools.” This index connects each of the 60 personal caregiving narratives to specific themes derived from lived experiences of caring for a person diagnosed with schizophrenia.

The document is organized into two major sections: *Stories by Topic Index* and *Topics by Story Index*. The first section allows users to identify which stories address specific topics related to patient behavior (e.g., psychotic symptoms, aggression, self-harm), caregiver experiences (e.g., distress, care dilemmas), and broader systemic issues (e.g., services, stigma, legal challenges). The second section lists each story alongside the themes it covers, offering a reverse lookup to explore the full complexity of individual caregiving narratives.

Each topic corresponds to a code in the SoC Map of Topics (MAP), a structured coding system comprising 168 themes grouped into 26 topic groups across three clusters: patient behavior (PAT), caregiver experience (FAM), and specific/systemic issues (SPT). These themes were empirically developed and iteratively refined through qualitative analysis of the stories.

This file is a practical tool designed to support professionals, educators, family members, and advocates in navigating this rich narrative resource. By facilitating targeted access to relevant stories, the index enhances the collection’s utility in peer counselling, professional training, public awareness campaigns, and personal reflection. It is an invitation to explore the shared humanity, resilience, and emotional depth behind the act of caregiving.
