

vKey® Device Manager Overview

The vKey® Device Manager (vDM) is the Cloud or privately hosted enterprise management console that enables organizations to manage the vKey platform from within a single pane of glass.

This centralized console enables administrators to streamline the deployment, management, support and security for their entire workforce, while benefiting from significant cost savings inherent with the vKey platform.

Above all, vDM is built to support a global workforce, no matter how simple or complex the corporate IT landscape or office structure may be.

vDM Management Console

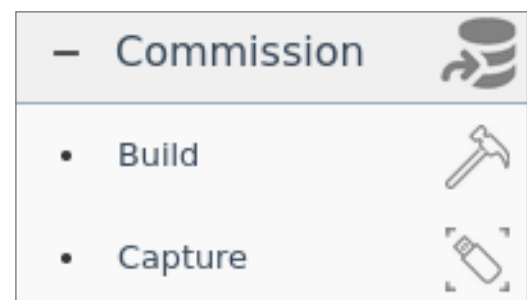

vDM Benefits Include:

- Integrate with Active Directory
- Centralized, single pane of glass console for Administrators
- Ability to deploy vKey globally in minutes
- Create Helpdesk screen sharing sessions as needed
- Remotely disable and delete vKeys
- Seamlessly push corporate software updates
- Leverage customized scripts for automation and management
- Effortlessly integrate any third-party applications or solutions

vKey® Device Manager Features

Deployment

The vDM Commission feature allows an organization to create, manage and deploy their corporate vKey images. Images can be deployed using vDM's integrated vKey Enterprise Builder (vEB) technology to effortlessly mass deploy vKey both locally and globally through direct (Network and Physical) or indirect (Cloud) image distribution features.

The vEB image creation and management feature allows organizations to pre-configure vKey corporate images that support all facets of Cloud, DaaS, VPN, SRA, VDI, SaaS and Virtualized environments.

Once deployed, vDM is then able to manage multiple master images controlled by its single pane of glass. vDM easily supports multi-tenancy, allowing for seamless and simplified management of satellite offices, users and kiosks.

vDM integrates with Active Directory (AD), LDAP, SCCM, SCOM and other user management platforms and protocols to drastically minimize the onboarding, user rights management and image maintenance process.

vKey[®] Device Manager Features

Monitor

vDM provides complete monitoring and logging of the vKey devices and users, including user activities, logins and IP information in addition to third party threat detection, prevention and group monitoring.

- Supports all device platforms such as laptops, PC's, Thin Clients, Mobile Devices, IoT, etc.
- Integrate with third party SIEM monitoring and EDMS and backup solutions
- Built-in Remote Helpdesk feature

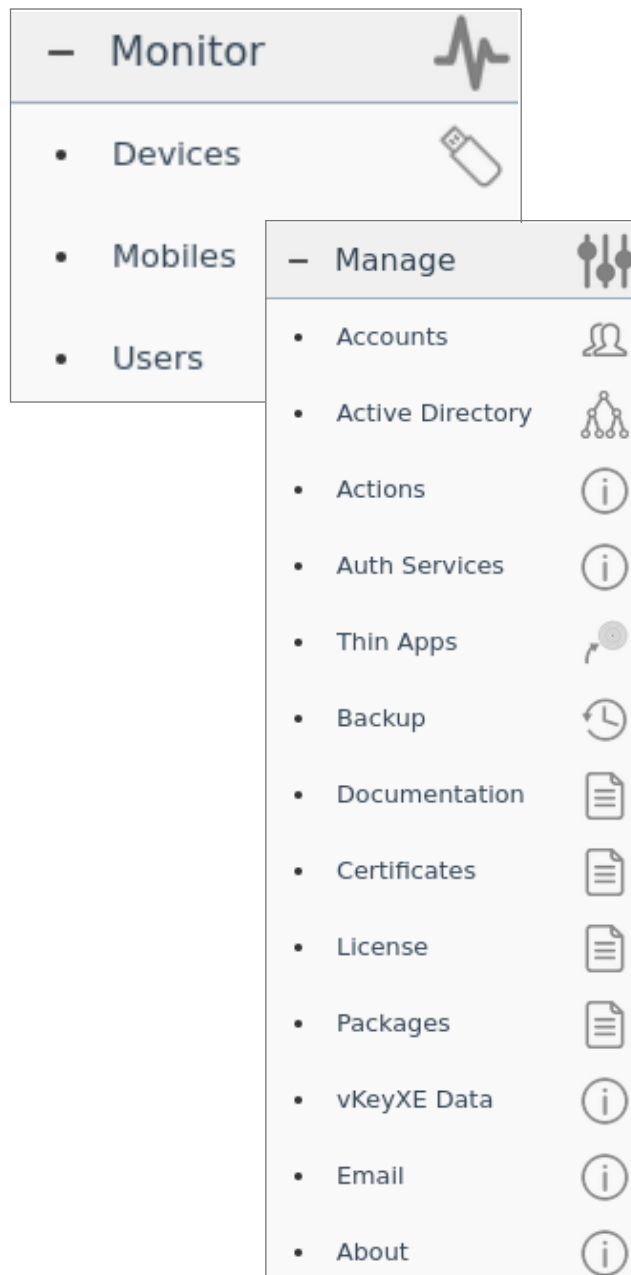

Manage

vDM allows administrators to manage all aspects of their environment.

- Enforce security policies
- Enable/disable/remote wipe devices
- Remotely push application updates/patches
- Remotely push OS updates/upgrades
- Integrate with Active Directory (AD/LDAP)
- Integrate with SCCM, SCOM
- Apply client based scripting commands

Agnostic Integration

The vKey platform fully integrates with any Windows, Linux or Hypervisor (VMWare, QEMU, KVM, etc.) supported environment as well as 3rd party applications and solutions such as Microsoft, M365, Azure, AWS, Cisco, Fortinet, Citrix, Okta, Entrust, Google, Mozilla, Micro Focus, SolarWinds, Splunk and Veeam just to name a few.

About DLS Technology Corporation

DLS Technology Corporation, one of Canada's Top 500 Growing and Growth 400 companies, is a leading Solutions Integrator and technology innovations firm providing advanced Cybersecurity, Cloud Computing, Data Analytics and Digital Transformation services nationwide. DLS offers comprehensive technology solutions and services to national clients within the government, healthcare, defence and finance sectors.

vKey was developed to mitigate the security risks associated with remote users and their endpoint devices, such as spyware, keyloggers, screen capture and ransomware by providing a secure work environment that protects the end user's workspace. vKey is designed to secure all aspects of your corporate data including Data in Use, Data in Motion and Data at Rest.
