Breakout Room: Activity 1

1. In the breakout room, discuss the following
2. Assign a spokesperson to report out to the group.

Discussion:

1. What approach(es) do you use for SSD?
2. Are there particular diagnosis, sounds, processes, etc. that you see that become persistent and resistant?
3. When it is a persistent speech sound disorder, do you do anything differently with your intervention?

9

Overview

15

- x All of us have stories of students with persistent speech sound disorders
- x Why? (developmental vs. neurological, attention, executive function, etc.)

This workshop will provide several systematic approaches to finally remediate those speech sounds.

10

Objectives

SLPs: Practical Therapy Techniques for Persistent and Resistant Speech Sound Errors (Grades PK-12)

NEW Session Presented By
Margo Krieger Courter, MS, CCC-SLP, BCSS-CL
Speech-Language Pathologist, Author and National Presenter

1. Determine the Most Effective Treatment Strategies for Persistent Speech Sound Disorders (PSSD)
2. Provide Step by Step Approach for Acquisition, Practice, Maintenance, & Generalization
3. Determine Type of Practice for Quicker Generalization
4. Discuss the Role of Multisensory Cueing for Faster Maintenance & Generalization

11

Ultimate Goals

1. Discuss how to mitigate SSD, so it doesn't become a PSSD.
2. Explore characteristics of developmental and neurological speech disorders to determine the best approach for remediation
3. Determine the best approach for severe phonological and neurological speech disorders for quickest remediation

12

13

Speech Sound Disorders (ASHA) 16

Any difficulty or a combination of difficulties with:

- ☐ Perception (ability to perceive the sound correctly),
- ☐ Motor production (ability to motor plan sequence of sounds), or
- ☐ Phonological representation (rules and patterns) of speech sounds and speech segments (i.e.: VC/CV/CVC),
 - ☐ including phonotactic rules governing permissible speech sound sequences in a language

13

14

Speech Sound Disorders can be

- x Functional/developmental (no known cause) such as articulation (motor) and phonological processing (linguistic)
- x Organic (developmental or acquired)
 - Neurological such as childhood apraxia of speech (CAS) (motor planning) and dysarthria (muscle weakness)
 - Structural such as cleft palate
 - Sensory/Perceptual such as with hearing impairment

14

15

4 Categories

Speech Sound Errors (Articulation)	★ Phonological Process
<p>Omissions: Doesn't produce a sound in a word (ub for tub)</p> <p>Substitutions: A very common speech sound error is the substitution (tun for sun)</p> <p>Distortions: Distortions are when a child uses a non-typical sound for a typically developing sound (i.e.: lateral and frontal /s/ and /z/)</p>	<p>Substitutions</p> <ul style="list-style-type: none"> Backing (/k/ and /g/ for /t/ and /d/) Fronting (/t/ and /d/ for /k/ and /g/) Gliding (/t/ or /l/ becomes a /w/ or /l/ becomes a /y/ sound) Stopping (fricatives and affricates are produced with a stopped consonant like /p/, /b/, /t/, /d/) <p>Assimilation</p> <ul style="list-style-type: none"> Assimilation (bub for bus) Denasalization (dap for map) Final Consonant Devoicing (bat for bad) Prevocalic Voicing (gat for cat) <p>Syllable Structure</p> <ul style="list-style-type: none"> Cluster Reduction (/tn/ for /sn/, /b/ for /br/, etc.) Final Consonant Deletion (do for dog) Initial Consonant Deletion (og for dog) Weak Syllable Deletion (nana for banana)

15

16

4 Categories

★ Childhood Apraxia of Speech	Dysarthria
Limited repertoire of vowels	Slurred or distorted speech production
Variability of errors	Imprecise articulation
Idiosyncratic patterns	Uneven speech rhythm
Errors increase in longer words or utterances	Difficulty with pitch or loudness control
Voicing errors	
Prosody errors	

16

17

Comparison of Speech Disorders 18

Characteristics	Neurological		Developmental	
	★ CAS	Dysarthria	★ Phonology Disorder	Articulation
Inconsistent errors on consonants (repeated production)	✓			
Inconsistent errors on vowels (repeated production)	✓			
Decreased vowel production	✓			
Disrupted coarticulation transitions between sounds and words	✓			

17

18

Characteristics	Neurological		Developmental	
	CAS	Dysarthria	Phonology Disorder	Articulation
Increased errors in longer more complex sequences	✓			
Decreased strength of oral motor musculature		✓		
Motor control for chewing and swallowing	If oral apraxia is presented ✓	✓		
Articulatory precision	Inconsistent in the same word	Imprecision but consistent	Consistent errors but rule based	Consistent sound errors

18

	Neurological		Developmental	
Characteristics	CAS	Dysarthria	Phonology Processing	Articulation
Types of errors	substitutions, omissions, additions, repetitions. vowel distortions, voice/voiceless consonant errors	distortions	Rule based i.e.: final consonant deletion	Substitutions, omissions, additions, repetitions.

19

	Neurological		Developmental		20
Characteristics	CAS	Dysarthria	Phonology Processing	Articulation	
Errors based on length of utterance	✓	Less precise in connected speech	consistent	consistent	
Receptive and Expressive Language	Could have gap with receptive higher	No discrepancy	Sometimes a difference	No difference typically	
Prosody - lexical and phrasal stress)	Disrupted ✓	Disrupted based on type (spastic, flaccid, etc.)	No disruption	No disruption	

20

Comparison of Speech Disorders

Characteristics	Childhood Apraxia	Dysarthria	Phonology Disorder	Articulation
Prosody - lexical and phrasal stress)	Disrupted ✓	Disrupted based on type (spastic, flaccid, etc.)	No disruption	No disruption

21

Prevalence

1. In 8-year-old children, 3.6% were estimated to have persistent SSDs (Wren et al., 2016).
2. Persistent and residual speech sound errors are estimated in 1-2% of all children (Culton (1986)
3. In young adults, 1%–2% exhibit residual or persistent speech errors (Flipsen, 2015).

22

Prevalence

4. Reports estimated that SSDs are more prevalent in boys than in girls, with a ratio of about 2:1 in grade school children (McKinnon et al., 2007). There were no indications whether the data collected were based on sex assigned at birth and/or gender identity.

23

Persistent Speech Sound Disorders

Persistent Speech Sound Disorder (PSD) is a speech sound disorder that cannot be easily remediated and resistant to traditional speech therapy methods that continue beyond the typical age of acquisition, often lasting into adolescence or adulthood.

24

Persistent Speech Sound Disorders

1. PSD may be due of a
 - a. history of speech delays
 - b. history of normal speech sound development but failure to achieve accurate production of one or two particular speech sounds, or history of motor speech impairment (e.g., [Shriberg et al., 2010, 2017](#)) and
 - c. may have accompanying deficits in motor, language, and literacy skills ([Cabbage, et al., 2016](#); [Wren et al., 2016](#)).

25

Persistent Speech Sound Disorders

2. Children with PSD demonstrate linguistic, literacy, and social deficits and have higher rates of LI than those children with resolved SSD ([Bishop et al., 2003](#); [Lewis et al., 2015, 2016](#))

26

Persistent Speech Sound Disorders

3. Early childhood factors that are associated with PSD include little or no babbling, unintelligible speech, limited morphology at 38 months, low cognition, neurobiological conditions (e.g., hearing loss, intellectual disability, cerebral palsy), and a history of coordination problems and poor motor skills and males ([Bishop, 2002](#); [Campbell et al., 2003](#); [Eadie et al., 2015](#); [Lewis et al., 2011](#); [Wren et al., 2016](#); [Wren, Roultstone & Miller, 2012](#)).

27

Persistent Speech Sound Disorders

4. Children with PSSD at 7 years did NOT find SES, IQ, family history, language, or gender to be predictive of PSD; rather, children with disordered speech (not delay) at 4 years were more likely to have PSD at 7 years than children with delayed speech ([Morgan et al., 2017](#)).

28

Key Aspects

- x Variability
- x Etiology
- x Associated Difficulties
- x Long Term Impact

29

Key Aspects

- Variability
- x Residual distortions (i.e.: /r/, /s/, /l/)
 - x Production of multisyllabic words
 - x Neurological impairments such as CAS

30

31

Key Aspects

Etiology

- x Known (genetics, hearing loss, physical structure, neuromotor)
- x Unknown (considered functional/developmental)

31

32

Key Aspects

Associated Difficulties

- x Motor
- x Language
- x Literacy

32

33

Key Aspects

Long Term Impact

- x Motor
- x Language
- x Literacy

33

34

Persistent Speech Sound Disorders and Attention

21

1. Children with moderate-severe SSD had
 - a. higher ratings on the inattention and hyperactive/impulsivity scales as rated by their parents than children with no SSD.

34

35

Persistent Speech Sound Disorders and Attention

2. Listening to speech when our attention is divided across multiple tasks is typically referred to as listening under cognitive load. It can also affect the processing of acoustic cues to speech sound categories (Chiu et al., 2020; Feng et al., 2021; Mattys & Wiget, 2011).

35

36

Persistent Speech Sound Disorders and Attention

3. Under cognitive load, as evidenced by poorer discrimination of speech sounds across a category boundary (Chiu et al., 2020; Mattys & Wiget, 2011) or a shallower identification curve (Feng et al., 2021) under divided attention conditions than when attention is focused only on the relevant speech perception task.

36

37

Persistent Speech Sound Disorders and Attention

4. Norrelgen et al. (1999) found participants with ADHD exhibited speech discrimination difficulties as compared to neurotypicals only when exposed to two- to five-syllable nonword pairs, a pattern attributed to higher sensitivity to working memory load, but not in a discrimination task with monosyllables.

37

38

Overall Guidelines

22

- x Developmental Norms
- x Impact
- x Implications for Treatment Timing

38

39

Keep in Mind

**IT'S NOT ABOUT LEARNING THE SOUND YOU TARGET.
IT'S ABOUT TRANSFORMING THE WHOLE SOUND SYSTEM**

Dr. Holly Storkel

39

40

Developmental Norms

23

McLeod and Crowe (2018/2020) reviewed 60 articles describing 64 studies of consonant acquisition. This included 26,007 children from 31 countries in 27 languages. In all 27 languages, most consonants were acquired by 5:0 with at least 93% of consonants produced correctly. The following chart provides English consonant acquisition across the world (Australia, Republic of Ireland, Malaysia, South Africa, United Kingdom, and the United States) with correct production (https://pubs.asha.org/doi/10.1044/2018_AJSLP-17-0100)

40

41

6 years	th voiceless
5 years	th voiced, zh, r
4 years	v, s, z, sh, ch, j, l
3 years	b, t, d, k, g, m, n, ng, f, h, y, w
2 years	p

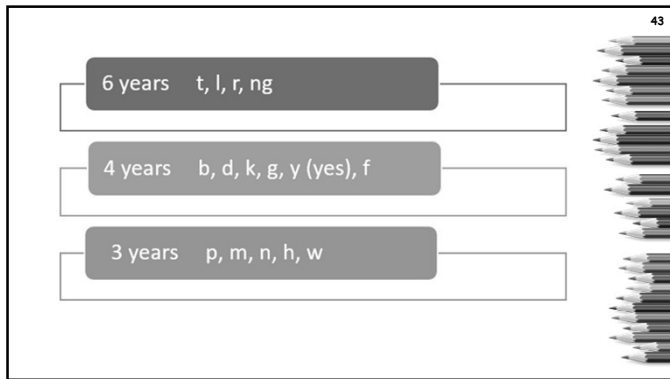

41

42

Previous Norms

Many SLPs used Sanders norms from 1972 which was actually based on research from Wellman et al. (1931) and Templin (1957) which described "customary" versus "mastery" production of English consonants based on research. Sander defined customary production as "that point when a child is producing a sound correctly more often than [s]he is misarticulating or omitting it" (p. 56). This also included /r/ in place for 90% of children by age 6.

42

43

44

Impact

- x Even mild SSD may reduce communication opportunities
- x Teacher's expectations (academic, social, and behavioral)
- x Listener's negative reaction
- x Communication Disorders:
 - Lower skills jobs
 - More likely to be unemployed (up to 43%)
 - 44% for speech disorders that impact intelligibility are in the lowest income strata

44

45

Implications for Timing

1. Social isolation & teacher perception and expectations
2. Children as young as 4-5 demonstrated success acquiring later developing sounds (Krueger & Storkel, 2023)

45

46

Implications for Timing

3. Regarding phonological disorders, there is a period of
 - x accelerated change from 4 to 6 years old,
 - x followed by a plateau from 6 to 7 years old.
 - x period of accelerated change from 7 to 8.5 years old,
 - x final stable plateau beginning at 8.5 years old

(Shriberg, Gruber, and Kwiatkowski, 1994)

46

47

Implications for Timing

4. Early intervention to reduce impact on language and literacy and overall negative educational outcomes
 - Phonological awareness can be impacted by SSD
 - Spelling and decoding

47

48

Implications for Timing

5. Children with persistent speech errors achieved lower educational attainment throughout adolescence based on standardized educational assessments when controlling for IQ (Wren et al., 2021).
 - One reason for these poor outcomes is that phonological awareness skills is often impacted in children with SSD which leads to difficulty with literacy acquisition (Hesketh, 2004).
 - At older ages are learning how to read and having difficulty with even one speech sound can impact their spelling and decoding abilities (Farquharson, 2019).

48

Link of SSD to Language & Literacy

25

- x Phonological/phonemic awareness, phonological memory, spelling, word reading
- x Lower morphological awareness
 - Which is a unique predictor of spelling abilities

49

Place and Manner of Articulation

Place and Manner (including vowels) can support treatment decisions.

50

	Manner of Articulation	Place of Articulation						
		Bilabial	Labio-dental	Dental	Alveolar	Palatal	Velar	Glottal
Obstruents (components produced with obstruction or turbulence)	Stop							
	Voice	p			t		k	
	Voiceless	b			d		g	
	Fricative		f	θ	s	ʃ		
	Voice							h
	Voiceless		v	ð	z	ʒ		
Sonorants (relatively free & continuous airflow)	Affricate					tʃ		
	Voice							
	Voiceless					dʒ		
	Nasal	m			n		ŋ	
	Liquid				l	r		
	Glide	w				j (y)		

51

Considerations

1. Continuants may be easier to perceive as correct or incorrect
2. ? Is the student having difficulty with a specific manner or place of articulation?

52

Considerations

3. Contrastive Therapy

Minimal pairs for discrimination – consider place, manner, and voicing changes

Minimal opposition: 2 of the three may be the same (ring/wing, cape/tape manner and voicing are the same, place is different)

Maximal opposition: all three are different

(chain/main (i.e.: compare obstruent /f/ with sonorant /l/)

Example on next slide

	Manner of Articulation	Place of Articulation						
		Bilabial	Labio-dental	Dental	Alveolar	Palatal	Velar	Glottal
Obstruents (components produced with obstruction or turbulence)	Stop							
	Voice	p			t		k	
	Voiceless	b			d		g	
	Fricative		f	θ	s	ʃ		
	Voice							h
	Voiceless		v	ð	z	ʒ		
Sonorants (relatively free & continuous airflow)	Affricate					tʃ		
	Voice							
	Voiceless					dʒ		
	Nasal	m			n		ŋ	
	Liquid				l	r		
	Glide	w				j (y)		

53

	Manner of Articulation	Place of Articulation						
		Bilabial	Labio-dental	Dental	Alveolar	Palatal	Velar	Glottal
Obstruents (components produced with obstruction or turbulence)	Stop							
	Voice	p			t		k	
	Voiceless	b			d		g	
	Fricative		f	θ	s	ʃ		
	Voice							h
	Voiceless		v	ð	z	ʒ		
Sonorants (relatively free & continuous airflow)	Affricate					tʃ		
	Voice							
	Voiceless					dʒ		
	Nasal	m			n		ŋ	
	Liquid				l	r		
	Glide	w				j (y)		

54

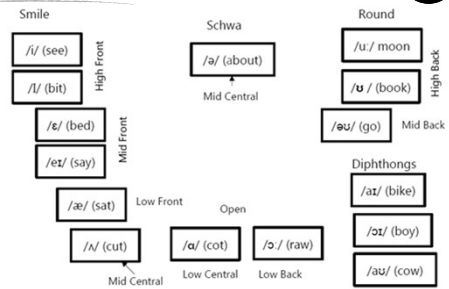

Considerations

4. Change of place of articulation (bilabial /b/ in bag to velar /g/ in gag)

55

55

Vowels

56

56

Intelligibility to Unfamiliar Listener

Single Words	Multiword
50% by 2;7 (31 months)	50% by 2;10 (34 months)
75% by 4;1 (49 months)	75% by 3;10 (46 months)
90% by 6;11 (83 months)	90% by 5;2 (62 months)

Hustad et al. (2021)

57

57

Screenings

- x All preschool and kindergarten should have speech, language, and hearing screening
- x Kindergarten through 2nd grade
 - If new to the district
 - Teacher referral
- x Dynamic assessment
 - x Without cueing
 - x Different cues with two occurrences for sounds in error

28

58

58

Screenings

- x Imitates
 - Isolation
 - Multiple word positions
 - Multiple vowels
 - Multisyllabic

Consider: place and manner of articulation

- x Stimulability
 - Can produce the target in 3 or more attempts correctly

- x Nonstimulable

- Less than 3
- Multiple vowels
- Multisyllabic

Phonemes that are stimulable are more likely to develop

59

59

Possible Screeners

- x Fluarty
- x Speech and Language Screener Quick Take Along (SuperDuper, \$19.95)
- x Little Bee Speech

<https://drive.google.com/file/d/1UQ8AL55W5sTJilc12leOWUw7Y2nBSfFa/view?usp=sharing> (screen and PA)

60

60

61

Documentation

- Hearing**
 - ☐ WNL
 - ☐ Rescreen
- Language**
 - ☐ Developmentally appropriate
 - ☐ Delayed

61

62

RTI/MTSS

- x Before referral for special education to determine if referral is warranted
- x Cannot be used to delay or deny evaluation for special education services

62

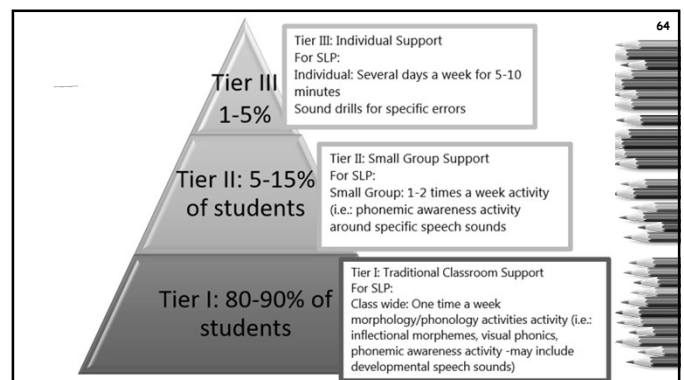

63

RTI/MTSS

includes:

- x Universal screening
- x High-quality instruction
- x Interventions matched to student need
- x Frequent progress monitoring, and
- x The use of child response data to make educational decisions

63

64

65

Tier I: General Education/Large Group

- x PreK, K, 1: Whole class morphology/phonology lesson one time per week by collaboration SLP/teacher

65

66

Tier I: Phonemic Awareness

Kirk and Gillon (2007) provided an integrated speech, phonemic awareness, and letter knowledge intervention approach to children with SSD. They found that *children who received an intervention that facilitated phonemic awareness and letter knowledge in addition to speech sound production outperformed children who received an intervention for speech sound production alone*

66

Tier I: Phonemic Awareness

- x Developmental Activity (Moats/Tolman) (Include developmental speech sounds for that age group in phonological/phonemic and morphological awareness activities)
- x Great site for activities: <https://fcr.org/student-center-activities>

67

Order of Acquisition: Phonological Awareness

Age	Skill	Activities
4 years	Rote imitation of rhymes and alliteration	https://sooperbooks.com/rhymes/
5 years	Rhyme recognition (which word does not belong)	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vpk_phonological_awareness/PA1_cards_color.pdf
	Recognize phonemic change in a word (Brown Pear, Brown Pear, What do you see?)	
	Clap out syllables (Target 2 and 3 syllables then move to 1)	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vpk_phonological_awareness/PA7_cards_color.pdf
5 1/2 years	Can separate a word into its phonemes (segmenting sounds in a word)	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vpk_phonological_awareness/vk1_phoneme_segmenting/vk1_pa040_say_and_slide_phonemes.pdf
	Blend onset and rhyme (c at = cat)	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vpk_phonological_awareness/PA24_cards_color.pdf

69

Order of Acquisition: Phonological Awareness

	Tell the first sound in a word	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vk1_phonological_awareness/vk1_phoneme_matching/vk1_pa025_one_cant_out.pdf
6 years	Can delete (manipulate) part of a compound word or a syllable from a two syllable word. Blends 2 or 3 phonemes	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vk1_phonological_awareness/PA14_cards_color.pdf
	Segment two or three phonemes in a word	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vk1_phoneme_segmenting/vk1_pa014_phoneme_counting_sort.pdf
6 1/2 years	Segment three or four phonemes in a word	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vk1_phoneme_segmenting_and_blending/vk1_pa017_phoneme_split_and_say.pdf
	Manipulate (substitute) a sound in a simple word to form a new word (Change the l in lip to /s/)	https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vk1_phoneme_manipulating/vk1_pa025_sound_changes.pdf
7 years	Delete sounds in the initial and final position (not including blends)	
8 years	Delete initial sounds including blends	
9 years	Sound deletion for medial and final sounds	

70

Visual Phonics

https://drive.google.com/file/d/1hAG4rDmea_KtjPlchK9t8RQLaQa-hV/view?usp=sharing (IC)

https://drive.google.com/file/d/1OLQw2HX9XHAnWni6u8M6soYNhIQhn_qv/view?usp=sharing

71

Morphological Awareness

Preschool children who demonstrate deficits in morphology and speech demonstrated better **morphosyntactic competence when it was targeted before speech sound errors** (Tyler, Lewis, Haskill, 2002).

Food for Thought:

- x Fronting: difficulty producing -ing
- x Backing: difficulty producing /t/, /d/, /ed/ for past tense
- x Cluster reduction: plural and possessive /s/ that follows another consonant (cats, dogs, dog's, cat's), superlative -est

72

Brown's MLU

https://fcr.org/sites/g/files/upcbnu2836/files/media/PDFs/student_center_activities/vk1_phonics/vk1_morpheme_structures/vk1_pa058_in_flection_toss.pdf

Inflectional Morpheme	Age of Acquisition	Example	Common Core State Standards
Present progressive (-ing)	27-30 months	Baby crying .	1 st grade
Plural regular (-s)	27-30 months	I want cars .	Kindergarten
Possessive ('s)	31-34 months	Sam's ball .	1 st grade
Past regular (-ed)	35-40 months	She walked home.	Kindergarten-1st
Third person regular (-s)	35-40 months	Malcolm plays .	1 st grade
Past participle (-en) (uncontractible and contractible aux. verbs)	41-46 months	She has spoken . It is written .	2 nd grade (irregular past tense)
Inflectional Morpheme		Grade Level Standard	
Comparative (-er) and Superlative (-est)		3 rd grade	

73

74

Activity

- **Today:** She is splashing in the puddle.
- **Today:** She splashes in the puddle.
- **Yesterday:** She splashed in the puddle.
- **Tomorrow:** She will be splashing in the puddle.
- **Possessive:** It is the girl's umbrella.
- **-er and -est:** The mommy bird is bigger than the baby birds.
- (Discuss plants).

The grass is bigger than the flowers.

The tree is the biggest plant in the picture.

- **-en:** One baby bird is hidden

75

RTI/MTSS II: Small Group Instruction

37

- x Students would move to small group instruction (especially preschool and kindergarten) when they demonstrate speech sound disorders and /or language delays that have not shown progress in Tier I.
- x Continue to incorporate phonological/phonemic awareness activities (i.e.: Integrated Phonological Intervention Program)

76

Tier II: SSD/Phonological Awareness

- x Include the speech sounds or phonological processes to adapt each activity. Use the following activities to target speech sound disorders in order to provide the support for students for literacy development.
- x Begin with VC, CV, VCV, or CVC first. For medial sounds, start with simple VCVC or CVCV words. Once the student can discriminate and segment these, move to CCVC or CVCC. Then move to 2 syllable words

77

Perceiving Phonemes

Minimal Pairs for SSD

Articulation		Phonological Processing
/f/ /t/		Fronting/backing
face/phase	peace/peas	bug/bud/buck
race/raise	once/ones	mug/mud/mutt, muck
bus/buzz	done/does	knot/knock/hood
fun/fuzz	base/bases	tap/tap/gap
six/six	base/bays	key/teal
place/plays		

Alphabet Center

78

Slide and Say

79

Tier II: Link SSD to Morphology

write (wrote, written, writing, writes)	redo (redoes, redoing, redid)
ride (rides, riding, ridden, rode)	rain (rainer, rainiest, rains, raining, rained)
roam (roams, roaming, roamed)	raincoat (raincoats, raincoat's)
rip (rips, ripped, ripping)	robin (robins, robin's)
run (runs, ran, running)	

Inflectional Targets

Today: She is writing about the rain.
Today: She writes about the rain.
Yesterday: She wrote about the fun in the rain.
Tomorrow: She will write about the fun she had.
Possessive: She writes about the rain's puddles.
-er and -est: It is a rainier day than yesterday. It is the rainiest day of the year.
-en: She has written about her day in the rain.

80

/s/ and /z/		Phonological process stopping
birds	skips	(see /s/ and /z/ list)
grass	skipped	four leaves (how many did i color)
boots	sleeping	five
coats	sleeps	flowers
rabbits	sleepier	the bird's worm
girls	sleepiest	the bird's nest
girl's	slips	the boy's boots
sing	slipping	the girl's coats
singing	slips	this flower
sways	slide	them
swaying	slides	then
leaves	sliding	those
trees		thick
glasses		thin
flies		hot
flying		hotter
nest		hottest
splashes		the girl's chin (cheek, chapped)
splashing		jump
flowers		jumps
		jumping

81

RTI/MTSS Tier III: 1-2 Students Speech Only

Sexton & Seth

Speech Program	Total number of months in therapy	Minutes per month based on average sessions	Total number of minutes in therapy	Equivalent number of hours in therapy
Traditional Therapy	18	210	3780	63
5-Minute Program	9.6	45	432	7
Differences Between Programs	8.4 months	165 minutes	3348 minutes	56 hours

82

Assessment

Any assessment instrument (formal or informal) should be conducted as a dynamic assessment.

Any assessment instrument (formal or informal) should be conducted as a dynamic assessment. According to Rvachew, et al (2004), if a child is stimutable for the phoneme sound, they are more likely to develop the sound without intervention. Phonemes that are not stimutable are less likely to be acquired without intervention.

83

Stimulability through Dynamic Assessment

41

```

graph TD
    Start[Child produces the target sound  
(isolation, multiple word positions)] --> Isolation[Isolation: Produced correctly in 3 or more attempts]
    Start --> IsolationError[Isolation in error]
    IsolationError --> Attempt1[Attempt 1: visual cue]
    Attempt1 --> Attempt2[Attempt 2: tactile cue]
    Attempt2 --> Attempt3[Attempt 3: kinesthetic]
    Attempt3 --> WordError[Word position in error]
    WordError --> Attempt1Word[Attempt 1: visual cue]
    Attempt1Word --> Attempt2Word[Attempt 2: tactile cue]

    Attempt3Word --> Attempt4[Attempt 3: prosodic cue]
    
```

Isolation: Produced correctly in 3 or more attempts

Move to words in initial, medial, and final word position (different vowels, and multisyllabic)

Multiple word positions: Produced in 3 or more attempts (Various positions, vowels, and multisyllabic) correctly. Move to next sound

Note: If a cue supports correct production, try the same cue again. Fade cue: check for correct production. If incorrect, cue again. Document. Note: cues can be used in any order.

Note: If a cue supports correct production, try the same cue again. Fade cue: check for correct production. If incorrect, cue again. Document. Note: cues can be used in any order.

84

Breakout Activity 2

Discuss the following.
Please assign a spokesperson

- Are you currently involved in RTI/MTSS?
- If yes, what is your involvement?
- If no, what could you do to target SSD before adding to your caseload to attempt to remediate developmental speech sounds?

85

86

Explicit, Systematic, Sequential Intervention

- x Explicit – Clearly defined, whatever is being targeted is clearly defined before targeting and students are informed what they are going to learn.
- x Systematic– Preestablished routines that presents any element and the relationship to the whole (I Do, We Do, You Do)
- x Sequential and Cumulative – Preplanned activities that build new skills on previously targeted and mastered skills
- x Diagnostic – Gathering data, reviewing that data, using this data to drive what the student needs to target

86

87

Explicit	Explain to the student what you are working on and why	cognitive-linguistic approaches seek to address how the child is thinking (cognitive) about how sounds in words affect meaning (linguistic)
Prepractice	Student judges production as correct or incorrect Perceives the difference between minimal pairs	<ul style="list-style-type: none"> • May start with CV/VC • Begin with continuant sounds to support understanding of concept (even if not the targeted sounds or processes) • Use Multisensory cues • Feedback: Phone Video, App: VowelViz/VowelViz Pro

87

88

Practice Approaches: * Complexity Approach * jppp * SMC *Based on Motor Learning	I DO:	Therapist demonstrates with several trials	<ul style="list-style-type: none"> • Explains • Uses multisensory cues
	We Do:	Practice together with feedback	<ul style="list-style-type: none"> • Motor Planning: May start with CV/VC/CVC • Phonological Processes (Complexity Approach) Start with most complex patterns (3 Cluster – if student has the 2nd and 3rd sound, 2 Clusters if not – start with /rl/ or /sl/. Once student is 80% at 2 Clusters, move to 3.
	YOU DO	Student practices with feedback and cueing as needed	Cueing fades as student is more successful
Assessment	Therapist is constantly assessing how the student is doing, what is working and not working.		Ongoing assessment/progress monitoring.

88

90

If More Than One Persistent Error: Where to Start

43

- x Determine frequency of occurrence in English
- x Target more frequently occurring to improve intelligibility
- x Consider influence of vowels

Note: If still only a couple of errors or processes, a traditional therapy approach (Minimal pairs, cycles approach) may be appropriate. If multiple sound errors or processes, move to one of the approaches that we will discuss.)

93

94

Distributive Practice: Therapy Intensity

- Higher number of sessions and practice trials per session results in the greatest gains within one block of treatment.
 - Minimum intensity two sessions a week (Namasivayam, Pukonen, Goshulak, et al., 2015; Thomas, McCabe, & Ballard, 2014)
 - most articles employing sessions 3-5 times a week and 100 production trials per session (Edeal & Gildersleeve-Neumann, 2011; Murray et al., 2015). [Murray, E., and Iuzzini-Seigel, J. (2017).

95

Blocked vs Random Practice

Blocked:

- 8-10 stimuli is presented in a block (e.g. you have 10 target words total and you practice target 1 10x, then move on to target 2 and practice 10x, target 3, etc).
- When establishing the motor plan, begin with a more blocked practice for acquisition (Shea et al., 2001) then move to random as movement accuracy improves.

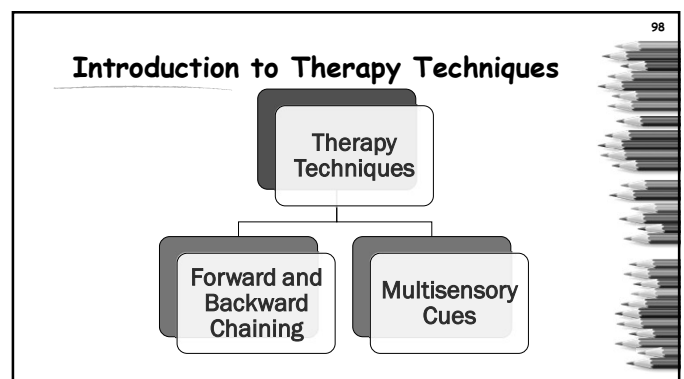

96

Random:

8-10 stimuli is practiced in random order (e.g. you have those same 8-10 target words, however the words are practiced in an unpredictable random order, alternate between words, phrases, sentences, structured tasks, intonation, etc).

Random practice leads to better motor learning maintenance and generalization (Shea et al., 1990)

97

98

99

Forward Chaining

46

- x Always keep the initial sound and the vowel together for coarticulation.
- x Have the student state the first part
 - Provide multisensory cues
 - Could attempt simultaneous production (saying it together)
- x Once the student is successful with the first part, have them state the second part
- x Blend the two together.
 - May need to use cues initially
 - Fade cues as student is successful

99

100

Example: initial /r/

<https://drive.google.com/file/d/1f61oivkTxQqTCwJUo8mHdOkwIPqdIZ/view?usp=sharing> (cello)

<https://drive.google.com/file/d/1SIwvFDd93sbDcKPaQ97rKYJJKgIfRAhx/view?usp=sharing> (boat)

100

Backward Chaining

- Consonants and vowels should be produced correctly
- Example: respect
- Re is produced correctly.
- spect is in error (i.e.: student states "spict" or "pect".)
- Correct the error in the second syllable.
- Then add the first syllable. May need to continue to cue the second syllable and fade as soon as possible.

<https://drive.google.com/file/d/1TIAze2jc2hGjn3MpnUW5YvW2xsDCIT/view?usp=sharing> (stream)

102

Multisensory Cues

47

- Prosodic Cues
- Tactile Cues
- Visual Cues
- Kinesthetic Cues

103

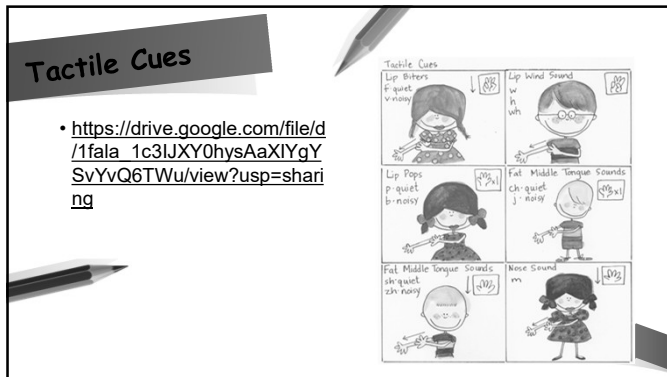

103

Prosodic Cues

104

Tactile Cues

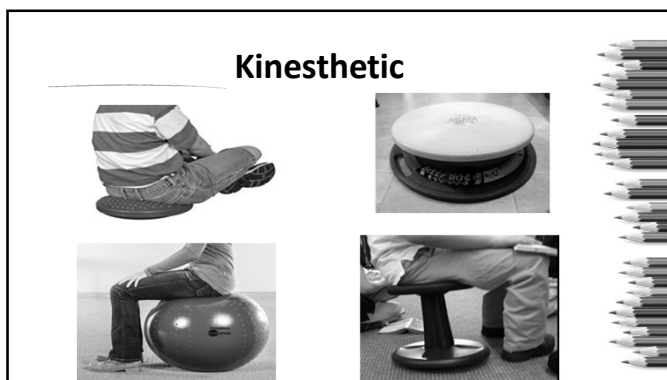

105

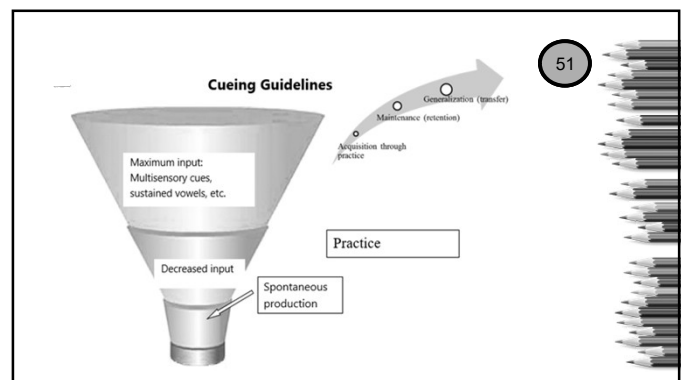

106

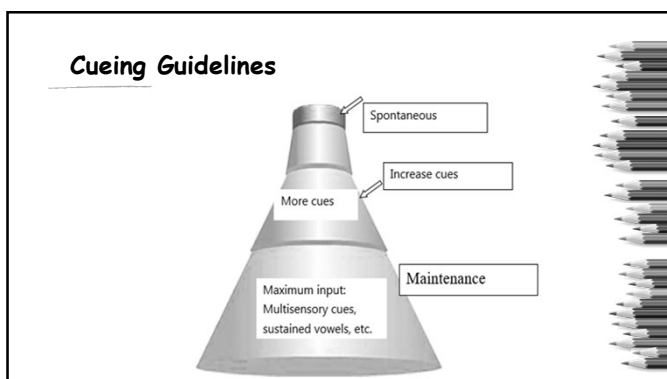

107

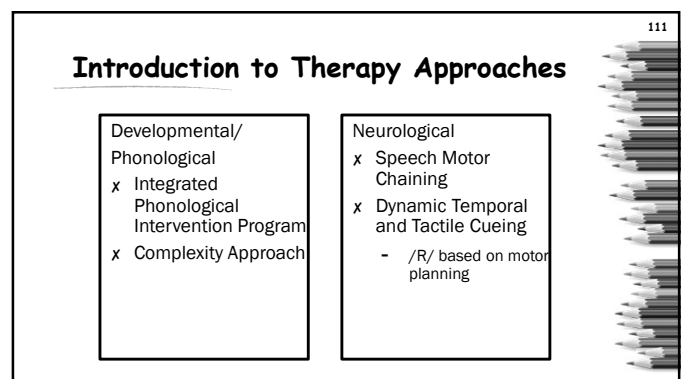

108

109

110

111

Reminder

Regardless of the approach chosen intensity and number of productions is the key!

The **minimum intensity** that has been shown to work **is two sessions a week** (Namasivayam, Pukonen, Goshulak, et al., 2015; Thomas, McCabe, & Ballard, 2014) with **most articles employing sessions 3–5 times a week and 100 production trials per session** (Edeal & Gildersleeve-Neumann, 2011; Murray et al., 2015). [Murray, E., and Iuzzini-Seigel, J. (2017).

112

Integrated Phonological Intervention Program (IPIP)

52

We know from the research that children with speech sound disorders are at greater risk for phonological/phonemic awareness delays, thus, delay in literacy development (Rvachew, Ohberg, & Grawburg, 2003; McCormack, et al, 2011; Tambraja, et al, 2022; Nathan, et al, 2004).

113

IPIP

Designed to facilitate speech production, phonological awareness, and sound/symbol in children ages 4-7 years with speech and language impairment. The intervention is based on activities implemented in the Gillon (2005), Moriarty and Gillon, (2006) and McNeill (2007) intervention studies.

The findings from these research investigations indicated that the program was effective in facilitating significant improvement in speech production, early reading, and spelling development in preschool children with speech impairment and in children aged 4-7 years diagnosed with childhood apraxia of speech.

114

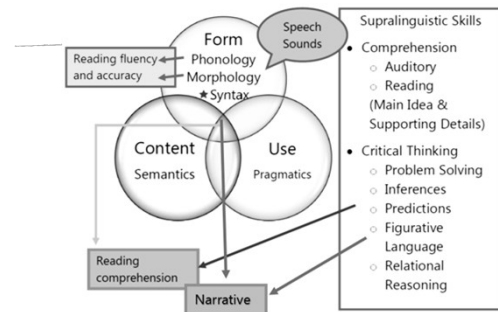

Links: SSD to Language and Literacy

1. Reports estimated that 40% of children with SSDs had concomitant language impairment (Eadie et al., 2015).
2. Approximately 25% of children receiving school-based speech services may also qualify for reading-related services (Tambraja et al., 2020).
3. Like children with dyslexia, a core deficit in the phonological system has been implicated in children with speech sound disorder (Anthony et al., 2011; Pennington & Bishop, 2009; Sutherland & Gillon, 2007).

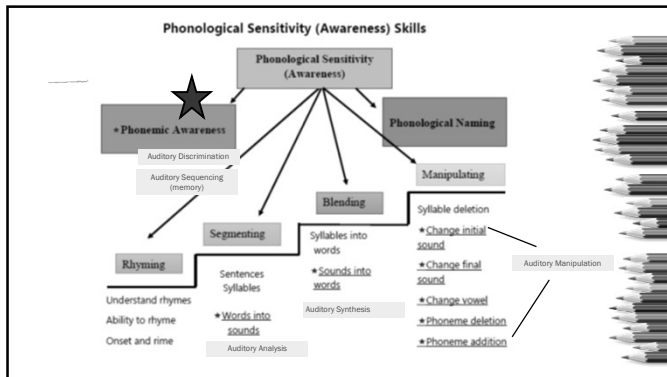

115

4. Studies indicate that at age 4, children with speech delay are at higher risk for impaired phonological awareness skills (e.g., rhyme matching, onset segmentation, onset matching) compared to children who are typically developing peers (Rvachew, Ohberg, & Grawburg, 2003).
5. Children whose speech production problems persist until age 6; 9 perform worse on tests of reading, spelling, and phonological awareness than controls matched for age and performance IQ (Nathan et al., 2004).

116

117

118

Program Structure

Each session in the intervention program should include activities to target speech production, phonological awareness, and sound/symbol

Shown Previously
https://drive.google.com/file/d/1hAG4rDimqa_KdpLqhk9t8RQLaQa-hV_j/view?usp=sharing (Cody)

119

- x The intervention should be administered twice weekly (2 one hour sessions) for a 6-8 week period or until 12 sessions are completed
- x followed by a break in therapy of approximately two months and then a second 6 –8 week block of therapy.

120

Margo's Notes

- x Due to the research on level of intensity recommendations, the twice weekly sessions may need to be adapted to 4 30 minute sessions/week or the amount of time needed for 100 productions
- x Changes may need to be made for phonological processes vs. speech sounds vs CAS
- x Add visual phonics
- x Base phonological awareness activities around development as well as specific speech area
- x Add multisensory cues

121

Complexity Approach

54

- x Approach by Gierut (2007)
- x designed for children with **moderate-to-severe phonological impairments with low intelligibility and limited phoneme inventories.**
- x by using a complexity approach during a period of accelerated phonological learning (4-6 years old), there is a greater chance to remediate multiple errors, thus, discharging before the students enter school

122

Complexity Approach

- x Concentrates on nonstimulable and later developing sounds
- x Concentrates on linguistically marked phonemes (i.e.: targeting affricates to increase stops and fricatives)

123

124

Complexity Approach

Marked (More Complex)	Unmarked (Least complex)
Fricatives (/f/, /v/, /θ/, /ð/, /s/, /z/, /ʃ/, /ʒ/)	Stops (/p/, /b/, /t/, /d/, /k/, /g/)
Affricates (/tʃ/ and /dʒ/)	Fricatives (/f/, /v/, /θ/, /ð/, /s/, /z/, /ʃ/, /ʒ/)
Liquids (/l/ and /r/) and glide sounds (/w/, /j/)	Nasal (/m/, /n/, /ŋ/)
Small sonority difference clusters (/sm/, /sn/)	Large sonority difference clusters (/tw/, /kw/, and /pl/)
Sonority: loudness of the speech sound	

124

125

Two Clusters (in order of sonority high to low for onset clusters)

More Complex	Less Complex
Voiceless stop + glide (/tw/, /kw/, /pj/, /kj/)	Voiced fricative + glide /vj/
Voiced stop + glide /bj/	Voiceless fricative + liquid (/fl/, /sl/, /tr/, /br/, /fr/)
Voiceless stop + liquid (/pl/, /kl/, /pt/, /tr/, /kr/)	/s/ + nasal (/sm/, /sn/)
Voiced stop + liquid (/bl/, /gl/, /br/, /dr/, /gr/)	Nasal + glide /mj/
Voiceless fricative + glide (/sw/, /fj/)	/s/ + stop (/sp/, /st/, /sk/)

Gierut (1999) provides evidence that treatment of marked clusters leads to greater system-wide change than treatment of unmarked clusters.

125

126

Three element clusters (most advanced phonological structure in English)	Two element clusters
/spl/ to target /sp/, /sl/, /pl/	/str/ to target /st/, /tr/
/skw/ to target /sk/, /kw/, /sw/	/spr/ to target /sp/, /pr/
/spr/ to target /sp/, /pr/	

Three-element cluster should only be selected as a treatment target if the child "knows" the target stop and glide or liquid as a singleton (Gierut & Champion, 2001).

126

127

Example From:
<https://kuscholarworks.ku.edu/entities/publication/bab8818a-1065-4b48-809f-e98a354eaead>

Higher number = more likely to impact other skills

Rated 1-4 with 4 being the most complex

127

129

The Nitty Gritty *****

- x Probe sounds
- x Get a baseline for Percent of Consonants Correct (PCC).
 - Use this periodically for data collection and progress

129

130

Phonemic Inventory Probe: Targeting /p/, /t/, /k/, /w/, /l/, /r/

Target	# Cons	Production	Target	# Cons	Production	Target	# Cons	Production	Phoneme(s)
1. white	2		20. write	2		39. light	2		
2. hip	2		21. hear	2		40. hit	2		
3. lock	2		22. rock	2		41. walk	2		
4. talk	2		23. tall	2		42. wall	2		
5. wing	2		24. ring	2		43. long	2		
6. tea	1		25. pea	1		44. key	1		
7. tape	2		26. tail	2		45. whale	2		
8. smile	3		27. stool	3					
9. toes	2		28. rose	2

19. hup	1/2	h u	38. wryp	1/2	w r				

Steel-Garnon (1986) stipulated that two occurrences are required for sounds to be included in the phonemic inventory. Circle sounds for which there are two occurrences on the above task: h u u p w r Y w h u

Gerat & Champion (2001) indicated that a child must have the second and third consonants of a three-element cluster in his/her phonemic inventory to teach a three-element cluster. Circle perceptible three-element clusters for treatment based on the phonemes indicated above: h u p h u p h u p h u p h u p

Total # of consonants = 85 (Correct # of consonants) 29 / 85 = 25%
Percentage Consonants Correct (PCC) = # correct consonants / total # of consonants
© 2019 Jennifer Tapp, M.A., CCC-SLP and SLPath.com

131

*** Target Selection

- Check for stimulability
- List sounds that are OUT of the phonetic inventory with 0% accuracy
- Cross out stimuable sounds (will typically develop without intervention) (Powel and Miccio, 1996)
- Next cross out all early developing sounds

Excerpted from the Phonological Assessment and Treatment Target Selection Barlow, Storkel & Tapp, (2010)

132

*** Target Selection

- Choose sounds that lead to greater system wide change based on language law
<https://slpath.com/docs/ImplicationalLaws.pdf>
 - Consonants imply vowels
 - Affricates imply fricatives
 - Fricatives imply stops
 - Voiced obstruents (stops, fricatives, affricates) imply voiceless obstruents
 - Liquids imply nasals

133

*** Target Selection

- If multiple sounds remain, select sounds that occur most frequently in the sound system
 - Attempt to use 3 clusters (if the students has the second and third member.
 - If cannot use 3 clusters, start with two with a sonority of +3 (loudness of a sound compared to other sounds) – typically /s/ or /f/
- Pick 3-5 targets (may start with CCV) (flee/flea, flew flow, flaw or sleigh, slow, slew, slaw)

134

*** Most Complex to Least Complex

- Clusters: 3 Elements
/str/, /spr/, /skr/, /spl/, /skw/
- Clusters: 2 Elements (often the starting point) (+3 sonority difference)
/l/: sl, fl, bl, gl, pl, kl
/r/: fr, shr, thr, br, dr, gr, pr, tr, kr
- Affricates
/tʃ/ and /dʒ/
- Fricatives
voiceless /tʃ/, /θ/, /s/, /f/, /h/ or voiced /v/, /ð/, /z/, /ʒ/
- Stops
Voiceless /p/, /t/, /k/ voiced /b/, /d/, /g/

135

** Explanation of Most to Least Complex

The most sonorous sounds are (The highest given a value score of 0)

Manner of Articulation	Place of Articulation						
	Bilabial	Labio-dental	Dental	Alveolar	Palatal	Velar	Glottal
Stop	p			t		k	
Fricative	b			d		g	
Voiced							
Voiceless							
Affricate							
Voiced							
Voiceless							
Nasal	m			n		ŋ	
Liquid							
Voiced							
Glides							
Voiced							

voiceless stops (7)
voiced stops (6)
voiceless fricatives (5)
voiced fricatives (4)
nasals (3)
liquids (2)
glides (1)
vowels (0)

136

*** Gierut (1999)

- x Gierut applied this principle to treatment. She identified an implicational relationship between clusters with small sonority distances and clusters with large sonority distances. (Sonority Sequence Principle)
- x Research has suggested that it is most efficacious to teach clusters with a small sonority difference (+3 plus (+) indicates sonority is rising)

(Linguists do not consider /sp-/ , /sk-/ and /st-/ to be true clusters. They do not follow the sonority sequence principle of sonority increase at the beginning from the first sound in the cluster to the second sound as the vowel is approached and falls at the end. Example: /s/ (5) voiceless stops (7). 5-7 = -2)

*** Explanation of Most to Least Complex

Sonority Sequencing Principle For Clusters (Gierut, 1999)

7 = voiceless stops
6 = voiced stops
5 = voiceless fricatives
4 = voiced fricatives

3 = nasals
2 = liquids
1 = glides (Gierut, 1999)

sonority distance = 2
voiceless fricative + nasal

/f/ + /n/

/f/ + /m/

/f/ + /ŋ/

sonority distance = 3
voiceless fricative + liquid

/f/ + /l/

/f/ + /r/

/f/ + /ʃ/

/f/ + /ʒ/

sonority distance = 4
voiced stops + liquid or voiceless fricative + glide

Principles of Motor Learning Approaches

- x Used for students with neurological speech disorder (Childhood apraxia of speech)
- x Students with neurological speech disorders
 - Higher likelihood of language, reading/spelling disorders
 - Language including morphology, phonological, syntax/grammar and vocabulary

143

Motor Learning Theory

1. Initial Condition: Articulatory placement, voicing, prosody, intonation, phrasing
2. Motor Commands Needed: Timing and amplitude of production
3. Sensory Consequences:
 - a. Tongue and lip movement for production
 - b. Tactile awareness of articulatory placement
4. Outcome: Were the speech sounds, voicing, intonation, and prosody correct?

(Schmidt, 1975, 2003; Schmidt and Lee, 2005)

144

Motor Performance and Motor Learning

Principles of Motor Learning

- Set of processes that facilitate the acquisition and retention of motor skills
- Lead to a permanent change
- Generalizes to other related but untrained tasks

145

Motor Performance

The ability to perform a motor task and how the movement is performed during training within a structured session.

146

Motor Learning

The stages to automaticity.

147

Feedback

- x Knowledge of Performance (KP) (motor performance) detailed feedback about movements, where to place articulators, etc.
- x Knowledge of Results (KR) (motor learning) less specific
- x Immediate feedback: acquisition
- x Delayed feedback: maintenance/generalization
- x Appropriate support

148

Checklist: Distinguishing CAS

☆ Indicates the top three characteristics of CAS (ASHA Technical Report, 2007)

Vowels

- ☆ Inconsistent use of vowels
- Limited repertoire of vowels
- Schwa additions/insertions to consonant clusters, within words and on the ends of words

149

Consonants

- ☆ Inconsistent errors on consonants
- May produce a sound correctly in one word position but not in another (i.e.: ball, ba _ y)
- May use an initial sound correctly in one word and substitute a sound or omit the sound in other initial position words (i.e.: ball, _aby)
- May say a word correctly one time, change the sounds in the word the next, then change them again (bye, dye, mye)
- Substitution of voice and voiceless consonants

150

Consonants and Vowels

- Idiosyncratic error patterns
- Increase difficulty and decreased intelligibility with increased length or complexity
- Imitation more difficult
- Poor speech intelligibility
- Distorted substitutions
- Restricted sound inventory

151

Coarticulation

- Lengthened and disrupted coarticulatory transition between sounds and syllables
- Difficulty achieving accurate articulatory movement gestures when trying to imitate words not yet mastered.

152

Prosody

- ☆ Inappropriate stress on syllables or words
- Equal stress or lexical stress errors (deleted po from potato, ba from balloon)
- Atypical prosody
- Altered and/or inconsistent suprasegmental characteristics (rate, pitch, loudness)

153

Language

- Reduced amount of babbling or vocal sounds from ages 7 to 12 months old
- Statistically significant discrepancy between receptive and expressive language
- Delayed onset of expressive language
- Loss of previous words

154

Other Characteristics

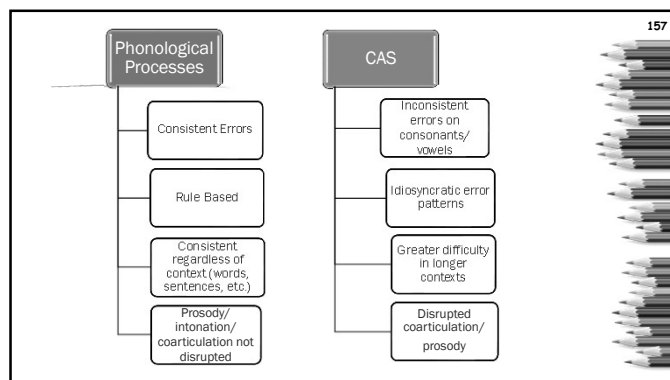

- Better performance on speaking tasks that require single postures versus sequences of postures (e.g., single sounds such as /o/ vs. words such as "no", or single words vs. phrases)
- Greater ease in producing automatic Impaired volitional nonspeech movement (oral apraxia)
- Trial and Error behavior
- Impaired diadochokinetic tasks

155

Breakout Activity 4

1. Discuss the difference between a phonological processing disorder and a neurological disorder (CAS).
2. How do you determine a differential diagnosis?
1. Why is a differential diagnosis important?

156

157

Keep In Mind: Motor Planning

- x Speech production involves continuous movement of parts of the vocal tract at the level of syllables. There is no stopping of movement during the syllable shapes; therefore, we must think in syllable patterns (CV, VC, CVC, C1V1C1V1, C1V1C1V2, etc.) and not in specific speech sounds which are isolated movement.
- x Assessment and treatment should be focused on the continuous movement within the syllable or string of syllables and not on specific speech sounds.

158

- x The student must first have an idea (cognitive function), then, retrieve information, map the sounds (phonological) as well as the morphosyntax (linguistic) before they can motor plan and program response (apraxia) (Strand, 2018).

159

- x According to Strand (2018), the motor planning parts of the brain must use a constant stream of information to determine articulatory placement and strength within the syllables for programming volitional movement to reach a specified temporal/spatial target. These include parameters of movement to include:

• Range of motion	• Speech	• Amount of muscle tension
• Direction of the motion	• Force	

160

Determining Severity & Prognosis 63

Mild	Moderate	Severe/Profound
Requires minimal cueing to obtain syllable production	Considerable cueing needed to produce syllable shape	With considerable cueing, cannot produce syllable shape
<ul style="list-style-type: none"> Improvement is more rapid Prognosis: Good Larger stimulus set (8-10) and can include words from more than one syllable shape More random practice 	<ul style="list-style-type: none"> Prognosis is good but longer duration in therapy Larger stimulus set and can consider words from more than one syllable shape 	<ul style="list-style-type: none"> Prognosis is guarded Smaller stimulus set (3-5) May not be able to include words from other motor shapes More block practice Increased frequency and type of feedback

161

Childhood Apraxia of Speech Evaluation 64-71

(See Appendix A for more information)

Hearing

☐ Passed a complete audiological assessment

☐ Failed a complete audiological assessment

☐ Hearing screening: Date: _____

Results

	500 Hz	1000 Hz	2000 Hz	4000 Hz
Right Ear				
Left Ear				

Preverbal

Child has communication intent ☐ yes ☐ no

Child shows joint attention ☐ yes ☐ no

☐ Limited cooing and babbling

☐ Delayed onset of first words

☐ Limited vowel production

The frequency and characteristics of early vocalizations can be affected by perceptual factors impacted by chronic otitis media (Petinou, et al 1999, Rvachew, et al 1999)

Cooing - 0-3 months **Babbling** - 3 months

4 months: consonants begin to emerge

7-8 months: "verbal turn taking"

Canonical babbling (7-10 months)

Variegated babbling (11-13 months)

162

Vowels: Short: a e i o u Long: a e i o u

Other: oo (boot) oo (foot) au/aw ou/oy ou/ow

☐ Limited consonant production

Consonants

Please use CHAT to jot down what motor planning patterns you hear.

164

Page 2: Preverbal continued

☐ Can make sounds in isolation but limited when words are combined into syllable shapes

Example: _____

Especially young children may show a significant gap between receptive and expressive language (receptive lag)

Receptive and Expressive Language

Test Given: _____

Results:

	Age	Standard Score	Percentile
Receptive Language			
Expressive Language			
Significant			

Comments: _____

Statistically significant difference between receptive and expressive language ☐ yes ☐ no

Language

Age of onset of first words: _____

Language sample: _____

Does the student show communication intent? ☐ Yes ☐ No

Does the student show joint attention? ☐ Yes ☐ No

☐ Free Play

☐ Structured Play (include toys and scenarios that would represent motor planning sequences (or syllable shapes specified motor planning patterns) Example: CV - hye VC - on C1VC1V2 dolly CVC - come, dck dog (for one) (see <https://www.nature.com/science>)

Comments: _____

165

Page 3: Linguistic continued

☐ Document vocal errors that are not a result of articulation

☐ Linguistic Difficulties (Comments from Teacher/Parent (or review of benchmark assessment student report))

Receptive and Expressive Language

☐ Receptive language better than expressive language

Test Given: _____

Results:

	Age	Standard Score	Percentile
Receptive Language			
Expressive Language			
Significant			

Comments: _____

Assessment of Motor Speech Skills

DEMSA (<https://products.brooksandjohnson.com/Dynaspec/Evaluation-of-Motor-Speech-Skill-DEMSA-Manual-C1202.aspx>) (revised and revised of recommended for 1 year and older)

MSK Courter Communication CAS Screen (<https://www.mskscreen.com/MSK-CAS-Screen.aspx>) (under therapy)

Testing should be dynamic and should include phonemes, words, and syllable shapes in order to determine severity of the disorder. (Comments should be used if administering an articulation test to determine CAS. If only errors are noted, the student may be deemed. Each answer must be transcribed to assess consistent production of phonemes, prosody, voicing and vowel errors.)

Test Given: _____

Comments: _____

Consonant errors are inconsistent

Vowel errors

Errors on vowel production

Unusual vowel production

Single word production better than:

☐ Sentences

☐ Connected speech

☐ Syllable shape where breakdown occurs

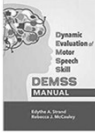

166

Dynamic Evaluation of Motor Speech Skill (DEMSS)
 Dr. Edith Strand and Dr. Rebecca McCauley
 Jslhr.pubs.asha April 2013

Ages 3-6.5

Movement accuracy

- Vowel Errors
- Consistency
- Prosody

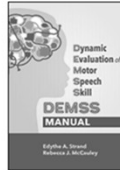

Subtests

- Consonant-Vowel (me; hi)
- Vowel-Consonant (up; eat)
- Reduplicated Syllables (mama; booboo)
- CVC1 (mom; peep; pop)
- CVC2 (mad; bed; hop)
- Bisyllabic 1 (baby; puppy)
- Bisyllabic 2 (bunny; happy; today; canoe)
- Multisyllabic (banana; video)

MK Courter Communications Dynamic CAS Screener

This screener is designed to assess syllable shapes (motor plan) from the simplest to the most complex. It is designed to use as a dynamic assessment to determine consonant and vowel production without and with cuing to determine where to begin therapy and how the student responds to the cues utilized.

Directions:

1. Begin with consonant – vowel (CV) and move through the screener.
2. Have the student look at you when you say the word. Do not provide any other cuing for the first production. Score production as a 1 for correct or a 0 for incorrect.
3. If the student does not produce the correct consonants and/or vowels, repeat the syllable shape. Take notes on any changes.
4. If not produced correctly, add cuing (if your child) to measure change of production with cuing. Score again in the space provided next to each word.

Scoring:

Overall Production	Vowels	Take Notes
1 = correct 0 = incorrect	2 = correct 1 = mild distortion 0 = incorrect	<input type="checkbox"/> Type of cue provided <input type="checkbox"/> Voicing errors <input type="checkbox"/> Incomplete production <input type="checkbox"/> Vowel distortions <input type="checkbox"/> Prosody errors
1. Score initial production with eye contact as correct or incorrect. 2. Score the second production. 3. Score third response as correct or incorrect.	1. Score vowel in first production as correct, mild distortion, or incorrect. 2. If vowel is distorted or incorrect, exaggerate the vowel and score again as correct, mild distortion, or incorrect. 3. Score the second production as correct or incorrect when cuing for the vowel occurs. 4. Add additional words to assess vowel if errors are noted.	Use the note section to indicate student responses including other characteristics of CAS.

☐ Decreased dysarthria (muscle is at rest)

Describe: _____

172

Diadochokinetic Rate

Lewis et al. (2004) found significant differences between preschool and school-age children with CAS and matched children with non-CAS speech delay in their ability to repeat nonwords and multisyllabic words, with the CAS group performing more poorly.

Vocal Quality	<p> <input type="radio"/> Adequate <input type="radio"/> Harsh <input type="radio"/> Nasal <input type="radio"/> Hoarse <input type="radio"/> Unpleasant </p>
<p> Cues are activated when assessing nasals. A possible method is: Have the child sustain a nasal sound (i.e. "m" or "n") for a vowel. If the clinician notices the nasals and the child doesn't change, then the velopharyngeal port is closed and the child is not able to change the sound. </p> <p> Have the student sustain a nasal sound (i.e. "m" or "n") for a vowel. If the vowel sounds like the child is not able to change the sound, then the nasals are occluded, thus the velopharyngeal port is functioning properly. </p> <p> Does a nasals analysis of difficulty with consonantization. Consonantization refers to the phonetic analysis of speech sounds in speech. This may be described in children with CAA. </p> <p> Motor control in typical and disordered speech claims that lack of coarticulatory coherence is related to problems in planning and programming of speech movements (Sergent & Madsen, 2007). </p>	
Rate	<p> <input type="radio"/> Adequate <input type="radio"/> Too fast <input type="radio"/> Too slow </p>
Stress (Prosody)	<p> <input type="radio"/> Adequate <input type="radio"/> Stress is on the wrong syllable <input type="radio"/> Excludes stress on all syllables </p>
Intonation	<p> <input type="radio"/> Adequate <input type="radio"/> Inappropriate (monotone/appropriate rise and fall for types of sentences) </p>

174

Page 7
Loadness

☐ Appropriate
☐ Too loud
☐ Too soft

Fluency

☐ Appropriate for age
☐ Atypical (Describe)

Describe: _____

Checklist of Characteristics: General

☐ Sound production limitations within syllable shapes

☐ Consonants

☐ Vowels

☐ Uses sounds inconsistently

☐ Changes sound production with repetition

☐ Lengthened or disrupted coarticulatory transition

☐ Between sounds

☐ Between syllables

Other

☐ Sensory Issues (Occupational Therapist consultation recommended)

☐ Motor coordination throughout body reported (Physical Therapist consultation recommended)

175

Characteristics of Childhood Apraxia of Speech

To be classified as positive for CAS, a speaker is required to meet criteria for at least 4 of the 10 listed signs ([Shriberg et al., 2016a](#)).

Segmental

- ☐ Vowel distortion
- ☐ Voicing errors
- ☐ Distorted substitutions
- ☐ Difficulty achieving initial articulatory configuration or transitory movement gestures
- ☐ Grouping
- ☐ Intrusive schwa
- ☐ Increased difficulty with multisyllabic words

Suprasegmental

- ☐ Difficulty with syllable segmentation (Noticeable gaps between syllables* when producing words of 3+ syllables. Within-word pauses)
- ☐ Slow speech and/or diadochokinetic rate
- ☐ Equal stress or lexical movement (prosody)

☐ The student demonstrates _____ out of 10 characteristics

☐ meets the criteria of CAS ☐ does not meet the criteria of CAS

176

Older patients may require and assist movement measurement for moving to foods with consistency. With young children with feeding issues when textures are increased should proceed for and practice.

☐ **Sturdier food not reliably feeding issues**

Choking and gagging

- ☐ Difficulty forming bolus
- ☐ Choking with solids
- ☐ Choking noted on textures
- ☐ Choking noted
- ☐ Safety Note

Textures: Difficulty with

- ☐ Smooth
- ☐ Lumpy
- ☐ Crunchy
- ☐ Other

Colors: Prefers

- ☐ Blind
- ☐ Salty
- ☐ Sweet
- ☐ Bitter
- ☐ Other

Temperatures:

- ☐ Room temperature
- ☐ Warm
- ☐ Hot
- ☐ Cold

Chewing pattern (www.beckmanmiller.com New Patterns)

- ☐ Winging (chewing with tongue food *not* ground meat)
- ☐ Lateral jaw shift (side to side movement)
- ☐ Disjunctal movement (lateral, downward movement of jaw)
- ☐ Disjunctal rotary (lateral, downward arc movement with horizontal sliding)
- ☐ Circular rotary (circular, downward arc movement arc midline)

Overall Notes

177

Intervention Based on Motor Learning Principles

x The primary focus of intervention based on motor learning principles is the movement from one sound to another, one syllable to another, and one word to another with correct vowels, consonants, voicing, prosody, and intonation.

179

180

181

182

183

184

185

Breakout Activity 5

In Breakout Room, come up with a couple of words for each motor shape

185

186

Intervention Approaches

The following two approaches are based on motor learning principles. Although these are designed for students with motor planning disorders, the concept and approach can apply to both developmental and neurological speech disorders.

186

187

74

Speech Motor Chaining

- x University of Syracuse (Preston)
- x Designed to facilitate acquisition of simple speech targets through frequent and specific feed back
- x Based on success, treatment is adapted through 5 levels.
- x Procedure involves selection of a target sound in a syllable position (i.e.: /k/ in onset and /s/ is coda which is the final consonant or the final consonant part. (i.e.: "alt" is the coda in "salt").

<https://chaining.myspeechlink.com/Identity/Account/Login>

Now requires a yearly membership: \$55/year

187

189

Examples: Sounds can be in the onset or coda

dog

onset
nucleus
coda

pl a nt

onset
nucleus
coda

189

190

Procedure

1. Target sound in syllable position is selected (e.g., /k/ in onset or /s/ in coda,
 - a. Appropriate targets are typically sounds that are below 50% accuracy in a particular syllable position when tested at the word level.
 - b. Typically, two broad targets are treated per child for each session (e.g., onset /t/ and coda /k/).

190

191

Procedure

2. Once the target sounds are selected, sound sequences of two phonemes (CV, VC, or CC) are chosen, which represent the target sound in syllable position.
 - a. For example, the target of onset /t/ could be addressed with four variants: two /t/ singleton variants such as /ti/ and /td/ and two /t/ cluster variants such as /dt-/ and /kt-/.
 - b. Coda /k/ could be addressed with four variants such as singletons /ek/ and /ʊk/ and clusters /-kt/ and /-sk/.
 - c. In each session, two different chains are chosen per variant, resulting in 16 chains per session (2 sounds × 4 variants × 2 chains).

191

Example

Table 1. Examples of target sound/position and four possible variants (sound sequences) for practice across a range of phonetic contexts.

Target sound/position	Variant 1	Variant 2	Variant 3	Variant 4
/s/ onset	/sa/	/si/	/di/	/ki/
/s/ onset	/si/	/so/	/sk/	/sn/
/k/ rhyme	/sk/	/æk/	/sk/	/kt/
/f/ rhyme	/tf/	/æf/	/nf/	/nf/

192

Procedure

3. During practice, additional movements are gradually added before the target sequence (backward chaining) or after the target sequence (forward chaining).
 - a. For example, when training the target /s/ in onset, one representative sound sequence is /sn/.
 - b. Chaining for each sequence begins in a syllable (e.g., /snæ/),
 - c. followed by a monosyllabic word (e.g., snap),
 - d. a multisyllabic word (e.g., snapping, resnap),
 - e. a short phrase (e.g., resnap the jacket, or He was snapping), a
 - f. eventually a self-generated sentence (e.g., using the word ssnap or snapping in a sentence).

193

Procedure

4. Practice at the higher levels of linguistic complexity only occurs when there is success at the previous level.

194

Session: Prepractice

- x Explicit Instruction: Correct or incorrect of variants with cueing as needed (knowledge of performance)
- x Knowledge of response: cueing and immediate response for correct production.

Prepractice is continued until client achieves several correct productions (at least three of each variant in a simple motor plan such as CV, VC, CC)

195

Session: SMC Practice

- x Target syllables, words, and phrases are elicited in blocks of 6 consecutive attempts
- x Practice begins at the syllable level

196

Session: SMC: 5 Practice Levels

1. Syllables, which contain at least one consonant and one vowel: CV, CC(V), VC, or (V)CC
2. Monosyllabic words, which begin or end with the syllable and which contain both an onset and a coda;
3. Multisyllabic words, which include two or more syllables and which contain the monosyllabic word;
4. Phrases, which include two to five words and which contain the monosyllabic word or the multisyllabic word;
5. Self-generated sentences, in which the child uses either the monosyllabic word or multisyllabic word in a novel sentence.

197

Examples

Table 2. Examples of chains.

Sound/position	Syllable	Monosyllabic word	Multisyllabic word	Phrase	Self-generated sentence
/r/ onset	/ra/	rot	rotten	rotten food	?
/r/ rhyme	/ra/	for	before	just before	?
/k/ onset	/ka/	keep	keeping	keeping my money	?
/k/ rhyme	/ka/	book	bookshelf	on the bookshelf	?
/s/ onset	/sa/	sit	sitting	sitting down	?
/s/ rhyme	/est/	cast	broadcast	national broadcast	?
/t/ onset	/te/	champ	champion	world champion	?
/t/ rhyme	/tʃ/	witch	sandwich	eat a sandwich	?

Note. Observe that the target sequence (in bold) remains consistent throughout the chain.

198

Progression

x Advancing from one level of a chain to the next level requires at least five of six correct productions in a block.

For example, five correct productions of the syllable /ja/ are needed to progress to the monosyllabic word *rock*.

Table 2. Examples of chains.

Sound/position	Syllable	Monosyllabic word	Multisyllabic word	Phrase	Self-generated sentence
/r/ onset	/ja/	rot	rotten	rotten food	?

199

Progression

Failure to achieve at least five correct productions at any level results in moving to a new chain with a different variant of the target, returning to Level 1.

Example: switching from a /ja/ chain to a /ji/ chain).

200

Progression

A chain is mastered when a child successfully progresses through all five levels of the chain on two separate occasions (i.e., at least five correct productions of a self-generated sentence).

Once the chain is mastered, a replacement chain with the same variant is used in the next session (e.g., replace *rock-rocket-my rocket ship* with a chain such as *rot-rotten-rotten food*).

201

Consideration

While using an approach such as Speech Motor Chaining, the severity of the student needs to be considered and whether they are able to move through multiple patterns. If yes, this is the best approach for quickest acquisition. If not, a more sequential approach that moves through each syllable shape would need to be considered.

202

Example: Complexity of Speech Chains from a Syllable Shape Perspective

Speech Chain Patterns /s/ Initial

V									
VV									
CV	see /s/	si /	se	say	sa	sis	so	saw	soo

204

205

Dynamic Temporal and Tactile Cueing

Edith Strand developed DTTC based in Integral Simulation Therapy. This approach is based on the following core elements :

(a) the focus on the movement (rather than the sound or phoneme) in terms of modeling, cueing, feedback, and target selection; (b) emphasis on facilitating the child's intent to improve motor skills; and (c) attention to proprioception

https://pubs.asha.org/doi/10.1044/2019_AJSLP-19-0005
Strand (2020)

205

206

Dynamic Temporal and Tactile Cueing

Edith Strand developed DTTC based in Integral Simulation Therapy. This approach is based on the following principles:

1. Improve the efficiency of neural processing for the development and refinement of sensorimotor planning and programming.

https://pubs.asha.org/doi/10.1044/2019_AJSLP-19-0005

206

207

2. Schema principles
 - a. One theory, from which much of the research in motor learning arose, is schema theory (Schmidt, 1975, 2003), which was intended to explain discrete actions (fast simple movements vs. Complex movements; Schmidt, 2003; Wulf & Shea, 2002).
 - b. A schema as a relationship between outcomes from previous attempts at executing motor programs and the specifications of movements used during those attempts.

207

208

3. Motor Learning Theory as Related to Speech Production
 - a. Initial Condition: Articulatory placement, voicing, prosody, intonation, phrasing
 - b. Motor Commands Needed: Timing and amplitude of production
 - c. Sensory Consequences:
 - i. Tongue and lip movement for production
 - ii. Tactile awareness of articulatory placement
 - d. Outcome: Were the speech sounds, voicing, intonation, and prosody correct?

208

209

4. Providing auditory and visual models, shaping the movement through slowed rate and visual and tactile cues, adding and fading cues as needed, providing specific feedback about the movement (knowledge of performance [kp]) early on, and fading to knowledge of results (kr) to facilitate learning and retention.
5. Modeling and provision of kp in which the child is given specific information about their errored movement helps the child refine the appropriate response specification (e.g., direction, range, speed, force) for the intended movement. The initially slowed rate and use of simultaneous production provide more time for the proprioceptive feedback

209

210

Therapy, just at for Speech Motor Chaining, concentrates on syllable patterns and not specific phonemes. clinicians implementing therapy based DTTC are encouraged to also think about vowels (as vowels are often distorted in motor planning disorders), syllable length and shape, and errors in prosody (e.g., segmentation, equal or incorrect stress) in target selection (Strand, 2020)

210

211

Motor Shapes

V/VV	(would not target vowels or VV outside of a syllable shape) USE THIS SPACE FOR DOCUMENTATION
C	(would not typically target a consonant by itself outside of a syllable shape) USE THIS SPACE FOR DOCUMENTATION

CIVIC1	
CIVIC2	
CVCVCV	
CVCV + CVC	

211

212

General Guidelines: Step 1 Stimulus

- x 8-10 stimulus (less for more severe cases)
- x Carefully selected
- x May start with one syllable shape if more severe.
- x Less severe: could start with current pattern with a few in the next pattern

Mild	Moderate	Severe/Profound
Requires minimal cuing to obtain syllable production	Considerable cuing needed to produce syllable shape	With considerable cuing, cannot produce syllable shape
<ul style="list-style-type: none"> Improvement is more rapid Prognosis: Good Larger stimulus set (8-10) and can include words from more than one syllable shape More random practice 	<ul style="list-style-type: none"> Progress is good but longer duration to therapy Larger stimulus set and can consider words from more than one syllable shape 	<ul style="list-style-type: none"> Progress is guarded Smaller stimulus set (3-5) May not be able to include words from other motor shapes More block practice Increased frequency and type of feedback

212

213

General Guidelines: Step 2 Stabilize Existing Consonants and Vowels

Sounds may be produced correctly in certain positions or contexts and not in others. Stabilize the consonants and vowels that the student is able to produce in various motor shapes.

213

214

General Guidelines: Step 3 Produce Stabilize Stabilized Consonants and Vowels

- VC (in)
- CV (no)
- VCV (oh no)
- CVCV (mama)

214

215

General Guidelines: Step 4 Target New Vowels and Consonants

- Choose sounds for which the child is most stimuable
- Select sounds that occur more frequently in English
Schwa /a/, /s/, /t/, /r/, /o/, /e/, /a/
- Select sounds that are visible (i.e.: /p/, /b/, /m/)
- Select sounds that are developmentally appropriate

215

216

General Guidelines: Step 4 Expand Motor Shapes

V/VV	(would not target vowels or VV outside of a syllable shape) USE THIS SPACE FOR DOCUMENTATION
C	(would not typically target a consonant by itself outside of a syllable shape) USE THIS SPACE FOR DOCUMENTATION
CV	
VC	
VCV	
CIVICIV1	
CIVICIV2	
CIVICV2	
CIVIC1	
CIVIC2	
CVCVCV	
CVCV + CVC	

216

217

General Guidelines: Step 6 Increase Variability

- x Concentrate of current motor shape while adding another one in proximity (based on the severity of the disorder).
- x New shape may require more cueing.

Current target	CIVICIV1	
	CIVICIV2	mommy, daddy
Proximity target	CIVICV2	pony, happy
	CIVIC1	
	CIVIC2	
	CVCVCV	
	CVCV + CVC	

217

218

General Guidelines: Step 7 Vary Prosody

- x Once the student can produce the stimuli over several repetitions, begin to vary the production with rising and following intonation, louder/softer, etc. to support motor learning. (Example: no, no!, no?)

218

219

*** Temporal Hierarchy

Goal: varying the amount of time between the clinician's model and the child's imitative response

https://pubs.asha.org/doi/10.1044/2019_AJSLP-19-0005

SPONTANEOUS PRODUCTION

219

221

Can't Remediate that /R/: Assessment and Intervention

221

222

Questions

- x Where is /r/ produced?
- x How many /r/s in English?

222

223

Why is /r/ so difficult?

83

- x Articulatory placement (alveolar, to post alveolar, to palatovelar)
- x Student hasn't responded to standard techniques
- x Instruction regarding placement is the wrong motor plan for that student
- x At least 21 different /r/s!

No other sounds in English have so many place of articulation or variations.

223

Dynamic /r/ Screener

MK Courter Communications Dynamic /R/ Screener

This screener is designed to assess /r/ from a motor planning approach. It is designed to use as a dynamic assessment to determine /r/ production without and with cueing to determine where to begin therapy and how the student responds to the cues utilized.

Directions:

1. State each word.
2. Have the student look at you when you say the word. Do not provide any other cueing for the first production. Score production as a 1 for correct or a 0 for incorrect.
3. If the student does not produce the word correctly, repeat the word adding a cue. Take notes on any changes.
4. If still not produced correctly, add a different cueing (of your choice) to measure change of production with cueing. Score again in the space provided next to each word.

ADD A FOOTER

225

225

Scoring:

Production	Take Notes
1 = correct	<input type="checkbox"/> Type of cue provided 1 st attempt
0 = incorrect	<input type="checkbox"/> Type of cue provided 2 nd attempt
	<input type="checkbox"/> Inconsistent production
	<input type="checkbox"/> Prosody errors
	<input type="checkbox"/> Other

1. Score initial production with eye contact as correct or incorrect.
2. Score the cued production if 1st attempt was not correct
3. Score cued response as correct or incorrect.

ADD A FOOTER

226

/r/		
1. art		
2. bark		
3. car		
/r/		
4. learn		
5. learn		
6. her		
7. father		

For Motor Planning, initiation is the most difficult

229

Summary

Most Stimulable

Starting Point for Therapy

236

Stimulus	Attempt Score: 1 or 0	Notes
Other		

https://drive.google.com/file/d/1F-rocp8A8I0r1UI0iBeRm2HOsO8Te_Jt/view?usp=sharing

237

If Probe Does Not Yield a Correct /R/

If motor planning, asking a student to produce a bunched or retro flex /r/ based on verbal directions would be contraindicated

238

Ways to Elicit /R/: Step 1

- ELICIT CORRECT PLACEMENT AND SOUND PRODUCTION
- PRODUCE /L/ OR /TH/ AND SLIDE BACK
- HARD /G/ AND SLIDE FORWARD FOR /GER/
- /Y/ AND RAISE TONGUE TIP TOWARD PALATE AND SLIGHTLY BACK
- *** MAY TRY OTHER CONSONANTS SUCH AS /SH/

239

Step 2

Once Placement is Achieved

- x The student produces a correct /r/, therapist taps student's arm and asks the student to hold the position
- x Student describes tongue position

240

Step 3: Right to Correct Position

- x 1. Continue sliding from one sound to /r/ until the student can go right to the correct tongue placement
- x 2. Once the student can produce the /r/ then have the student go to the correct /r/ placement
- x 3. Therapist continues to tap to hold the place

Reminder, if motor planning, asking a student to produce a bunched or retro flex /r/ based on verbal directions would be contraindicated

241

How to Begin to Remediate

- x 1. Therapist chooses which /r/ to begin with (by using a mastered /r/ from the screener or choosing which /r/ if there are no mastered /r/s.
- x 2. A mastered /r/ can be used to move to a unmastered /r/

242

If /r/ is established by sliding from one phoneme to the /r/

1. Therapist chooses if no /r/ mastered
2. Greatest impact on intelligibility
3. Which /r/ will make it easier to get to the next /r/

243

Example: Initial /r/

- x Therapist chose initial /r/ to target first

244

Step 1: Vowel Circle with CV

Vowels

Smile /i/ (ree) /ɪ/ (ri) /e/ (re) /æ/ (ray) /a/ (ra) /ʌ/ (ru)	High Front Mid Front Low Front Mid Central	Schwa /ə/ Mid Central	Round /u/ (roo) /ʊ/ (roo) /o/ (ro) /ɔ/ (raw) /ɑ/ (ro) /ɒ/ (row) /ɔʊ/ (row)	High Back Mid Back Low Back
---	---	-----------------------------	---	-----------------------------------

Diphthongs
/aɪ/ (rie)
/ɔɪ/ (roy)
/aʊ/ (row)

245

Premise

- x Student may be stimutable for one or some but not necessarily all
- x Target the ones that are correct (8-10 words)
- x If more than one are correct, split the words between the correct ones
- x Once maintained, rescreen (vowel + /r/)

Acquisition through practice
Maintenance (retention)
Generalization (transfer)

246

Premise

- x 5. Once all /r/ + vowels + consonants are generalized, therapist would move to a new /r/ (vocalic /r/)
- x 6. To determine which vocalic /r/ to target, rescreen all /r/s
- x 7. If no vocalic /r/ is mastered, therapist chooses
- x 8. Base next /r/ on the prevalence in English

Acquisition through practice
Maintenance (retention)
Generalization (transfer)

247

Example

****ree	roo (root)
ri	roo (roof, foot)
re	roe
ray	rie
ra	row
ru	roy
ro	rue (are you)
raw	

248

8-10 Target Words

read	wreath
reef	reach
reek	respect
real	redo
ream	
reap	

249

Motor Planning Patterns/Syllable Shapes

Words chosen for targets should begin with simple single syllable words (consonant-vowel patterns). Multisyllable words may need to be targeted after mastery of single syllable words. The student may also have to move from 2 syllable, then 3, then 4.

Step 2: Determine 8-10 Stimulus

- respect
- regard
- response
- ripple
- radio
- ripped

250

8-10 Target Words

****ree	roo (root)
****ri	roo (roof, foot)
re	roe
ray	rie
ra	row
ru	roy
ro	rue (are you)
raw	

251

8-10 Target Words

reed	rid
reef	rig
reek	rim
real	rip
ream	
rib	

252

Forward Chaining

97

1. Always keep the initial sound and the vowel together for coarticulation.
2. Have the student state the first part
 - a. Provide multisensory cues
 - b. Could attempt simultaneous production (saying it together)
3. Once the student is successful with the first part, have them state the second part
4. Blend the two together.
 - a. May need to use cues initially
 - a. Fade cues as student is successful

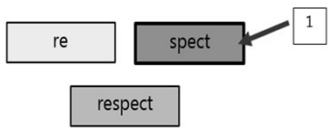

253

Backward Chaining

1. Consonants and vowels in the word must be produced correctly.
2. If the student is able to produce the first syllable correctly, but let's say, produced the vowel or another sound incorrectly in the second syllable (or any syllable in a multisyllabic word), backward chaining could be used to get the correct production of the incorrect syllable.
3. Use multisyllable cues to demonstrate the correct production of the incorrect sound.

256

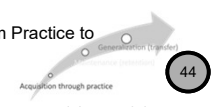

Re is produced correctly.
spect is in error (i.e.: student states "spit" or "pect").
Correct the error in the second syllable.

Then add the first syllable. May need to continue to cue the second syllable and fade as soon as possible

257

Step 3: Therapy Progression from Practice to Maintenance

1. The student produces the targeted /r/ word(s) by repeating 8-10 targeted words one at a time (reek, read, reef, real, ream, reap, wreath, reach, respect, repeat).
2. The student then attempts 2 repetitions of the word (i.e.: ream, ream)
3. The student can repeat a targeted word 3 times (i.e.: ream, ream, ream)

258

Therapy Progression from Practice to Maintenance

4. The student can repeat a targeted word 4 time.
5. The student can repeat a targeted word 5 time.
6. The student can repeat the targets rapidly with changing the word to another target (i.e.: ream, ream, ream, reap)

259

Therapy Progression from Practice to Maintenance

7. The student can add another word (i.e.: ream, ream, reap, reap, real, real)
8. The student can alternate patterns (i.e.: ream, reap, ream, reap)

260

Step 4: Therapy Progression from Maintenance to Generalization

Once the student is able to alternate patterns with ALL C1V1C2 words, then, this motor planning pattern needs to move toward generalization before rescreening all /r/ patterns.

1. The student can produce the word with a carrier phrase. (re: one word + the target.
Then, 2 word phrases + the target, etc.)
2. The student can produce the word correctly in a given sentence.

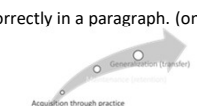

261

Therapy Progression from Maintenance to Generalization

Once the student is able to alternate patterns with ALL C1V1C2 words, then, this motor planning pattern needs to move toward generalization before rescreening all /r/ patterns.

3. The student can produce the word in a novel sentence.
4. The student can produce the words correctly in a paragraph. (only containing the /r/s that are mastered)

262

https://drive.google.com/file/d/1oIWR9Gx3sPPi8hkjaiw3eB_9ctpZaIK/view?usp=sharing

263

Next Step: /r/ Therapy Progression

The goal is to use an /r/ that has been remediated, maintained, and generalized to target the next /r/.

99

Moving to the Next /r/

1. Once the next target is determined, the therapist can use a previous target to target the new /r/.

New target		/r/ initial word that is the easiest to produce
her	rrrrrr	rabbit
burr	rrrrrr	rabbit
sir	rrrrrr	rabbit
fur	rrrrrr	rabbit

264

2. May have to delete the /r/ from the new word so that the student does not motor plan the incorrect /r/ first.

h	rrrrrr	rabbit
---	--------	--------

265

Goal

1. Get the student to think about the mastered /r/

2. May have to cover the /r/ of the new word

3. Tap the student as soon as you hear the correct /r/ sound

4. Once the student can say the new word without the mastered word, take the mastered word away, and move to multiple productions

5. One the student can produce multiple repetitions, rescreen

266

- ***** May have to practice these as nonsense one syllable words in order to move to multisyllable nonstressed vocalic /r/

267

Example using /ar/ to get to /r/

https://drive.google.com/file/d/1hPiD3v2Vqy9bFbFLqvqieVI_EOtWzgXA/view?usp=sharing

268

Final R to Initial R Practice

Use the word "ar" in front of the following words. Hold out the /r/ sound at the end of "ar" (ie: "ar rrrrr") and add the words below.

arrrrrrr

eek

Example

Judge your /r/ sound before you say the new word.

Long /ee/	Short /i/	Short /e/	Long /ae/	Short /a/
ar rrrrr	ar rrrrr	ar rrrrr	ar rrrrr	ar rrrrr
eek	ib	ed	ake	ack
eef	id	ef	aid	ag
eal	iff	eck	age	am
eam	ick	ep	ail	an
esp	im	est	ain	ap
ease	ip	ev	ace	at
eath	ist		ate	ave
each			aise	

269

Moving to /r/ Medial: Using Forward Chaining

101

Example of Forward Chaining

C1V1C2V2

rob

in

ro

bin

C1V1C2

rea

ch

270

Once the final /r/ is mastered, the next position of that /r/ can be targeted.

271

Goals and Objectives: SMART

101

Specific

- This is the specific goal or goals that are being targeted
- (Name of student) will produce initial /r/ and vocalic /r/

Timely

- This is the timeframe of your goal. Are you writing for an IEP cycle, calendar year, or shorter time increment?
- By _____ (date or timeframe)

272

Realistic/Achievable

- This is the opportunity to determine how realistic the goal is based on the student.
- Pick: at the single word level, with 5 repetitions, with alternating patterns, in phrases, sentences, structured tasks (reading sentences, reading paragraphs, spontaneous speech), unstructured tasks, or spontaneous speech

Measurable

- This is the data collection. How will the goal be measured? (# of trials, percent correct, etc)
- with 95% accuracy (over three consecutive sessions, in the classroom, in spontaneous production, etc)

273

Goal (Long Term)

By the end of the fourth quarter (timely), student will produce initial /r/ and vocalic /r/ in unstructured task such as spontaneous speech (specific and reasonable) with 95% accuracy while talking with peers or in class (measurable).

274

Objectives (Short Term)

1. Student will produce _____ (initial /r/ or specific vocalic /r/ or other speech sounds being targeted) in (single, with 2, 3, 4, or 5 repetitions, alternating patterns,) words using 8-10 words (stimulus) with 100% accuracy (with cues, without cues) over three consecutive sessions.

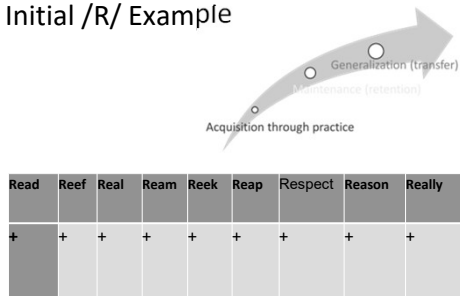

275

2. Student will produce _____ (initial /r/ or specific vocalic /r/ or other speech sounds being targeted) in structured tasks for generalization (phrases, sentences, reading) with 95% accuracy (with cues, without cues) over three consecutive sessions.
3. Student will produce _____ (initial /r/ or specific vocalic /r/ or other speech sounds being targeted) in unstructured tasks for generalization with 95% accuracy (with cues, without cues) while conversing with peers over three consecutive sessions.

276

Initial /R/ Example

Practice

278

Targets and Documentation

Maintenance

Read	Reef	Real	Ream	Reek	Reap	Respect	Reason	Really
++	+-	+-	--					
visual/tactile	visual/prosodic	visual/prosodic	prosodic/visual					

279

Targets and Documentation

Maintenance

2 repetitions maintained without cuing

Read	Reef	Real	Ream	Reek	Reap	Respect	Reason	Really
++	++	++	++	++	++	++	++	++

Once the student is able to produce 2 repetitions without cuing, move to 3 then 4 repetitions

280

Targets and Documentation

Maintenance

Once the student is able to produce 2 repetitions without cuing, move to 3 then 4 repetitions

281

5 Repetitions (not yet maintained)

Read	reef	Real	Ream	reek
+++++	++---	-----++	--+++	--+++
	Visual/Tactile	Visual/tactile/ Prosodic	Prosodic/Visual	Visual/Tactile

282

5 Repetitions (maintained without cuing)

Read	reef	Real	Ream	reek
+++++	+++++	+++++	++ +++	+++++

283

Repeat Word 3 Times Then New Word

Once the student can do 5 repetitions **without cues or errors**, have the student repeat the same word three times then switch to another word.

CIVIC1	read	read	read	reap	reap	reap
1 change						

change

284

Repeat Two Times, Change, Repeat Two Times, Change

Once the student can make the one change as the example above without cues or errors, then have the student make two changes. Repeat the same word a couple of times, then switch to a new word then switch again.

CIVIC1	read	read	reap	reap	reek	reek
2 changes						

change change

285

Alternating Patterns

An alternating pattern may be more difficult than the above patterns.

CIVIC1	read	reap	read	reap	read	reap
alternate						

286

**Generalization
Pivot Phrases and Documentation**

One syllable	2 syllables	3 syllables	4 syllables
My _____	Open _____	Open the _____	Can I have _____
Help _____	Put on _____	Put on a _____	I don't want _____
No _____	Take off _____	Take off the _____	Help me open _____
Help _____	I want _____	I want a _____	
On _____	Help me _____	Help me on _____	
Hi _____	Begin _____		
Bye _____	Enjoy _____		
Blue _____			

287

Next

4. Develop sentences of any complexity
5. Move to paragraphs with only mastered /r/
6. All maintained /r/ patterns should be included for practice

288

Next Steps

Step 1:
Rescreen all /r/s

Step 2:
Pick the next /r/ and follow the above steps

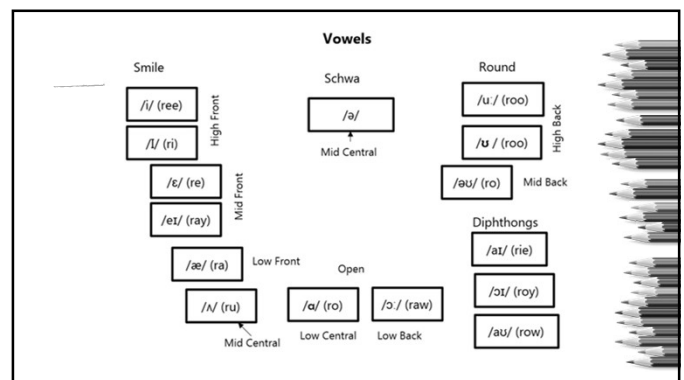

289

Using /ar/ as a starting point

Student can produce /ar/ in the final position. How do you use this /ar/ to get to the next target?

/ar/	/r/ initial in a CV pattern
car	re
bar	ri
far	re
star	rae

290

291

Let's Chat

What if your student can only produce /ar/ in the medial position like in bark, park, farm, yarn, cart, large, march, heart. What would you need to do first?

292

Generalization of Persistent Speech Sound Disorders

We often see difficulty with generalization with students with PSSD.

When attentional issues are added, the ability to generalize becomes a heavy burden for the student. The following section will provide some strategies for generalization for PSSD.

293

294

Generalization of Persistent Speech Sound Disorders

- X Goal Setting – Explicit Instruction
- X High Interest Activities and Discussion
- X Practice in a Variety of Contexts and Environments to lead to quicker generalization
- X Introduce Distractions into Therapy – increase the cognitive load
- X Invite a Friend to Therapy

294

295

Generalization of Persistent Speech Sound Disorders

X Homework

- Talking time: Ask parents to have the student share the best part of their day.
- Talking time during a meal: Each person shares something about their day without interruption of other family members.

295

296

Generalization of Persistent Speech Sound Disorders

- X Choose a Word of the Day
- X Collaboration with Classroom Teacher

296

297

You Decide: Best Approach

The following case studies are designed for you to determine the best treatment approach.

297

298

Case Study #1

- Age at evaluation: 5;9
- Background: normal pregnancy and birth history, no history of ear infections, physical development delayed, language development delayed. Significant family history for speech and language disorders

Clinical Evaluation of Language Fundamentals Preschool:
Auditory Comp standard score: 93. Expressive: 83

298

299

Case Study continued

Speech: Kaufman Test of Speech Praxis
Oral motor: standard score 12
Simple movement: below norms
Complex movement: below norms

299

Case Study continued

Information reported:

- Difficulty with moving articulators on demand
 - Difficulty maintaining the same speech patterns twice
 - Difficulty imitating with increased complexity
 - Difficulty with diadochokinesis
 - Vowel distortions and errors
 - Better production of single words than longer utterances
- Intelligibility: 90% unintelligible in connect speech

**** You Decide**

300

301

Diagnostic Statement: Case Study 1

This 5 year 9 month old child who is exhibiting average receptive language and low average expressive language skills, and a severe impairment in speech acquisition with the following characteristics:

- Difficulty moving her articulators on demand
- Difficulty maintaining the same speech movement twice
- Difficulty imitating speech patterns with increasing complexity
- Difficulty performing diadochokinesis
- Vowel distortions/errors
- Better production on single words than longer utterances

These are due to primarily difficulty with planning and programming movement gestures for speech production (CAS). There is no evidence of dysarthria. She is pragmatically and socially appropriate, attends to the speaker, and attempts most tasks.

Case Study #2

- Age at evaluation: 3;6
- Background: Full term, uncomplicated birth
- Born with patent ductus arteriosus (PDA) required surgery at 2.6 years of age
- One diagnosed ear infection
- Developmental milestones on target for language development
- Family history of learning disabilities
- Language Sample: Using 6-8 word utterances. Could retell past events, verbal turn taking noted

302

303

Case Studies cont.

- Structured Photo Articulation Test
- Final consonant deletion
- Medial consonant deletion
- Voicing errors
- Substitutions (i.e.: /w/ for voiced /th/ in the initial position and /y/ in the medial, /y/ for /s/ initial, /f/ for /sw/, /d/ for /st/, /w/ for /br/ and /tr/)
- Blend reduction
- Fronting
- Could produce multisyllable words although sound errors or deletions were present

Phonemic inventory Probe: Targeting /p/, /t/, /n/, /l/, /r/									
Child Name: <i>Aw</i>					Child Name: <i>Aw</i>				
Target	# Cons	Production	Target	# Cons	Production	Target	# Cons	Production	Phoneme(s)
1. wjyly	1/2	wɔ: /	26. wjyly	0/2	wɔ: /	39. wjyly	0/2	wɔ: /	
2. hly	1/2	hɛ /	27. hly	0/2	hɛ /	40. hly	1/2	hɛ /	
34. wjyly	0/2	wɔ: /	28. wjyly	0/2	wɔ: /	41. wjyly	1/2	wɔ: /	
4. taly	1/2	tɛ /	29. taly	1/2	tɛ /	42. waly	1/2	wɔ: /	
5. wjyly	1/2	wɔ: /	24. wjyly	0/2	wɔ: /	43. haly	1/2	hɛ /	
6. tea	1/3	tɛ /	25. pea	1/3	pɛ /	44. hxy	0/1	tɛ /	
7. taly	1/2	tɛ /	26. waly	1/2	wɔ: /	45. whaly	1/2	wɔ: /	
8. haly	1/2	hɛ /	27. haly	0/2	hɛ /				
9. tory	1/2	tɛ /	28. tory	0/2	tɛ /				
10. paly	1/2	pɛ /	29. taly	0/2	tɛ /				
11. wjyly	0/2	wɔ: /	30. waly	1/2	wɔ: /				
12. pte	1/1	pɛ /	31. wjyly	1/2	wɔ: /				
13. hly	1/2	hɛ /	32. wjyly	1/2	wɔ: /				
14. taly	0/2	tɛ /	33. wjyly	1/2	wɔ: /				
15. wjyly	0/2	wɔ: /	34. haly	0/2	hɛ /				
16. haly	0/2	hɛ /	35. haly	1/2	hɛ /				
17. taly	1/1	tɛ /	36. wjyly	0/2	wɔ: /				
18. wjyly	1/2	wɔ: /	37. haly	0/2	hɛ /				
19. taly	1/2	tɛ /	38. wjyly	0/2	wɔ: /				

Stoel-Gammon (1986) stipulated that two occurrences are required for sounds to be included in the phonemic inventory. Circle sounds for which there are two occurrences on the above task:

Gierat & Champion (2001) indicated that a child must have the second **and** third consonants of a three-element cluster in his/her phonemic inventory to teach a three-element cluster. Circle permissible three-element clusters for treatment based on the phonemes indicated above:

/sp/ /sp/ /sk/ /sk/ /sp/

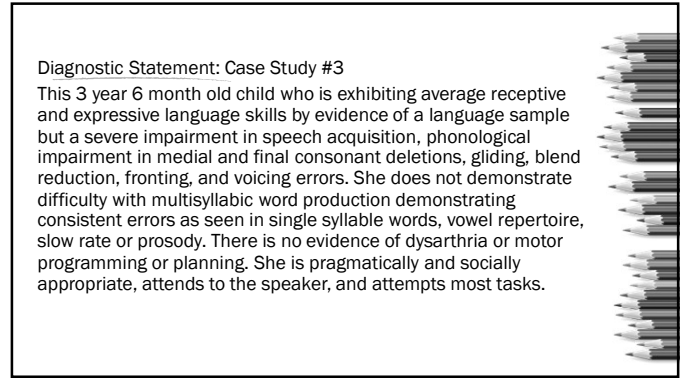

Total # of Consonants = 85 (Correct # of consonants) 29 / 85 = 25 %
Percentage Consonants Correct (FCC) = # correct consonants / total # of consonants

304

305

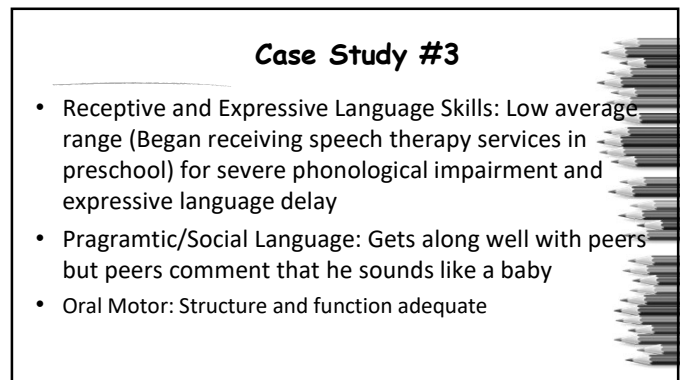

306

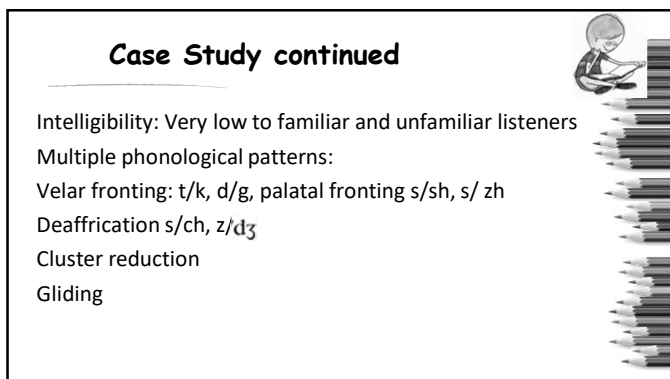

307

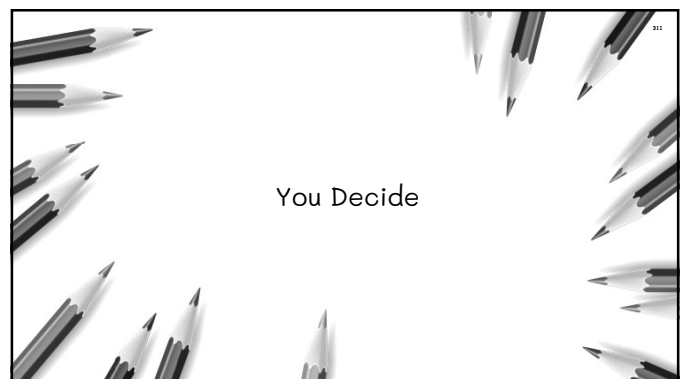

308

309

310

311

Diagnostic Statement: Case Study 6

This 6 year 2 month old child who is exhibiting below average receptive language and low average expressive language skills, and a severe impairment in speech acquisition with the following characteristics:

- Oral motor structure and function: adequate
- Multiple phonological processing errors
- Decreased overall speech sound development
- Low intelligibility

The student presents with multiple errors that requires an approach (Complexity Approach) to increase accurate speech production due to moderate to severe phonological impairment with low intelligibility and limited phoneme inventory. Language skills will also be targeted with building phonological awareness, morphology, syntax, and semantics through articulation targets. He is pragmatically and socially appropriate, attends to the speaker, and attempts most tasks.

What is Good Enough?

Story of Jack

312

313

SSD and Educational Impact: IDEA

Academic performance (i.e., class grades) is not the only factor that should be considered in making eligibility decisions (Dublinske, 2002; Posny, 2002).

- x Academic
- x Social-emotional (child's perceptions, feelings, and attitudes about how others view his or her communication, as well as the perceptions, feelings, and attitudes held by those who interact with the child.)

Great Resource: Wisconsin Department of Public Instruction: Considerations for Speech Impairment <https://dpi.wi.gov/sites/default/files/mce/sped/pdf/sl-speech-rubric.pdf>

SSD and Educational Impact: IDEA

Researchers have consistently found that having a communication disorder results in long-term negative academic outcomes (Lewis & Freebairn, 1992; Sices, Taylor, Freebairn, Hansen, & Lewis, 2007) and social interactions (McCormack, Harrison, McLeod, & McAllister, 2011; McCormack, McLeod, McAllister, & Harrison, 2009). Negative academic outcomes and social interactions may lead to a reduction in quality of life through adulthood (Feeney, Desha, Ziviani, & Nicholson, 2012).

314

315

From ASHA

Termination Due to Lack of Progress

An apparent "lack of progress" is based on the assumption that the prescribed treatment goals, methods, data collection, and use are all appropriate for the individual with disabilities and their family. However, *it is possible that the perceived lack of progress is actually an indication that the procedures being implemented are not well-suited to the individual with disabilities. In other words, lack of progress might indicate that the intervention is a poor fit. It is important to examine whether the intervention itself is optimal for the individual, their family, and their other caregivers and educators.*

Before we go ...!

316

317

318

Takeaways

- x Differential diagnosis leads to the right approach!
- x There are so many reasons for persistent speech sound disorders (developmental, neurological, hx of speech delays, hx of normal development but failure to achieve accurate production of 1 or 2 sounds, one syllable words OK but multisyllable difficult)
- x PSSD 1-2% and can persist into adulthood causing possible lower skilled jobs and unemployment

318

319

Takeaways

- x Perception of others regarding academic, social, and behavioral performance are impacted by SSD
 - Teachers have lower expectations
- x Research shows that children as young as 4-5 were successful with treatment of later acquired sounds
- x Strong link between SSD & phonology and morphology
- x Explicit, Systematic, and Sequential instruction works!
- x Generalization for PSD can cause cognitive overload

319

320

Thank you for making a difference!

PEANUTS

I wonder what SLPs make.

A difference. Peppermint Patty, they make a difference!

320
