

Spring Water Fresh

Whole House Water Filtration and Softeners

Our **High Quality Low-cost** Whole House Water 3-Stage Filtration Systems removes sediment, chlorine, chloramine, and much more! Enjoy healthier, better-tasting water from every tap in your home.

Because this 3-Stage water filtration system is installed at the main point for water coming into your house this means that water from every faucet in your home will have passed through the three filtration stages, giving you better tasting, smelling, and healthier water for you and your family.

What exactly do these three stages of filtration do? Used as the first stage of defense on the system, the **Stage 1-Filter** is a 5-micron high-capacity polypropylene sediment filter. This filter removes dirt and other various larger sized

particles from the water that can clog the following filters.

The **Stage 2-Filter** is a Granular Activated Carbon (GAC) filter made from granulated carbon that is the first line of defense for removing bad taste and odor from your water. The **Stage 3-Filter** is a Carbon Block filter (CTO) made of coconut shell carbon. Block carbon is more effective than other forms of carbon in that it is finely ground up carbon packed into a solidified block. Carbon block filters are made of a solid block of compressed carbon and are often used as a pre-filter in reverse osmosis and other water filtration systems. Carbon block water filters are extremely effective in filtering out a variety of contaminants including very small contaminants or particle size. All treatment systems require

proper installation and will require periodic maintenance.

Eventually, the filters' ability to bind and remove chemicals is used up and needs to be changed. How often the filters need to be changed is based on contaminant levels and water volume use. While some filters may last for years if contaminant levels and/or water use are low, higher levels or use may require more frequent change-outs, like once a year. This 3-Stage system is a very low maintenance water treatment system that **can be self-installed** by any individual that has any plumbing experience, or a DIY type of person that can do handyman task by watching videos.

This system is available with an **optional plumbing kit** that comes with water pressure gauges that can monitor the water pressure levels to help determine when the filters need changing. It also comes with a bypass valve to allow the system to be bypassed if an issue arises and to assist in any maintenance performed on the filters. It comes with a pre-filter screened filter with a manual drain. It comes with all the necessary PVC pipe fittings to complete a successful installation. (Does not include PVC pipe, PVC Pipe Cutter, or PVC glue).

Optional **professional installation is available** in certain geographic locations. (Call for locations and installation cost) All installations should comply to local housing codes.

The system comes with a 1" NPT inlet / outlet ports, and filter housing wrench to easily remove the filter canisters to replace the filters. It also has pressure release valves to release the water pressure when changing out the filters. Each filter canaster has a rubber O-ring to seal each filter with no leakage.

Whole House water filtration to protect your family has never been easier with our simple low maintenance 3-Stage filter system. It will deliver better quality water than bottled water to every faucet in your home.

You can take your water quality and safety to an even higher level by adding one of our inline UV water sterilizing systems. UV light inside the water channel **tube destroys 98% of viruses and bacteria**. UV treatment purifies water by exposing living organisms to ultraviolet light. UV disinfection treats water for: Cryptosporidium, Giardia, Dysentery bacilli, Salmonella, Mycobacterium Tuberculosis, Streptococcus, E. coli, Hepatitis B, Cholera, Algae, Fungi, and some viruses. UV light is your best defense against things invisible to the naked eye in contaminated water!
