

VeriSign is the most recognized data authentication service in the world. To maintain the highest levels of data authentication and protection, VeriSign monitors transactions on the internet 24/7/365. Upon moving into new headquarters in Reston, VA in 2011, officials at VeriSign sought a more effective way to notify team members about various actionable situations. They wanted a proactive approach, something that would immediately alert key personnel to mission critical events.

Customization

The Metis Secure system is flexible enough to double as a notification system for critical internal issues, as well as general emergency notifications and building evacuations. The clarity of the voice messaging and the use of multi-color lights fit in perfectly with VeriSign's response plan. Having one system that meets the needs for both cases is a cost-effective, win-win solution.

Integration

Another key component is integration with VeriSign's corporate notification system. Notifications issued by VeriSign's internal network automatically activate the Metis Secure system. Metis Secure engineers designed a custom API in the Command Center software to accommodate this type of integration and automation.

Emergency Notification Takes Many Forms and Colors

MS-5100 Emergency Help Stations display color-coded messages and lights to maximize response at VeriSign.
