

Crime, Economics and Split Regressions

The St. Louis Fred Database covers county economic as well as social data. In this blog I look for a connection between crime and socio-economic data. This study does not have all the relevant data for a complete policy study but my example does illustrate the power of using dummy variables to segregate distinct population groups. I employ 'split regressions' in a cross sectional analysis.

What conclusions can we make? Mankind's first violent crime occurred when Cain struck Able. Not much has changed. Human passions are often at play and not economics. Much of the American landscape experiences violence at a rate less than the mean. A gamma distribution allows for that outcome. It is our outlier counties which give us the notion that United States is a violent nation. Our media loves to exploit outliers; outliers are profitable. Only in the more violent counties do we see economic data related to criminal behavior. Being wary of correlation and causation, it is more likely violent crime drives out a good economic environment. In most of these counties, we map the legacy effects of slavery, Jim Crow and Native American Reservation policies. Immigration appears not to be a significant issue; instead, immigration might actually mitigate the overall county crime rate.

Tip O'Neill once said 'All politics is local' and this study reveals violent crime as a local phenomena. Policymakers and corporate leaders take heed. If our nation is to succeed in reducing the overall violent crime rate, efforts should be directed to our nation's most violent counties.

First the Data Summary.

I must immediately point out that the cross-sectional distributions for each variable are not normally distributed. Instead, the distributions more closely resemble [gamma distributions](#) of different 'shapes'. I also point out that many smaller counties do not have complete data-- those counties are removed from this analysis. Regardless, we have 2606 observations to arrive to some interesting results.

Using dummy variables, I divide our sample set into three distinct groups. Note that with 2606 observations, three group results in over 2.6 billion [combinations](#) of regressions. I will explain how I use a 'cumulative' regression technique to efficiently calculate the set of groups that minimized the total sum of squared errors in a forthcoming. My contention is that when using dummy variables we more effectively exploit the [Law of Large Numbers](#) in finding a regression equation where the error terms are more closely normally distributed.

We note the three variables which might have statistical significance (t-statistics over 2.0). [Bachelor'sDegree or Higher \(5-year estimate\)](#) appears to be a mitigating factor in violent crimes across all counties. Unexpectedly, [Estimated Percent of People of All Ages in Poverty](#) appears to be a mitigating factor in violent crimes across all counties. We'll look at that possibility later. Finally, those areas with higher subprime credit score [Equifax Subprime Credit Population](#) typically have a higher crime rates.

Given the problem of non-normally distributed variables, the weak R-Square of 0.098 and the resulting gamma distribution of residuals, I view the regression on the entire sample dataset with some skepticism. Let's add dummy variables.

Note the significant increase in R-Square statistic from 0.098 to 0.805. This increase alone suggest that crime is a local phenomena. Furthermore, only the subprime variable shows any statistical significance. We also note that the residual values are more normally distributed. Finally, I point out for [Population Estimate, Total, Hispanic or Latino, Black or African American Alone](#) (the Minority Population Percent coefficient and t-statistic are high enough to pique our interest --does having a minority population decrease crime? More interesting is the sizable differences in dummy constant values for the three groups. Group 3's violent crime rate is 7.746 than Group 1. Let's take a look at the map

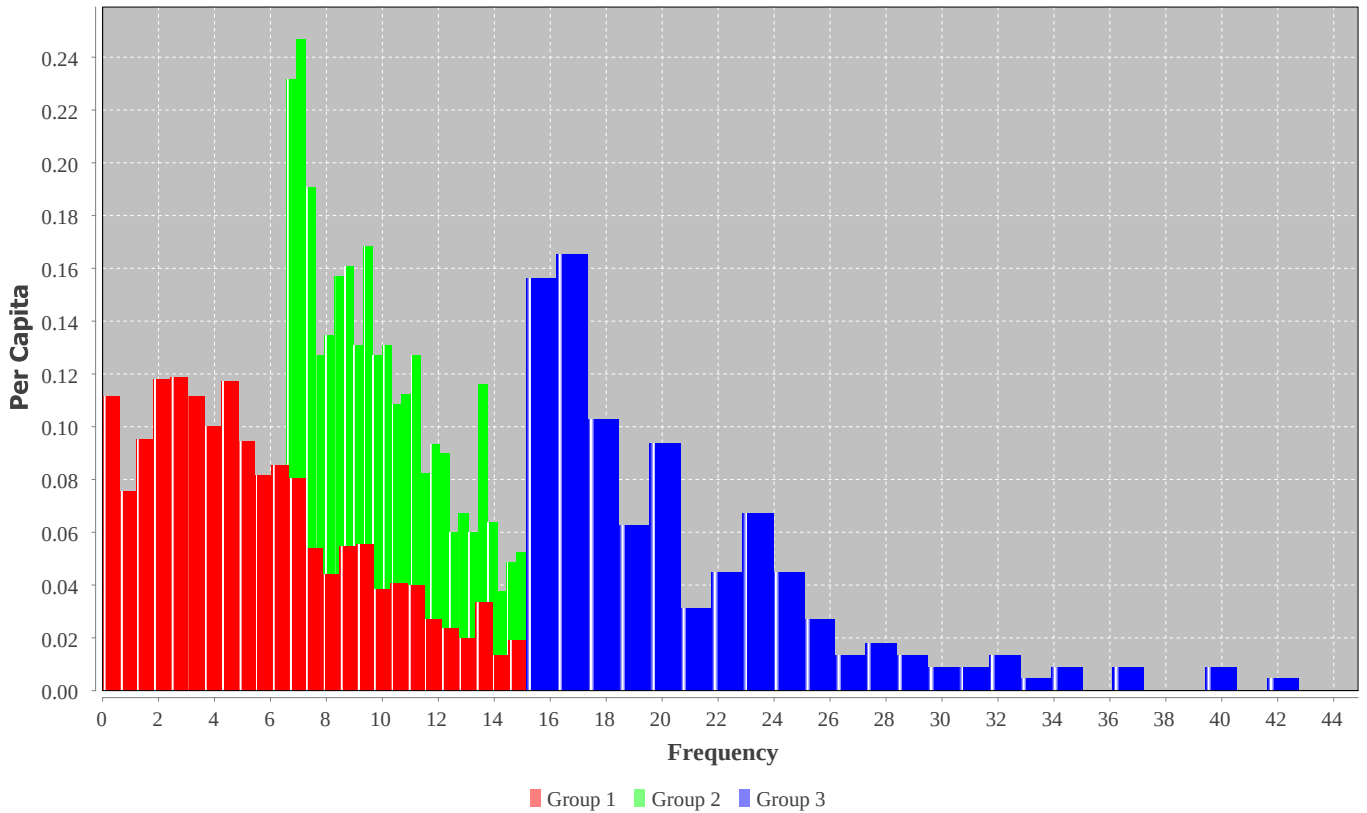

Map of Selected Groups-- excluding Alaska and Hawaii

As we can see much of the county is in the first group

Histogram of Selected groups

Combined Violent Crime

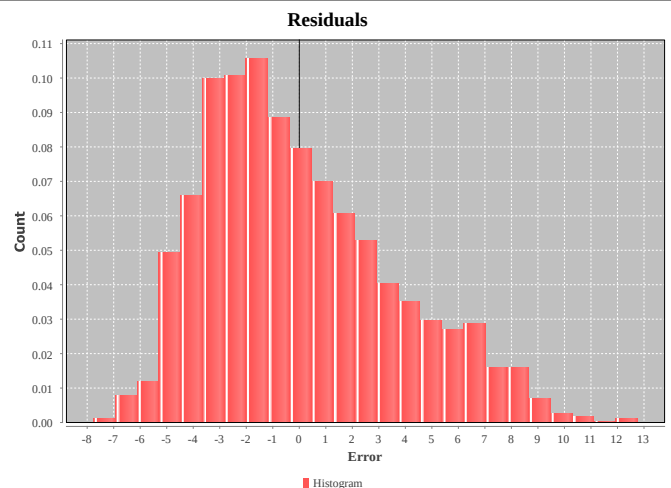

The histogram chart shows the three population sets. Visually, we can see the combination of the three distributions looks normal with group 2 being our centroid. I could add two more dummy variables to create a quintile of distributes. The combinations of 5 on 2530 is sizable and incalculable without a supercomputer.

Now let's look are regressions for each group separately.

In groups one and two a high subprime credit rating is related to a higher incidence of crime. Obviously, the causality of subprime to violent crime should be the reverse-- it is hard to pay one's mortgage if one is sitting in prison

In group three, high unemployment and a bachelor's degree both conspire to create an environment where the incidence of violent crime is higher. I do not make judgement call in this third grouping, but is a population's sense of career/economic frustration at play here? Reflective thought and study is required for these disadvantaged communities

For those who are interested, the actual county data is tabulated below.

Be safe and always stay healthy my friends.
