

DAILY POOL WATCHER CHECKLIST

- Check that the chlorinator, feeders, or skimmers have chlorine tablets in them
- If pool is a salt pool check that the salt system is running
- Check that the pump and filter are running
- Make sure the water level is in the middle of the skimmer (if its below the skimmer add water to the pool because otherwise the pump can run dry causing issues)
- If anyone swims make sure to shock the pool with powdered or liquid chlorine shock and leave the cover off.
- Add 1 lb powdered or 1 gal liquid shock to the pool per 10,000 gallons of water.

Biggest Priority is Chlorine

The most important component of a functioning swimming pool is not only balanced water but chlorine. Chlorine is the pools line of defense against contaminants. Chlorine is what eliminates bacteria and sanitizes the pool to ensure safe swimming. Without chlorine bacteria can spread, algae can form, and next thing you know you have a swamp in your backyard. Optimal chlorine levels are necessary to help keep the pool in working order and sanitized.
