

Proprietary Science – The Tesseract Effect®

How many of us have bought a promising-sounding new natural remedy for what ails us – only to toss it in the garbage can a few weeks later?

Two major factors share some responsibility for nutritional supplement products that fail to live up to their claims:

1. The problem of poor absorption of otherwise very good active ingredients, and
2. The unpalatable taste and smell of many products, especially medical foods that help gut-related disorders.

But these two nutritional supplement issues have now been solved, thanks to Tesseract Medical Research's revolutionary new molecular delivery technology. Tesseract's breakthrough technology ensures that the active nutrients in the supplement or medical food reach the intended target in the body, thus achieving maximum absorption. This innovation has profoundly positive implications for supporting the body's natural responses to digestive, neurocognitive, and inflammatory disorders. It may also hold future promise in cancer and prevention and treatment.

Tesseract's proprietary and patent-pending science utilizes the following three-step approach: First, Tesseract isolates individual molecules of an active ingredient to achieve nano-level scale.

Second, CyLoc technology then encases each molecule of the active ingredient in its own dextrin delivery cage, thus eliminating the issue of unpalatable taste and smell. And third, Tesseract's one-of-a-kind, proprietary DexKey technology accompanies the molecule and breaks the cage at the desired release point in the intestinal tract, thus resolving the problem of poor absorption and further enhancing proprietary absorption mechanisms already in place and supplementing the body's own efforts.
